SECTION 01 11 00

SUMMARY OF WORK

PART 1 GENERAL

1.01 SUMMARY

A. The work covered under this contract will be performed at Salt Lake City Department of Public Utilities' (SLCDPU) City Creek Water Treatment Plant located at 2200 City Creek Canyon Road, Salt Lake City UT, 84103

1.02 DESCRIPTION OF OWNER'S PROJECT

A. The overall project shall consist of furnishing tools, equipment, materials, supplies, and furnishing all labor, transportation, and services, including fuel, power, water, and essential communications, and performing all work or other operations required for the fulfillment of the Contract in strict accordance with the Contract Documents. The Work shall be complete and all work, materials, and services not expressly indicated or called out in the Contract Documents which may be necessary for the complete and proper construction or the Work in good faith shall be provided at no increase in cost to the Owner.

1.03 WORK OF THIS CONTRACT

A. The work to be performed under this contract includes furnishing of all labor, materials and services required for the City Creek Treatment Plant BRIC Package project. Specific features include, but are not limited to:
   1. Construction of a new conventional water treatment plant within the footprint of the existing flocculation and sedimentation basins.
   2. Construction of all yard piping associated with the new treatment plant to make it operational.
   3. Construction of an addition to the existing Fluoride Building.
   4. Construction of a septic drain tank, discharge pipe, and drain field.
   5. Modifications to the existing clarifier to include replacement of the rake arm/motor, replacement of reclaim pumps, placement of a geodesic dome cover, construction of a vestibule over the control cabinet, construction of new stair access to clarifer.
   6. Construction a soil nail/shotcreet retaining wall on the south side of the clarifier.
   7. Construction of piping and gates between Drying Beds 1 and 2 and Beds 2 and 3.
   8. Construction of infiltration gallery.
   9. Modifications to the existing Operations Building to house a new 1,000kW generator, demolition of the existing 1,000 gallon external fuel tank, and construction of a new 3,000 gallon external fuel tank.
   10. Construction of rock weirs in the City Creek channel between the intake and footbridge.
   11. Raising the creek channel embankment adjacent to the Fluoride Building.
   12. Demolition of the existing Filter Building.
   13. Demolition of the plant inlet channel from the operations building to the flocculation basin distribution channels.

B. Except as specifically noted otherwise, provide and pay for:
   1. Insurance and bonds.
   2. Labor, materials, and equipment.
   3. Applicable sales tax.
   4. Tools, equipment and machinery required for the Work.
   5. Traffic control and dust control measures.
   6. Other facilities and services necessary for proper execution and completion of Work.
   7. Permits for disposal of demolished construction materials, if required; provide a chain-of-custody document to OWNER upon completion of the Work to document proper disposal.

C. Work shall be performed while minimizing shutdowns and interference to the existing water treatment plant operations.

D. Work shall be performed while minimizing interference to the existing public walking and bike paths of City Creek Canyon
   1. Contractor shall schedule the Work with Owner to minimize interference.

1.04 ACTIVITIES BY OTHERS

A. Owner, utilities, and others may perform activities within Project area while the Work is in progress.

B. Activities by others which may affect performance of work include:
   1. Water treatment plant operations
   2. Chemical deliveries
   3. Routine maintenance
   4. Public recreation on the main road of City Creek Canyon on weekends and Holidays between the canyon entrance gate and Picnic Site 16.

C. Cooperate with others to minimize interference and delays.

1.05 EARLY OCCUPANCY OF PORTIONS OF WORK

A. Substantially Complete following portions of Work for Owner's early occupancy including specified testing, training of Owner's personnel, and other preparations necessary for Owner's occupancy or use:
   1. New Treatment Building Facility (flash mix, flocculation, sedimentation, filtration, chlorine contact gallery, and backwash pumping facilities).

B. Certificates of Substantial Completion will be executed for each designated portion of Work prior to Owner occupancy.

C. Following occupancy, Owner will:
   1. Provide power to operate equipment and systems.
   2. Repair damage caused by Owner's occupancy.

1.06 COMPIANCE WITH DRINKING WATER PERMIT

A. The existing facility operates under the terms of a permit issued by the Utah Division of Drinking Water. This permit specifies the water quality limits that the plant must meet prior to discharge of finished water.

B. Contractor shall bear the costs of penalties imposed on the Owner for water quality violations caused by actions of the Contractor, including any and all costs to remedy the situation.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 11 80
ENVIRONMENTAL CONDITIONS

PART 1 GENERAL

1.1 ENVIRONMENTAL CONDITIONS

A. This section describes the environmental conditions which have been observed at the site of the work and which may reasonably be anticipated throughout the life of the project.

1.2 CLIMATE CONDITIONS

A. The work elevation is approximately 5,335 feet above mean sea level. In the winter, snow may be present earlier and last longer than at lower elevations.

B. Climate conditions are described as follows:

Description	Range of Conditions
Low Winter Temperature (degrees F)	10° (average), -12° (low)
High Summer Temperature (degrees F)	84° (average), 97° (high)

1.3 ADDITIONAL CONDITIONS

A. Additional conditions which may be applicable are specified in other sections.

END OF SECTION

[This page was intentionally left blank.]

SECTION 01 12 16

WORK SEQUENCE AND RESTRICTIONS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Requirements for sequencing and scheduling the Work affected by existing site and facility, work restrictions, and coordination between construction operations and plant operations.

B. Related Sections:
   1. The following Sections are related to the Work described in this Section. This list of Related Sections is provided for convenience only and is not intended to excuse or otherwise diminish the duty of the CONTRACTOR to see that the completed Work complies accurately with the Contract Documents.
      a. Section 01 11 00 – Summary of Work
      b. Section 01 32 17 – Baseline and Progress Schedules
      c. Section 01 33 00 – Submittal Procedures
      d. Section 33 01 30 – Bypass Piping and Pumping

1.02 DEFINITIONS

A. Reduced Capacity Shutdown: A reduced capacity shutdown occurs when the plant is able to produce a reduced quantity of finished water that meets the drinking water permit requirements.

B. Full Plant Shutdown: A full plant shutdown occurs when the plant is not able to produce any finished water that meets the drinking water permit requirements.

C. Substantial Completion: As defined in Section 00 72 00 Part 14.5.

1.03 SUBMITTALS

A. CONTRACTOR to submit detailed schedule describing work tasks, crew, schedule, materials, and equipment needed during shutdown period for approval to ENGINEER at least one (1) month prior to shutdown event (refer to forms immediately following this specification)

B. WORK SEQUENCE PLANS, Submit Work Sequence Plans detailing the contractors activities are scheduled and coordinated between the various work activities and contract requirements. Failure to coordinate the various requirements causing rework and additional work is contractors responsibility.

1.04 PART 2 GENERAL CONSTRAINTS ON SEQUENCE AND SCHEDULING OF WORK

A. Water projects:
   1. Conduct Work such that the Owner's ability to meet its customer's demands for treated drinking water shall not be impaired or reduced in terms of the required quantity or quality of treated water. Do not impair the operational capabilities of essential elements of the treatment process or reduce treatment capacity below levels sufficient to meet demands for water throughout the contract time. The quantities of and quality of treated water required are described in this Section.
   2. The existing facility operates under the terms of a permit issued by the Utah Division of Drinking Water. This permit specifies the water quality limits that the plant must meet prior to discharge of finished water. A copy of the existing permit is on file for review at the Utah Division of Drinking Water. Contractor shall bear the cost of penalties imposed on the Owner for water quality violations caused by actions of the Contractor, including any and all costs to remedy the situation.
   3. The Owner will obtain project approval from the Utah Division of Drinking Water prior to the contractor beginning construction onsite.

B. Work sequence and constraints presented do not include all items affecting completion of the Work, but are intended to describe critical events necessary to minimize disruption of the existing facilities and to ensure compliance with Utah Pollutant Discharge Elimination System (UPDES) and other permit requirements.

C. The work sequencing and description of critical events provided in this Section are provided to assist the Contractor in scheduling and undertaking the Work. They do not include all items affecting completion of the Work but are intended to describe critical events necessary to minimize disruption of the existing facilities and to ensure compliance with water quality permit requirements, and Owner’s water quality standards.

D. The constraints provided in this Section are contractual obligations that limit the Contractor’s activities and the Contractor’s impact to plant operations.

E. General plant shutdown constraints:
   1. Activities that disrupt individual process operations must comply with these shutdown constraints.
   2. Provide thorough advanced planning, including having required equipment, materials, and labor on hand at time of shutdown.
   3. Where required to minimize treatment process interruptions while complying with specified sequencing constraints, provide temporary pumping, power, lighting, controls, instrumentation, and safety devices.
   4. Final determination of the permitting of shutdowns will be the sole judgment of the Owner. Any full treatment plant shutdown, or significant reduction in treatment capacity or treatment capabilities, must be authorized by the SLC Department of Public Utilities Director or Deputy Director.
   5. Owner maintains the ability to abort shutdown on the day of the scheduled shutdown.
   6. During shutdown period, Contractor shall work longer workdays and on weekends to minimize shutdown period. Contractor shall use additional work crews as needed to meet shutdown restrictions including schedule constraints.

7. Contractor to submit detailed schedule describing work tasks, crew, schedule, materials, and equipment needed during shutdown period for approval to Engineer at least one (1) month prior to shutdown event (refer to forms immediately following this specification).

F. Definitions
   1. Reduced Capacity Shutdown: A reduced capacity shutdown occurs when the plant is able to produce a reduced quantity of finished water that meets the drinking water permit requirements.
   2. Full Plant Shutdown: A full plant shutdown occurs when the plant is not able to produce any finished water that meets the drinking water permit requirements.
   3. Substantial Completion: As defined in Section 00 72 00 Part 14.5.

1.05 SPECIFIC WORK CONSTRAINTS ON SEQUENCE AND SCHEUDLING OF WORK

A. Escort Vehicle Requirement:
   1. Construction equipment and material deliveries to the CCWTP that require a vehicle larger than a US GVWR Class 2B vehicle or single axle trailer require a contractor provided escort vehicle up and down City Creek Canyon Road. Escort vehicle shall use flashing hazard lights and a loudspeaker to alert people within the canyon of the oncoming vehicles. Contractor shall also provide an electronic marquee at the entrance to City Creek Canyon Road and at the CCWTP to alert the public of large vehicle traffic within the canyon.

B. Snow Removal:
   1. Contractor shall remove snow from the work area to allow access by SLCDPU vehicles and pedestrians.

C. Roadway Closure
   1. City Creek Canyon Road closure from the entrance gate to the CCWTP drying beds is permitted starting January 1, 2025 at 6:00 AM, following a closure schedule of Monday @ 6:00 AM through Friday @ 5:00 PM. Occasional closures on weekends are permitted with SLCDPU approval given 14-day notification. No closures are allowed on holidays.

D. Project Milestones:
   1. BRIC Package Early Works Project shall be substantially completed prior to starting work on BRIC package.
   2. Milestone 1: Completion of the New Treatment Building includes the following.
      a. Operations Building
         1) New standby generator and diesel fuel tank installed at Operations Building and operational.
         2) Operations building standby feeder run to feed Operations Building.
      b. Backwash storage tank
         1) Existing I/O and camera at Backwash Storage Tank transferred to New Treatment Building.
      c. New Treatment building
         1) Treatment Building and associated equipment commissioning complete and operational.

3. Milestone 2: Demolition of Filter Building, Clarifier Modifications, and New Septic Treatment System Complete.
    a. Demolition of filter building.
    b. Existing Clarifier electrical utility feed replaced with standby electrical feed provided from Treatment Building.
    c. New Septic Tank Treatment and Drain Field operational.
4. Milestone 3: Completion of Fluoride Building Addition and Perimeter Drain Pump Station.
    a. Fluoride Building addition complete and facility operational.
    b. Perimeter drain pump station operational.

E. Utilize the following table for construction sequencing planning. The table includes existing pipe description, where the pipe extends from and to, and the until milestone completion it shall remain operational.

Table 1 Existing Yard Piping to Remain Operational

Pipe (Existing)	From (Existing)	To (Existing)	Shall Remain in Operation Until:	Milestone/Notes
36-inch Raw Water (RW)	Plant Intake	Operations Building	New Treatment Plant Commissioned	Milestone 1
24-inch Backwash (BW)	Backwash Tank	Filter Building	New Treatment Plant Commissioned	Milestone 1
Morris 21-inch Filtered Water (FW)	Filter Building Clearwell	21-inch (FW) Morris Pipeline	New Treatment Plant Commissioned	Milestone 1
City 21-inch Filtered Water (FW)	Filter Building Clearwell	21-inch (FW) City Pipeline	New Treatment Plant Commissioned	Milestone 1
12-inch Recycle Water (RCW)	Waste Backwash Clarifier/Recycle Pump Station	Operations Building	New Treatment Plant Commissioned	Milestone 1
12-inch Sludge (SL)	Operations Building Drainpipe	Waste Backwash Clarifier	New Septic Tank and Drain Field Commissioned	Milestone 3
8-inch Plant Utility Water (UW1)	Filter Building	Operations Building	New Treatment Plant Commissioned	Milestone 1
30-inch Drain (DR)	Filter Building North and South Troughs/Junction Box	Waste Backwash Clarifier	New Treatment Plant Commissioned	Milestone 1
8-inch Groundwater Return (GW)	Groundwater Sump/Pump	Plant Intake Pentagon	New Plant Groundwater Sump/Pump Commissioned	Milestone 3
Chemical Ductbank pipes (CEM 6x)	Operations Building	Filter Building	New Plant Commissioned	Milestone 1
6-inch Gray Water (GW)	Operations Building	Septic Tank/Drain Field	New Septic Tank and Drain Field Commissioned	Milestone 2

F. The Treatment Plant shall remain online and unaffected by the Contractor's activities except for the shutdowns shown in Table 2. Table 2 describes construction items, plant shut down allowances, bypass pumping requirements, and bypass pumping maximum flow rates for scheduling and constructing the work.

Table 2 Construction Allowable Shutdowns

Construction Item	Plant Shutdown Allowed	Bypass Pumping Required	Bypass Pumping Maximum Flow Rate	Notes
36-inch Raw Water Pipe (RW) tie in	No	Yes	4.4 mgd	From Plant Intake to upstream of Operations Building Parshall Flume.
12-inch Recycled Water Pipe (RCW) tie in	No	Yes	450 gpm (10% of RW flow to meet FBRR)	From Existing Recycle Pump Station at Waste Backwash Clarifier to Plant Raw Water Intake 1. Winter (October – March) 2-day clarifier/recycle pump station shutdown allowed. 2. Summer (April – September) 1-day clarifier/recycle pump station shutdown allowed.
Clarifier Decant 12-inch Pipe (RCW) and Recycle Pump Replacement	No	Yes	450 gpm (10% of RW flow to meet FBRR)	From clarifier to raw water intake (bypass recycle pump station) 1. Winter (October – March) 2-day clarifier/recycle pump station shutdown allowed. 2. Summer (April – September) 1-day clarifier/recycle pump station shutdown allowed.
Clarifier Rake Mechanism Replacement, Dome Installation, PLC Cabinet Relocation	No	Yes	20,010 gpm (backwash at 23 gpm/sf)	From collection box to manhole 2 (first manhole downstream of clarifier). 1. Winter (October – March) 2-day clarifier/recycle pump station shutdown allowed. 2. Summer (April – September) 1-day clarifier/recycle pump station shutdown allowed.
36-inch Drainpipe (OF) tie into Waste Backwash Clarifier	No	Yes	20,010 gpm (backwash at 23 gpm/sf)	From existing collection box to clarifier 1. Winter (October – March) 2-day clarifier/recycle pump station shutdown allowed. 2. Summer (April – September) 1-day clarifier/recycle pump station shutdown allowed.
36-inch Drainpipe (OF) tie into Waste Backwash Clarifier	No	Yes	20,010 gpm (backwash at 23 gpm/sf)	From new junction box to existing collection box
24-inch Filtered Water (FW) Pipe tie into Existing 21-inch Morris Pipeline	No	No	NA	Tying into existing 21-inch Morris Pipeline is not possible while plant is operating in direct filtration. The new treatment plant must be commissioned and operational.
24-inch Filtered Water (FW) Pipe tie into Existing 21-inch City Pipeline	No	No	NA	New Treatment Plant must be ready to be commissioned prior to tying into City Pipeline. Utilize Morris Pipeline connection to keep direct filtration plant operating while tying into City Pipeline.
12-inch Solids Pipe tie in	No	No	NA	Solids line shall be available to receive solids at any time except for the following: 1. Winter (October – March) 2-day clarifier shutdown allowed. 2. Summer (April – September) 1-day clarifier shutdown allowed.

Construction Item	Plant Shutdown Allowed	Bypass Pumping Required	Bypass Pumping Maximum Flow Rate	Notes
24-inch Backwash Tank Pipe tie in	No	No	NA	Water shall always be available for backwashes. If used, temporary pipes shall be 24-inch diameter and shall be capable of conveying 20,000 gpm from existing Backwash Tank at existing available head. 1. Winter (October – March) 2-day backwash tank shutdown allowed. 2. Summer (April- September) 1-day backwash tank shutdown allowed.
Sodium hypochlorite, ferric chloride, and PEC tie in	No	No	NA	No full shutdowns of chemicals are allowed.
Fluoride Building	No	No	NA	Filter Building demolished prior to starting work in Fluoride Building. Fluoride treatment system can be off-line no more than 6 months.

1.06 CONTINUOUS OPERATION OF EXISTING FACILITIES

A. Conduct the Work and provide temporary facilities required to keep the existing plant continuously operational.

B. Do not remove or demolish existing facilities required to keep the existing plant operational at the capacities specified until the existing facilities are replaced by temporary, new, or upgraded facilities or equipment.
   1. Test replacement facilities to demonstrate operational success prior to removing or demolishing existing facilities.

C. Temporary Standby Power must be onsite and operational before demolition of any equipment tied to existing standby generator operation in operations building.

1.07 OPERATIONS AND MAINTENANCE ACCESS

A. Provide safe, continuous access to process control equipment for plant operations personnel.

1.08 UTILITIES

A. Provide advance notice to, and utilize services of, Blue Stake for location and marking of underground utilities operated by utility agencies other than the Owner.

B. New yard utilities were designed using existing facility drawings.
   1. Field verification of utilities locations was not performed during design. Contractor shall pothole existing utilities to confirm exact location prior to ordering materials for project work and shall not rely on the identification or location of utilities shown on the Drawings.
   2. Services crossed or located nearby by new yard utilities may require relocation and possible shutdowns.
   3. Pipe alignments as indicated on the Drawings.

1.09 LIMITATIONS OF CONSTRUCTION

A. The following constraints shall be followed during construction, commissioning, startup, and testing.
   1. Always protect-in-place existing 36-inch Sedimentation Bypass Piping and Flocculation Basin Inlet Channel. No shutdowns of the channel and pipe are allowed.
   2. At all times, allow CCWTP access via City Creek Canyon Road for plant staff and service vehicles.
   3. Coordinate with SLCDPU to allow CCWTP access via City Creek Canyon Road for chemical deliveries as often as once per month.

1.10 RESTRICTIONS (BEYOND MAINTAINING PLANT OPERATIONS)

A. Milestone 1
   1. Temporary Dewatering shall always be provided until perimeter drain collection piping and pump station is operational.
   2. Standby plant power shall always be maintained. The following are the only acceptable times for standby power to be unavailable:
      a. One 3-hour maximum duration shutdown allowed for tie in of a temporary generator to the existing operations building ATS to allow for demo of the existing generator and diesel tank.
      b. One 3-hour maximum duration shutdown allowed for tie-in to new switchgear. Shutdown will include removal of the temporary generator and connection to the new switchgear with the new generator and diesel tank operational back to the existing operations building ATS.
   3. Communication with the existing networking equipment and controllers shall not be interrupted during construction activities. The new fiber optic cables shall be tested and approved prior to startup, testing, and commissioning of the new equipment. The existing fiber optic cabling may be abandoned or demolished only after the new systems are tested, commissioned and brought on-line for water production.

B. Milestone 2
   1. Temporary dewatering shall always be provided until perimeter drain collection piping and pump station is operational.
   2. Clarifier
      a. Shutdown for rake replacement shall occur during the same shutdown for panel relocation.

C. Milestone 3
   1. Temporary dewatering shall always be provided until perimeter drain collection piping and pump station is operational.
   2. Fluoride treatment system shall only be offline for 4 months or less.

PART 2 PRODUCTS

Not Used.

PART 3 EXECUTION

Not Used.

APPENDIX A

"Method of Procedure" (MOP)

Instructions and Forms

Definition and Purpose

"Method of Procedure" (MOP) is a detailed document submitted by the Contractor to request process shutdown(s), utility tie-in(s), work in areas that may risk unanticipated outages, or flow diversions to accommodate site construction activities during a project. Such activities may include (but are not limited to) new tie-ins to utilities or structures, mechanical modifications to process piping or equipment, demolition, bulkhead installation, and cleaning processes.

The MOP provides a detailed plan to the Owner and Engineer that describes specific aspects of the work including purpose, time of execution, and anticipated impacts on treatment processes. The MOP also includes contingency measures and provisions for rapid closure in the event that shutdown or work progress difficulties are encountered. Information from relevant trades associated with the requested shutdown, diversion, or tie-in is also included.

The Owner should use the information within the MOP to define operational procedures and methods to safely and successfully assist the Contractor.

MOP Process Summary

WHO	STEP		TIMING
Contractor	1.	Identify MOPs needed on MOP Log and Baseline Schedule.	7 days prior to Preconstruction Meeting
Contractor, Owner, Engineer	2.	Pre-MOP Meeting.	More than 28 days prior to work
Contractor	3.	Submits MOP.	No later than 28 days prior to work
Owner	4.	Reviews MOP.	
Owner	5.	MOP finalized.	7 days prior to work
Contractor	6.	Complete Readiness Checklist.	5 days prior to work
Contractor	7.	Complete Safety Checklist.	Just prior to commencing work
Contractor	8.	Complete Work.	
Contractor	9.	Update MOP Log and Progress Schedules.	Monthly

MOP Process Detail

STEP 1. Identifies MOPs needed on MOP Log and Baseline Schedule.

Contractor submits a preliminary list of anticipated project MOPs on MOP Log. MOPs identified but not limited to those shutdowns, diversions, or tie-ins described in the Contract Documents. Incorporate MOPs as tasks in Baseline Schedule. Date scheduled MOPs to coincide with the appropriate construction activities.

STEP 2. Pre-MOP Meeting.

Contractor requests a Pre-MOP Meeting with the Owner and Engineer to discuss the nature of the shutdown, diversion, or tie-in, and to gather the information necessary to complete the MOP Form. The pre-MOP meeting may be waived by the Owner or Engineer if the work is deemed to be minor.

STEP 3. Submits MOP.

Contractor completes the MOP Form and submit 3 copies for approval to the Engineer/Owner.

STEP 4. Reviews MOP.

Engineer/Owner distributes MOP Form for review by the Owner's Construction Coordinator, O&M Representative, and Engineer's Project Representative. Review MOP Form for completeness, accuracy, compliance with both the construction schedule, constraints defined in contract documents, and to ensure that the requested work does not negatively impact plant operations or other concurrent project activities. Additional information may be requested to better understand the nature of and method for completing the Work.

STEP 5. MOP finalized.

Once the MOP is agreed to by all parties, the MOP will be finalized by signature. Copies are distributed to the Owner, Engineer, and Contractor.

STEP 6. Complete Readiness Checklist.

Contractor verifies everything is ready for the work.

STEP 7. Complete Safety Checklist.

Contractor ensures safety.

STEP 8. Complete work.

Contractor complete work.

STEP 9. Update MOP Log and Progress Schedules.

Contractor updates MOP Log weekly and distributes at the regularly scheduled construction progress meetings.

READINESS CHECKLIST

(5 days prior to work)

Checklist provided as a guide but is not all inclusive.

1. Confirm all parts and materials are on site:

   _____

   _____

2. Review work plan:

   _____

   _____

3. Review contingency plan:

   _____

   _____

SAFETY CHECKLIST

(Just prior to commencing work)

Checklist provided as a guide but is not all inclusive.

4. Location awareness:
    a. Emergency exits:
    b. Emergency shower and eyewash:
    c. Telephones and phone numbers:
    d. Shut-off valve:
    e. Electrical disconnects:
5. Inspect work area:
    a. Take time to survey the area you are working in. Ensure that what you want to do will work. Do you have enough clearance? Is your footing secure? Do you have adequate lighting and ventilation? Are surrounding utilities out of the way for you to perform your work?
6. SDS (Safety Data Sheets):
    a. Understand the chemicals and substances in the area you are working in by reading the SDS.
7. Lockout/Tagout Procedure:
    a. Lockout/tagout energy sources before beginning work.
    b. Make sure all valves associated with the work are locked out and tagged out on each side of the penetration.
    c. Make sure the lines are depressurized.
8. Overhead work:
    a. Use appropriate personal protective equipment; i.e., safety harness, lifeline, etc.
    b. Select appropriate tie-off points; i.e., structurally adequate, not a pipe or conduit, etc.
    c. Spotter assigned and in position.
    d. Pipe rack access; i.e., check design capacity, protective decking or scaffolding in place, exposed valves or electrical switches identified and protected.
9. Safety equipment:
    a. Shepherd's hook.
    b. ARC flash protection.
    c. Fire extinguisher.
    d. Other: .
10. Accidents:
    a. Should accidents occur, do not shut off and do not attempt to correct the situation, unless you are absolutely positive that your action will correct the problem and not adversely affect other people or equipment.
11. Review process start-up documents:
    a. In the event the system is shutdown, the Control Center should have a working knowledge of the process start-up procedures in order to deal effectively with unforeseen events.

12. Evacuation procedures:
    a. Do not obstruct evacuation routes.
    b. Take time to survey the area for evacuation routes.

SECTION 01 14 19

USE OF SITE

PART 1 GENERAL

1.01 SUMMARY

A. The OWNER's operating personnel will be responsible for operating the existing treatment plant throughout the execution of this contract. Equipment presently installed in the treatment plant must be available to plant personnel at all times for use, maintenance, and repair. If it is necessary in the course of operating the plant, for the CONTRACTOR to move his equipment, materials, or any material included in the work, he shall do so promptly and place that equipment or material in an area which does not interfere with the plant operation. The CONTRACTOR shall not adjust or operate serviceable or functioning equipment or systems except as specifically required by this contract.

B. The existing treatment plant will remain in operation throughout the execution of this contract. The CONTRACTOR shall schedule and conduct his work to minimize necessary shutdowns and interference with normal plant operations and maintenance.

C. The CONTRACTOR shall notify the Construction Manager, in accordance with Section 01 12 16, 1 week in advance of the time it is necessary to take out of service any existing tank, pipeline, channel, electrical circuit, equipment or structure. The CONTRACTOR shall be responsible for providing whatever temporary piping, pumping, power, and control facilities as are required to maintain continuous plant operation and complete treatment except as otherwise specified. The integrity of existing plant utilities shall be maintained by the CONTRACTOR at all times.

SECTION 01 31 13

COORDINATION

This specification changes a portion of APWA Standard Specification Section 01 31 13. All other provisions of the Section remain in full force and effect. This project is in City Creek Canyon so it will be necessary to have a good coordination effort.

Add the following Article to Part 1 (page 100):

1.8 PUBLIC AGENCIES AND UTILITY PERSONNEL TO CONTACT

A. Utility Companies: Utility companies generally require a minimum of 48 hours notice if their utility requires location, relocation or protection. Contact the following individuals to coordinate. (Please note Contractor must contact **Blue Stakes** before digging, phone **(801) 208-2100**.)

1. The Salt Lake City Department of Public Utilities: Tammy Wambeam, G.I.S. & IT Manager, (801) 483- 6746 – Mapping Questions
2. The Salt Lake City Department of Public Utilities to schedule inspection and survey of project of installed sanitary sewer mains, storm drain mains, street lighting and water mains prior to backfilling fittings, valves, washouts, etc.: Call (801) 483-6727.
3. The Salt Lake City Department of Public Utilities Industrial Storm Program Coordinator, Greg Archuleta, (801) 483-6821
4. The Salt Lake City Department of Public Utilities Street Lighting Program Manager, David Pearson, (801) 483-6738

1.9 COORDINATION WITH SALT LAKE DEPARTMENT OF PUBLIC UTILITIES

A. Construction equipment and material deliveries to the CCWTP that require a vehicle larger than a US GVWR Class 2B vehicle or single axle trailer shall be coordinated the Salt Lake City Department of Public Utilities Watershed Manager. Provide a minimum of 72 hours notice to the watershed manager prior to scheduled delivery.

1. The Salt Lake Department of Public Utilities Watershed Manager, Patrick Nelson, (801) 483-6889.

1.10 COORDINATION WITH PUBLIC RELATIONS COORDINATOR

A. Public Relations Coordinator: Provide a minimum of 72 hours notice to the public relations coordinator for all work that impacts the public's use of City Creek Canyon Road. Examples include transporting of excavation equipment or haul trucks, concrete trucks, excavations, etc. The public relations coordinator will share this information with the public via a project website.

1. Kimley-Horn: Jordan King, Project Relations Coordinator, (385) 881-6528

SECTION 01 32 17

BASELINE AND PROGRESS SCHEDULES

PART 1 GENERAL

1.01 PURPOSE

A. The OWNER is committed to delivering quality, cost-effective infrastructure to its customers in a timely manner. One of the most important tools the OWNER uses to achieve this goal is accurate, updated, current schedules for its capital projects. Accurate and updated schedules allow the OWNER to effectively track and manage its projects both in aggregate (at the program or OWNER-wide level) and project-by-project.

B. The OWNER's goal is to take every reasonable step to ensure that projects finish on time and within budget. Project schedules are the fundamental building blocks to planning and executing projects efficiently and on time. These schedules are best prepared by those closest to the work. Because the vast majority of capital project delivery at the OWNER is performed by CONTRACTOR, it is critical that CONTRACTOR prepare schedules as part of performing their work for the OWNER.

C. This Schedule Guidance Document is designed to guide CONTRACTOR in preparing and submitting acceptable schedules for use by the OWNER.

1.02 APPLICABILITY AND BASIC REQUIREMENTS

A. CONTRACTOR is responsible for preparing schedules as defined herein and as required in their contracts. A waiver allowing a CONTRACTOR not to prepare a schedule in accordance with this Schedule Guidance Document may only be granted by the OWNER or designee.

B. There are three (3) basic elements to schedule submittals.
   1. Baseline Schedule: Initial schedule submitted before work begins that will serve as the baseline for measuring progress and departures from the schedule. The Baseline Schedule is prepared by the CONTRACTOR at the beginning of the project and submitted to the OWNER for review and approval.
   2. Progress Schedule: Monthly submittal of a Progress Schedule documenting progress on the project and any changes anticipated. The Progress Schedule is prepared monthly by the CONTRACTOR and submitted to the OWNER.
   3. Schedule Narrative: Concise narrative that highlights changes in the schedule, expected delays, key schedule issues, etc., along with a cash flow graph or summary table. The Schedule Narrative is submitted to the OWNER monthly in conjunction with the Progress Schedule.

C. The schedules required herein will be prepared using the following software (or saved down in the following version) in order to be compatible with the OWNER's schedule system, unless prior permission to use another software is requested and granted by the OWNER.
   1. Primavera Project Planner (now owned by Oracle) version 8.2 or later
   2. or Microsoft Project.

D. Completion time and all specific dates given in the Contract Documents, and sequencing requirements described in Section 01 12 16, shall be shown on the schedule. Activities making up the critical path shall be identified.

1.03 BASELINE SCHEDULE

A. General: The CONTRACTOR will develop a cost loaded schedule using the software version required in Section 1.2 and the Critical Path Method (CPM).
   1. The OWNER will inform the CONTRACTOR of the Project Code (Project Number) for the Project. The file naming convention is demonstrated in the examples below.
      a. Baseline
         Format. ProjectCode (project number)_DocumentType_Date_
         Example. 1701_ScheduleBaseline_03162017.XER
      b. Monthly Update
         Format. ProjectCode (project number)_DocumentType_Date_
         Example. 1701_ScheduleUpdate_03162017.XER
      c. Monthly Schedule Narrative
         Format. ProjectCode (project number)_DocumentType_Date_
         Example. 1701_ScheduleNarrative_03162017.DOC
   2. The approved Baseline Schedule is a part of the contract by reference. The CONTRACTOR has the sole responsibility to correct any latent defects in the Baseline Schedule and perform to the subsequently revised schedule.
   3. The CONTRACTOR will use the Baseline Schedule to coordinate and monitor the work (including the activities of subcontractors, equipment vendors and suppliers).
   4. The CONTRACTOR must keep a copy of the approved Baseline Schedule.

B. Schedule Work Breakdown Structure and Activities
   1. Work Breakdown Structure (WBS): The OWNER's Work Breakdown Structure is designed to meet the basic reporting needs for the OWNER's financial and tracking systems. The CONTRACTOR's project-specific WBS should work within this basic framework and provide additional detail to efficiently deliver and track the work.
      a. WBS elements that are definitely not a part of the scope of services need not be included in the schedule. Note that as many subtasks and activities as desired may be included underneath the WBS elements.
   2. Activities: Activities are the discrete elements of work that make up the schedule. They should be organized underneath the umbrella of the WBS as described in Exhibit A.
      a. The following information should be provided for each activity:
         1) Activity ID Number
            a) Use a four-digit number left justified in the activity I.D. field.
            b) Alphanumeric activity numbers are NOT acceptable.
      b. Activity Description
         1) Activity descriptions should adequately describe the activity and in some cases the extent of the activity. Examples of acceptable descriptions might include "install pipeline between Avenue A and Avenue B", "water line route layout", etc.).

c. Activity Durations
    1) The activity duration will be based upon the physical amount of work that is to be performed for the stated activity and are limited to 20 working days. If work is to exceed 20 days, then break the work down so the work will be completed within a 20-day time frame.
    2) The intent of this requirement is to ensure that the activities are segmented sufficiently to adequately track progress.
d. Activity Start and Finish Dates
    1) Activity start and finish dates will only be accepted if calculated by the software.
    2) Actual activity start and finish dates may not be assigned in a baseline. However, they must accurately be assigned in the working version of the schedule (see Section 4 Progress Schedule).
e. Activity Dependencies
    1) All activities will be logically tied with a predecessor and a successor. The only exception to this rule will be for the project start and project finish milestones.
f. Milestone Activities
    1) The following milestone activities (i.e., important events on a project that mark critical points in time) are of particular interest to the OWNER and should be reflected in the Project Schedule for all phases of work, as applicable. Notice to Proceed (Construction)
    2) Draft Baseline Schedule submittal
    3) Preparation and submission of shop drawings, submittals, and any required re-submittals (if applicable)
    4) Mobilization
    5) Fabrication and delivery of equipment and materials (if applicable)
    6) Substantial Completion
    7) Construction Complete

C. **Baseline Schedule Development: The** CONTRACTOR will designate an authorized representative (Project Scheduler) responsible for developing and updating the schedule and preparing reports. It is recommended that a qualified scheduler develop the Baseline Schedule.
1. The CONTRACTOR's initial schedule submittal will contain NO progress and represent the planned work for the duration of the project. Once approved by the OWNER, this schedule will become the baseline against which all future variance analysis will be performed.
2. The use of activity external constraint dates and lags on relationships is discouraged unless specified or approved by the OWNER. An example of an external constraint date is "concrete placement will begin no later than January 1." The reason for this requirement is that it creates an artificial (rather than calculated) critical path.
3. The Baseline Schedule will consider delivery lead times, construction and access constraints and the coordination of construction with OWNER operations.
    a. **Safety Requirements:** Schedule performance should never take precedence over safety. Project schedules must allow work to be performed in a safe manner.
        1) The CONTRACTOR cannot reduce safety or worker protection in order to shorten schedules, recover lost time or accelerate the work.

b. **Inclement Weather**: Refer to climatology data for anticipating work that can be affected by inclement weather. Historical rain days can be reviewed from the following web site: http://www.noaa.gov/climate

D. Changes to Approved Baseline Schedule: The approved Baseline Schedule is the basis for measuring progress on the project (see Paragraph 1.4, Progress Schedule). As such, the CONTRACTOR should develop the Baseline Schedule considering the realistic delivery of the work tasks and likely constraints.

1. Total and free float is not for the exclusive use or benefit of either the OWNER or the CONTRACTOR, but is a resource available to both parties for the benefit of the project on a first needed basis. Changes to the Baseline Schedule will only be considered after all float has been consumed.
2. Changes to the approved Baseline Schedule may only be considered under limited circumstances. If warranted, any changes will require PRIOR approval by the ENGINEER's Designee and OWNER's Program Manager. Project circumstances that could be considered by the OWNER as potentially warranting re-baselining include the following:
   a. Change Orders to the contract affecting the scope of the work to be performed and the associated schedule completion date

1.04 PROGRESS SCHEDULE

A. As described in Paragraph 1.3, the Baseline Schedule is used to coordinate and monitor the work. The CONTRACTOR is required to keep a copy of the approved Baseline Schedule.

B. The Progress Schedule is simply a copy of the approved Baseline Schedule that will be statused monthly. In other words, progress on the project will be shown monthly as an update of the schedule that will be compared to the approved Baseline Schedule.

C. Note that the Progress Schedule will be statused (data date) through month end, although the submittal date must comply with Paragraph 1.6 of this section.

1. **Progress Updates:** The CONTRACTOR should show on the Progress Schedule updates of the following:
   a. The actual dates that activities start
   b. The actual dates that activities finish
   c. The remaining duration of activities in progress
   d. The percent complete of all activities on the schedule (0 percent to 100 percent complete)
2. **Schedule Narrative**: The Progress Schedule will be accompanied monthly by a concise Schedule Narrative that explains the submitted schedule. The purpose of the Schedule Narrative is to:
   a. Speed review time
   b. Explain variances from Baseline on critical path activities
   c. Explain to the OWNER logic changes and potential schedule conflicts related to dependences.
   d. Concisely summarize the projected cash flow for the project based on the statused schedule.

3. If the project is on schedule, and no significant issues related to schedule exist, then the Schedule Narrative is extremely brief. On the other hand, if the project is falling behind, and/or there are significant conflicts and obstacles to meeting the Baseline Schedule, then the Schedule Narrative should describe the issues and what steps will be necessary for the project to recover. Sharing this information ensures that the entire project team will be aware of the issues and have opportunity to assist, where applicable.

1.05 ADDITIONAL GUIDANCE APPLICABLE TO CONSTRUCTION SCHEDULES ONLY

A. In addition to the requirements in Sections 1.1 – 1.4 of this Schedule Guidance Document, the CONTRACTOR's schedule will include the following.
   1. Schedule of Value Pay Items: Schedule of Values Pay Items (Work) shall be loaded into the scheduling software using the labor, materials, and equipment resource types showing the quantity of Work to be done along with the corresponding value of the Work measured in dollars.

1.06 SUBMITTAL OF SCHEDULES

A. Submittal File Formats: Every time that a schedule or report is submitted (baseline and monthly progress) the following file formats are required.
   1. Baseline Schedule: Submit the schedule in native file format (see below).
      a. Also submit a .pdf of the bar chart schedule consisting of the following columns:
         1) Activity ID
         2) Activity Name
         3) Duration
         4) Start Date
         5) Finish Date
         6) Float
         7) Cost
   2. Progress Schedule: Submit the schedule in native file format (see below).
      a. Also submit a .pdf of the bar chart schedule consisting of the following columns:
         1) Activity ID
         2) Activity Name
         3) Physical Percent Complete
         4) Duration
         5) Start Date
         6) Finish Date
         7) Total Float
         8) Remaining Total Cost
   3. Schedule Narrative: Submit the schedule narrative in .doc format.
   4. Native Schedule File Formats: The native file structure is to save the schedule as follows:
      a. In Primavera 6, save the file as an .XER file.
      b. In Microsoft Project, save the file as an .MPP file.

B. **Submittal Process**: All submittals of schedules must be made to the ENGINEER's Designee. Draft project Baseline Schedules must be submitted within thirty (30) calendar days after the formal Notice to Proceed from the OWNER. All schedules must be submitted in their native format (.XER file or .MPP) as well as in a PDF format. The OWNER will review, accept or reject the schedule within five (5) days of submittal.

1. Once the Baseline Schedule has been accepted, Progress Schedule updates will be due monthly prior to the monthly progress meetings.

SECTION 01 32 23

PART 1 GENERAL

1.01 SURVEY AND LAYOUT

A. The Owner will establish reference benchmarks and baselines as specified.

B. From the information provided, the Contractor shall develop and make such additional surveys as are needed for construction, such as control lines, slope stakes, batter boards, stakes for pipe locations and other working points, lines, and elevations.

C. Contractor shall reestablish reference benchmarks and survey control monuments destroyed by his operations at no cost to the Owner.

D. Survey work shall be performed under the supervision of a licensed land surveyor or registered civil engineer. Contractor shall submit Surveyor's name, certificate of assurance, license number, and schedule of values prior to starting work.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 32 33
PHOTOGRAPHIC DOCUMENTATION

PART 1 GENERAL

1.1 SUMMARY

A. This Section specifies progress photographs to be provided for pre-construction, during construction, and post-construction.

PART 2 SUBMITTALS

A. Photographs shall be submitted in accordance with Section 01 33 00 - Submittal Procedures.

PART 3 PRODUCTS

1.1 PHOTOGRAPHS

A. Photographs shall be taken using a digital camera. Photographs shall be in color and shall have a minimum image area of [1600 X 1200] pixels.

B. Upload, maintain, and organize the photographs monthly using a commercially available photo management system. Organize files by area, year, and month. Assign file names that include location by area, direction, description and date taken.

C. Submit photographs in digital format on a monthly basis.

PART 4 EXECUTION

1.1 GENERAL

A. Photographs shall be taken at locations designated by the Owner and Construction Manager.

B. The photographer shall be equipped to photograph interior and exterior exposures, with lenses ranging from wide-angle to telephoto and flash equipment as necessary for interior spaces.

PART 5 PRE-CONSTRUCTION PHOTOGRAPHS

A. The Contractor shall provide preconstruction photographs prior to commencement of work on the Site.

PART 6 CONSTRUCTION PHOTOGRAPHS

A. The Contractor shall provide construction photographs showing the progress of the Work. The photographs shall be taken of such subjects as may be directed by the Owner and Construction Manager.

B. Photographs of all underground piping and structures prior to backfilling. Include associated location information.

PART 7 POST-CONSTRUCTION PHOTOGRAPHS

A. Take the number of exposures specified until Final Acceptance of the Work. Locations shall be designated by the Owner and Construction Manager.

PART 8 REQUIRED NUMBER OF PHOTOGRAPHS

A. For the work of this Contract, photographs shall provide the minimum number of photographs as follows:

Category	Number of Photographs
Preconstruction	50
Construction	15 weekly
Acceptance	50

END OF SECTION

SECTION 01 33 00

SUBMITTAL PROCEDURES

PART 1 GENERAL

1.01 SUMMARY

A. This Section includes administrative and procedural requirements for submittals.

1.02 ADMINISTRATIVE REQUIREMENTS

A. General:
   1. Furnish submittal items as specified in the Contract Documents.
   2. Review submittal information to verify it is accurate and fulfills specified submittal requirements before submitting for review and comment.
   3. Edit submittal content to clearly indicate only those items, models, or series of equipment, which are being submitted for review. Cross out or otherwise obliterate extraneous materials.
   4. Ensure there is no conflict with other submittals and notify the Owner's Representative in each case where the submittal may affect the work of another contractor or the Owner.
   5. Coordinate submittals among subcontractors and suppliers including those submittals complying with unit responsibility requirements specified in the Contract Documents.
   6. For each submittal, certify field conditions, compliance with the Contract Documents, and review of the submittal prior to submitting for review.
   7. Designate the installation location within the facility, application, or intended purpose for each submittal item. Review comments are solely applicable to the circumstances designated in the submittal.
   8. Coordinate submittals with the work so that work will not be delayed. Coordinate and schedule different categories of submittals, so that one will not be delayed for lack of coordination with others.
   9. No extension of time will be allowed because of failure to properly schedule, coordinate or compile submittals.
   10. Submittals will be rejected for lack of legibility, lack of coordination, ambiguity, or are incomplete. Incomplete submittals will be returned without review.
   11. Do not proceed with work related to a submittal until the submittal process is complete. This requires that submittals for review and comment be returned to the Contractor stamped "No Exceptions Taken" or "Make Corrections Noted."
   12. If desired, authorize material or equipment suppliers to deal directly with the Owner's Representative regarding a submittal. Such dealings require written authorization from the Contractor and are limited to contract interpretations to clarify and expedite the work.

1.03 DEFINITIONS

A. Action Submittals:
   1. Action Submittals content require review and response by the Owner's Representative before proceeding with incorporating the subject equipment, materials, or procedure into the work.
   2. Review comments on Action Submittals, and perform subsequent actions based on the REVIEW ACTION requirements specified below.

B. Informational Submittals:
   1. Informational Submittals are examined to verify that the specified submittal contents have been furnished as specified.
   2. The Contractor's actions are not contingent on the disposition of review comments on Informational Submittals.
   3. Review comments on Informational Submittals, and perform subsequent actions based on the REVIEW ACTION requirements specified below.

C. Closeout Submittals:
   1. Closeout Submittals consist of documentation that is not available for review at the time Action Submittals are submitted for review or documentation that is typically generated or furnished following incorporation of the equipment, materials, or procedure into the work. Closeout submittals include spare parts inventory listing, spare parts, extra stock materials, special tools and other materials or components that are furnished separate from the installed and completed work.
   2. Review comments on Closeout Submittals, and perform the subsequent actions based on the REVIEW ACTION requirements specified below.

D. Samples:
   1. Samples include partial sections of components, cuts, or containers of materials, color range sets, and swatches showing color, texture and pattern.
   2. Samples may be Action or Informational submittals.

E. Mock-Ups:
   1. Mock-ups are scale representations of items to be constructed as part of the work as required in the Contract Documents.
   2. Mock-ups are Action Submittals.

F. Review Actions:
   1. The following definitions and actions are associated with the REVIEW ACTIONS DEFINED below:
      a. NO EXEPTIONS TAKEN: If the review indicates that the material, equipment or work method complies with the Contract Documents, submittal will be marked "NO EXCEPTIONS TAKEN." Implement the work method or incorporate the material or equipment covered by the submittal.

b. MAKE CORRECTIONS NOTED: If the review indicates limited corrections are required, submittals will be marked "MAKE CORRECTIONS NOTED." Implement the work method or incorporate the material and equipment covered by the submittal in accordance with the noted corrections. Where submittal information will be incorporated in O&M data, provide a corrected copy.

c. AMEND AND RESUBMIT: If the review reveals that the submittal is insufficient or contains incorrect data, submittals will be marked "AMEND AND RESUBMIT." Do not undertake work until the submittal has been revised, resubmitted and returned marked either "NO EXCEPTIONS TAKEN" or "MAKE CORRECTIONS NOTED".

d. REJECTED – SEE REMARKS: If the review indicates that the material, equipment, or work method does not comply with Contract Documents, the submittal will be marked "REJECTED - SEE REMARKS." Do not undertake the work covered by such submittals until a new submittal is made and returned marked either "NO EXCEPTIONS TAKEN" or "MAKE CORRECTIONS NOTED" except at your own risk.

1.04 MASTER SUBMITTAL LIST

A. A minimum of five (5) business days following the Notice to Proceed, the Contractor will provide the Owner's Representative a Master Submittal List listing anticipated submittal requirements for the contract.

B. Contractor shall update the list as submittals are completed and transmit to the Owner's Representative. Provide updated list to Owner's Representative monthly.

C. Include the following as a minimum in the updated list:
   1. Submittal number.
   2. Date submitted.
   3. Requested time for return of comments.
   4. Special requests, if any, for that particular submittal.

PART 2 PRODUCTS

(Not Used)

PART 3 EXECUTION

3.01 SUBMITTAL PROCEDURES

A. General:
   1. Owner's Representative will review submittal information and indicate a REVIEW ACTION. Review of submittals does not relieve the Contractor of responsibility for performance of the work according to the Contract Documents.
   2. Coordinate submittal transmittal for related elements of work to ensure the submittals are processed as needed to meet the intent of the work and that delays are minimized.
   3. Submittal review activity will be prioritized based on the order received unless otherwise requested by the Contractor.
   4. Submittal sequencing should coincide with the Construction Schedule in Section 01 32 17 - Construction Progress Schedule.

5. A review duration of 21 calendar days is allotted for each submittal, from the date of receipt by the Owner's Representative to the date of return to the Contractor.

B. Submittal Preparation:
   1. Excepting, mock-ups, spare parts, physical samples, and other items that cannot be converted to electronic media, furnish submittal contents electronically in a searchable PDF format.
      a. Include a table of contents and labeled divider sheets that are coordinated with the table of contents.
      b. Diagrams, drawings, pictures, and illustrations presented with a consistent orientation.
   2. Shop Drawings, Samples and Mock-ups
      a. Submit one electronic copy per the requirements described above and the following:
         1) Shop Drawings: one (1) reproducible and two (2) prints for job site reference. One marked up print will be returned to the Contractor when the review is complete.
         2) Samples: 2 samples
         3) Mock-up: As required by individual specification
         4) Demonstrations: As required to facilitate installation and inspection
      b. Reference applicable specifications for additional requirements

C. Submittal Completeness:
   1. Submittals without all required information are not acceptable and may be marked "REJECTED" and returned without review.
   2. For a submittal to be deemed complete, provide the information required below and specified in specification sections, including those elements in the special transmittal procedures where required.

D. In the event of the need to "revise and resubmit", provide a complete stand-alone submittal with corrections, revisions, and new information clearly identified.

E. Resubmit changes to submittals that require a stamp and signature by a licensed engineer or other certification with the requisite stamp and signature or certifications.

3.02 TRANSMITTAL PROCEDURE

A. General:
   1. Equipment and Material Submittals: Unless otherwise specified, complete the Transmittal Form 01 33 00-A - Submittal Transmittal Form specified in Section 01 99 90 - Reference Forms
   2. Operation and maintenance manuals, information and data Submittals: Complete the Transmittal Form 01 78 23-A - Operation and Maintenance Transmittal Form specified in Section 01 99 90 - Reference Forms.
   3. Unless otherwise specified, submittals regarding material and equipment shall be submitted electronically using a document control program/website such as Procore or SLCDPU's Project Central.

B. SUBMITTAL REGISTER

1. List submittals required by Contract Documents on the attached Submittal Register form. Identify CONTRACTOR's need dates and ENGINEER's action dates.
2. SCHEDULED ACTIVITY: If an activity on the Progress Schedule is assigned to the submittal, place the schedule activity number in the "SCHEDULED ACTIVITY" column.
3. SUBMITTAL ITEM No.: Assign to each entry on the Submittal Register a sequential number in the "SUBMITTAL IDENTIFICATION (ITEM NUMBER)" column.
4. REVIEW ACTION: The "REVIEW ACTION" column identifies technical review responsibility of submittal. Review of all products and materials is the CONTRACTOR's responsibility; however, certain specified submittals will also require ENGINEER's review.
    a. If REVIEW ACTION Column is Blank: Identified submittal shall be approved by the CONTRACTOR and then submitted to the ENGINEER for information.
    b. If the "ENGINEER" is Identified in the REVIEW ACTION Column: Identified submittals shall be first approved by the CONTRACTOR and then submitted to the ENGINEER for review.
5. ENGINEER ACTION DATES: This column is for ENGINEER's use to record date submittal was received and the action code assigned in the submittal review process.
6. Upload the Submittal Register to the SLCDPU Project Central site or Procore.

C. Check Marked Specification Transmittal Procedures:

1. When submittal requirements require a "marked" copy of the specification, provide a copy of the specification marked as indicated below. Provide the following when transmitting the submittal:
    a. Provide a copy of the specification section(s) that specifies a marked copy of the specification. Include addendum updates and referenced specification sections, with addendum updates. Complete the following:
        1) Checkmark each paragraph to indicate submittal compliance with that specification requirement. Check marks (ü) shall denote full compliance with that paragraph as a whole.
        2) Mark paragraphs where deviations are proposed by underlining text that is the subject of the proposed deviation. Denoting each proposed deviation with a number in the margin to the right of the identified paragraph and provide a detailed written explanation for each numbered deviation. The remaining portions of the paragraph not underlined signify compliance with specified requirements.
        3) The Engineer is the final authority for determining acceptability of requested deviations.
    b. For equipment specifications, provide a copy of the control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the subject equipment. Complete the following:
        1) Mark drawings or diagrams to show specific changes necessary for the equipment proposed in the submittal.
        2) If no changes are required, mark the drawings or diagrams with "no changes required".

D. Provide a Certificate of Unit Responsibility assigning unit responsibility in accordance with the requirements of the specification Section. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with the Specifications.

E. Samples and Mock-ups:
   1. Submit samples and mock-ups in accordance with the Contract Documents. Package samples to facilitate review. Include the following with the Submittal Transmittal Form:
      a. Generic description of the sample
      b. Sample source
      c. Product name and name of manufacturer
      d. Compliance with recognized standards
      e. Submittal Number
      f. Availability and delivery time
      g. Specification Section
   2. Submit samples and mock-ups before installation. Where variation in color, pattern, texture or other characteristics are inherent in the material, submit four units to show variation range.
   3. Where samples are for selection of appearance characteristics from a range of standard choices, submit a full set of choices for the material or products.
   4. Maintain sets of approved samples and mock-ups at the Project Site, for quality comparisons throughout the course of construction.
   5. Demolish and remove all samples and mock-ups prior to substantial completion.

3.03 REVIEW PROCEDURE

A. General:
   1. Owner's Representative will review each submittal, indicate a REVIEW ACTION, and return to the Contractor.
   2. Returned submittals indicate one of the following REVIEW ACTIONS: NO EXEMPTIONS TAKEN, MAKE CORRECTIONS NOTED, AMEND AND RESUBMIT, or REJECTED – SEE REMARKS.

3.04 EFFECT OF REVIEW OF CONTRACTOR'S SUBMITTALS

A. General:
   1. Review of contract drawings, methods of work, or information regarding materials or equipment the Contractor proposes to provide, does not relieve the Contractor of responsibility for errors therein and is not regarded as an assumption of risks or liability by the Owner's Representative or the Owner, or by any officer or employee thereof, and the Contractor has no claim under the contract on account of the failure, or partial failure, of the method of work, material, or equipment reviewed. A mark of "NO EXCEPTIONS TAKEN" or "MAKE CORRECTIONS NOTED" means that the Owner has no objection to the Contractor, upon his own responsibility, using the plan or method of work proposed, or providing the materials or equipment proposed.

SECTION 01 35 24

CONTRACTORS CERTIFICATION OF

COMPLIANCE TO SAFETY PLAN

PART 1 GENERAL

1.01 CONTRACTORS CERTIFICATION

A. The Contractor will certify that they will comply with the Safety and Protection Plan requirements of the City. A letter from the Contractor describing the hazards present on this project and their plan to mitigate those hazards is attached following this page.

END OF SECTION

THIS PAGE WAS INTENTIONALLY LEFT BLANK

SECTION 01 35 43

ENVIRONMENTAL PROCEDURES

PART 1 GENERAL

1.01 SITE MAINTENANCE

A. The Contractor shall keep the work site clean and free from rubbish and debris. Materials and equipment shall be removed from the site when they are no longer necessary. Upon completion of the work and before final acceptance, the work site shall be cleared of equipment, unused materials, and rubbish to present a clean and neat appearance.

1.02 TEMPORARY DAMS

A. Except in time of emergency, earth dams are not acceptable at catch basin openings, local depressions, or elsewhere. Temporary dams of sand bags, asphaltic concrete, or other acceptable material will be permitted when necessary to protect the work, provided their use does not create a hazard or nuisance to the public. Such dams shall be removed from the site as soon as they are no longer necessary.

1.03 AIR POLLUTION CONTROL

A. The Contractor shall not discharge smoke, dust, and other contaminants into the atmosphere that violate the regulations of any legally constituted authority. He shall also abate dust nuisance by cleaning, sweeping, and sprinkling with water, or other means as necessary. The use of water, in amounts which result in mud on public streets, is not acceptable as a substitute for sweeping or other methods.

1.04 NOISE CONTROL

A. Between 7:30 p.m. and 7:00 a.m., noise from Contractor's operations shall not exceed limits established by applicable laws or regulations and in no event shall exceed 86 dBA at a distance of 50 feet from the noise source.

SECTION 01 45 00
QUALITY CONTROL

This specification changes a portion of APWA Standard Specification Section 01 45 00. All other provisions of the Section remain in full force and effect.

Add the following Article to Part 1.

1.8 QUALITY CONTROL PROGRAM

A. Quality Control Program: Provide a quality control program which includes procedures and organization so equipment, workmanship, fabrication, construction, operations, and inspections comply with the Contract Documents.

B. Quality Control Program Manager Qualifications:

1. Not CONTRACTOR's work or site superintendent.
2. Quality control experience with projects of similar type and magnitude.
3. Authorized as CONTRACTOR's representative for all quality control and quality assurance matters.

C. Quality Control Program Manager Responsibilities:

1. Manage and supervise quality control plan and quality control surveillance personnel.
2. Verify that testing procedures comply with contract requirements.
3. Verify that facilities and testing equipment are available and comply with testing standards.
4. Check test instrument calibration data against certified standards.
5. Verify that recording forms, including all the documentation requirements, have been prepared.
6. Prepare copies of each test result with all necessary data recorded and with documentation and computations compiled.
7. Provide more testing, if, in ENGINEER's opinion, work is not being adequately controlled.
8. Immediately report any non-compliance of materials and mixes to ENGINEER and CONTRACTOR.
9. When an out-of-tolerance condition exists, perform additional control testing until tolerance is attained.
10. Correlate CONTRACTOR's assurance testing program (APWA Section 01 43 00) with ENGINEER's acceptance testing program (APWA Section 01 45 00).

END OF SECTION

[This page was intentionally left blank.]

SECTION 01 45 20

EQUIPMENT AND SYSTEM PERFORMANCE AND OPERATIONAL TESTING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section contains requirements for the Contractor's performance in documenting testing work required under this contract. In addition, this section contains requirements the for the Contractor's performance during installed performance testing of all mechanical, electrical, instrumentation, and HVAC equipment and systems, including structures for watertight construction, provided under this contract. This section supplements but does not supersede specific testing requirements found elsewhere in this project manual.

1.02 QUALITY ASSURANCE

A. Contractor's Quality Assurance Manager:

1. The Contractor shall appoint an operations engineer or equally qualified operations specialist as Quality Assurance Manager to manage, coordinate, and supervise the Contractor's quality assurance program. The Quality Assurance Manager shall have at least 5 years of total experience, or experience on at least five separate projects, in managing the startup commissioning of mechanical, electrical, instrumentation, HVAC, and piping systems. Operations engineers shall be graduates from a minimum 4-year course in mechanical or civil engineering. Operations specialists shall have equivalent experience in plant operation and maintenance. The quality assurance program shall include:
    a. A testing plan setting forth the sequence in which all testing work required under this project manual will be implemented.
    b. A documentation program to record the results of all equipment and system tests.
    c. An installed performance testing program for all mechanical, electrical, instrumentation, and HVAC equipment and systems installed under this contract.
    d. A calibration program for all instruments, meters, monitors, gages, and thermometers installed under this contract.
    e. A calibration program for all instruments, gages, meters, and thermometers used for determining the performance of equipment and systems installed under this contract.
    f. A testing schedule conforming to the requirements specified in paragraph 2.02 Testing Schedule.
2. For the purposes of this section, a system shall include all items of equipment, devices and appurtenances connected in such a fashion as their operation or function complements, protects or controls the operation or function of the others. The Quality Assurance Manager shall coordinate the activities of all subcontractors and suppliers to implement the requirements of this section.

B. Calibration:

1. All test equipment (gages, meters, thermometers, analysis instruments, and other equipment) used for calibrating or verifying the performance of equipment installed under this contract shall be calibrated to within plus or minus 2 percent of actual value at full scale. Test equipment employed for individual test runs shall be selected so that expected values as indicated by the detailed performance specifications will fall between 60 and 85 percent of full scale. Pressure gages shall be calibrated in accordance with ANSI/ASME B40.1. Thermometers shall be calibrated in accordance with ASTM E77 and shall be furnished with a certified calibration curve.
2. Liquid flow meters, including all open channel flow meters and all meters installed in pipelines with diameters greater than 2 inches shall be calibrated in situ using either the total count or dye dilution methods. Flow meter calibration work shall be performed by individuals skilled in the techniques to be employed. Calibration tests for flow metering systems shall be performed over a range of not less than 10 percent to at least 75 percent of system full scale. At least five confirmed valid data points shall be obtained within this range. Confirmed data points shall be validated by not less than three test runs with results which agree within plus or minus 2 percent.

C. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of issue to the Contractor to develop their Guaranteed Maximum Price (GMP). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/ASME B40.1	Gauges Pressure Indicating Dial Type—Elastic Element
ASTM E77	Method for Verification and Calibration of Liquid-in-Glass Thermometers
Dye Dilution Calibration Method	
	Flow Measurement in Open Channels and Closed Conduits, Vol 1, U.S. Department of Commerce, National Bureau of Standards, pg. 361
	Techniques of Water-Resources Investigations of the United States Geological Survey, Chapter 16, Measurement of Discharge Using Tracers

1.03 SUBMITTALS

A. Submittal material, to be submitted in accordance with Section 01 33 00, shall consist of the following:
   1. A complete description of the Contractor's plan for documenting the results from the test program in conformance with the requirements of paragraph 2.02 Documentation Plans, including:
      a. Proposed plan for documenting the calibration of all test instruments.
      b. Proposed plan for calibration of all instrument systems, including flow meters and all temperature, pressure, weight, and analysis systems.
      c. Sample forms for documenting the results of field pressure and performance tests.
   2. The credentials and certification of the testing laboratory proposed by the Contractor for calibration of all test equipment.
   3. Preoperational check-out procedures, reviewed and approved by the respective equipment manufacturers.
   4. Detailed testing plans, setting forth step-by-step descriptions of the procedures proposed by the Contractor for the systematic testing of all equipment and systems installed under this contract.
   5. A schedule and subsequent updates, presenting the Contractor's plan for testing the equipment and systems installed under this contract.
   6. A schedule establishing the expected time period (calendar dates) when the Contractor plans to commence operational testing of the completed systems, along with a description of the temporary systems and installations planned to allow operational testing to take place.
   7. A summary of the Quality Assurance Manager's qualifications, showing conformance to paragraph 1.02 Contractor’s Quality Assurance Manager requirements.

PART 2 PRODUCTS

2.01 GENERAL

A. The Contractor shall prepare test plans and documentation plans as specified in the following paragraphs. The Construction Manager will not witness any test work for the purpose of acceptance until all test documentation and calibration plans and the specified system or equipment test plans have been submitted and accepted.

2.02 DOCUMENTATION

A. Documentation Plans:
   1. The Contractor shall develop a records keeping system to document compliance with the requirements of this Section. Calibration documentation shall include identification (by make, manufacturer, model, and serial number) of all test equipment, date of original calibration, subsequent calibrations, calibration method, and test laboratory.

2. Equipment and system documentation shall include date of test, equipment number or system name, nature of test, test objectives, test results, test instruments employed for the test and signature spaces for the Construction manager's witness and the Contractor's quality assurance manager. A separate file shall be established for each system and item of equipment. These files shall include the following information as a minimum:
    a. Metallurgical tests
    b. Factory performance tests
    c. Accelerometer recordings made during shipment
    d. Field calibration tests[1]
    e. Field pressure tests[1]
    f. Field performance tests[1]
    g. Field operational tests[1]
3. Section 01 99 90 contains samples showing the format and level of detail required for the documentation forms. The Contractor is advised that these are samples only and are not specific to this project nor to any item of equipment or system to be installed under this contract. The Contractor shall develop test documentation forms specific to each item of equipment and system installed under this contract. Once the Construction Manager has reviewed and taken no exception to the forms proposed by the Contractor, the Contractor shall produce sufficient forms, at his expense, to provide documentation of all testing work to be conducted as a part of this contract.

B. Test Plans:
1. The Contractor shall develop test plans detailing the coordinated, sequential testing of each item of equipment and system installed under this contract. Each test plan shall be specific to the item of equipment or system to be tested. Test plans shall identify by specific equipment or tag number each device or control station to be manipulated or observed during the test procedure and the specific results to be observed or obtained. Test plans shall also be specific as to support systems required to complete the test work, temporary systems required during the test work, subcontractors' and manufacturers' representatives to be present and expected test duration. As a minimum, the test plans shall include the following features:
    a. Step-by-step proving procedure for all control and electrical circuits by imposing low voltage currents and using appropriate indicators to affirm that the circuit is properly identified and connected to the proper device.
    b. Calibration of all analysis instruments and control sensors.
    c. Performance testing of each individual item of mechanical, electrical, and instrumentation equipment. Performance tests shall be selected to duplicate the operating conditions described in the project manual.
    d. System tests designed to duplicate, as closely as possible, operating conditions described in the project manual.
2. Test plans shall contain a complete description of the procedures to be employed to achieve the desired test environment.

[1]Each of these tests is required even though not specifically noted in detailed specification section.

3. The Contractor shall have submitted all test plans required for the systematic field performance and operational tests for all equipment and systems installed under this contract. Once the Construction Manager has reviewed and taken no exception to the Contractor's test plans, the Contractor shall reproduce the plans in sufficient number for the Contractor's purposes and copies for delivery to the Construction Manager. No test work shall begin until the Contractor has delivered the specified number of final test plans to the Construction Manager.

C. Testing Schedule:

1. The Contractor shall produce a testing schedule setting forth the sequence contemplated for performing the test work. The schedule shall be in bar chart form, plotted against calendar time, shall detail the equipment and systems to be tested, and shall be coordinated with the Contractor's construction schedule specified in Section 01 32 17. The schedule shall show the contemplated start date, duration of the test and completion of each test. The test schedule shall be submitted no later than 4 weeks in advance of the date testing is to begin. The Construction Manager will not witness any testing work for the purpose of acceptance until the Contractor has submitted a schedule to which the Construction Manager takes no exception. The test schedule shall be updated weekly, showing actual dates of test work, indicating systems and equipment testing completed satisfactorily and meeting the requirements of this project manual.

2.03 SYSTEM AND EQUIPMENT PERFORMANCE TESTS

A. Each item of mechanical, electrical, instrumentation, and HVAC equipment installed under this contract shall be tested to demonstrate compliance with the performance requirements of this project manual. Each electrical, instrumentation, mechanical, piping, and HVAC system installed or modified under this contract shall be tested in accordance with the requirements of this project manual.

2.04 OPERATIONAL TESTS

A. Once all equipment and systems have been tested individually, the Contractor shall fill all systems except wastewater, scum sludge and other wastewater derived systems with the intended process fluids. Wastewater-derived process systems shall be filled with water. After filling operations have been completed, the Contractor shall operate all systems for a continuous period of not less than 30 days, simulating actual operating conditions to the greatest extent possible. The Contractor shall install temporary connections, bulkheads and make other provisions to recirculate process fluids or otherwise simulate anticipated operating conditions. During the operational testing period, the Contractor's Quality Assurance Manager and testing team shall monitor the characteristics of each machine and system and report any unusual conditions to the Construction Manager.

2.05 PRODUCT DATA

A. Product data, to be provided in accordance with Section 01 33 00, shall be the original and three copies of all records produced during the testing program.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor's quality control manager shall organize teams made up of qualified representatives of equipment suppliers, subcontractors, the Contractor's independent testing laboratory, and others, as appropriate, to efficiently and expeditiously calibrate and test the equipment and systems installed and constructed under this contract. The objective of the testing program shall be to demonstrate, to the Construction Manager's complete satisfaction, that the structures, systems, and equipment constructed and installed under this contract meet all performance requirements and the facility is ready for the commissioning process to commence. In addition, the testing program shall produce baseline operating conditions for the Owner to use in a preventive maintenance program.

3.02 CALIBRATION OF FIXED INSTRUMENTS

A. Calibration of analysis instruments, sensors, gages, and meters installed under this contract shall proceed on a system-by-system basis. No equipment or system performance acceptance tests shall be performed until instruments, gages, and meters to be installed in that particular system have been calibrated and the calibration work has been witnessed by the Construction Manager.

B. All analysis instruments, sensors, gages, and meters used for performance testing shall be subject to recalibration to confirm accuracy after completion, but prior to acceptance of each performance test. All analysis instruments, sensors, gages, and meters installed under this contract shall be subject to recalibration as a condition precedent to commissioning under the provisions of Section 01 91 00.

3.03 PERFORMANCE TESTS

A. General:
   1. Performance tests shall consist of the following:
      a. Pressure and/or leakage tests.
      b. Electrical testing as specified in Division 26.
      c. Wiring and piping, individual component, loop, loop commissioning and tuning testing as described in Division 40.
      d. Preoperational checkout for all mechanical and HVAC equipment. Preoperational check-out procedures shall be reviewed and approved by the respective equipment manufacturers.
      e. Initial operation tests of all mechanical, electrical, HVAC, and instrumentation equipment and systems to demonstrate compliance with the performance requirements of this project manual.
   2. In general, performance tests for any individual system shall be performed in the order listed above. The order may be altered only on the specific written authorization of the Construction Manager after receipt of a written request, complete with justification of the need for the change in sequence.

B. Pressure And Leakage Tests:
   1. Pressure and leakage tests shall be conducted in accordance with applicable portions of Divisions 3 and 40. All acceptance tests shall be witnessed by the Construction Manager. Evidence of successful completion of the pressure and leakage tests shall be the Construction Manager's signature on the test forms prepared by the Contractor.

C. Functional Checkout:
   1. Prior to energization (in the case of electrical systems and equipment), all circuits shall be rung out and tested for continuity and shielding in accordance with the procedures required in Division 26.

D. Component Calibration And Loop Testing:
   1. Prior to energization (in the case of instrumentation system and equipment), all loops and associated instruments shall be calibrated and tested in accordance with the procedures required in Division 40.

E. Electrical Resistance:
   1. Electrical resistance testing shall be in accordance with Division 26.

F. Preoperational Tests:
   1. Preoperational tests shall include the following:
      a. Alignment of equipment using reverse dial indicator method.
      b. Pre-operation lubrication.
      c. Tests per the manufacturers' recommendations for prestart preparation and preoperational check-out procedures.

G. Functional Tests:

1. General: Once all affected equipment has been subjected to the required preoperational check-out procedures and the Construction Manager has witnessed and has not found deficiencies in that portion of the work, individual items of equipment and systems may be started and operated under simulated operating conditions to determine as nearly as possible whether the equipment and systems meet the requirements of these specifications. If available, plant effluent may be employed for the testing of all liquid systems except gaseous, oil, or chemical systems. If not available, potable water shall be employed as the test medium. Test media for these systems shall either be the intended fluid or a compatible substitute. The equipment shall be operated a sufficient period of time to determine machine operating characteristics, including noise, temperatures and vibration; to observe performance characteristics; and to permit initial adjustment of operating controls. When testing requires the availability of auxiliary systems such as looped piping, electrical power, compressed air, control air, or instrumentation which have not yet been placed in service, the Contractor shall provide acceptable substitute sources, capable of meeting the requirements of the machine, device, or system at no additional cost to the Owner. Disposal methods for test media shall be subject to review by the Construction Manager. During the functional test period, the Contractor shall obtain baseline operating data on all equipment with motors greater than 1 horsepower to include amperage, bearing temperatures, and vibration. The baseline data shall be collected for the Owner to enter in a preventive maintenance system.
    a. Test results shall be within the tolerances set forth in the detailed specification sections of this project manual. If no tolerances have been specified, test results shall conform to tolerances established by recognized industry practice. Where, in the case of an otherwise satisfactory functional test, any doubt, dispute, or difference should arise between the Construction Manager and the Contractor regarding the test results or the methods or equipment used in the performance of such test, then the Construction Manager may order the test to be repeated. If the repeat test, using such modified methods or equipment as the Construction Manager may require, confirms the previous test, then all costs in connection with the repeat test will be paid by the Owner. Otherwise, the costs shall be borne by the Contractor. Where the results of any functional test fail to comply with the contract requirements for such test, then such repeat tests as may be necessary to achieve the contract requirements shall be made by the Contractor at his expense.
    b. The Contractor shall provide, at no expense to the Owner, all power, fuel, compressed air supplies, water, and chemicals, all labor, temporary piping, heating, ventilating, and air conditioning for any areas where permanent facilities are not complete and operable at the time of functional tests, and all other items and work required to complete the functional tests. Temporary facilities shall be maintained until permanent systems are in service.
2. Retesting: If under test, any portion of the work should fail to fulfill the contract requirements and is adjusted, altered, renewed, or replaced, tests on that portion when so adjusted, altered, removed, or replaced, together with all other portions of the work as are affected thereby, shall, unless otherwise directed by the Construction Manager, be repeated within reasonable time and in accordance with the specified conditions. The Contractor shall pay to the Owner all reasonable expenses incurred by the Owner, including the costs of the Construction Manager, as a result of repeating such tests.

3. Post-test Inspection: Once functional testing has been completed, all machines shall be rechecked for proper alignment and realigned, as required. All equipment shall be checked for loose connections, unusual movement, or other indications of improper operating characteristics. Any deficiencies shall be corrected to the satisfaction of the Construction Manager. All machines or devices which exhibit unusual or unacceptable operating characteristics shall be disassembled and inspected. Any defects found during the course of the inspection shall be repaired or the specific part or entire equipment item shall be replaced to the complete satisfaction of the Construction Manager at no cost to the Owner.

3.04 OPERATIONAL TESTS

A. The Contractor shall provide system operation testing. After completion of all performance testing and certification by the Construction Manager that all equipment complies with the requirements of the specifications, the Contractor shall fill all process units and process systems, except those employing domestic water, oil, air, or chemicals, with plant effluent water. All domestic water, oil, air, and chemical systems shall be filled with the specified fluid.

B. Upon completion of the filling operations, the Contractor shall circulate water through the completed facility for a period of not less than 48 hours, during which all parts of the system shall be operated as a complete facility at various loading conditions, as directed by the Construction Manager. The operational testing period shall commence after this initial period of variable operation. Should the operational testing period be halted for any reason related to the facilities constructed or the equipment furnished under this contract, or the Contractor's temporary testing systems, the operational testing program shall be repeated until the specified continuous period has been accomplished without interruption. All process units shall be brought to full operating conditions, including temperature, pressure, and flow.

C. As-built documents specified in Section 01 78 39 of facilities involved shall be accepted and ready for turnover to the Owner at the time of operational testing.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 45 23

TESTING AND INSPECTION SERVICES

PART 1 GENERAL

1.01 SUMMARY

A. GENERAL REQUIREMENTS: Comply with the testing and inspection specified in this Section and elsewhere in the Construction Documents. For the purpose of this Section, all references made herein to Testing Agency or Special Inspector or Geotechnical Consulting Firm shall be referred to as those tests or inspections which will be conducted by an inspector provided by the Owner.

1. The Owner or registered design professional in responsible charge acting as the Owner's agent will select and employ an independent Testing Agency to conduct the tests and inspections in accordance with applicable standard methods of American Society for Testing and Materials (ASTM) as a requirement of the building permit. The Owner may require other special inspection services to inspect and verify the Work installed is in accordance with the Construction Documents and construction industry standards.

1.02 DEFINITIONS

A. Special Inspector – A qualified individual employed or retained by an approved agency and approved by SLCDPU as having the competency necessary to inspect a particular type of construction requiring special inspection.

B. Testing Agency - firm responsible for performing specific inspections and/or tests as part of the Special Inspection program.

1.03 QUALITY ASSURANCE

A. QUALIFICATIONS: The inspector for all Work as hereinafter specified, except for geotechnical inspections, waterproofing and roofing, shall be a registered Special Inspector employed by an approved inspection and/or Testing Agency. All inspection personnel used on this Project are subject to being disapproved from the Project at the discretion of the Owner.

1. The Special Inspector shall have the required technical knowledge and experience for the product or construction element being installed.
2. Geotechnical Inspection will be performed by a licensed Geotechnical Consulting Firm.

1.04 DUTIES OF OWNER'S TESTING AGENCY

A. GENERAL: The Owner's Testing Agency will conduct testing and inspection services, interpret them, and evaluate the results for compliance with the building permit, the site development permit, and the Construction Documents; agency will report findings to the Owner, Contractor, and Owner's Resident Project Representative (RPR). Testing and inspection services shall be in accordance with applicable standard methods of ASTM or other standards specified by SLCDPU, the Construction Documents, and construction industry standards. The Testing Agency will reasonably support overtime, second shift, and out-of-area activity if requested by the Contractor and approved at the Owner's sole discretion.

B. TESTING AND INSPECTION: Materials to be tested are specified by the building permit and as required by the Construction Documents, as directed by Owner, or required by Owner's RPR. Quantities and extent of tests and inspections shall be as specified and/or required by the Owner's RPR.

C. NON-CONFORMING WORK: The Owner's Inspector shall document and immediately notify the Contractor and Owner of any Work found defective or not in accordance with the requirements of the Construction Documents. Non-conforming Work shall be corrected.

D. The Owner's inspectors are not authorized to do the following:
   1. Release, revoke, alter or enlarge on requirements of Construction Documents.
   2. Approve or accept any portion of the Work.
   3. Perform any duties of the Contractor.
   4. Stop Work.

1.05 COSTS

A. The Owner's Testing Agency and Special Inspector costs for initial testing and inspection as specified in the Construction Documents will be paid for by the Owner or registered design professional in responsible charge acting as the Owner's agent. Initial tests and inspections are defined as those required to complete the first tests and inspections specified. Costs for subsequent re-testing and re-inspection of items found not to be in compliance with Construction Documents shall be borne by the Contractor.

B. Additional tests and inspections not herein specified, but requested by the Owner, shall be paid for by the Owner. However, if the results of such tests or inspections are found to be not in compliance with Construction Documents, the Contractor will be back charged for all costs for initial testing as well as re-testing, re-inspection and Owner's Consultants services.

C. Costs for additional tests or inspections required because of Contractor changes to reviewed and accepted products or materials provided, or source, or supply shall be borne by the Contractor.

D. Costs for any Work which is required to correct any deficiencies shall be borne by the Contractor.

E. Costs of any testing which is required solely for the convenience of Contractor in its scheduling and performance of the Work shall be borne by the Contractor.

F. Costs for verification testing of Work done without prior notice, with improper supervision, or contrary to construction practice shall be borne by the Contractor.

G. Costs for testing of materials for which fabrication and mill reports are required but not furnished shall be borne by the Contractor.

H. The cost, if any, of providing access for inspections and tests shall be considered part of the normal expense of conducting business and therefore non-reimbursable.

I. In those instances where inspector(s) arrive at the agreed-upon location, at the agreed upon date and time, and find articles to be inspected are not ready for inspection, the inspector(s) shall return to their home office and all expenses incurred shall be borne by the Contractor.

1.06 TESTS AND INSPECTION REPORTS

A. Copies of Owner and Contractor test and inspection reports shall be distributed at weekly intervals. Such reports shall include all tests made, regardless of whether such tests indicate that the material is satisfactory or unsatisfactory; a final report should be submitted documenting corrective work done on of any unsatisfactory material and or work identified in the testing or inspection reports. Samples taken, but not tested, shall also be reported. Records of special sampling operations that are required shall also be reported. Test and inspection reports shall be distributed as follows:
   1. Owner
   2. Owner's RPR
   3. Contractor
   4. Structural Engineer of Record

B. A report shall be prepared for each inspection and test and shall include:
   1. Date issued.
   2. Project title and number.
   3. Name and signature of inspector.
   4. Date of inspection or sampling and test.
   5. Record of temperature and weather.
   6. Identification of product and Specification Section.
   7. Location in Project.
   8. Type of inspection or test.
   9. Results of inspections and tests, and observations regarding compliance with Laws and Regulations, and standards.

1.07 CONTRACTOR'S RESPONSIBILITIES

A. COORDINATION: It is the Contractor's responsibility to initiate, coordinate, and conform to the required tests and inspections. Inspection of the Work by the Owner's Special Inspectors and/or Testing Agency shall not relieve the Contractor from responsibility for compliance with the Construction Documents requirements. Owner's Special Inspectors and/or Testing Agency and Owner shall have authority to reject Work whenever the provisions of the Construction Documents are not being complied with, and the Contractor shall instruct his employees accordingly.

B. ACCESS FOR THE PURPOSE OF INSPECTION: Ensure the Owner's Special Inspectors and/or Testing Agency have free access to all parts of the Work and to the shops where the Work is in preparation; are provided proper facilities and safe access for such inspection; and are reasonably furnished access, equipment, tools, samples, certifications, test reports, design mixes, storage, and assistance as requested by the Owner's Inspector.

C. STORAGE FACILITIES: Furnish adequate storage facilities as approved by the Owner for the sole use of the Owner's Testing Agency for safe storage and curing of such specimens which must remain on the site prior to transport to the laboratory.

D. DATA: Furnish records, Contract Drawings and shop drawings, certificates, approved Change Orders, and similar data as required by Owner's Inspectors to perform their work to assure compliance with the Construction Documents.

E. NOTICE: Furnish notice to Owner and coordinate with Owner's Inspectors a minimum of five (5) working days in advance of all required tests and a minimum of forty-eight (48) hours in advance of all required inspections, unless otherwise specified.

F. NON-CONFORMING WORK: Remove and replace Non-conforming Work at no additional cost to the Owner prior to Final Completion. Where Non-conforming Work requires design modifications, such re-design shall be performed by the Engineer of Record and costs shall be borne by the Contractor.

G. CANCELLATIONS: Contractor shall give sufficient advance notice to Owner and Inspectors to allow rescheduling of their work load in the event of cancellation or time extension of any scheduled test or inspection

1.08 TEST FAILURES

A. GENERAL: The Owner may require re-test of a sampled material when a sample or procedure has failed to pass the required tests. In the event any test or inspection indicates failure of a material or procedure to meet requirements of Construction Documents, all costs for re-testing or re-inspection shall be borne by the Contractor. The Contractor may opt to replace the imperfect Work, equipment or material in lieu of performing the tests.

1.09 REPORT TEST FAILURES

A. GENERAL: Immediately upon determination of a test failure, the Owner's Inspector shall notify the Owner and Contractor. By the end of the following day the Owner's Inspector shall send written test results to those named on the distribution list.

B. Contractor shall similarly report test failures to Owner resulting from work of testing agencies provided by the Contractor.

PART 2 - NOT USED

PART 3 - EXECUTION

A. Contractor shall complete field testing in accordance with the minimum requirements indicated in the following schedule and throughout the Contract Documents. Additional source material testing shall be complete as necessary to establish the basis of field tests. The frequency of testing in this schedule lists the minimum number of tests to be requested and completed per quantity of work completed by the Contractor and should be verified in the individual Specifications sections. See the Statement of Special Inspections in the General Structural Notes for additional information and requirements.

B. FILL
   1. SUBGRADE PREPARATION AND COMPACTION: Verify depth of scarification, moisture content within optimal limits for compaction, and degree of compaction specified in Section 31 23 00. Frequency of testing shall generally conform to 25 foot maximum spacing for strip footings, each isolated pad footing, every 900 square feet for slabs and mat foundations, or as directed by the Resident Project Representative in light of actual geometry and conditions extent.
   2. STRUCTURE FILL: Verify material provided, lift thickness, and compaction density. Frequency of sampling and testing shall be the same as for Subgrade Preparation and Compaction.
   3. STRUCTURE BACKFILL: Verify material provided, lift thickness, and compaction density. Frequency of sampling and testing shall be as directed by the Resident Project Representative but not less than every 2 feet vertical (lifts) and every 1600 square feet of filled area.
   4. PIPE TRENCH BACKFILL: Verify material provided, lift thickness, and compaction density. Frequency of sampling and testing for Bedding, pipe zone, and trench back fill shall be at performed intervals no greater than 500 feet. Testing at minimum shall be performed at the spring line on both sides of the pipe and at 12-inches above the crown of the pipe.
   5. OTHER FILL MATERIALS: Verify material used, lift thickness, and compaction density. Frequency of sampling and testing shall be as directed by the Resident Project Representative/Construction Manager.

C. CONCRETE REINFORCING
   1. Provide Special Inspection for all structural reinforcing in concrete and masonry.
   2. Provide Special Inspection for mechanical reinforcing connectors and splicing systems as required by that product's ICBO Evaluation Report, or equivalent.

D. CAST-IN-PLACE CONCRETE
   1. Sample the first daily truck load of ready mixed concrete and every 50 cubic yards thereafter, complying with ASTMC 172.
   2. Perform one slump test for the first daily truck load of ready mixed concrete and every 50 cubic yards thereafter or as requested by Resident Project Representative/Construction Manager if consistency is in question, complying with ASTM C143.

3. Perform one air content test for each set of compressive strength specimens, complying with ASTM C 31.
4. Fabricate compressive strength specimens, complying with ASTM C 39.
5. Make one set of 6 of compressive strength specimens for each day of structural concrete placing or each 150 cubic yards or fraction thereof for each class of concrete.
6. Test two specimens after curing 7 days, two specimens after curing 28 days, and retain two specimens for later testing if required.
7. Comply with ACI 350 Section 5.6 (ACI 318 for non-water retaining structures) for evaluation and acceptance of concrete.

E. ANCHOR BOLTS AND ANCHORS

1. SPECIAL INSPECTIONS: Provide Special Inspection for wedge anchors, undercut anchors, adhesive anchors, epoxy anchors, and all other anchoring systems installed in hardened concrete and masonry as required by that product's ICBO Evaluation Report, or equivalent.
2. SITE INSPECTION OF STRUCTURAL ANCHOR BOLTS: Visually inspect all structural anchor bolts for grade, diameter, embedment, geometry or type ("J" bolt or hex-head), quantity and general location. Contractor shall assume all responsibility for detailed dimensions locating each individual bolt, each bolt group in total, and locations of bolts within each group (template).

F. ROUGH CARPENTRY

1. CONVENTIONAL FRAMING WITH SAWN LUMBER: Special Inspector visually inspect for size and grade of sawn lumber bearing wall elements, joists, rafters, and beams. Visually inspect for adequate bearing on supporting elements.
2. ENGINEERED AND MANUFACTURED WOOD JOISTS, BEAMS AND POSTS: Special Inspector visually inspect for size, type, and manufacturer's product grade for all elements using engineered and manufactured wood including glu-laminated members. Verify tension rated lamination of glu-laminated beams is properly oriented. Visually inspect for adequate bearing on supporting elements.
3. ENGINEERED WOOD TRUSSES: Special Inspector visually inspect against reviewed and accepted manufacturer's shop drawings, including general shape, chord and web sizes, bridging and bracing, and adequate bearing.
4. ROOF AND WALL SHEATHING: Special Inspector visually inspect for specified thickness and plies, Index, APA rating, strength axis across supporting members, staggered layout on roofs and floors, blocking or clips, edge nailing and field nailing.
5. CONNECTORS: Special Inspector verify bolted and nailed connections conform to specifications. In particular, visually inspect "gun nails" for conformance to specified common nail diameters and lengths. Inspect cold-formed steel framing connectors, rafter/truss ties, straps and seismic hold-downs according to ICBO Evaluation Report descriptions, controlling Code or specified standard. Inspect split ring connectors and their bolting.

END OF SECTION

SECTION 01 51 00

TEMPORARY UTILITIES

PART 1 GENERAL

1.01 OFFICE

A. The Contractor shall maintain a suitable office at the site of the work.

1.02 POWER

A. The Contractor shall provide power for construction at the plant site. He shall make arrangements with the electrical utility and with the Owner for power takeoff points, voltage and phasing requirements, transformers and metering and shall pay the costs and fees arising therefrom. The Contractor shall provide the special connections required for his work.

B. Contractor shall arrange for, pay for, install, protect, and maintain piping for all construction water and facilities. Secure written permission from the Owner for each connection and use of the Owner's water system. Meet the Owner's specified requirements for use. The fire hydrants at the plant are fed from the Filter Backwash Tank. Obtain permission from the Owner prior to using any water from any onsite fire hydrant. Notify the fire department before obtaining water from any fire hydrants located outside of the plant boundaries. Use only special hydrant-opening wrenches to open hydrants. Makes certain hydrant valve is fully open, since cracking the valve causes damage to the hydrant. Notify the City and the Fire Department immediately of any hydrant damage. Hydrants shall be completely accessible to fire department at all times.

1.03 TELEPHONE

A. The Contractor shall provide telephone service at his construction site office. Radio-telephone service is not acceptable as a substitute for telephone service.

1.04 SANITARY FACILITIES

A. The Contractor shall provide toilet and washup facilities for his work force at the site of work. The facilities shall comply with applicable laws, ordinances, and regulations pertaining to the public health and sanitation of dwellings and camps.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 52 00

CONSTRUCTION FACILITIES

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies field office equipment, and services to be provided for the Construction Manager or Owner at the project site during the entire time of construction.

B. General Field Office Requirements:
   1. The field office, equipped as specified herein, shall be provided at the site, ready for use by the Construction Manager or Owner.
   2. Unless released earlier by the Construction Manager in writing, the field office shall be maintained in full operation at the site with all utilities connected and operable until the Notice of Completion has been executed or recorded. Upon execution or recordation of the Notice of Completion, or upon early release of the field office by the Construction Manager the Contractor shall remove the field office(s) within 14 days from the date of notification, and shall restore the site to its original condition.

C. Office Facilities:
   1. The Contractor shall provide all necessary electrical wiring, plumbing, toilet and lavatory fixtures, air conditioning and heating equipment, and shelving, and shall furnish all necessary light, heat, water, and daily janitorial services in connection with the field office specified herein, for the duration of the Work.
   2. The Contractor shall provide and maintain for the exclusive use of the Construction Manager, and the Owner's representative and personnel, at a point convenient to the construction operations, one separate, well lighted, air conditioned, electrically heated field office the equivalent to a 12-foot x 60-foot mobile office with a toilet room, containing a water closet and lavatory partitioned off from the working area and outside door lock. The Contractor shall provide all furnishings, services, and equipment specified herein. The office shall be of the portable trailer type unless otherwise specifically authorized by the Construction Manager in writing and shall be separate unit, not attached or connected to any other structures. The office will have as a minimum two private offices, one conference room and one common area.

1.02 FIELD OFFICE FURNISHINGS

A. The Contractor shall provide the following listed items in good condition for the primary field office:
   1. 6 Standard 30 x 60-inch desk with not less than 3 drawers
   2. 1 Plan table 36 x 72-inch top; 36 inches high
   3. 1 Plan rack (all metal plan-hold type) capable of holding 6 sets of plans, complete with 6 standard all metal plan-hold clamps
   4. 6 Office chair, standard arm rest type, adjustable swivel tilt-back with casters
   5. 8 Office chair, stiff-leg type, no arm rest
   6. 5 Waste baskets

7. 2 Tack board 36 x 42 inches, well mounted
8. 1 Bottled water dispenser unit (supplying both hot and cold water) and bottled water service and continuous supply of paper cups
9. 1 4' x 8' conference room table
10. 2 3' x 5' office tables
11. Small refrigerator and freezer (Approx. 24” W x 72” H)
12. 1,000-Watt microwave oven with small cabinet to hold plates and utensils
13. 1 Freestanding book shelves, minimum 4 feet high. Nine linear feet of shelf space shall be provided in each.
14. 1 Whiteboard, 4' x 3' with erasable color markers and supplies.
15. 1 10-inch indoor/outdoor maximum/minimum thermometer

1.03 SPECIAL OFFICE EQUIPMENT

A. Printer and Copy Machine:
   1. The Contractor shall provide, for the exclusive use of the Construction Manager, one combination printer and copy machine.
   2. The copier/printer shall be Laser Writer automatic feed type and shall be complete with connecting cord for a computer, capable of reproducing original 8-1/2 x 11 and 11 x 17 originals on either 8-1/2 x 11 or 11 x 17 plain bond paper. The machine must have a stack-feed capability and collating capability.
   3. The Contractor shall furnish all necessary powders, chemicals, or other materials required for proper operation of the copy machine, exclusive of bond paper. The Construction Manager will supply all bond reproduction paper required.

1.04 FIELD WIFI SERVICE

A. The Contractor shall provide in the field office provided as specified herein, for the use of the Owner's or Construction Manager's employees in connection with performance of the work hereunder, WIFI Service, in good order.

1.05 FIELD OFFICE SERVICES

A. The field office required hereunder shall be provided with sufficient lighting to provide not less than 50 foot-candles at desk top height at each desk location. Exterior lighting shall be provided over the entrance door.

B. A minimum of four 110V AC duplex electric convenience outlets shall be provided in the office and in the conference room and common area. At least one such outlet shall be located on each wall. The electric distribution panel shall service not less than two 110V, 60 Hz circuits.

C. Where inside toilet facilities are not connected to outside plumbing, a flush-type chemical toilet with a holding tank shall be provided. All such sanitary waste material shall be regularly pumped out and the chemicals recharged. A continuous supply of toilet paper and paper towels shall be furnished for the toilet facility.

1.06 FIELD OFFICE UTILITIES

A. The Contractor shall make all provisions and pay all installation and other costs for the Contractor's and the Construction Manager's offices in order to provide power service, exterior lights and any local code and OSHA requirements. Contractor shall pay all monthly charges for the various services provided to the Construction Manager's office throughout the construction period.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials, equipment and furnishings may be new or used, but must be serviceable, adequate for the required purpose, and must not violate applicable codes for regulations.

PART 3 EXECUTION

3.01 PREPARATION

A. The Contractor shall fill and grade sites for temporary structures to provide surface drainage. Provide all-weather surfaced access roads and paths and parking areas.

3.02 INSTALLATION

A. The Contractor shall construct temporary field office on proper foundations and provide connections for utility services. He shall secure portable or mobile buildings when used. Steps and landings shall be provided at entrance doors and a thermometer mounted at a convenient outside location, not in direct sunlight.

3.03 LOCATION

A. The field office facilities shall be located within the Contractor's work area shown at specific site approved by the Construction Manager.

3.04 MAINTENANCE AND CLEANING

A. The Contractor shall provide periodic maintenance and cleaning for field offices, furnishings, and equipment.

3.05 REMOVAL

A. The Contractor shall remove temporary field offices, workshops and storage buildings, and contents and services at a time when no longer needed. Foundations and debris shall be removed; site shall be graded to required elevations and the area cleaned.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 57 00

TEMPORARY CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. This specification changes a portion of 2017 APWA Standard Specification Section 01 57 00. All other provisions of the Section remain in full force and effect. Provide temporary facilities for the proper completion of the Work as required and specified.

B. Changes:
   1. Change the following paragraph in **Article 3.2 DUST AND MUD CONTROL** to:
      a. At a minimum, dust and mud control efforts shall include a daily sweeping of the work area streets. One sweeping shall take place at the end of the workday at a minimum, if needed additional sweeping shall take place midway through the workday. Additional efforts may be required as determined by the ENGINEER, OWNER, SWPPP inspector, or other representative.
   2. Add the following paragraph in **Article 3.2 DUST AND MUD CONTROL**:
      a. Contractor shall prepare, submit and implement a Fugitive Dust Control Plan with the Utah Department of Environmental Quality, Division of Air Quality.
   3. Change the following paragraph to **Article 3.3 SURFACE WATER CONTROL** to:
      a. Control all on-site surface water. Provide proper drainage so flooding of the site or changed flow conditions including path, quantity or quality onto an adjacent property does not occur.
   4. Add the following paragraph to **Article 3.3 SURFACE WATER CONTROL**:
      a. CONTRACTOR shall prepare a Storm Water Pollution Prevention Plan (SWPPP) specifically for this project in compliance with Salt Lake City and State of Utah requirements for Stormwater Discharges Associated with Construction and Land Disturbance Activities. CONTRACTOR shall comply with all Clean Water Act, City Ordinance and SWPPP requirements for the project.
      b. Some minimum erosion control and storm water protection components have been identified. These do not constitute all necessary components of a comprehensive SWPPP.
      c. The CONTRACTOR shall provide all labor, equipment, materials, and services necessary to complete the work.
         1) Site Map: Showing boundaries and BMPs that will be implemented.
         2) Concrete washout: Describe in detail how concrete washout will be contained and removed from the site.
         3) Concrete/Road cutting (must be contained): Describe in detail how concrete & road cutting dust and pollutants will be contained.
         4) Housekeeping BMPs: Describe in detail general housekeeping e.g. restroom (port-a-potty), dumpster(s), roll off container or cans, etc. Provide means for secondary containment of housekeeping BMPs to prevent discharge to the site or City Creek in the event of a spill or rain event.
         5) Erosion/sediment controls: Describe in detail the boundary controls to be used e.g. inlet protection, silt fence, fiber rolls, wattle, cut back, etc.

6) Offsite tracking prevention: Describe in detail how you will mitigate tracking dirt/mud outside of construction boundaries in compliance with the City's Clean Wheel Ordinance.

7) Dewatering: BMPs that will be used to sample and treat discharge before entering a waterway/storm drain e.g. dewatering bag, filter sock, check down dam, frac tank, etc. Any water the CONTRACTOR intends to send to the creek shall be sampled, tested, in compliance with the City's MS4 permit requirements, in compliance with the project's UPDES UTG permit requirements, and meet the receiving water quality standards before being discharged to the creek.AD1

d. The CONTRACTOR shall identify type and placement of BMPs.

e. The CONTRACTOR shall be responsible for implementation and maintenance of all BMPs.

f. The CONTRACTOR shall perform weekly inspections of the site for the duration of the project. Note: Inspection shall include housekeeping, placement and condition of all BMPs.

g. The CONTRATOR shall be responsible stabilizing and removing all temporary BMPs at the conclusion of the job.

h. If work is being performed outside the boundaries of Salt Lake City the CONTRACTOR shall contact the MS4 operator and comply to any additional stormwater pollution prevention requirements for that jurisdiction.

i. If CONTRACTOR is assessed fines for not meeting permit requirements, those costs will not be passed onto the OWNER.

j. Contractor Shall submit a Dewatering Control Plan (DCP) specifically for this project in compliance with Salt Lake City and the State of Utah requirements for discharges associated with dewatering activities (if applicable).AD1

5. Change the following paragraph to **Article 3.4 GROUND WATER CONTROL** to:
   a. Remove all dewatering facilities meeting inspector requirements when no longer required.
6. Add the following paragraph to **Article 3.4 GROUND WATER CONTROL**:
   a. Any ground water the CONTRACTOR intends to send to the creek shall be sampled, tested an in compliance with the City's MS4 permit requirements before being discharged to the creek.
7. Add the following **Article 3.7 Sanitation to Part 3 – Execution**

3.7 Sanitation

A. Toilet Facilities: Provide portable chemical toilets at each active work site or staging area for the use of employees. Toilets at construction job sites shall conform to the requirements of Part 1926 of the OSHA Standards for Construction.

1. Furnish at least one portable toilet at each active work site.

END OF SECTION

SECTION 01 57 29

INTEGRATED EXCAVATION PLAN

PART 1 GENERAL

1.01 REQUIREMENTS

A. CONTRACTOR shall provide a thorough Integrated Excavation Plan (IEP) that unifies the requirements for Excavation and Fill (31 23 00), Dewatering (31 23 19), Sheeting, Shoring, and Bracing (31 41 00), Vibration Control (31 41 01), Demolition 02 41 00, and Geotechnical Instrumentation and Monitoring (31 09 00).

1.02 SUBMITTALS

A. Submittals in accordance with the General Conditions and Section 01 33 00.

B. The CONTRACTOR shall submit drawings and complete design data showing the means, methods and equipment the CONTRACTOR proposes for the IEP. The CONTRACTOR shall submit information sufficient for the ENGINEER to understand how the following systems are to be integrated:

1. Excavation and Fill
2. Dewatering
3. Sheeting, Shoring, and Bracing
4. Vibration Control
5. Geotechnical Instrumentation and Monitoring
6. Demolition

C. The IEP shall be stamped by a Ground Control Specialist/Professional Engineer licensed in the State of Utah with at least ten (10) years of experience working in these types of ground conditions.

D. The Specialist/Professional Engineer shall have professional liability insurance coverage as specified in contract documents.

PART 2 PRODUCTS (NOT USED)

PART 3 REQUIREMENTS

A. The IEP shall address the necessary means and methods required that are deemed critical to the success of the project and thoroughly protect the owner's facilities.

B. For unshored excavations near existing structures, The Professional Engineer responsible for the IEP shall provide stamped calculations demonstrating a factor of safety of at least 1.30 for global stability and 1.25 against sliding based on a 0.30 sliding coefficient of friction.

C. The Professional Engineer responsible for the IEP shall provide stamped calculations demonstrating that construction traffic loads will be mitigated so as to not impact the Owner's facilities.

D. The Professional Engineer responsible for the IEP shall also address the excavation under the existing walls adjacent to by-pass piping, Operations and Admin building, Filter Building, and Fluoride Building. As well as proposed pipelines within the yard adjacent to the walls.

E. The Professional Engineer for the IEP shall be available during construction and will address any conditions or events that may arise. This Work will include developing solutions to these said conditions or events.

F. The IEP shall include a Contingency Plan that addresses:
   1. Thresholds and limitations of the plan
   2. Mitigation Actions
   3. Contact list for an incident, e.g. Incident Commander
   4. Communication (Internal and External)
   5. Resources

G. The IEP shall include a summary for the expectations of the plan's performance.

END OF SECTION

SECTION 01 58 00

PROJECT IDENTIFCATION AND SIGNS

PART 1 GENERAL

1.01 SECTIONS INCLUDED

A. Temporary on-site identification and informational signs to identify key elements of construction facilities and traffic routing.

1.02 1.2 SUBMITTALS

A. Sketch of informational signs.

1.03 1.3 QUALITY ASSURANCE

A. Sign Painter: Professional experienced in type of work required.

B. Finishes, Painting: Adequate to resist weathering and fading for scheduled construction period.

PART 2 PRODUCTS

2.01 SIGN MATERIALS

A. Structure and Framing: May be new or used, wood or metal, in sound condition, structurally adequate to work and suitable for specified finish.

B. Sign Surfaces: Exterior grade plywood
   1. Type 4'x4': 4-feet high by 4-feet wide
   2. Type 4'x8': 4-feet high by 8-feet wide
   3. Thickness: As required by standards to span framing members, resist wind loading, and to provide an eve, smooth surface without waves or buckles.

C. Rough Hardware: Galvanized steel or equal.

D. Paint: Exterior quality
   1. Background: White
   2. Lettering: Black
   3. Accents: Green

PART 3 EXECUTION

3.01 PROJECT INDENTIFICATON SIGNS

A. Content to include:
   1. Title of Project
   2. City logo and motto
   3. Name of Mayor

4. Names of City Council members and the district they represent
5. Names of professional consultants and their titles
6. Name of ENGINEER and title
7. Name of CONTRACTOR

B. Graphic design, style of lettering, colors: See Drawing

C. Paint exposed surfaces of supports, framing, and surface material; one coat of primer and one coat of exterior paint.

D. Erect on the site at a lighted location of high public visibility, adjacent to the main entrance to the site, as approved by ENGINEER.

3.02 INFORMATIONAL SIGNS

A. Size of signs and lettering: As required by regulatory agencies, or as appropriate to usage.

B. Colors: As required by regulatory agencies, otherwise of uniform colors throughout project.

C. Paint exposed surfaces: One coat of primer, and one coat of exterior paint.

D. Paint graphics in styles, sizes, and colors selected.

E. Install at a height for optimum visibility, on ground-mounted poles, or attached to temporary structural surfaces.

F. No Commercial or advertising signs will be allowed on the site of the Work.

3.03 MAINTENANCE

A. Maintain signs and supports in a neat, clean condition; repair damages to structure, framing, or sign.

B. Relocate information signs, as required by progress of the Work.

C. Remove graffiti from signs immediately.

3.04 REMOVAL

A. Remove signs, framing, supports, and foundations at completion of Project.

B. Repair landscaping, and surface improvements damaged by removal.

C. At the completion of the removal the sign becomes property of the OWNER.

SECTION 01 61 45

AREA EXPOSURE DESIGNATIONS

PART 1 GENERAL

1.01 DESCRIPTION

A. SCOPE:
   1. This section designates area exposure types for each location, room, area, or space at the site of the Work.
   2. Area exposures are used to specify materials based on the corrosion environment that the material is exposed to when the materials for the component are not scheduled or otherwise identified for each specific installation (e.g., pipe, anchor bolts, pipe supports, coatings, etc.). Where materials are scheduled for specific individual components (e.g., equipment, instruments, conduit, panels, etc.), furnish materials as specified.

1.02 RELATED SECTIONS:

A. Section 01 11 80 – Environmental Conditions

1.03 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Atmospheric: Air space surrounding a structure or process.
   2. Solution: Liquid or solid which may contain water or other free liquid.

B. EXPOSURE TYPE: Included as a supplement to this Section, the Area Exposure Table designates an Exposure Type for each room or area. Each Exposure Type, listed from least to most severe corrosion potential, is defined below:
   1. Indoor Dry: locations inside a building or other enclosed structure not subjected to wash down and not in contact with a liquid holding or earth retaining wall.
   2. Indoor Wet: locations inside a building or structure that are damp, subject to wash down, or surfaces of structures that are in contact with a liquid holding or earth retaining wall or slab.
   3. Outdoor: locations not protected from the weather, or only partly protected by a roof or open enclosure, and exposed to exterior ambient conditions. Local ambient conditions may be expected to vary, generally within the ranges specified in Section 01 11 80.
   4. Buried: below grade wall or roofs; locations covered and in contact with earth/soil.
   5. Submerged: locations inside a covered liquid or solids holding structure that are below a plane located 12 inches below the minimum operating level of the liquid in the tank or structure.
   6. Process Corrosive: locations exposed to high humidity, frequent wash down and/or corrosive gases or vapors from the process stream. Process corrosive includes locations inside an open (not covered) liquid or solids holding structure that are above a plane located 12 inches below the minimum operating level of liquid in the structure and below the top of the wall of the structure.

7. Head Space: locations inside a covered liquid or solids holding structure that are above a plane that starts 1-foot below the minimum operating liquid level in the structure.
8. Chemical Corrosive: walls, ceilings, floors, trenches and other surfaces exposed to delivery, storage, transfer, use or containment of corrosive chemicals.

C. ENVIRONMENTAL CONDITIONS: Environmental conditions for each Exposure Type are tabulated below:

Exposure Type	Environment	Chemical Exposure	Chemical Concentration
Indoor Dry	Atmospheric, Dry	None	Not Applicable
Indoor Wet	Atmospheric, Wet	None	Not Applicable
Outdoor	Atmospheric, Wet	None	Not Applicable
Buried	Solution	Earth/Soil	Not Applicable
Submerged	Solution	Various Chemicals	Dilute
Process Corrosive	Atmospheric	Hydrogen Sulfide	1 - 10 ppm
		Chlorides	Dilute
		Ferric chloride	45% wt
		Sodium hypochlorite	5.5 % wt
		Trace Chemicals	Dilute
Head Space	Low Oxygen, Wet	Hydrogen Sulfide	10 - 1500 ppm
		Other trace gases	Dilute
Chemical Corrosive	Atmospheric, Wet	Ferric chloride	45% wt
		Sodium hypochlorite	5.5% wt

D. AREA EXPOSURE TABLE: The Area Exposure Table schedules an Exposure Type for each location, room, area, or space at the site of the Work. The Area Exposure Table is provided in Part 4 of this Section.

PART 2 NOT USED

PART 3 EXECUTION

A. MATERIAL SELECTION
1. Provide construction materials, coating systems, and lining systems consistent with materials requirements specified in individual equipment/material Specifications for the exposure assigned in the area exposure table. In the event of a conflict between the individual equipment/material specification and this Section, the individual equipment/material specification governs. In the event an area exposure is not designated for a particular location, the area exposure with the most severe corrosion potential from all area exposures for adjacent locations, rooms, areas, or spaces governs, and shall be the basis of the Contract Price.
2. Where components are assigned multiple area exposures, select the material and coating specified for the area exposure that has the most severe corrosion potential. When components cross, span, or straddle the boundary separating two or more area exposures, select materials specified for the area exposure that has the most severe corrosion potential. Where materials change at a boundary between exposures, change the material at the boundary or within the less severe exposure. At material transitions, separate dissimilar metals by a dielectric coupling or other suitable barrier.

PART 4 AREA EXPOSURE TABLE

Area Number	Area Name	Room Number	Room Name / Delineation	Exposure Type	Notes
01	Site	---	Outside the perimeter of facilities, above grade	Outdoor	
01	Site	---	Outside the perimeter of facilities, below grade	Buried	
01	Site	---	Interior of below grade vaults and hand holes	Submerged	Does not include manholes on buried piping.
03	Operations Building	111	Electrical Room	Indoor Dry	
03	Operations Building	---	Other First Floor Areas	Indoor Wet	
03	Operations Building	113	Chemical Storage, exposed	Indoor Dry	
03	Operations Building	113	Chemical Storage, sumps	Chemical Corrosive	
35	Flocculation Basins	---	Upper level	Indoor Dry	
35	Flocculation Basins	---	Basin Interior, intermediate level, lower level	Submerged	
35	Sedimentation Basins	---	Upper level	Indoor Dry	
35	Sedimentation Basins	---	Basin Interior, intermediate level, lower level	Submerged	
35	Filters	---	Upper Level, filter gallery	Indoor Dry	
35	Filters	---	Filter inlet channel, filter basins, below Grade	Submerged	
60	Clarifier	---	Upper level	Outdoor, wet	
60	Clarifier	---	Lower level	Submerged	
70	Clearwell	---	Upper level, intermediate level	Indoor Dry	
70	Clearwell	---	Lower level	Submerged	
87	Fluoride	---	Upper level	Indoor dry	
87	Fluoride	---	Sumps	Chemical Corrosive

SECTION 01 66 00

PRODUCT STORAGE AND HANDLING REQUIREMENTS

PART 1 GENERAL

1.01 DAMAGE

A. Equipment, products and materials shall be shipped, handled, stored, and installed in ways which will prevent damage to the items. Damaged items will not be permitted as part of the work except in cases of minor damage that have been satisfactorily repaired and are acceptable to the Construction Manager.

1.02 PIPE

A. Pipe and appurtenances shall be handled, stored, and installed as recommended by the manufacturer. Pipes with paint, tape coatings, linings or the like shall be stored to protect the coating or lining from physical damage or other deterioration. Pipes shipped with interior bracing shall have the bracing removed only when recommended by the pipe manufacturer.

PART 2 EQUIPMENT

2.01 PACKAGE AND MARKING:

A. All equipment shall be protected against damage from moisture, dust, handling, or other cause during transport from manufacturer's premises to site. Each item or package shall be marked with the number unique to the specification reference covering the item.

B. Stiffeners shall be used where necessary to maintain shapes and to give rigidity. Parts of equipment shall be delivered in assembled or subassembled units where possible.

2.02 IDENTIFICATION:

A. Each item of equipment and valve shall have permanently affixed to it a label or tag with its equipment or valve number designated in this contract. Marker shall be of stainless steel. Location of label will be easily visible.

2.03 SHIPPING:

A. Bearing housings, vents and other types of openings shall be wrapped or otherwise sealed to prevent contamination by grit and dirt.

B. Damage shall be corrected to conform to the requirements of the contract before the assembly is incorporated into the work. The Contractor shall bear the costs arising out of dismantling, inspection, repair and reassembly.

2.04 FACTORY APPLIED COATINGS:

A. Unless otherwise specified, each item of equipment shall be shipped to the site of the work with the manufacturer's shop applied epoxy prime coating as specified in Section 09 90 00 . The prime coating shall be applied over clean dry surfaces in accordance with the coating manufacturer's recommendations. The prime coating will serve as a base for field-applied finish coats. Electrical equipment and materials shall be painted by manufacturer as specified in Section 09 90 00-3.03 Electrical and Instrumentation Equipment and Materials.

2.05 STORAGE:

A. During the interval between the delivery of equipment to the site and installation, all equipment, unless otherwise specified, shall be stored in an enclosed space affording protection from weather, dust and mechanical damage and providing favorable temperature, humidity and ventilation conditions to ensure against equipment deterioration. Manufacturer's recommendations shall be adhered to in addition to these requirements.

B. Equipment and materials to be located outdoors may be stored outdoors if protected against moisture condensation. Equipment shall be stored at least 6 inches above ground. Temporary power shall be provided to energize space heaters or other heat sources for control of moisture condensation. Space heaters or other heat sources shall be energized without disturbing the sealed enclosure.

2.06 PROTECTION OF EQUIPMENT AFTER INSTALLATION:

A. After installation, all equipment shall be protected from damage from, including but not limited to, dust, abrasive particles, debris and dirt generated by the placement, chipping, sandblasting, cutting, finishing and grinding of new or existing concrete, terrazzo and metal; and from the fumes, particulate matter, and splatter from welding, brazing and painting of new or existing piping and equipment. As a minimum, vacuum cleaning, blowers with filters, protective shieldings, and other dust suppression methods will be required at all times to adequately protect all equipment. During concreting, including finishing, all equipment that may be affected by cement dust must be completely covered. During painting operations, all grease fittings and similar openings shall be covered to prevent the entry of paint. Electrical switchgear, unit substation, and motor load centers shall not be installed until after all concrete work and sandblasting in those areas have been completed and accepted and the ventilation systems installed.

END OF SECTION

SECTION 01 71 13

MOBILIZATION AND DEMOBILIZATION

This specification changes a portion of APWA Standard Specification Section 01 71 13. All other provisions of the Section remain in full force and effect.

Add the following paragraph:

1.5 **SUBMITTALS**

A. Project Video Recording: Video record the project area prior to commencing construction. The ENGINEER's representative shall be present during recording. The recording shall be performed on foot, noting all salient existing features in the project area and the location of the recording shall be clearly indicated. "Drive-by" video recording will not be accepted. The video recording shall be submitted to the ENGINEER a minimum of 5 days prior to starting construction.

END OF SECTION

THIS PAGE WAS INTENTIONALLY LEFT BLANK

SECTION 01 73 24

DESIGN REQUIREMENTS FOR
NON-STRUCTURAL COMPONENTS AND NON-BUILDING STRUCTURES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Minimum structural requirements for the design, anchorage, and bracing of non-structural components such as architectural/mechanical/HVAC/electrical components, equipment, or systems, and non-building structures such as tanks.

B. The requirements of this section apply to design of the structural elements and features of equipment and to platforms/walkways that are provided with equipment or non-building structures.

C. This section applies to non-building structures and non-structural components that are permanently attached to structures as defined below and in ASCE 7.

D. Design and conform to criteria and design codes listed within this section. Engineering design is not required for attachments, anchorage, or bracing detailed on the Drawings or where the size of attachments, anchorage, or bracing is defined in specific technical specification sections.

E. The following non-structural components are exempt from seismic design loading requirements of this section.
   1. Components in Seismic Design Category A.
   2. Furniture (except permanent floor supported storage cabinets over 6 ft tall).
   3. Temporary or movable equipment.
   4. Architectural components in Seismic Design Category B other than parapets supported by bearing walls or shear walls provided that the component importance factor, I_p, is equal to 1.0.
   5. Mechanical and electrical components in Seismic Design Category B.
   6. Mechanical and electrical components in Seismic Design Category C provided that the component importance factor, I_p, is equal to 1.0.
   7. Mechanical and electrical components in Seismic Design Categories D, E, or F where all of the following apply:
      a. The component importance factor, I_p, is equal to 1.0;
      b. The component is positively attached to the structure;
      c. Flexible connections are provided between the component and associated ductwork, piping, and conduit;
      d. And either:
         1) the component weighs 400 lb or less and has a center of mass located 4 ft or less above the adjacent floor level; or
         2) the component weighs 20 lb or less, or in the case of a distributed systems, 5 lb/ft or less.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related section. Additional related sections may apply that are not specifically listed below.
   1. Section 05 05 20 Anchor Bolts
   2. Section 05 50 00 Metal Fabrications

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

SMACNA	Seismic Restraint Manual Guidelines for Mechanical Systems

1.04 DEFINITIONS

A. Structure: The structural elements of a building that resist gravity, seismic, wind, and other types of loads. Structural components include columns, posts, beams, girders, joists, bracing, floor or roof sheathing, slabs or decking, load-bearing walls, and foundations.

B. Non-structural Components: Non-structural portions of a building include every part of the building and all its contents, except the structural portions, that carry gravity loads and that may also be required to resist effects of wind, snow, impact, temperature and seismic loads. Non-structural components include, but are not limited to, ceilings, partitions, windows, equipment, piping, ductwork, furnishings, lights, etc.

C. Non-building Structures: Self-supporting structures that carry gravity loads and that may also be required to resist the effects of wind, snow, impact, temperature and seismic loads. Non-building structures include, but are not limited to, pipe racks, storage racks, stacks, tanks, vessels and structural towers that support tanks and vessels.

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for requested deviations to specification requirements, with the submittal is sufficient cause for rejection of the entire submittal with no further consideration.
   4. For structural elements of non-structural components and non-building structures required to be designed per this section, provide Drawings and design calculations stamped by a Utah licensed professional engineer qualified to perform structural engineering.
   5. List of non-structural components and non-building structures requiring wind and seismic design and anchorage.
   6. Shop drawings showing details of complete wind and seismic bracing and anchorage attachment assemblies including connection hardware, and embedment into concrete.
   7. Shop drawings showing plans, elevations, sections and details of equipment support structures and non-building structures, including anchor bolts, structural members, platforms, stairs, ladders, and related attachments.
   8. Identify interface points with supporting structures or foundations, as well as size, location, and grip of required attachments and anchor bolts. Clearly indicate who will be providing each type of attachment/anchor bolt. Equipment vendor shall design anchor bolts, including embedment into concrete, and submit stamped calculations.
   9. Calculations for supports, bracing, and attachments shall clearly indicate design criteria applied. Coordinate concrete embedment calculations with thickness and strength of concrete members. Submit a tabulation of the magnitude of unfactored (service level) equipment loads at each support point, broken down by type of loading (dead, live, wind, seismic, etc.). Indicate impact factors applied to these loads in design calculations.

10. Special Seismic Certification for non-structural components identified in article 1.07 of this section.
11. Submit all non-structural seismic anchorage and bracing submittals and corresponding structural calculations to FM Global representative for review in addition review by the Engineer(s).

1.06 QUALITY ASSURANCE

A. Quality Control By Owner:
   1. Special Inspection of non-structural components and non-building structures, and their anchorages shall be performed by the Special Inspector under contract with the Owner and in conformance with IBC Chapter 17. Special Inspector(s) and laboratory shall be acceptable to the Owner in their sole discretion. Special Inspection is in addition to, but not replacing, other inspections and quality control requirements. Where sampling and testing required conforms to Special Inspection standards, such sampling and testing need not be duplicated.
   2. For non-structural components requiring Special Seismic Certification, the Special Inspector shall verify that the label, anchorage, and mounting conform with the Special Seismic certificate of compliance.

1.07 SPECIAL SEISMIC CERTIFICATION

A. Special Seismic Certification is certification of equipment and components to not only withstand the effects of earthquakes, but also to function following the design seismic event.

B. Special Seismic Certification is required for the following non-structural components in Seismic Design Categories C through F, which have a component importance factor of I_p=1.5 (referred to as “Designated Seismic Systems” in ASCE 7):
   1. Components required to function for life-safety purposes after an earthquake, including fire protection sprinkler systems and fire dampers.
   2. Components that contain or convey toxic, hazardous, or explosive substances where the quantity of the material exceeds threshold quantities established by the governing code authority, or the component is attached to a structure classified as a hazardous occupancy.
   3. Components in gor attached to a Risk Category IV structure and needed for continued operation.

C. Non-structural components requiring Special Seismic Certification could include, but are not limited to, the following:
   1. Fire protection systems and dampers.
   2. Makeup air units, supply ducts, exhaust ductwork, inline exhaust fans, furnaces, condensing units, and instantaneous water heaters.
   3. Electrical MCC’s, switchgear, panelboards, transformers, generators, control panels (fire alarm), and PLC panels.

D. Methods for Achieving Special Seismic Certification

1. For active components (e.g. equipment with parts that rotate, move mechanically, or are energized during operation), Special Seismic Certification is achieved by the following method, unless the component is listed below as being considered inherently rugged:
    a. Shake table testing (see below for requirements).
2. For non-active components and active components listed below as being considered inherently rugged, Special Seismic Certification is achieved by one of the following methods:
    a. Analysis demonstrating a complete load path and capacity of components to resist loading, including seismic loading calculated in accordance with design criteria in this section.
    b. Shake table testing (see below for requirements).
    c. Experience data meeting requirements described in ASCE 7, Chapter 13.
3. The following non-structural components could be considered "inherently rugged":
    a. Rigid and anchored process mechanical equipment such as pumps.
    b. Electrical conduit and cable tray.
    c. Gas/domestic water/vent/refrigerant piping.
4. Shake table testing requirements:
    a. In accordance with ICC-ES AC 156.
    b. Test for a minimum S_{DS} (0.2 second design spectral response) shown in the design criteria in this section.
    c. Base testing on a ratio of height of component attachment in structure with respect to base of structure of z/h equal to 1.0.
    d. Mount equipment in the shake table test in a similar manner to mounting on the project (e.g. mounting to floor vs wall vs suspended mounting, and rigid vs isolated mountings).

PART 2 PRODUCTS

2.01 GENERAL

A. Provide materials in conformance with information shown on the Drawings and in other technical specification sections. See individual component and equipment specifications for additional requirements.

2.02 DESIGN CRITERIA

A. Design Codes

Design	Code
Buildings/Structures:	International Building Code 2021, FMDS, and ASCE 7-16
Reinforced concrete:	ACI 350-20 and ACI 350.3-20 for Concrete Liquid Containing Structures, ACI 318-19 for all other reinforced concrete
Structural steel:	AISC 360-16 and AISC 341-16
Aluminum:	Aluminum Design Manual, Latest Edition
Welding:	AWS Welding Codes, Latest Edition
Occupational health and safety requirements:	OSHA

Note: When conflicting requirements occur, the most stringent requirements will govern the design.

B. Design Loads

1. Design non-structural components and non-building structures for the following minimum loads: (Do not apply wind and snow loads to non-structural components and non-building structures that are located inside buildings.)
2. Dead Loads:
   a. Add an additional allowance for piping and conduit when supported and hung from the underside of equipment and platforms.
   b. Typical allowance for piping and conduit: 20 psf
3. Uniform Live Loads:

Elevated grating floors:	100 psf
Columns:	No column live load reduction allowed
Exitways, stairs and landings:	100 psf
Equipment platforms, walkways/catwalks (other than exitways):	60 psf
Utility bridges:	75 psf per level

4. Snow Loads:

Code:	IBC 2021,FMDS & ASCE 7-16
Risk Category:	IV
Ground Snow Load (p_g):	70 psf
Exposure Factor (C_e):	C
Thermal Factor (C_t):	1.0
Importance Factor (I_s):	1.2
Flat Roof Snow Load (p_f):	65 psf
Drifting:	Per ASCE 7 & FMDS

5. Wind Loads:

Code:	IBC 2021, FMDS & ASCE 7-16
Risk Category:	IV
Basic Wind Speed (Ultimate, 3-second gust) for Risk Category Shown Above:	120 mph
Exposure:	C
Topographic Factor (K_{zt})	1.0

Note:

1. *Design exterior non-structural components and non-building structures, unless located in a pit or basin, to withstand design wind loads without consideration of shielding effects by other structures.*

6. Seismic Loads:

Code:	IBC 2018 & ASCE 7-16
Risk Category:	IV
0.2 Sec. Mapped Spectral Response, S_S:	1.229 g
1.0 Sec. Mapped Spectral Response, S_1:	0.456 g
Site Class:	B
0.2 Sec. Design Spectral Response, S_{DS}:	0.74 g
1.0 Sec. Design Spectral Response, S_{D1}:	0.24 g
Importance Factor (I_e):	1.5
Component Importance Factor (I_p):	1.0, except I_p=1.5 for components identified in Section 13.1.3 of ASCE 7
Seismic Design Category	D

Notes:

1. *Calculate seismic loads on the basis of governing building code. Include equipment operating loads in structure dead load.*
2. *Check individual members for seismic and full member live load acting simultaneously, except that flooded equipment loads (infrequent occurrence) need not be combined with seismic loads. Combine equipment operating loads with seismic loads.*

7. Impact Loads:
   a. Consider impact loads in design of support systems.
   b. Use the following impact load factors unless recommendations of the equipment manufacturer will cause a more severe load case:

Rotating machinery:	20% of moving load
Reciprocating machinery:	50% of moving load
Monorail Hoists:	
• Vertical	25% of lifted load
• Longitudinal	10% of lifted load
Hangers supporting floors and platforms:	33% of live and dead load

8. Temperature:
   a. Include effects of temperature in design where non-structural components and non-building structures are exposed to differential climatic conditions. See climatic conditions below for temperature extremes.

C. Load Combinations
   1. Design non-structural components and non-building structures to withstand load combinations as specified in the governing building code. Where the exclusion of live load or impact load would cause a more severe load condition for the member under investigation, ignore the load when evaluating that member.

D. Design Considerations
   1. Design non-structural components and non-building structures for the following conditions:
   2. Climatic Conditions:

Maximum design temperature:	90	degrees Fahrenheit
Minimum design temperature:	15	degrees Fahrenheit

   3. Foundations:
      a. Extend foundations supporting non-structural components and non-building structures below the frost line, or support on non-frost susceptible structural fill down to the frost line.

Frost line for foundations:	36 inches

Note: Consult project geotechnical report for allowable soil bearing recommendations at location of structure.

E. Column Base Fixity
   1. Design column bases as pinned connections. No moments shall be assumed to be transferred to foundations.
   2. Where significant shear loads (greater than 5,000 lb. per anchor bolt) are transferred at column base plates, provide a shear key designed to transfer shear load.

F. Deflection
   1. Maximum beam deflection as a fraction of span for walkways and platforms: L/240 for total load and L/360 for live load.
   2. Maximum total load deflection for equipment support: L/450.

PART 3 EXECUTION

3.01 GENERAL

A. Make attachments and braces in such a manner that component force is transferred to the lateral force-resisting system of the structure. Base attachment requirements and size and number of braces per calculations submitted by Contractor.

B. Anchorage of equipment is specified to be made by cast-in anchor bolts in concrete elements unless specifically noted otherwise on the Drawings or other specification sections. Contractor is responsible for remedial work or strengthening (of concrete elements because of superimposed seismic loading) if anchor bolts are improperly installed or omitted due to lack of submittal review or improper placement for any reason, at no additional cost to Owner.

C. Provide anchor bolts in accordance with Section 05 05 20. Base size of anchor bolts and embedment on submitted calculations.

D. Submit details of and calculations for anchorages prior to placement of concrete or erection of other structural supporting members. Submittals received after structural supports are in place will be rejected if proposed anchorage method would create an overstressed condition of the supporting member. Contractor is responsible for revisions to anchorages and/or strengthening of structural support so that there is no overstress condition, at no additional cost to Owner.

SECTION 01 75 18

DISINFECTION

PART 1 GENERAL

1.01 SCOPE

A. Section includes: Cleaning and disinfection requirements for new and existing facilities located downstream of the first point of disinfectant application that are affected by the Work. The first point of disinfectant application is at the plant inlet Parshall flume.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C651 - Disinfecting Water Mains.
   2. C652 - Disinfection of Water Storage Facilities.
   3. C653 - Disinfection of Water Treatment Plants.

B. U.S. Environmental Protection Agency (EPA):
   1. Safe Drinking Water Act (SDWA).

1.03 SUBMITTALS

A. Submit disinfection test plan which details procedure to be utilized to disinfect the facilities including:
   1. Method and locations of disinfectant application.
   2. Locations of sampling points.
   3. Method of flushing and location of flushing ports (as appropriate for method of chlorination).
   4. Method of dechlorination (as appropriate for method of chlorination).
   5. Disposal location for chlorinated water (as appropriate for method of chlorination).

B. Submit disinfection reports and include the following:
   1. Date issued.
   2. Project name and location.
   3. Treatment subcontractor's name, address, and phone number.
   4. Type and form of disinfectant used.
   5. Time and date of disinfectant injection start.
   6. Time and date of disinfectant injection completion.
   7. Test locations.
   8. Initial and 24-hour disinfectant residuals in milligrams per liter for each outlet tested.
   9. Time and date of flushing start.
   10. Time and date of flushing completion.
   11. Disinfectant residual after flushing in milligrams per liter for each outlet tested.

C. Submit required permits, including but not limited to permit clearance.
   1. Coordinate with Owner and Engineer to obtain any necessary signatures.

1.04 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Protect chlorine and bacteriological samples against damage and contamination.

B. Maintain caution labels on hazardous materials.

C. Maintain storage room dry and with temperatures as uniform as possible between 60 degrees Fahrenheit and 80 degrees Fahrenheit.

1.05 PROTECTION

A. Provide necessary signs, barricades, and notices to prevent persons from accidentally consuming water or disturbing system being treated.

PART 2 PRODUCTS

2.01 MATERIALS

A. Disinfectant: Free chlorine in liquid, powder, tablet, or gas form in accordance with AWWA C653.

B. Dechlorination agent: Sulfur dioxide, sodium bisulfate, sodium sulfite, sodium thiosulfate, or ascorbic acid in accordance with AWWA C653.

PART 3 EXECUTION

3.01 PRELIMINARY CLEANING

A. Complete hydrostatic/leakage tests prior to disinfection.

B. Clean newly constructed and/or modified facilities located downstream of the first point or disinfectant application including flocculation basins, bypass piping, sedimentation basins, filters and conveyance facilities, such as pipes and channels at the plant, in accordance with AWWA C653 and the following:
   1. Remove debris and material not associated with the structure or process prior to disinfection.
   2. Clean wall, floor, ceiling, and attached surfaces by use of high-pressure water jet, sweeping, scrubbing, or equally effective means.
   3. Remove water, paint flakes, sediment, dirt, and foreign material accumulated during cleaning.
   4. Remove by flushing or other means, soil and debris from water pipes and channels in accordance with AWWA C651.
   5. Protect surfaces from adverse environmental exposure between the preliminary cleaning and the disinfection stages.

C. Prior to chlorination, clean newly constructed and/or modified facilities to be disinfected in accordance with AWWA C651, C652, or C653, as applicable.

D. Provide necessary blind flanges, hoses, sample taps, or any other appurtenances that may be required to clean and disinfect the piping and wetted surfaces.

3.02 SURFACES TO BE DISINFECTED

A. All treatment building process piping and basins in contact with raw, settled, or finished water including, but not limited to:
   1. Floc inlet piping
   2. Floc basins
   3. Sedimentation basins
   4. Filter inlet channel
   5. Filters
   6. Filter outlet pipe
   7. New backwash piping
   8. Constant head box
   9. Clearwells
   10. Backwash storage basins and pump station
   11. Plant water piping

B. New plant water plumbing and eyewash stations

C. Chemical piping and systems
   1. Sodium hypo chlorite systems
   2. Fluoride piping and carrier water system

D. Finished water pipes
   1. New Morris pipe
   2. New City pipe

3.03 DISINFECTION OF WATER TREATMENT STRUCTURES AND PIPING

A. Disinfect new and existing water treatment process structures and piping located downstream of the first disinfectant application point that are affected by the work. Disinfection shall be performed in accordance with AWWA C651, C652, and C653 as applicable.

B. Test for disinfectant residual at locations as specified in Disinfection Test Plan:
   1. Inlet and outlet piping.
   2. Coordinate sampling and testing with the Owner.

C. When disinfectant residual in the flocculation basins and bypass piping is less than 1 parts per million after 24 hours, repeat disinfection process.

3.04 DISPOSAL OF CHLORINATED WATER

A. Dispose of chlorinated water in accordance with the submitted disinfection test plan and applicable requirements of federal, state, county, and city having jurisdiction over disposal of hazardous wastes in location of the Project and disposal site.

B. A sanitary sewer system is not available at this site. Chlorinated water may only be disposed of in the backwash clarifier or the solids drying beds, in coordination with OWNER. Chlorinated discharge water shall be dechlorinated to a residual less than 2 parts per million before being discharged to the clarifier or the solids drying beds.

3.05 BACTERIOLOGICAL TEST

A. The Owner will conduct bacteriological tests. The Contractor shall coordinate with Owner.

END OF SECTION

SECTION 01 78 23

OPERATION AND MAINTENANCE DATA

PART 1 GENERAL

1.01 SCOPE

A. Operation and maintenance (O&M) instructions shall be provided in accordance with this section and as required in the technical sections of this project manual. O&M information shall be provided for each maintainable piece of equipment, equipment assembly or subassembly, and material provided or modified under this contract.

B. O&M instructions must be submitted and accepted before on-site training may start.

1.02 TYPES OF INFORMATION REQUIRED

A. General:
   1. O&M information shall contain the names, addresses, and telephone numbers of the manufacturer, the nearest representative of the manufacturer, and the nearest supplier of the manufacturer's equipment and parts. In addition, one or more of the following items of information shall be provided as applicable.

B. Operating Instructions:
   1. Specific instructions, procedures, and illustrations shall be provided for the following phases of operations:
      a. Safety Precautions: List personnel hazards for equipment and list safety precautions for all operating conditions.
      b. Operator Prestart: Provide requirements to set up and prepare each system for use.
      c. Start-Up, Shutdown, And Post shutdown Procedures: Provide a control sequence for each of these operations.
      d. Normal Operations: Provide control diagrams with data to explain operation and control of systems and specific equipment.
      e. Emergency Operations: Provide emergency procedures for equipment malfunctions to permit a short period of continued operation or to shut down the equipment to prevent further damage to systems and equipment. Include emergency shutdown instructions for fire, explosion, spills, or other foreseeable contingencies. Provide guidance on emergency operations of all utility systems including valve locations and portions of systems controlled.
      f. Operator Service Requirements: Provide instructions for services to be performed by the operator such as lubrication, adjustments, and inspection.
      g. Environmental Conditions: Provide a list of environmental conditions (temperature, humidity, and other relevant data) which are best suited for each product or piece of equipment and describe conditions under which equipment should not be allowed to run.

C. Preventive Maintenance:
   1. The following information shall be provided for preventive and scheduled maintenance to minimize corrective maintenance and repair:
      a. Lubrication Data: Provide lubrication data, other than instructions for lubrication in accordance with paragraph 1.02 Operator Service Requirements.
         1) A table showing recommended lubricants for specific temperature ranges and applications;
         2) Charts with a schematic diagram of the equipment showing lubrication points, recommended types and grades of lubricants, and capacities; and
         3) A lubrication schedule showing service interval frequency.
      b. Preventive Maintenance Plan And Schedule: Provide manufacturer's schedule for routine preventive maintenance, inspections, tests, and adjustments required to ensure proper and economical operation and to minimize corrective maintenance and repair. Provide manufacturer's projection of preventive maintenance man-hours on a daily, weekly, monthly, and annual basis including craft requirements by type of craft.

D. Corrective Maintenance:
   1. Manufacturer's recommendations shall be provided on procedures and instructions for correcting problems and making repairs.
      a. Troubleshooting Guides And Diagnostic Techniques: Provide step-by-step procedures to promptly isolate the cause of typical malfunctions. Describe clearly why the checkout is performed and what conditions are to be sought. Identify tests or inspections and test equipment required to determine whether parts and equipment may be reused or require replacement.
      b. Wiring Diagrams And Control Diagrams: Wiring diagrams and control diagrams shall be point-to-point drawings of wiring and control circuits including factory-field interfaces. Provide a complete and accurate depiction of the actual job-specific wiring and control work. On diagrams, number electrical and electronic wiring and pneumatic control tubing and the terminals for each type identically to actual installation numbering.
      c. Maintenance And Repair Procedures: Provide instructions and list tools required to restore product or equipment to proper condition or operating standards.
      d. Removal And Replacement Instructions: Provide step-by-step procedures and list required tools and supplies for removal, replacement, disassembly, and assembly of components, assemblies, subassemblies, accessories, and attachments. Provide tolerances, dimensions, settings, and adjustments required. Instructions shall include a combination of test and illustrations.
      e. Spare Parts And Supply Lists: Provide lists of spare parts and supplies required for maintenance and repair to ensure continued service or operation without unreasonably delays. Special consideration is required for facilities at remote locations. List spare parts and supplies that have a long lead time to obtain.
      f. Corrective Maintenance Manhours: Provide manufacturer's projection of corrective maintenance man-hours including craft requirements by type of craft. Corrective maintenance that requires participation of the equipment manufacturer shall be identified and tabulated separately.

E. Appendices:
   1. The following information shall be provided; include information not specified in the preceding paragraphs but pertinent to the maintenance or operation of the product or equipment.
      a. Parts Identification: Provide identification and coverage for all parts of each component, assembly, subassembly, and accessory of the end items subject to replacement. Include special hardware requirements, such as requirement to use high-strength bolts and nuts. Identify parts by make, model, serial number, and source of supply to allow reordering without further identification. Provide clear and legible illustrations, drawings, and exploded views to enable easy identification of the items. When illustrations omit the part numbers and description, both the illustrations and separate listing shall show the index, reference, or key number which will cross-reference the illustrated part to the listed part. Parts shown in the listings shall be grouped by components, assemblies, and subassemblies.
      b. Warranty Information: List and explain the various warranties and include the servicing and technical precautions prescribed by the manufacturers or contract documents to keep warranties in force.
      c. Personnel Training Requirements: Provide information available from the manufacturers to use in training designated personnel to operate and maintain the equipment and systems properly.
      d. Testing Equipment And Special Tool Information: Provide information on test equipment required to perform specified tests and on special tools needed for the operation, maintenance, and repair of components.

1.03 TRANSMITTAL PROCEDURE

A. Unless otherwise specified, O&M manuals, information, and data shall be transmitted in accordance with Section 01 33 00 accompanied by Transmittal Form 01 78 23-A and Equipment Record Forms 01 78 23-B and/or 01 78 23-C, as appropriate, all as specified in Section 01 99 90. The transmittal form shall be used as a checklist to ensure the manual is complete. Only complete sets of O&M instructions will be reviewed for acceptance.

B. Two (2) hard copies of the specified O&M information shall be provided. For ease of identification, each manufacturer's brochure and manual shall be appropriately labeled with the equipment name and equipment number as it appears in the project manual. The information shall be organized in the binders in numerical order by the equipment numbers assigned in the project manual. The binders shall be provided with a table of contents and tab sheets to permit easy location of desired information.

C. If manufacturers' standard brochures and manuals are used to describe O&M procedures, such brochures and manuals shall be modified to reflect only the model or series of equipment used on this project. Extraneous material shall be crossed out neatly or otherwise annotated or eliminated.

1.04 PAYMENT

A. Acceptable O&M information for the project must be delivered to the Construction Manager prior to the project being 65 percent complete. Progress payments for work in excess of 65 percent completion will not be made until the specified acceptable O&M information has been delivered to the Construction Manager.

1.05 FIELD CHANGES

A. Following the acceptable installation and operation of an equipment item, the item's instructions and procedures shall be modified and supplemented by the Contractor to reflect any field changes or information requiring field data.

END OF SECTION

SECTION 01 78 39

PROJECT RECORD DOCUMENTS

PART 1 GENERAL

1.01 DRAWINGS

A. Record drawings refer to those documents maintained and annotated by the Contractor during construction and are defined as
   1. a neatly and legibly marked set of contract drawings showing the final location of piping, equipment, electrical conduits, outlet boxes and cables;
   2. additional documents such as schedules, lists, drawings, and electrical and instrumentation diagrams included in the specifications; and
   3. Contractor layout and installation drawings.

B. Unless otherwise specified, record drawings shall be full size and maintained in a clean, dry, and legible condition. Record documents shall not be used for construction purposes and shall be available for review by the Construction Manager during normal working hours at the Contractor's field office. At the completion of the work, prior to final payment, all record drawings shall be submitted to the Construction Manager.

C. Marking of the drawings shall be kept current and shall be done at the time the material and equipment are installed. Annotations to the record documents shall be made with an erasable colored pencil conforming to the following color code:
   1. Additions - Red
   2. Deletions - Green
   3. Comments - Blue
   4. Dimensions - Graphite*

**Legibly mark to record actual depths, horizontal and vertical location of underground raceways, cables, and appurtenances referenced to permanent surface improvements.*

PART 2 PRODUCTS – NOT USED

PART 3 EXECUTION

3.01 USE DURING CONSTRUCTION

A. Record Documents shall be maintained in a clean, dry, and legible condition.

B. Record Documents shall not be used for construction purposes and shall be available for review by the Construction Manager during normal working hours at the Contractor's field office.

3.02 UPDATES

A. Marking of the Record Documents shall be kept current and shall be done at the time the material and equipment are installed.

B. Annotations to the Record Documents shall be made with an erasable colored pencil conforming to the following color code:
   1. Additions – Red
   2. Deletions – Green
   3. Comments – Blue
   4. Dimensions – Graphite*

**Legibly mark to record actual depths, horizontal and vertical location of underground raceways, cables, and appurtenances referenced to permanent surface improvements.*

C. Monthly Review Meetings:
   1. During the monthly project meetings, the Contractor and Construction Manager shall review the record documents.
   2. At that time the Contractor and Construction Manager shall review the working set of record drawings and initial the accepted areas where everyone has agreed that the location, elevation and/or other construction modification is at the indicated final location.
   3. At the conclusion of each meeting, the Contractor shall submit the up-to-date Record Drawings to the Construction Manager.

D. Underground Utilities:
   1. Contractor shall provide digital photographs of underground piping and conduits, a fixed measurement on the record drawings, and/or GPS coordinates showing locations from buildings or structures prior to burying piping or electrical conduit.
   2. Contractor shall note the depth of buried piping and electrical conduit.

3.03 SUBMISSION

A. At the completion of the work, prior to final payment, all record drawings shall be submitted to the Construction Manager.

B. The electrical and instrumentation record drawings are typically the last mark ups to be completed. Final payment shall be withheld until the Contractor, Construction Manager, and Engineer have reviewed, verified and agreed on the final electrical and instrumentation record drawings.

END OF SECTION

SECTION 01 79 00

DEMONSTRATION AND TRAINING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section contains requirements for training the Owner's personnel, by persons retained by the Contractor specifically for the purpose, in the proper operation and maintenance of the equipment and systems installed under this contract.

1.02 QUALITY ASSURANCE

A. Where required by the detailed specifications, the Contractor shall provide on-the-job training of the Owner's personnel. The training sessions shall be conducted by qualified, experienced, factory-trained representatives of the various equipment manufacturers. Training shall include instruction in both operation and maintenance of the subject equipment.

1.03 SUBMITTALS

A. The following information shall be submitted to the Construction Manager in accordance with the provisions of Section 01 33 00. The material shall be reviewed and accepted by the Construction Manager as a condition precedent to receiving progress payments in excess of 50 percent of the contract amount and not less than 3 weeks prior to the provision of training.
   1. Lessons plans for each training session to be conducted by the manufacturer's representatives. In addition, training manuals, handouts, visual aids, and other reference materials shall be included.
   2. Subject of each training session, identity and qualifications of individuals to be conducting the training, and tentative date and time of each training session.

PART 2 PRODUCTS

2.01 GENERAL

A. Where specified, the Contractor shall conduct training sessions for the Owner's personnel to instruct the staff on the proper operation, care, and maintenance of the equipment and systems installed under this contract. Training shall take place at the site of the work and under the conditions specified in the following paragraphs. Approved operation and maintenance manuals shall be available at least 30 days prior to the date scheduled for the individual training session.

2.02 LOCATION

A. Training sessions shall take place at the site of the work in City Creek WTP Operations Building conference room and the new water treatment plant as applicable.

2.03 LESSON PLANS

A. Formal written lesson plans shall be prepared for each training session. Lesson plans shall contain an outline of the material to be presented along with a description of visual aids to be utilized during the session. Each plan shall contain a time allocation for each subject.

B. One complete set of originals of the lesson plans, training manuals, handouts, visual aids, and reference material shall be the property of the Owner and shall be suitably bound for proper organization and easy reproduction. The Contractor shall furnish ten copies of necessary training manuals, handouts, visual aids and reference materials at least 1 week prior to each training session.

2.04 FORMAT AND CONTENT

A. Each training session shall be comprised of time spent both in the classroom and at the specific location of the subject equipment or system. As a minimum, training session shall cover the following subjects for each item of equipment or system:
   1. Familiarization
      a. Review catalog, parts lists, drawings, etc., which have been previously provided for the plant files and operation and maintenance manuals.
      b. Check out the installation of the specific equipment items.
      c. Demonstrate the unit and indicate how all parts of the specifications are met.
      d. Answer questions.
   2. Safety
      a. Using material previously provided, review safety references.
      b. Discuss proper precautions around equipment.
   3. Operation
      a. Using material previously provided, review reference literature.
      b. Explain all modes of operation (including emergency).
      c. Check out Owner's personnel on proper use of the equipment.
   4. Preventive Maintenance
      a. Using material previously provided, review preventive maintenance (PM) lists including:
         1) Reference material.
         2) Daily, weekly, monthly, quarterly, semiannual, and annual jobs.
      b. Show how to perform PM jobs.
      c. Show Owner's personnel what to look for as indicators of equipment problems.
   5. Corrective Maintenance
      a. List possible problems.
      b. Discuss repairs--point out special problems.
      c. Open up equipment and demonstrate procedures, where practical.
   6. Parts
      a. Show how to use previously provided parts list and order parts.
      b. Check over spare parts on hand. Make recommendations regarding additional parts that should be available.

7. Local Representatives
    a. Where to order parts: name, address, telephone.
    b. Service problems:
        1) Who to call.
        2) How to get emergency help.
8. Operation and Maintenance Manuals
    a. Review any other material submitted.
    b. Update material, as required.

2.05 VIDEO RECORDING:

A. The Owner will retain the services of a commercial video taping service to record each training session. After taping, the material will be edited and supplemented with professionally produced graphics to provide a permanent record. The Contractor shall advise all manufacturers providing training sessions that the material will be video taped and shall make available to the Owner's video taping contractor such utility services and accommodation as may be required to facilitate the production of the video tape record.

PART 3 EXECUTION

3.01 SUMMARY

A. Training shall be conducted in conjunction with the operational testing and commissioning periods. Classes shall be scheduled such that classroom sessions are interspersed with field instruction in logical sequence. The Contractor shall arrange to have the training conducted on consecutive days, with no more than 6 hours of classes scheduled for any one day. Concurrent classes shall not be allowed. Training shall be certified on Form 43 05 11-B specified in Section 01 99 90.

B. Acceptable operation and maintenance manuals for the specific equipment shall be provided to the Owner prior to the start of any training. Video taping shall take place concurrently with all training sessions.

C. The following services shall be provided for each item of equipment or system as required in individual specification sections. Additional services shall be provided, where specifically required in individual specification sections.
    1. As a minimum classroom equipment training for operations personnel will include:
        a. Using slides and drawings, discuss the equipment's specific location in the plant and an operational overview.
        b. Purpose and plant function of the equipment.
        c. A working knowledge of the operating theory of the equipment.
        d. Start-up, shutdown, normal operation, and emergency operating procedures, including a discussion on system integration and electrical interlocks, if any.
        e. Identify and discuss safety items and procedures.
        f. Routine preventative maintenance, including specific details on lubrication and maintenance of corrosion protection of the equipment and ancillary components.
        g. Operator detection, without test instruments, of specific equipment trouble symptoms.

h. Required equipment exercise procedures and intervals.
i. Routine disassembly and assembly of equipment if applicable (as judged by the Owner on a case-by-case basis) for purposes such as operator inspection of equipment.

2. As a minimum, hands-on equipment training for operations personnel will include:
   a. Identify location of equipment and review the purpose.
   b. Identifying piping and flow options.
   c. Identifying valves and their purpose.
   d. Identifying instrumentation:
      1) Location of primary element.
      2) Location of instrument readout.
      3) Discuss purpose, basic operation, and information interpretation.
   e. Discuss, demonstrate, and perform standard operating procedures and round checks.
   f. Discuss and perform the preventative maintenance activities.
   g. Discuss and perform start-up and shutdown procedures.
   h. Perform the required equipment exercise procedures.
   i. Perform routine disassembly and assembly of equipment if applicable.
   j. Identify and review safety items and perform safety procedures, if feasible.
3. Classroom equipment training for the maintenance and repair personnel will include:
   a. Theory of operation.
   b. Description and function of equipment.
   c. Start-up and shutdown procedures.
   d. Normal and major repair procedures.
   e. Equipment inspection and troubleshooting procedures including the use of applicable test instruments and the "pass" and "no pass" test instrument readings.
   f. Routine and long-term calibration procedures.
   g. Safety procedures.
   h. Preventative maintenance such as lubrication; normal maintenance such as belt, seal, and bearing replacement; and up to major repairs such as replacement of major equipment part(s) with the use of special tools, bridge cranes, welding jigs, etc.
4. Hands-on equipment training for maintenance and repair personnel shall include:
   a. Locate and identify equipment components.
   b. Review the equipment function and theory of operation.
   c. Review normal repair procedures.
   d. Perform start-up and shutdown procedures.
   e. Review and perform the safety procedures.
   f. Perform Owner approved practice maintenance and repair job(s), including mechanical and electrical adjustments and calibration and troubleshooting equipment problems.

END OF SECTION

SECTION 01 81 13.01

SUSTAINABLE DESIGN REQUIREMENTS

PART 1 GENERAL

1.01 DESCRIPTION:

A. Envision is a sustainability certification framework developed by the Institute for Sustainability Infrastructure (ISI, https://sustainableinfrastructure.org) that includes 64 sustainability and resilience credits organized around five categories: Quality of Life (QL), Leadership (LD), Resource Allocation (RA), Natural World (NW), and Climate and Resilience (CR). There are five levels of achievement under each credit. The levels of achievement, in order of increasing point value, are Improved, Enhanced, Superior, Conserving, and Restorative. Envision is designed for infrastructure projects and will be applied campus-wide for the City Creek Treatment Plant Upgrades Project. Based on a pre-assessment, the project team has agreed that pursuing Gold certification is feasible under the Envision v3 framework. As the project progresses, if Gold certification is no longer considered feasible, the project team will reconvene to discuss, and the OWNER may adjust Envision requirements accordingly.

B. Documentation of sustainability practices from design through long term operation of the WTP to meet framework requirements is the basis of project certification by ISI.

C. This section includes general requirements and procedures for compliance with specific Envision credits needed for the Project to obtain Envision Gold certification (i.e., at least 40 percent of total applicable points must be met under Envision Version 3, 2018).

D. The following Envision credits require compliance during construction:
   1. QL1.3 Improve Construction Safety
   2. QL1.6 Minimize Construction Impacts
   3. QL3.3 Enhance Local Views and Character
   4. RA1.1 Support Sustainable Procurement Practices
   5. RA1.2 Use Recycled Materials
   6. RA1.4 Reduce Construction Waste
   7. RA1.5 Balance Earthwork on Site
   8. RA2.2 Reduce Construction Energy Consumption
   9. RA3.3 Reduce Construction Water Consumption
   10. NW2.2 Manage Stormwater
   11. NW3.4 Control Invasive Species
   12. NW3.5 Protect Soil Health

1.02 REFERENCES:

A. Institute for Sustainable Infrastructure (ISI) (https://sustainableinfrastructure.org/): Envision – Version 3

1.03 ADMINISTRATIVE REQUIREMENTS:

A. The Contractor shall respond to questions and requests from the Engineer, the Owner, and ISI regarding the Envision credits or other sustainability requirements documented here in that are the responsibility of the Contractor. These responses may include documentation for product selection or product qualities, or queries regarding on the Contractor's procedures. These responses may be documented as design RFIs (DRFIs) or informational submittals.

B. Contractor will designate a person as the Envision Coordinator. This person can have other project responsibilities but shall be the point person for all Envision-related meetings, workshops, questions, reporting, etc.

C. The Envision Coordinator shall:
   1. Be ISI Envision Certified and remain Certified for the duration of the Work.
   2. Ensure compliance with the sustainability requirements as identified and provided in the construction documents and agreed to for the Envision certification process.
   3. Provide monthly reporting (written and verbal) of inventories related to sustainable procurement (RA1.1), recycled materials (RA1.2), construction waste diverted (RA1.4), earthwork (RA1.5), and energy (RA2.2) and potable water consumption during construction (RA3.3).
   4. Provide sustainability submittal documentation from applicable Manufacturers as agreed to and requested by the Engineer and Owner.
   5. Attend monthly Envision coordination meetings.
   6. Provide a monthly log of progress on sustainability/Envision requirements evaluated and implemented throughout the entire Project as agreed to by the Contractor, Engineer and Owner.
   7. Provide a draft Envision Action Plan within 30 days of Notice to Proceed and include the following:
      a. Envision Coordinator Contact Information.
      b. Construction Management Plan for complying with identified Envision credits.
   8. Incorporate comments on Envision Action Plan and finalize the document within 90 days of Notice to Proceed.
   9. Update Envision Action Plan as needed throughout the construction project.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Envision Coordinator: Notify the Engineer of changes in personnel performing the Envision Coordinator function.

D. The Owner reserves the right to reject products and assemblies based on incomplete or inaccurate submittals.

1.05 SUBMITTALS:

A. Submit the following documents in accordance with Section 01 33 00.
   1. Envision Action Plan.
   2. Sustainability Submittals to meet documentation requirements as described herein.

1.06 ENVISION CRITERIA & SUSTAINABILITY SUBMITTAL REQUIREMENTS:

A. Refer to the Envision Manual – Version 3 for more information related to the criteria outlined below.

B. The Owner, Engineer and Contractor have preliminarily agreed to target achieving the Envision criteria listed herein. Contractor will make every reasonable effort to support the Project in meeting these criteria. Based on budget and schedule constraints, these targeted levels of achievement will be revisited throughout construction and may be modified by the Team as agreed to and directed by the Owner to better reflect achievable levels of achievement.

C. QL 1.3 Improve Construction Safety:
   1. Targeted Level of Achievement: Conserving
      a. Contractor makes strong commitments to monitor and improve health and safety for onsite construction operations.
      b. Documentation is created to track health and safety performance, promote best practices during construction, and to correct any deficiencies.
      c. Safety and security competency training for all field personnel are conducted as specified in project safety plan. Contractor provides at least the minimum training requirements.
      d. Contractor has a specific site and project site security plan and provides at least minimum training requirements.
      e. Contractor provides programs that promote health and wellbeing and provides documentation indicating such.

D. QL1.6 Minimize Construction Impacts:
   1. Targeted Level of Achievement: Conserving
      a. A Construction Management Plan is implemented to address the temporary inconveniences to stakeholders associated with construction. Plan is informed by stakeholder engagement performed and communicated by Owner/Owner's representative.
      b. The Construction Management Plan addresses four types of construction impacts to stakeholders: noise, safety/wayfinding, access/mobility, or lighting.
      c. The Construction Management Plan describes robust feedback mechanisms and performance monitoring and reporting for construction impacts to be provided by the Owner/Owner's representative.

E. QL3.3 Enhance Local Views and Character:
   1. Targeted Level of Achievement: Superior:
      a. The Construction Management Plan identifies how character features, high value landscapes, or landscape features will be protected during construction.

F. RA1.1 Support Sustainable Procurement Practices:
   1. Targeted Level of Achievement: Improved
      a. A minimum of 5 percent (by weight, cost, or volume) of the purchased materials shall follow sustainable practices as identified and described by Salt Lake City Policy 6.01.07 Sustainable Procurement.

G. RA1.2 Use Recycled Materials:
   1. Targeted Level of Achievement: Improved
      a. A minimum of 5 percent (by weight, cost, or volume) of the purchased materials shall be considered recycled materials with recycled content and/or reused existing structures or materials.
      b. Provide documentation to demonstrate the targeted level of achievement has been met.

H. RA1.4 Reduce Construction Waste:
   1. Targeted Level of Achievement: Enhanced
      a. A Construction Waste Management Plan developed within the first 60 days of construction and implemented that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be sorted on site or commingled.
      b. A minimum of 50 percent (by weight or volume) of the waste materials shall be recycled, reused and/or salvaged.

I. RA1.5 Balance Earthwork on Site:
   1. Targeted Level of Achievement: Improved
      a. Excavated material moved off site and / or fill brought onto the site does not exceed 70% of total site soil handling or
      b. 100% of fill and excavated materials are sourced or reused within 25 mi/40 km of the site.
      c. RA2.2 Reduce Construction Energy Consumption:
   2. Targeted Level of Achievement: Enhanced
      a. Planning reviews are used to identify and analyze options for reducing energy consumption during construction.
      b. At least two (2) energy reduction strategies are implemented and documented.

J. RA3.3 Reduce Construction Water Consumption:
   1. Targeted Level of Achievement: Enhanced
      a. Planning reviews are used to identify and analyze options for reducing water consumption during construction.
      b. At least three (3) potable water conservation strategy are implemented.

K. NW2.2 Manage Stormwater:
   1. Targeted Level of Achievement: Improved
      a. The project will include an erosion, sedimentation, and pollutant control plan for construction activities.

L. NW3.4 Control Invasive Species:
   1. Targeted Level of Achievement: Restorative
      a. Best practices are used to prevent unintentional introduction of known invasive species to the site.
      b. The Construction Management Plan includes provisions for preventing the introduction of invasive species (plant or animal).
      c. The Construction Management Plan establishes a program that controls minor infestations of invasive species on site before and throughout construction.
      d. Contractor establishes and implements a program that controls minor infestations of invasive species on site before and throughout construction. Plan will incorporate Salt Lake Department of Public Utilities Watershed Division's Guide to Identify and Control Common Invasive Weeds.
      e. Contractor guards against future infestations by supporting the establishment of native and/or noninvasive species.

M. NW3.5 Protect Soil Health:
   1. Targeted Level of Achievement: Enhanced
      a. The project limits the area that is disturbed by development activities.
      b. At least 95% of post-construction vegetated areas disturbed during construction are restored for appropriate soil type, structure, and function to support healthy plant and tree growth.

1.07 QL1.3 IMPROVE CONSTRUCTION SAFETY:

1. Contractor shall submit documentation of strong commitments to monitor and improve health and safety for onsite construction operations.
2. Contractor shall submit documentation of tracking health and safety performance, promoting best practices during construction, and correcting any deficiencies.
3. Contractor shall submit documentation of safety and security competency training programs.
4. Contractor shall submit documentation of a specific site and project security plan.
5. Contractor shall submit documentation of programs that promote health and wellbeing.

B. QL1.6 Minimize Construction Impacts:
   1. Contractor shall submit a Construction Management Plan that addresses concerns from stakeholders associated with the temporary inconveniences of construction and mitigation measures for at least four of the following: noise, safety/wayfinding, access/mobility, or lighting. The Construction Management Plan shall include robust feedback mechanisms and performance monitoring and reporting for construction impacts.
   2. Programs to monitor and inform impacted stakeholders on project performance in addressing construction impacts shall be documented.

C. QL3.3 Enhance Views and Local Character:
   1. Contractor shall submit a Construction Management Plan that addresses how the character features, high value landscapes, or landscape features will be protected during construction.

D. RA1.1 Support Sustainable Procurement Practices:
   1. Contractor shall submit an inventory of purchases with supporting calculations of the percentage of total project materials by cost, weight or volume that align with the sustainable procurement practices including a description of the materials, the Manufacturer or Supplier of the material, and evidence of the disclosure requirements.

E. RA1.2 Use Recycled Materials:
   1. Contractor shall submit an inventory of total materials used on the project by weight, volume, or cost (this must be consistent for all inventories).
   2. Contractor shall submit an inventory of materials containing recycled content including the name of the product, name of the manufacturer, the weight, volume, or cost of the material (consistent for all materials), and the percentage of recycled content (either post-industrial or post-consumer recycled content).
   3. Contractor shall submit an inventory of existing materials or structures that have been reused or salvaged including the location and weight, volume, or cost. In determining weight, volume, or cost, the project team may refer to standard equivalents.

F. RA1.4 Reduce Construction Waste:
   1. Contractor shall submit a Construction Waste Management Plan that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be sorted on site or commingled.
   2. Contractor shall submit an inventory of waste materials that have been recycled, reused, or salvaged including a general description of each type/category of construction and demolition materials generated, location and percentage of materials diverted by weight or volume.

G. RA1.5 Balance Earthwork on Site:
   1. Contractor shall submit documentation showing how the project reused at least 30% of earthwork onsite OR sourced and reused 100% of earthwork within 25 mi/40 km of the project site.

H. RA2.2 Reduce Construction Energy Consumption:
   1. Contractor shall submit documentation that one or more planning reviews were conducted to identify and analyze options for reducing energy consumption during construction.
   2. Contractor shall submit documentation that the project has implemented two (2) energy reduction strategies during construction as specified in the Envision V3 manual.

I. RA3.3 Reduce Construction Water Consumption:
   1. Contractor shall submit documentation that one or more planning reviews were conducted to identify and analyze options for reducing potable water consumption during construction.
   2. Contractor shall submit documentation that the project has implemented at least three (3) water conservation strategies during construction as specified in the Envision V3 manual.

3. Contractor shall submit calculation of potable water saved (gallons) for each strategy as compared to not implementing the strategy over the construction duration.

J. NW2.2 Manage Stormwater:
   1. Contractor shall submit documentation of an erosion, sedimentation, and pollutant control plan such as a Stormwater Pollution Prevention Plan (SWPPP) or Erosion and Sedimentation Control Plan (ESCP), for all construction activities associated with the project.

K. NW3.4 Control Invasive Species:
   1. Contractor shall submit a Construction Management Plan to prevent the introduction of invasive species. The plan includes best practices to ensure that construction materials and equipment used on site are free of invasive species and seeds.
   2. Contractor shall submit documentation of control, containment or suppression activities during construction for any major infestations of invasive species found on site.

L. NW3.5 Protect Soil Health:
   1. Contractor shall submit documentation showing how soil disturbance will be limited during construction.
   2. Contractor shall submit post-construction soil restoration plans, procedures and calculations for both post-constructed and existing vegetated areas. Calculations of soil restoration activities must constitute at least 95% of the post-construction vegetated areas on site.

PART 2 PRODUCTS

(Not Used)

PART 3 EXECUTION

3.01 ENVISION CREDITS:

A. QL 1.3 Improve Construction Safety:
   1. Contractor shall comply with project safety plan.
   2. Contractor shall track health and safety performance and correct any deficiencies that are identified during construction as specified by the project safety plan.
   3. Contractor shall implement safety training for all field personnel as specified by the project safety plan.

B. QL1.6 Minimize Construction Impacts:
   1. Contractor shall implement procedures and policies to minimize construction impacts as specified by the Construction Management Plan.

C. QL 3.3 Enhance Views and Local Character:
   1. Contractor shall comply with the components of the Construction Management Plan that protect character features, high-value landscapes, or landscape features during construction.

D. RA1.1 Support Sustainable Procurement Practices:
   1. Contractor shall select materials that align with Salt Lake City Policy 6.01.07 Sustainable Procurement guidelines.

E. RA1.2 Use Recycled Materials:
   1. Contractor shall select recycled materials, materials with recycled content, and/or reused existing structures or materials in accordance with recycled materials requirement.

F. RA1.4 Reduce Construction Waste:
   1. Contractor shall recycle, reuse and/or salvage waste materials in accordance with the waste reduction requirement.

G. RA1.5 Balance Earthwork On Site:
   1. Contractor shall source fill and/or reuse cut from sites that meet credit requirements.

H. RA2.2 Reduce Construction Energy Consumption:
   1. Contractor shall attend planning reviews to identify and analyze options for reducing energy consumption during construction.
   2. Contractor shall implement two (2) energy reduction strategies identified during planning reviews.

I. RA3.3 Reduce Construction Water Consumption:
   1. Contractor shall attend planning reviews to identify and analyze options for reducing water consumption during construction.
   2. Contractor shall implement three (3) water conservation strategies identified during planning reviews.

J. NW2.2 Manage Stormwater:
   1. Contractor shall implement the programs for erosion, sedimentation and pollution control as specified in the erosion, sedimentation and pollutant control plan.

K. NW3.4 Control Invasive Species:
   1. Contractor shall implement the programs and policies for controlling invasive species throughout construction as specified by the Construction Management Plan.

L. NW3.5 Protect Soil Health:
   1. Contractor shall restore at least 95% of post-construction vegetated areas on site, including areas disturbed by development, to a condition that can support healthy plant and tree growth. Soils must be reused for functions comparable to their original function (i.e., topsoil is used as topsoil, subsoil as subsoil, or subsoil is amended to become function topsoil).

END OF SECTION

SECTION 01 91 00

COMMISSIONING, TESTING AND START-UP

PART 1 GENERAL

1.01 SUMMARY

A. This Section establishes the Contractor's responsibilities for developing and conducting the complete commissioning, including testing and startup, of all equipment, systems, and facilities (new or existing) which are defined within the Contract Documents. This effort and the associated experience requirements are significant and critical to a safe and successful startup that meets the project schedule requirements.

B. This Section provides the overarching guidelines for commissioning but does not supersede specific testing requirements found elsewhere in the Contract Documents. Where there is any discrepancy, Contractor shall assume the more stringent requirements control unless confirmed otherwise by the Engineer. Refer to Division 26 and Division 40 for specific execution requirements related to electrical and instrumentation components and systems. For pre-commissioning activities, refer to other technical specifications, including Division 03 for requirements for testing of concrete hydraulic structures and Section 40 05 01 for testing requirements of hydraulic structures and piping.

C. All commissioning activities must be coordinated early in the project to minimize interference with the operation of the existing facility, or delays to the project schedule; see Section 01 12 16 for project work sequence and constraints. Unless otherwise specified, or agreed to in advance by the Engineer, Owner and Construction Manager, no commissioning activities will be scheduled to take place on a weekend or holiday recognized by the Owner.

D. This Section contains specific references to the following related specification sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 11 00 Summary of Work
   2. Section 01 12 16 Work Sequence and Restrictions
   3. Section 01 32 16 Construction Progress Schedule
   4. Section 01 33 00 Submittal Procedures
   5. Section 01 45 23 Testing and Inspection Services
   6. Section 01 51 00 Temporary Utilities

E. The Contractor shall provide an experienced Commissioning Manager who will be responsible for overseeing, organizing, administering, recording, and documenting all aspects of the commissioning efforts.

F. A representative or representatives of the equipment manufacturer(s) shall participate in the commissioning phases per the requirements of the Specifications.

1. Commissioning Overview: The sequence of the commissioning shall proceed as follows. Variations to this sequence may be requested by the Contractor and may be authorized by the Engineer (with input from the Construction Manager) where necessary to meet other constraints described in these Contract Documents. Any requested changes to the extent of testing quality control checks, related sequencing, and/or level or frequency of documentation shall be considered a deviation from the accepted Commissioning Plan and require resubmittal. The equipment and facility startup is a bottom-up approach, where testing starts at the component level, which is then followed by testing at the system, and then facility level.
    a. Phase 1 Commissioning: Component Test Phase. The Component Test Phase is comprised of the following three parts.
        1) Part 1 – Component Installation Review
        2) Part 2 – Component Operational Test
        3) Part 3 – Component Network Communications Test
    b. Phase 2 Commissioning: Functional Test Phase
        1) Part 1 – Functional Test of Individual Components and Independent Systems
        2) Part 2 – Comprehensive Functional Test of Integrated Systems
    c. Phase 3 Commissioning: Operations Test Phase. The Operations Test Phase is comprised of the following two parts.
        1) Part 1 – Walkdown
        2) Part 2 – Seven (7) Day Operations Test
    d. Phase 4 Commissioning: Acceptance Test Phase
    e. Optimization/Performance Commissioning Phase
2. Unless otherwise specified or agreed to in writing by the Engineer (with input from the Construction Manager), all testing activities required as part of facility construction will occur prior to initiation of Phase 1 Commissioning. These include, but are not limited to, testing hydraulic structures for water tightness, pressure testing of piping systems, etc. Refer to applicable specification sections for specific requirements.

1.02 CONTRACTOR COMMISSIONING MANAGER RESPONSIBILITIES AND QUALIFICATIONS

A. The Contractor shall provide an experienced Commissioning Manager who will be responsible for overseeing, organizing, administering, recording, and documenting all aspects the testing and startup efforts, including development of System Commissioning Plans. Refer to paragraph 1.02 Contractor Commissioning Manager Responsibilities and Qualifications for experience requirements.

B. At 90 days prior to the commencement of the first component testing, the Commissioning Manager shall be full time, working only on the testing and startup activities of this Work.

C. The Commissioning Manager's responsibilities shall include, but are not limited to, the following activities.
   1. Direct and oversee the development of all commissioning planning documents.
   2. Coordinate and be responsible for all testing and startup activities.
   3. Coordinate activities with overall Contractor's project schedule, providing a schedule update at each meeting.
   4. Serve as liaison between the Contractor and the Engineer/Construction Manager for all testing and startup activities. Coordinate directly with Owner's staff as directed by the Construction Manager.
   5. Organize, lead, and provide minutes for Commissioning Meetings from the initial development of the System Commissioning Plans until the completion of all testing and startup activities.
   6. Maintain the System Commissioning Plans and provide monthly updates to the Startup Team until the month prior to startup, then provide weekly updates until commissioning is complete.
   7. Oversee and administer all testing activities, including either direct participation in the testing, and/or oversight and monitoring of all testing, and related documentation.
   8. Assure that all tests have been successfully completed in accordance with the submitted testing procedures.
   9. Develop, compile, review for completeness and compliance to the specifications, and submit all required completed test submittals and other related documentation in a timely manner.
   10. Work with the Contractor's Safety Supervisor to provide safe work conditions during commissioning.
   11. Prior to submittal, review and approve the content of all training sessions to assure that the training includes all applicable operation, maintenance, safety, and functional, operations, and acceptance testing information.

D. Commissioning Manager's Statement of Qualifications:
   1. Bachelor's degree in civil, mechanical, or electrical engineering with A minimum of 10 years of construction experience and 5 years of experience serving in a role with responsibilities similar to those described in this Section.
   2. Experience in the startup of similar systems on at least one completed drinking water treatment facility, with a minimum construction cost of $50 million; over 400 sheets of drawings; and including pumping, pipelines, equipment, liquid and/or solids treatment process modifications, networked controls, and electrical infrastructure.

1.03 DEFINITIONS

A. Commissioning:
   1. The systematic process composed of all elements and requirements related to testing and startup of the Work.

B. Commissioning Hierarchy:
   1. Area
      a. A collection of systems usually constructed within or primarily within the confines of a single building or structure.
      b. Generally, the Drawings are compiled by Area number, in ascending order. Area numbers used in the Drawings correspond with the numbering system utilized during the last several facility upgrades.
      c. In most cases, Areas correspond with treatment processes. In some cases, however, multiple treatment processes are included in the same Area and/or a single treatment process is incorporated into multiple Areas.
   2. System
      a. An arrangement of components or other systems so related or connected to perform a specific function and which form an identifiable, unified, functional, operational, safe, and independent part of the Owner's facility.
      b. A system may consist of solely new equipment installed as part of the Work, or as a combination of new equipment installed as part of the Work and existing equipment operating in conjunction with each other.
      c. A system may include equipment and facilities in more than one Area.
   3. Component
      a. Components comprise every discrete item associated within the Work.
      b. Example components include but are not limited to the following:
         1) Structural system components include: buildings, tanks and reservoirs.
         2) Architectural system components include: floors, walls, doors, windows, ceilings and roofs.
         3) Process system components are usually discrete pieces of equipment and their respective motors and include: pumps, tanks, blowers, and other types of treatment equipment.
         4) Piping system components include: the piping, the piping connections, and the valves, whether manual or powered.
         5) Electrical system components include: wiring, equipment including but not limited to panelboards, MCCs, starters, and VFDs.
         6) Control system components include: Wiring, instruments, control panels, human-machine interfaces (HMIs'), computers, programmable logic controllers (PLCs), instrument networks, and process control networks
         7) Heating, ventilation and air conditioning (HVAC) system components include: pumps discrete pieces of HVAC equipment, and their respective motors and include: pumps, heat pumps, heat exchangers, water quality systems, valves, fans, louvers and ductwork.
         8) Plumbing system components include: pumps, strainers, valves, water supply piping, and area collection/drainage for system
         9) Fire alarm system components include: fire alarms, and network communication.

10) Fire suppression system components include: sprinklers, valves, and piping.
11) Security system components include: video surveillance, locking systems, identification systems, access to existing or other systems, and security staffing.
12) Communication systems, including internet connectivity devices, speakers, and receivers.
13) Access control systems, including motorized gates and interface to existing and/or other systems.
14) Indoor and outdoor lighting control systems and interface to other systems.

C. Summary of Test Phases. Reference paragraph 3.05 Testing for comprehensive test phase requirements.
   1. Phase 1 Commissioning: Component Test Phase. The Component Test Phase is intended to:
      a. Perform inspection and testing in a logical, stepwise sequence to ensure that the installed components have been safely and properly assembled, serviced, aligned, adjusted, connected, and calibrated prior to operation.
      b. Perform operational tests to prove that the components are operating as needed, intended, and specified.
      c. Perform component network communications tests to prove that all network reporting, data received, and control aspects for a given component are being correctly performed as needed, intended and specified.
   2. Phase 2 Commissioning: Functional Test Phase. The Functional Test Phase is performed on a system, multiple integrated systems and/or a facility to prove that they function as required in conformance with the performance requirements and as needed, intended and specified. Functional tests use plant water, non-potable water, air, or simulated signals, not the specified media.
   3. Phase 3 Commissioning: Operations Test Phase. The Operations Test Phase prepares a system, multiple integrated systems or a facility for the Acceptance Test Phase, proves that all systems are correctly set up and that the facility will reliably function over time in real world conditions. The Operations Test Phase is intended to:
      a. Provide for operations testing to prove compliance with performance requirements using either raw water, plant water, non-potable water, air, or the specified media, depending on the tests performed.
      b. Perform a complete inspection (walkdown) by the commissioning team to verify readiness for the 7-day operational test.
      c. Provide for 7-day operations test which shall consist of a continuous un-interrupted seven-day run period using the specified media.

4. Phase 4 Commissioning: Acceptance Test Phase. The Acceptance Test Phase operates a system, multiple integrated systems or a facility with the specified media, by the Owner (with assistance from the Contractor), for 30 days, without operational or performance failure to demonstrate satisfactory performance with the performance requirements specified. Performance tests, specified in individual specification sections to verify guaranteed performance, are performed during Phase 4 Commissioning.
5. Optimization Commissioning Phase: Some systems may be specified with Optimization Testing which is intended to provide the Manufacturer's services to optimize specific systems.

D. Other Key Terms:
1. Tests: Unless otherwise specified, denotes all field-testing including component tests, functional tests, operational tests, acceptance tests, and optimization/performance tests.
2. Startup Constraints: Startup constraints are identified throughout these Contract Documents with major construction constraints with reference to the effects on process startup are being discussed in Section 01 12 16.
3. Commissioning Team. Led by the Commissioning Manager, the Commissioning Team is comprised of key operations and maintenance personnel of the Owner, the Construction Manager, the Engineer and key representatives of the Suppliers.
4. Commissioning Manager: A testing and startup expert employed by the Contractor who is responsible for overseeing, organizing, administering, recording, and documenting all aspects the commissioning efforts.
5. Temporary Provision: Outages, re-routes, systems, components, materials, or equipment which is temporarily required to allow any test to occur.
6. Integrator: party responsible for control panel fabrication or alteration
7. Programmer: responsible for configuration of controllers (PLC, DCS, RTUs), HMI software. This may be separate from the party responsible for the control panel, fabrications or alternation, instrument installation and configuration.
8. Vendor Programmer: party responsible for controllers or local interface on vendor package equipment, defined as separate from plant or area SCADA systems.

1.04 SYSTEMS FOR PRE-COMMISSIONING AND COMMISSIONING

A. The following are list the major areas and systems within those areas to be commissioned as individual packages:
1. Area 01 and 05: Septic System and Infiltration Gallery
a. System 1:
1) Septic Tank Pump System
2) [_____]
3) [_____]
b. System 2:
1) Infiltration Gallery Pump System
2) [_____]

3) [_____]

2. Area 20, 35, 50, 70, 71, 73, 84 and 89: Treatment Building
   a. System 1:
      1) Flocculators
      2) Hoseless Solids Collection/Blower System
      3) Filters
   b. System 2:
      1) Constant Head Backwash Pumping System
      2) Plant Water Pump System
      3) Backwash Tank Flow Control Valve
3. Area 89: Operations Building
   a. System 1:
      1) Flash Mix Chemical Feed System
      2) Sodium Hypochlorite Chemical Feed System
      3) [_____]
   b. System 2:
      1) Backup Power Generator and Fuel Tank System
      2) [_____]
      3) [_____]
      4) [_____]
4. Area 87: Fluoride Building
   a. System 1:
      1) Fluoride Chemical Feed System
      2) [_____]
      3) [_____]
   b. System 2:
      1) Groundwater Pump System
      2) [_____]
      3) [_____]
   c.
5. Area 60: Clarifier
   a. System 1:
      1) Recycle Water Pump System
      2) [_____]
      3) [_____]
   b. System 2:
      1) Clarifier Rake Arm Assembly
      2) [_____]
      3) [_____]
6. For all areas, facilities, equipment not explicitly included in the areas listed above, Contractor to provide listing of systems and equipment.

1.05 COMMISSIONING PLAN

A. The commissioning plan shall include:
   1. Provisions to maintain operations of the Direct Filtration treatment plant until an operating permit for the new treatment plant is obtained from the Utah Division of Drinking Water.
   2. Means and methods for discharging treated water to City Creek until new treatment plant is fully commissioned and is discharging water to the SLCDPU potable water distribution system.
   3. Means and methods to commission the systems according to the milestones outlined in Section 01 12 16 Work Sequence and Restrictions.

1.06 MANUFACTURER'S FIELD SERVICES

A. Where manufacturer's services are specified in this Section or other specification sections, furnish an authorized representative of the manufacturer who is factory-trained, knowledgeable and experienced in the technical aspects of their products and systems supplied on the Project and qualified to provide these services. Manufacturer representatives shall be available during equipment installation, commissioning and training of Owner's personnel.

B. Manufacturer's representatives shall be subject to the acceptance of by the Construction Manager and Engineer as a submittal with each System Commissioning Plan. No substitute representatives will be allowed without prior written approval from the Construction Manager.

C. Manufacturer's Certifications:
   1. After equipment installation and before equipment energization, each manufacturer's representative shall prepare a written Manufacturer's Installation Certification Form, Form 43 05 11-A in Section 01 99 90, certifying that each equipment specified in Divisions 26 through 46 that the manufacturer supplied is properly installed and lubricated, has been properly maintained by the Contractor, is in accurate alignment, is free from any undue stress imposed by connecting piping and anchor bolts, and is in accordance with the manufacturer's installation instructions.
   2. During Phase 4 Commissioning, each manufacturer's representative shall prepare a written Manufacturer's Operation Certification Form, Form 43 05 11-D in Section 01 99 90, certifying that each equipment specified in Divisions 26 through 46 that the manufacturer supplied is properly lubricated; has been properly maintained by the Contractor; is in accurate alignment; is free from any undue stress imposed by connecting piping and anchor bolts; and has been operated under all design conditions and meets the performance criteria in accordance with the requirements in the applicable specification sections and the manufacturer's operating requirements.

D. The Manufacturer's authorized representative shall perform all services when Manufacturer's services are specified in the individual specification sections. The authorized representative shall be factory-trained and experienced in the technical applications, installation, operation and maintenance of the equipment, subsystem or system.

E. The scheduling of all visits to the site by the manufacturer's field services representative shall be determined by the Contractor and coordinated through the Commissioning Manager. The Contractor shall notify the Construction Manager a minimum of 7 days in advance of all visits.

F. The Manufacturer's authorized representative shall not independently determine any requirements can be omitted, reduced or otherwise change testing requirements, protocols, or required documentation without submitting a request for deviation to the accepted Commissioning Plan or other related submittals.

1.07 SUBMITTALS

A. Action Submittals: The following minimum submittals shall be submitted in accordance with Section 01 33 00.
   1. Within 60 days following Notice to Proceed.
      a. A copy of this Section, with addendum updates included, and all referenced and applicable Sections, with addendum updates included, with each paragraph check-marked to indicate Specification compliance or marked to indicate requested deviations from Specification requirements or those parts which are to be provided by the Contractor or others shall be provided. Check marks (") shall denote full compliance with a paragraph as a whole.
      b. If deviations from the Specifications are indicated, and therefore requested, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Engineer shall be the final authority for determining acceptability of requested deviations.
      c. The remaining portions of the paragraph not underlined shall signify compliance with the Specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the requirements of the Specification shall be cause for rejection of the entire submittal and no further submittal material will be reviewed.
      d. Commissioning Manager qualifications and past work experience including contact names, addresses, and current telephone numbers that can be used to verify the accuracy of the provided information.
   2. Within 120 days following Notice to Proceed.
      a. Master Commissioning Plan.

3. Not less than 120 days prior of the initiation of the first planned component testing in a system.
    a. System Commissioning Plan for the system within which the first components will be tested. Submit system test plans in two parts as described below:
        1) Submit the portion of the system commissioning plan for Component and Functional testing.
        2) After successful completion of the Component testing, submit the test plan for the remaining phases of testing and commissioning.
    b. Submit remaining System Commissioning Plans not less than 120 days prior to first planned component testing within each system, following the same two-part submittal process described above.
4. Qualifications of equipment manufacturer's representatives, to be submitted with each System Commissioning Plan.
5. Within 7 days following completion of each phase of Commissioning for each System Commissioning Plan, submit documentation demonstrating successful completion of the testing phase for that system. Any issues identified during the testing phase shall be identified along with the actions taken, or planned to be taken, to rectify the issue.
6. Certificates of instrument calibration, provided upon request from the Construction Manager or Engineer.

B. Informational Submittals: The following minimum informational submittals shall be submitted in accordance with the timing requirements specified in these Contract Documents, prior to Substantial Completion and in accordance with Section 01 33 00.
    1. Updates to Comprehensive Testing Schedule.

C. Closeout Submittals: The following minimum closeout submittals shall be submitted in accordance with the timing requirements specified in these Contract Documents, prior to Substantial Completion and in accordance with Section 01 33 00.
    1. Manufacturer's Certificates of Proper Installation, Form 43 05 11-A in Section 01 99 90, or reference to completed certificates provided under separate submittals where specified.
    2. Test Reports, including completed test forms as specified in Section 01 99 90, and paragraph 1.05 Commissioning Plan, or reference to completed test forms provided under separate submittals where specified.
    3. Certificate of Testing and Commissioning
    4. Certificate of Training Completion, Form 43 05 11-B in Section 01 99 90, or reference to completed Certificates of Training Completion provided under separate submittals where specified.
    5. Manufacturer's Certificates of Proper Operation, Form 43 05 11-D in Section 01 99 90, or reference to completed Manufacturer's Certificate of Proper Operation provided under separate submittals where specified.

D. Samples:
   1. Reference the individual specifications within the Contract Documents for items requiring samples to be submitted.

E. Mock-ups:
   1. Reference the individual specifications within the Contract Documents for items requiring mock-ups to be submitted.

PART 2 PRODUCTS

2.01 TEST MATERIALS AND EQUIPMENT

A. Provide calibrated test gauges, meters, recorders and monitors, reagents and test gases and associated assemblies, as required, to supplement or augment the Work specified in the Contract Documents to facilitate compliance with requirements of the commissioning. Select devices designed to measure the performance of the specific equipment and systems incorporated into the Work.

B. When testing requires the use of temporary provisions such as, but not limited to equipment, power, compressed air, or instrumentation which have not yet been placed in service, provide substitute sources acceptable to both the Owner and Construction Manager, and capable of meeting the requirements needed to perform the testing.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall install all equipment in accordance with Manufacturer's requirements and the Contract Documents. Notify the Engineer/Construction Manager of any conflict between a manufacturer's installation recommendations and the Contract Documents.

B. The Contractor shall perform component testing, functional testing, and startup testing, of all installed component and systems. Unless specified otherwise, the Owner shall be responsible for operating the facility during acceptance testing, with assistance and support from the Contractor in performing specific testing activities.

C. The Contractor shall provide the services of all technical and craft personnel required to support the Work throughout the duration of all testing phases, except as otherwise noted in this Section.

D. The Contractor shall maintain the appropriate staff (either on-site or on-call) to be able to respond immediately (24-hours per day) to deficiencies discovered during the Operations Test Phase and the Acceptance Test Phase. The Contractor's qualified personnel must be capable of being on-site within a maximum of 2 hours of notice to correct any deficiencies.

E. Owner's Operations and Maintenance Responsibility during Testing:
   1. Systems, multiple integrated systems, or facilities in the Operations Test Phase which require raw water to be treated and disposed of shall be operated by the Owner with guidance from the Commissioning Manager.
   2. Unless specified otherwise, systems, multiple integrated systems, or facilities in the Acceptance Test Phase shall be operated by the Owner with assistance and support from the Commissioning Manager.

F. Until completion of the Acceptance Test Phase, the Contractor shall maintain all facilities undergoing testing. This includes, but is not limited to, manufacturer recommended preventative maintenance, repairs as needed, consumables such as lubricants, coating touch-up, etc.

G. The Contractor shall provide temporary systems, piping, valving, drains, power, controls, etc. to facilitate any of the tests, as needed to cycle water or air through the facilities in a manner that simulates the ultimate operation of the system.

H. All testing that may affect the operation of the existing facilities shall be coordinated with the Owner, including the proper isolation (e.g., lock out/tag out) procedures and features prior to commencing Work.

I. Timing of Testing:
   1. No testing shall commence until the related specific System Commissioning Plan has been submitted, reviewed, and received a review action of No Exceptions Taken, or Make Corrections Noted.
   2. No testing shall commence until the O&M Manual for the equipment involved has been reviewed and received a review action of No Exceptions Taken or Make Corrections Noted.
   3. Progression from one test phase to the next shall only be allowed at the written approval of the Construction Manager, following submission of written documentation from the Contractor signifying that the intent of that testing phase has been met with satisfactory results. The written approval will include a listing of items still owed by the Contractor regarding the testing which has occurred.
   4. Operations Testing shall not commence until all tagging and labeling including but not limited to piping, conduit, wires, panels, and equipment, have been completed.
   5. Acceptance Testing shall not commence until training has been completed.
   6. All life-safety systems, including but limited to ventilation, fire monitoring and alarms, hazard monitoring and alarms, communication systems, associated with a specific system, must have successfully completed operations testing prior to proceeding with Functional Testing of the system.

J. At the satisfactory conclusion of each test phase, the Contractor shall dismantle and remove all temporary valving, hoses, and other equipment used during the test, and return the facilities to conditions as existed before the test.

K. All deficiencies found during any test phase and subsequent correction thereof, must be inspected and approved by the Construction Manager prior to re-testing or continuation of testing. The contractor shall correct all noted deficiencies.

3.02 TESTING AND STARTUP MEETINGS AND WEEKLY REPORTS

A. The Commissioning Manager shall conduct regular commissioning meetings.

B. The first meeting shall be at least 6 months prior to submitting the Project Commissioning Plan and shall include preliminary discussions regarding this plan. Commissioning meetings shall then be held monthly until 120 days prior to the first planned Component Testing. Ongoing development of the individual System Commissioning Plans will be among the topics discussed in these meetings.

C. At a point commencing 120 days prior to the first Component Test Phase, the commissioning meetings shall be held weekly.

D. Commissioning meetings shall be attended by the Construction Manager, key members from the Contractor staff, Subcontractors, key representatives of the Manufacturers, along with representatives for the Owner and the Engineer.

E. The Commissioning Manager shall prepare meeting minutes from the Testing and Start-up and distribute to all attendees not later than 3 days prior to the next meeting, or within 5 working days of each meeting, whichever is sooner. These should be issued as draft with a request for comments within 3 business days, followed by a final issuance.

F. Weekly Test Reports:
   1. During testing activities, submit weekly test reports describing the tests performed, test methods, test strategies implemented during the test, summary of successful testing completed, and specific highlight of any problems and/or deficiencies found during testing.
   2. For all troubleshooting, describe the troubleshooting strategy, methods, and final resolution.

3.03 EQUIPMENT AND MATERIALS REQUIRED FOR TESTING

A. It shall be the Contractor's responsibility to ensure that all required materials and test and repair equipment are on hand during all planned testing activities. Spare parts, specified to be provided as part of the work, shall not be used for testing without the written approval of the Construction Manager.

B. All instruments used to measure performance shall be calibrated. Certificates of calibration shall be current (as required in Division 40), and shall be at the job site during testing, and provided upon request or when specified.

C. Contractor is required to provide all expendables during all tests (not including Acceptance Testing, unless otherwise specified), including but not limited to, chemicals, fuel, oil and filters (e.g., air, fuel, natural gas, oil, media, etc.). Upon completion of Operational Testing (or Acceptance Testing, where specified) all expendables shall be replaced with new.

3.04 TEMPORARY PROVISIONS

A. Maintain temporary provisions until the testing phase requiring the temporary facilities are complete, or until the permanent facilities are in service where specified.

3.05 TESTING

A. Phase 1 Commissioning: Component Test Phase: The Component Test Phase shall be comprised of the following three parts.
   1. Part 1 – Component Installation Review
      a. Perform inspection and testing in a logical, stepwise sequence to ensure that the installed components have been safely and properly assembled, serviced, aligned, adjusted, connected, and calibrated prior to operation.
      b. Perform all changes, adjustments, and replacements required to make the equipment operate properly.
      c. The Component Installation Review includes but is not limited to the following activities.
         1) Verification of adherence to manufacturer's installation and pre-startup requirements and procedures.
         2) For structures and tanks, perform and confirm compliance of structural leakage tests in accordance with Division 03 of these specifications.
         3) For piping, perform and confirm compliance of piping testing in accordance with Section 40 05 01.
         4) Verify wiring continuity for all components, equipment, instruments, panels, and devices. Check power, control, and monitoring circuits for continuity prior to connection to power source. Reference Division 26 and Division 40 for additional specifics regarding installation review of electrical and controls components including, but not limited to:
            a) Electrical acceptance tests per Section 26 08 00, complete.
            b) Arc flash hazard and coordination study, protective device settings, and labeling completed.
         5) Confirm cleanliness of connecting piping systems.
         6) Confirm alignment of connected machinery.
         7) Confirm correct lubrication.
         8) Confirm valve orientation and position status for manual operating mode.
         9) Confirm correct tagging and identification
         10) Confirm proper functioning of all safety components.
         11) Confirm proper connections, alignment, calibration, and adjustment.
         12) Manually rotate or move all moving parts to assure freedom of movement.
         13) Confirm all safety equipment is installed per contract requirements, including but not limited to eye wash stations, warning signs, ventilation systems and equipment, etc.

14) Provide Manufacturer's Certificate of Proper Installation following the completion of this review.

2. Part 2 – Component Operations Test
    a. Perform testing showing that the component is operating as needed, intended, and specified for the Work including but not limited to the following.
        1) Bump electric motors to verify power and direction of rotation.
        2) Verify correct voltage and phase sequence of all circuits.
        3) Verify correct amperage.
        4) Loop tests per Section 40 61 21.
        5) Complete testing of all control circuits including interlocks.
        6) Verify that every component is operational through its entire range of operation.
    b. Reference Division 26 and Division 40 for specific execution requirements related to electrical and instrumentation components and systems.
    c. Unless otherwise specified or allowed by the Construction Manager, the test media for component operational testing shall be plant water or non-potable water.
3. Part 3 – Component Network Communications Test
    a. The component network communication tests shall prove that all network reporting, data received, and control aspects for a given component are being correctly performed as needed, intended, and specified.
    b. Perform network tests for all network panels, network hardware, network cables, and all other network systems that are required to be installed and operational for each component.
    c. Refer to Division 40 for specific execution requirements for the component network tests.

B. Phase 2 Commissioning: Functional Test Phase:
1. Functional testing shall be performed on all components and systems as required to prove that they function as required in conformance with the performance requirements and as needed and intended to complete the Work. All components of a system shall be operated together during functional testing.
    a. The Functional Test Phase is required for all process equipment, HVAC equipment, other equipment, piping, electrical, instrumentation, controls, and package system equipment.
    b. Testing for all DCS controls associated with all components with DCS monitoring or DCS controls shall be performed. This test shall include testing of multiple components that have interfaces between them. For packaged equipment this shall include testing of interfaces and interlocks between equipment supplied by the Supplier of the packaged equipment and equipment supplied in other technical specification sections.

c. When testing requires the use of auxiliary systems such as electrical power, compressed air, control air, or instrumentation which have not yet been placed in service, provide acceptable substitute sources, capable of meeting the requirements of the component or system.

d. Functionally test each system as an independent system.
   1) Tests shall include all the functional requirements provided in Division 26 and Division 40, within the individual requirements in the Specifications and as required by the Supplier.
   2) Demonstrate that each, and every, component within the system interacts and functionally operates as specified throughout its entire range of operation.
   3) Test each interlock for the system, all local controls, and all DCS controls.

e. Functionally test multiple integrated systems. The testing shall include individual components and systems that were previously tested independently.
   1) Test in a step-by-step method to accomplish orderly and systematic testing of integrated systems to simulate the functionality of the completed Work.
   2) Tests shall be run through normal operating ranges and to prove specific performance requirements as required by the Specifications or otherwise needed to prove compliance with the Specifications.
   3) To the greatest extent practical, test at conditions which represent the full range of operating parameters (or specified test parameters if greater) as defined in the Contract Documents.
   4) The tests shall include all network controls, all network interlocks, all inter-process interlocks, and all operations interfaces.
   5) The tests shall be performed until the specified operating modes or performance has been accomplished without interruption for the specified duration as indicated in the Specifications or in no instance less than 4 hours.
   6) Should the functional testing of the integrated systems be halted for any reason, the testing shall be repeated until it has been accomplished without interruption.
   7) Coordinate with Construction Manager such that Construction Manager can witness each individual step in the procedures.

f. Following the testing perform the following.
   1) Check equipment for loose connections, unusual movement or other indications of improper operating characteristics.
   2) Disassemble and inspect equipment which exhibits unusual or unacceptable operating characteristics. Re-align machines identified as out of alignment. Repair, or remove and replace with new if unable to pass the requirement of the testing. Test until the equipment meets the requirements of the Specifications.

g. Unless otherwise specified or allowed by the Construction Manager and Engineer, the test media for functional testing shall be the water identified in the System Commissioning Plan (e.g., plant water, non-potable water, air, or specified media, depending on the system).

C. Phase 3 Commissioning: Operations Test Phase:
   1. General Requirements of the Operations Test Phase
      a. Tests shall be performed using the specified media.
      b. Disposal of test media shall follow all laws and regulations and with proper permits.
      c. Unless otherwise indicated in these Contract Documents or permitted by the Construction Manager, training shall be performed during the Operations Test Phase.
      d. The Operations Test Phase shall be conducted at a time and date which is requested by the Contractor and agreed to by the Owner.
      e. Coordinate with the Owner for introduction of specified media, disposal (or return to treatment plant) of specified material, and operation of facilities with specified media.
      f. Prior to commencement of the Operations Test Phase, the facility shall be fully operational, capable of accepting design flows and performing functions as designed.
      g. The Operations Test Phase shall test for normal operational sequence as an integrated system conforming to the requirements of the Specifications through full specified operating range. Test network control logic across multiple systems.
      h. During the Operations Test Phase, tests shall be executed for all components. Tests shall include all the operations tests as specified in the individual equipment technical specification sections. This includes vibration tests where specified.
      i. Provide required support to the Owner such that the facility attains its fully operational mode.
   2. Part 1 -Walkdown: After the completion of the functional testing, a complete inspection by the Startup Team shall be performed to determine if the facility is ready for the Seven (7) Day Operational Test.
      a. Walk through the facility with the Construction Manager, the Owner, and the Engineer to acknowledge facility is ready for the Seven (7) Day Operational Test.
      b. A working punch-list will be developed and provided by the Construction Manager.
      c. The punch-list shall be identified by the following ranking criteria:
         1) Level 1: Significant impact item and no further tests shall be performed until resolved. Requires a signoff prior to proceeding.
         2) Level 2: Minimal impact item that can be corrected later and does not affect continuation of testing.
   3. Part 2 - Seven (7) Day Operational Test. The Operations Test Phase shall consist of a continuous un-interrupted seven-day run period using the specified media.

D. Phase 4 Commissioning: Acceptance Test Phase:
   1. The Acceptance Test Phase shall be a test of a system or multiple systems by the Owner using the specified media, without operational or performance failure to demonstrate conformance with the performance requirements specified. The minimum duration of the Acceptance Test Phase shall be 30 days, unless otherwise specified within individual equipment specifications. This is the final test to demonstrate the facility including new and existing processes operate together as needed, intended, and specified.
      a. During this test, vary operational parameters during the day, with steady state conditions overnight.
      b. Conduct performance testing where required in individual specification sections. Where practical, coordinate timing of performance testing to fall within the nominal 30 days allocated for Acceptance Testing; however, performance testing outside of this 30-day period may be required in order to fully comply with specified performance testing requirements.
      c. The Acceptance Test Phase shall be judged completed wholly at the discretion of the Engineer with input from the Construction Manager.
      d. This test may last significantly longer than the specified calendar days listed if deficiencies are found, and the test is restarted one or more times. The Contractor shall coordinate with the Owner and provide support as necessary.
      e. After satisfactory completion the facility shall be placed into normal operation.
      f. Provide documentation of successful performance testing where required in individual equipment specifications.
      g. Provide Manufacturer's Certificates of Proper Operation.

E. Optimization Testing:
   1. Provide optimization testing as required in individual equipment specifications.

3.06 RETESTS

A. If any portion of a test does not pass, the Contractor shall correct the problem in a timely manner and repeat the test until it passes to the satisfaction of the Engineer and Owner.
   1. Functional testing of equipment or a system shall be considered complete when, in opinion of the Engineer and Construction Manager, the system, facility, or designated portion has operated in manner intended for (7) continuous days without significant interruption, unless otherwise agreed upon.
   2. Operational testing of the system, the entire facility or any portion thereof shall be considered complete when, in opinion of the Engineer and Construction Manager, the system, facility, or designated portion has operated in manner intended for (28) continuous days without significant interruption, unless otherwise agreed upon.

3. Significant Interruption: May include any of the following events:
    a. Failure of Contractor to provide and maintain qualified onsite startup personnel as scheduled.
    b. Failure of any critical equipment or unit process that is not satisfactorily corrected within 6 hours after failure.
    c. Failure of any noncritical equipment or unit process that is not satisfactorily corrected within 24 hours after failure.
4. Operational testing of the system, the entire facility or any portion thereof shall be considered complete when, in opinion of the Engineer and Construction Manager, the system, all specified testing has been successfully completed, and all deficiencies have been corrected.

B. If a failure of any component or system occurs during any phase of commissioning, the entire phase shall be re-started. If the Commissioning Manager determines that the failure is minor and recommends continuation of the test rather than re-starting, then the Commissioning Manager shall request continuation in writing to the Construction Manager and Engineer, who, if in agreement, may permit continuation of testing.

C. If a failure of any component should occur during any phase of commissioning, the Contractor shall be responsible for the actual cost of any idle time due to such failure. Such costs of idle time shall include personnel costs of Owner's, Construction Manager's, and Engineer's staff who are assigned to coordinate, assist and witness the commissioning activities. This includes personnel costs, rental costs of equipment and any other incidental costs of the delay.

3.07 AFTER TESTS

A. Once testing has been completed, and until the Construction Manager has issued a certificate of Final Completion, all equipment shall be rechecked once by the Contractor (or more often if specified) for proper alignment and realigned, if necessary. All equipment shall be checked for loose connections, unusual movement, or other indications of improper operating characteristics. Any deficiencies shall be corrected to the satisfaction of the Construction Manager. All equipment or devices which exhibit unusual or unacceptable operating characteristics shall be disassembled, inspected and shall then be repaired or removed from the Site and replaced at no cost to the Owner.

Project Name			
Owner		Coating System Manufacturer (CSM)	
General Contractor (GC)		Coating System Applicator (CSA)	
Area or Structure		Location within Structure	
Coating System (eg E-1)		Coating Type (eg Epoxy, etc.)	

Coating System Inspection Checklist

Step	Description		Name	Signature	Date
1	Completion of cleaning and substrate decontamination prior to abrasive blast cleaning.	GC QC			
		CSM QC			
		CSA QC			
2	Installation of protective enclosure of structure or area and protection of adjacent surfaces or structures that are not to be coated.	GC QC			
		CSM QC			
		CSA QC			
3	Completion of ambient condition control in structure or building area and acceptance of ventilation methods in structure or Area.	GC QC			
		CSM QC			
		CSA QC			
4	Completion of Surface Preparation for Substrates to Be Coated.	GC QC			
		CSM QC			
		CSA QC			
5	Completion of Primer Application.	GC QC			
		CSM QC			
		CSA QC			
6	Completion of Concrete Repairs If Required and Related Surface Preparation Rework Prior to Coating System Application.	GC QC			
		CSM QC			
		CSA QC			
7	Completion of Concrete Filler/ Surface Application to Concrete.	GC QC			
		CSM QC			
		CSA QC			
8	Completion of First Finish Coat Application and of Detail Treatment at Transitions or Terminations.	GC QC			
		CSM QC			
		CSA QC			

Coating System Inspection Checklist

Step	Description		Name	Signature	Date
9	Completion of Second Finish Coat Application and of Detail Treatment at Transitions and Terminations.	GC QC			
		CSM QC			
		CSA QC			
10	Completion of Full and Proper Cure of Coating System.	GC QC			
		CSM QC			
		CSA QC			
11	Completion of Testing of Cured Coating System including Adhesion, Holiday (Continuity) Testing and Dry Film Thickness.	GC QC			
		CSM QC			
		CSA QC			
12	Completion of Localized Repairs to Coating System Following Testing.	GC QC			
		CSM QC			
		CSA QC			
13	Final Acceptance of Coating System Installation Including Final Clean-Up Complying with Specification Requirements and the CSM's Quality Requirements.	GC QC			
		CSM QC			
		CSA QC

26 05 00-C. DRY TRANSFORMER TEST DATA FORM

(Note: Use Data Form for dry type transformers with voltage rating of 600 Vac or less and sizes to 167 kVA single phase and 500 kVA three phase. Use NETA Test Forms and Test Procedures for higher voltages and larger transformers.)

Equipment Tag No.: _____ Temperature Rating: _____

Description/Location: _____ Feeder size/Source: _____

Primary Voltage: _____ Secondary Voltage: _____ Winding Connection: _____

A. VISUAL INSPECTION

Transformer Inspection	Pass	Fail	Note
1. Nameplate data as specified			
2. Mechanical condition			
a. Free of dents and scratches			
b. Anchored properly			
c. Shipping brackets removed			
d. Spacing from wall per nameplate			
3. Grounding *			
a. Equipment grounding			
b. System grounding			

B. INSULATION-RESISTANCE TESTS:

Perform tests with calibrated megohmeter. Apply 1000 Vdc test voltage for 60 seconds and record readings in megohms at 30-seconds and 60-seconds intervals.

Test Group	Resistance between		30-second reading	60-second reading	Absorption Ratio Index 60-sec. / 30-sec.
Primary Winding to ground	A	GRD			
	B	GRD			
	C	GRD			
Secondary Winding to ground with * N-G Bond removed	a	GRD			
	b	GRD			
	c	GRD			
Primary Winding to Secondary Winding	A	a			
	B	b			
	C	c			

Submit resistance readings to the Construction Manager immediately after the tests that are less than the manufacturer's recommended value or less than 10-megohms. Record the Absorption Ratio Index values for future reference. Ratio must be 1.0 or greater, with infinity (∞) equal to 1.0.

Contractor Representative Certified: _____ Date _____

Owner Representative Witnessed:_____ Date _____

26 05 00-D. MOTOR CONTROL CENTER TEST FORM

Equipment No.: _____ Ambient room temperature: _____

Location: _____

A. MECHANICAL CHECK:

All bolted connections either bus to bus or cable to bus shall be torqued to the manufacturer's recommendations.

B. ELECTRICAL TESTS:

1. Measure insulation resistance of each bus section phase to phase and phase to ground for 1 minute using a megohmmeter at 1000 volts.

Test results (megohms)			
Phase		Phase	
A-GRD		A-B	
B-GRD		B-C	
C-GRD		C-A	

2. Set the circuit breaker in the starter unit to comply with the requirements of NEC, Article 430-52 and Table 430-152.

3. Motor overload heater elements shall be sized and installed based on the actual nameplate full load amperes of the motor connected to the starter.

26 05 00-E. MEDIUM VOLTAGE MOTOR STARTER TEST FORM

Equipment No.: _____

Location: _____

Room Temperature: _____

The protective devices shall be set in accordance with the specification before the tests are performed.

1. Measure contact resistance (micro-ohms)

Phase:	A		B		C	

Contacts shall be replaced if resistance exceeds 50 micro-ohms.

2. Perform an insulation resistance test (1000 volts DC for 1 minute).

Phase	A		B		C		
Pole to ground							megohms
Across open pole							megohms
Pole to pole	AB		BC		CA		megohms

3. Perform minimum pickup voltage tests on trip and close coils.
4. Motor RTDs shall be tested by using a hot oil bath. The temperature at which the sensor trips shall be recorded for each RTD.
5. The Contactor shall be tripped by operation of each protective device.

26 05 00-F. MEDIUM VOLTAGE SWITCHGEAR TEST FORM

Equipment No.: _____

Location: _____

Room Temperature: _____

The protective devices shall be set in accordance with the specification before the tests are performed.

1. Measure contact resistance (micro-ohms).

Phase:	A		B		C	

Contacts shall be replaced if resistance exceeds 50 micro-ohms.

2. Perform an insulation resistance test (1000 volts DC for 1 minute).

Phase	A		B		C		
Pole to ground							megohms
Across open pole							megohms
Pole to pole	AB		BC		CA		megohms

3. Perform minimum pickup voltage tests on trip and close coils.
4. Verify the instrument transformer ratios. Check the transformer's polarity electrically.
5. The Contactor shall be tripped by operation of each protective device.

26 05 00-G. PROTECTIVE RELAY TEST FORM

Location: _____

Switchgear Breaker No.: _____

Protective Relay Description: _____

The protective relays shall be tested in the following manner:

1. Each protective relay circuit shall have its insulation resistance tested to ground.
2. Perform the following tests on the specified relay setting:
    a. Pickup parameters on each operating element.
    b Timing test shall be performed at three points on the time dial curve.
    c. Pickup target and seal-in units.

The results shall be recorded and signed. A copy shall be given to the Construction Manager in accordance with paragraph 26 05 00-1.05 Corrosive Areas.

26 05 00-H. LOW VOLTAGE SWITCHGEAR TEST FORM

Equipment No.: _____

Location: _____

Room Temperature: _____

The protective devices shall be set in accordance with the specification before the tests are performed.

1. Measure contact resistance (micro-ohms).

Phase:	A		B		C	

Contacts shall be replaced if resistance exceeds 50 micro-ohms.

2. Perform an insulation resistance test (1000 volts DC for 1 minute).

Phase	A		B		C		
Pole to ground							megohms
Across open pole							megohms
Pole to pole	AB		BC		CA		megohms

3. Minimum pickup current shall be determined by primary current injection.
4. Long time delay shall be determined by primary injection at three hundred percent (300%) pickup current.
5. Short time pickup and time delay shall be determined by primary injection of current.
6. Instantaneous pickup current shall be determined by primary injection.
7. Trip unit reset characteristics shall be verified.
8. Auxiliary protective devices, such as ground fault or under voltage relays, shall be activated to ensure operation of shunt trip devices.

26 05 00-I. MEDIUM VOLTAGE LOAD INTERRUPTER SWITCH TEST FORM

Equipment Number: _____

Location: _____

Date: _____

1. Measure switch blade resistance (micro-ohms).

Phase:	A		B		C	

Contacts shall be replaced if resistance exceeds 50 micro-ohms.

2. Perform an insulation resistance test (1000 volts DC for 1 minute).

Phase	A		B		C		
Pole to ground							megohms
Across open pole							megohms
Pole to pole	AB		BC		CA		megohms

The results shall be recorded and signed. A copy shall be given to the Construction Manager in accordance with paragraph 26 05 00-2.06 Product Data.

CERTIFIED _____ Date _____

Contractor's Representative

WITNESSED _____ Date _____

26 05 00-J. LIQUID-FILLED TRANSFORMER TEST FORM

Equipment Number: _____

Location: _____

Date/Weather Conditions: _____

A. Perform the "Insulation-Resistance Test" and "Dielectric Absorption Test" using Form 26 05 00-C, Dry Transformer Test Data Form.

B. Perform an applied voltage (low frequency dielectric) test in accordance with ANSI C57.12.90, paragraph 10.5, Applied Voltage Test. Applied voltage levels shall be 75 percent of recommended factory test levels or recommended test levels of ANSI C57.12.00, Table 5.

C. Insulating oil shall be sampled and shall be laboratory tested for the following:

1. Dielectric strength.
2. Acid neutralization.
3. Interfacial tension.
4. Color.
5. Power factor.

D. Perform a turns ratio test between the windings for all tap positions.

E. The temperature and pressure switches shall be tested using a hot oil bath and air pump.

F. The results shall be recorded and signed by the Contractor and Construction Manager. A copy shall be given to the Construction Manager in accordance with paragraph 26 05 00-2.06 Product Data. Any readings which are abnormal to ANSI industry standards shall be reported to the Construction Manager.

26 05 00-K. AUTOMATIC TRANSFER SWITCH TEST FORM

Equipment Number: _____

Location: _____

Date: _____

1. Perform an insulation resistance test (1000 volts DC for 1 minute):

Phase	A		B		C		
Pole to ground							megohms
Pole to pole	AB		BC		CA		megohms

2. Perform the following operations and initial:
   a. Manual transfer _____
   b. Loss of normal power; __sec delay
   c. Return to normal power; _____sec delay

The results shall be recorded and signed. A copy shall be given to the Construction Manager in accordance with paragraph 26 05 00-2.06 Product Data.

CERTIFIED _____ Date _____

26 05 00-L. NEUTRAL GROUNDING RESISTOR TEST

Equipment No.: _____

Location: _____

The pickup and time delay setting on the ground fault relay shall be set in accordance with Section 26 05 74.

1. The transformer neutral insulation resistance shall be measured with and without the grounding resistor connected to insure no parallel ground paths exist.
2. The protective relay pickup current shall be determined by injecting test current into the current sensor. The pickup current should be within 10 percent of the dial setting. Record the dial setting and actual pickup tie.
3. The relay timing shall be tested by injecting 150 and 300 percent of pickup current into the current sensor. The relay timing shall be in accordance with the manufacturer's published time-current characteristic curves. Record the relay timing at 150 and 300 percent of pickup current.
4. The circuit interrupting device shall be operated by operating the relay.

The results shall be recorded and signed by the Contractor and Construction Manager. A copy shall be given to the Construction Manager in accordance with paragraph 26 05 00-2.06 Product Data.

40 61 13-A. LOOP WIRING AND INSULATION RESISTANCE TEST DATA FORM

Loop No.: _____

List all wiring associated with a loop in table below. Make applicable measurements as indicated after disconnecting wiring.

Wire No.	Panel Tie	Field TB	Continuity Resistance[a]		Insulation Resistance[b]			
			Cond./ Cond.	Cond./ Shield	Shield/ Gnd.	Shield/ Cond.	Cond./ Gnd.	Shield/ Shield
A			--	(A/SH)				
B			(A/B)	--				
C			(A/C)	--				
D			(A/D)	--				
etc.								

NOTES:

a. Continuity Test. Connect ohmmeter leads between wires A and B and jumper opposite ends together. Record resistance in table. Repeat procedure between A and C, A and D, etc. Any deviation of ±2 ohms between any reading and the average of a particular run indicates a poor conductor, and corrective action shall be taken before continuing with the loop test.

b. Insulation Test. Connect one end of a 500 volt megger to the panel ground bus and the other sequentially to each completely disconnected wire and shield. Test the insulation resistance and record each reading.

CITY CREEK WATER TREATMENT PLANT UPGRADES

CERTIFICATE OF UNIT RESPONSIBILITY

FOR SPECIFICATION SECTION _____

_____

[SECTION TITLE]

In accordance with Section 43 05 11-1.02 Unit Responsibility of the contract documents, the undersigned manufacturer of driven equipment ("manufacturer") accepts unit responsibility for all components of equipment furnished to the Project under specification Section_____ , and for related equipment manufactured under sections**_____, _____, and _____ .**

We have reviewed the requirements for sections 43 05 11 and 43 23 03 where applicable) and all sections referencing this (these) section(s), including but not limited to drivers, supports for driving and driven equipment and all other specified appurtenances to be furnished to the Project by manufacturer. And, we have further reviewed, and modified as necessary, the requirements for associated variable speed drives and motor control centers. We hereby certify that all specified components are compatible and comprise a functional unit suitable for the specified performance and design requirements whether or not the equipment was furnished by us. We will make no claim nor establish any condition that problems in operation for the product provided under this specification Section _____ are due to incompatibility of any components covered by this Certificate of Unit Responsibility. Nor will we condition or void any warranty for the performance of the product of this specification Section _____ due to incompatibility of any components covered under this Certificate of Unit Responsibility.

Our signature on this Certificate of Unit Responsibility does not obligate us to take responsibility for, nor to warrant the workmanship, quality, or performance of related equipment provided by others under specification sections _____, _____, and _____. Our obligation to warranty all equipment provided by us shall remain unaffected.

SECTION 02 41 00

DEMOLITION

PART 1 - GENERAL

1.01 SCOPE

A. Section includes demolition of designated structures, foundations, slabs-on-grade, sidewalks, and roadways; disconnection and demolition or capping of identified utilities; process equipment; electrical equipment; building mechanical equipment; and cleanup and removal of demolished materials from the site. Section also includes temporary construction to protect adjacent structures and property against damage and soiling, allow building occupancy, and provide safe access around demolition work. Finally, section includes protection of items to remain.

1.02 GENERAL

A. Coordination
   1. When unanticipated mechanical, electrical, or structural elements that conflict with the intended function or design are encountered, investigate and measure the nature and extent of the conflict and promptly submit written report to the Construction Manager.
   2. Demolition activities to be coordinated with Integrated Excavation Plan. Address protection and support of adjacent structures, utilities, and pipelines.

1.03 QUALITY ASSURANCE

A. Accomplish demolition without damaging or soiling existing structures, equipment, and appurtenances that are to remain.

B. Contractors Qualifications
   1. Contractor shall have a minimum of 5 years' experience in construction and similar demolition work.

1.04 SUBMITTALS

A. Drawings and Data
   1. Submit a demolition plan for review, describing proposed sequence, methods, and equipment for demolition and disposal of each item or structure prior to any demolition work commencing. Include dust, noise, and odor control measures. Provide inventories of items to be removed.
   2. Provide photographs or videotape, sufficiently detailed, of existing conditions of adjoining structures and site improvements that might be misconstrued as damage caused by selective demolition operations.
   3. Provide product data for any repair materials to Construction Manager prior to use.
   4. The Contractor shall submit a plan to the Construction Manager that describes the hazardous materials work.
   5. Contractor's Demolition Plan shall take into account all geotechnical conditions.

6. Include description of demolition by pipeline if contractor will abandon in place and fill or remove entirely. See requirements in 3.01.C.

B. Certifications
   1. The Contractor shall submit certified copies of all permits, applications and other documentation required by the regulating agency for performance, to completion, of the hazardous materials work. Submit landfill records indicating receipt and acceptance of wastes by a landfill facility licensed to accept these wastes.

C. Record Drawings
   1. Locate, identify, and mark each disconnected service and utility termination point on the project Record Drawings and As-Built Drawings.

1.05 WARRANTY

A. Existing Special Warranty
   1. Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials so as not to void existing warranties.

PART 2 - PRODUCTS

2.01 SERVICE CONDITIONS

A. The Contractor shall provide 72 hours notice to Construction Manager of any activities that will affect the public.

B. The Contractor shall maintain circulation of traffic within area at all times during demolition operations.

2.02 MATERIALS

A. Unless otherwise specified, use repair materials identical to existing materials. Where identical materials are unavailable or cannot be used for exposed surfaces, use materials that visually match adjacent surfaces to the fullest extent possible and whose installed performance equals or surpasses that of existing materials.

B. FLOWABLE FILL FOR ABANDONMENT
   1. Flowable fill for abandonment shall be Type K: CLSM. See 31 23 00 Excavation and Fill.

PART 3 - EXECUTION

3.01 PREPARATION

A. Survey Marker Reference Points
   1. Provide three reference points for each survey marker and monument removed, establish by a registered surveyor in the State of Utah and record locations and designations of survey markers and monuments prior to removal.
   2. Store removed markers and monuments during demolition work, and replace upon completion of work. Reestablish survey markers and monuments in conformance

with recorded reference points. Provide documentation verifying reestablishment of survey markers and monuments, signed by registered surveyor in the State of Utah.

B. Disconnection of Utility Service
   1. CONTRACTOR shall contact “Blue Stakes of Utah 811” before performing Work requiring excavation to remove or abandon existing facilities. Contractor shall be responsible to notify and coordinate with affected utility companies before starting work and comply with their requirements.
   2. Locate, identify and mark each existing service and utility to be disconnected, at the termination points. Arrange with and perform work required by utility companies for discontinuance or interruption of utility services due to demolition work. Obtain permission from utility owner before abandoning or removing any existing structures, materials, equipment and appurtenances. Verify that services and utilities are disconnected and capped prior to beginning demolition.

C. Pipe Abandonment In-Place and Demolition Removal.

For pipelines shown on Contract Drawings, Demolition Plans and identified as abandon:
   1. Abandon In-Place:
      a. Over unpaved areas: Grout and plug ends
      b. Over paved areas: Grout fill entire pipeline and seal
   2. Pipe Demolition Removal
      a. Remove pipe entirely and backfill compact per 31 23 00 Excavation and Fill
      b. Contractor may elect to remove pipes entirely in-lieu of abandonment in place.

D. CUTTING, PLUGGING, CAPPING, AND ABANDONMENT OF PIPING
   1. Do not begin cut, plug, cap, and abandonment operations until replacement process lines have been constructed, tested, and have been approved for use.
   2. Make cut and install Type K: CLSM (typ) or blind flange at locations shown on the Drawings and/or as directed by Owner or Engineer.
   3. Process piping to be abandoned shall not be valved off and shall not be cut, plugged, or capped. other than as shown on the Drawings and/or as directed by Owner or Engineer.
   4. Plug openings in abandoned process piping part of structures, a minimum plug length of 10 feet, to prevent groundwater infiltration.
   5. For abandoned lines beneath paved areas, the entire line underneath paved areas shall be plugged and filled with CLSM or concrete slurry. Fill pipe end with CLSM 8 inches beyond the end of pipe.
   6. For abandoned lines under unpaved areas plug a minimum of 10 ft on both sides.
   7. A blind flange shall be used for abandoned or demolished sections of pressurized process piping where remaining portions are to remain in service. Blind flange material and pressure rating shall be in accordance Section 40 05 01 Piping Systems.
   8. Remove and dispose of surface identifications such as cleanouts. Cleanouts shall be filled with CLSM.
   9. Remove surface identifications and appurtenances such as valve boxes.

10. Collect and dispose of excess flowable fill material utilizing the Concrete Washout Facility in accordance with contractors stormwater pollution prevention plan.

E. Protection

1. Prior to beginning work, provide suitable protection such that the Work shall not hinder or interfere with safe use of adjacent building spaces in any way, for any purpose. Passageways to, from, and between building spaces adjacent to the Work shall be maintained free and clear of obstruction and safe for normal occupancy and intended use at all times. Cap or plug pipes and other conduits abandoned due to demolition as indicated on drawings or as specified.

3.02 PERFORMANCE

A. Carefully remove materials to be reused and salvaged. Such materials shall be suitably cleaned and dismantled, moved to designated storage areas, protected from weathering, staining, construction damage, theft and vandalism, and arranged to facilitate inspection. Carefully handle, assemble, and reinstall materials to be reused, in undamaged and usable condition. Deliver material to be salvaged to the Owner as directed by Construction Manager.

B. Repair or remove items that are damaged. Repair and installation of damaged items shall be at no additional compensation and to condition at least equal to that, which existed prior to start of work. Replace materials that are damaged by the Work with suitable equivalent new materials.

C. Demolition

1. Execute the Work in a careful, orderly manner. Provide and maintain barriers, dust screens, ventilation, and warning lights as may be necessary to protect persons and property. Perform the Work with care, using tools and methods that will not transfer any heavy shocks to adjacent structures. Prevent conditions, obstructions, contamination, vibrations, or disturbances that are hazardous. Conduct the Work in a manner giving prime consideration to, but not necessarily limited by:
   a. Protection of the public, the Owners property, the Work, and of the existing adjacent structures.
   b. Protection for adverse weather.
   c. Control/prevention of unwanted sounds (noise), shocks, vibration, dirt, and dust.
   d. Provision and maintenance of safe and orderly ingress, access and egress to, within and from the Work.
   e. Coordination and cooperation with the Owner through the Construction Manager.
   f. Remove from the project site and legally dispose of the removed materials not reused and salvaged.

D. Partial Demolition

1. Remove all facilities that are scheduled for demolition to their full depth, including foundation slabs and footings, unless otherwise shown or specified for partial demolition.
2. Partial demolition includes those facilities where a portion of a structure is to remain. Partial demolition also includes the removal and disposal of all pipe, pipe hangers, mechanical equipment, equipment supports, structural attachments and supports,

and embedded items from below grade portion of facilities that will be left in place and backfilled. Limits of partial demolition are shown on the Drawings.

3. Partial demolition procedures shall not impair the integrity of the existing structure that is to remain. Where necessary, and where shown, the Contractor shall saw cut or line core drill the existing structure to prevent rupturing or cracking facilities that remain in use.
4. Those structures damaged by the Contractor that are to remain in service shall be repaired to the satisfaction of the Owner at the Contractor's expense.
5. Cut off all pipes, structural attachments, and embedded metal supports that project into the demolition area flush with the wall, floor or ceiling.
6. Remove all pipe hangers, mechanical equipment, mechanical attachments, and supports. Where necessary, empty pipes shall be plugged with fireproof sealant to maintain fire rating for wall.
7. Unless otherwise noted on the drawings where concrete removal occurs, existing reinforcing that is exposed shall be burned off at least 1 inch into the remaining concrete. All holes shall be patched with epoxy concrete to form a smooth wall or floor finish.
8. For floors and walls to be abandoned in place, provide bracing, protection, additional reinforcement, and support in coordination with the final restoration and backfill. Provide drainage relief to structure with penetrations or relief holes within the foundation floors.
9. Structural walls to be demolished or abandoned in place shall be removed entirely to a minimum of 10 feet below finish grade unless otherwise specified on drawings.

E. Debris Removal

1. Remove from the project site and legally dispose of all debris resulting from the Work. Debris shall not be accumulated.
2. Maintain the work areas free of debris and swept broom clean at all times.
3. Provide and maintain readily accessible debris containers, appropriate and suitable for the type of refuse and local work conditions, and as designated and approved by the Construction Manager.
4. Clean each active work area no less than once each workday. Empty each debris container and remove all debris from each active work area no less than once each workday, and more often as necessary to prevent obvious accumulation and hazardous conditions.

F. Salvage

1. Materials, equipment and appurtenances removed, that are not designated for relocation, shall become the property of Contractor and shall be hauled from site and disposed of at no additional cost to the Owner. However, Owner has first right of refusal on all equipment being demolished.
2. Material salvaged from this work shall not be reused, except, where reuse is specifically indicated in the Contract Documents, or when the equipment is to be turned over to the Owner for reuse.
3. Store equipment to be salvaged for relocation where directed by Construction Manager, and protect from the elements and damage during work. Other materials,

equipment and appurtenances removed and designated for salvage by the Owner shall also be stored where directed by the Construction Manager.

END OF SECTION

SECTION 03 11 00

CONCRETE FORMING

PART 1 GENERAL

1.01 DESCRIPTION

A. Formwork requirements for concrete construction.

1.02 QUALITY ASSURANCE

A. References:

1. The references listed below are part of this section. Where a referenced document cites other standards, such standards are included as references under this section as if referenced directly. In the event of conflict, the requirements of this section shall prevail.

Reference	Title
ACI 117	Tolerances for Concrete Construction and Materials
ACI 301	Specifications for Structural Concrete
ACI 318	Building Code Requirements for Structural Concrete
ACI 350	Code Requirements for Environmental Engineering Concrete Structures
ACI 350.5	Specifications for Environmental Concrete Structures
National Institute of Standards - PS1	Construction and Industrial Plywood

B. Design – General:

1. Provide design of formwork, shoring and reshoring systems by the Contractor's Professional Engineer currently registered in the State of Utah.
2. Design, engineering, and construction of formwork, shoring, and reshoring systems is the responsibility of the Contractor.
3. Develop a procedure and schedule for removal of shores (and installation of reshores).
4. Structural record calculations, signed and sealed by the Contractor's Engineer, are required to prove that all portions of the structure, in combination with the remaining forming and shoring systems, have sufficient strength to safely support their own weight plus the loads placed thereon.
5. When developing procedures, schedules, and structural calculations; consider the structural system that exists, effects of imposed loads, and the strength of concrete at each stage of construction.

C. Design Criteria:

1. Design formwork in accordance with ACI 301 and ACI 318 for building structures and ACI 350 and 350.5 for environmental structures to provide concrete finishes as specified in Section 03 30 00.
2. Design systems for full height of wet concrete pressure.
3. Design formwork to limit maximum deflection of form facing materials, as reflected in concrete surfaces exposed to view, to 1/240 of span.

1.03 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. Manufacturer's product data with installation instructions:
      a. Form materials.
      b. Form ties (with waterstops).
      c. Form release compound.
      d. Void forms.

B. Informational Submittals:
   1. Procedures: Section 01 33 00.
   2. Letter of certification:
      a. Stating that formwork has been designed in accordance with this specification and referenced documents, sealed and stamped by the Contractor's registered design Engineer.

PART 2 PRODUCTS

2.01 FORMS

A. Wood Forms:
   1. Provide new and unused exterior grade plywood panels manufactured in accordance with American Plywood Association (APA) and bearing the trademark of that group.
      a. Forms for concrete surfaces exposed to view: use APA High Density Overlay (HDO) Plyform Class I Exterior 48" X 96" X 3/4".
      b. Forms for other concrete surfaces: use APA Douglas Fir B-B Plyform Class I Exterior 48" X 96" X 3/4-inch.
   2. When approved, plywood may be reused.

B. Metal Forms:
   1. Do not use aluminum. Provide forms free of rust and straight without dents to provide members of uniform thickness.

2.02 FORM TIES

A. Commercially fabricated for use in form construction. Fabricated so that ends or end fasteners can be removed without causing spalling at surfaces of the concrete. Cone on ends shall be 3/4 inch to 1 inch diameter. Provide embedded portion of tie not less than 1 1/2 inch from face of concrete after cone ends have been removed. Provide ties with integral waterstops at water-retaining and below grade structures.

B. Tapered through-bolts may be used when approved. Use 1-inch minimum diameter at the smallest end. Fill tapered tie holes after cleaning to produce watertight construction. Use a mechanical waterstop plug near the center of the wall and fill each side with non-shrink cement grout. Mechanical waterstop plug shall be Greenstreak Group, Inc. "X-Plug"; or equal.

2.03 FORM RELEASE COMPOUND

A. Coat form surfaces in contact with concrete using a non-staining, non-residual, water based, bond-breaking form coating. Use NSF approved form release agents in potable water containment structures.

PART 3 EXECUTION

3.01 PREPARATION

A. Cover surface of forms with form release compound prior to form installation in accordance with manufacturer's recommendations.

B. Do not permit excess form coating material to stand in puddles on forms or hardened concrete surfaces against which fresh concrete is to be placed.

C. Clean surfaces of forms, reinforcing steel and other embedded items of accumulated mortar, grout, or other foreign materials from previous concreting or construction activities before concrete is placed.

3.02 FORMWORK CONSTRUCTION

A. Form vertical surfaces of cast-in-place concrete including sides of footings.

B. Construct and place forms so that the resulting concrete will be of the shape, lines, dimensions, and appearance indicated on the Drawings. Brace or tie forms together to maintain position and shape under the load of freshly-placed concrete.

C. Tighten forms to prevent leakage.

D. Provide temporary openings(windows) at base of column and wall forms and at other points where necessary to facilitate cleaning and observation immediately before concrete is placed.

E. Provide temporary openings to limit height of free fall of concrete and to limit the lateral movement of concrete during placement. Openings are required in wall placements greater than 20 feet in height, spaced no more than 8 feet on center measured horizontally and vertically.

F. Place a 3/4-inch chamfer strip at exposed to view corners of formed surfaces.

G. At construction joints, overlap hardened concrete surface by at least 1 inch. Brace forms against hardened concrete to prevent movement, offsets, or loss of mortar at construction joint and to maintain a true surface. Where possible, locate juncture of built-in-place forms at architectural lines, control joints, or at other inconspicuous lines.

H. Where circular sections are formed using flat faced materials, use flat form lengths not exceeding 2 feet wide and the resulting deflection angles at the joints is not greater than 3-1/2 degrees.

I. Construct wood forms for openings to facilitate loosening. Anchor forms so that movement of any part of the formwork system is prevented during concrete placement.

J. At platforms constructed to move equipment over in-place reinforcement, provide beams, struts, and/or legs, supported directly on formwork or other structural members without resting on reinforcing steel.

K. Provide a positive means of adjustment (wedges or jacks) at shores and struts to take up settlement during concrete placement. Brace forms against lateral deflection. Fasten in-place wedges and shims used for final adjustment of forms prior to concrete placement.

L. Place tapered through-bolt form ties with the larger end on the side of the structure in contact with liquid.

3.03 TOLERANCES

A. Install formwork with tolerances in accordance with ACI 117 and the following (the more stringent requirement controls):

1. Install formwork in accordance with manufacturer's written instructions.
2. Vertical surface tolerance from plumb; walls, columns, piers, and risers:
   ± 1/2 inch for entire height
   ± 1/4 inch in any 10 feet of height
3. Vertical surface tolerance from plumb; exposed wall corners, end columns, control-joint grooves, and other exposed to view vertical lines:
   ± 1/2 inch for entire height
   ± 1/4 inch in any 20 feet of height
4. Horizontal variation from level or from grade; top of slabs, slab soffits, ceilings, and beam soffits, measured before removal of supporting shores:
   ± 3/4 inch for entire length
   ± 3/8 inch for any bay or 20 foot length
   ± 1/4 inch in any 10 feet of length
5. Horizontal variation from level or from grade; exposed lintels, sills, parapets, horizontal grooves, and other exposed-to-view horizontal lines:
   ± 1/2 inch for entire length
   ± 1/4 inch in any 20 feet of length.
6. Plan position variation; columns, walls, and partitions:
   ± 3/4 inch for entire length
   ± 3/8 inch for any bay or 20 foot length
7. Plan location and size; sleeves, floor openings, walls, wall openings, beams, and columns:
   ± 1/2 inch
8. Cross sectional dimensions; columns and beams and thickness of slabs and walls:
   ± 3/8 inch
9. Plan dimensions; footings and foundations:
   minus 1/2 inch
   + 2 inches
10. Misplacement or eccentricity; footings and foundations:
    2 percent of footing width in direction of misplacement not more than 2 inches

11. Thickness; footings and foundations:

    minus 5 percent

    no limit on the maximum increase except that which may interfere with other construction.

12. Step variance in flight of stairs:

    Rise $\pm$ 1/16 inch

    Tread from level $\pm$ 1/8 inch

B. Use control points and benchmarks for reference purposes to check tolerances. Establish and maintain reference points in an undisturbed condition until final completion and acceptance of the work.

C. Regardless of tolerances listed, no portion of a structure shall extend beyond the legal boundary of work site.

D. Camber formwork to compensate for anticipated deflections in formwork under wet load of concrete. Adjust camber to maintain above specified tolerances in hardened concrete after forms and shoring are removed.

3.04 REMOVAL OF FORMS

A. Do not impose construction loads or remove shoring from any part of the structure until that portion of the structure in combination with remaining forming and shoring systems has sufficient strength to safely support its weight and loads placed thereon.

B. If forms are loosened and not removed, proceed same day with wet curing operations to soak surfaces of concrete where forms are loosened. When wet curing is not practical or not planned, loosen, remove, and start approved curing procedures on the same day.

C. When required for concrete curing in hot weather, required for repair of surface defects, or when required for finishing at an early age; remove forms as soon as concrete has hardened sufficiently to resist damage from removal operations or lack of support.

D. Remove top forms on sloping surfaces as soon as concrete has attained sufficient stiffness to prevent sagging. Make repairs or finishing treatment on such sloping surfaces immediately after form removal.

E. Remove wood forms for wall openings as soon as this can be accomplished without damage to concrete.

F. Remove formwork from columns, walls, sides of beams, and other parts not supporting weight of concrete as soon as concrete has hardened sufficiently to resist damage from removal.

G. When shores and supports are so arranged such that non-load-carrying form facing material can be removed without loosening or disturbing other shores and supports, facing material may be removed when concrete has sufficiently hardened to resist damage from removal.

H. In all cases, proceed with curing same day as form removal.

I. Where no reshoring is planned, forms and shoring used to support weight of concrete shall be left in place until concrete has attained its specified 28-day compressive strength.

3.05 RESHORING

A. Do not impose construction loads or remove shoring from any part of the structure until that portion of the structure, in combination with remaining forming and shoring systems, has sufficient strength to safely support its weight and loads placed thereon.

B. While reshoring is underway, no superimposed dead or live loads are permitted on the new construction.

C. During reshoring, do not subject concrete in structural members to combined dead and construction loads in excess of loads that the structural members can adequately support.

D. Place reshores as soon as practicable after stripping operations are complete, but in no case later than the end of working day on which stripping occurs.

E. Place reshores to carry their required loads without overstressing.

F. Where a reshoring procedure is planned, supporting formwork may be removed when concrete has reached the concrete strength specified by the formwork engineer's structural calculations and verified by field cured test cylinders or other approved method.

END OF SECTION

SECTION 03 20 00

CONCRETE REINFORCING

PART 1 GENERAL

1.01 DESCRIPTION

A. Section includes: Reinforcing steel for use in reinforced concrete.

1.02 REFERENCES:

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ACI 117	Specification for Tolerances for Concrete Construction and Materials
ACI 315	Details and Detailing of Concrete Reinforcement
ACI 318	Building Code Requirements For Structural Concrete
ACI SP-66	ACI Detailing Manual
ASTM A615	Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement
ASTM A706	Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement
ASTM A775	Epoxy-Coated Steel Reinforcing Bars
ASTM A884	Epoxy-Coated Steel Wire and Welded Wire Reinforcement
ASTM A1064	Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete
AWS D1.4	Structural Welding Code - Reinforcing Steel
CRSI-PRB	Placing Reinforcing Bars
CRSI-MSP	Manual of Standard Practice
FEDSPEC QQ-W-461H	Wire, Steel, Carbon (Round, Bare, and Coated)

1.03 SUBMITTALS

A. Action Submittals
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

4. Mill certificates of mill analysis, tensile, and bend tests for all reinforcing.
5. Manufacturer and type of proprietary reinforcing steel splices. Submit a current ICC Report and manufacturer's literature that contains instructions and recommendations for each type of coupler used.
6. Qualifications of welding operators, welding processes and procedures.
7. Reinforcing steel shop drawings showing reinforcing steel bar quantities, sizes, spacing, dimensions, configurations, locations, mark numbers, lap splice lengths and locations, concrete cover and reinforcing steel supports. Reinforcing steel shop drawings shall be of sufficient detail to permit installation of reinforcing steel without reference to the contract drawings. Shop drawings shall not be prepared by reproducing the plans and details indicated on the contract drawings but shall consist of completely redrawn plans and details as necessary to indicate complete fabrication and installation of reinforcing steel, including large scale drawings at joints detailing bar placement in congested areas. Placement drawings shall be in accordance with ACI 315. Reinforcing details shall be in accordance with ACI SP-66.

1.04 DELIVERY, STORAGE AND HANDLING

A. Ship reinforcing steel to the jobsite with attached plastic or metal tags having permanent mark numbers which match the shop drawing mark numbers. All reinforcing shall be supported and stored above ground. Use only plastic tags secured to the reinforcing steel bars with nylon or plastic tags for epoxy coated reinforcing steel bars.

PART 2 PRODUCTS

2.01 BAR REINFORCEMENT

A. Reinforcing steel bars shall be deformed billet steel in conformance with ASTM A615, Grade 60. Bars to be welded shall be deformed billet steel conforming to ASTM A706. Where specified, reinforcing steel shall be epoxy-coated in conformance with ASTM A775.

B. Reinforcing steel bars in structural elements designated on the design drawings as "concrete shear walls" shall be ASTM A706. ASTM A615 Grade 60 reinforcement may be used if the following requirements are met:
   1. The actual yield strength based on mill tests does not exceed the specified yield strength by more than 18,000 psi.
   2. The ratio of the actual tensile strength to the actual yield strength is not less than 1.25.

C. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

2.02 WIRE FABRIC

A. Wire fabric shall be welded steel mesh conforming to ASTM A1064.

2.03 WIRE AND PLAIN BARS

A. Wire used as reinforcement and bars used as spiral reinforcement in structures shall be cold drawn steel conforming to ASTM A1064.

2.04 SMOOTH DOWEL BARS

A. Smooth dowel bars shall conform to ASTM A615, Grade 60, with a metal end cap at the greased or sliding end to allow longitudinal movement.

2.05 EPOXY COATED BARS

A. Epoxy coated bars shall conform to ASTM A775 and ASTM A884.

B. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

2.06 EPOXY COATED REINFORCING STEEL BAR PATCHING MATERIAL

A. Epoxy coated reinforcing steel bar patching material shall be compatible with coating material, inert in concrete, obtained from manufacturer of the epoxy resin used to coat the reinforcing steel bars and meet the requirements of ASTM A775.

2.07 REINFORCING STEEL MECHANICAL SPLICES

A. Reinforcing steel mechanical splices shall be a positive connecting threaded type mechanical splice system manufactured by Erico, Inc., Dayton Superior, Williams Form Engineering Company, or approved equal.

B. Type 1 mechanical splices shall develop in tension or compression a strength of not less than 125 percent of the ASTM specified minimum yield strength of the reinforcement and shall meet all other ACI 318 requirements. Where splices at the face of wall are shown or approved, form saver-type mechanical couplers may be used. Form-saver couplers shall have integral plates designed to positively connect coupler to formwork. Type 1 mechanical splices are typical except for locations noted below where Type 2 mechanical splices are required.

C. Type 2 mechanical splices shall meet the requirements for a Type 1 mechanical splice, plus develop the ASTM specified tensile strength of the reinforcement. Type 2 mechanical splices shall be provided at locations specifically noted on the design drawings.

2.08 TIE WIRE

A. The wire shall be minimum 16 gage annealed steel conforming to FEDSPEC QQ-W-461H.

2.09 BAR SUPPORTS

A. Bar supports coming into contact with forms shall be CRSI Class 1 plastic protected or Class 2 stainless steel protected and shall be located in accordance with CRSI-MSP and placed in accordance with CRSI-PRB. Plastic coating on legs shall extend at least 0.5-inch upward from form surface.

B. Provide precast concrete blocks, four inches square in plan, with embedded tie wires (wire dobies) as specified by CRSI 1 MSP for footing and slabs on grade. Do not use brick, broken concrete masonry units, spalls, rocks, construction debris, or similar material for supporting reinforcing steel. Precast concrete blocks shall have same or higher compressive strength as specified for concrete in which they are located.

C. Provide stainless steel or plastic protected plain steel supports for other work.

2.10 FABRICATION:

A. Fabricate reinforcing steel bars in accordance with ACI 315 and the following tolerances:
   1. Sheared lengths: +/-1 inch.
   2. Overall dimensions of stirrups, ties, and spirals: +/-1/2 inch.
   3. All other bends: +0 inch, -1/2 inch
   4. Minimum diameter of bends of reinforcing steel bars: Per ACI 318.

PART 3 EXECUTION

3.01 PLACEMENT TOLERANCE

A. Reinforcing steel placement tolerance shall conform to the requirements of ACI 117, ACI 318, and the following:
   1. Reinforcing steel bar clear distance to formed surfaces shall be within +/-1/4 inch of specified clearance and minimum spacing between bars shall be a maximum of 1/4 inch less than specified.
   2. Reinforcing steel top bars in slabs and beams shall be placed +/-1/4 inch of specified depth in members 8 inches deep or less and -1/4", +1/2 inch of specified depth in members greater than 8 inches deep.
   3. Reinforcing steel spacing shall be placed within +/- one bar diameter or +/- 1 inch, whichever is greater.
   4. The minimum clear distance between reinforcing steel bars shall be equal to the greater of 1 inch or the reinforcing steel bar diameter for beams, walls and slabs, and the greater of 1 1/2 inches or 1.5 times the reinforcing steel bar diameter for columns.
   5. Beam and slab reinforcing steel bars shall be threaded through column vertical reinforcing steel bars without displacing the column reinforcing steel bars and still maintain clear distances for beam and slab reinforcing steel bars.

3.02 CONCRETE COVER

A. Unless specified otherwise on the Drawings or in the General Structural Notes, reinforcing steel bar cover shall conform to the following:
   1. Reinforcing steel bar cover shall be 3 inches for concrete cast against earth.
   2. Reinforcing steel bar cover shall be 2 inches for reinforcing steel bars for formed concrete surfaces exposed to earth and weather.
   3. Reinforcing steel bar cover shall be 2 inches for any formed surfaces exposed to or above any liquid.
   4. Reinforcing steel bar cover shall be 1 ½ inches for reinforcing not in the above categories unless noted otherwise on the design drawings.

3.03 SPLICING

A. Reinforcing steel splicing shall conform to the following:
   1. Use Class B splice lengths in accordance with ACI 318 for all reinforcing steel bars unless shown otherwise on the drawings.
   2. For welded wire fabric the splice lap length measured between the outermost cross wires of each fabric sheet shall not be less than one spacing of cross wires plus 2 inches, nor less than 1.5 times the development length nor less than 6 inches.
   3. Splices of reinforcement steel bars not specifically indicated or specified shall be subject to the approval of the Owner's Representative. Mechanical proprietary splice connections may be used when approved by the Owner's Representative or as indicated on the drawings.
   4. Welding of reinforcing steel bars is not allowed unless approved by the Owner's Representative.

3.04 CLEANING

A. Reinforcing steel bars at time of concrete placement shall be free of mud, oil, loose rust, or other materials that may affect or reduce bond. Reinforcing steel bars with rust, mill scale or a combination of both may be accepted without cleaning or brushing provided dimensions and weights including heights of deformation on a cleaned sample are not less than required by applicable ASTM standards.

3.05 PLACEMENT

A. Reinforcing steel bar placement shall conform to the following:
   1. Uncoated reinforcing steel bars shall be supported and fastened together to prevent displacement by construction loads or concrete placement. For concrete placed on ground, furnish concrete block supports or metal bar supports with non-metallic bottom plates. For concrete placed against forms furnish plastic or plastic coated metal chairs, runners, bolsters, spacers and hangers for the reinforcing steel bar support. Only tips in contact with the forms require a plastic coating.
   2. Fasten coated reinforcing steel bars together to prevent displacement. Use plastic or nylon ties to hold the coated reinforcing steel bars rigidly in place. Support coated reinforcing steel bars with plastic or plastic coated chairs, runners, bolsters, spacers and supports as required.
   3. Support reinforcing steel bars over cardboard void forms by means of concrete supports which will not puncture or damage the void forms nor impair the strength of the concrete member.
   4. Where parallel horizontal reinforcement in beams is indicated to be placed in two or more layers, reinforcing steel bars in the upper layers shall be placed directly over the reinforcing steel bars in the bottom layer with the clear distance between each layer to be 2 inches unless otherwise noted on the Drawings. Place spacer reinforcing steel bars at a maximum of 3'-0" on center to maintain the minimum clear spacing between layers.
   5. Extend reinforcement to within 2 inches of formed edges and 3 inches of the concrete perimeter when concrete is placed against earth.
   6. Reinforcing steel bars shall not be bent after embedding in hardened concrete unless approved by the Owner's Representative.

7. Tack welding or bending reinforcing steel bars by means of heat is prohibited.
8. Where required by the contract documents, reinforcing steel bars shall be embedded into the hardened concrete utilizing an adhesive anchoring system specifically manufactured for that application. Installation shall be per the manufacturer's written instructions.
9. Bars with kinks or with bends not shown shall not be used.
10. Heating or welding bars shall be performed in accordance with AWS D1.4 and shall only be permitted where specified or approved by the Owner's Representative. Bars shall not be welded at the bend.

3.06 REPAIR OF EPOXY COATING

A. Epoxy coating damage need not be repaired in cases where the damaged area is 0.1 square inch or smaller. Repair all damaged areas larger than 0.1 square inch in conformance with ASTM A775.

3.07 FIELD QUALITY CONTROL

A. Field quality control shall include the following:
   1. Notify the Owner's Representative whenever the specified clearances between the reinforcing steel bars cannot be met. The concrete shall not be placed until the Contractor submits a solution to the congestion problem and it has been approved by the Owner's Representative.
   2. The reinforcing steel bars may be moved as necessary to avoid other reinforcing steel bars, conduits or other embedded items provided the tolerance does not exceed that specified in this section. The Engineer's approval of the modified reinforcing steel arrangement is required where the specified tolerance is exceeded. No cutting of the reinforcing steel bars shall be done without written approval of the Owner's Representative.
   3. Coated reinforcing steel bars will be inspected on the jobsite for handling defects, coating abrasion, coating thickness and continuity of coating. The Owner's Representative may defer final inspection of the coated reinforcing steel bars until bar erection and handling is complete. Repair coated areas as directed by the Owner's Representative and completed prior to concrete placement.
   4. An independent laboratory shall be employed to review and approve Contractor welding procedures and qualify welders in accordance with AWS D1.4. The laboratory shall visually inspect each weld for visible defects and conduct non-destructive field testing (radiographic or magnetic particle) on not less than one sample for each 10 welds. If a defective weld is found, the previous 5 welds by the same welder shall also be tested.

END OF SECTION

SECTION 03 30 00

CAST-IN-PLACE CONCRETE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Cast-in-place concrete, which consists of providing material, mixing, transporting equipment, and labor for the proportioning, mixing, transporting, placing, consolidating, finishing, curing, and protection of concrete in the structure.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related specification sections. Additional related sections may apply that are not specifically listed below.
   1. Section 03 60 00 Grouting
   2. Section 03 70 00 Mass Concrete
   3. Section 05 50 00 Metal Fabrications
   4. Section 07 91 26 Joint Fillers
   5. Section 07 92 00 Joint Sealants
   6. Section 09 90 00 Painting and Coating

1.03 REFERENCES:

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

1.04 SUBMITTALS

A. Action Submittals:

1. Procedures: Section 01 33 00.
2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.

3. Check-marks (✓) denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined signify compliance with the specification. Include a detailed, written justification for each deviation. Failure to include a copy of this marked-up specification section, along with justification(s) for requested deviations, with the submittal, is cause for rejection of the entire submittal with no further consideration.
4. Each proposed mix design showing:
    a. Expected strength at 7 and 28-days
    b. Slump, before and after introduction of high-range water-reducing admixture
    c. Water/cement ratio
    d. Weights and test results, certifications, and mill reports of the ingredients
    e. Chemical analysis report and report of other specified test analyses for supplementary cementitious material
    f. Aggregate gradation and documentation of test results classifying aggregate as non-potentially reactive
    g. Test results of mix design prepared by an independent testing laboratory
    h. Shrinkage test results for liquid containing structures
    i. Other physical properties necessary to review each mix design for conformance with these specifications
5. Mix designs proposed shall be sealed by a Professional Engineer registered in the state where the project is located. Mix designer shall be certified as NRMCA Concrete Technologist Level 2 or DOT certified mix designer in jurisdiction of Work.
6. Product literature and technical data for aggregates, cement, and pozzolan.
7. Product literature, technical data, and dosage of proposed admixtures including, but not limited to, air entraining, water reducing, retarding, shrinkage reducing, crystalline waterproofing, etc.
8. Anticipated average delivery time from batch plant to site. If this time exceeds the limit specified in Part 3, include proposed method to extend set time without deleterious effects on final product. Owner's Representative reserves the right to accept or reject such proposed methods.
9. Lift Drawings: Submit shop drawings for concrete placements on the project before on-site construction begins. The drawings shall be organized by structure and submitted as a complete set for the Engineer's review. The drawings shall be drawn to scale and show dimensions, forming details, and placement volumes. Show location of construction joints, details of surface preparation, scheduled finish, embedments (including conduits, inserts, and anchor bolts), penetrations (including pipe sleeves), openings, keyways, blockouts, bulkheads, etc. The drawings shall clearly show the placement sequence and will be accompanied by a schedule that shows the schedule dates for forming, placement, and stripping for each section of concrete placed within each structure.
10. Curing program description in sufficient detail to demonstrate that the Contractor will provide acceptable strength, finish, and crack control within the completed structure. Detailed plan for curing and protection of concrete in cold and hot weather.
11. Product literature and technical data for waterstops, curing and sealing compounds, bonding compounds, surface hardeners, epoxy and chemical grout for crack injection, retardant, bearing pads, and trench drains.

12. Sample panels at least 12-inches by 12-inches by three inches thick to demonstrate formed wall surface finishes as specified in Part 3.
13. Samples of concrete floor and slab for each finish specified in Part 3 approximately four feet square and a minimum of four inches thick, with one construction joint and one expansion joint, if used.
14. Concrete delivery truck tickets showing the information listed in ASTM C94, section 14.
15. Neoprene bearing pad sample, 4 inches x 4 inches; material data sheets verifying conformance with specification; shop drawing of each bearing pad showing splice locations, if any, and description of manufacturing and splice procedure.
16. Product data for prefabricated trench drains: material properties, cover, dimensions, and manufacturer's installation instructions.
17. Product data for floor type pressure relief valves.

1.05 QUALITY ASSURANCE

A. Quality Control By Owner:
   1. Special Inspection of concrete work shall be performed by the Special Inspector under contract with the Owner and in conformance with the IBC Chapter 17. Special Inspection of concrete is in addition to, not replacing, other inspections and quality control requirements specified herein. Where sampling and testing specified herein conforms to Special Inspection standards, such sampling and testing need not be duplicated.
   2. All structural concrete work shall receive Special Inspection in accordance with IBC Chapter 17. Structural concrete includes elements which resist code-defined loads and whose failure would impact life safety. Non-structural site work concrete does not require Special Inspection. Anchor bolts and anchors installed in hardened concrete require Special Inspection.
   3. Refer to Section 01 45 23 Testing and Inspection Services for Owner provided testing.

B. Quality Control By Contractor:
   1. Where required to demonstrate conformance with the specified requirements for cast-in-place concrete, the Contractor shall provide the services of an independent testing laboratory which complies with the requirements of ASTM E329 and ASTM C1077. The testing laboratory shall sample and test concrete materials as specified in this section. Costs of testing laboratory services shall be borne by the Contractor.
   2. Concrete testing laboratory personnel shall be certified in accordance with the ACI Concrete Laboratory Testing Technician – Level 1 Certification Program or the ACI Concrete Strength Testing Technician Certification Program, or an equivalent program.
   3. Refer to Section 01 45 00 Contractor Quality Control.

C. Basis For Quality:
   1. Cast-in-place concrete shall conform to the requirements of ACI 301, except as modified herein.

D. Concrete Conference
    1. Contractor shall schedule and conduct a meeting to review the specification requirements and the proposed concrete design mixes, including procedures for producing proper concrete construction. Hold the meeting no later than 28 days after the Notice to Proceed.
    2. All parties involved in the concrete work shall be included to attend the conference, including the following: Contractor's representative, testing laboratory, concrete subcontractor, concrete supplier, reinforcing steel subcontractor, Owner's Representative, and Engineer.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Cement:
    1. Store cement bags immediately upon receipt in a weatherproof structure as airtight as practicable. Elevate floor above ground to prevent absorption of moisture. Stack bags close together to reduce circulation of air but do not stack against outside walls. Stack to permit easy access for inspection and identification of each shipment.
    2. Transfer bulk cement to elevated airtight and weatherproof bins. At the time of use, cement shall be free flowing and free of lumps. Do not use cement which has been in storage longer than 6 months.

B. Aggregates:
    1. Store aggregates on areas covered with tightly laid wood planks, sheet metal, or other hard and clean surfaces in a manner that will preclude the inclusion of foreign material. Store aggregates of different sizes in separate piles. Build stock piles of coarse aggregate in horizontal layers exceeding 4 feet in depth to minimize segregation. Remix segregated aggregates to conform to the grading requirements.

C. Admixtures:
    1. Store admixtures to prevent damage. Do not use air-entraining admixture which has been in storage for longer than 6 months or has been frozen.

D. Pozzolan:
    1. Deliver and store pozzolan in the same manner as cement.

PART 2 PRODUCTS

2.01 MATERIALS

A. Cement:
    1. Portland cement shall be ASTM C150, Type II or Type V, low alkali, containing less than 0.60 percent alkalis. In addition to standard requirements, cement shall satisfy optional chemical and physical requirements of ASTM C150, Tables 2 and 4, respectively.
    2. If low alkali portland cement is not available, test results shall be submitted showing aggregates meet the alkali-silica reactivity criteria in 2.01.D.1.b below.
    3. Blended Hydraulic Portland- cement shall be ASTM C595, Type IL (MS).
    4. Portland blast-furnace slag cement shall be ASTM C595, Type IS (<70) (MS), interground, low alkali.

5. Hydraulic cements meeting the performance specifications of ASTM C1157 are not permitted.
6. Use cementitious materials that are of the same brand and type and from the same plant of manufacture as the cementitious materials used in the concrete represented by the submitted field test records or used in the trial mixtures. See Change of Materials paragraph below.

B. Ground granulated blast-furnace slag (GGBFS), if used in conjunction with portland cement, shall be per ASTM C989, Grade 100 or Grade 120, limited to 50 percent of the weight of cementitious materials. If GGBFS is combined with pozzolans and/or silica fume, the total weight of GGBFS, pozzolans, and silica fume shall not exceed 50 percent of the weight of cementitious materials.

C. Silica fume, if used in conjunction with portland cement, shall be per ASTM C1240, limited to 10 percent of the weight of cementitious materials. Silica fume shall be used with a high-range water-reducing admixture.

D. Aggregates:
   1. General:
      a. Except as modified herein, fine and coarse aggregates shall conform to ASTM C33. Fine and coarse aggregates are regarded as separate ingredients. Aggregates shall be non-reactive and washed before use.
      b. Check aggregates for alkali-silica reactivity to meet the following criteria. Aggregates or combinations of cementitious materials and aggregates shall have less than 0.10% expansion at 16 days when tested in accordance with ASTM C1260 or ASTM C1567. Alternatively, aggregate tested independently in accordance with ASTM C1293 shall have less than 0.04% expansion at one-year, or combinations of aggregate and cementitious materials tested in accordance with ASTM C1293 shall have less than 0.04% expansion at two years. Test results shall be no older than two years.
      c. Tests for size and grading of fine and coarse aggregates shall be in accordance with ASTM C136. Combined aggregates shall be well and uniformly graded from coarse to fine sizes to produce a concrete that has optimum workability and consolidation characteristics. Establish the final combined aggregate gradation during mix design.
      d. Aggregates used in the project production concrete shall be obtained from the same sources and have the same size ranges as the aggregates used in the concrete represented by the submitted historical data or trial mixtures. See Change of Materials paragraph below.
   2. Fine Aggregate:
      a. Fine aggregate shall be hard, dense, durable particles of either sand or crushed stone regularly graded from coarse to fine. Gradation shall conform to ASTM C33. For classes of concrete which will be used in liquid retaining structures, fine aggregate shall not exceed 40 percent by weight of combined aggregate total, except for concrete with coarse aggregate of less than maximum size 1/2 inch.

b. Variations from the specified gradations in individual tests will be acceptable if the average of three consecutive tests is within the specified limits and the variation is within the permissible variation listed below:

U.S. standard sieve size	Permissible variation in individual tests, percent
30 and coarser	2
50 and finer	0.5

c. Other tests shall be in accordance with the following specifications:

Test	Test method	Requirements
Amount of material	ASTM C117	3 percent passing No. 200 sieve maximum by weight
Sand equivalent	ASTM D2419	Minimum 70 percent

3. Coarse Aggregate:
   a. Coarse aggregate shall be hard, dense and durable gravel or crushed rock free from injurious amounts of soft and friable particles, alkali, and organic matter. Other deleterious substances shall not exceed the limits listed in ASTM C33, Table 4 for Class Designation 4S. Gradation of each coarse aggregate size specified shall conform to ASTM C33, Table 3.
   b. Variations from the specified gradations will be acceptable in individual tests if the average of three consecutive tests is within the specified limits.

E. Pozzolan:
   1. Pozzolan shall be Class F fly ash conforming to ASTM C618. Class C fly ash is not allowed. Pozzolan supplied during the life of the project shall have been formed at the same single source. See Change of Materials paragraph below.
   2. The pozzolan color shall not substantially alter the resulting concrete from the normal gray color and appearance.
   3. Use pozzolan materials that are of the same brand and type and from the same plant of manufacture as the materials used in the concrete represented by the submitted field test records or used in the trial mixtures.
   4. The loss on ingnitition shall be a maximum of four percent.
   5. The maximum percent of sulfur trioxide (SO3) shall be 4.0

F. Admixtures:
   1. General:
      a. Admixtures shall be compatible with the concrete and with each other. Calcium chloride or admixtures containing calcium chloride are not acceptable. Use admixtures in accordance with the manufacturer's recommendations and add separately to the concrete mix. Water reducing retarders and admixtures shall reduce the water required by at least 11 percent for a given concrete consistency and shall comply with the water/cement ratio standards of ACI 211.1. Retarder dosage shall result in set time consistent with requirements specified in Part 3.
   2. Water Reducing Admixtures:
      a. Conform to ASTM C494, Type A. Acceptable products include: BASF Corporation “MasterPozzolith Series”; SIKA Chemical Corp. “Plastocrete 161”; Euclid Chemical Co. “Eucon WR 91”; or approved equal.

3. Water Reducing and Retarding Admixtures:
    a. Conform to ASTM C494, Type D. Acceptable products include: BASF Corporation "MasterSet R Series"; Sika Chemical Corp. "Plastiment"; Euclid Chemical Co. "Eucon Retarder 75"; or approved equal.
4. High Range Water Reducing (Superplasticizing) Admixtures:
    a. Conform to ASTM C494, Type F. Acceptable products include: BASF Corporation "MasterGlenium" Series; Sika Chemical Corp. "Viscocrete 2100" or "Viscocrete 2110" (Hot Weather) or "Viscocrete 6100" (Cold Weather); Euclid Chemical Co. "Eucon 37"; GCP Applied Technologies "ADVA 195"; or approved equal.
5. High Range Water Reducing And Retarding Admixtures:
    a. Conform to ASTM C494, Type G. Acceptable products include: GCP Applied Technologies "Daracem 100"; Sika Chemical Corp. "Sikaplast 200" ; Euclid Chemical Co. "Eucon 537"; or approved equal.
6. Air Entraining Agent:
    a. Conform to ASTM C260 and produce air entrained concrete as specified in the Mix Proportioning table below. Acceptable products include: BASF Corporation "MasterAir Series"; Sika Chemical Corp. "Sika AEA-14" or "Sika AIR" ; Euclid Chemical Co. "Eucon AEA-92"; or approved equal.
7. Shrinkage Reducing Admixture:
    a. Select admixture for compatibility with air entrainment admixture and other ingredients in the concrete mix. Acceptable products include: BASF Corporation "MasterLife SRA Series"; GCP Applied Technologies "Eclipse 4500"; or approved equal.
8. Crystalline Waterproofing Admixture:
    a. Select admixture for compatibility with other ingredients in the concrete mix. Acceptable products include: Penetron International "PENETRON ADMIX SB", Xypex "Admix C-Series", Kryton "Krystol Internal Membrane (KIM)", BASF Corporation "MasterLife 300D", or approved equal.
9. Corrosion Inhibiting Admixture:
    a. Select admixture for compatibility with other ingredients in the concrete mix. Acceptable products include: BASF "MasterLife CI 222", GCP Applied Technologies "DCI S", or approved equal.

G. Water:
1. For washing aggregate, mixing, and for curing shall be free from oil and deleterious amounts of acids, alkalis, and organic materials; comply with the requirements of ASTM C1602. Additionally, water used for curing shall not contain an amount of impurities sufficient to discolor the concrete.

H. Change of Materials:
1. After each concrete mix design is approved, no changes of any sort or source will be allowed without prior written approval from the Engineer. When brand, type, size, or source of cementitious materials, aggregates, water, ice, or admixtures are proposed to be changed, new field data, data from new trial mixtures, or evidence that indicates that the change will not affect adversely the relevant properties of the concrete shall be submitted for approval by the Engineer before use in concrete.

2.02 CONCRETE CHARACTERISTICS

A. Mix Proportioning:

1. Concrete shall be normal weight concrete composed of cement, pozzolan, admixtures, aggregates, and water; proportioned and mixed to produce a workable, strong, dense, and impermeable concrete. It is acceptable to substitute interground Portland-pozzolan cement conforming to ASTM C595, containing the specified amount of pozzolan in lieu of Portland cement and pozzolan. Water-cementitious material (w/cm) ratio is based on the combined contents of cement and pozzolan.
2. Add crystalline waterproofing admixture to Class C-1 concrete used for liquid containing structures and below-grade walls and slabs which are common with rooms, tunnels, and galleries to be occupied by equipment, piping, conduit, or personnel. Dosage rates in accordance with manufacturer's recommendations.
3. Add corrosion inhibiting admixture to Class A, C-1, and C-2 mixes.
4. Provide concrete mix designs in accordance with the following guidelines:

Concrete class	Minimum[a] 28-day compressive strength, psi	ASTM coarse aggregate size	Maximum water-cementitious materials (w/cm) ratio	Minimum cementitious materials content (pounds/CY)	Pozzolan, percent by weight of cementitious materials	Air content (percent)	Slump range[f] (inches)
A	4000[b]	467	0.42	515	20-35	4-6	3-5
B	3000	57 or 67	0.45	560	15-25[d]	4-6	3-5
C-1	4500	57 or 67	0.40	560	15-25	4-6	3-5
C-2	5000	57 or 67	0.40	560	15-25[d]	4-6	3-5
C-3	5000[g]	57 or 67	0.40	560	15-25[d]	4-6	3-5
D-1	4000	8	0.42	600	15-25[d]	4-6	3-5
D-2	5000	8	0.40	600	15-25	4-6	3-5
E[c]	2000	57	--	-	15-25[d]	Not Required	4-8
F	500[e]	-	--		15-25[d]	Not Required	4-8

[a] *Determine compressive strength at the end of 28 days based on test cylinders made and tested in accordance with ASTM C39.*

[b] *Compressive strength of Class A concrete may be determined at 56 days.*

[c] *Concrete encasement for electrical conduit shall contain 3 pounds of red oxide per sack of cement.*

[d] *Pozzolan use is optional for this class of concrete.*

[e] *Minimum 28-day compressive strength shall be 500 psi and maximum 28-day compressive strength shall be 1,000 psi.*

[f] *Slump before addition of high range water reducing admixture (superplasticizer). Maximum slump after addition of high range water reducing admixture shall be 8".*

[g] *.4500psi may be used for starter courses at class C-1 walls.*

B. Use:

1. Provide concrete by class for the uses listed below.

Concrete class	Type of use
A	Concrete greater than 36 inches thick See Section 03 70 00 for additional requirements
B	Non-structural concrete (sidewalks, curbs, pavers, etc.)
C-1	Typical cast-in-place structural concrete
C-2	Liquid-containing concrete
D-1	Topping concrete, flume interstitial "grout", and 2" concrete topping at clarifiers
D-2	Wall starter course
E[a]	Pipe bedding and encasement, electrical conduit encasement (duct banks) and concrete fill
F	Encasement of reinforcement extension for future construction

[a] *Contractor's option to use the same concrete mix for pipe encasement as the concrete slab above.*

C. Control Tests:

1. General:
   a. Select and adjust proportions of ingredients in accordance with ACI 211.1. Verification of mix characteristics for submittal may be achieved using either the Trial Mix Design method or Field Experience Data method. Do not place concrete prior to submittal and acceptance of proposed mix.
2. Trial Mix Design:
   a. Mixes verified by this method shall have the samples produced for testing, manufactured at the batch plant which will supply concrete to the project, using materials proposed for the Work and material combinations listed above. Testing, data, and reporting shall conform to ACI 318 and the following:
      1) Required compressive strength used as the basis for selecting concrete proportions (f'cr) shall be the specified concrete strength (f'c) + 1000 psi for specified concrete strengths less than 3,000 psi and f'c + 1200 psi for specified concrete strengths between 3000 psi and 5000 psi.
      2) Make at least three different trial mixtures for each class of concrete qualified by the Trial Mix Design. Each trial mixture shall have a different w/cm ratio or different cementitious materials content that will produce a range of compressive strengths encompassing f'cr.
      3) Design trial mixtures to produce a slump within ¾ inch of the maximum specified and an air content within 0.5 percent of the maximum specified.
      4) For each w/cm ratio or cementitious materials content, cast and cure at least twelve standard test cylinders in accordance with ASTM C192. Four cylinders from each batch tested at age 7-days, 14-days, and 28-days or as required to comply with ACI 318.
      5) From results of the cylinder tests, plot a curve showing the relationship between w/cm ratio and compressive strength.

6) From the curve of w/cm ratio versus compressive strength, select the w/cm ratio that will produce f'cr. This is the maximum w/cm ratio to be used unless a lower w/cm ratio is specified above.

3. Field Experience Data:
   a. When sufficient test data for a particular mix design is available which is identical or substantially similar to that proposed for use, Contractor may substitute use of this data in lieu of a trial mix design. Field data, reports, and analysis shall conform to ACI 318, except as modified herein.
      1) Historical mix design proportions for which data are submitted may vary from the specified mix within the following limits:
      a) f'c as specified or up to 500 psi above
      b) w/cm ratio as specified or lower
      c) pozzolan content within 5 percent of that specified
      d) maximum coarse aggregate size may not vary smaller, but gradation of coarse aggregate may vary
      e) slump after introduction of admixtures +0/-1 inch.
   b. Use of historical Field Experience Data does not allow modification of the project mix specifications herein without review and acceptance by the Engineer.
4. Shrinkage:
   a. Liquid containing structures using Class C-1 concrete mix are intended to be watertight. Provide test results for Class C-1 concrete mix meeting the following requirement: drying shrinkage limit of 0.038 percent in the laboratory at 35-days (7-days moist cure and 28-days drying) as tested in accordance with ASTM C157 and the following modifications:
      1) Wet cure specimens for a period of 7-days (including the period of time the specimens are in the mold). Wet cure may be achieved either through storage in a moist cabinet or room in accordance with ASTM C 511, or through storage in lime saturated water.
      2) Slump of concrete for testing shall match job requirements and need not be limited to restrictions as stated in ASTM C 157 section 8.4.
      3) Report results in accordance with ASTM C 157 at 0, 7, 14 & 28-days of drying.
   b. Concrete shall not be placed in the field prior to acceptance of the concrete mix. To meet the drying shrinkage limit, it is recommended that a shrinkage reducing admixture be considered for use in concrete for liquid containing structures.

2.03 WATERSTOPS

A. Polyvinyl Chloride (PVC):
   1. Manufacture PVC waterstops from virgin polyvinyl chloride conforming to the Corps of Engineers Specification No. CRD-C572.
   2. Use 6-inch by 3/8-inch ribbed flat ribbed with center bulb waterstop in construction joints. Acceptable products include: Greenstreak Group, Inc. "Model 705"; Vinylex Waterstops and Accessories "Model RB6-38; or approved equal.
   3. Use 9 inch by 3/8-inch ribbed with center bulb waterstop in expansion joints. Acceptable products include: Greenstreak Group, Inc. "Model 696"; Vinylex Waterstops and Accessories Model "RLB9-38"; or approved equal.

4. Use molded crosses, tees, and other shapes for changes of direction, intersections, and transitions as recommended by manufacturer.

B. hermoplastic:
   1. Acceptable products include: Greenstreak Group, Inc. “Westec Envirostop TPE-R”; Vinylex Waterstops and Accessories “Petro Stop”; or approved equal of similar profiles to above specified PVC waterstops.

C. Retro-Fit:
   1. Use “Tee” or “L” shape as indicated with epoxy adhesive, stainless steel batten strips, and stainless steel adhesive anchors. Acceptable products include: Greenstreak Group, Inc Model “667” or approved equal.

D. Expanding (Hydrophilic) Waterstops:
   1. Bentonite-free, made from unvulcanized rubber. Acceptable products include: Adeka Corporation “Ultra Seal MC-2010MN with P-201 adhesive/sealant”; Greenstreak Group, Inc. “Hydrotite CJ-1020-2K with Leakmaster LV-1 adhesive/sealant”; or approved equal. These are allowable for use only where indicated on the drawings or accepted in writing by Engineer. Provide adhesive/sealant approved by manufacturer plus concrete nails and fender washers to secure waterstop material in-place during concrete placement. The waterstop MUST be placed between two mats or curtains of steel reinforcementwith minimum 3-inches concrete cover.
   2. For limited cover applications or where only one mat or curtain of reinforcement is present, use Adeka Corporation “Ultra Seal KBA-1510FP”or approved equal.

E. Non-expanding Waterstops:
   1. Acceptable products include: Henry Company “SF302 Synko-Flex Waterstop with primer” or approved equal.

F. Chemical Grout Injected Tube:
   1. Acceptable products include: De Neef Construction Chemicals “Injecto System” or approved equal.

2.04 SEALANTS AND JOINT FILLERS

A. Sealants and preformed joint fillers are specified in Sections 07 92 00 and 07 91 26.

2.05 BONDING COMPOUNDS

A. Epoxy resin bonding compounds for use in wet areas shall conform to ASTM C881 Types IV or V, Class A, B, or C depending on temperature at use. Acceptable products include: BASF Corporation “MasterEmaco ADH 327RS”; Sika Chemical Corporation “Sikadur 32”; or approved equal.

B. Non-epoxy bonding compounds for use in dry areas for non-structural bonding or as noted on the drawings shall conform to ASTM C1059 Type II. Acceptable products include: Penetron Specialty Products “Acrylic Bondcrete”; ChemMasters “Cretelox”; or approved equal.

C. Apply bonding compounds in accordance with the manufacturer’s instructions.

2.06 EPOXY FOR CRACK INJECTION

A. Use a two-component, moisture insensitive, high modulus, injection grade, 100 percent solids, epoxy-resin blend. Consistency as required to achieve complete penetration into cracks. Material shall conform to ASTM C881 Type 1 Grade 1. Acceptable products include: Sika Corporation “Sikadur 52”; Adhesives Technology Corporation “Crackbond SLV302”; or approved equal.

B. Use epoxy injection for structural crack repairs except as noted below for non-structural cracks in liquid-containing concrete structures. The Engineer shall determine whether a crack is classified as structural or non-structural.

2.07 CHEMICAL GROUT FOR CRACK INJECTION

A. Use hydrophobic polyurethane grout at the Engineer's discretion as an alternative for sealing non-structural cracks in concrete structures intended to be watertight. Acceptable products for sealing hairline cracks include: GCP Applied Technologies "DE NEEF Flex SLV PURe” (must be used with DE NEEF Flex Cat PURe); or Sika Corporation “SikaFix HH LV” as appropriate for crack width; or approved equal. Coordinate with product supplier to verify and select appropriate product for crack widths to be injected.

2.08 SURFACE RETARDANT

A. Retardant for exposing aggregate for unformed surfaces in construction joints shall be Sika Corporation“Rugasol-S”; GCP Applied Technologies “Top-Cast”; or approved equal.

B. Apply retardant in accordance with manufacturer’s instructions sufficient to assure a minimum penetration of 1/4 inch.

2.09 SURFACE HARDENER

A. Moderate Duty Hardener:
   1. Use a premixed, non-colored, and non-metallic hardener. Acceptable products include: BASF Corporation “MasterTop 100”; or approved equal.
   2. Apply hardener in accordance with manufacturer’s instructions, in an amount of at least 0.75 pounds per square foot for commercial, light duty traffic and 1.25 pounds per square foot for heavy duty traffic and process spaces. Product and/or application procedure shall be coordinated with air content of concrete being placed.

B. Heavy Duty Hardener:
   1. Use an emery aggregate dry shake applied during slab finishing. Acceptable products include: L&M Construction Chemicals “Emeryplate FF”; or approved equal.
   2. Apply in accordance with manufacturer’s recommendations at a minimum rate of 1.5 pounds per square foot; adjust for the specific floor traffic and use anticipated. Product and/or application procedure shall be coordinated with air content of concrete being placed.

C. Hardener For Existing Concrete:
   1. Use an alkaline siliconate solution to harden, densify, and seal the surface. Acceptable products include: L&M Construction Chemicals “Seal Hard”; or approved equal.

2. Proposed product shall be approved by Owner after review of similar floors so-treated for at least 2 years.

2.10 CURING AND SEALING COMPOUNDS

A. Acceptable products include: BASF Corporation “MasterKure CC 250SB”; Dayton Superior “Cure & Seal 25% J22UV”; or approved equal, conforming to ASTM C1315.

B. Compound shall be clear and applied in accordance with the manufacturer’s instructions.

C. Curing and sealing compound shall be certified compliant with final finish system if applicable, including compatibility with floor hardeners in areas where floor hardeners are specified to be used.

D. Acceptable products include: Atlas Tech Products “Atlas Quantum-Cure 61”; or approved equal certified to conform to NSF/ANSI Standard 61.

E. Compound shall be clear and applied in accordance with the manufacturer’s instructions.

F. Curing compounds shall be certified compliant with final finish system if applicable, including compatibility with floor hardeners in areas where floor hardeners are specified to be used.

2.11 FLOOR TYPE PRESSURE RELIEF VALVES

A. Where indicated on design drawings, floor type hydrostatic pressure relief valves shall be provided for installation in the bottom slab of reinforced concrete liquid containing tanks to limit groundwater uplift pressure.

B. Size of valve: 6 inch inside diameter; length to suit slab thickness, provide PVC extension as required. Valve shall start to open under a minimum hydrostatic head of 9 inches.

C. The valve assembly shall consist of three parts: cover, body and grate. All three parts shall be of cast iron conforming to ASTM A126. The cover or the grate shall not become separated from the body of the valve due to groundwater pressure around the tank.

D. Both cover and grate must be removable for valve inspection by turning left or right to free them from integrally cast locking lugs on the inside of the valve body.

E. Valve seats shall be of BUNA-N rubber, bonded to the cover, mating with a machined bronze seat in the body.

F. Valve shall have an integrally cast seepage ring around the outside of the body.

G. Acceptable products include: Clow Valve Company “F-1493-T; Neenah Foundry Company “No. R-5001-1 Type A; Troy Valve “No. A2550RSN”, or equal.

2.12 TRENCH DRAINS

A. Use either field formed and cast with grate and frame, or utilize a pre-engineered manufactured trench drain system that conforms to the design load requirements of AASHTO H-20 in traffic areas or 300 pounds per square foot elsewhere. Include the following minimum requirements:
   1. A round or V-bottom channel, sloped to a minimum of 1/16-inch per foot. See drawings for channel cross section or size. If not shown, use 12 inches wide and deep (nominal) and confirm with Owner's Representative.
   2. Aluminum grating frame with anchors at 45 degrees into the surrounding concrete. Coat aluminum to prevent direct concrete contact.
   3. Aluminum grate conforming to Federal Specification RR-F-621C.
   4. A locking device which directly connects the grate to the frame.

B. Candidate manufacturers include: MultiDrain Systems, Atlanta, Georgia; ABT, Inc., Troutman, North Carolina; or approved equal.

2.13 NEOPRENE BEARING, SEAL PADS, AND RODS

A. Use 100 percent chloroprene (neoprene), 50 Durometer A, conforming to AASHTO Standard Specifications for Highway Bridges. Pads and rods shall conform to geometry as shown on the drawings. Products shall be one-piece as manufactured, or factory spliced; using a process proven gas-tight in repeated similar applications. Do not use glues and adhesives to bond pieces together.
   1. Deliver to job site in protective containers or packaging and maintain the integrity of the pad/rod through construction.

PART 3 EXECUTION

3.01 GENERAL

A. Use only truck-mixed, ready-mixed concrete conforming to ASTM C94. Proportion materials by weighing.

B. Introduce pozzolan into the mixer with cement and other components of the concrete mix; do not introduce pozzolan into a wet mixer ahead of other materials or with mixing water.

C. Introduce water at the time of charging the mixer; additional water may be introduced within 45 minutes from charging the mixer, provided the specified w/c ration and slump is not exceeded and the maximum total water per the approved mix design is not exceeded.

D. Arrange with the testing laboratory for inspection as required to comply with these specifications.

E. Deliver concrete to the site and complete discharge within 90 minutes after introduction of water to the mixture. Extension of allowable time beyond this limit requires a Contractor proposed remedial action plan to be reviewed and accepted by the Owner's Representative.

3.02 BATCHING:

A. General:

1. Batch concrete only from equipment with a current National Ready Mix Concrete Association Certificate of Compliance. Provide and maintain such means and equipment as are required to accurately determine and control the relative amounts of the various materials, including water, cement, pozzolan, admixtures, sand and each size of coarse aggregate used in the concrete.
2. Proportion concrete batches on the basis of integral sacks of cement unless the cement is weighed. Introduce pozzolan into the mixture only with cement and other dry components of the concrete mix. Do not introduce pozzolan into wet mixer ahead of other materials or with mixing water. Determine amounts of sand and coarse aggregate required for each batch of concrete by weighing, and the required water by either weighing or metering.
3. Deposit aggregates in the batch bins directly over the discharge gates. Deposit coarse aggregate in the batch bins through rock ladders when the free drop of the aggregate exceeds 4 feet. Convey batch materials from the weighing and batching hoppers so that there will be no spillage of the batched materials or overlapping of batches.
4. Provide sufficient trucks to continuously deliver batched material. Each truck shall carry a delivery ticket showing the mix number, size of batch, and time water was added to the batch.

B. Weighing And Metering Equipment:

1. Equipment shall be sealed by the state agency having authority over weights and measures and shall be capable of adjustment for compensating for the varying weights and moisture changes which affect the concrete mix proportions and concrete consistencies.
2. Batching equipment shall be constructed and operated so that when the entire plant is running, the combined inaccuracies in feeding and measuring materials will not exceed 1 percent for water or cement and pozzolan, 2 percent for any size of aggregate, and 1 1/2 percent for the total aggregate in any batch.
3. Design equipment for convenient confirmation of the accuracy required for each batch. The equipment for measuring water shall not leak when the valves are closed.
4. Provide standard test weights and other auxiliary equipment required for checking the operating performance of each scale or meter and make tests at intervals of not more than 6 months in the presence of the state inspector. Provide copies of the complete results of check tests made, and make such adjustments, repairs, or replacements as necessary to secure satisfactory performance.
5. Where the batch plant involves the use of storage bins and weighing hoppers, each weighing unit shall include a visible springless dial or equally suitable device which will register the scale load at any stage of the weighing operation from zero to full capacity. Construct weighing hoppers to permit the convenient removal of overweight material in excess of the prescribed tolerances. Each dial and water-measuring device shall be in view of the operator and, if practicable, arrange the weighing equipment so that the operator may conveniently observe the operation of the bin gates and also the materials discharged into the mixer hopper.

6. Batching equipment in automatic plants shall be interlocked so that:
    a. A new weighing cycle cannot be started until the batchers are emptied and the dispatcher discharge gates and valves are closed.
    b. The batcher discharge gate cannot be opened until the correct weights of the materials are in the batching hoppers and the scales in balance.
    c. The discharge gates cannot be closed until materials are entirely discharged from the hopper and are back in balance.
    d. The water batcher discharge valve cannot be opened until the filling valve is closed. The admixture dispenser shall be interlocked to operate with the water batcher.
7. Dispensers for admixtures shall have sufficient capacity to measure at one time the full quantity of solution required for each batch. Add admixtures to premeasured water for the batch, or arrange their discharge into the batch to flow uniformly into the water stream for the batch from beginning to end of its flow into the mixer. Dosages of admixtures shall not vary from the required dosage by more than 5 percent.

3.03 MIXING:

A. Mix the concrete ingredients in batch mixers until the mixture is homogeneous and uniform in consistency. Mix each batch for at least 1 1/2 minutes for concrete not containing pozzolan and for at least 2 minutes for concrete containing pozzolan after all the ingredients, except the full amount of water, are in the mixer. The minimum mixing period specified is predicated on control of the speed of rotation of the mixer and the introduction of materials, including water, into the mixer.

B. Add water prior to, during, and following the mixer charging operations. Excessive mixing time requiring the addition of water (retempering) to preserve and secure the required concrete consistency is not acceptable.

C. Mixers shall not be loaded in excess of their rated capacity. Equip each mixer with a satisfactory mechanically operated timing, signaling (or locking), and metering device for indicating and assuring the completion of the required mixing period and for counting the batches.

3.04 CONVEYING AND PLACING CONCRETE

A. Convey concrete from the mixer to the forms in accordance with ACI 301. Remove concrete that has segregated in conveying from the site of the work.

B. Placing Concrete:
    1. General:
        a. Place concrete in accordance with ACI 301. Do not permit concrete to drop freely more than 4-ft (6-ft when superplasticizer is used).
    2. Placing Concrete By Pumping:
        a. Concrete placed by pumping is at Contractor's discretion and shall not be the cause to change or relax specified mix design characteristics. Concrete shall possess the specified characteristics at the point of placement.

b. Measure slump at the hose discharge, except as follows: Initial slump testing in each placement shall occur at both the pumping unit inlet hopper and hose discharge. Slump loss in pumping, measured between the inlet hopper and the hose discharge, shall not exceed 1 inch. After these criteria have been satisfied, slump may be measured at the inlet hopper with allowable slump increased by the earlier measured difference, not to exceed 1 inch.

c. Measure air content at the hose discharge, except as follows: Initial air content testing shall occur at both the pumping unit inlet hopper and the hose discharge. Loss of air content shall be measured between the inlet hopper and the hose discharge. Increase the air content of the delivered concrete at the inlet hopper to provide the specified air content at the hose discharge. After these criteria have been satisfied, air content may be measured at the inlet hopper.

d. Before starting each pumping operation, prime the pump and line with a cement slurry to lubricate the system. Waste cement slurry outside the forms. Equip hose tip with a safety chain for recovery in case of hose blowout during pumping. Hose or accessories shall not remain in the freshly placed concrete.

e. Use tremie placing techniques and equipment for pump placed concrete. Pump discharge system shall remain full of concrete from pump to discharge point at all times. Concrete pumping shall not occur until Owner's Representative has verified equipment including the tremie plug. Should the discharge line become open, with zones empty of concrete, cease pumping and re-primed with tremie plug installed before continuing.

3. Placing Concrete In Hot Weather:
   a. In temperatures above 80 degrees F, place concrete in accordance with ACI 305.1.
4. Placing Concrete In Cold Weather:
   a. In temperatures below 40 degrees F, place concrete in accordance with ACI 306.1.
5. Starter Course At Waterstops:
   a. When placing concrete in wall forms for liquid containing structures over 8 feet in height and without form windows, use a starter course of Class D-2 concrete placed to a uniform consolidated depth of approximately 6 inches. Subsequent lift of Class C-1 or C-2 concrete shall be placed onto this starter course within 10 minutes of the starter course placement, and the two lifts consolidated together with no cold joint.

3.05 CONSOLIDATING CONCRETE:

A. Consolidate concrete in accordance with ACI 301. If evidence of inadequate consolidation is observed, concrete placement will be suspended until Contractor provides a revised plan to achieve proper consolidation.

3.06 CURING AND SEALING

A. General:
   1. Cure concrete using water (including form curing and use of moister retaining covers), a clear membrane curing compound, or by a combination of both methods. Coordinate repairs or treatment of concrete surfaces so that interruption of curing will not be necessary.

2. Maintain concrete surface temperature between 50 degrees F and 80 degrees F for at least 5 days. Cure concrete in hot weather (above 80 degrees F) in accordance with ACI 305.1. Cure concrete in cold weather (below 45 degrees F) in accordance with ACI 306.1.

B. Water Curing:
   1. Keep concrete continuously wet for a minimum of 10-days after placement (14 days after placement for sections over 3-feet thick). Absorptive mats or fabric may be used to retain moisture during the curing period. Absorptive covers shall comply with AASHTO M182, Class 3, and moisture retaining covers shall comply with ASTM C171.
   2. Use water curing in hot weather for liquid containment structures. Cover forms and keep moist. Loosen forms as soon as possible without damage to the concrete, and make provisions for curing water to run down inside them. During form removal, take care to provide continuously wet cover to newly exposed surfaces.

C. Curing Compound:
   1. When curing compound is allowed, apply it as soon as the concrete has set sufficiently so as not to be marred by the application or apply it immediately following form removal for vertical and other formed surfaces. Preparation of surfaces, application procedures, and installation precautions shall follow manufacturer's instructions. For liquid containing structures, apply curing compound at twice the manufacturer's recommended dosage rate, applied in two coats perpendicular to each other.
   2. Do not use curing compound on concrete surfaces to be coated, waterproofed, moisture-proofed, tiled, roofed, or where other coverings are to be bonded. In these cases, use water curing unless the curing compound is first removed or is compatible with the final finish covering.

3.07 PROTECTION

A. Protect concrete from injurious action by sun, rain, wind, flowing water, frost, excessive vibration and mechanical means.

B. Loading green concrete is not permitted. Green concrete is defined as concrete with less than 100 percent of the specified strength.

C. Backfill shall not be placed against concrete walls until the concrete has reached the specified strength, connecting slabs and beams have been cast and have also reached the specified strength, and watertightness testing and repairs have been completed for liquid containing structures to the satisfaction of the Owner's Representative.

D. Arrangements for covering, insulating, heating, and protecting concrete in cold weather shall be in accordance with ACI 306.1.

3.08 CONSTRUCTION JOINTS

A. General:
   1. Place concrete in each unit of construction continuously. Before new concrete is placed on or against concrete which has set, retighten forms and clean foreign matter from the surface of the set concrete. Provide waterstops as specified.

B. Construction:

1. Form construction joints by producing a rough surface of exposed aggregates using a surface retardant; include joints between the slab and topping concrete. The limit of the treated surfaces shall be 1 inch away from the joint edges. Within 24 hours after placing, remove retarded surface mortar either by high pressure water jetting or stiff brushing or combination of both so as to expose coarse aggregate. A rough surface of exposed aggregate may also be produced by sandblasting followed by high pressure water jetting. Sandblasting, if used, shall remove 1/4 inch of laitance film and expose coarse aggregate to ensure adequate bond and watertightness at the construction joints.

C. Locations:

1. Provide construction joint locations as follows:
    a. Cast walls exceeding 50 feet in length in panels not to exceed 30 feet in length. Cast adjoining panels only after 5-days have elapsed. Joints are not allowed within the lesser of 10 feet or 25 percent of the wall length from a corner unless specifically detailed thus on the drawings.
    b. Locate joints in beams or girders at or near the quarter point between supports.
    c. Make joints in the members of a floor system at or near the quarterpoint of the span.
    d. Make joints in walls and columns at the underside of floors, slabs, beams or girders and at the tops of footings or floor slabs.
    e. Cast slab panels in checkerboard patterns not to exceed 40 feet in length and not to exceed 900 square feet in area, with maximum 1 ½ to 1 ratio of side lengths. Minimum lapsed time between placing adjacent panels shall be 3-days. The requirements for size of slab panel is waived if joints are located on the Drawings.
2. Vertical construction joints shall have edges grooved or beveled at faces exposed to view including interior faces of basins and tanks. Seal grooves subjected to wetting or weather with joint sealant.
3. Continue reinforcing steel and welded wire reinforcement through construction joints. Beams, girders, and floor slabs shall not be constructed over columns or walls until at least one day has elapsed to allow for initial shrinkage in the column or wall. No joint will be allowed between a slab and a beam or girder unless otherwise shown. Joints shall be perpendicular to the main reinforcement. Provide waterstops in construction joints as specified.

3.09 INSERTS AND EMBEDMENTS

A. Inserts:

1. Where pipes, castings, or conduits are to pass through structures, position in forms before placing concrete; or where shown on Drawings or approved by the Owner's Representative, provide openings in the concrete for subsequent insertion of such pipes, castings, or conduits. Provide waterstops and a slight flare in the form to facilitate grouting and permit the escape of entrained air during grouting.
2. Provide additional reinforcement around openings. Use non-shrink grout to infill around inserts.

3. Place horizontal conduits and pipes, in slabs and beams, between the top and bottom layers of reinforcement. Spacing and size limitations shall conform to ACI 318.
4. Conduits and pipes shall not run directly beneath a column or base plate.
5. Position conduit, pipe, and other ferrous items such that there will be a minimum of 2-inches clearance between said item and concrete reinforcement. Welding inserts to reinforcement is not permitted.
6. The outside diameter of conduit or pipe shall not exceed one-fourth the slab or beam thickness.

B. Embedments:
1. Gate frames, gate thimbles, special castings, channels, grating frames, or other miscellaneous metal parts to be embedded in concrete shall be secured in the forms prior to concrete placement.
2. Embed anchor bolts and inserts in concrete as shown. Provide inserts, anchors, or other bolts necessary for the attachment of piping, valves, metal parts, and equipment.
3. Provide nailing blocks, plugs, strips, and the like necessary for the attachment of trim, finish, and similar work. Voids in sleeves, inserts, and anchor slots shall be filled temporarily with readily removable material to prevent entry of concrete. Do not use continuous anchor slots or strips in concrete intended to be watertight.
4. Position operators or sleeves for gate or valve stems to clear reinforcing steel, conduit, and other embedments, and to align accurately with equipment.

3.10 WATERSTOPS

A. Waterstops shall conform to ACI 301. Tie waterstops in position prior to placement of concrete to prevent movement and deformation.

B. Provide waterstops in construction and expansion joints as follows:
1. Joints in parts of structures exposed to ground or water on one side and occupied by non-submerged equipment or by personnel on the other.
2. Wall and slab joints of tanks and channels subject to water pressure.
3. Waterstops shall be provided for the full height of the walls.
4. Provide at other locations shown on the Drawings.

C. Field splices shall be at straight sections using heat fused welded, butt splices only. Lapping of splices or joining by means other than heat fused welding is not allowed.

D. Install hydrophilic waterstops according to manufacturer's recommendations. Surfaces of concrete shall be prepared level/plumb and to the smoothness required by manufacturer. Grind surface as necessary. Provide bonding adhesive and concrete nails with fender washers to hold waterstop in position during concrete placement.

3.11 FLOOR TYPE PRESSURE RELIEF VALVES

A. Pressure relief valves or other miscellaneous metal parts to be embedded in concrete shall be secured in place prior to concrete placement. Position pressure relief valves to clear reinforcing steel and other embedments.

B. Install in accordance with manufacturer's recommended instructions.

C. Install valve in a vertical position.

D. Prevent damage to valve seats during installation and pouring of concrete slab.

E. Frequency of inspection shall be as recommended by the manufacturer.

3.12 MODIFICATION OF EXISTING CONCRETE

A. General:
   1. Verify structural dimensions related to or controlled by previously constructed or existing structures prior to concrete work.

B. Cutting or Coring Concrete:
   1. Saw cut concrete to a depth of 1 inch to form straight outlines of concrete areas to be removed. Where reinforcement is exposed due to saw cutting or core drilling and no new material is to be placed on the cut surface, provide a protective epoxy coating to the entire cut surface.
   2. Coat surfaces of oversized openings with an epoxy bonding compound prior to re-finishing with profiling mortar to the required opening size.
   3. Grind existing joint edges to create a chamfer matching those used on adjacent construction.
   4. Investigate concrete to be drilled, cored, or sawcut to determine location of reinforcing steel. Locate penetrations to clear existing reinforcing steel. Where not possible to avoid reinforcing steel, consult the Engineer as to acceptability of cutting reinforcing steel and provide new reinforcing systems as directed.
   5. Locating methods include chipping to expose reinforcing steel, ground penetrating radar, X-ray, or magnetic flux devices. Locates of existing reinforcing shall be by the Contractor.

C. Joining New Concrete To Existing:
   1. Existing concrete surfaces to be joined with new concrete shall be cleaned and roughened by abrasive blasting, bush hammering, or other method to achieve ¼-inch amplitude surface. Remove existing metalwork, embeds, or other interfering items. Coat existing surface with epoxy bonding compound prior to placement of new concrete.

D. Post-Installed Anchors and Dowels:
   1. Use non-destructive methods for locating reinforcement prior to drilling operations. For anchor and dowel locations that interfere with reinforcement, attempt to relocate to avoid drilling through the reinforcement if possible.
   2. For situations that do not allow relocation, cutting of reinforcement for installation is subject to the following:
      a. Prior to drilling through reinforcement, the Contractor shall consult the Owner's Representative or Engineer.
      b. Drill holes with a hammer drill and carbide bit (core drilled holes are not allowed), followed by brushing and air-cleaning with oil-free compressed air.

c. Holes drilled through reinforcement must be in compliance with adhesive anchor assumptions for roughened hole surface typical of a hammer drill and carbide bit. No smooth hole surfaces are allowed.
d. Do not cut slab rebar within 24 inches of a supporting wall, column, or an opening in the slab.
e. No cutting of rebar is allowed in the middle third of slab spans for anchors with diameters equal to or greater than 3/4 inch.
f. Maximum of two rebar may be cut in any 10 foot width of slab.
g. Maximum of two rebar may be cut within any 10 foot width of concrete wall.
h. Maximum of one rebar may be cut within any 8 foot width of CMU wall.

3. For anchors that cannot be moved and that conflict with the above requirements, consult Engineer for direction. It is not acceptable to cut reinforcement in beams, columns, precast members, or stairs.
4. Use a pre-manufactured, self-mixing, injectable, two-component, epoxy adhesive, as per Section 03 60 00. Follow manufacturer's recommendations and ICC Evaluation Report for installation.

E. Waterstops:
1. Where a waterstop between new and existing concrete is required, install a hydrophilic waterstop, or a retrofit waterstop where indicated on the design drawings for the specific location.

3.13 FORMED SURFACE FINISHES

A. Repair Of Surface Defects:
1. Repair surface defects, including tie holes, minor honeycombing, or otherwise defective concrete in accordance with ACI 301. Clean areas to be repaired. Cut and chip out honeycombed or otherwise defective areas to solid concrete, to a depth of at least 1-inch. If defective area includes exposed reinforcing steel, correct by removing concrete a minimum of 1-inch beyond the reinforcing. Make edges of the cut perpendicular to the surface of the concrete in a neat rectangular pattern.
2. Joints shall be grooved to a radius or bevel of ¾-inch depth.
3. Finish patches on exposed surfaces to match and blend with adjoining work. Cure patches as specified for the concrete. Protect finished surfaces from stains and abrasions.

B. Formed Surface Finishes:
1. Finish A - Grout Rubbed Finish
a. After repair of surface defects, apply a grout rubbed finish in accordance with ACI 301 except that all form fins and other protrusions shall be completely removed. Lightly sandblast surfaces prior to sacking. Sandblasting shall occur after the specified curing period.
b. Add a PVA bonding compound to the mix water used in sacking mortar; as recommended by the manufacturer.

c. Provide Finish A at uncoated surfaces of stair wells, at interior surfaces of equipment rooms, galleries, tunnels, operations areas, exposed channels and tanks from 1 foot below minimum water surfaces and up, at exposed exterior surfaces to 1 foot below grade, and at permanently exposed vertical and sloped surfaces such as pipe chases.

d. Do not provide Finish A at concrete surfaces receiving a coating.

2. Finish B - Smooth Surface Finish
    a. Initial surface preparation is the same as Finish A; repair surface defects and remove all form fins.
    b. Provide Finish B at surfaces to be coated, at interior surfaces of exposed channels and tanks from 1 foot below minimum water surfaces and down (Finish A applied above this level), and full height at surfaces of wet wells, tanks, and channels not exposed to view. See Section 09 90 00 for additional concrete surface preparation, including filling of bug holes, and coating requirements.
3. Finish C - Rough Form Finish
    a. Repair surface defects and imperfections greater than 3/8 inch in any dimension. Remove form fins and protrusions down to less than 3/8 inch projection.
    b. Provide Finish C or smoother at exterior surfaces from 1 foot below grade and down, at other vertical surfaces not exposed to view and not specified above to receive Finish A or B.
    c. Also apply Finish C to unoccupied interior areas not otherwise specified.
4. Finish D – Unfinished Surface
    a. Repair surface defects and otherwise leave the surfaces as they come from the forms, except plug tie holes and repair or remove defects greater than 1/2 inch in any dimension.

C. Sample Of Formed Surface Finish A:
1. Provide a sample concrete panel, minimum 4 feet by 4 feet; representative of formed surface Finish A. The panel shall be representative of the workmanship and finish required, including repair of defects, filling of tie holes, sandblasting, and rubbing.
2. The sample shall be approved by the Owner's Representative prior to the start of production work. The sample shall be on display at the job site, and finished surfaces shall match sample.

3.14 SLAB FINISHES

A. General:
1. The finishes specified herein include surface finishes, treatments and toppings for floors and slabs. Do not use dry cement on new concrete surfaces to absorb excess moisture. Round edges to a radius of 1/2 inch.
2. Slope floors to drain uniformly within a room or space. Unless otherwise specified, slope shall be a minimum of 1/8 inch per foot toward nearest drain. Restrict use of floor drains with only locally depressed slabs to locations specifically noted.
3. Immediately after final finish is applied, the surface shall be cured and protected as specified in Curing, Sealing, and Protection paragraphs above.
4. Where finish is not specified, floor slabs shall receive a Steel Trowel Finish.

B. Float Finish:
   1. Perform floating with a hand or power-driven float in accordance with ACI 301. Begin floating when the bleed water sheen has disappeared and the surface has stiffened sufficiently. Float as required to meet tolerance requirements of ACI 117 for a conventional surface.
   2. Floating shall close cracks and checks plus compact and smooth the surface. Refloat the slab to a uniform texture.
   3. Apply float finish to surfaces of channels, tank bottom slabs, exterior below grade horizontal surfaces, including tops of footings, and surfaces to receive insulation or roofing.

C. Steel Trowel Finish:
   1. Float the concrete surface as indicated above and then trowel in accordance with ACI 301.
   2. Provide Steel Trowel Finish on interior exposed floors and slabs that will receive resilient flooring, carpet or ceramic tile, unless specified otherwise.
   3. Surface Hardener (see Part 2) shall be troweled into the finished surface at the following locations shown on the drawings.

D. Broom Finish:
   1. Float the concrete surface as indicated above, then immediately give the concrete a coarse transverse scored texture by drawing a broom or burlap belt across the surface in accordance with ACI 301.
   2. Provide a Broom Finish for steps and ramps, exterior exposed horizontal surfaces, and where otherwise indicated.

E. Samples Of Concrete Slab Finishes:
   1. Provide a sample concrete slab, minimum 4 feet by 4 feet, representative of workmanship and each specified finish.
   2. Samples shall be approved by the Owner's Representative prior to the start of production work. The samples shall be on display at the job site, and finished surfaces shall match samples.

3.15 TOPPING CONCRETE

A. Subfloor Finish:
   1. Slabs to receive a topping concrete, topping grout, or tile; shall be float finished to required elevations. Immediately following the final finishing, either:
      a. treat slab with a retardant and abrasive blast to create expose aggregate with ¼ inch amplitude, or
      b. create the ¼ inch amplitude roughened surface by raking the freshly floated surface using a standard garden rake.
   2. Immediately after finishing, proceed with required curing and protection of the slab as stated above.

B. Topping Concrete or Grout:
   1. Remove dirt, laitance, and loose aggregate. Keep cleaned base slab saturated surface dry for a period of 24 hours prior to the application of topping. Remove excess water.
   2. Apply and scrub a neat cement grout into the surface of the base slab using a stiff broom. The cement grout shall not be allowed to dry and shall be spread within 15 minutes ahead of the topping placement.
   3. The topping shall then be placed, compacted, and floated. Test surface with a straight edge to detect and correct high and low spots to a tolerance of 1/8 inch in 10 feet.
   4. Incorporate float finish, surface hardener, steel trowel finish, etc. as specified.

3.16 RELATED SURFACES

A. Stair Treads:
   1. Construct stair treads with a nonskid nosing as specified in Section 05 50 00.
   2. Treads shall have a Float Finish followed by a Steel Trowel Finish with a slope of 1/8 inch toward the front.
   3. Ends of treads shall have a 1/16 to 1/8 inch cut between concrete and metal tread to allow for expansion.

B. Finishing of Unformed Surfaces:
   1. Adjacent Unformed Surfaces:
      a. Tops of walls, buttresses, horizontal offsets, and similar unformed surfaces occurring adjacent to formed surfaces shall be struck smooth after concrete is placed and shall be Float Finished to a texture reasonably consistent with that of the adjacent formed surface.
      b. Continue final treatment of formed surface uniformly across the top of the unformed surface.
   2. Pavements and Sidewalks:
      a. The surface of the concrete shall be screeded to grade and sloped to drain. After screeding, the surface shall be Float Finished followed by a Broom Finish.
      b. Round edges and expansion joints to a radius of 1/2 inch. Control joints shall be grooved or sawcut to a minimum depth of 1/4 the slab thickness.

3.17 FIELD SAMPLING AND TESTS

A. General:
   1. Field sampling and tests shall be performed by an independent testing laboratory. Samples of aggregates and concrete will be obtained at such times to represent the quality of the materials and work throughout the project.
   2. The laboratory shall provide necessary labor, materials and facilities for sampling aggregate and for casting, handling, and initially storing the concrete samples at the work site.
   3. The minimum number of samples and tests are specified in Testing paragraph below.

B. Sampling:
    1. Aggregates:
        a. General:
            1) Sample fine and coarse aggregates in accordance with ASTM D75 not less than 30 days prior to the use of such aggregates in the work.
            2) Take samples at the discharge gates of the bins feeding the weigh hopper. Repeat sampling when the source of material is changed or when unacceptable deficiencies or variations from the specified requirements of materials are found.
            3) Aggregate samples shall be tagged and their sources identified.
        b. Coarse Aggregate:
            1) Take a sample weighing between 50 and 60 pounds after the batch plant is brought up to full operation.
            2) Take samples to obtain a uniform cross section, accurately representing the materials on the belt or in the bins for sieve analysis.
        c. Fine Aggregate:
            1) Take samples as specified for coarse aggregate.
            2) Take samples of sand when the sand is moist for sieve analysis and specific gravity tests.
    2. Concrete:
        a. Take samples of plastic concrete in accordance with ASTM C172.
        b. Take samples at the hopper of mixing equipment or transit mix truck, except as noted in the Placing Concrete by Pumping subparagraph of the Conveying and Placing article above.

C. Testing:
    1. Aggregate:
        a. A minimum of one test of coarse aggregate per 400 cubic yards of concrete used and a minimum of one test of fine aggregate per 200 cubic yards of concrete used shall be made to confirm continuing conformance with specifications for gradation, cleanliness and sand equivalent.
        b. A maximum of one test per day of each aggregate is required.
        c. Repeat of the entire concrete mix design test program is required before source changes will be accepted.
    2. Concrete:
        a. Strength Tests:
            1) The strengths specified for the design mix shall be verified by the independent testing laboratory during placement of the concrete. Verification shall be accomplished by testing standard cylinders of concrete samples taken at the job site. Cylinders shall be 4 by 8 inch or 6 x 12 inch.

2) Concrete samples shall represent the concrete placed in the forms. One set of six standard 6 x 12 inch (or nine 4 x 8 inch) cylinders shall be cast of each class of concrete for each 150 cubic yards or less, or for each 5,000 square feet of slab or wall surface area placed per day. Provide additional cylinders when an error in batching is suspected. Each set of cylinders are cast from material taken from a single load of concrete.
3) Casting, handling and curing of cylinders shall be in accordance with ASTM C31. For the first 24 hours after casting, keep cylinders moist in a storage box constructed and located so that its interior air temperature will be between 60 and 80 degrees F. At the end of 24 hours, the testing laboratory will transport the cylinders to their laboratory.
4) Testing of specimens for compressive strength shall be in accordance with ASTM C39. Each test shall consist of two 6 x 12 inch (or three 4 x 8 inch) test cylinders from each group of six (or nine) specimens. Test at the end of 7 days and at the end of 28 days. The remaining cylinders shall be tested at the end of 56 days if the 28-day strength reports below specification.
5) A strength test shall consist of the average strength of two 6 x 12 inch (or three 4 x 8). If one cylinder shows evidence of low strength due to improper sampling, casting, handling, or curing, the result of the remaining cylinders may be used if approved by the Owner's Representative.
6) The average of any three consecutive 28-day strength test results of the cylinders representing each class of concrete for each structure shall be equal to or greater than the specified strength. Not more than 10 percent of the individual strength test results shall have values less than the specified 28-day strength for the total job concrete. No individual strength test result shall be less than the specified strength by more than 500 pounds per square inch.
7) Provide certified reports of the test results directly to the Owner's Representative and the Engineer. Test reports shall include sufficient information to identify the mix used, the stationing or location of the concrete placement, and the quantity placed. Slump, water/cement ratio, air content, temperature of concrete, and ambient temperature shall be noted.
8) The 28-day strength test results shall be evaluated in accordance with ACI 214R. Quality control charts showing field test results shall be included with the test results for each class of concrete in each major structure. Charts shall be prepared in accordance with ACI 214R. Quality control charts shall be maintained throughout the entire project and shall be available for the Owner's Representative's inspection at any time.
9) If the 28-day test results fall below the specified compressive strength for the class of concrete required for any portion of the work, adjustment in the proportions, water content, or both, shall be made as necessary at the Contractor's expense. Report changes and adjustments in writing to the Owner's Representative.

10) If compressive test results indicate concrete in place may not meet structural requirements, tests shall be made to determine if the structure or portion thereof is structurally sound. Tests may include, but not be limited to, cores in accordance with ASTM C42 and any other analyses or load tests acceptable to the Engineer. Costs of such tests and/or analysis shall be borne by the Contractor.

b. Tests for Consistency of Concrete:
   1) Measure slump in accordance with ASTM C143. Take samples for slump determination from concrete during placement. Tests shall be made at the beginning of concrete placement operation, whenever test cylinders are cast, and at subsequent intervals to ensure that the specification requirements are met.
   2) For pumped concrete, measure slump in accordance with the Placing Concrete by Pumping subparagraph of the Conveying and Placing article above.
   3) When high range water reducer is added at the site, slump tests shall be taken before and after addition of the admixture.

c. Tests for Temperature and Air Content:
   1) Temperature tests shall be made at frequent intervals during hot or cold weather conditions until satisfactory temperature control is established. Perform temperature tests whenever test cylinders are cast.
   2) Measure air content in accordance with ASTM C231 whenever test cylinders are cast. For pumped concrete, measure air content in accordance with the Placing Concrete by Pumping subparagraph of the Conveying and Placing article above.

D. Final Laboratory Report:
   1. The testing laboratory shall provide a final report at the completion of all concreting. This report shall summarize the findings concerning concrete used in the project and provide totals of concrete used by class and structure.
   2. Include final quality control charts for compressive strength tests for classes of concrete specified in each major structure. Also include the concrete batch plant's coefficient of variation and standard deviation results for each class of concrete.

3.18 REPAIR OF DAMAGED AND CRACKED CONCRETE:

A. Acceptance Of Concrete:
   1. Completed cast-in-place concrete work shall conform to the applicable requirements of ACI 301 and the Contract Documents. Concrete work that fails to meet these requirements shall be repaired, as approved by the Engineer, to bring the concrete into compliance. Repair methods shall be in accordance with ACI standards, including ACI 503.7, and are subject to the approval of the Engineer.
   2. Concrete that cannot be brought into compliance by approved repair methods will be rejected. Remove and replace rejected concrete work.
   3. The cost of repairs and replacement of defective concrete shall be borne by the Contractor.

B. Repair Methods:
   1. Damaged/defective concrete or concrete with crack widths exceeding 0.004 inches at liquid-containing and conveying structures or crack widths exceeding 0.006 inches for other structures shall be repaired by one of the following methods (only the Engineer may determine that a defect or crack does not require repair):
      a. Perform watertightness testing and repair as needed to meet leakage criteria in this specification even when liquid-containing and conveying structures meet the crack width criteria defined above.
      b. Damaged or defective concrete includes surface defects, honeycomb, rock pockets, indentations greater than 3/16 inch, spalls, chips, air bubbles greater than 1/2 inch diameter, pinholes, bugholes, embedded debris, lift lines, sand lines, bleed lines, leakage from form joints, fins, projections, form popouts, texture irregularities, and stains or other color variation that cannot be removed by cleaning.
         1) Damaged or defective concrete is repaired according to procedures outlined above under finish requirements, Repair of Surface Defects.
   2. Crack Repair Method 1:
      a. Fill the joint or crack by drilling holes to the affected area (following the product manufacturer's details), install injection ports, and force epoxy or chemical grout (expanding urethane) into the joint under pressure.
      b. Material type and repair procedures shall be approved by Engineer.
      c. After injection and curing; ports, sealing mix, and surface shall be cleaned and worked to match the adjacent specified finish.
   3. Crack Repair Method 2:
      a. Fill cracks with low viscosity epoxy, applied by pouring/flooding crack zone until cracks are filled. Prepare surface, install, and cure according to manufacturer's recommendations.
      b. At a minimum, prepare surface to be clean and dry with no visible detrimental material in cracks to be filled. Conform to temperature limitations of epoxy. Clean and refinish to match adjacent surfaces.
   4. Crack Repair Method 3:
      a. Cut a bevel groove 3/8 to 1/2 inch in width and depth, use backer rod or tape, and fill with sealant in accordance with manufacturer's instructions.
      b. This repair method is only used where approved by Engineer.
      c. Groove and sealant shall be applied on wet or hydrostatic pressure side of surface.

C. Repair Method Use:
   1. Repair Method 1: For cracks in walls, surfaces sloped 1:1 or greater, beams, columns, structural slabs, overhead surfaces, and liquid retaining surfaces. Need for repair depends upon crack width, location, and leakage.
   2. Epoxy grout is used for repair of structural cracks and chemical grout (expanding urethane) for repair of non-structural cracks at liquid-containing structures. The Engineer shall determine whether a crack is classified as structural or non-structural.
   3. Repair Method 2: Utilized in lieu of Method 1 for slabs when approved by Owner's Representative. Final finish shall match adjacent surfaces.

4. Repair Method 3: Limited to dry-surface slabs, walls subject to less than three feet of liquid pressure, or as approved by Engineer. Repair Method 3 is not an equivalent repair method to Repair Methods 1 or 2, which shall be considered the standards.

3.19 BEARING AND SEAL PADS

A. General:
   1. Seal pads are intended to result in a gas-tight and liquid tight seal between surfaces and may also serve as bearing pads. Bearing pads are intended primarily to transmit structural loads between two structural elements.
   2. A seal pad is intended to seal by dead load compressive force or mechanical clamping force as detailed. The seal pad may be bonded to one or both surfaces to maintain uniformly tight contact with the pieces contacting it. Neoprene materials may not be compatible with coatings applied later, and the Contractor shall verify that the particular coating(s) proposed for use are:
      a. contact compatible without neoprene breakdown; or
      b. mask off neoprene which may be exposed to the coating to prevent contact.

B. Concrete Contact:
   1. Neoprene pads shall bear against clean, smooth concrete. Clean concrete with high-pressure hydro-blast (3,500 psi) equipment. Epoxy grout cracks as specified above. Repair surfaces with irregularities greater than 1/16 inch. Create a 1/4-inch amplitude surface roughness and patch using an epoxy bonding agent followed by either polymer modified repair concrete or profiling mortar. Cure patch material before installing pad.
   2. Bond seal pad, as indicated, to concrete prepared as above. Bonding agent shall be as recommended by the pad manufacturer to not allow shear sliding of the pad either with or without load normal to its surface.

C. Metal Surface Contact:
   1. Neoprene pads with metal-to-metal or metal-to-concrete contact shall be 1/4 inch minimum thickness or as shown on the drawings.
   2. Contact surfaces shall be clean, smooth, and without evidence of harmful sharp edges or chemicals.
   3. Compression is achieved by tightening connection bolts to specified torque, determined by:
      a. the equipment manufacturer; or
      b. structural specifications on the drawings; or
      c. minimum 1/16 turn past “snug tight” as defined by AISC Steel Construction Manual.
   4. Tighten bolts in multiple steps, proceeding around the joint to result in a uniform compression of the pad.
   5. Certain pieces of equipment may have gasket specifications particular to that piece of equipment. Refer to those Sections of the specifications for requirements.

3.20 WATERTIGHTNESS TESTING AND REPAIR

A. Liquid Containing Concrete Tanks And Channels:

1. Watertightness testing shall comply with ACI 350.1 and the following requirements.
2. Concrete tanks, basins, reservoirs and channels which have walls or slabs subjected to hydrostatic pressure shall be tested for watertightness. The tests shall be made after the structure is complete and the concrete has achieved its specified 28-day strength, but prior to application of waterproof coating or backfill.
3. Filling of the tank for watertightness testing shall not exceed a rate of 4 feet/hour. Fill with water to the maximum operating water surface. Keep water at this level for at least 72 hours prior to start of test.
4. Testing includes visual inspection of the dry sides of all walls, wall base construction joint at top of the slab, and the soffit of elevated slabs for evidence of leakage. Damp spots, leakage, or seepage revealed by the test, including those caused by shrinkage of concrete, honeycombed areas, construction joints, or other sources shall be repaired by Repair Method 1 (see Repair Methods paragraph in the Repair of Damaged Concrete and Cracking article above).
5. Damp spots are defined as areas from which water that can be picked up on dry hand and smeared across the dry concrete surface.
6. Re-test tanks or channels which have been repaired to check the suitability of repairs.
7. Provide water required for testing and re-testing and dispose of in an approved manner.
8. After repair of visual leakage, liquid containing or conveying concrete structures supported on soil must also meet maximum leakage criteria into the soil through their base slab or mat foundation as follows:

Structure Type	Tightness Criterion
Containment structures fully lined prior to hydrostatic test	No measurable loss
Cylindrical water and wastewater storage tanks and reservoirs other than digesters	0.050 percent per day
Digesters	0.050 percent per day (surcharged hydrostatic test)
Rectangular basins and tanks	0.050 percent per day
Concrete paved reservoirs and channels	0.10 percent per day

Note: All damp spots and/or leakage through walls, wall-to-slab joints, and elevated slabs shall first be repaired as described above.

9. Record volume loss by measuring the vertical distance from the water surface to a fixed point on the tank above the water surface. Account for evaporation from open surfaces.
10. If the drop in water surface during the test period exceeds the values given in the table above, exclusive of evaporation, the leakage is considered excessive and shall be remedied. The test period shall be per ACI 350.1.

3.21 CLEANUP

A. Upon completion of the work and prior to final inspection, clean all concrete surfaces as follows: Sweep with a broom to remove loose dirt, then mop and/or flush with clean water. Scrub by hand or machine as required to remove and blend stains or discolored areas .

B. Clean floors that have curing and sealing compound as stated above, followed by the final application of curing and sealing compound.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 30 10

CAST-IN-PLACE CONCRETE TOPPING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Cast-in-place concrete topping replacement at existing clarifiers, which includes dewatering site, removal of existing topping, preparation of surfaces, providing material, mixing, equipment, and labor for the proportioning, mixing, transporting, testing, placing, consolidating, finishing, curing, and protection of concrete topping.

B. Contractor provided testing laboratory services.

C. Groundwater is normally high in this area. Project includes dewatering immediate site around clarifiers to prevent floatation.

D. New concrete topping to be “swept-in” using existing clarifier equipment with temporary scraper blades installed by Contractor.

1.03 SUBMITTALS

A. Action Submittals:
   1. Mix design showing:
      a. Expected strength at 7 and 28-days
      b. Water/cement ratio
      c. Weights and test results of ingredients
      d. Aggregate gradation
      e. Test results of mix design prepared by an independent testing laboratory
      f. Other physical properties necessary to review mix design for conformance with these specifications
   2. Product literature and technical data for cement and pozzolan.
   3. Product literature, technical data, and dosage of proposed admixtures including, but not limited to, air entraining, water reducing, retarding, etc.
   4. Curing program description in sufficient detail to demonstrate that the Contractor will provide acceptable strength, finish, and crack control.
   5. Product literature and technical data for bonding and curing compounds.
   6. Concrete delivery truck tickets showing the information listed in ASTM C94.

1.04 QUALITY ASSURANCE

A. Quality Control By Contractor:
   1. To demonstrate conformance with specified requirements of this section, provide services of an independent testing laboratory which complies with requirements of ASTM E329. The testing laboratory shall sample and test concrete materials as specified in this section.

PART 2 PRODUCTS

2.01 MATERIALS

A. Cement:
   1. Portland cement shall be ASTM C150, Type II, low alkali, containing less than 0.60 percent alkalis. In addition to standard requirements, cement shall satisfy optional chemical and physical requirements of ASTM C150, Tables 2 and 4, respectively.
   2. Blended Hydraulic Portland- cement shall be ASTM C595, Type IL (MS).
   3. If low alkali cement is not available, aggregates shall show an expansion of less than 0.1% when tested in accordance with ASTM C1260 or ASTM C1567 concrete mix test results shall be submitted verifying that aggregates are not reactive. ASTM C1260 and ASTM C1567 results shall be no older than 1 year.
   4. Use cementitious materials that are of the same brand and type and from the same plant of manufacture as the cementitious materials used in the concrete represented by the submitted field test records or used in the trial mixtures.

B. Ground granulated blast-furnace slag (GGBFS), if used in conjunction with Portland cement, shall be per ASTM C989.

C. Aggregates:
   1. General:
      a. Except as modified herein, fine and coarse aggregates shall conform to ASTM C33. Fine and coarse aggregates are regarded as separate ingredients. Aggregates shall be non-reactive and washed before use.
      b. Check aggregates for alkali-silica reactive constituents per ASTM C1260. Aggregate shall have less than 0.1% expansion when tested in accordance with ASTM C1260. Aggregates having 0.1% or greater expansion may still be satisfactory provided ASTM C1567 concrete mix test results are submitted and show an expansion of less than 0.1% at 16 days. Test results shall be no older than 1 year.
      c. Test for size and grading of fine and coarse aggregates in accordance with ASTM C136.
      d. Aggregates used in the project production concrete shall be obtained from the same sources and have the same size ranges as the aggregates used in the concrete represented by the submitted historical data or trial mixtures.
   2. Fine Aggregate:
      a. Fine aggregate shall be hard, dense, durable particles of either sand or crushed stone regularly graded from coarse to fine. Gradation shall conform to ASTM C33.
   3. Coarse Aggregate:
      a. Coarse aggregate shall be hard, dense and durable gravel or crushed rock free from injurious amounts of soft and friable particles, alkali, and organic matter. Other deleterious substances shall not exceed the limits listed in ASTM C33, Table 3 for Class Designation 5S. Gradation of coarse aggregate size specified shall conform to ASTM C33, Table 2.

D. Pozzolan:
   1. Pozzolan shall be Class N, natural pozzolan, or Class F fly ash conforming to ASTM C618. Class C fly ash is not allowed.
   2. Use pozzolan materials that are of the same brand and type and from the same plant of manufacture as the materials used in the concrete represented by the submitted field test records or used in the trial mixtures.

E. Admixtures:
   1. General:
      a. Admixtures shall be compatible with the concrete and with each other. Calcium chloride or admixtures containing calcium chloride are not acceptable. Use admixtures in accordance with the manufacturer's recommendations and add separately to the concrete mix.
   2. Water Reducing Admixtures:
      a. Conform to ASTM C494, Type A. Acceptable products include: BASF "MasterPozzolith 322"; SIKA Chemical Corp. "Plastocrete 161"; Euclid Chemical Co. "Eucon WR 91"; or approved equal.
   3. Water Reducing and Retarding Admixtures:
      a. Conform to ASTM C494, Type D. Acceptable products include: BASF "MasterPozzolith 80"; Sika Chemical Corp. "Plastiment"; Euclid Chemical Co. "Eucon Retarder 75"; or approved equal.
   4. High Range Water Reducing (Superplasticizing) Admixtures:
      a. Conform to ASTM C494, Type F. Acceptable products include: BASF "MasterGlenium" Series; Sika Chemical Corp. "Viscocrete 2100" or "Viscocrete 2110" (Hot Weather) or "Viscocrete 6100" (Cold Weather); Euclid Chemical Co. "Eucon 37"; W.R. Grace "ADVA 195"; or approved equal.
   5. High Range Water Reducing And Retarding Admixtures:
      a. Conform to ASTM C494, Type G. Acceptable products include: W.R. Grace "Daracem 100"; Sika Chemical Corp. "Sikaplast 200"; Euclid Chemical Co. "Eucon 537"; or approved equal.
   6. Air Entraining Agent:
      a. Conform to ASTM C260 and produce air entrained concrete as specified in the Mix Proportioning table below. Acceptable products include: Sika Chemical Corp. "AEA-15"; Euclid Chemical Co. "AEA-92"; or approved equal.

F. Water:
   1. For washing aggregate, mixing, and for curing shall be free from oil and deleterious amounts of acids, alkalis, and organic materials; comply with the requirements of ASTM C1602. Additionally, water used for curing shall not contain an amount of impurities sufficient to discolor the concrete.

2.02 CONCRETE CHARACTERISTICS

A. Mix Proportioning:

1. Concrete topping shall be normal weight concrete composed of cement, pozzolan, admixtures, aggregates, and water; proportioned and mixed to produce a workable, strong, dense, and impermeable concrete. It is acceptable to substitute interground Portland-pozzolan cement conforming to ASTM C595, containing the specified amount of pozzolan in lieu of Portland cement and pozzolan. Water-cementitious material (w/cm) ratio is based on the combined contents of cement and pozzolan.

2. Provide concrete mix design in accordance with the following guidelines:

Concrete Class	Minimum[a] 28-day Compressive Strength, psi	ASTM Coarse Aggregate Size	Maximum Water-Cementitious Materials (w/cm) ratio	Minimum Cementitious Materials Content (pounds/CY)	Pozzolan, Percent by weight of Cementitious Materials	Air Content (percent)	Slump range[c] (inches)
D-1	4000	3/8	0.42	550	15-20[b]	4-6	3-5

[a] *Determine compressive strength at the end of 28 days based on test cylinders made and tested in accordance with ASTM C39.*

[b] *Pozzolan use is optional.*

[c] *Slump before addition of high range water reducing admixture (superplasticizer). Maximum slump after addition of high range water reducing admixture shall be 8".*

B. Control Tests:

1. General:
   a. Select and adjust proportions of ingredients in accordance with ACI 211.1. Verification of mix characteristics for submittal may be achieved using either the Trial Mix Design method or Field Experience Data method.
   b. Do not place concrete prior to submittal and acceptance of proposed mix.
2. Trial Mix Design:
   a. Mixes verified by this method shall have the samples produced for testing, manufactured at the batch plant which will supply concrete to the project, using materials proposed for the Work and material combinations listed above. Testing, data, and reporting shall conform to ACI 318 and the following:
      1) Required compressive strength used as the basis for selecting concrete proportions (f'cr) shall be the specified concrete strength (f'c) + 1200 psi.
      2) Make at least three different trial mixtures for concrete to be qualified by the Trial Mix Design. Each trial mixture shall have a different w/cm ratio or different cementitious materials content that will produce a range of compressive strengths encompassing f'cr.
      3) Design trial mixtures to produce a slump within ¾ inch of the maximum specified and an air content within 0.5 percent of the maximum specified.
      4) For each w/cm ratio or cementitious materials content, cast and cure at least twelve standard test cylinders in accordance with ASTM C192. Four cylinders from each batch tested at age 7-days, 14-days, and 28-days or as required to comply with ACI 318.

5) From results of the cylinder tests, plot a curve showing the relationship between w/cm ratio and compressive strength.

6) From the curve of w/cm ratio versus compressive strength, select the w/cm ratio that will produce f'cr. This is the maximum w/cm ratio to be used unless a lower w/cm ratio is specified above.

3. Field Experience Data:

a. When sufficient test data for the mix design is available which is identical or substantially similar to that proposed for use, Contractor may substitute use of this data in lieu of a trial mix design. Field data, reports, and analysis shall conform to ACI 318, except as modified herein.

1) Historical mix design proportions for which data are submitted may vary from the specified mix within the following limits:

a) f'c as specified or up to 500 psi above

b) w/cm ratio as specified or lower

c) pozzolan content within 5 percent of that specified

d) maximum coarse aggregate size may not vary smaller, but gradation of coarse aggregate may vary

e) slump after introduction of admixtures +0/-1 inch.

b. Use of historical Field Experience Data does not allow modification of the project mix specifications herein without review and acceptance by the Engineer.

c. Do not place concrete prior to acceptance of the concrete mix.

2.03 EPOXY BONDING COMPOUND

A. Conform to ASTM C881 Types IV or V, Class A, B, or C depending on temperature at use. Acceptable products include: BASF "MasterEmaco ADH 327RS" or "MasterEmaco ADH 1490"; Sika Chemical Corporation "Sikadur 32"; or approved equal.

B. Apply bonding compound in accordance with the manufacturer's instructions.

2.04 CURING AND SEALING COMPOUND

A. Conform to ASTM C309 and ASTM C1315. Acceptable products include: BASF "MasterKure CC 250SB"; Dayton Superior "Cure & Seal 25% J22UV"; or approved equal.

B. Compound shall be clear and applied in accordance with the manufacturer's instructions but apply at twice the standard application rate.

PART 3 EXECUTION

3.01 GENERAL

A. Use only truck-mixed, ready-mixed concrete conforming to ASTM C94. Proportion materials by weighing.

B. Introduce pozzolan into the mixer with cement and other components of the concrete mix; do not introduce pozzolan into a wet mixer ahead of other materials or with mixing water.

C. Introduce water at the time of charging the mixer; additional water may be introduced within 45 minutes from charging the mixer, provided the specified w/c ratio and slump is not exceeded and the maximum total water per the approved mix design is not exceeded.

D. Arrange with the testing laboratory for inspection and testing.

E. Deliver concrete to the site and complete discharge within 90 minutes after introduction of water to the mixture. Extension of allowable time beyond this limit requires a Contractor proposed remedial action plan to be reviewed and accepted by the Owner's Representative.

3.02 CONVEYING AND PLACING CONCRETE TOPPING

A. Convey concrete from the mixer to the clarifier base slab in accordance with ACI 301.

B. Placing Concrete:
   1. General:
      a. Place concrete in accordance with ACI 301. Do not permit concrete to drop freely more than 4-ft.
   2. Placing Concrete By Pumping:
      a. Concrete topping placed by pumping is at Contractor's discretion and shall not be cause to change or relax specified mix design characteristics. Concrete shall possess the specified characteristics at the point of placement.
      b. Measure slump at the hose discharge, except as follows: Initial slump testing in each placement shall occur at both the pumping unit inlet hopper and hose discharge. Slump loss in pumping, measured between the inlet hopper and the hose discharge, shall not exceed 1 inch. After these criteria have been satisfied, slump may be measured at the inlet hopper with allowable slump increased by the earlier measured difference, not to exceed 1 inch.
      c. Measure air content at the hose discharge, except as follows: Initial air content testing shall occur at both the pumping unit inlet hopper and the hose discharge. Loss of air content shall be measured between the inlet hopper and the hose discharge. Increase the air content of the delivered concrete at the inlet hopper to provide the specified air content at the hose discharge. After these criteria have been satisfied, air content may be measured at the inlet hopper.
   3. Placing Concrete In Hot Weather:
      a. In temperatures above 80 degrees F, place concrete in accordance with ACI 305.1.
   4. Placing Concrete In Cold Weather:
      a. In temperatures below 45 degrees F, place concrete in accordance with ACI 306.1.

3.03 CONSOLIDATE CONCRETE:

A. In accordance with ACI 301.

3.04 CURING

A. General:
   1. Cure concrete topping using water, a membrane curing compound, or by a combination of both methods.
   2. Maintain concrete surface temperature between 50 degrees F and 80 degrees F for at least 5 days. Cure concrete in hot weather (above 80 degrees F) in accordance with ACI 305.1. Cure concrete in cold weather (below 45 degrees F) in accordance with ACI 306.1.

B. Water Curing:
   1. Keep concrete continuously wet for a minimum of 10-days after placement. Absorptive mats or fabric may be used to retain moisture during the curing period.
   2. Use water curing in hot weather. Cover surface and keep moist.

C. Curing Compound:
   1. When curing compound is allowed, apply it as soon as the concrete has set sufficiently so as not to be marred by the application. Preparation of surfaces, application procedures, and installation precautions shall follow manufacturer's instructions.
   2. Apply curing compound at twice the manufacturer's recommended dosage rate, applied in two coats perpendicular to each other.

3.05 PROTECTION

A. Protect concrete topping from injurious action by sun, rain, flowing water, frost, and mechanical means.

B. Arrangements for covering, insulating, heating, and protecting concrete in cold weather shall be in accordance with ACI 306.1.

3.06 CONSTRUCTION JOINTS

A. Place concrete topping continuously without joints.

3.07 PREPARATION OF EXISTING CONCRETE

A. Bonding of New Concrete Topping To Existing Slab:
   1. Remove entire existing grout/concrete topping.
   2. Roughen existing concrete slab surface by abrasive blasting, bush hammering, or other method to achieve ¼-inch amplitude surface. Clean prepared surface.
   3. Coat existing surface with epoxy bonding compound immediately prior to placement of new concrete topping. As an alternate, wet concrete slab surface to a saturated, surface dry condition, apply a cement paste (topping mix without course aggregate) and scrub the paste into the existing surface using stiff brooms. Immediately apply concrete topping prior to drying of the scrub coat paste.

3.08 CONCRETE TOPPING FINISH

A. General:
   1. Do not use dry cement on new concrete surfaces to absorb excess moisture.
   2. Immediately after final finish is applied, the surface shall be cured and protected as specified above.

B. Float Finish:
   1. Apply float finish to concrete topping by final spreading and truing of the topping using the clarifier equipment. “Sweep-in” the concrete topping by first changing out the existing clarifier mechanism scraper blades with a similar temporary blade as recommended by the equipment manufacturer for this use.
   2. After “sweeping-in” the concrete topping, wait and begin final floating when the bleed water sheen has disappeared and the surface has stiffened sufficiently.
   3. Floating shall close cracks and checks plus compact and smooth the surface. Float the concrete topping to a uniform texture using the existing clarifier mechanism.

3.09 FIELD SAMPLING AND TESTS

A. General:
   1. Field sampling and tests shall be performed by the Contractor’s independent testing laboratory. Samples of aggregates and concrete will be obtained at such times to represent the quality of the materials and work throughout the project.
   2. The laboratory shall provide necessary labor, materials and facilities for sampling aggregate and for casting, handling, and initially storing the concrete samples at the work site.
   3. The minimum number of samples and tests are specified below.

B. Sampling:
   1. Aggregates:
      a. General:
         1) Sample fine and coarse aggregates in accordance with ASTM D75 not less than 30 days prior to the use of such aggregates in the work.
      b. Coarse Aggregate:
         1) Take a sample weighing between 50 and 60 pounds after the batch plant is brought up to full operation.
         2) Take samples to obtain a uniform cross section, accurately representing the materials on the belt or in the bins for sieve analysis.
      c. Fine Aggregate:
         1) Take samples as specified for coarse aggregate.
         2) Take samples of sand when the sand is moist for sieve analysis and specific gravity tests.
   2. Concrete:
      a. Take samples of plastic concrete in accordance with ASTM C172.
      b. Take samples at the hopper of transit mix truck, except as noted in the Placing Concrete by Pumping article above.

C. Testing:
    1. Aggregate:
        a. Repeat of the entire concrete mix design test program is required before source changes will be accepted.
    2. Concrete:
        a. Strength Tests:
            1) Verify the strength specified for the design mix by the independent testing laboratory during placement of the concrete topping. Verification shall be accomplished by testing standard cylinders of concrete samples taken at the job site. Cylinders shall be 4 x 8 inch or 6 x 12 inch.
            2) Concrete samples shall represent the concrete placed. One set of six standard 6 x 12 inch (or nine 4 x 8 inch) cylinders shall be cast for each clarifier topping. Provide additional cylinders when an error in batching is suspected. Each set of cylinders are cast from material taken from a single load of concrete.
            3) Casting, handling, and curing of cylinders shall be in accordance with ASTM C31.
            4) Testing of specimens for compressive strength shall be in accordance with ASTM C39. Two standard cylinders (three 4 x 8) tested at 7-days and two standard cylinders (three 4 x 8) tested at 28-days. The remaining cylinders are held in reserve.
            5) A strength test consists of the average strength of two 6 x 12 inch (three 4 x 8). If one cylinder shows evidence of low strength due to improper sampling, casting, handling, or curing, the result of the remaining cylinders may be used if approved by the Owner's Representative.
            6) The 28-day strength test results of the cylinders representing the concrete topping at each clarifier shall be equal to or greater than the specified strength. Individual strength test result shall not be less than the specified strength by more than 500 pounds per square inch.
            7) Provide certified reports of the test results directly to the Owner's Representative and Engineer. Test reports shall include sufficient information to identify the mix used, the stationing or location of the concrete placement, and the quantity placed. Slump, water/cement ratio, air content, temperature of concrete, and ambient temperature noted.
        b. Tests for Consistency of Concrete:
            1) Measure slump in accordance with ASTM C143. Take samples for slump determination from concrete during placement. Tests shall be made at the beginning of concrete placement operation, whenever test cylinders are cast, and at subsequent trucks to ensure that the specification requirements are met.
            2) For pumped concrete, measure slump in accordance with the Placing Concrete by Pumping article above.
            3) When high range water reducer is added at the site, slump tests shall be taken before and after addition of the admixture.

c. Tests for Temperature and Air Content:
    1) Temperature tests shall be made at frequent intervals during hot or cold weather conditions until satisfactory temperature control is established. Perform temperature tests whenever test cylinders are cast.
    2) Measure air content in accordance with ASTM C231 whenever test cylinders are cast. For pumped concrete, measure air content in accordance with the Placing Concrete by Pumping article above.

3.10 CLEANUP

A. Upon completion of the work and prior to final inspection, clean concrete surfaces as follows: Sweep with a broom to remove loose dirt and debris, then flush with clean water.

B. Coordinate dewatering activity with Owner until clarifier is returned to service.

SECTION 03 48 11

PRECAST CONCRETE VAULTS

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Factory design and manufacture of precast concrete vault sections and accessories.

B. Quality assurance and control.

C. Field installation of vaults.

D. Waterproofing and epoxy coating of vaults.

E. Installation of frames, hatches, and fall protection.

F. Ladders and safety devices.

G. Vault schedule.

1.04 DESIGN

A. All vaults shall be designed by a licensed professional engineer registered in the State of Utah, and engaged by the manufacturer. All dead loads, live loads, flotation, erection, temperature and anchorage stresses shall be considered.

B. The calculations and drawings shall be prepared in a neat and legible manner, sealed by the licensed Professional Engineer performing the calculations.

C. The sealed calculations shall include a summary page to list all design loads, material specifications, and design criterion used in the calculations.

D. For design, groundwater shall be assumed at grade and the design shall provide for a 125 percent factor of safety against floatation.

E. Vaults shall be designed for H-20 wheel load on top slab, hatches, and surcharge loading at grade around all sides of the vault.

1.05 SUBMITTALS

A. Submit evidence that shows current PCI, NPCA, and/or DOT certification.

B. Submit shop drawings of wall sections and bases proposed for this project, include joint design and related details for field assembly as applicable.

C. Submit certification of conformance with Contract Documents and ASTM C478, C858, and C913.

D. Submit catalog cut and installation details for cast iron manhole covers, aluminum hatches with fall protection grates, and ladders with safety devices

E. Submit catalog cut for epoxy coating system used at interior surfaces and waterproofing system used on exterior surfaces.

F. Under a separate submittal, provide two file copies of calculations for each vault indicating all loads and load combinations. Other than the summary page, calculations will not be reviewed; calculations will not be returned to Contractor.

1.06 QUALITY ASSURANCE

A. Manufacturer shall be a PCI, NPCA, and/or DOT-certified plant for production of precast vaults as specified herein.

B. Aggregate used in producing concrete shall be from DOT approved sources.

1.07 QUALITY CONTROL INSPECTION

A. The quality of all materials, the process of manufacture and the finished sections shall be subject to inspection by Engineer. Such inspection may be made at the place of manufacture and/or at the Site after delivery.

B. All sections shall be inspected for general appearance, dimensions, soundness, etc. The surface shall be dense, close-textured and free of honeycomb, cracks, roughness, exposure of reinforcement, damaged joints, or other irregularities.

C. All sections which have been damaged after delivery will be rejected, or if already installed, shall be repaired or removed and replaced entirely at Contractor's expense.

D. Rejected sections shall be tagged as such, segregated from other sections, and removed from the Site.

PART 2 PRODUCTS

2.01 CONCRETE

A. Reference Section 03 30 00.

2.02 REINFORCEMENT

A. Reference Section 03 20 00.

2.03 PRECAST OR CAST-IN-PLACE CONCRETE BASES

A. Design and manufacture of precast concrete bases shall conform to the requirements of this section and ASTM C478, C858, and C913. Cast-in-place concrete bases shall conform to Section 03 11 00 and Section 03 30 00.

B. Bases shall conform to the dimensions indicated on the Drawings or as required by design. The horizontal joint at the top of the base shall be compatible with that of the precast wall section.

C. Sumps shall be field constructed where shown on the Drawings. Walking surfaces shall be sloped to the sump, have a non-slip broom finish, and be sealed with a penetrating concrete sealer. Minimum concrete fill thickness at sumps shall be two inches.

2.04 PRECAST CONCRETE WALLS

A. Design and manufacture of precast concrete walls shall conform to the requirements of this section and ASTM C478, C858, and C913.

B. All tongue-and-groove joints in the precast wall, including the joint at the top of the base, shall be made up using gaskets.

C. The precast sections shall be provided with a special groove to receive and hold the gasket in position during joint assembly.

D. After joint assembly, the gap between sections shall be packed on the inside and outside with "Masterflow 713" by Master Builder; "Five Star Grout" by U.S. Grout Corp.; or equal, and shall be troweled smooth so that no projections remain on the inside. There shall be concrete to concrete bearing between the various sections. The gasket shall not support the weight of the section.

2.05 PRECAST CONCRETE SLAB TOPS

A. Precast reinforced concrete slab tops shall be manufactured in accordance with ASTM C478, C858, and C913. Openings and frames shall be provided for hatches where shown on the Drawings. Slab tops shall be set in a full bed of mortar.

B. Slab tops shall be crowned or sloped to drain, minimum 1/4 inch per foot.

C. Concrete slab tops shall receive a non-slip broom finish and a penetrating concrete sealer per Section 03 30 00.

2.06 GRATING TOPS

A. Where grated tops are shown on the Drawings, the Contractor shall supply fabricated grating frames to the precast manufacturer and coordinate the grating installation for a complete Project.

2.07 PIPE SEALS

A. Where polyethylene, plastic or PVC pipe is utilized, connections between vault and pipes shall be made with flexible rubber sleeves with stainless steel straps and bolts. Provide an elastomeric waterstop gasket where sleeve sizes are not commercially available.

B. The annular space around the pipe wall or sleeve shall be packed with “Masterflow 713” by Master Builders, “Five Star Grout” by U.S. Grout Corp.; or equal. Before the grout has set, Contractor shall recheck invert elevations of the pipe.

C. For steel or ductile iron pipe, provide a pipe sleeve sized to accept the pipe plus a modular mechanical seal such as Link Seal or equal.

2.08 HATCHES

A. Hatches shall be of the size and type shown on the Drawings and as described in Section 08 31 20.
   1. Aluminum single leaf, watertight gasketed floor hatch. Floor hatch shall be furnished with flush stainless steel hinges, aluminum stiffeners, and lockable slam latch. Hatches shall have extended aluminum frame to match concrete thickness with continuous anchor and shall be constructed of 1/4 inch minimum aluminum diamond pattern plate design.
   2. Hatches shall be provided with an auto-lock, hold-open device and torsion spring assembly. All hardware, including all parts of the latch and lifting mechanism assemblies, hold-open arms and guides, and all brackets, hinges, pins and fasteners shall be stainless steel or bronze.
   3. The hatches shall be designed for an H-20 wheel load. A 1-inch drain coupling shall be provided in hatch frame. Contractor to extend drain to exterior of structure or to sump pit at vaults intended to remain dry.
   4. At all hatches, provide a hinged aluminum grate fall-through protection system.

2.09 LADDER

A. Where shown on the Drawings, provide ladders as specified in Section 05 50 00.

B. Where shown on Drawings, provide ladder rungs made of cast iron or polypropylene with steel reinforcement. Rungs shall be either cast in place or drilled and adhesive grouted in the shop. Rungs are equally spaced at a maximum 12-inch spacing from the top of the base slab to the top of the top slab.

C. Install ladder rungs so that the distance from the rungs to the finished wall is 7 inches.

D. Provide aluminum or stainless steel ladder access safety post as specified in Section 08 31 20

2.10 OPENINGS AND INSERTS

A. All openings required in the concrete shall be reinforced with additional diagonal bars tied to each layer of wall or slab reinforcement.

B. Any required pipe sleeves, inserts, and wall openings shall be coordinated with mechanical requirements prior to casting the units.

2.11 WATERPROOFING

A. Around the exterior of all wall joints, apply the “Bituthene” primer and membrane waterproofing system by W.R. Grace Company, or equal.

B. Exterior wall surfaces shall be waterproofed using manufacturer’s standard two-coat system, specifically designed to waterproof the exterior of concrete surfaces in a below-grade submerged condition.

C. For the top slab and above-grade exposed side walls, the concrete shall be sealed as per Section 03 30 00.

2.12 EPOXY COATING

A. The interior surface of the wet well shall receive a factory applied epoxy coating. Apply at wall surfaces (full height) and ceiling.

B. Surfaces shall be abrasive blasted and allowed to cure a minimum of 28 days prior to application of epoxy coating system. Follow manufacture’s instructions for primer, application temperatures, etc. Use Sika Corporation “Sikagard 62”, Euclid Chemical Company “Duraltex 1707”, or equal.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that subgrade elevations for vault base is correct, excavation is dewatered, and subgrade is pre-compacted.

B. Verify that rejected units have been removed from Site.

3.02 PREPARATION

A. Provide foundation mat of run-of-crusher stone to support base. Mat shall be 6 inches minimum depth and shall bear on sound undisturbed earth; excavate and remove subgrade material as necessary to reach sound subgrade.

B. Stone foundation mat shall be a minimum of 1 foot greater than the footprint of the vault base, and shall be compacted to a uniform, level surface.

3.03 INSTALLATION

A. Vault shall be accurately located and uniformly supported on the foundation mat in a level position.

B. Install wall sections in properly oriented position; follow manufacturer's instructions for joining together each section using the gaskets. Pack joints with grout.

C. Units shall be laid-up plumb and level.

D. Contractor is responsible for the integrity of all materials and protection against flotation during the installation and backfilling process.

3.04 COATINGS

A. All exterior below-grade wall joints shall be sealed using a membrane waterproofing system. Next, all below-grade wall surfaces shall be waterproofed, applied per manufacturer's instructions.

B. After installation is complete, the cover slab and interior walking surfaces shall be sealed as specified above.

C. After installation of mechanical equipment, provide touch-up painting of damaged epoxy wall finish.

3.05 BACKFILLING

A. Backfill using well compacted structural fill material, being careful to not damage exterior waterproof coating while providing full support under connecting pipes using compacted bedding material.

B. During the one year warranty period, all visible leaks shall be sealed in an approved manner.

3.06 SCHEDULE OF VAULTS

Vault Identification	Reference Drawing
Perimeter Drain Pump Station	GM-05 Perimeter Drain Pump Station
Infiltration Gallery Pump Station	GM-04 Infiltration Gallery Pump Station

SECTION 03 60 00

GROUTING

PART 1 GENERAL

1.01 DESCRIPTION

A. Section includes: Grout for column base plates, other structural supports, equipment bases, reinforcing bar dowels, surface repair, grout toppings, patching of fresh concrete, and uses other than masonry. Grout for masonry is specified in Section 04 20 00. Adhesive anchor bolt grouting is specified in Section 05 05 20.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 03 30 00 Cast-In-Place Concrete
   2. Section 04 20 00 Concrete Unit Masonry
   3. Section 05 05 20 Anchor Bolts
   4. Section 43 05 13 Rigid Equipment Mounts

1.04 SUBMITTALS

A. Action Submittals
   1. Procedure: Section 01 33 00:
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   4. Complete product literature, including mixing, handling and placement instructions for the following: Cementitious non-shrink grout, epoxy grout, adhesive for reinforcing bar dowel grouting, concrete repair mortar, and prepackaged cement grout products to be used on the project.
   5. Mix design for cement grout that is not prepackaged, including product data for aggregates and cement in accordance with Section 03 30 00.
   6. Current ICC Evaluation Service reports for adhesives used for reinforcing dowels.
   7. Installer certification in accordance with ACI/CRSI Adhesive Anchor Installer Certification Program for installers of horizontal or upwardly inclined reinforcing bar dowels grouted using adhesive.
   8. Certified test results verifying the compressive strength, shrinkage and expansion requirements specified herein.

1.05 QUALITY ASSURANCE

A. Quality Control by Owner
   1. The Owner will provide the services of a qualified Special Inspector in accordance with Section 01 45 29.
   2. Adhesive anchors installed in horizontal or upwardly inclined orientations to resist sustained tension loads shall be continuously inspected during installation by a Special Inspector.
      a. The Special Inspector shall furnish a report to the Engineer, Owner's Representative and Building Official that the work covered by the report has been performed and that the materials used and the installation procedures used conform with the approved Project Manual and the Manufacturer's Printed Installation Instructions (MPII).

B. Quality Control by Contractor
   1. Provide the services of an independent testing laboratory which complies with the requirements of ASTM E329 if a product other than those listed below is proposed and test data is not available from the supplier to demonstrate equivalence to the specified grout. The testing laboratory shall sample and test the proposed grout materials. Costs of testing laboratory services shall be borne by the Contractor.

C. Certifications
   1. Installer certification shall be in accordance with ACI/CRSI Adhesive Anchor Installer Certification Program for installers of horizontal or upwardly inclined reinforcing bar dowels grouted using adhesive.

D. Compression test specimens will be taken during construction from the first placement of each type of grout and at intervals thereafter as selected by the Engineer to insure continued compliance with these Specifications.
   1. Compression tests and fabrication of specimens for epoxy grout will be performed as specified in ASTM C579, Method B, at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing at seven days and any other time period as appropriate.
   2. Compression tests and fabrication of specimens for cement grout and non-shrink grout will be performed as specified in ASTM C109 at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing at seven days, 28 days and any additional time period as appropriate.

E. Manufacturer Qualifications
   1. Manufacturer shall have a minimum of five years experience of producing products substantially similar to that required and shall be able to submit documentation of at least five satisfactory installations that have been in successful operation for at least five years each.
   2. When required, provide services of manufacturer's full-time employee, factory-trained in handling, use, and installing the products required, with at least five years of experience in field applications of the products required.

PART 2 PRODUCTS

2.01 CEMENTITIOUS NON-SHRINK GROUT

A. The grout material shall be an approved ready to use mixture requiring only water for use at the job site. The 2-inch cubes shall have a minimum compressive strength of 3,000 psi at 7 days and 7,000 psi at 28 days.

B. Cementitious non-shrink non-metallic aggregate grout shall be:
   1. BASF, Masterflow 928
   2. Euclid Chemical Company, Hi-Flow Grout
   3. Five Star Products, Inc., Five Star Grout
   4. Sika Corporation, SikaGrout 212
   5. Approved Equal

C. Non-shrink grout shall conform to CRD-C 621 and ASTM C1107, Grade B or C when tested at a maximum fluid consistency of 30 seconds per ASTM C939 at temperature extremes of 45 degrees Fahrenheit and 90 degrees Fahrenheit and an extended working time of 15 minutes.

D. Fluid grout shall pass through the flow cone, with continuous flow, one hour after mixing.

2.02 EPOXY GROUT FOR EQUIPMENT MOUNTING:

A. Epoxy grout shall be a pourable, non-shrink, 100-percent solids system.

B. Epoxy grout for equipment mounting shall be a non-cementitious, resin based, multi-component formulation. Epoxy grout shall be flowable, with shrinkage minimized to achieve minimum 98% effective bearing area. Epoxy grout shall be:
   1. BASF, Masterflow 648
   2. Euclid Chemical Company, E3-G
   3. Sika Corporation, Sikadur 42
   4. Approved Equal.

C. The following properties shall be attained with the minimum quantity of aggregate allowed by epoxy grout manufacturer.
   1. Length change after hardening shall be less than 0.0006-inch per inch and coefficient of thermal expansion shall be less than 0.00003-inch per inch per degree F when tested in accordance with ASTM C531.
   2. Compressive creep at one year shall be less than 0.001-inch per inch when tested under a 400-psi constant load at 140 degrees F in accordance with ASTM C1181.
   3. Minimum seven-day compressive strength shall be 14,000 psi when tested in accordance with ASTM C579
   4. Grout shall be capable of maintaining at least a flowable consistency for minimum of 30 minutes at 70 degrees F.
   5. Shear bond strength to portland cement concrete shall be greater than shear strength of concrete when tested in accordance with ASTM C882/C882M.

2.03 ADHESIVE FOR GROUTING REINFORCING BAR DOWELS

A. Adhesive for setting dowels in concrete shall be an injectable two-component epoxy adhesive. Adhesive shall be approved for the intended use per the product ICC Report. Adhesive shall be as per the General Structural Notes.

B. Adhesive for setting dowels in concrete masonry shall be an injectable two-component epoxy adhesive. Adhesive shall be approved for the intended use per the product ICC Report or IAPMO Report. Adhesive shall be as per the General Structural Notes.

2.04 CONCRETE REPAIR MORTAR

A. Horizontal Applications: Repair mortars shall be:
   1. BASF, MasterEmaco S 466CI
   2. Sika Corporation, SikaTop 111 Plus
   3. Approved Equal

B. Vertical and Overhead Applications: Repair mortars shall be:
   1. BASF, MasterEmaco 1500HCR Vertical Overhead
   2. Sika Corporation, SikaTop 123 Plus
   3. Approved Equal

2.05 CEMENT GROUT

A. Cement grout shall be comprised of cement, fine aggregate, coarse aggregate, water, and admixtures proportioned and mixed in accordance with this Section.
   1. Minimum Compressive Strength: 4,500 psi at 28 days.
   2. Maximum Water Cement Ratio: 0.42 by weight.
   3. Coarse Aggregate: ASTM C33/C33M, No. 8 size.
   4. Fine Aggregate: ASTM C33/C33M, approximately 60 percent by weight of total aggregate.
   5. Air Content: Five percent (plus or minus one percent).
   6. Minimum Cement Content: 564 pounds per cubic yard.
   7. Slump for grout fill shall be adjusted to match placing and finishing conditions, and shall not exceed four inches.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine and accept existing conditions before beginning work.

3.02 CEMENTITIOUS NON-SHRINK GROUT

A. Non-shrink, cementitious, nonmetallic aggregate grout shall be used for column base plates, structural bearing plates, and all locations where the general term “non-shrink grout” is indicated on the Drawings. Use of this grout to support the bearing surfaces of machinery shall be as specified in Section 43 05 13 or as detailed on the Drawings for specific locations or pieces of equipment. If guidance is not provided in locations noted above, use of non-shrink grout for equipment mounting shall be limited to equipment less than 25 horsepower or 750 pounds. Grout shall be placed and cured in accordance with the manufacturer's instructions.

B. Non-shrink cementitious grout shall not be used as a surface patch or topping. Non-shrink cementitious grout must be used in confined applications only.

3.03 EPOXY GROUT FOR EQUIPMENT MOUNTING

A. Prepare concrete surfaces of equipment pads as indicated in details on the Drawings and as required by the epoxy grout manufacturer. Epoxy grout for equipment mounting shall be placed and cured in accordance with the requirements of Section 43 05 13, details on the Drawings, and in conformance with manufacturer’s recommendations.

3.04 ADHESIVE FOR GROUTING REINFORCING BAR DOWELS

A. Follow manufacturer’s instructions.

3.05 CONCRETE REPAIR MORTAR

A. Concrete repair materials and procedures shall be submitted for review to the Owner's Representative and shall be accepted prior to commencement of the repair work.

B. Follow all manufacturer's instructions, including those for minimum and maximum application thickness, surface preparation and curing. Add aggregate as required per manufacturer's recommendations. Any deviations from the manufacturer's instructions shall be submitted for review to the Owner's Representative and shall be accepted prior to commencement of the work.

3.06 CEMENT GROUT

A. Cement grout shall be used for grout toppings less than four inches thick and for patching of fresh concrete.

B. Grouting shall comply with temperature and weather limitations in Section 03 30 00, Cast-In-Place Concrete.

C. Cure grout in accordance with grout manufacturer's instructions for prepackaged grout and Section 03 30 00, Cast-In-Place Concrete, for non-prepackaged cement grout.

END OF SECTION

SECTION 03 70 00

MASS CONCRETE

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes: Requirements for cast-in-place mass concrete as defined in Section 03 30 00 for Class A concrete.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 03 30 00 Cast-In-Place Concrete

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ACI 207.1R	Guide to Mass Concrete
ACI 207.2R	Report on Thermal and Volume Change Effects on Cracking Of Mass Concrete
ACI 207.4R	Cooling and Insulating Systems for Mass Concrete
ACI 301	Specifications for Structural Concrete
ASTM C494	Chemical Admixtures for Concrete

1.04 SUBMITTALS

A. Action Submittals
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

4. Temperature control plan, including system for monitoring the temperature of concrete and reducing excessive temperature and temperature differentials. Temperature control plan shall include the following items:
    a. Calculated or measured temperature rise of concrete.
    b. Upper limit for concrete temperature at time of placement.
    c. Description of specific measures and equipment that will be used to ensure maximum temperature in placement will not exceed specified maximum temperature limit.
    d. Calculated maximum temperature in placement based on expected conditions at time of placement and use of proposed measures to control temperatures.
    e. Description of specific measures and equipment that will be used to ensure temperature difference will not exceed specified temperature difference limit.
    f. Calculated maximum temperature difference in placement based on expected conditions at time of placement and use of proposed measures to control temperature differences.
    g. Description of equipment and procedures that will be used to monitor and log temperatures and temperature differences.
    h. Drawing showing locations for temperature sensors.
    i. Description of format and frequency of providing temperature data.
    j. Description of measures to address and reduce excessive temperatures and temperature differences, if they occur.
    k. Description of curing procedures, including materials and methods, and curing duration.
    l. Description of formwork removal procedures to ensure temperature difference at temporarily exposed surface will not exceed temperature difference limit, and how curing will be maintained.
    m. If concrete design mixture is changed, temperature control plan must be updated.
    n. Temperature control plan shall take into account and be coordinated with the lift heights that the Contractor plans for mass concrete pours. Locations of horizontal joints in the mass concrete pours due to planned lift heights shall be submitted for approval to the Engineer.
5. Performance-Based Temperature Difference Limit Approach:
    a. If the performance-based approach to differential temperatures is utilized (see Temperature Control article below in Part 3), submit report with substantiating test data and graphs showing relation between differential temperature and strength of concrete.
6. Layout of cooling pipe system, if used, showing pipe sizes and material type, connections, location, spacing, method of support, and system for monitoring the temperature of the water in the cooling pipes.

1.05 QUALITY ASSURANCE

A. General
1. Quality control shall be in accordance with Section 03 30 00, plus the additional provisions specified in this section for mass concrete.

PART 2 PRODUCTS

2.01 GENERAL

A. Mass concrete materials and concrete characteristics, including mix design, shall be in accordance with the requirements for Concrete Class in Section 03 30 00 and shall further comply with the additional requirements specified in this section.

1. Compressive Strength: Minimum compressive strength as specified in the General Structural Notes, but use 56-day compressive strength.
2. Cement:
    a. Cement shall be Portland Cement Type II (moderate heat of hydration), except as modified herein.
    b. Cement shall contain no more than 8 percent tricalcium aluminate.
    c. The sum of tricalcium aluminate and tricalcium silicate shall be less than 58 percent.
    d. Cement shall be stored in a covered, shaded silo to prevent heating by direct sunlight.
3. Coarse Aggregate:
    a. Aggregates shall be stored in a covered area and the aggregates shaded to prevent heating by direct sunlight.
    b. Aggregates shall be continuously sprayed with water to cool the aggregates. The water content of the concrete mix shall be adjusted to account for the cooling water.
4. Fine Aggregate:
    a. Aggregates shall be stored in a covered area and the aggregates shaded to prevent heating by direct sunlight.
    b. Aggregates shall be continuously sprayed with water to cool the aggregates. The water content of the concrete mix shall be adjusted to account for the cooling water.
5. Concrete Admixtures:
    a. Provide water reducing admixture, as specified in Section 03 30 00, in all mass concrete.
    b. Provide pozzolan (fly ash) as specified in Section 03 30 00 in all mass concrete. Note that only Class F fly ash is allowed.
    c. Set Retarding Admixture:
        1) At the Contractor's option, a set retarding admixture can be used to control set time and minimize premature setting of concrete and formation of cold joints.
        2) Set retarding admixture shall conform to ASTM C494, Type B.
        3) Admixture dosage shall be per the manufacturer's written requirements.
6. Water and Ice:
    a. Mixing water shall be as specified in Section 03 30 00.
    b. Ice used in lieu of, or in addition to, mixing water shall be made from water conforming to Section 03 30 00.

PART 3 EXECUTION

3.01 PLACING CONCRETE

A. Concrete placement shall conform to Section 03 30 00 except as modified herein.

3.02 TEMPERATURE CONTROL

A. General:
   1. Maximum as-delivered concrete temperature shall be 70 degrees F.
   2. During placement of concrete, temperature control measures shall be in place to limit the maximum initial concrete temperature rise to 20 degrees F during placement.
   3. The maximum allowable temperature of the concrete shall be 158 degrees F.
   4. Difference in temperature between concrete interior and surface temperatures shall not exceed 35 degrees F. As an alternative to meeting the 35 degree F maximum differential temperature limit, submit for approval a "Performance-Based Temperature Difference Limit" approach where the allowable differential temperature limit varies with the in-place compressive strength of the concrete (reference ACI 207.2R for more information on this approach). The performance based approach shall be based on measurements of key thermal and physical properties of the project mass concrete mix, such as compressive strength, elastic modulus, and tensile strength, to determine relations between these parameters.
   5. Install a temperature monitoring system to measure temperatures within the interior and at the surface of the concrete.
   6. Provide a means to control the concrete temperature differential based on the temperature monitoring data.
   7. The interior of the concrete shall be allowed to cool down and stabilize for a minimum of 21 days from the time of placement.
   8. No mass concrete placement shall occur until written approval of the temperature control plan.

B. Pre-Cooling of the Concrete Mix:
   1. Pre-cooling of the concrete mix prior to placement may also be attained by the following means:
      a. Batch water shall be cooled and ice may be substituted for a portion of the batch water.
      b. Alternative means proposed and approved by the Construction Manager.

C. Cooling During Concrete Placement:
   1. Use fog sprayers to reduce the ambient air temperature. Adjust the water content of the concrete to account for added water.

D. Post-Cooling of the Concrete:
   1. Concrete shall be water cured as soon as possible following placement per the requirements of Section 03 30 00. Cold water shall not be used for curing because it will increase the differential temperature between the surface and interior.

2. The temperature of the interior and surfaces of the concrete shall be continuously monitored during the cooling period.
3. The cooling period is defined as the time required for the interior of the concrete placement to stabilize and shall be a minimum of 21 days from the time of placement.
4. Insulating blankets may be used over the pumped curing water to prevent rapid surface cooling.
5. Embedded thin-walled piping and circulating water may be used to control heat gain in the previously cast concrete. Clearly indicate in the temperature control plan if cooling piping will be embedded in the concrete. The embedded piping shall not be installed within the top 20 inches of the slab or wall. The cooling pipe system shall be operated for the duration of the cooling period.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 93 20

CHEMICAL GROUT CRACK INJECTION

PART 1 GENERAL

1.01 DESCRIPTION OF WORK

A. Seal leaking cracks and joints in concrete by pressure injecting chemical resin to prevent water leakage into the areas. Work includes, but not limited to, the following.
   1. Injection of chemical grout to seal leaking cracks and joints.

1.02 RELATED SECTIONS

A. Section 03 30 00 Cast-in-Place Concrete

1.03 INJECTION SUBMITTALS

A. Product Data: Provide manufacturer's information and technical data on the injection materials.

B. Samples:
   1. Injection resin materials, 1 each type.
   2. Packers.

C. Qualification Data: For installers and manufacturers.
   1. For Injection Specialist and supervisor on the project, submit a list of at least 5 similar injection projects that the Injection Specialist and supervisor on the project have completed successfully.
   2. For products required to be installed by workers approved by product manufacturers, include letters of acceptance by product manufacturers certifying that installers are approved to apply their products.

D. Quality Control Submittals:
   1. Certificates: Furnish manufacturer's certification that materials meet or exceed Specification requirements, including certified test laboratory reports as necessary for compliance with the requirements.
   2. Manufacturer's Instructions: Furnish manufacturer's literature, specifications, and application instructions.
   3. Procedure: Submit written description of water-proofing procedures and operations sequencing based on manufacturer's requirements prior to commencing the Work.
   4. Submit intent to guarantee document (sample warranty) and all warranty requirements, with a performance guarantee against water penetration through approximately 95 percent of the length of the crack that was injected for a 1 year period. It is expected that approximately 5 percent of the injected crack area could experience leakage in the future.

E. Guarantee: Submit applicators guarantee and manufacturer’s warranty.

1.04 QUALITY ASSURANCE

A. Manufacturer Qualifications: The manufacturer shall be a domestic company with at least twenty years of manufacturing experience in the field of injection resins. The manufacturer shall maintain product liability insurance in the amount at least two million dollars aggregate coverage.

B. Contractor Qualifications: Company specializing in the injection repair of cracks shall have a minimum of three years' experience and at least five similar installations of equal magnitude which have proven successful in all respects for a period of at least three years. Contractor shall be trained by the injection material manufacturer and certified in order to obtain the manufacturer's warranty.

C. Manufacturer's Representative: All work of this Section shall be performed under the supervision of the injection material manufacturer's representative. The representative shall attend pre-construction meetings and make regular visits during the course of construction to ensure that method of installation is acceptable so that warranty will be obtained.

D. Mockups: Prepare mockups for crack injection to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

E. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver all materials in the manufacturer's sealed original container's bearing the manufacturer's name and product identification in a manner to prevent damage by breakage, water or moisture.

B. Store and handle all products of this section in a strict compliance with the manufacturer's instructions.

1.06 PROJECT CONDITIONS

A. Do not execute the Work of this section unless the Owner's Representative is present, or unless the Representative directs that the Work be performed during the Representative's absence.

B. Execute the work of the section in presence of the product manufacturer's representative.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Do not apply if the temperature is below 50°F or above 85°F unless the material manufacturer is consulted for recommendations.

1.08 ENVIRONMENTAL REQUIREMENTS

A. Warranty: Furnish a labor and material warranty (ies) for the Work of this Section, to cover the repair for a period of 1-year warranty. The warranty shall include but not be limited to, repair of leakage in more than 5 percent of the total length of cracks injected that were caused by defects in materials or workmanship within areas of injection. The monetary value of the warranty shall be at least equal to the original cost of the installation.

B. Should any defects develop or any leaks occur in the Work within the guarantee/warranty period, such defects or leaks shall at once be remedied and made good without cost or expense to the Owner.

PART 2 PRODUCTS

2.01 MATERIALS, GENERAL

A. Source Limitations: Obtain each color, grade, finish, type, and variety of product from single source with resources to provide products of consistent quality in appearance and physical properties.

2.02 MANUFACTURERS

A. DeNeef Construction Chemicals Inc.

B. 5610 Brystone Drive

C. Houston, TX 77041

D. Phone: (800) 732-0166

E. Approved Equivalent.

2.03 MATERIAL

A. General:
   1. Chemical grouts (resins) are to be used for sealing concrete cracks and joints to prevent current or future water seepage. The selection of a particular material for use at a specific location shall be based on the nature of the crack or joints in relation to the materials properties.
   2. The methacrylic acrylate copolymer resin is intended for use in filling small to moderate sized cracks in concrete with little or minimal running water.
   3. The Owner shall have final approval on the choice of resin system for each application.

B. Products:
   1. Methacrylic acrylate copolymer resin:
      a. Hydrophilic methacrylic acrylate copolymer resin shall be a two component resin system for injection into cracks to create a waterproof barrier. The cured resin shall be capable of an elongation at break of 300%. Viscosity shall be less than 6-8 cps when mixed.
         1) Material shall be Superflex AR by DeNeef.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine all adjoining work on which this Work is in anyway dependent for proper installation and workmanship. Report to the Owner and Engineer any conditions that prevent the performance of this Work.

3.02 SURFACE PREPARATION AND PROTECTION

A. Remove paint, oil, and foreign material off all concrete surfaces of area to be injected prior to injection. Cleaning shall be to a degree acceptable to the injection material manufacturer.

B. Protect adjacent areas from chemicals.

C. Keep area dry by mopping and pumping in order to place material and determine crack location.

D. Clean surface of injection area to locate crack.

E. Preparatory Work:
   1. Drill holes diagonally at a 45° angle to intersect crack or joint. Hole diameter shall suit injection packer size. Injection packer shall be acceptable to the grout manufacturer.
   2. Distance from starting of hole to crack or joint shall be equal to one-half the thickness of the structural slab or wall. This will be usually determined by trial and error.
   3. If the repair is at a crack, holes should be spaced on both sides to ensure that at least one-half of the total number of holes shall intersect the crack.
   4. Spacing of holes shall be dependent upon crack width and chemical grout material viscosity to ensure continuity of seal within the crack or joint. Spacing of holes should not exceed 1'-6" on center, unless demonstrated to be effective.
   5. The drilled holes shall be produced by a rotary percussion hammer drill using a masonry bit with a minimum diameter of ½" to a maximum diameter of 5/8". Masonry bits need to be sharp and straight as not to produce out-of-round holes.
   6. The drilling of the grout holes shall in no way cause damage to the reinforcing bars or electrical conduit. It is the contractor's responsibility to locate reinforcing bars and conduit prior to drilling grout holes.

3.03 INJECTION WORK

A. Prepare components as per manufacturer's instructions. Add accelerator to suit field conditions, including, but not limited to, water flow, surface being injected, ambient temperature, crack or joint width, etc. Process chemical resin materials using appropriate protective gear including gloves, mask or goggles, and appropriate clothing. Follow manufacturer's recommendation for product safety guidelines.

B. Drill holes and cracks shall be vacuumed and cleaned with water prior to receiving packers and injection of the resin. Typical pressure needed to flush a crack shall be between 200 and 300 psi. The flushing may reveal blind drill holes, voids, cavities, honeycombs that require special treatment. Modify application procedure as required. After flushing is completed at one injector, the Contractor shall repeat the procedure at the next injector until all have been flushed.

C. Using suitable power stainless steel pumping equipment acceptable to the manufacturer, pump components through a suitable static mixer to ensure homogeneous blending of the components. Static mixer shall be firmly coupled to injection packer to make sure residue does not clog.
   1. During pumping operations take proper precautions against loose or spalled concrete dislodging and falling.

D. If injection packers have been left out of holes to verify material travels, once material is observed at the next hole, a packer shall be securely placed in that hole. Begin pumping at that next packer. If all packers have been installed prior to pumping, when material flow has been observed exiting crack or joint adjacent to another packer, begin pumping at that packer.

E. For cracks on a wall, start at the lowest port and work up injecting resin until grout material appears at the next port adjacent to the one being filled.

F. When material appears at the adjacent port, discontinue injection at entry port and begin injection at the adjacent port.

G. If water is actively flowing, use the single-component polyurethane to prevent water from flowing. After the water is stopped, re-inject the same crack with the methacrylic acrylate copolymer resin or as recommended by the manufacturer. Other cracks and joints shall be repaired by using either the methacrylic acrylate copolymer resin at the crack or joint or the acrylate monomer resin to create a barrier.

H. Should set time need to be hastened, accelerator may be added in accordance with manufacturer's recommendation and Injection Contractor's experience.

I. When work is either complete or temporarily halted, flush static mixer with manufacturer's recommended solvent to prevent clogging.

J. Injection pressures shall be kept as low as possible to allow material to thoroughly permeate the full depth of the crack or joint.

K. Injection pressure will vary from 200 psi to 3000 psi depending on the width of the crack, thickness of the structure, and condition of the concrete. Surface surrounding the cracks should be wet down with water to reduce the grout's bonding ability, thus aiding in clean-up.

L. Inject all packers until no further chemical resin can be pumped.

M. If the Injection Contractor suspects that a void exists behind and/or beneath the concrete substrate after pumping excessive amounts of mixed injection resin into an injection port, he/she should cease pumping activities and immediately notify the Engineer and Owner's Representative.
   1. This contact and notification must take place within 24 hours of the work stoppage.

2. A jobsite meeting should be organized to include all parties involved, i.e., General Contractor, injection sub-contractor, Owner's Representative, Engineer of Record, and manufacturer's representative.
3. During this meeting, the area in question should be identified and investigated. A detailed plan will be discussed and formulated to ascertain what steps may be necessary to remediate the problem. Remedial work may require the void space to be filled with a cement grout by injection to fill the void prior to injecting the area further. It may be decided to continue with the resin injection. The Contractor may require additional compensation for the unforeseen work in the area requiring the remedial cement grout injection work or the additional chemical grout material.

N. If the crack or joint continues to leak, drill hole(s) in accordance with above procedures at the leaking segment(s) and repeat procedures for injection.

O. Remove the ports after work in complete. Remove at least 1" of resin material from the top 1" of the hole of resin material, and fill hole with urethane sealant, matching the texture of the existing concrete surface.

3.04 CLEANING AND PROTECTION

A. Clean all adjacent areas of excess material; powder, resin, and droppings.

3.05 FIELD QUALITY CONTROL

A. The Engineer will observe surfaces and reject any that contain defects. Any defective areas shall be fixed at Contractor's expense.

B. All work is to be done under the supervision of the manufacturer's representative.

C. Testing Agency: Owner will engage a qualified testing agency to sample materials and perform tests as follows:
1. Crack Injection Resin: Core drilled samples to verify proper installation.
   a. Testing Frequency: 1 sample for each 300 feet (30 m) of crack injected.
   b. Where samples are taken, fill holes with epoxy mortar.

END OF SECTION

SECTION 04 20 00

UNIT MASONRY

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies masonry work consisting of concrete masonry units, general unreinforced and reinforced masonry construction.

B. Type:
   1. Masonry work shall be constructed from units of concrete or clay in combination with reinforcing, mortar, and grout as specified.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A82	Steel Wire, Plain, for Concrete Reinforcement
ASTM A90	Weight of Coating on Zinc-Coated (Galvanized) Iron or Steel Articles
ASTM A153	Zinc Coating (Hot-Dip) on Iron and Steel Hardware
ASTM C27	Classification of Fireclay and High-Alumina Refractory Brick
ASTM C55	Concrete Building Brick
ASTM C67	Sampling and Testing Brick and Structural Clay Tile
ASTM C90	Loadbearing Concrete Masonry Units
ASTM C91	Masonry Cement
ASTM C129	Non-Load-Bearing Concrete Masonry Units
ASTM C144	Aggregate for Masonry Mortar
ASTM C150	Portland Cement
ASTM C207	Hydrated Lime for Masonry Purposes
ASTM C270	Mortar for Unit Masonry

Reference	Title
ASTM C404	Aggregates for Masonry Grout
ASTM C476	Grout for Masonry
ASTM C666	Resistance of Concrete to Rapid Freezing and Thawing
ASTM E514	Water Penetration and Leakage Through Masonry

B. Sample Panel:
   1. A sample masonry panel for each type of masonry, approximately 6 feet long by 4 feet high shall be constructed on site for approval by the Construction Manager. Each panel shall show the workmanship, coursing, bond, anchors, joint reinforcing wall ties, tooling of joints, range of color, texture of masonry, and mortar color. Finished work shall match the approved sample panel.

C. Appearance:
   1. Source or supply of materials shall not be changed after the work has started if the appearance of the finished work would be affected.

D. Efflorescence Testing:
   1. Certified efflorescence test reports shall be provided on masonry units that are to be exposed to weathering. Schedule tests far enough in advance of starting masonry work to permit retesting if necessary. Test three pairs of specimens of each type of masonry unit for efflorescence in accordance with ASTM C67. If any pair is rated "effloresced," the units represented by the samples will be rejected.

E. PRISM TESTS

F. The following information shall be provided in accordance with Section 01 33 00:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Shop drawings showing details of bond beams and lintels.
   3. Three representative full-size sample masonry units showing full range of color, texture, finish, and dimensions.

1.03 DELIVERY, STORAGE, AND HANDLING:

A. Cementitious materials shall be delivered to the site in unbroken containers, plainly marked and labeled with manufacturers' names and brands, stored in dry, weathertight enclosures to prevent entry of foreign materials and damage by water or dampness. Masonry units shall be stored off the ground and handled with care to avoid chipping and breakage. Materials shall be protected from damage and, except for sand, kept dry until used. Sand shall be covered to prevent intrusion of water and foreign materials and to prevent drying. Materials containing frost or ice shall not be used.

PART 2 PRODUCTS

2.01 MASONRY UNITS

A. Concrete Masonry Units:
   1. General:
      a. Concrete masonry units shall be of modular dimensions and air, water, or steam cured. Unless otherwise specified, exposed surfaces of units shall be comparatively smooth and of uniform texture. Special surface texture or, architectural faces shall be provided where specified. Surfaces of units which are to be plastered or stuccoed shall be sufficiently rough to provide a suitable bond.
   2. Hollow Load-Bearing Units:
      a. Hollow load-bearing units shall conform to ASTM C90, Grade N, Type I, made with lightweight or normal weight aggregate. Load-bearing units shall be provided, unless otherwise specified.
   3. Hollow Non-Load-Bearing Units:
      a. Hollow non-load-bearing units, where specified, shall conform to ASTM C129, Type I, made with lightweight or normal weight aggregate. Load-bearing units may be provided in lieu of non-load-bearing units.
   4. Concrete Building Brick:
      a. Concrete building brick shall conform to ASTM C55, Grade N, Type I, and shall be made with lightweight or normal weight aggregate. Concrete brick shall match the concrete masonry units in color and surface characteristics.
   5. Solid Load-Bearing Units:
      a. Solid load-bearing units shall conform to ASTM C145, Grade N, Type I, and made with lightweight or normal weight aggregates. Solid load-bearing units shall be provided where specified.
   6. Special Shapes:
      a. Special shapes such as closures, header units, and jamb units shall be provided as necessary to complete the work. Special shapes shall conform to the requirements for the units with which they are used.

B. Facing Brick:
   1. Unless building brick is specified, facing brick shall be provided for all brickwork. Facing brick shall conform to ASTM C216, Grade SW, Type Emperor, 4 inches thick, 4 inches high, and 16 inches long. Facing brick shall be of uniform Ochre Buff color with a mate texture.

C. Hollow Brick Units:
   1. General:
      a. Hollow brick units shall be of modular dimensions unless otherwise specified, exposed surfaces of units shall be comparatively smooth and of uniform texture. Where the finish surface will be visible, masonry units shall be colored based on submitted color samples chosen by the Architect.
         1) For ends of sills and caps and for similar applications that would otherwise expose unfinished brick surfaces, provide units without cores or frogs and with exposed surfaces finished.
         2) Provide special shapes for applications where shapes produced by sawing would result in sawed surfaces being exposed to view.
   2. Hollow Load-Bearing Units:
      a. Hollow load-bearing units shall conform to ASTM C652, Grade SW, Type SBX. Load-bearing units shall be provided, unless otherwise specified.
         1) Basis-of-Design Product: Interstate Brick, Atlas Brick.
         2) Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 9000 psi.
         3) Efflorescence: Provide brick that has been tested in accordance with ASTM C67/C67M and is rated "not effloresced."
         4) Size (Actual Dimensions): 7-5/8 inches wide by 3-5/8 inches high by 15-5/8 inches long.

2.02 MORTAR

A. Cement:
   1. Cement shall be Portland cement conforming to ASTM C150, Type II, low alkali containing less than 0.60 percent alkalis.

B. Hydrated Lime:
   1. Hydrated lime shall conform to ASTM C207, Type S.

C. Masonry Cement:
   1. Masonry cement shall conform to ASTM C91, except that for masonry cement used in mortar for exterior walls, the air content of the mortar specimen shall be not more than 16 percent by volume in lieu of 22 percent. Containers shall bear complete instructions for proportioning and mixing to obtain the required types of mortar.

D. Sand:
   1. Aggregate for mortar shall be sand conforming to ASTM C144.

E. Water:
   1. Water shall be clean, potable, and free from substances which could adversely affect the mortar.

F. Waterproofing Compound:
   1. Mortar shall contain an admixture of Master Builders Rheomix 235, Sonneborn Hydrocide Powder, or approved equal.

G. Mortar Types:
   1. Unless otherwise specified, mortar shall be ASTM C270, Type S. Waterproofing compound shall be added in accordance with manufacturer's recommendations. Air content shall not be less than 11 percent. Where colored mortar is specified to match the masonry units, add colorant to obtain the color indicated. Coordinate color and type with 04 26 13 Masonry Veneer mortar.

H. Premixed Mortar:
   1. Premixed mortar shall be ASTM C270, Type S for use as specified in paragraph 2.02 Mortar Types. Water proofing compound shall be added in accordance with manufacturer's recommendation. Air content shall not be less than 11 percent. Coordinate color and type with 04 26 13 Masonry Veneer mortar.

I. Admixtures:
   1. Admixtures may be used in mortar to retard curing and provide up to 36 hours of workability, provided that the admixture does not adversely affect bonding or compressive strength.

2.03 ACCESSORIES

A. Horizontal Joint Reinforcement (where required in the Drawings):
   1. Horizontal joint reinforcement shall be fabricated from cold drawn steel wire, ASTM A82. Wire shall be hot-dipped galvanized after fabrication in accordance with ASTM A153. Reinforcement shall be truss type with two or more longitudinal wires welded to a continuous diagonal cross wire, or ladder type with perpendicular cross wires not more than 16 inches o.c. Reinforcement shall be provided in flat sections 10 feet long, and preformed corners and tees approximately 30 inches long. Overall width shall be approximately 2-inches less than nominal thickness of wall.
   2. For single-wythe walls and partitions, two 9-gage longitudinal wires and 9-gage cross wires shall be provided.

B. Reinforcing Bars:
   1. Reinforcing steel shall be as specified in Section 03 20 00.

C. Anchors And Ties:
   1. General:
      a. Anchors and ties shall be approved designs of stainless steel, zinc-coated steel, or noncorrosive metal having the equivalent total strength of steel types. Zinc-coated steel shall be coated by the hot-dip process after fabrication to a minimum of 1.25 ounces of zinc per square foot of surface when tested in accordance with ASTM A90. See General Structural Notes in the Drawings for Anchors and Ties for brick veneer.
   2. Corrugated Metal Ties:
      a. Metal ties shall be not less than 7/8-inch wide by approximately 7 inches long and not lighter than 22 gage.
   3. Rigid Steel Anchors:
      a. Rigid steel anchors shall be not less than 1 inch wide, 1/4 inch thick, and 24 inches long with each end bent not less than 2 inches.

4. Dovetail Flat Bar Or Wire Anchors:
    a. Flat bar anchors shall be sheet steel, not lighter than 16 gage, and 7/8-inch wide, with end turned up 1/4 inch. Wire anchors shall be not lighter than 6 gage, 7/8-inch wide with wire looped and closed.
5. Dovetail Anchor Slots:
    a. Unless otherwise specified, Dovetail slots shall be made of galvanized steel with minimum dimensions of 1 inch wide back by 1 inch deep by 5/8-inch throat.

D. Through-Wall Flashing:
1. Flashing, where specified, shall be 5-ounce, electrolytic copper sheet, uniformly coated on both sides with acidproof, alkaliproof, elastic bituminous compound. Factory applied coating shall weigh not less than 6 ounces per square foot (approximately 3 ounces per square foot on each side).

2.04 GROUT

A. General:
1. Grout shall comply with ASTM C476, shall use Type II cement, and shall be proportioned by volume to achieve a minimum 28-day compressive strength of 2,000 psi. Grout shall have sufficient water added to produce a consistency for pouring without segregation.

B. Aggregate:
1. Aggregate shall comply with ASTM C404.

C. Fine Grout:
1. Fine grout shall be composed of one part cement, not more than 1/10 part lime, and 2 1/4 to 3 parts fine aggregate.

D. Coarse Grout:
1. Coarse grout shall be composed of one part cement, not more than 1/10 part lime, 2 to 3 parts fine aggregate, and not more than 2 parts coarse aggregate.

E. Prism test results specified in paragraph 1.02 Prism Tests."

2.05 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00. Information shall be received by the Construction Manager at least 14 days prior to the beginning of masonry work.
1. Masonry unit certificates showing compliance to the specifications shall be submitted for each type of masonry unit.
2. Reinforcing certificates showing compliance to the specifications shall be submitted for reinforcing steel, including reinforcing steel wire and joint reinforcing, as specified herein and in Section 03 20 00.
3. Certified efflorescence test reports specified in paragraph 1.02 Efflorescence Testing.
4. Shop drawings showing details of anchors, adjustable wall ties, positioning devices, and other accessories.

5. Manufacturer's data and descriptive literature for each type of masonry accessory, premixed mortar, masonry cement, grout admixtures, and flashing. Clearly mark the data to indicate which type, size, or item the Contractor intends to provide. Data shall show conformance to specified requirements and Contractor's proposed usage details.
6. Prism test results specified in paragraph 1.02 Prism Tests.

PART 3 EXECUTION

3.01 PREPARATION

A. General:
   1. Foundations for masonry work shall be straight, on-line, and level. All surfaces to be bonded with masonry shall be clean and free from laitance or foreign materials. Reinforcing dowels shall be in the correct location as specified. The placement and location of anchor ties, inserts, and other embedded items in concrete or other adjoining work shall be coordinated by the Contractor to suit the masonry work.

B. Protection:
   1. Exposed surfaces shall be protected from mortar and other stains. When mortar joints are tooled, remove mortar from exposed surfaces with fiber brushes and wooden paddles. Base of walls shall be protected from splash stains by covering adjacent ground with sand, sawdust, or polyethylene.
   2. Uniform loads shall not be applied for at least 12 hours or concentrated loads for at least 72 hours after masonry is constructed.
   3. Temporary bracing shall be provided as required to prevent damage during construction.
   4. Protective boards for polyester film shall be provided during job installation to ensure no damage from building debris.

3.02 WORKMANSHIP

A. Masonry shall be level and plumb. Story poles or gage rods shall be used throughout the work. Changes in coursing or bonding after the work is started will not be permitted; neither will carrying one section of the walls up in advance of the others be permitted. Unfinished work shall be stepped back for joining with new work; toothing will not be permitted. Heights of masonry at each floor and at sills and heads of openings shall be checked with an instrument to maintain the level of the walls. Door and window frames, louvered openings, anchors, pipes, ducts, and conduits shall be built in as the masonry work progresses. Spaces around metal door frames shall be filled solidly with mortar. Drilling, cutting, fitting, and patching to accommodate the work of others shall be performed by masonry mechanics. Masonry shall be cut with masonry saws for exposed work. Structural steelwork, bolts, anchors, inserts, plugs, ties, lintels, and miscellaneous metalwork shall be placed in position as the work progresses. Chases of approved dimensions for pipes and other purposes shall be provided where specified and necessary. Tops of exposed walls and partitions not being worked on shall be covered with a waterproof membrane secured in place and extended down at least 2 feet on both sides.

3.03 MORTAR MIXING

A. Mortar materials shall be measured in 1 cubic foot containers to maintain control and accuracy of proportions; measuring materials with shovels is not permitted. Mortar shall be mixed in a mechanical batch mixer for not less than 3 nor more than 5 minutes after all ingredients are in so as to produce a uniform mixture. Water shall be added gradually as required to produce a workable consistency. Mortar not formulated to include retarding admixtures, which has not been placed in final position within 2-1/2 hours after the initial mixing, shall not be retempered and used. Use of antifreeze compounds, salts, or other substances to lower the freezing point of mortar is prohibited.

B. Mortar shall be mixed in accordance with ASTM C270 to obtain type mortar required. Where colored mortars are required, pigments may be added at the site or provided as part of prepackaged mortar mix. When masonry cement is used, mixing shall conform to printed instructions of the masonry cement manufacturer.

3.04 MORTAR JOINTS

A. Mortar joints shall be a uniform thickness of 3/8-inch unless otherwise specified. Exposed joints shall be tooled slightly concave with a round or other suitable jointer when the mortar is thumbprint hard except where otherwise required to match existing construction. For horizontal joints, jointers shall be at least 12 inches long for brickwork and 16 inches long for concrete masonry. Jointers shall be slightly larger than the width of the joint so that complete contact is made along the edges of the units, compressing and sealing the surface of the joint. Joints that will not be exposed shall be struck flush. Vertical joints shall be tooled first. Horizontal joints shall be level; vertical joints shall be plumb and in alignment from top to bottom of wall within a tolerance of plus or minus 1/2 inch in 40 feet.

B. Weep holes shall be placed at a maximum spacing of 48 inches at the base of cavity walls or veneer walls and in the course bearing on through-wall flashing.

3.05 TOLERANCES

A. Masonry work shall be within the following limits:
   1. Pilasters and Columns: 1/4 inch from true line.
   2. Face of Brick: 1/32 inch from face of adjacent brick.
   3. Face of Concrete Masonry Unit: 1/16 inch from face of adjacent unit.
   4. Variation from True Plane: 1/4 inch in 10 feet and 1/2 inch maximum in 20 feet or more.
   5. Variation from Plumb: 1/4 inch in each story, noncumulative and 1/2 inch maximum in two stories or more.
   6. Variation from Level: 1/8 inch in 3 feet, 1/4 inch in 10 feet, and 1/2 inch maximum.
   7. Variation in Wall Thickness: Plus or minus 1/4 inch.

3.06 BRICKWORK

A. General:
   1. Brickwork shall conform to requirements of paragraph 3.05. Brick shall be selected and placed so that the better face of stretchers and headers are exposed.

B. Testing:
   1. Except during cold weather, as defined under paragraph 3.16, clay or shale brick shall be tested daily on the job, prior to laying. Testing shall be done using a wax pencil to draw a circle the size of a quarter on five randomly selected bricks and applying 20 drops of water with a medicine dropper to the surface within the circle on each brick. If the average time that the water is completely absorbed in the five bricks is less than 1 1/2 minutes, bricks represented by the five bricks tested shall be wetted. Each brick shall be nearly saturated, but surface dry when laid. During cold weather, masonry units shall be kept dry until laid.

C. Application:
   1. Unless otherwise specified, brick shall be laid in running bond. Joints between bricks shall be filled completely with mortar. The practice of slushing head joints will not be permitted. Closure bricks shall be laid with mortar on all bedding surfaces of unit to be laid and units in place. Dry or butt joints will not be permitted. Grouting shall be provided where specified. Grout all cells with reinforcing steel solid.

3.07 CONCRETE MASONRY UNIT WORK

A. General:
   1. The first course shall be laid in a full bed of mortar for the full width of the unit. Succeeding courses shall be laid in running bond unless otherwise specified. Bed-joints shall be formed by applying the mortar to the entire top surfaces of the inner and outer face shells and to head joints by applying the mortar for a width of about 1 inch to the ends of the adjoining units. The mortar shall be of such thickness that it will be forced out of the joints as the units are placed in position. Where anchors, bolts, and ties occur within the cells of the units, metal lath shall be placed in the joint at the bottom of such cells and the cells filled with mortar or grout as the work progresses. Except at grouted or reinforced masonry, concrete brick shall be used for bonding walls, working out the coursing, topping out walls under sloping slabs, distributing concentrated loads, backing brick headers, and elsewhere as required. Concrete masonry units shall not be dampened before or during laying.

B. Special Concrete Masonry Unit Work:
   1. Where exposed concrete masonry unit walls and partitions are specified, special concrete masonry unit work shall be provided. Units shall be selected for uniformity of size, texture, true plane, and undamaged edges and ends of exposed surfaces. Units shall be placed plumb, parallel, and with properly tooled joints of maximum 3/8-inch thickness, and exposed surfaces kept clean and free from blemishes or defects.

C. Reinforced Concrete Masonry Unit Walls:

1. Where vertical reinforcement occurs, cores shall be filled solid with grout, and units laid in such a manner as to preserve the unobstructed vertical continuity of cores to be filled. Adjacent webs shall be embedded in mortar to prevent leakage of grout, and mortar fins protruding from joints removed before grout is placed. Minimum clear dimensions of vertical cores shall be 2 by 3 inches. Reinforcing shall be positioned and held accurately before placing grout by tying or by using bar positioners at maximum 8-foot intervals. Vibrator shall be used to consolidate the grout. Minimum clear distance between masonry and vertical reinforcement shall be 1/2 inch. Unless otherwise specified, splices shall be formed by lapping bars not less than 40 bar diameters.

3.08 BONDING AND ANCHORING

A. Unless otherwise specified, partitions shall extend from the floor to the bottom of the construction above. Walls and partitions shall be structurally bonded and anchored to each other and to concrete walls and beams. Unless otherwise specified, non-load-bearing partitions and interior walls shall be securely anchored to the construction above in a manner that provides lateral stability while permitting unrestricted deflection of construction above. Anchors shall be completely embedded in mortar joints.

B. In addition, bonding and anchoring shall comply with the following procedures unless otherwise specified.

1. At corners of load-bearing walls, provide a true masonry bond in each course.
2. At intersections of load-bearing walls, provide a true masonry bond in each course, or anchor with rigid steel anchors not more than 2 feet apart vertically.
3. At intersections of non-load-bearing partitions with other walls or partitions, tie with wire mesh ties at vertical intervals of not more than 2 feet or with masonry bonding in alternate courses.
4. At masonry walls facing or abutting new concrete members, anchor masonry to the concrete with dovetail or wire-type anchors inserted in slots or inserts built into the concrete. To anchor masonry walls to existing concrete members, use corrugated metal ties anchored by drive pins to the concrete. Locate anchors not more than 18 inches o.c. vertically and not more than 24 inches o.c. horizontally.

3.09 HORIZONTAL JOINT REINFORCEMENT

A. Unless otherwise specified, reinforcement shall be provided at 16-inch spacing in all masonry walls. Reinforcement shall be continuous except at control joints and expansion joints. Reinforcement above and below openings shall extend not less than 24 inches beyond each side of openings. Reinforcement shall be provided in the longest available lengths, utilizing the minimum number of splices. Welded L-shaped assemblies and welded T-shaped assemblies to match the straight reinforcement shall be provided at corners and intersections of walls and partitions. Refer to the drawings for additional requirements.

3.10 CONCRETE MASONRY UNIT LINTELS AND BOND BEAMS

A. Special units, lintels, and bond beams shall have cells filled solidly with grout or concrete, and provided with not less than two No. 5 reinforcing bars, unless otherwise specified. Reinforcing shall overlap a minimum of 40 bar diameters at splices. Bond beams and reinforcing shall terminate on each side of expansion joints. Concrete masonry units used for lintels and bond beams shall have exposed surfaces of the same material and texture as the adjoining masonry units. Bond beam units shall be produced from standard vertically-voided units with precut knock-out cross walls. Lintels shall be straight and true and shall have at least 8 inches of bearing at each end. Lintels shall set at least 6 days before shoring is removed.

3.11 GROUT

A. General:

1. Fine grout shall be provided in grout spaces which are less than 2 inches in any horizontal dimension after deducting the thickness of horizontal reinforcing or in which clearance between reinforcing and masonry is less than 3/4 inch. Coarse grout shall be provided in grout spaces which are 2 inches or greater in all horizontal dimensions after deducting the thickness of horizontal reinforcing provided the clearance between reinforcing and masonry is not less than 3/4 inch. For a coarse grout pour over 6 feet high, increase grout space minimum horizontal dimension to 3 inches.

B. Placement:

1. Grout shall be placed from the interior side of walls, except as approved otherwise. Sills, ledges, offsets, and other surfaces shall be protected from grout droppings. Prior to grouting, the grout space shall be clean so that all spaces to be filled with grout do not contain mortar projections greater than 1/2 inch, mortar droppings, or other foreign material. Grout shall be well mixed to prevent segregation, shall be sufficiently fluid to flow into joints and around reinforcing without leaving voids, and shall be placed by pumping or pouring from buckets equipped with spouts. Grout shall be placed in a continuous pour in grout lifts not exceeding 6 feet. At grout pours exceeding 6 feet, cleanouts shall be provided in the bottom course at every vertical bar but shall not be spaced more than 32 inches on center for solidly grouted masonry. Pours shall be 1-1/2 inches below the top of masonry units in top course, except at the finish course. Grout shall be agitated thoroughly to eliminate voids. Masonry displaced by grouting operation shall be removed and relaid in alignment with fresh mortar.

3.12 FORMS AND SHORING

A. Contractor shall construct forms to the shape, lines, and dimensions of members indicated and make sufficiently rigid to prevent deflections which may result in cracking or other damage to supported masonry. Forms shall not be removed until members have cured.

3.13 CLEANING

A. Concrete Masonry Unit Cleaning:
   1. Contractor shall protect work which may be damaged, stained, or discolored during cleaning operations.
   2. Exposed masonry surfaces shall be cleaned with clear water and stiff fiber brushes and rinsed with clear water. Where stains, mortar, or other soil remain, scrubbing shall continue with warm water and detergent. Immediately after cleaning, each area shall be rinsed thoroughly with clear water. Damaged, stained, and discolored work shall be restored to original condition or replaced with new work.

B. Hollow Brick Unit Cleaning:
   1. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.
   2. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:
      a. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
      b. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Engineer approval of sample cleaning before proceeding with cleaning of masonry.
      c. Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
      d. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
      e. Clean brick by bucket-and-brush hand-cleaning method described in BIA Technical Notes 20.
      f. Clean concrete masonry by applicable cleaning methods indicated in NCMA TEK 8-4A.
      g. Clean masonry with a proprietary acidic masonry cleaner applied according to manufacturer's written instructions.

3.14 COLD WEATHER CONDITIONS

A. Construction:
   1. During cold weather, that is, when the air temperature is below 40 degrees F and falling, or when it appears that the air temperature will drop to 40 degrees F or below within 24 hours, Contractor shall not lay masonry unless the work is protected from freezing as specified below. Surfaces receiving mortar shall be free of ice and frost. The following requirements shall be adhered to:
      a. Air Temperature 40 to 32 Degrees F:
         1) Heat sand or mixing water to produce mortar temperature between 40 and 120 degrees F.
      b. Air Temperature 32 to 25 Degrees F:
         1) Heat sand and mixing water to produce mortar temperature between 40 and 120 degrees F.

c. Air Temperature 25 to 20 Degrees F:
   1) Heat sand and mixing water to produce mortar temperature between 40 and 120 degrees F. Use other heat sources on both sides of walls under construction. Use windbreaks when wind is in excess of 15 mph.
d. Air Temperature 20 Degrees F and Below:
   1) Heat sand and mixing water to produce mortar temperature between 40 and 120 degrees F. Provide enclosures and auxiliary heat to maintain air temperature above 32 degrees F on both sides of walls under construction. Ascertain that temperatures of masonry units are not less than 20 degrees F when units are laid.

B. Protection:
1. Newly laid masonry shall be protected as specified below for the respective mean daily air temperature (MDAT), that is, the average of the daytime high temperature and the forecasted nighttime low temperature.
   a. MDAT 40 to 32 degrees F:
      1) Protect masonry from rain and snow by covering the top 4 feet with weather-resistive membrane for 24 hours after laying.
   b. MDAT 32 to 25 degrees F:
      1) Completely cover newly-laid masonry with weather-resistive membrane for 24 hours.
   c. MDAT 25 to 20 degrees F:
      1) Completely cover newly-laid masonry with insulating blankets and weather-resistive membrane for 24 hours.
   d. MDAT 20 degrees F and Below:
      1) Maintain temperature of masonry above 32 degrees F for 24 hours by providing enclosures and supplementary heat or other approved means.

3.15 SPECIAL INSPECTION

A. Special masonry inspection as defined by the Uniform Building Code will be provided by the Construction Manager where specified. The Contractor shall notify the Construction Manager of any masonry work requiring special inspection at least 48 hours before the work begins."

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 04 26 13

MASONRY VENEER

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Brick.
   2. Mortar materials.
   3. Ties and anchors.
   4. Embedded flashing.
   5. Accessories.
   6. Mortar mixes.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Samples: For each type and color of brick and colored mortar.

1.03 INFORMATIONAL SUBMITTALS

A. Material Certificates: For each type and size of product.

1.04 MOCKUPS

A. Sample Panels: Build sample panels to verify selections made under Sample submittals and to demonstrate aesthetic effects. Comply with requirements in Section 01 45 00 "Contractor Quality Control" for mockups.
   1. Build sample panels for typical exterior wall in sizes approximately 48 inches long by 48 inches high by full thickness.

1.05 FIELD CONDITIONS

A. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in TMS 602.

B. Hot-Weather Requirements: Comply with hot-weather construction requirements contained in TMS 602.

PART 2 PRODUCTS

2.01 UNIT MASONRY, GENERAL

A. Masonry Standard: Comply with TMS 602, except as modified by requirements in the Contract Documents.

B. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to contain chips, cracks, or other defects exceeding limits stated. Do not use units where such defects will be exposed in the completed Work.

2.02 BRICK

A. General: Provide shapes indicated and as follows, with exposed surfaces matching finish and color of exposed faces of adjacent units.
   1. For ends of sills and caps and for similar applications that would otherwise expose unfinished brick surfaces, provide units without cores or frogs and with exposed surfaces finished.
   2. Provide special shapes for applications where shapes produced by sawing would result in sawed surfaces being exposed to view.

B. Clay Face Brick: Facing brick complying with ASTM C216, Grade SW, Type FBX Type FBS Type FBA.
   1. Products: Subject to compliance with requirements, provide the following:
      a. Interstate Brick; 4" Emperor.
   2. Initial Rate of Absorption: Less than 30 g/30 sq. in. per minute when tested in accordance with ASTM C67/C67M.
   3. Efflorescence: Provide brick that has been tested in accordance with ASTM C67/C67M and is rated "not effloresced."
   4. Surface Coating: Brick with colors or textures produced by application of coatings withstand 50 cycles of freezing and thawing in accordance with ASTM C67/C67M with no observable difference in the applied finish when viewed from 10 ft..
   5. Size (Actual Dimensions): 3-5/8 inches wide by 3-9/16 inches high by 15-5/8 inches long.
   6. Color and Texture: As selected by Engineer.

2.03 MORTAR MATERIALS

A. Portland Cement: ASTM C150/C150M, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.

B. Hydrated Lime: ASTM C207, Type S.

C. Portland Cement-Lime Mix: Packaged blend of portland cement and hydrated lime containing no other ingredients.

D. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes and complying with ASTM C979/C979M. Use only pigments with a record of satisfactory performance in masonry mortar.

E. Preblended Dry Mortar Mix: Packaged blend made from portland cement and hydrated lime, sand, mortar pigments, and admixtures and complying with ASTM C1714/C1714M.
   1. Preblended Dry Masonry Cement Mortar Mix:

a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1) Amerimix is a trademark of Bonsal American, an Oldcastle company.
   2) SPEC MIX, LLC.

F. Aggregate for Mortar: ASTM C144.
   1. Colored-Mortar Aggregates: Natural sand or crushed stone of color necessary to produce required mortar color.

G. Cold-Weather Admixture: Non-chloride, noncorrosive, accelerating admixture complying with ASTM C494/C494M, Type C, and recommended by manufacturer for use in masonry mortar of composition indicated.

H. Water: Potable.

I. Waterproofing Compound:
   1. Mortar shall contain an admixture of Master Builders Rheomix 235, Sonneborn Hydrocide Powder, or approved equal.

2.04 TIES AND ANCHORS

A. General: Ties and anchors extend at least 1-1/2 inches into veneer but with at least a 5/8-inch cover on outside face.

B. Materials: Provide ties and anchors specified in this article that are made from materials that comply with the following unless otherwise indicated:
   1. Hot-Dip Galvanized, Carbon-Steel Wire: ASTM A1064/A1064M, with ASTM A153/A153M, Class B-2 coating.

C. Adjustable Masonry-Veneer Anchors:
   1. General: Provide anchors that allow vertical adjustment but resist a 100 lbf load in both tension and compression perpendicular to plane of wall without deforming or developing play in excess of 1/16 inch.
   2. Fabricate wire ties from 0.187-inch- diameter, hot-dip galvanized steel wire unless otherwise indicated.
   3. Masonry-Veneer Anchors; See General Structural Notes on the Drawings.

D. Metal Flashing: Provide metal flashing complying with SMACNA's "Architectural Sheet Metal Manual" and as follows:
   1. Stainless Steel: ASTM A240/A240M or ASTM A666, Type 304, 0.016 inch thick.
   2. Fabricate metal drip edges from stainless steel. Extend at least 3 inches into wall and 1/2 inch out from wall, with outer edge bent down 30 degrees and hemmed.

E. Flexible Flashing:
   1. EPDM Flashing: Sheet flashing product made from ethylene-propylene-diene terpolymer, complying with ASTM D4637/D4637M, 40 mil thick.

F. Adhesives, Primers, and Seam Tapes for Flashings: Flashing manufacturer's standard products or products recommended by flashing manufacturer for bonding flashing sheets to each other and to substrates.

G. Termination Bars for Flexible Flashing, Flanged: Stainless steel sheet 0.019 inch by 1-1/2 inches with a 3/8-inch flange at top.

2.05 ACCESSORIES

A. Compressible Filler: Premolded filler strips complying with ASTM D1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene.

B. Weep/Vent Products: Use the following unless otherwise indicated:
   1. Mesh Weep/Vent: Free-draining mesh; made from polyethylene strands, full height and width of head joint and depth 1/8 inch less than depth of outer wythe; in color selected from manufacturer's standard.
      a. Basis-of-Design Product: Subject to compliance with requirements, provide Mortar Net Solutions ; Mortar Net Weep Vents. or a comparable product by one of the following:
         1) CavClear; a division of Archovations, Inc.
         2) Hohmann & Barnard, Inc.
         3) Keene Building Products.
         4) Or approved equal.

C. Cavity Drainage Material: Free-draining mesh, made from polymer strands that will not degrade within the wall cavity.
   1. Mortar Deflector: Strips, full depth of cavity and 10 inches high, with dovetail-shaped notches that prevent clogging with mortar droppings.
      a. Basis-of-Design Product: Subject to compliance with requirements, provide Mortar Net Solutions; Mortar Net with Insect Barrier or a comparable product by one of the following:
         1) Advanced Building Products Inc.
         2) Hohmann & Barnard, Inc.
         3) Keene Building Products.
         4) Wire-Bond.
         5) York Manufacturing, Inc.
         6) Or approved equal.

D. Proprietary Acidic Masonry Cleaner: Manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces. Use product expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

2.06 MORTAR MIXES

A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures unless otherwise indicated.
   1. Do not use calcium chloride in mortar or grout.
   2. Use portland cement-lime mortar unless otherwise indicated.
   3. Add cold-weather admixture (if used) at same rate for all mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.

B. Preblended, Dry Mortar Mix: Furnish dry mortar ingredients in form of a preblended mix. Measure quantities by weight to ensure accurate proportions, and thoroughly blend ingredients before delivering to Project site.

C. Mortar for Unit Masonry: Comply with ASTM C270, Proportion Specification. Use Type N unless another type is indicated.

D. Pigmented Mortar: Use colored cement product.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.

B. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures. Mix units from several pallets or cubes as they are placed.

C. Wetting of Brick: Wet brick before laying if initial rate of absorption exceeds 30 g/30 sq. in. per minute when tested in accordance with ASTM C67/C67M. Allow units to absorb water so they are damp but not wet at time of laying.

3.02 TOLERANCES

A. Dimensions and Locations of Elements:
   1. For dimensions in cross section or elevation, do not vary by more than plus 1/2 inch or minus 1/4 inch.
   2. For location of elements in plan, do not vary from that indicated by more than plus or minus 1/2 inch.
   3. For location of elements in elevation, do not vary from that indicated by more than plus or minus 1/4 inch in a story height or 1/2 inch total.

B. Lines and Levels:
   1. For bed joints and top surfaces of bearing walls, do not vary from level by more than 1/4 inch in 10 ft., or 1/2-inch maximum.

2. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 ft., 1/4 inch in 20 ft., or 1/2-inch maximum.
3. For vertical lines and surfaces, do not vary from plumb by more than 1/4 inch in 10 ft., 3/8 inch in 20 ft., or 1/2-inch maximum.
4. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 ft., 1/4 inch in 20 ft., or 1/2-inch maximum.
5. For lines and surfaces, do not vary from straight by more than 1/4 inch in 10 ft., 3/8 inch in 20 ft., or 1/2-inch maximum.

C. Joints:
1. For bed joints, do not vary from thickness indicated by more than plus or minus 1/8 inch, with a maximum thickness limited to 1/2 inch.
2. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch. Do not vary from adjacent bed-joint and head-joint thicknesses by more than 1/8 inch.

3.03 LAYING MASONRY WALLS

A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.

B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in running bond; do not use units with less-than-nominal 4-inch horizontal face dimensions at corners or jambs.

C. Fill space between steel frames and masonry solidly with mortar unless otherwise indicated.

3.04 MORTAR BEDDING AND JOINTING

A. Lay masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.

B. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated.

3.05 ANCHORED MASONRY VENEERS

A. Anchor masonry veneers to concrete and masonry backup with seismic masonry-veneer anchors to comply with the following requirements:
1. Embed connector sections and continuous wire in masonry joints.
2. Locate anchor sections to allow maximum vertical differential movement of ties up and down.

3. Space anchors as indicated, but not more than 16 inches o.c. vertically and horizontally. Install additional anchors within 12 inches of openings and at intervals, not exceeding 24 inches, around perimeter.

B. Provide not less than 1 inch of airspace between back of masonry veneer and face of insulation.

3.06 FLASHING, WEEP HOLES, AND VENTS

A. General: Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated.

B. Install flashing as follows unless otherwise indicated:
   1. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Where flashing is within mortar joint, place through-wall flashing on sloping bed of mortar and cover with mortar. Before covering with mortar, seal penetrations in flashing with adhesive, sealant, or tape as recommended by flashing manufacturer.
   2. At lintels and shelf angles, extend flashing 6 inches minimum, to edge of next full unit at each end. At heads and sills, extend flashing 6 inches minimum, to edge of next full unit and turn ends up not less than 2 inches to form end dams.
   3. Install metal drip edges beneath flexible flashing at exterior face of wall. Stop flexible flashing 1/2 inch back from outside face of wall, and adhere flexible flashing to top of metal drip edge.

C. Install weep holes in veneers in head joints of first course of masonry immediately above embedded flashing.
   1. Use specified weep/cavity vent products to form weep holes.
   2. Space weep holes 24 inches o.c. unless otherwise indicated.

D. Place cavity drainage material in airspace behind veneers to comply with configuration requirements for cavity drainage material in "Accessories" Article.

3.07 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections. Allow inspectors access to scaffolding and work areas as needed to perform tests and inspections. Retesting of materials that fail to comply with specified requirements will be at Contractor's expense.

B. Inspections: Special inspections in accordance with Level 2 in TMS 402.
   1. Begin masonry construction only after inspectors have verified proportions of site-prepared mortar.

C. Testing Prior to Construction: One set of tests.

D. Clay Masonry Unit Test: For each type of unit provided, in accordance with ASTM C67/C67M for compressive strength.

E. Mortar Aggregate Ratio Test (Proportion Specification): For each mix provided, in accordance with ASTM C780.

3.08 CLEANING

A. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

B. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:
   1. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Architect's approval of sample cleaning before proceeding with cleaning of masonry.
   2. Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
   3. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
   4. Clean brick by bucket-and-brush hand-cleaning method described in BIA Technical Notes 20.
   5. Clean masonry with a proprietary acidic cleaner applied according to manufacturer's written instructions.

3.09 MASONRY WASTE DISPOSAL

A. Waste Disposal as Fill Material: Dispose of clean masonry waste, including excess or soil-contaminated sand, waste mortar, and broken masonry units, by crushing and mixing with fill material as fill is placed.
   1. Do not dispose of masonry waste as fill within 18 inches of finished grade.

B. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above or recycled, and other masonry waste, and legally dispose of off Owner's property.

END OF SECTION

SECTION 05 05 14

HOT-DIP GALVANIZING

PART 1 GENERAL

1.01 DESCRIPTION

A. Section includes: Hot-dip galvanizing of steel materials.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 09 90 00 Painting and Coating

1.03 REFERENCES:

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ASTM A123	Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
ASTM A143	Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedure for Detecting Embrittlement
ASTM A153	Zinc Coating (Hot-Dip) on Iron and Steel Hardware
ASTM A384	Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies
ASTM A385	Providing High-Quality Zinc Coatings (Hot-Dip)
ASTM A780	Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
ASTM B6	Zinc
ASTM D6386	Preparation of Zinc (Hot-Dip Galvanized) Coated Iron and Steel Product and Hardware Surfaces for Painting
ASTM E536	Test Methods for Chemical Analysis of Zinc and Zinc Alloys
DOD-P-21035A	Paint, High Zinc Dust Content, Galvanizing Repair

1.04 SUBMITTALS

A. Action Submittals
   1. Procedure: Section 01 33 00:
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.

3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. Coating applicator's Certificate of Compliance that the hot-dip galvanized coating meets or exceeds the specified requirements of ASTM A123 or A153, as applicable.
5. Evidence that the galvanized coating applicator is a member of the American Galvanizing Association.

1.05 QUALITY ASSURANCE

A. Hot-dip galvanized coating applicator shall be a member of the American Galvanizing Association.

PART 2 PRODUCTS

2.01 MATERIALS

A. Zinc used for galvanizing shall conform to ASTM B6, and shall be at least equal to the grade designated as Prime Western.

B. Maximum amount of aluminum added to a galvanizing bath shall not exceed 0.01 percent.

C. Hot-Dip Galvanized Coating: Conform to ASTM A123 and A153, as applicable.

D. Repair: Zinc dust-zinc oxide coating conforming to DOD-P-21035A and containing 95 percent zinc in the dry film. Acceptable product is ZRC Cold Galvanizing Compound by ZRC Worldwide, or approved equal.

2.02 FABRICATION REQUIREMENTS

A. Fabrication practices for products to be galvanized: In accordance with applicable portions of ASTM A143, A384 and A385. Avoid fabrication techniques that could cause steel distortion or embrittlement.

B. Coordinate with steel detailer to provide vent and drain holes of sufficient size and quantity to achieve specified galvanized coating.

PART 3 EXECUTION

3.01 PREPARATION

A. Casting surfaces to be galvanized shall be sand blasted or ground smooth. When a smooth cast is required, castings shall be tumbled and all high spots ground flush. Castings shall be normalized to prevent cracking. Malleable iron shall be safeguarded against embrittlement by pre-annealing.

B. Steel work shall be precleaned utilizing a caustic bath, acid pickle and flux or shall be blast cleaned and fluxed to obtain an acceptable surface for quality hot dip galvanizing.

3.02 APPLICATION

A. Steel Members, Fabrications, and Assemblies: Hot-dip galvanize after fabrication in accordance with ASTM A123.

B. Steel Bolts, Screws, Nuts, Washers and Hardware Components: Hot-dip galvanize in accordance with ASTM A153.

3.03 COATING REQUIREMENTS

A. Hot-dip Coating Thickness: Conform to ASTM A123 or ASTM A153, as applicable.

3.04 TESTING

A. Chemical analysis for impurities in the bath shall be made in conformity with ASTM E536.

B. Test Requirements and Methods: In accordance with ASTM A123 or ASTMA153, as applicable.

3.05 GALVANIZED SURFACES TO BE PAINTED

A. Where galvanized surfaces are specified to be painted in Section 09 90 00 or elsewhere in the Project Manual, conform to ASTM D6386.

3.06 REPAIR OF DEFECTIVE GALVANIZED COATING

A. Where zinc coating has been damaged after installation, clean substrate surface and repair with zinc dust-zinc oxide coating in accordance with ASTM A780. Apply zinc dust-zinc oxide coating in accordance with manufacturer's recommendation. Apply multiple coats to achieve a minimum film thickness of 8 mils.

B. Remove items not physically damaged, but which have insufficient or deteriorating zinc coatings, and items damaged in shipment or prior to installation, from the project site for repair by the hot-dip zinc coating method.

END OF SECTION

SECTION 05 05 20

ANCHOR BOLTS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Bolts and all-thread rods used to attach structural elements and equipment to concrete and concrete masonry. Included are cast-in-place and post-installed anchors (adhesive systems and wedge type expansion anchors), nuts and washers.

B. Cast-in-place and post-installed anchors shall be Type 316 stainless steel unless noted otherwise.

1.01 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 73 24 Design Requirements for Nonstructural Components and Nonbuilding Structures
   2. Section 03 30 00 Cast-In-Place Concrete
   3. Section 03 60 00 Grouting
   4. Section 43 05 13 Rigid Equipment Mounts
   5. Section 43 05 18 Vibration Isolation Systems

1.02 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ACI 318	Building Code Requirements for Structural Concrete
ASTM A193	Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications
ASTM A194	Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
ASTM A320	Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service
ASTM A563	Carbon and Alloy Steel Nuts
ASTM F593	Stainless Steel Bolts, Hex Cap Screws, and Studs
ASTM F594	Stainless Steel Nuts
ASTM F844	Washers, Steel, Plain (Flat), Unhardened for General Use
ASTM F1554	Anchor Bolts, Steel, 36, 55, 105-ksi Yield Strength
IBC	International Building Code with local amendments

1.03 SUBMITTALS

A. Action Submittals
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   4. Anchor bolt placement plans.
   5. Anchor bolt, nut, and washer material information, including material certifications.
   6. Record copy of design calculations and details showing the required diameter, length, embedment, edge distance, confinement, anchor reinforcement, anchor bolt sleeves, connection redesign, and other conditions, stamped and signed by a Professional Engineer currently registered in the state of Utah. Calculations shall comply with the provisions of ACI 318-19, Chapter 17. Base anchor capacity determination on cracked concrete condition and compressive strength of new concrete per Section 03 30 00. Assume compressive strength of existing concrete is 3,000 psi unless otherwise noted.
   7. Submit record copy of proof loading test results within five days after test.
   8. Product Data:
      a. ICC Evaluation Service Reports for post-installed adhesive type anchors and expansion (wedge type) anchors when allowed. Products shall be ICC approved for use in cracked concrete in high seismic areas (Seismic Design Category D, E and F).
      b. Product data indicating load capacity charts/calculations.
      c. Chemical resistance.
      d. Temperature limitations.
      e. Manufacturers written installation instructions.
   9. Installer certification for horizontal or upwardly inclined adhesive anchors in accordance with ACI/CRSI Adhesive Anchor Installer Certification Program.

1.04 QUALITY ASSURANCE

A. Quality Assurance By Owner
   1. Special inspection of anchor bolts shall be performed by the Special Inspector under contract with the Owner and in accordance with IBC Chapter 17.
   2. A five percent sample of installed post-installed anchors shall be proof-loaded by an independent laboratory contracted by the Contractor. The quantity of samples and locations shall be coordinated with the Owner's Representative.

3. Adhesive anchors installed in horizontal or upwardly inclined orientations to resist sustained tension loads shall be continuously inspected during installation by a Special Inspector.
4. The Special Inspector shall furnish a report to the Engineer, Owner's Representative, and Building Official that the work covered by the report has been performed and that the materials used and the installation procedures used conform with the approved Project Manual and the Manufacturer's Printed Installation Instructions (MPII).

B. Certifications
1. Installer certification shall be in accordance with ACI/CRSI Adhesive Anchor Installer Certification Program for installers of horizontal or upwardly inclined adhesive anchors.

PART 2 PRODUCTS

2.01 GENERAL

A. Anchor bolt holes in equipment support frames shall not exceed the bolt diameters by more than 1/4 inch. Minimum anchor bolt diameter shall be 1/2 inch. Anchor bolts for equipment mounting and vibration isolation systems shall be provided as specified in Sections 43 05 13 and 43 05 18, respectively.

B. Tapered washers shall be provided where mating surface is not square with the nut.

C. Anchor bolts shall be cast-in-place anchors unless post-installed anchors are specified or shown on the Drawings. Substitution of post-installed anchors will not be permitted unless specifically requested by the Contractor and approved by the Engineer.

2.02 PERFORMANCE/DESIGN CRITERIA

A. Anchor bolts for equipment shall be designed by the equipment manufacturer to include equipment operational loads combined with seismic and wind forces when applicable. Design criteria provided in Section 01 73 24.

B. Design anchor bolts for support and bracing of non-structural components and non-building structures for loading specified in Section 01 73 24.

2.03 MATERIALS

A. Anchor bolt materials shall be as specified in the following table:

Material	Specification
Stainless Steel Anchor Bolts	ASTM A193 or A320, Type 316
Stainless Steel Threaded Rods	ASTM F593, Type 316
Stainless Steel Nuts	ASTM A194 Heavy Hex Nuts, Type 316 ASTM F594 Heavy Hex Nuts at Adhesive Anchors, Type 316 ASTM A194 Heavy Hex Nuts Grade 8S (Nitronic 60)
Stainless Steel Washers	Type 316 to match bolt material
Carbon Steel Anchor Bolts	ASTM F1554, Grade 36, Hot Dip Galvanized

Material	Specification
High-Strength Carbon Steel Anchor Bolts	ASTM F1554, Grade 55, Weldable per Supplementary Requirement S1, Hot Dip Galvanized
Carbon Steel Nuts and Washers	ASTM A563 and F844, Heavy Hex, Hot-Dip Galvanized
Concrete Adhesive Anchors	Hilti “HIT-RE 500v3”, Simpson Strong-Tie “SET-XP”, or approved equal, with Type 316 Stainless Steel threaded rods
Concrete Masonry Adhesive Anchors	Hilti "HIT-HY 70", Simpson Strong-Tie “SET-XP”, or approved equal, with Type 316 Stainless Steel threaded rods
Concrete Masonry Expansion (wedge) Anchors*	Hilti "KWIK BOLT 3", or approved equal, Type 316 Stainless Steel
Concrete Expansion (wedge) Anchors *	Hilti “KWIK BOLT TZ”, or approved equal, Type 316 Stainless Steel

**Post installed anchors shall always be an adhesive type anchor system except where noted otherwise or when Contractor makes a request for a specific application and Engineer approves.*

2.04 STAINLESS STEEL FASTENER LUBRICANT (ANTI-SEIZING)

A. Anti-seizing Lubricant for Stainless Steel Threaded Connections:
   1. Suitable for potable water supply.
   2. Formulated to resist washout.
   3. Acceptable manufacturers are Bostik, Saf-T-Eze, or equal.

2.05 ANCHOR BOLT SLEEVES

A. Provide anchor bolt sleeves as shown on design drawings and as required by equipment manufacturer’s design.
   1. Provide high density polyethylene plastic sleeves of single unit construction with deformed sidewalls such that the concrete and grout lock in place.
   2. The top of the sleeve shall be self-threading to provide adjustment of the threaded anchor bolt projection.
   3. Acceptable manufacturers are Contec, Wilson, or equal.

PART 3 EXECUTION

3.01 GENERAL

A. Anchor bolts shall be cast-in-place anchors unless post-installed anchors are specified or shown on the Drawings.

B. Grouting of anchor bolts using plastic sleeves with non-shrink or epoxy grout, where specified, shall be in accordance with Section 03 60 00.

C. The threaded end of anchor bolts and all-thread rods shall be long enough to project through the entire depth of the nut and if too long, shall be cut off at ½-inch beyond top of nut and ground smooth.

3.02 CAST-IN-PLACE ANCHOR BOLTS

A. Anchor bolts to be embedded in concrete shall be placed accurately and held in correct position using templates while the concrete is placed.

B. After anchor bolts have been embedded, their threads shall be protected by grease and the nuts run on.

3.03 ADHESIVE ANCHOR BOLTS

A. Note that adhesive anchors shall not be substituted for cast-in-place anchor bolts unless the adhesive anchors have been specified or shown on the Drawings, or approval has been obtained from the Engineer that substitution of adhesive anchors is acceptable for the specific use and location. Use of adhesive anchors shall be subject to the following conditions:
   1. Limit to locations where intermittent or continuous exposure to the following is extremely unlikely:
      a. Acid concentrations higher than 10 percent
      b. Chlorine gas
      c. Machine or diesel oils
   2. Limit to applications where exposure to the following is extremely unlikely:
      a. Fire
      b. Concrete or rod temperature above 120 degrees F
   3. Overhead applications (such as pipe supports) shall not be allowed unless approved by the Engineer and installation is by an Installer specially certified for overhead applications.
   4. Approval from Engineer for specific application and from supplier of equipment to be anchored, if applicable.
   5. Anchor diameter and material shall be per Contract Documents or equipment manufacturer's specifications. Anchor shall be threaded or deformed the full length of embedment and shall be free of rust, scale, grease, and oils.
   6. Embedment depth shall be as specified or as required by the equipment manufacturer.
   7. Follow the anchor system manufacturer's installation instructions.
   8. Holes shall have rough surfaces created by using a hammer drill with carbide bit. Core drilled holes are not allowed.
   9. Holes shall be blown clean with oil-free compressed air and be free of dust or standing water prior to installation. Follow additional requirements of the adhesive manufacturer.
   10. Concrete and air temperature shall be compatible with curing requirements of adhesives per adhesive manufacturer's instructions. Anchors shall not be placed in concrete when the temperature is below 25 degrees F.
   11. Anchors shall be left undisturbed and unloaded for full adhesive curing period, which is based on temperature of the concrete.

3.04 EXPANSION ANCHORS

A. Expansion (wedge type) anchors shall not be substituted for cast-in-place anchor bolts or adhesive anchors unless approved by the Engineer for a specific application. Use of expansion anchors shall be subject to conditions 4 through 9 as specified above for adhesive anchors. Expansion anchors shall not be used in a submerged condition or in mounting of equipment subject to vibration or cyclic motion.

3.05 REINFORCING STEEL CONFLICTS WITH POST-INSTALLED ANCHOR INSTALLATION

A. When reinforcing steel is encountered in the drill path, slant drill to clear obstruction and provide beveled washer to match angle of anchor. Drill shall not be slanted more than 10 degrees.

B. Where slanting the drill does not resolve the conflict, notify the Owner's Representative and resolve the conflict to the satisfaction of the Owner's Representative in consultation with the Engineer.

C. Abandoned post-installed anchor holes shall be cleaned and filled with non-shrink grout and struck off flush with adjacent surface.

D. The costs of determining and executing the resolution shall be borne by the Contractor. The determination and execution of the resolution shall not result in additional cost to the Owner.

E. Reinforcing steel in masonry shall not be damaged.

F. In order to avoid or resolve a conflict, locate embedded reinforcing steel using non-destructive methods and/or redesign the attachment.
   1. Redesign shall be done by the Contractor's Professional Engineer currently registered in the state of Utah.
   2. Calculations and details for redesign shall be submitted.

END OF SECTION

SECTION 05 10 00

STRUCTURAL METAL FRAMING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Structural metals consisting of standard shapes, hollow sections, fasteners, rods and plates that are used in structural supports and connections.

AWS-D1.1	Structural Welding Code–Steel
AWS D1.2	Structural Welding Code - Aluminum
AWS D1.6	Structural Welding Code - Stainless Steel
ASW D1.8	Structural Welding Code – Seismic Supplement
IBC	International Building Code
AISC Steel Construction Manual	American Institute of Steel Construction, Manual of Steel Construction

1.03 SUBMITTALS

A. Action Submittals:

1. Procedures: Section 01 33 00.
2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. Shop drawings for approval prior to fabrication. Shop drawings shall not be reproductions of the Drawings. Include complete information for the fabrication and erection of the structure's components, including the location, type, and size of bolts, welds, member sizes and lengths, coatings, connection details, blocks, copes, and cuts. Substitutions of details shown on the Drawings shall be clearly highlighted on the fabrication drawings. Explain the reasons for any deviations from the Drawings.
5. Certification that steel fabricator is approved to perform steel fabrication without special inspection.
6. AISC quality certification: Evidence that steel fabricator has AISC 201 Certification as a “Standard Steel Building Structures” fabricator. Certificate to show name and address of certified firm, effective date, and category of certification.
7. Welding procedures, qualifications, and inspection report.
8. Certified mill test reports for structural steel and high-strength bolts and nuts.
9. In accordance with IBC Chapter 17, Fabricator at the completion of fabrication to submit Certification of Compliance stating that the fabrication was performed in accordance with the design documents.
10. Certified copies of all surveys conducted by a registered professional engineer or surveyor showing elevations and locations of base plates and anchor bolts to receive structural steel or aluminum, and final elevations and locations for major members. Indicate discrepancies between actual installation and contract documents.

1.04 QUALITY ASSURANCE

A. Quality Control by Owner:
   1. Special Inspection of structural metals work shall be performed by the Special Inspector under contract with the Owner and in conformance with the IBC Chapter 17. Special Inspector(s) and laboratory shall be acceptable to the Owner in their sole discretion. Special Inspection of structural metals is in addition to, but not replacing, other inspections and quality control requirements herein. Where sampling and testing required herein conforms to Special Inspection standards, such sampling and testing need not be duplicated.
   2. All structural steel work shall receive Special Inspection in accordance with IBC, Chapter 17. Structural steel includes all steel elements that resist code-defined loads and whose failure would affect life safety. Items to be inspected include, but are not limited to, mechanical/electrical supports, beams, stringers, columns, access walkways and stairways.

B. Fabricator Qualifications:
   1. A qualified fabricator must participate in the AISC 201 Certification program and be designated an AISC Certified Plant, Category STD (Standard for Steel Building Structures).

PART 2 PRODUCTSMATERIALS

A. Steel:
   1. Materials for structural metals shall be as specified in Table A.

Table A - Steel Materials

Material	Specification
Standard steel S-shapes, channels, angles and plates	ASTM A36
Standard rolled steel wide-flange sections and WTs	ASTM A992
Pipe sections for posts	ASTM A53, Type E or S, Grade B
Round Hollow Structural Sections (HSS)	ASTM A500, Grade B (Fy=42 ksi)
Square and Rectangular Hollow Structural Sections (HSS)	ASTM A500, Grade B (Fy = 46 ksi)
Stainless steel bolts (used at stainless steel and aluminum framing unless noted otherwise)	ASTM F593, Type 316
Stainless steel nuts and washers (used at stainless steel and aluminum framing unless noted otherwise)	ASTM F594, Type 316
Steel bolts (used at galvanized and painted steel framing)	Galvanized ASTM A325 (Type 1), bearing type bolts fully tensioned
Carbon steel nuts and washers	Galvanized ASTM A563 nuts and galvanized ASTM F436 washers

B. Aluminum:

Table B - Aluminum Materials

Material	Specification

Table B - Aluminum Materials

Material	Specification
Aluminum structural shapes	Alloy 6061-T6 per ASTM B308
Bolts	Use stainless steel bolts for aluminum framing (see Table A above)
Aluminum guardrail and handrail pipe	Alloy 6061-T6 or 6063-T6 per ASTM B241
Aluminum plates	Alloy 6061-T6 per ASTM B209

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine and accept conditions before beginning work.

3.02 FABRICATION

A. Fabrication of steel shall be in accordance with the applicable provisions of the AISC Steel Construction Manual, sixteenth Edition. Fabrication of aluminum shall be in accordance with Aluminum Design Manual – Latest Edition. Fabrication and assembly shall be done in the shop to the greatest extent possible. The fabricating plant shall be certified under AISC 201 for Category STD (Standard for Steel Building Structures).

B. Compression joints depending on contact bearing shall have a surface roughness not in excess of 500 micro-inch and ends shall be square within the tolerances for milled ends specified in ASTM A6.

C. Shop splices of members will be permitted only where indicated on the Drawings. Splices not indicated require the approval of the Owner's Representative.

D. Verify measurements at the job site prior to fabrication. Fabricate to match job site measurements.

E. Provide holes as necessary or as indicated for securing other work to structural steel framing, and for passage of other work through steel framing members.

3.03 INSTALLATION

A. General:
   1. Erection of structural steel shall be in accordance with the applicable provisions of AISC Steel Construction Manual. Erection plan shall conform to AISC 303. For low-rise structural steel buildings, 60 feet tall or less and a maximum of 2 stories, the structure shall be erected in accordance with AISC 810.
   2. Coordinate installation of anchor bolts and other connectors required for securing structural steel to in place work.
   3. Employ a registered professional engineer or surveyor for accurate erection of the structural steel. Check elevations of concrete and locations of anchor bolts before erection proceeds and report discrepancies to the Owner's Representative.
   4. Placement tolerances shall be in accordance with AISC 303.

5. After final positioning of steel members, provide full bearing under base plates and bearing plates using non-shrink grout. Place non-shrink grout in accordance with the manufacturer's instructions.
6. Protect dissimilar metals from galvanic corrosion by means of pressure tapes, coatings or isolators. Protect aluminum in contact with concrete or grout with a heavy coat of bituminous paint.
7. Metalwork to be embedded in concrete shall be placed accurately and held in correct position while the concrete is placed. The surfaces of metalwork in contact with or embedded in concrete shall be thoroughly cleaned.
8. Structural steel completely encased in concrete shall not be galvanized or painted and shall have a clean surface for bonding to concrete.
9. Metalwork which is bent, broken or otherwise damaged shall be repaired or replaced.

B. Welding:
1. Welding shall be done by welders, welding operators, and tackers who have been qualified by tests as prescribed by AWS to perform the type of work required. The quality of welding shall conform to AWS Codes.
2. Develop and submit the Welding Procedure Specifications (WPS) for all welding, including welding done using prequalified procedures.
3. Provide continuous seal welds for plates or structural shapes that are exposed to or submerged in water or wastewater.

C. Bolted Connections:
1. Bolted connections, unless noted otherwise, shall conform to AISC 360 and AISC 341, and shall be bearing type connections with bolts fully tensioned unless connecting HSS shapes. Punch, subpunch and ream, or drill bolt holes perpendicular to the surface of the member. Holes shall be punched 1/16 inch larger than the nominal size of the bolts, unless otherwise specified. Bolts, nuts, and washers shall be clean of dirt and rust and lubricated immediately prior to installation. No drifting of bolts or enlargement of holes will be allowed to correct misalignment. Holes shall not be cut or enlarged by burning. Mismatched holes shall be corrected with new material.

3.04 CORROSION PROTECTION

A. Unless otherwise specified, carbon steel shall be galvanized. If coatings are indicated on the Drawings or elsewhere in the Specifications, coat in accordance with Section 09 90 00. Coating surface preparation shall be as specified in Section 09 90 00 and shall include the following operations:
1. Grind the exterior and interior edges of all flame-cut plates or members to a smooth surface.
2. Grind all sharp edges off of the sheared plates and punched holes.
3. Grind uneven or rough welds with high beads to a smooth finish.

3.05 CLEANING

A. After installation, damaged surfaces of shop primed metals shall be cleaned and touched up with the same material used for the shop coat. Damaged surfaces of galvanized metals shall be repaired as specified in Section 05 05 14.

END OF SECTION

SECTION 05 31 23

STEEL ROOF DECKING

PART 1 GENERAL

1.01 DESCRIPTION

A. General:
   1. This section specifies fabrication and erection of steel roof deck.

B. Related Sections:
   1. The work of the following Sections is related to the work of this Section. Other Sections, not referenced below, may also be related to the proper performance of this work.
      a. Section 05 10 00 – Structural Metal Framing
      b. Section 05 05 14 – Hot-Dip Galvanizing

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
AISI SG-673	Design of Cold-Formed Steel Structural Members
ASTM A36	Carbon Structural Steel
ASTM A611	Steel, Sheet, Carbon, Cold Rolled, Structural Quality
ASTM A653	Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron, Alloy-Coated (Galvannealed) by the Hot-Dip Process
ASTM 780	Repair of Damaged and Uncoated Areas of Hot-Dipped Galvanized Coatings
ASTM A924	Steel Sheet, Metallic-Coated by the Hot-Dip Process
ASTM D1056	Standard Specification for Flexible Cellular Materials Sponge or Expanded Rubber.
AWS D1.3	Structural Welding Code Sheet Steel
Steel Deck Institute (SDI)	Design Manual for Composite Decks, Form Decks, Roof Decks, and Cellular Metal Floor Deck with Electrical Distribution
FMDS	FM Global Property Loss Prevention Data Sheets

1.03 SUBMITTALS

A. Procedures: Section 01 33 00.

B. Complete shop drawings showing framing and deck layout indicating length, type, cross section, thickness, markings of metal deck units, and size and locations of all openings. Shop drawings shall not be a reproduction of the Contract Drawings.

C. Details and gages of all accessories and miscellaneous items showing sump pans, cant strips, ridge and valley plates, closure strips and insulation supports.

D. Manufacturer's load table including design thickness in inches, section properties, allowable gravity load, allowable diaphragm shear loads.

E. Erection marks. Mark each bundle to correspond to the shop drawings.

F. Certification from SDI that manufacturer is a member of SDI and that the steel roof deck is designed in accordance with SDI standards.

G. Certification for installers of deck fastening systems.

1.04 QUALITY ASSURANCE

A. Steel roof deck shall conform to the requirements of the SDI standard for Steel Roof Deck.

B. Deck manufacturer shall be a member of the Steel Deck Institute and design of the deck shall be by a qualified professional engineer.

C. Deck installer shall have minimum three years experience on comparable steel deck projects. Installers shall be trained and certified by manufacturer to install fastening systems.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Store materials off the ground with one end elevated to provide drainage. Protect from the elements with a waterproof covering, ventilated to avoid condensation. Prevent rust, deterioration and accumulation of foreign materials.

PART 2 PRODUCTS

2.01 MATERIALS

A. Sheet Steel:
   1. ASTM A653, SS, Grade 33, minimum yield 38 ksi, with Designation G60 galvanized coating, unless noted otherwise.

B. Structural Steel:
   1. ASTM A36, unless noted otherwise.

C. Galvanizing Repair Paint:
   1. Paint shall be 95 percent zinc dust, organic vehicle primer compatible with galvanized surfaces per Section 05 05 14.

2.02 FABRICATION

A. General:
   1. Form deck units in lengths to span three or more support spacings, with minimum two-inch laps and side laps. Configuration shall be appropriate for side lab connection.
   2. Deck profile and gage shall be as shown on the drawings. Acceptable manufacturer is Verco or approved equal.

B. Closure Plates:
   1. Fabricate closure plates of galvanized sheet steel of same quality as deck units. Provide tight-fitting closure with deck units.

C. Fabrication Tolerances:
   1. Maximum variation in unit alignment shall be 1/4 inch in 40 feet.

PART 3 EXECUTION

3.01 INSPECTION

A. Check supporting members for correct layout and alignment. Verify that surfaces to receive steel deck are free of debris. Do not proceed with installation until defects are corrected.

3.02 INSTALLATION

A. Install steel roof deck and accessories in accordance with the manufacturer's instructions and in accordance with final approved shop drawings and as specified herein.

B. Fasten steel roof deck to all interior and exterior transverse supports and at side laps and longitudinal supports. Deck fasteners and fastener spacing shall be as shown on the Drawings. End lap of steel roof deck shall be at least 2 inches and shall occur over transverse supporting members.

C. Coordinate size, location, and details of penetrations with the Drawings, other trades, and details of approved equipment. Pipe and conduit openings in the steel roof deck shall be reinforced according to the manufacturer's recommendation.
   1. Cutting and Fittings:
      a. Cut and fit steel roof deck units and accessories around projections through steel roof deck.
      b. Make cuts neat, square, and trim.
      c. Cut openings in steel roof deck true to dimensions using metal saws or drills.
      d. Do not use cutting torches.
      e. Openings less than 12-in in greatest dimension shall be reinforced as indicated in the drawings.

D. Suspended ceilings, light fixtures, ducts, piping, conduits, or other utilities shall not be attached to steel roof deck.

3.03 FIELD PAINTING

A. Touch up galvanized surfaces with galvanizing repair paint applied in accordance with manufacturer’s instructions and Section 05 05 14.

3.04 INSPECTION

A. The Engineer reserves the right to observe steel roof deck in the field for compliance with the requirements specified herein and the approved shop drawings. The Engineer may reject or require repair or re-fabrication of steel roof deck or accessories not meeting these requirements.

END OF SECTION

SECTION 05 40 00

COLD-FORMED METAL FRAMING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Exterior load-bearing wall framing.
   2. Joist framing.
   3. Soffit framing.

1.03 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.04 ACTION SUBMITTALS

A. Product Data: For each type of cold-formed steel framing product and accessory.

B. Shop Drawings:
   1. Include layout, spacings, sizes, thicknesses, and types of cold-formed steel framing; fabrication; and fastening and anchorage details, including mechanical fasteners.
   2. Indicate reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachment to adjoining work.

1.05 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Welding certificates.

C. Product Test Reports: For each listed product, for tests performed by manufacturer and witnessed by a qualified testing agency.
   1. Steel sheet.
   2. Expansion anchors.
   3. Power-actuated anchors.
   4. Mechanical fasteners.
   5. Miscellaneous structural clips and accessories.

D. Research Reports: For non-standard cold-formed steel framing, from ICC-ES.

1.06 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated.

B. Product Tests: Mill certificates or data from a qualified independent testing agency, or in-house testing with calibrated test equipment indicating steel sheet complies with requirements, including base-metal thickness, yield strength, tensile strength, total elongation, chemical requirements, and metallic-coating thickness.

C. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
   2. AWS D1.3/D1.3M, "Structural Welding Code - Sheet Steel."

1.07 DELIVERY, STORAGE, AND HANDLING

A. Protect cold-formed steel framing from corrosion, moisture staining, deformation, and other damage during delivery, storage, and handling.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. AllSteel & Gypsum Products, Inc.
   2. California Expanded Metal Products Company.
   3. ClarkWestern Building Systems, Inc.
   4. Consolidated Fabricators Corp.; Building Products Division.
   5. Craco Mfg., Inc.
   6. Custom Stud Inc.
   7. Design Shapes in Steel.
   8. Dietrich Metal Framing; a Worthington Industries Company.
   9. Formetal Co. Inc. (The).
   10. MarinoWARE.
   11. Nuconsteel; a Nucor Company.
   12. Olmar Supply, Inc.
   13. Quail Run Building Materials, Inc.
   14. SCAFCO Corporation.
   15. Southeastern Stud & Components, Inc.
   16. State Building Products, Inc.
   17. Steel Construction Systems.

18. Steel Network, Inc. (The).
19. Steel Structural Systems.
20. Steeler, Inc.
21. Super Stud Building Products, Inc.
22. Telling Industries, LLC.
23. United Metal Products, Inc.
24. United Steel Manufacturing.

2.02 PERFORMANCE REQUIREMENTS

A. Cold-Formed Steel Framing Design Standards:
   1. Floor and Roof Systems: AISI S210.
   2. Wall Studs: AISI S211.
   3. Headers: AISI S212.

B. AISI Specifications and Standards: Unless more stringent requirements are indicated, comply with AISI S100 and AISI S200.

2.03 COLD-FORMED STEEL FRAMING, GENERAL

A. Steel Sheet: ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of grade and coating weight as follows:
   1. Grade: As indicated.
   2. Coating: G60, A60, AZ50, or GF30.

B. Steel Sheet for Drift Clips: ASTM A 653/A 653M, structural steel, zinc coated, of grade and coating as follows:
   1. Coating: G60 (Z180).

2.04 EXTERIOR LOAD-BEARING WALL FRAMING

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, and as follows:
   1. Minimum Base-Metal Thickness: As indicated.
   2. Flange Width: 1-5/8 inches.

B. Steel Track: Manufacturer's standard U-shaped steel track, of web depths indicated, unpunched, with straight flanges, and as follows:
   1. Minimum Base-Metal Thickness: As indicated.
   2. Flange Width: 1-1/4 inches.

2.05 SOFFIT AND CEILING JOIST FRAMING

A. Steel Joists: Manufacturer's standard C-shaped steel joists, of web depths indicated, punched, with stiffened flanges, and as follows:
   1. Minimum Base-Metal Thickness: As indicated.
   2. Flange Width: As indicated.

B. Steel Joist Track: Manufacturer's standard U-shaped steel joist track, of web depths indicated, unpunched, with unstiffened flanges, and as follows:
   1. Minimum Base-Metal Thickness: As indicated.
   2. Flange Width: 1-1/4 inches minimum.

2.06 FRAMING ACCESSORIES

A. Fabricate steel-framing accessories from steel sheet, ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of same grade and coating weight used for framing members.

B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:
   1. Supplementary framing.
   2. Bracing, bridging, and solid blocking.
   3. Web stiffeners.
   4. Anchor clips.
   5. End clips.
   6. Foundation clips.
   7. Joist hangers and end closures.
   8. Hole reinforcing plates.
   9. Backer plates.

2.07 ANCHORS, CLIPS, AND FASTENERS

A. Steel Shapes and Clips: ASTM A 36/A 36M, zinc coated by hot-dip process according to ASTM A 123/A 123M.

B. Mechanical Fasteners: ASTM C 1513, corrosion-resistant-coated, self-drilling, self-tapping, steel drill screws.
   1. Head Type: Low-profile head beneath sheathing, manufacturer's standard elsewhere.

C. Welding Electrodes: Comply with AWS standards.

2.08 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint: SSPC-Paint 20 or MIL-P-21035B or ASTM A 780.

B. Cement Grout: Portland cement, ASTM C 150, Type I; and clean, natural sand, ASTM C 404. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.

C. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, and plasticizing and water-reducing agents, complying with ASTM C 1107/C 1107M, with fluid consistency and 30-minute working time.

D. Shims: Load bearing, high-density multimonomer plastic, and nonleaching; or of cold-formed steel of same grade and coating as framing members supported by shims.

E. Sealer Gaskets: Closed-cell neoprene foam, 1/4 inch (6.4 mm) thick, selected from manufacturer's standard widths to match width of bottom track or rim track members.

F. Provide double neoprene sway braces for resilient indirect attachment between acoustically isolated structures. Provide sway braces only at head and other necessary attachment points as indicated on drawings and in accordance with requirements indicated by the Project Structural Engineer.
   1. Acceptable product: mason Industries Type DNSB or approved equal.

2.09 FABRICATION

A. Fabricate cold-formed steel framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced AISI's specifications and standards, manufacturer's written instructions, and requirements in this Section.
   1. Fabricate framing assemblies using jigs or templates.
   2. Cut framing members by sawing or shearing; do not torch cut.
   3. Fasten cold-formed steel framing members by welding, screw fastening, clinch fastening, pneumatic pin fastening, or riveting as standard with fabricator. Wire tying of framing members is not permitted.
      a. Comply with AWS D1.3/D1.3M requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
      b. Locate mechanical fasteners and install according to Shop Drawings, with screw penetrating joined members by no fewer than three exposed screw threads.
   4. Fasten other materials to cold-formed steel framing by welding, bolting, pneumatic pin fastening, or screw fastening, according to Shop Drawings.

B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or permanent distortion.

C. Fabrication Tolerances: Fabricate assemblies level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet (1:960) and as follows:
   1. Spacing: Space individual framing members no more than plus or minus 1/8 inch (3 mm) from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
   2. Squareness: Fabricate each cold-formed steel framing assembly to a maximum out-of-square tolerance of 1/8 inch.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine supporting substrates and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Install load bearing shims or grout between the underside of load-bearing wall bottom track and the top of foundation wall or slab at locations with a gap larger than 1/4 inch (6 mm) to ensure a uniform bearing surface on supporting concrete or masonry construction.

B. Install sealer gaskets at the underside of wall bottom track or rim track and at the top of foundation wall or slab at stud or joist locations.

3.03 INSTALLATION, GENERAL

A. Cold-formed steel framing may be shop or field fabricated for installation, or it may be field assembled.

B. Install cold-formed steel framing according to AISI S200 and to manufacturer's written instructions unless more stringent requirements are indicated.

C. Install shop- or field-fabricated, cold-formed framing and securely anchor to supporting structure.
   1. Screw, bolt, or weld wall panels at horizontal and vertical junctures to produce flush, even, true-to-line joints with maximum variation in plane and true position between fabricated panels not exceeding 1/16 inch (1.6 mm).

D. Install cold-formed steel framing and accessories plumb, square, and true to line, and with connections securely fastened.
   1. Cut framing members by sawing or shearing; do not torch cut.
   2. Fasten cold-formed steel framing members by welding, screw fastening, clinch fastening, or riveting. Wire tying of framing members is not permitted.
      a. Comply with AWS D1.3/D1.3M requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
      b. Locate mechanical fasteners and install according to Shop Drawings, and complying with requirements for spacing, edge distances, and screw penetration.

E. Install framing members in one-piece lengths unless splice connections are indicated for track or tension members.

F. Install temporary bracing and supports to secure framing and support loads comparable in intensity to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

G. Do not bridge building expansion joints with cold-formed steel framing. Independently frame both sides of joints.

H. Install insulation in built-up exterior framing members, such as headers, sills, boxed joists, and multiple studs at openings, that are inaccessible on completion of framing work.

I. Fasten hole reinforcing plate over web penetrations that exceed size of manufacturer's approved or standard punched openings.

J. Erection Tolerances: Install cold-formed steel framing level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet (1:960) and as follows:
   1. Space individual framing members no more than plus or minus 1/8 inch (3 mm) from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

3.04 INTERIOR LOAD-BEARING WALL INSTALLATION

A. Install continuous tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure as indicated.

B. Fasten both flanges of studs to top and bottom track unless otherwise indicated. Space studs as follows:
   1. Stud Spacing: As indicated.

C. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar requirements.

D. Install horizontal bridging in wall studs, spaced vertically in rows but not more than 48 inches (1220 mm) apart. Bridging at wall studs is not required where the studs are sheathed on both sides for the full height of the wall. Where sheathing on one side doesn't continue the full height of the wall, bridging is required. Fasten at each stud intersection.
   1. Bridging: Cold-rolled steel channel, mechanically fastened to webs of punched studs using bridging clips.
   2. Bridging: Combination of flat, taut, steel sheet straps of width and thickness indicated and stud-track solid blocking of width and thickness to match studs. Fasten flat straps to stud flanges and secure solid blocking to stud webs or flanges.
   3. Bridging: Proprietary bridging bars installed according to manufacturer's written instructions.

E. Install miscellaneous framing and connections, including stud kickers, web stiffeners, clip angles, continuous angles, anchors, and fasteners, to provide a complete and stable wall-framing system.

F. Fully seat load-bearing wall studs in bottom and top tracks with gaps of 1/8" or less.

3.05 JOIST INSTALLATION

A. Install perimeter joist track sized to match joists. Align and securely anchor or fasten track to supporting structure at corners, ends, and spacings indicated on Shop Drawings.

B. Install joists bearing on supporting frame, level, straight, and plumb; adjust to final position, brace, and reinforce. Fasten joists to both flanges of joist track.
   1. Install joists over supporting frame with a minimum end bearing of 1-1/2 inches (38 mm).
   2. Reinforce ends and bearing points of joists with web stiffeners, end clips, joist hangers, steel clip angles, or steel-stud sections as indicated on Contract Drawings.

C. Space joists not more than 2 inches (51 mm) from abutting walls, and as follows:
   1. Joist Spacing: As indicated.

D. Frame openings with built-up joist headers consisting of joist and joist track, or another combination of connected joists if indicated.

E. Install bridging at intervals indicated. Fasten bridging at each joist intersection as follows:
   1. Bridging: Joist-track solid blocking of width and thickness indicated, secured to joist webs.

F. Secure joists to load-bearing interior walls to prevent lateral movement of bottom flange.

G. Install miscellaneous joist framing and connections, including web stiffeners, closure pieces, clip angles, continuous angles, hold-down angles, anchors, and fasteners, to provide a complete and stable joist-framing assembly.

3.06 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Field and shop welds will be subject to testing and inspecting.

C. Testing agency will report test results promptly and in writing to Contractor and Architect.

D. Remove and replace work where test results indicate that it does not comply with specified requirements.

E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.07 REPAIRS AND PROTECTION

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed steel framing with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer that ensure that cold-formed steel framing is without damage or deterioration at time of Substantial Completion.

SECTION 05 50 00

METAL FABRICATIONS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Custom fabricated metal items and certain manufactured units not otherwise indicated to be provided under work of other specification sections.
   2. Seat angle frames
   3. Fall arrest anchors
   4. Iron castings
   5. Ladders, ladder cages, and safety posts
   6. Ladder Rail Fall Protection System
   7. U-channel concrete inserts
   8. Cover plates and frames
   9. Pipe sleeves
   10. Bollards
   11. Stairs
   12. Safety nosings at concrete stairs
   13. Miscellaneous metal fabrications not covered elsewhere

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 73 24 Design Requirements for Nonstructural Components and Nonbuilding Structures
   2. Section 05 05 14 Hot-Dip Zinc Coating
   3. Section 05 05 20 Anchor Bolts
   4. Section 05 10 00 Structural Metal Framing
   5. Section 05 52 10 Aluminum Railings
   6. Section 05 53 10 Metal Gratings and Stair Treads
   7. Section 09 90 00 Painting and Coating

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

1.04 DEFINITIONS

A. Galvanize: Hot-dip galvanize per ASTM A123 or ASTM A153, per Section 05 05 14.

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration
   4. Manufacturer's product data.
   5. Product Data for Recycled Content: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
   6. Detailed Shop Drawings:
      a. Fabrication drawings showing layouts, connections to structural system, and anchoring details.

b. Erection and installation drawings indicating thickness, type, grade, class of metal, coating system and dimensions.
c. Construction details, reinforcement, anchorage, and installation with relation to the building construction.

7. Welding procedures and welder certificates and qualifications.
8. U-Channel Concrete Inserts: Manufacturer's product description and allowable load tables.
9. Passivation method for stainless steel fabrications.
10. Fall Arrest Anchor Certificate:
    a. Certify fall arrest system is designed to meet OSHA 29 CFR 1926.502 specified performance requirements.
    b. Signed and sealed by a Professional Engineer licensed in the state in which the project is located.

1.06 QUALITY ASSURANCE

A. Qualifications
   1. Fabricator shall have a minimum of five years experience in fabrication of metal specified.

B. Certificates
   1. Certified welding procedures and welding operators in accordance with AWS. Welding operator certificates shall be no more than one-year old and the welder shall have used the welding process to be performed within the last six months.

C. The use of salvaged, reprocessed or scrap materials will not be permitted.

D. Shop Assembly: Items in the shop shall be preassembled to the greatest extent possible, so as to minimize field splicing and assembly of units. Units shall be disassembled only to the extent necessary for shipping and handling limitations. Units shall be clearly marked for reassembly and coordinated installation.

1.07 DELIVERY, STORAGE AND HANDLING

A. Avoid damage during delivery and handling of fabrications.

B. Store off the ground on skids or other supports to keep items free of dirt and other foreign debris and to protect against corrosion.

PART 2 PRODUCTS

2.01 MATERIALS

A. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than the following:
   1. W-Shapes: 60 percent.
   2. Channels, Angles: 60 percent.
   3. Plate and Bar: 25 percent.

4. Cold-Formed Hollow Structural Sections: 25 percent.
5. Steel Pipe: 25 percent.
6. All Other Steel Materials: 25 percent.

B. Materials for miscellaneous metalwork are specified in the following table.

Material	Specification
Steel	
• Sheets, plates and shapes (except W shapes)	ASTM A36
• W shapes	ASTM A992
• Pipe	ASTM A53, Grade B
• Square/rectangular tubing	ASTM A500, Grade B
• Headed Anchor Studs	ASTM A108
• Carbon steel bolts	ASTM A307, Grade A
• High strength bolts	ASTM A325 (Type 1)
• Nuts	ASTM A563
• Washers	ASTM F436
Stainless Steel	
• Sheet and Plates	ASTM A240, Type 316 or 316L
• Shapes, bars, and similar items	ASTM A276, Type 316 or 316L
• Pipe	ASTM A312, Type 316 or 316L
• Headed Anchor Studs	ASTM A276, Type 316L
• Bolts	ASTM F593, Type 316
• Nuts	ASTM F594, Type 316
Aluminum	
• Sheets and plates	ASTM B209, Type 6061-T6
• Bars, flats and similar items	ASTM B211 or B221, Type 6061-T6
• Shapes	ASTM B308, Type 6061-T6
• Round tubing and pipe	ASTM B241, Type 6061-T6
• Square and rectangular tubing	ASTM B221, Type 6063-T52
• Pipe	ASTM B211 or B241, Type 6061-T6
• Bolts, Stainless Steel	ASTM F593, Type 316
• Nuts, Stainless Steel	ASTM F594, Type 316
Checker Plate	
• Steel	ASTM A786
• Stainless steel	ASTM A793, Type 304
• Aluminum	ASTM B632, Type 6061-T6
Other steel items	
• Iron castings	ASTM A48
• Eyebolts	ASTM A489
• Threaded rods	ASTM A36

2.02 FABRICATION

A. General
   1. Conform to AISC or Aluminum Association standards as applicable. Where Code defined loads apply, also conform to IBC requirements.
   2. Shop and field welding shall conform to the requirements of AISC, the Aluminum Design Manual, and applicable AWS procedures and specifications as required by the material being welded.
   3. Grind exposed joints flush and smooth with adjacent finish surface. Make exposed joints butt, tight, flush, and hairline. Remove burrs and weld splatter. Ease exposed edges to small uniform radius.
   4. Holes shall be punched 1/16 inch larger than the nominal size of the bolts, unless otherwise specified. Whenever needed, because of the thickness of the metal, holes shall be subpunched and reamed or shall be drilled.
   5. Fabrication, including cutting, drilling, punching, threading and tapping required for fabrications or adjacent work, shall be performed prior to galvanizing.

B. Seat Angle Frames
   1. Provide recessed seat angle frames for grating and floor plates. Miter corners to ensure accurate fit. Match depth of recess with grating or floor plate thickness. Anchor frames in concrete with headed studs. Steel angle support frames shall be stainless steel, ASTM A276, Type 316, unless indicated otherwise.

C. Fall Arrest Anchors
   1. Fall arrest anchors shall meet requirements of OSHA 29 CFR 1926.502. Anchorages attached to personal fall arrest equipment shall be capable of supporting at least 5,000 pounds per employee attached, or shall be designed, installed, and used as part of a complete personal fall arrest system which maintains a safety factor of at least two. Type of anchor shall fit the application and substrate material.
   2. Fall arrest anchors shall be manufactured by:
      a. Thaler Metal Industries
      b. DBI-SALA
      c. Approved Equal

D. Iron Castings
   1. Castings shall be as specified on the Drawings. Castings weighing less than 100 pounds shall be galvanized after machining. Castings weighing greater than 100 pounds shall be galvanized where specified.

E. Ladders
   1. Aluminum Ladders: Ladders shall be vendor supplied pre-engineered aluminum ladders. Ladders shall be fabricated of alloy 6063-T6. Rungs shall have non-slip grip surface. Finish shall be anodized. Fabricate ladders with rails, rungs, landings and cages to meet applicable requirements of OSHA 29 CFR 1910.27. Rungs shall be a minimum clear length of 16 inches, uniformly spaced at a maximum of 12 inches and plug welded into side rails. Install ladders so that the distance from the centerline of rungs to the finished wall surface is not less than 7 inches nor more than 12 inches. Provide clip angle supports bolted to the side rail at the top. Provide intermediate clip angle lateral supports at a maximum of 10 feet on center.

2. Ladder Safety Post:
    a. Provide a telescoping ladder safety post at ladders below all floor and roof hatches, and other coverings.
    b. The ladder safety post shall be pre-assembled from the manufacturer.
    c. Performance characteristics:
        1) Post shall lock automatically when fully extended.
        2) Post shall have controlled upward and downward movement.
        3) Release lever shall disengage the post to allow it to be returned to its lowered position.
        4) Post shall have adjustable mounting brackets to fit ladder rung spacing up to 14" on center and clamp brackets to accommodate ladder rungs up to 1-3/4" in diameter.
        5) Post: Manufactured of high strength square tubing with a pull up loop provided at the upper end of the post to facilitate raising the post.
        6) Material of construction: Aluminum
        7) Balancing spring: Stainless steel spring balancing mechanism to provide smooth, easy, controlled operation when raising and lowering the safety post.
    d. Acceptable products include:
        1) LadderUp Safety Post by Bilco
        2) Ladder Safety Post Model SP by Nystrom Inc.
        3) Approved equal
3. Ladder Cages:
    a. Provide ladder cages when ladders are greater than 20 feet tall between floor/landing surfaces. Conform to OSHA 29 CFR 1910.27.
4. Ladder Rail Fall Protection System:
    a. System shall consist of a vertical rigid track carrier rail securely and permanently attached to ladder, over which travels a sleeve to harness belt can be attached.
    b. Rail:
        1) Notched at six-inch intervals and constructed of stainless steel Type 316.
        2) Provide ladder attachments/rail mounting brackets of same material as rail, and as required by Supplier.
        3) For all ladders, include provisions to secure safety sleeve to carrier rail at top of vertical ladder so that sleeve will not slide down rail when safety belt is unsnapped.
        4) Ladders Below Hatches: Rail for ladder shall extend from bottom of ladder to top of ladder. Provide telescopic safety post.
        5) Ladders Not Below Hatches: Rail for ladder shall extend from bottom of ladder to above horizontal landing or roof at top of ladder. Provide removable extension section at top of ladder. Arrange rail to allow climber to land on landing or roof without unsnapping climber's safety harness.
    c. Accessories: Provide with each ladder the following, all furnished by the fall prevention system Supplier:
        1) One safety sleeve compatible for use with the rail. Sleeve shall be cast bronze with five zinc plated steel roller bearings. Sleeve shall travel smoothly on straight or curved rail.

2) One safety harness that attaches to sleeve. Harness shall be of woven high-strength nylon, with padded straps and forged steel buckles and rings. Harness shall distribute impact forces of a fall over climber's thighs, buttocks, chest, and shoulders.

3) One shock adsorbing lanyard no longer than six-feet, complying with ANSI Z359.1. Lanyard shall be 5/8-inch diameter nylon rope with double locking hooks at each end.

d. Acceptable ladder rail fall protection systems include:

1) Miller Saf-T-Climb as manufactured by Honeywell

2) Vertical Rigid Track Fall Arrest System as manufactured by Diversified Fall Protection

3) Approved equal

F. U-Channel Concrete Inserts

1. U-Channel Concrete Inserts shall be stainless steel conforming to attachment hardware and materials attached. Channels shall be 1 5/8 inch wide by 1 3/8 inch deep with a minimum thickness of 0.105 inches. Channels shall be open-bottom with curved or lipped flange edges to engage standard nuts and connection hardware. Load rating shall meet or exceed a 2,000 pound point load at 12 inch minimum spacing. Provide standard accessories and hardware per manufacturers recommendations.

G. Cover Plates and Frames

Fabricate aluminum cover plates weighing not more than 80 pounds per cover with a raised pattern nonslip top surface conforming to ASTM B632. Reinforce to sustain a live load of 100 pounds per square foot (foot traffic only) or as indicated on the Drawings. Frames shall be stainless steel angles and plates, with stainless steel

headed anchors welded to frame for anchoring to concrete. Miter and weld corners and butt joint straight runs. Provide flush drop handles for removal. Remove sharp edges and burrs from cover plates and exposed edges of frames. Weld connections and grind top surface smooth. Provide 1/8 inch clearance at edges.

H. Pipe Sleeves

1. Unless otherwise indicated on the Drawings, fabricate pipe sleeves from schedule 40 steel pipe with 3/16 inch thick by 3 feet wide seep ring continuously seal welded to the outside of the pipe. Galvanize after fabrication in accordance with ASTM A123.

I. Bollards

1. Provide minimum 6 inch galvanized standard weight steel pipe or as indicated on the Drawings. Pipe to be in accordance with ASTM A53. Anchor posts in concrete and fill solidly with concrete of a minimum compressive strength of 2500 psi. Coat galvanized pipe above grade in accordance with Section 09 90 00. Top coat cover color shall be safety yellow.

J. Stairs – Galvanized Steel

1. Provide galvanized steel stairs complete with stringers, metal-pan concrete-filled treads, grating treads, landings, columns, guardrails, handrails, and necessary bolts and other fastenings. Hot-dip galvanize steel stairs and accessories.

2. Fabricate stringers of structural steel channels. Provide closures for exposed ends of stringers. Construct landings of structural steel channel headers and miscellaneous framing members as indicated.
3. Grating Treads and Landings: Provide galvanized grating conforming to Section 05 53 10. Fabricate grating treads with abrasive nosing and with steel angle or plate carrier at each end for string connections. Secure treads to stringers with bolts. Fabricate grating landings with nosing that matches grating treads. Provide toe-plates at open-sided edges of landing.
4. Metal-Pan Concrete-Filled Treads: Form metal pans of 12-gage thick structural steel sheets, conforming to ASTM A1011, Grade 36. Shape pans to configuration indicated. Construct riser and subtread metal pans with steel angle supporting brackets, of size indicated, welded to stringers. Secure metal pans to brackets with welds. Cast metal abrasive safety nosings into concrete fill at tread and landing.
5. Provide railings for stairs and landings in accordance with Section 05 52 10 *or* 05 52 20.

K. Stairs – Aluminum
1. Provide aluminum stairs complete with stringers, grating treads, landings, columns, guardrails, handrails, and necessary bolts and other fastenings.
2. Fabricate stringers of structural aluminum channels. Provide closures for exposed ends of stringers. Construct landings of structural channel headers and miscellaneous framing members.
3. Grating Treads and Landings: Provide aluminum grating for treads and landings conforming to Section 05 53 10. Fabricate grating treads with abrasive nosing and with angle or plate carrier at each end for stringer connections. Secure treads to stringers with bolts. Fabricate grating landings with nosing that matches grating treads. Provide toe-plates at open-sided edges of landing.
4. Provide railings for stairs and platforms in accordance with Section 05 52 10.

L. Safety Nosings at Concrete Stairs
1. Safety stair treads shall be 4 inches wide and manufactured by:
   a. Safe T Metal Company Incorporated, Style AX;
   b. Wooster Products Incorporated, Alumogrit, Type 101;
   c. Approved Equal.

M. Other Miscellaneous Steel Metalwork
1. Other miscellaneous steel metalwork including embedded and non-embedded steel metalwork, hangers and inserts shall be as specified or shown on the Drawings, and shall be galvanized after fabrication unless otherwise noted.

2.03 FINISHES

A. Galvanizing
1. Galvanize items specified to be zinc-coated, after fabrication where practicable. Galvanizing in accordance with ASTM A123, ASTM A153, ASTM A653 or ASTM A924, Z275 G90, as applicable. Galvanize anchor bolts, grating fasteners, washers, and parts or devices necessary for proper installation, unless indicated otherwise.

2. Repair damaged Zinc-Coated surfaces with galvanizing repair method and paint conforming to ASTM A780 or by application of stick or thick paste material specifically designed for repair of galvanizing, as approved by Owner's Representative.
3. Safeguard against warpage and distortion during galvanizing of steel in accordance with ASTM A384. Straighten items after galvanizing so that they are straight, free of racking and distortion.

B. Shop Painting
1. Prepare and coat surfaces in accordance with Section 09 90 00.
2. Steel to be embedded in concrete shall be free of dirt and grease.

C. Aluminum Surfaces
1. Surface condition aluminum before finishes are applied. Remove roll marks, scratches, rolled-in scratches, kinks, stains, pits, orange peel, die marks, structural streaks, and other defects which will affect uniform appearance of finished surfaces.
2. Aluminum finishes for unexposed sheet, plate and extrusions may have mill finish as fabricated.
3. Provide other aluminum items with a standard mill finish.
4. Provide a coating thickness not less than that specified for protection.
5. Provide decorative type finishes for items used in interior occupied locations or architectural type finish for items used in exterior locations.
6. Provide a polished satin finish on items to be anodized.

D. Stainless Steel Passivation
1. Stainless steel to be cleaned, descaled, and passivated after fabrication in accordance with ASTM A380. Passivate to remove iron compounds from the surface of the stainless steel.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify measurements at the site. Include field dimensions in shop drawings.

B. Examine and accept existing conditions before beginning work.

3.02 PREPARATION

A. Make provisions for erection loads with temporary bracing. Keep work in alignment.

B. Supply items required to be cast into concrete or embedded in masonry with setting templates.

3.03 INSTALLATION

A. Install items plumb, level and square, accurately fitted, and free from distortion or defects. Install rigid, substantial, and neat in appearance.

B. Allow for erection loads and provide temporary bracing to maintain true alignment until completion of erection and installation of permanent attachments.

C. Fieldwork shall not be permitted on galvanized items. Drilling of bolts or enlargement of holes to correct misalignment will not be allowed.

D. Protect encased or embedded dissimilar metals (both metals must be encased or embedded) from galvanic corrosion by means of pressure tapes, coatings or isolators.

E. Place metalwork to be embedded in concrete accurately and hold in correct position while the concrete is placed or, if indicated, form recesses or blockouts in the concrete. Thoroughly clean the surfaces of metalwork in contact with or embedded in concrete.

F. Seat angles, supports and guides: Set seat angles for grating and supports for floor plates so that they maintain the grating and floor plates flush with the floor.

G. Ladder Safety Post: Comply with manufacturer's installation instructions.

H. Pipe Sleeves: Provide where pipes pass through concrete or masonry. Holes drilled with a rotary drill may be provided in lieu of sleeves in existing walls. Provide a center flange for water stoppage on sleeves in exterior or water bearing walls. Provide a rubber caulking sealant or a modular mechanical unit to form a watertight seal in the annular space between pipes and sleeves.

I. U-Channel Concrete Inserts: Provide as indicated for pipe supports and where otherwise specified or shown on Drawings.

J. Safety Nosings: Unless otherwise specified, safety stair nosing shall be installed on concrete stairs. Nosing shall be secured to concrete with suitable anchors at 15 inches on center and not more than 4 inches from the ends. 1/8 inch thick rubber tape shall be provided at both ends and cut to fit shape of nosing prior to concrete placement.

K. Concrete: Pan-filled stairs to be constructed in accordance with Section 03 30 00. Finish concrete with a "nonslip" finish with "very flat" tolerance as specified in ACI 301.

L. Fastening to Construction-In-Place: Provide anchorage devices and fasteners where necessary for fastening fabricated items to construction-in-place. Design anchorage devices in accordance with Section 01 73 24. Anchor bolts to be in accordance with Section 05 05 20.

M. Set steel stair baseplates on wedges, or shims. After stairs have been positioned and aligned, tighten anchor bolts. Do not remove wedges or shims, but if protruding, cut off flush with edge of bearing plate before packing with grout.

N. Railing: Adjust railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing required by design loads and as limited on Drawings. Plumb posts in each direction.

3.04 REPAIR/RESTORATION

A. Galvanized
   1. Maximum area to be repaired shall not be more than 1/2 of 1 percent of the surface area or 36 sq. in. per ton of piece weight, whichever is less. Damage in excess of this requirement shall be repaired by stripping and recoating entire piece.
   2. Clean damaged areas to SSPC-SP5. Repair with zinc-rich paint in accordance with the manufacturer's instructions and with ASTM A780, Annex A2. Minimum thickness requirements shall be in accordance with ASTM A123.
   3. Use zinc-rich repair paint. Acceptable manufacturers:
      a. LPS, Cold Galvanize
      b. ZRC Worldwide, ZRC Galvilite
      c. Approved Equal

B. Painted
   1. After installation, clean and touch up damaged areas with the same materials used for the shop coat.

3.05 FIELD QUALITY CONTROL

A. Electrolytic Protection

B. Protect dissimilar metals from galvanic corrosion by means of pressure tapes, coatings, or isolators. Aluminum in contact with concrete or grout shall be protected with a heavy coat of bituminous paint.

C. Stainless Steel
   1. During handling and installation, take necessary precautions to prevent carbon impregnation of stainless steel members.
   2. After installation, visually inspect stainless steel surfaces for evidence of iron rust, oil, paint, and other forms of contamination.
   3. Remove contamination in accordance with requirements of ASTM A380.
   4. Brushes used to remove foreign substances shall utilize only stainless steel or nonmetallic bristles.

END OF SECTION

SECTION 05 52 10

ALUMINUM RAILINGS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Prefabricated anodized aluminum component type guardrail and handrail systems; herein referred to as railing.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 03 30 00 Cast-in-Place Concrete.

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title

1.04 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.

3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. Layout, installation, and detail shop drawings for railing.
5. Design calculations stamped and signed by a licensed professional engineer in the State of Utah. Railing and base support connections to be designed by the Contractor incorporating specified criteria and provisions in the current building code with local governing amendments.

B. Informational Submittals:
1. Material certification for compliance with this specification for aluminum and stainless steel materials.

1.05 QUALITY ASSURANCE

A. General:
1. Railing shall conform to the standards of the Occupational Safety and Health Administration (OSHA) and International Building Code.

1.06 DELIVERY, STORAGE AND HANDLING

A. Cushion wrap complete rails, modules and components to prevent scratching and denting during shipment, storage, and installation.

B. Leave wrap intact, insofar as possible, until railing is completely installed.

PART 2 PRODUCTS

2.01 PERFORMANCE/DESIGN CRITERIA

A. Railing assembly and attachments shall resist a minimum uniform load of 50 pounds per linear foot on the top rail and a concentrated load of 200 pounds (not acting concurrently with the uniform load) applied in any direction. Contractor's supplier and engineer are responsible for designing the guardrail/handrail system along with its base support and anchor bolt size and embedment depth into concrete, or connection to metal framing, to resist the above loading condition taking into account anchor edge distances and concrete strengths at the point of attachment. Contractor shall submit calculations signed and sealed by a professional engineer in the State of Utah.

B. Thermal Movements: Provide railing that allow for thermal movements resulting from the project site maximum range in ambient and surface temperatures. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.

2.02 MANUFACTURERS

A. Julius Blum & Co., Inc.

B. Golden Railing Inc.

C. Moultrie Manufacturing.

D. American Railing Systems, Inc.

E. Approved equal.

2.03 MATERIALS

Component	Material
Aluminum pipe	ASTM B210 Alloy 65060-T832; ASTM B 221 Alloy 6063-T5/T52; ASTM B 429, Alloy 6063-T832; ASTM B483, Alloy T832
Aluminum plate	ASTM B209, Alloy 6061-T6
Stainless steel bolts	ASTM A593, Type 316
Stainless steel nuts and washers	ASTM A594, Type316

2.04 CONFIGURATION/COMPONENTS

A. Guard Top Rails: Minimum 1 1/2 inch nominal diameter pipe, Schedule 40.

B. Intermediate Rails: Minimum 1 1/2 inch nominal diameter pipe, Schedule 40.

C. Handrails: 1 1/2 inch nominal diameter pipe, Schedule 40.

D. Posts: Minimum 1 1/2 inch nominal diameter pipe, Schedule 80.

E. Provide manufacturer’s heavy-duty base fitting with stainless steel set screws.

F. Provide aluminum toe boards at guardrails, except where concrete curbs are indicated. Aluminum toe boards shall be minimum 3/16-inch thick plate, connected to the posts.

G. Bolts, including anchor bolts, shall be Type 316 stainless steel.

H. Fittings:
   1. Fittings shall be cast aluminum elbows, T-shapes, post brackets and escutcheons. Provide adapter and anchor plugs as required for a complete installation.
   2. Floor sleeves for removable railing shall be stainless steel, embedded in concrete.

2.05 ASSEMBLY/FABRICATION

A. Pipe cuts shall be clean, straight, square and accurate for minimum joint gap. Work shall be done in conformance with the guardrail and handrail manufacturer's instructions. Work shall be free from blemishes, defects, and misfits of any type which can affect durability, strength, or appearance.

B. Guardrailing and handrailing shall be connected by screws or bolts or welding. Holes shall be punched 1/16 inch larger than the nominal size of the bolts, unless otherwise specified. Wherever needed because of the thickness of the metal, holes shall be subpunched and reamed or drilled. Components with mismatched holes shall be replaced. No drifting of bolts or enlargement of holes will be allowed to correct misalignment.

C. Supply components required for anchorage of fabrications.

D. Where shop welding is used, grind exposed joints flush and smooth with adjacent finish surface. Make exposed joints tight and flush. Round exposed edges to small, uniform radius. Use filler alloy rods that will not discolor when anodized, such as ER 5154, ER 5254, ER 5183, ER 5356 or ER 5556 filler alloy rods.

2.06 ISOLATION COATING

A. Isolation coating shall be applied to all aluminum surfaces in contact with concrete, masonry, or dissimilar metals. Use a heavy coat of bituminous paint.

2.07 FINISHES

A. Clear anodized in accordance with the Aluminum Association AA-M12-C22-A41. Anodize exposed prefabricated components, except stainless steel fasteners, after fabrication.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine and accept existing conditions before beginning work.

B. Field verify measurements for railings before fabrication.

3.02 INSTALLATION

A. Install in accordance with manufacturer's written instructions.

B. Protect dissimilar metals from galvanic corrosion by means of pressure tapes, coatings, or isolators. Aluminum in contact with concrete or grout shall be protected with a heavy coat of bituminous paint.

C. Accurately place metal to be embedded in concrete and hold in correct position while the concrete is placed. Where recesses or blockouts are formed in the concrete, grout metalwork in place after concrete has attained its design strength in accordance with Section 03 30 00.

D. Unless otherwise indicated, field welding of railing is not permitted.

3.03 TOLERANCES

A. Maximum variance from plumb: 1/4 inch.

B. Maximum offset from true alignment: 1/4 inch.

SECTION 05 53 10

METAL GRATINGS AND STAIR TREADS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Aluminum, galvanized steel, and stainless steel bar grating and stair treads.

1.02 RELATED SECTIONS

A. This section contains references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 03 30 00 Cast-In-Place Concrete.
   2. Section 05 05 14 Hot-Dip Zinc Coating.

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ASTM A123	Zinc (Hot Dip Galvanized) Coatings on Iron and Steel Products
ASTM A153	Zinc Coating (Hot-Dip) on Iron and Steel Hardware
ASTM A167	Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip
ASTM A380	Cleaning, Descaling, and Passivation of Stainless Steel
[ASTM A666	Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
[ASTM A1011	Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, and High- Strength Low-Alloy]
ASTM B221	Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
ANSI/NAAMM	Metal Bar Grating Design Manual

1.04 DEFINITIONS

A. Galvanize: Hot-dip galvanize per ASTM A123 or ASTM A153, per Section 05 05 14.]

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   1. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.

2. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
3. Shop drawings showing placing plans for grating.
    a. Provide layout and fabrication details of support frames.
    b. Provide panel layout with individual panel dimensions.
4. Manufacturer's product data with load tables.

PART 2 PRODUCTS

2.01 MATERIALS

Component	Material
Aluminum grating bearing and cross bars	ASTM B221, alloy 6061
[Steel grating bearing and cross bars	ASTM A1011, mild carbon steel]
[Stainless steel grating	ASTM A167 or A666, alloy 316L]

2.02 ASSEMBLY/FABRICATION

A. Welds:
    1. Grind smooth rough welds and sharp metal edges. Make welds exposed to view uniform and neat.
    2. [Prior to galvanizing, sandblast welds.]

B. Clearance: provide ¼" separation between panels and at bearing ends of panel to support frame.

C. Grating:
    1. General
        a. Provide serrated grating for slip resistance.
        b. Bearing bars and cross bars are continuous.
        c. Openings shall be banded with bars having the same dimensions as the bearing bars. Band perimeter edges with bars flush at the top surface of the grating and 1/4 inch clear of the bottom surface.
        d. Bars terminating against edge bars shall be welded to the edge bars when welded construction is used.
        e. When crimped or swaged construction is used, bars at edges shall protrude a maximum of 1/16 inch and be peened or ground to a smooth surface.
        f. Fabrication methods employing bending or notching of bearing or cross bars is not permitted.
        g. Maximum grating panel weigh shall not exceed 80 pounds.

2. Aluminum Grating
    a. Fabricate grating with a mill class 1 clear anodize finish. Punch bearing bars to receive cross bars. After insertion in the bearing bars, cross bars are deformed by a hydraulic press or similar means to permanently lock the bars into the bearing bar openings.
3. Steel Grating
    a. Use only where specified. Hot-dip galvanized finish after fabrication.
4. Stainless Steel Grating
    a. Use only where specified. Stainless steel grating to be cleaned, descaled, and passivated after fabrication in accordance with ASTM A380.

D. Stair Treads:
1. Treads shall match the grating material and type furnished for landings. Use serrated surface for slip resistance. Provide abrasive nosings on each tread. Provide carrier angle at each end for attachment to stair stringers. Attach components to support members with Type 316 stainless steel fasteners.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine and accept existing conditions before beginning work.

B. Field measure grating for proper cutouts and sizes prior to fabrication.

3.02 INSTALLATION

A. Fieldwork is not permitted on galvanized items.

B. Drilling of bolts or enlargement of holes to correct misalignment is not permitted.

C. Protect dissimilar metals from galvanic corrosion by means of pressure tapes, coatings, or isolators. Protect aluminum in contact with concrete with a heavy coat of bituminous paint.

D. Use stainless steel metalwork to be embedded in concrete. Clean surfaces in contact with or embedded in concrete and hold in correct position while concrete is placed. Or, provide formed recesses or blockouts in concrete and then, after concrete has attained design strength, grout metalwork in-place using non-shrink grout.

3.03 [REPAIR

A. Repair damaged surfaces of galvanized metals per Section 05 05 14.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 06 10 00

ROUGH CARPENTRY

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Wood blocking, cants, and nailers.
   2. Wood furring and grounds.

1.02 ACTION SUBMITTALS

A. Product Data:
   1. For each type of process and factory-fabricated product.
   2. For preservative-treated wood products.

1.03 INFORMATIONAL SUBMITTALS

A. Material Certificates:
   1. For preservative-treated wood products. Indicate type of preservative used and net amount of preservative retained.

B. Evaluation Reports: For the following, from ICC-ES:
   1. Wood-preservative-treated wood.
   2. Fire-retardant-treated wood.

PART 2 PRODUCTS

2.01 WOOD PRODUCTS, GENERAL

A. Lumber: Comply with DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, comply with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Grade lumber by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.
   1. Factory mark each piece of lumber with grade stamp of grading agency.
   2. Dress lumber, S4S, unless otherwise indicated.

B. Maximum Moisture Content:
   1. Boards: 19 percent.
   2. Dimension Lumber: 19 percent unless otherwise indicated.

2.02 PRESERVATIVE TREATMENT

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with ground, Use Category UC3b for exterior construction not in contact with ground, and Use Category UC4a for items in contact with ground.
   1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.

B. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or that does not comply with requirements for untreated material.

C. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.

D. Application: Treat all rough carpentry unless otherwise indicated.
   1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
   2. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
   3. Wood framing and furring attached directly to the interior of below-grade exterior masonry or concrete walls.

2.03 FIRE-RETARDANT-TREATMENT

A. General: Where fire-retardant-treated materials are indicated, materials are to comply with requirements in this article, that are acceptable to authorities having jurisdiction, and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Lumber and Plywood by Pressure Process: Products with a flame-spread index of 25 or less when tested according to ASTM E84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet beyond the centerline of the burners at any time during the test.
   1. Exterior Type: Treated materials are to comply with requirements specified above for fire-retardant-treated lumber and plywood by pressure process after being subjected to accelerated weathering according to ASTM D2898. Use for exterior locations and where indicated.
   2. Interior Type A: Treated materials are to have a moisture content of 28 percent or less when tested according to ASTM D3201/D3201M at 92 percent relative humidity. Use where exterior type is not indicated.

C. Kiln-dry lumber after treatment to maximum moisture content of 19 percent. Kiln-dry plywood after treatment to maximum moisture content of 15 percent.

D. Identify fire-retardant-treated wood with appropriate classification marking of qualified testing agency.

E. Application: Treat all rough carpentry unless otherwise indicated.
   1. Concealed blocking.
   2. Roof construction.

2.04 MISCELLANEOUS LUMBER

A. Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:
   1. Blocking.
   2. Nailers.
   3. Cants.
   4. Furring.
   5. Grounds.

B. Dimension Lumber Items: Construction or No. 2 grade lumber, Douglas Fir.

C. Concealed Boards: 19 percent maximum moisture content and the following species and grades:
   1. Western woods; Construction or No. 2 Common grade; WCLIB or WWPA.

2.05 FASTENERS

A. General: Fasteners are to be of size and type indicated and comply with requirements specified in this article for material and manufacture. Provide nails or screws, in sufficient length, to penetrate not less than 1-1/2 inches into wood substrate.
   1. Where rough carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A153/A153M.

2.06 MISCELLANEOUS MATERIALS

A. Flexible Flashing: Composite, self-adhesive, flashing product consisting of a pliable, butyl rubber or rubberized-asphalt compound, bonded to a high-density polyethylene film, aluminum foil, or spunbonded polyolefin to produce an overall thickness of not less than 0.025 inch.

B. Adhesives for Gluing Furring and Sleepers to Concrete or Masonry: Formulation complying with ASTM D3498 that is approved for use indicated by adhesive manufacturer.

PART 3 EXECUTION

3.01 INSTALLATION

A. Set work to required levels and lines, with members plumb, true to line, cut, and fitted. Fit rough carpentry accurately to other construction. Locate furring, nailers, blocking, grounds, and similar supports to comply with requirements for attaching other construction.

B. Do not splice structural members between supports unless otherwise indicated.

C. Comply with AWPA M4 for applying field treatment to cut surfaces of preservative-treated lumber.

D. Where wood-preservative-treated lumber is installed adjacent to metal decking, install continuous flexible flashing separator between wood and metal decking.

E. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
   1. Table 2304.9.1, "Fastening Schedule," in ICC's International Building Code (IBC).
   2. Table R602.3(1), "Fastener Schedule for Structural Members," and Table R602.3(2), "Alternate Attachments," in ICC's International Residential Code for One- and Two-Family Dwellings.
   3. ICC-ES evaluation report for fastener.

3.02 PROTECTION

A. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

B. Protect rough carpentry from weather. If, despite protection, rough carpentry becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

END OF SECTION

SECTION 06 16 00

SHEATHING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Wall sheathing.
   2. Composite nail base insulated roof sheathing.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product.

1.03 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For the following, from ICC-ES:
   1. Wood-preservative-treated plywood.
   2. Fire-retardant-treated plywood.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Fire-Resistance Ratings: As tested in accordance with ASTM E119; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

B. Structural Performance: Provide roofing systems capable of withstanding the effects of the following loads:
   1. Wind Loads: As indicated on Drawings.
   2. Deflection Limits: For wind loads, no greater than 1/240 of the span.

C. FM Global Listing: Provide metal roof panels and component materials that comply with requirements in FM Global 4471 as part of a panel roofing system and that are listed in FM Global's "Approval Guide" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Global markings.

2.02 PRESERVATIVE-TREATED PLYWOOD

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with ground, Use Category UC3b for exterior construction not in contact with ground, and Use Category UC4a for items in contact with ground.

B. Mark plywood with appropriate classification marking of an inspection agency acceptable to authorities having jurisdiction.

C. Application: Treat all plywood unless otherwise indicated.

2.03 FIRE-RETARDANT-TREATED PLYWOOD

A. General: Where fire-retardant-treated materials are indicated, use materials complying with requirements in this article that are acceptable to authorities having jurisdiction and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Plywood by Pressure Process: Products with a flame-spread index of 25 or less when tested in accordance with ASTM E84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet beyond the centerline of the burners at any time during the test.

1. Exterior Type: Treated materials are to comply with requirements specified above for fire-retardant-treated plywood by pressure process after being subjected to accelerated weathering in accordance with ASTM D2898. Use for exterior locations and where indicated.
2. Design Value Adjustment Factors: Treated lumber plywood is to be tested in accordance with ASTM D5516 and design value adjustment factors are to be calculated in accordance with ASTM D6305. Span ratings after treatment are to be not less than span ratings specified.

C. Kiln-dry material after treatment to a maximum moisture content of 15 percent.

D. Identify fire-retardant-treated plywood with appropriate classification marking of qualified testing agency.

E. Application: Treat all plywood unless otherwise indicated.

2.04 WALL SHEATHING

A. Plywood Sheathing, Walls: Either DOC PS 1 or DOC PS 2, Exposure 1, Structural I sheathing.

2.05 COMPOSITE NAIL BASE INSULATED ROOF SHEATHING

A. Plywood-Surfaced, Polyisocyanurate-Foam Sheathing: ASTM C1289, Type V with DOC PS 2, Exposure 1 Fire-Resistant-Treated CDX plywood on one face.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   a. Atlas Molded Products, a division of Atlas Roofing Corporation.
   b. Cornell Performance Building Products, a Subsidiary of GAF.
   c. Johns Manville; a Berkshire Hathaway company.
   d. Rmax, Inc.
   e. The Dow Chemical Company.
   f. Polyisocyanurate-Foam Thickness: 3 inches; one layer composite nail base insulated roof sheathing and one layer insulation only, 6 inches total.

2. Plywood Nominal Thickness: 5/8 inch.

2.06 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.
   1. For roof sheathing, provide fasteners with hot-dip zinc coating complying with ASTM A153/A153M.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of sheathing or pieces that are too small to use with minimum number of joints or optimum joint arrangement. Arrange joints so that pieces do not span between fewer than three support members.

B. Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction unless otherwise indicated.

C. Securely attach to substrate by fastening as indicated, complying with the following:
   1. Table 2304.10.1, "Fastening Schedule," in the ICC's International Building Code.
   2. ICC-ES evaluation report for fastener.

D. Coordinate roof sheathing installation with flashing and joint-sealant installation so these materials are installed in sequence and manner that prevent exterior moisture from passing through completed assembly.

E. Do not bridge building expansion joints; cut and space edges of panels to match spacing of structural support elements.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 11 13

BITUMINOUS DAMPPROOFING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Cold-applied, emulsified-asphalt dampproofing.
   2. Protection course.
   3. Drainage board.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. VOC Content: Products are to comply with VOC content limits of authorities having jurisdiction unless otherwise indicated.

2.02 COLD-APPLIED, EMULSIFIED-ASPHALT DAMPPROOFING

A. Basis-of-Design Product: Subject to compliance with requirements, provide W. R. Meadows, Inc; Sealmastic Emulsion or a comparable product by one of the following:
   1. ChemMasters, Inc.
   2. Euclid Chemical Company (The); a subsidiary of RPM International, Inc.
   3. Retain one or more of "Trowel Coats," "Fibered Brush and Spray Coats," and "Brush and Spray Coats" paragraphs below; coordinate with applications retained in Part 3.

B. Trowel Coats: ASTM D1227, Type II, Class 1.

C. Fibered Brush and Spray Coats: ASTM D1227, Type II, Class 1.

D. Brush and Spray Coats: ASTM D1227, Type III, Class 1.

2.03 PROTECTION COURSE

A. Protection Course, Asphaltic: ASTM D6506/D6506M; semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
   1. Thickness: Nominal 1/8 inch for vertical applications.
   2. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for protection course type.

2.04 DRAINAGE BOARD

A. Basis-of-Design Product: Subject to compliance with requirements, provide W. R. Meadows, Inc; MEL-DRAIN 7955-B or a comparable product by one of the following:
   1.
   2. ChemMasters, Inc.
   3. Euclid Chemical Company (The); a subsidiary of RPM International, Inc.
   4. Geocomposite Drainage Board: ASTM D6364 or ASTM D162, High strength dimple raised molded polypropylene core with a high strength woven geotextile fabric bonded to the dimples of the core. Attached to the back side of the dimples is a polyethylene sheet designed to prevent soft waterproofing membranes from working their way into the backside of the dimples.

B. Accessories:
   1. Termination Bar.
   2. Pointing Mastic.

2.05 AUXILIARY MATERIALS

A. Furnish auxiliary materials recommended in writing by dampproofing manufacturer for intended use and compatible with bituminous dampproofing.

B. Emulsified-Asphalt Primer: ASTM D1227, Type III, Class 1, except diluted with water as recommended in writing by manufacturer.

PART 3 EXECUTION

3.01 APPLICATION, GENERAL

A. Comply with manufacturer's written instructions for dampproofing application, cure time between coats, and drying time before backfilling unless otherwise indicated.
   1. Apply dampproofing to provide continuous plane of protection.
   2. Apply additional coats if recommended in writing by manufacturer or to achieve a smooth surface and uninterrupted coverage.

B. Where dampproofing footings and foundation walls, apply from finished-grade line to top of footing; extend over top of footing and down a minimum of 6 inches over outside face of footing.
   1. Extend dampproofing 12 inches onto intersecting walls and footings, but do not extend onto surfaces exposed to view when Project is completed.
   2. Install flashings and corner protection stripping at internal and external corners, changes in plane, construction joints, cracks, and where indicated as "reinforced," by embedding an 8-inch-wide strip of asphalt-coated glass fabric in a heavy coat of dampproofing. Dampproofing coat for embedding fabric is in addition to other coats required.

3.02 COLD-APPLIED, EMULSIFIED-ASPHALT DAMPPROOFING

A. Concrete Foundations: Apply two brush or spray coats at not less than 1.5 gal./100 sq. ft. for first coat and 1 gal./100 sq. ft. for second coat one fibered brush or spray coat at not less than 3 gal./100 sq. ft. or one trowel coat at not less than 4 gal./100 sq. ft..

3.03 INSTALLATION OF DRAINAGE BOARDS

A. Place and secure molded-sheet drainage panels, with geotextile facing away from wall or deck substrate, in accordance with manufacturer's written installation instructions. Use adhesive or another method that does not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed molded-sheet drainage panels during subsequent construction.
   1. For vertical applications, install protection course before installing drainage panels.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 13 26

SELF-ADHERING SHEET WATERPROOFING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Modified bituminous sheet waterproofing.
   2. Protection course.
   3. Drainage board.
   4. Underslab waterproofing membrane.

1.02 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.
   1. Review waterproofing requirements including surface preparation,
   2. substrate condition and pretreatment, minimum curing period, forecasted
   3. weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Show locations and extent of waterproofing and details of substrate joints and cracks, expansion joints, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, air barrier, and other termination conditions.
   1. Include setting drawings that indicate layout, sizes, sections, profiles, and joint details of pedestal-supported concrete pavers.

C. Samples: For each exposed product.

1.04 INFORMATIONAL SUBMITTALS

A. Qualification Statements: For Installer.

B. Sample warranties.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by waterproofing manufacturer.
   1. The Contractor is responsible for the workmanship and quality of the system installation. Inspections by the Owner's Representative or the System Manufacturer's Technical Representative (TR) will not relieve or limit the Contractor's responsibilities.
   2. Installation methods shall conform to requirements of this specification. Changes in the system installation requirements will be allowed only with the written acceptance of the Owner's Representative before work commences.

3. Only personnel who are trained by the TR specifically for the system or who are approved by the coating system manufacturer (SM) specifically for the system are allowed to perform the system installation specified in this Section.
4. For repairs, provide the same products, or products recommended by the SM, as used for the original installation.
5. Identify the points of access for inspection by the Owner's Representative. Provide ventilation, ingress and egress, and other means necessary for the Owner's Representatives to safely access the work areas.
6. Conduct and inspect the work so that the system is installed as specified. Work that does not conform to the specifications shall be corrected.

1.06 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to furnish replacement waterproofing material for waterproofing that does not comply with requirements or that fails to remain watertight within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 SOURCE LIMITATIONS

A. Waterproofing System: Obtain waterproofing materials, protection course, drainage boards, under-slab waterproofing from single source from single manufacturer.

2.02 MODIFIED BITUMINOUS SHEET WATERPROOFING

A. Modified Bituminous Sheet Waterproofing: Minimum 60-mil nominal thickness, self-adhering sheet consisting of 56 mils of rubberized asphalt laminated on one side to a 4-mil-thick, polyethylene-film reinforcement, and with release liner on adhesive side.
   1. Basis-of-Design Product: Subject to compliance with requirements, provide W. R. Meadows, Inc; MEL-ROL or a comparable product by one of the following:
      a. Grace Construction Products.
      b. Tremco Commercial Sealants and Waterproofing, part of Tremco CPG.
      c.
   2. Physical Properties:
      a. Tensile Strength, Membrane: 250 psi minimum; ASTM D412, Die C, modified.
      b. Ultimate Elongation: 300 percent minimum; ASTM D412, Die C, modified.
      c. Low-Temperature Flexibility: Pass at minus 20 deg F; ASTM D1970/D1970M.
      d. Puncture Resistance: 40 lbf minimum; ASTM E154/E154M.
      e. Water Absorption: 0.2 percent weight-gain maximum after 48-hour immersion at 70 deg F; ASTM D570.
      f. Water Vapor Permeance: 0.05 perm maximum; ASTM E96/E96M, Water Method.
      g. Hydrostatic-Head Resistance: 200 ft. minimum; ASTM D5385/D5385M.
   3. Sheet Strips: Self-adhering, rubberized-asphalt strips of same material and thickness as sheet waterproofing.

2.03 UNDERSLAB WATERPROOFING MEMBRANE

A. Blindside Waterproofing Membrane: 73 mil thick, composite sheet membrane comprised of an elastomeric membrane bonded to a seven-ply plasmatic matrix and a non-woven geotextile fabric.
   1. Basis-of-Design Product: Subject to compliance with requirements, provide W. R. Meadows, Inc; PRECON or a comparable product by one of the following:
      a. Grace Construction Products.
      b. Tremco Commercial Sealants and Waterproofing, part of Tremco CPG.
      c.
   2. Physical Properties:
      a. Membrane Thickness: 73 mil
      b. Low Temperature Flexibility, ASTM D1970: Pass
      c. Resistance to Hydrostatic Head, ASTM D5385-93: 230'
      d. Elongation, ASTM D412-06: >400%
      e. Tensile Strength (film), ASTM D882: 9,200 psi
      f. Crack Cycling, ASTM C836: Pass
      g. Puncture Resistance, ASTM E154: >210 lb.
      h. Peel Adhesion to Concrete, ASTM D903: 10 lb./in
      i. Moisture Vapor Transmission, ASTM E96 (Method B): 0.0011 perms
      j. Resistance to Penetration by Pesticides, ASTM F2130, Percentage of Penetration: 0.0%
      k. Resistance to Fungi in Soil, GSA-PBS 07115 – 16 weeks: No Effect

2.04 ACCESSORIES FOR WATERPROOFING

A. Furnish accessory materials as recommended in writing by waterproofing manufacturer for intended use and compatibility with sheet waterproofing.
   1. Furnish liquid-type accessory materials that comply with VOC limits of authorities having jurisdiction.

B. Primer: Liquid waterborne primer as recommended in writing for substrate by sheet waterproofing material manufacturer.

C. Surface Conditioner: Liquid, waterborne surface conditioner as recommended in writing for substrate by sheet waterproofing material manufacturer.

D. Liquid Membrane: Elastomeric, two-component liquid, cold fluid applied, of trowel grade or low viscosity.

E. Substrate Patching Membrane: Low-viscosity, two-component, modified asphalt coating.

F. Metal Termination Bars: Aluminum or stainless steel bars, approximately 1 by 1/8 inch, predrilled at 9-inch centers.

2.05 PROTECTION COURSE

A. Protection Course, Asphaltic: ASTM D6506/D6506M; semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
   1. Thickness: Nominal 1/8 inch for vertical applications.
   2. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for protection course type.

2.06 DRAINAGE BOARD

A. Basis-of-Design Product: Subject to compliance with requirements, provide W. R. Meadows, Inc; MEL-DRAIN 7955-B or a comparable product by one of the following:
   1. Grace Construction Products.
   2. Tremco Commercial Sealants and Waterproofing, part of Tremco CPG.
   3. Geocomposite Drainage Board: ASTM D6364 or ASTM D162, High strength dimple raised molded polypropylene core with a high strength woven geotextile fabric bonded to the dimples of the core. Attached to the back side of the dimples is a polyethylene sheet designed to prevent soft waterproofing membranes from working their way into the backside of the dimples.

B. Accessories:
   1. Termination Bar.
   2. Pointing Mastic.

PART 3 EXECUTION

3.01 PREPARATION

A. Clean, prepare, and treat substrates in accordance with manufacturer's written installation instructions. Provide clean, dust-free, and dry substrates for waterproofing application.

B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.

C. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through waterproofing and at drains and protrusions.

3.02 INSTALLATION OF MODIFIED BITUMINOUS SHEET WATERPROOFING

A. Install modified bituminous sheets in accordance with waterproofing manufacturer's written installation instructions.

B. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours.

C. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform 2-1/2-inch-minimum lap widths and end laps. Overlap and seal seams, and stagger end laps to ensure watertight installation.
   1. When ambient and substrate temperatures range between 25 and 40 deg F, install self-adhering, modified bituminous sheets produced for low-temperature application. Do not use low-temperature sheets if ambient or substrate temperature is higher than 60 deg F.

D. Horizontal Application: Apply sheets from low to high points of decks to ensure that laps shed water.

E. Apply continuous sheets over already-installed sheet strips, bridging substrate cracks, construction, and contraction joints.

F. Seal edges of sheet waterproofing terminations with termination bar and sealant.

G. Install sheet waterproofing and accessory materials to tie into adjacent waterproofing.

H. Roll waterproofing membrane to firmly adhere to substrate. Roll seams and terminations.

I. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fish-mouths and blisters. Patch with sheet waterproofing extending 6 inches beyond repaired areas in all directions.

J. Immediately install protection course with butted joints over waterproofing membrane.
   1. Drainage boards may be used in place of a separate protection course to vertical applications when approved by waterproofing manufacturer and installed immediately.

3.03 INSTALLATION OF DRAINAGE BOARDS

A. Place and secure molded-sheet drainage panels, with geotextile facing away from wall or deck substrate, in accordance with manufacturer's written installation instructions. Use adhesive or another method that does not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed molded-sheet drainage panels during subsequent construction.
   1. For vertical applications, install protection course before installing drainage panels.

3.04 INSTALLATION OF UNDERSLAB WATERPROOFING MEMBRANE – HORIZONTAL

A. Prepare subgrade prior to membrane application according to ACI 302.1R.17.

B. Ensure the fabric side of the membrane is facing up.

C. Remove release paper on 6” selvedge edge and overlap edges of additional sheet. Roll press into place.

D. For end-to-end overlap, overlap membrane 6”.

E. Apply liquid detail membrane in this area to be lapped and roll press membrane into this liquid detail membrane.

F. Apply liquid detail membrane at terminations of membrane, 12” wide, centered over the termination.

G. Embed detail fabric into this wet liquid detail membrane centered over the termination, 6” on each side of lap edge and roll press into place.

H. Apply additional liquid detail membrane on all terminations of detail fabric.

I. Inspect membrane prior to pouring of concrete for any punctures or damage.

J. Repair damaged areas as directed by the manufacturer.

K. Ensure membrane is not damaged prior to concrete pour. Ensure concrete is poured within 60 days of membrane application.

3.05 PROTECTION, REPAIR, AND CLEANING

A. Do not permit foot or vehicular traffic on unprotected membrane.

B. Protect waterproofing from damage and wear during remainder of construction period.

C. Protect installed insulation drainage panels from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

D. Correct deficiencies in or remove waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.

E. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended in writing by manufacturer of affected construction.

END OF SECTION

SECTION 07 16 00

CEMENTITIOUS WATERPROOFING

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Surface preparation.

B. Application of a flexible, cementitious, waterproofing coating.

C. The general conditions, supplementary conditions and general requirements of this document apply to general contractors, sub-contractors, material suppliers, and all other persons furnishing labor and materials under this section.

1.02 WORK INCLUDED

A. Provide all labor, material, and equipment necessary to apply cementitious coating in application over concrete surfaces as shown on the contract drawings and specified herein.

1.03 RELATED SECTIONS

A. Section 03 30 00 – Cast-In-Place Concrete.

1.04 REFERENCES

A. ASTM C 672 - Standard Test Method for Scaling Resistance of Concrete Surfaces Exposed to Deicing Chemicals.

B. ASTM D412 (modified) - Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers—Tension.

C. ASTM E96 - Standard Test Methods for Water Vapor Transmission of Materials ("Wet Cup" Procedure).

D. TT-P-1411 – Federal Specification, Paint, Copolymer-Resin, Cementitious (for Waterproofing Concrete and Masonry Walls).

E. Gemite ISO TP (Test Procedure) 005-97 - Tensile Properties of Thin Cement Composites.

1.05 QUALITY ASSURANCE

A. Contractor will provide the manufacturer’s recommended equipment, manpower, and supervision at the jobsite to install the cementitious coating in compliance with the project plans and specifications.

B. Prepare a site sample approximately 4' x 4'. This sample will be regarded as the minimum standard of workmanship acceptable for this project.

C. Installation must be carried out by an experienced contractor with an adequate number of skilled personnel, experienced in the application of the crystalline coating systems.

D. Maintain a record of the batch numbers of all materials supplied for this project.

1.06 PRE-CONSTRUCTION MEETING

A. Convene one week prior to commencing work of this section, in accordance with Section 1.05 - Quality Assurance, meeting with manufacturer's technical representative, General Contractor, and Site Engineer to review the installation procedures.

1.07 SUBMITTALS

A. Comply with Section 01 33 00 - Submittal Procedures.

B. Submit manufacturer's product data and application instructions.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

B. Store cementitious coating in a clean, dry area protected from direct sunlight, weather and other damage. Store all wet materials at a temperature of not less than 44o F at all times.

C. Protect materials during handling and application to prevent damage or contamination.

1.09 ENVIRONMENTAL REQUIREMENTS

A. Product not intended for uses subject to abuse.

B. Product must never be applied if ambient temperatures cannot be kept above 40° F during application and for 48 hours thereafter.

C. Avoid applications at temperatures above 82° F.

D. Protect surrounding surfaces from damage due to work of this trade.

E. Hot Weather Application
   1. Protect the surface against rapid evaporation of water between the finishing and the final set time.
   2. Use water misting or apply a surface evaporation retarder.

F. Cold Weather Application
   1. Apply in temperatures above freezing point.
   2. Protect the material against freezing for a minimum of 48 hours.
   3. Use electrical heaters to avoid carbonation and carbonation cracking.

PART 2 PRODUCTS

2.01 CEMENTITIOUS WATERPROOFING

A. Basis-of-Design Product: Subject to compliance with requirements, provide W. R. Meadows, Inc; CEM-KOTE FLEX ST or a comparable product by one of the following:
   1. Euclid Chemical Company.

B. ACCESSORIES
   1. Reinforcing Fabric (Woven) for cove reinforcement or entire surface application: REINFORCING FABRIC HD.
   2. Reinforcing Fabric (Non-Woven) for crack treatment: REINFORCING FABRIC NW.
   3. Bonding Mortar for coves on protruding steel and plastic pipes: CEM-KOTE BARRIER COAT 100.
   4. Thin Patching Mortar for thin repairs, including bug holes: MEADOW-PATCH T1. For spray application: CEM-KOTE FLEX ST.
   5. General Purpose Structural Repair Mortar for repairs or coves: MEADOW-CRETE GPS.
   6. Thin-Set Concrete Finishing Mortar: GEM-PLAST TC.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine surfaces to receive the flexible cementitious coating.

B. Report to owner's representative, in writing, any defects in previously prepared Work or unsatisfactory site conditions.

C. Do not begin surface preparation or application until unacceptable conditions have been corrected.

D. Starting work under this section means acceptance of the surface and previously prepared work.

3.02 SURFACE PREPARATION

A. Thoroughly clean the surface using high-pressure wash with a minimum 5,000 psi or 3,500 psi with sand brought into the nozzle.

B. Ensure all soft concrete surfaces and any bond-inhibiting materials, such as release agents, are removed.

C. Wash the surface thoroughly with water prior to the application of the cementitious coating.

D. Allow all surface water to dry off to achieve a saturated surface dry (SSD) condition.

E. To ensure proper surface preparation, a bond test should be performed in accordance with manufacturer’s instructions.

F. Surface Repair
   1. Use thin patching mortar to patch the "honeycombing" and air pockets.
   2. Use polymer-modified structural repair mortar for patching in excess of 1/4”.
   3. Uneven concrete, due to concrete form misplacement, must be chipped away and surface patched smooth.
   4. Build corner coves 2" x 2" minimum, using an overhead or vertical structural repair mortar.

G. Thin Set Concrete Restoration Mortar
   1. Hand application
      a. Apply thjn set mortar using a trowel, in a manner similar to stucco application; a “scratch” coat and the second (third) coat), and finish using a float, to obtain an “open structure” surface. Apply in strict accordance with the manufacturer’s printed instructions
   2. Spray Application
      a. Apply first a thin “scratch” coat and brush the surface to obtain continuity.
      b. Apply the second (third) coat – “wet to green condition.”
      c. Compact the material using a trowel to eliminate entrapped air and finish with float to obtain “open structure” surface.
      d. Apply in strict accordance with the manufacturer’s printed instructions
   3. Air dry cure GEM-PLAST TC for a minimum three days prior to application of flexible cementitious coating.

H. Treatment of Existing Cracks and All Non-Structural Joints
   1. Identify all the existing cracks and joints and apply a thin layer of the flexible cementitious coating approximately 4 ½” wide and 19 mils thick by trowel or brush.
   2. Embed the non-woven reinforcing fabric over the entire area of this coating and work in using trowel.
   3. Ensure this coating application totally covers the reinforcing fabric.
   4. Let dry sufficiently and apply an additional coat of this flexible cementitious coating to build up to a total thickness of 38 mils over the entire area.

I. Treatment of Inside Corners
   1. Install a 2” x 2” cove over the inside corners using polymer-modified structural repair mortar.
   2. Apply a thin layer of flexible cementitious coating approximately 10" wide and 31 mils by trowel or brush.
   3. Embed the woven reinforcing fabric over the entire area of this coating and work in using trowel.
   4. Ensure this coating application totally covers the reinforcing fabric.
   5. Apply an additional coat of this flexible cementitious coating to build up a total thickness of 63 mils over the entire area.

J. Treatment of Protruding Elements
   1. Apply two coats of flexible cementitious coating at a thickness of 63 mils to both the concrete surface and protruding element.

2. Form a 2” x 2” minimum cove using polymer-modified structural repair mortar in the corner.
3. Allow polymer-modified structural repair mortar to cure.

3.03 MIXING

A. Mix the content of the bag, component A, with the liquid component B.

B. Use a heavy-duty drill (400 - 600 RPM) with a helix screw or paddle mixer to achieve thorough mixing.

C. Pour approximately 80% of the liquid component B into the mixing container (mixer) and gradually add the dry component A into the liquid and mix until a smooth and lump-free mix is obtained.

D. Add the remaining liquid as required for a given application consistency.

E. At high ambient temperatures, and depending on application, one to two cups of water can be added if required.

3.04 APPLICATION

A. Application
1. Brush or spray apply the first coat of cementitious coating to a thickness of 1/32”.
2. If spraying, brush the first coat to eliminate any pinholes.
3. Apply the second coat after approximately 15 - 30 minutes at the same thickness as the first coat (1/32”), giving a finish thickness of 1/16”.
4. Brush the second coat to eliminate pinholes.
5. Protect against surface water evaporation.

B. Finishing
1. To obtain a smooth surface, if required, finish the surface using a steel trowel.

C. Curing
1. Air-dry cure flexible cementitious coating for 72 hours at 68^{o} F and 70 – 80% RH prior to filling with water.
2. Allow for longer curing/drying time will be required with cooler temperatures and a higher relative humidity.

3.05 SITE CLEANUP

A. Remove all excess and waste materials from the jobsite in accordance with contract provisions.

B. Ensure all surrounding areas where the material has been applied and is free of debris.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 21 00

THERMAL INSULATION

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Extruded polystyrene foam-plastic board insulation.

1.02 ACTION SUBMITTALS

A. Product Data: For the following:
   1. Extruded polystyrene foam-plastic board insulation.

1.03 INFORMATIONAL SUBMITTALS

A. Installer's Certification: Listing type, manufacturer, and R-value of insulation installed in each element of the building thermal envelope.
   1. Sign, date, and post the certification in a conspicuous location on Project site.

B. Product test reports.
   1. Documentation of tests performed by a qualified testing agency

C. Research reports.
   1. For foam-plastic insulation, from ICC-ES

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Maximum flame-spread and smoke-developed indexes less than 25 and 450 when tested in accordance with ASTM E84.

B. Fire-Resistance Ratings: Comply with ASTM E119 or UL 263; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   1. Indicate design designations from UL's "Fire Resistance Directory" or from listings of another qualified testing agency.

C. Fire Propagation Characteristics: Passes NFPA 285 testing as part of an approved assembly.

D. Labeling: Provide identification of mark indicating R-value of each piece of insulation 12 inches and wider in width.

E. Thermal-Resistance Value (R-Value): R-value as indicated on Drawings in accordance with ASTM C518.

2.02 EXTRUDED POLYSTYRENE FOAM-PLASTIC BOARD INSULATION

A. Extruded Polystyrene Board Insulation, Type VI: ASTM C578, Type VI, 40-psi minimum compressive strength.

2.03 ACCESSORIES

A. Insulation for Miscellaneous Voids:
   1. Spray Polyurethane Foam Insulation: ASTM C1029, Type II, closed cell, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E84.

B. Insulation Anchors, Spindles, and Standoffs: As recommended by manufacturer.

C. Adhesive for Bonding Insulation: Product compatible with insulation and air and water barrier materials, and with demonstrated capability to bond insulation securely to substrates without damaging insulation and substrates.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Comply with insulation manufacturer's written instructions applicable to products and applications.

B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.

C. Install insulation with manufacturer's R-value label exposed after insulation is installed.

D. Extend insulation to envelop entire area to be insulated. Fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

E. Provide sizes to fit applications and selected from manufacturer's standard thicknesses, widths, and lengths. Apply single layer of insulation units unless multiple layers are otherwise shown or required to make up total thickness or to achieve R-value.

3.02 INSTALLATION OF CAVITY-WALL INSULATION

A. Foam-Plastic Board Insulation: Install pads of adhesive spaced approximately 24 inches o.c. both ways on inside face and as recommended by manufacturer.
   1. Fit courses of insulation between wall ties and other obstructions, with edges butted tightly in both directions, and with faces flush.
   2. Press units firmly against inside substrates.
   3. Supplement adhesive attachment of insulation by securing boards with two-piece wall ties designed for this purpose and specified in Section 04 20 00 "Unit Masonry."

END OF SECTION

SECTION 07 24 13

POLYMER-BASED EXTERIOR INSULATION AND FINISH SYSTEM (EIFS)

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. EIFS-clad barrier-wall assemblies that are field applied over substrate.

1.02 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.03 ACTION SUBMITTALS

A. Product Data: For each EIFS component, trim, and accessory.

B. Samples: For each exposed product and for each color and texture specified.

1.04 INFORMATIONAL SUBMITTALS

A. Manufacturer certificates.

B. Product certificates.

C. Product test reports.

D. Field quality-control reports.

E. Sample warranty.

1.05 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: An installer who is certified in writing by AWCI International as qualified to install Class PB EIFS using trained workers.

1.07 WARRANTY

A. Manufacturer's Special Warranty: Manufacturer agrees to repair or replace components of EIFS that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Dryvit Systems, Inc.
   2. Parex USA, Inc.
   3. Sto Corp.
   4. PERFORMANCE REQUIREMENTS

B. EIFS Performance: Comply with ASTM E2568 and with the following:
   1. Weathertightness: Resistant to water penetration from exterior.
   2. Impact Performance: ASTM E2568, High impact resistance.

2.02 EIFS MATERIALS

A. Flexible-Membrane Flashing: Cold-applied, self-adhering, self-healing, rubberized-asphalt and polyethylene-film composite sheet or tape and primer; EIFS manufacturer's standard or product recommended in writing by EIFS manufacturer.

B. Insulation Adhesive: EIFS manufacturer's standard formulation designed for indicated use; compatible with substrate.
   1. Thermal-Resistance Value (R-Value): R-value as indicated on Drawings in accordance with ASTM C518.

C. Molded, (Expanded) Rigid Cellular Polystyrene Board Insulation: Comply with ASTM E2430/E2430M.

D. Reinforcing Mesh: Balanced, alkali-resistant, open-weave, glass-fiber mesh treated for compatibility with other EIFS materials, made from continuous multi-end strands with retained mesh tensile strength of not less than 120 lbf/in. in accordance with ASTM E2098/E2098M.
   1. Reinforcing Mesh for EIFS, General: Not less than weight required to comply with impact-performance level specified in "Performance Requirements" Article.

E. Base Coat: EIFS manufacturer's standard mixture.

F. Primer: EIFS manufacturer's standard factory-mixed, elastomeric-polymer primer for preparing base-coat surface for application of finish coat.

G. Finish Coat: EIFS manufacturer's standard acrylic-based coating.
   1. Colors: As selected by Engineer from manufacturer's full range.
   2. Textures: As selected by Engineer from manufacturer's full range.

H. Trim Accessories: Type as designated or required to suit conditions indicated and to comply with EIFS manufacturer's written instructions; manufactured from UV-stabilized PVC; and complying with ASTM D1784 and ASTM C1063.

PART 3 EXECUTION

3.01 EIFS INSTALLATION

A. Comply with ASTM C1397, ASTM E2511, and EIFS manufacturer's written instructions for installation of EIFS as applicable to each type of substrate.

B. Flexible-Membrane Flashing: Apply and lap to shed water; seal at openings, penetrations, and terminations. Prime substrates with flashing primer if required and install flashing.

C. Trim: Apply trim accessories at perimeter of EIFS, at expansion joints, and elsewhere as indicated. Coordinate with installation of insulation.

D. Board Insulation: Adhesively attach insulation to substrate in compliance with ASTM C1397.

1. Rasp or sand flush entire surface of insulation to remove irregularities projecting more than 1/16 inch from surface of insulation and to remove yellowed areas due to sun exposure; do not create depressions deeper than 1/16 inch. Prevent airborne dispersal and immediately collect insulation raspings and/or sandings.
2. Coordinate installation of flashing and insulation to produce wall assembly that does not allow water to penetrate behind flashing and EIFS lamina.

E. Expansion Joints: Install at locations indicated and where required by EIFS manufacturer.

F. Base Coat: Apply full coverage to exposed insulation with not less than 1/16-inch dry-coat thickness.

G. Reinforcing Mesh: Embed reinforcing mesh in wet base coat to produce wrinkle-free installation with mesh continuous at corners, overlapped not less than 2-1/2 inches or otherwise treated at joints to comply with ASTM C1397. Do not lap reinforcing mesh within 8 inches of corners. Completely embed mesh, applying additional base-coat material if necessary, so reinforcing-mesh color and pattern are invisible.

H. Double-Layer Reinforcing-Mesh Application: Where indicated or required, apply second base coat and second layer of reinforcing mesh, overlapped not less than 2-1/2 inches or otherwise treated at joints to comply with ASTM C1397 in same manner as first application. Do not apply until first base coat has cured.

I. Additional Reinforcing Mesh: Apply strip-reinforcing mesh around openings, extending 4 inches beyond perimeter. Apply additional 9-by-12-inch strip-reinforcing mesh diagonally at corners of openings (re-entrant corners). Apply 8-inch-wide, strip-reinforcing mesh at both inside and outside corners unless base layer of mesh is lapped not less than 4 inches on each side of corners.

J. Double Base-Coat Application: Where indicated, apply second base coat in same manner and thickness as first application, except without reinforcing mesh. Do not apply until first base coat has cured.

K. Finish Coat: Apply full-thickness coverage over dry primed base coat, maintaining a wet edge at all times for uniform appearance, to produce a uniform finish of color and texture matching approved sample and free of cold joints, shadow lines, and texture variations.

L. Sealer Coat: Apply over dry finish coat, in number of coats and thickness required by EIFS manufacturer.

END OF SECTION

SECTION 07 27 26

FLUID-APPLIED MEMBRANE AIR BARRIERS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Vapor-permeable, fluid-applied air barriers.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include manufacturer's written instructions for evaluating, preparing, and treating each substrate; technical data; dry film thickness; and tested physical and performance properties of products.

B. Shop Drawings: For air-barrier assemblies.
   1. Include details for substrate joints and cracks, counterflashing strips, penetrations, inside and outside corners, terminations, and tie-ins with adjoining construction.

1.03 INFORMATIONAL SUBMITTALS

A. Product certificates.
   1. From air-barrier manufacturer, certifying compatibility of air barriers and accessory materials with Project materials that connect to or that come in contact with the barrier.

B. Product test reports.
   1. For each air-barrier assembly, for tests performed by a
   2. qualified testing agency.

C. Field quality-control reports.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
   1. Installer to be licensed by ABAA according to ABAA's Quality Assurance Program and to employ ABAA-certified installers and supervisors on Project.

B. Mockups: Build mockups to set quality standards for materials and execution.
   1. Build integrated mockups of exterior wall assembly, incorporating backup wall construction, external cladding, window, storefront, door frame and sill, insulation, ties and other penetrations, and flashing to demonstrate surface preparation, crack and joint treatment, application of air barriers, and sealing of gaps, terminations, and penetrations of air-barrier assembly.
      a. Coordinate construction of mockups to permit inspection and testing of air barrier before external insulation and cladding are installed.
      b. Include junction with roofing membrane and foundation wall intersection.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Air-Barrier Performance: Air-barrier assembly and seals with adjacent construction to be capable of performing as a continuous air barrier and as a liquid-water drainage plane flashed to discharge to the exterior incidental condensation or water penetration. Air-barrier assemblies to be capable of accommodating substrate movement and of sealing substrate expansion and control joints, construction material changes, penetrations, and transitions at perimeter conditions without deterioration and air leakage exceeding specified limits.

B. Air-Barrier Assembly Air Leakage: Maximum 0.04 cfm/sq. ft. of surface area at 1.57 lbf/sq. ft., when tested in accordance with ASTM E2357.

C. Air Permeance: Maximum 0.004 cfm/sq. ft. of surface area at 1.57 lbf/sq. ft. pressure difference; ASTM E2178.

D. Ultimate Elongation: Minimum 500 percent; ASTM D412, Die C.

E. Adhesion to Substrate: Minimum 30 lbf/sq. in. when tested in accordance with ASTM D4541.

F. Fire Propagation Characteristics: Passes NFPA 285 testing as part of an approved assembly.

G. UV Resistance: Can be exposed to sunlight for 30 days in accordance with manufacturer's written instructions.

2.02 HIGH-BUILD AIR BARRIERS, VAPOR PERMEABLE

A. High-Build, Vapor-Permeable Air Barrier Synthetic Polymer Type: Synthetic polymer membrane with an installed dry film thickness, according to manufacturer's written instructions, of 35 mils or thicker over smooth, void-free substrates.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. 3M Industrial Adhesives and Tapes Division.
      b. Carlisle Coatings & Waterproofing Inc.
      c. DuPont de Nemours, Inc.

d. GE Construction Sealants; Momentive Performance Materials Inc.
e. Hohmann & Barnard, Inc.
f. Sto Corp.
g. W. R. Meadows, Inc.
h. Vapor Permeance: Minimum 5 perms; ASTM E96/E96M, Procedure B, Water Method.

2.03 ACCESSORY MATERIALS

A. Requirement: Provide primers, transition strips, termination strips, joint reinforcing fabric and strips, joint sealants, counterflashing strips, flashing sheets and metal termination bars, termination mastic, substrate patching materials, adhesives, tapes, foam sealants, lap sealants, and other accessory materials that are recommended in writing by air-barrier manufacturer to produce a complete air-barrier assembly and that are compatible with primary air-barrier material and adjacent construction to which they may seal.

PART 3 EXECUTION

3.01 SURFACE PREPARATION

A. Clean, prepare, treat, fill, and seal substrate and joints and cracks in substrate in accordance with manufacturer's written instructions and details. Provide clean, dust-free, and dry substrate for air-barrier application.

B. Mask off adjoining surfaces not covered by air barrier to prevent spillage and overspray affecting other construction.

C. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids in concrete with substrate-patching material.

D. Remove excess mortar from masonry ties, shelf angles, and other obstructions.

E. At changes in substrate plane, apply sealant or termination mastic beads at sharp corners and edges to form a smooth transition from one plane to another.

F. Bridge expansion joints and discontinuous wall-to-wall, deck-to-wall, and deck-to-deck joints with air-barrier accessory material that accommodates joint movement in accordance with manufacturer's written instructions and details.

3.02 INSTALLATION

A. Install materials in accordance with air-barrier manufacturer's written instructions and details to form a seal with adjacent construction and ensure continuity of air and water barrier.
   1. Coordinate the installation of air barrier with installation of roofing membrane and base flashing to ensure continuity of air barrier with roofing membrane.
   2. Install transition strip on roofing membrane or base flashing so that a minimum of 3 inches of coverage is achieved over each substrate.

3. Unless manufacturer recommends in writing against priming, apply primer to substrates at required rate and allow it to dry.
4. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by air-barrier material on same day. Reprime areas exposed for more than 24 hours.

B. Connect and seal exterior wall air-barrier material continuously to roofing-membrane air barrier, concrete below-grade structures, floor-to-floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings, using accessory materials.

C. Wall Openings: Prime concealed, perimeter frame surfaces of windows, curtain walls, storefronts, and doors. Apply transition strip so that a minimum of 3 inches of coverage is achieved over each substrate. Maintain 3 inches of full contact over firm bearing to perimeter frames.

D. Repair punctures, voids, and deficient lapped seams in strips and transition strips. Slit and flatten fishmouths and blisters. Patch with transition strips extending 6 inches beyond repaired areas in strip direction.

E. High-Build Air Barriers: Apply continuous unbroken air-barrier material to substrates according to the following thickness. Apply air-barrier material in full contact around protrusions such as masonry ties.
1. Vapor-Permeable, High-Build Air Barrier: Total dry film thickness as recommended in writing by manufacturer to comply with performance requirements, but not less than 35 mils, applied in one or more equal coats.

F. Do not cover air barrier until it has been tested and inspected by testing agency.

G. Correct deficiencies in or remove air barrier that does not comply with requirements; repair substrates and reapply air-barrier components.

3.03 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Tests: As determined by testing agency from among the following tests:
1. Air-barrier dry film thickness.
2. Air-Leakage-Location Testing: Air-barrier assemblies will be tested for evidence of air leakage in accordance with ASTM E1186, chamber pressurization or depressurization with smoke tracers.
3. Air-Leakage-Volume Testing: Air-barrier assemblies will be tested for air-leakage rate in accordance with ASTM E2357.
4. Adhesion Testing: Air-barrier assemblies will be tested for required adhesion to substrate in accordance with ASTM D4541 for each 600 sq. ft. of installed air barrier or part thereof.

C. Air barriers will be considered defective if they do not pass tests and inspections.
   1. Apply additional air-barrier material, in accordance with manufacturer's written instructions, where inspection results indicate insufficient thickness.
   2. Remove and replace deficient air-barrier components for retesting as specified above.

D. Repair damage to air barriers caused by testing; follow manufacturer's written instructions.

E. Prepare test and inspection reports.

3.04 CLEANING AND PROTECTION

A. Protect air-barrier system from damage during application and remainder of construction period, in accordance with manufacturer's written instructions.

B. Remove masking materials after installation.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 07 41 13

STANDING-SEAM METAL ROOF PANELS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Standing-seam metal roof panels.
   2. Vapor retarder.

1.02 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.
   1. Meet with Owner, Architect, Owner's insurer if applicable, metal panel Installer, metal panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects metal panels, including installers of roof accessories and roof-mounted equipment.
   2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
   3. Review methods and procedures related to metal panel installation, including manufacturer's written instructions.
   4. Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
   5. Review structural loading limitations of deck purlins and rafters during and after roofing.
   6. Review flashings, special details, drainage, penetrations, equipment curbs, and condition of other construction that affect metal panels.
   7. Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
   8. Review temporary protection requirements for metal panel systems during and after installation.
   9. Review procedures for repair of metal panels damaged after installation.
   10. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel and accessory
   2. For recycled content, indicating post-consumer and pre-consumer recycled content and cost.

B. Shop Drawings: Include fabrication and installation layouts of metal panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details.

C. Samples: For each type of metal panel indicated, minimum 2” x 2”

1.04 INFORMATIONAL SUBMITTALS

A. Product test reports.
   1. for tests performed by a qualified testing agency.

B. Warranties: Sample of special warranties.

1.05 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

B. UL-Certified, Portable Roll-Forming Equipment: UL-certified, portable roll-forming equipment capable of producing metal panels warranted by manufacturer to be the same as factory-formed products. Maintain UL certification of portable roll-forming equipment for duration of work.

1.07 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal panel systems that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Two years from date of Substantial Completion.

B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
   1. Finish Warranty Period: 20 years from date of Substantial Completion.

C. Special Weathertightness Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace standing-seam metal roof panel assemblies that fail to remain weathertight, including leaks, within specified warranty period.
   1. Warranty Period: 20 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Energy Performance:
   1. Provide roof panels that are listed on the EPA/DOE's ENERGY STAR "Roof Product List" for steep-slope roof products.

2. Provide roof panels according to one of the following when tested according to CRRC-1:
    a. Three-year, aged solar reflectance of not less than 0.55 and emissivity of not less than 0.75.
    b. Three-year, aged Solar Reflectance Index of not less than 64 when calculated according to ASTM E1980.

B. Structural Performance: Provide metal panel systems capable of withstanding the effects of the following loads, based on testing according to ASTM E1592:
    1. Wind Loads: As indicated on Drawings.
    2. Deflection Limits: For wind loads, no greater than 1/240 of the span.

C. Air Infiltration: Air leakage of not more than 0.06 cfm/sq. ft. when tested according to ASTM E1680 at the following test-pressure difference:
    1. Test-Pressure Difference: 6.24 lbf/sq. ft.

D. Water Penetration under Static Pressure: No water penetration when tested according to ASTM E1646 at the following test-pressure difference:
    1. Test-Pressure Difference: 6.24 lbf/sq. ft.

E. Hydrostatic-Head Resistance: No water penetration when tested according to ASTM E2140.

F. FM Global Listing: Provide metal roof panels and component materials that comply with requirements in FM Global 4471 as part of a panel roofing system and that are listed in FM Global's "Approval Guide" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Global markings.
    1. Hail Resistance: SH.

G. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
    1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

2.02 STANDING-SEAM METAL ROOF PANELS

A. Provide factory-formed metal roof panels designed to be installed by lapping and interconnecting raised side edges of adjacent panels with joint type indicated and mechanically attaching panels to supports using concealed clips in side laps. Include clips, cleats, pressure plates, and accessories required for weathertight installation.
    1. Steel Panel Systems: Unless more stringent requirements are indicated, comply with ASTM E1514.

B. Vertical-Rib, Seamed-Joint, Standing-Seam Metal Roof Panels: Formed with vertical ribs at panel edges and a flat pan between ribs; designed for sequential installation by mechanically attaching panels to supports using concealed clips located under one side of panels, engaging opposite edge of adjacent panels, and mechanically seaming panels together.
   1. Basis-of-Design Product: Subject to compliance with requirements, provide Berridge Manufacturing Company; Berridge Zee-Lock Double Lock or a comparable product by one of the following:
      a. AEP Span a brand of ASC Profiles LLC, a part of BlueScope.
      b. ATAS International, Inc.
      c. Fabral; a brand of OmniMax International.
      d. MBCI; Cornerstone Building Brands.
      e. Metal Sales Manufacturing Corporation.
      f. PAC-CLAD; Petersen Aluminum Corporation; a Carlisle company.
      g. Ultra Seam, Inc.
      h. Or approved equal.
   2. Metallic-Coated Steel Sheet: Zinc-coated (galvanized) steel sheet complying with ASTM A653/A653M, G90 coating designation, or aluminum-zinc alloy-coated steel sheet complying with ASTM A792/A792M, Class AZ50 coating designation; structural quality. Pre-painted by the coil-coating process to comply with ASTM A755/A755M.
      a. Nominal Thickness: 0.028 inch.
      b. Exterior Finish: Two-coat fluoropolymer.
      c. Color: As selected by Engineer from manufacturer's full range.
   3. Clips: One-piece fixed.
   4. Material:
      a. 0.028-inch- nominal thickness, zinc-coated (galvanized) or aluminum-zinc alloy-coated steel sheet.
   5. Joint Type: Double folded.
   6. Panel Coverage: 16 inches.
   7. Panel Height: 2.0 inches.

2.03 VAPOR RETARDER

A. Butyl Rubber Sheet Vapor Retarder, Self-Adhering: Polyethylene film laminated to layer of butyl rubber adhesive, minimum 30-mil total thickness; maximum permeance rating of 0.1 perm; cold applied, with slip-resisting surface and release paper backing. Provide primer when recommended by vapor-retarder manufacturer.

2.04 UNDERLAYMENT MATERIALS

A. Self-Adhering, High-Temperature Underlayment: Provide self-adhering, cold-applied, sheet underlayment, a minimum of 40 mils thick, consisting of slip-resistant, polyethylene-film top surface laminated to a layer of butyl or SBS-modified asphalt adhesive, with release-paper backing. Provide primer when recommended by underlayment manufacturer.
   1. Thermal Stability: Stable after testing at 240 deg F; ASTM D1970.
   2. Low-Temperature Flexibility: Passes after testing at minus 20 deg F; ASTM D1970.

3. Basis-of-Design Product: Subject to compliance with requirements, provide Grace Ice & Watershield HT or a comparable product by one of the following:
   a. Tamko.
   b. Mid-States Asphalt.
   c. Soprema.
   d. MFM.
   e. Polyglass.
   f. Or approved equal.

B. Slip Sheet: Manufacturer's recommended slip sheet, of type required for application.

2.05 MISCELLANEOUS MATERIALS

A. Miscellaneous Metal Sub-framing and Furring: ASTM C645; cold-formed, metallic-coated steel sheet, ASTM A653/A653M, G90 hot-dip galvanized coating designation or ASTM A792/A792M, Class AZ50 coating designation unless otherwise indicated. Provide manufacturer's standard sections as required for support and alignment of metal panel system.

B. Panel Accessories: Provide components required for a complete, weathertight panel system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal panels unless otherwise indicated.
   1. Closures: Provide closures at eaves and ridges, fabricated of same metal as metal panels.
   2. Backing Plates: Provide metal backing plates at panel end splices, fabricated from material recommended by manufacturer.
   3. Closure Strips: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin-foam or closed-cell laminated polyethylene; minimum 1-inch-thick, flexible closure strips; cut or pre-molded to match metal panel profile. Provide closure strips where indicated or necessary to ensure weathertight construction.

C. Flashing and Trim: Provide flashing and trim formed from same material as metal panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, eaves, rakes, corners, bases, framed openings, ridges, fasciae, and fillers. Finish flashing and trim with same finish system as adjacent metal panels.

D. Gutters and Downspouts: Formed from same material as roof panels according to current edition of SMACNA's "Architectural Sheet Metal Manual." Finish to match metal roof panels, roof fascia and rake trim.

E. Panel Fasteners: Self-tapping screws designed to withstand design loads.

F. Panel Sealants: Provide sealant type recommended by manufacturer that are compatible with panel materials, are nonstaining, and do not damage panel finish.
   1. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing; 1/2 inch wide and 1/8 inch thick.
   2. Joint Sealant: ASTM C920; as recommended in writing by metal panel manufacturer.
   3. Butyl-Rubber-Based, Solvent-Release Sealant: ASTM C1311.

2.06 FABRICATION

A. Fabricate and finish metal panels and accessories at the factory, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.

B. On-Site Fabrication: Subject to compliance with requirements of this Section, metal panels may be fabricated on-site using UL-certified, portable roll-forming equipment if panels are of same profile and warranted by manufacturer to be equal to factory-formed panels. Fabricate according to equipment manufacturer's written instructions and to comply with details shown.

C. Provide panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel.

D. Fabricate metal panel joints with factory-installed captive gaskets or separator strips that provide a weathertight seal and prevent metal-to-metal contact, and that minimize noise from movements.

E. Sheet Metal Flashing and Trim: Fabricate flashing and trim to comply with manufacturer's recommendations and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.

2.07 FINISHES

A. Panels and Accessories:
   1. Two-Coat Fluoropolymer: AAMA 621. Fluoropolymer finish containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat.
   2. Concealed Finish: White or light-colored acrylic or polyester backer finish.

PART 3 EXECUTION

3.01 PREPARATION

A. Miscellaneous Supports: Install sub-framing, furring, and other miscellaneous panel support members and anchorages according to ASTM C754 and metal panel manufacturer's written recommendations.

3.02 INSTALLATION OF VAPOR RETARDER

A. Loosely lay vapor retarder in a single layer over area to receive vapor retarder, side and end lapping each sheet a minimum of 2 and 6 inches, respectively.

3.03 INSTALLATION OF UNDERLAYMENT

A. Self-Adhering Sheet Underlayment: Apply primer if required by manufacturer. Comply with temperature restrictions of underlayment manufacturer for installation. Apply at locations indicated below, wrinkle free, in shingle fashion to shed water, and with end laps of not less than 6 inches staggered 24 inches between courses. Overlap side edges not less than 3-1/2 inches. Roll laps with roller. Cover underlayment within 14 days.
   1. Apply over the entire roof surface.

B. Slip Sheet: Apply slip sheet over underlayment before installing metal roof panels.

C. Flashings: Install flashings to cover underlayment to comply with requirements specified in Section 07 62 00 "Sheet Metal Flashing and Trim."

3.04 INSTALLATION OF STANDING-SEAM METAL ROOF PANELS

A. Standing-Seam Metal Roof Panel Installation: Fasten metal roof panels to supports with concealed clips at each standing-seam joint at location, spacing, and with fasteners recommended in writing by manufacturer.
   1. Install clips to supports with self-tapping fasteners.
   2. Install pressure plates at locations indicated in manufacturer's written installation instructions.
   3. Seamed Joint: Crimp standing seams with manufacturer-approved, motorized seamer tool so clip, metal roof panel, and factory-applied sealant are completely engaged.
   4. Watertight Installation:
      a. Apply a continuous ribbon of sealant or tape to seal joints of metal panels, using sealant or tape as recommend in writing by manufacturer as needed to make panels watertight.
      b. Provide sealant or tape between panels and protruding equipment, vents, and accessories.
      c. At panel splices, nest panels with minimum 6-inch end lap, sealed with sealant and fastened together by interlocking clamping plates.

B. Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.

C. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.

3.05 CLEANING AND PROTECTION

A. Remove temporary protective coverings and strippable films, if any, as metal panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of metal panel installation, clean finished surfaces as recommended by metal panel manufacturer. Maintain in a clean condition during construction.

END OF SECTION

SECTION 07-53-23

ETHYLENE-PROPYLENE-DIENE-MONOMER (EPDM) ROOFING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Adhered ethylene-propylene-diene-terpolymer (EPDM) roofing system.
   2. Accessory roofing materials.
   3. Roof insulation.
   4. Insulation accessories and cover board.

1.02 ACTION SUBMITTALS

A. Shop Drawings: Include roof plans, sections, details, and attachments to other work, including the following:
   1. Layout and thickness if insulation.
   2. Base flashings and membrane terminations.
   3. Flashing details at penetrations.
   4. Tapered insulation, thickness, and slopes.
   5. Roof plan showing orientation of steel roof deck and orientation of roof membrane and fastening spacings and patterns for mechanically fastened roofing system.
   6. Insulation fastening patterns for corner, perimeter, and field-of-roof locations.
   7. Tie-in with air barrier.

B. Wind Uplift Resistance Submittal: For roofing system, indicating compliance with wind uplift performance requirements in the Drawings

1.03 INFORMATIONAL SUBMITTALS

A. Manufacturer Certificates:
   1. Performance Requirement Certificate: Signed by roof membrane manufacturer, certifying that roofing system complies with requirements specified in "Performance Requirements" Article.
      a. Submit evidence of complying with performance requirements.
   2. Special Warranty Certificate: Signed by roof membrane manufacturer, certifying that all materials supplied under this Section are acceptable for special warranty.

B. Product Test Reports: For components of roof membrane and insulation, for tests performed by a qualified testing agency, indicating compliance with specified requirements.

C. Research reports.

D. Field Test Reports:
   1. Concrete internal relative humidity test reports.
   2. Fastener-pullout test results and manufacturer's revised requirements for fastener patterns.

E. Field quality-control reports.
   1. Provide field quality control reports recommended by manufacturer.

F. Sample warranties.

1.04 CLOSEOUT SUBMITTALS

A. Maintenance data.

B. Certified statement from existing roof membrane manufacturer stating that existing roof warranty has not been affected by Work performed under this Section.

1.05 QUALITY ASSURANCE

A. Qualifications:
   1. Installers: A qualified firm that is approved, authorized, or licensed by roofing system manufacturer to install manufacturer's product and that is eligible to receive manufacturer's special warranty.

1.06 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of roofing system that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 10 years from Date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Accelerated Weathering: Roof membrane to withstand 2000 hours of exposure when tested in accordance with ASTM G152, ASTM G154, or ASTM G155.

B. Impact Resistance: Roof membrane to resist impact damage when tested in accordance with ASTM D3746, ASTM D4272, or the "Resistance to Foot Traffic Test" in FM Approvals 4470.

C. Wind Uplift Resistance: Design roofing system to resist the following wind uplift pressures when tested in accordance with FM Approvals 4474, UL 580, or UL 1897:

2.02 ETHYLENE-PROPYLENE-DIENE-TERPOLYMER (EPDM) ROOFING

A. EPDM Sheet: ASTM D4637/D4637M, Type I, nonreinforced, EPDM sheet.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Carlisle Syntec Systems.
      b. GenFlex Roofing Systems.
      c. Johns Manville; a Berkshire Hathaway company.
      d. Versico Roofing Systems; Carlisle Construction Materials.
      e. Or approved equal.
      f.
   2. Thickness: 60 mils, nominal.
   3. Exposed Face Color: Black.

2.03 ACCESSORY ROOFING MATERIALS

A. General: Accessory materials recommended by roofing system manufacturer for intended use and compatible with other roofing components.
   1. Adhesive and Sealants: Comply with VOC limits of authorities having jurisdiction.

B. Sheet Flashing: 60-mil-thick EPDM, partially cured or cured, according to application.

C. Protection Sheet: Epichlorohydrin or neoprene nonreinforced flexible sheet, 55 to 60 mils thick, recommended by EPDM manufacturer for resistance to hydrocarbons, non-aromatic solvents, grease, and oil.

D. Slip Sheet: ASTM D2178/D2178M, Type IV; glass fiber; asphalt-impregnated felt.

E. Prefabricated Pipe Flashings: As recommended by roof membrane manufacturer.

F. Bonding Adhesive: Manufacturer's standard, water based.

G. Seaming Material: Manufacturer's standard, synthetic-rubber polymer primer and 3-inch-wide minimum, butyl splice tape with release film.

H. Lap Sealant: Manufacturer's standard, single-component sealant.

I. Water Cutoff Mastic: Manufacturer's standard butyl mastic sealant.

J. Metal Termination Bars: Manufacturer's standard, predrilled stainless steel or aluminum bars, approximately 1 by 1/8 inch thick; with anchors.

K. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening components to substrate, and acceptable to roofing system manufacturer.

L. Miscellaneous Accessories: Provide pourable sealers, preformed cone and vent sheet flashings, molded pipe boot flashings, preformed inside and outside corner sheet flashings, reinforced EPDM securement strips, T-joint covers, in-seam sealants, termination reglets, cover strips, and other accessories.

2.04 ROOF INSULATION

A. Polyisocyanurate Board Insulation: ASTM C1289, Type II, Class 2 coated glass-fiber facer on both major surfaces.
   1. Size: 48 by 96 inches.
   2. Thickness:
      a. Base Layer: 3 inches.
      b. Upper Layer: 3 inches.

B. Tapered Insulation: Provide factory-tapered insulation boards.
   1. Material: Match roof insulation.
   2. Minimum Thickness: 1/4 inch.
   3. Slope:
      a. Roof Field: 1/4 inch per foot unless otherwise indicated on Drawings.

2.05 INSULATION ACCESSORIES AND COVER BOARD

A. Insulation Adhesive: Insulation manufacturer's recommended adhesive formulated to attach roof insulation to substrate or to another insulation layer as follows:
   1. Modified asphaltic, asbestos-free, cold-applied adhesive.
   2. Bead-applied, low-rise, one-component or multicomponent urethane adhesive.
   3. Full-spread, spray-applied, low-rise, two-component urethane adhesive.

B. Glass-Mat Gypsum Cover Board: ASTM C1177/C1177M, water-resistant gypsum board.
   1. Thickness: 1/2 inch.
   2. Surface Finish: Fiberglass facer.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
   1. Verify that minimum concrete drying period recommended by roofing system manufacturer has passed.
   2. Verify that concrete substrate is visibly dry and free of moisture, and that minimum concrete internal relative humidity is not more than 75 percent, or as recommended by roofing system manufacturer when tested in accordance with ASTM F2170.
      a. Test Frequency: One test probe per each 1000 sq. ft., or portion thereof, of roof deck, with not less than three test probes.
      b. Submit test reports within 24 hours of performing tests.

3. Verify that concrete-curing compounds that will impair adhesion of roofing components to roof deck have been removed.

3.02 PREPARATION

A. Perform fastener-pullout tests in accordance with roof system manufacturer's written instructions.
   1. Submit test result within 24 hours of performing tests.
      a. Include manufacturer's requirements for any revision to previously submitted fastener patterns required to achieve specified wind uplift requirements.

B. Install sound-absorbing insulation strips in accordance with acoustical roof deck manufacturer's written instructions.

3.03 INSTALLATION OF ROOFING, GENERAL

A. Install roofing system in accordance with roofing system manufacturer's written instructions, assembly requirements, and FM Global Property Loss Prevention Data Sheet 1-29.

B. Complete terminations and base flashings and provide temporary seals to prevent water from entering completed sections of roofing system at end of workday or when rain is forecast. Remove and discard temporary seals before beginning work on adjoining roofing.

C. Install roof membrane and auxiliary materials to tie in to existing roofing to maintain weathertightness of transition.

3.04 INSTALLATION OF INSULATION

A. Coordinate installing roofing system components, so insulation is not exposed to precipitation or left exposed at end of workday.

B. Comply with roofing system and insulation manufacturer's written instructions for installing roof insulation.

C. Installation Over Concrete Decks:
   1. Install base layer of insulation with joints staggered not less than 24 inches in adjacent rows.
      a. Where installing composite and noncomposite insulation in two or more layers, install noncomposite board insulation for bottom layer and intermediate layers, if applicable, and install composite board insulation for top layer.
      b. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
      c. Make joints between adjacent insulation boards not more than 1/4 inch in width.
      d. At internal roof drains, slope insulation to create a square drain sump with each side equal to the diameter of the drain bowl plus 24 inches.
         1) Trim insulation so that water flow is unrestricted.
      e. Fill gaps exceeding 1/4 inch with insulation.

f. Cut and fit insulation within 1/4 inch of nailers, projections, and penetrations.
g. Loosely lay base layer of insulation units over substrate.
h. Adhere base layer of insulation to concrete roof deck in accordance with FM Approvals' RoofNav assembly requirements and FM Global Property Loss Prevention Data Sheet 1-29 for specified Windstorm Resistance Classification, as follows:
    1) Prime surface of concrete deck with asphalt primer at rate of 3/4 gal./100 sq. ft. and allow primer to dry.
    2) Set insulation in a solid mopping of hot roofing asphalt, applied within plus or minus 25 deg F of equiviscous temperature.
    3) Set insulation in ribbons of bead-applied insulation adhesive, firmly pressing and maintaining insulation in place.
    4) Set insulation in a uniform coverage of full-spread insulation adhesive, firmly pressing and maintaining insulation in place.

2. Install upper layers of insulation and tapered insulation with joints of each layer offset not less than 12 inches from previous layer of insulation.
    a. Staggered end joints within each layer not less than 24 inches in adjacent rows.
    b. Install with long joints continuous and with end joints staggered not less than 12 inches in adjacent rows.
    c. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
    d. Make joints between adjacent insulation boards not more than 1/4 inch in width.
    e. Fill gaps exceeding 1/4 inch with insulation.
    f. Cut and fit insulation within 1/4 inch of nailers, projections, and penetrations.
    g. Loosely lay each layer of insulation units over substrate.
    h. Adhere each layer of insulation to substrate using adhesive in accordance with FM Approvals' RoofNav assembly requirements and FM Global Property Loss Prevention Data Sheet 1-29 for specified Windstorm Resistance Classification, as follows:
        1) Set each layer of insulation in a solid mopping of hot roofing asphalt, applied within plus or minus 25 deg F of equiviscous temperature.
        2) Set each layer of insulation in ribbons of bead-applied insulation adhesive, firmly pressing and maintaining insulation in place.
        3) Set each layer of insulation in a uniform coverage of full-spread insulation adhesive, firmly pressing and maintaining insulation in place.

3.05 INSTALLATION OF COVER BOARDS

A. Install cover boards over insulation with long joints in continuous straight lines with end joints staggered between rows. Offset joints of insulation below a minimum of 6 inches in each direction.
    1. Trim cover board neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
    2. At internal roof drains, conform to slope of drain sump.
        a. Trim cover board so that water flow is unrestricted.
    3. Cut and fit cover board tight to nailers, projections, and penetrations.

4. Loosely lay cover board over substrate.
5. Adhere cover board to substrate using adhesive in accordance with FM Approvals' RoofNav assembly requirements and FM Global Property Loss Prevention Data Sheet 1-29 for specified Windstorm Resistance Classification, as follows:
    a. Set cover board in a solid mopping of hot roofing asphalt, applied within plus or minus 25 deg F of equiviscous temperature.
    b. Set cover board in ribbons of bead-applied insulation adhesive, firmly pressing and maintaining insulation in place.
    c. Set cover board in a uniform coverage of full-spread insulation adhesive, firmly pressing and maintaining insulation in place.

B. Install slip sheet over cover board and immediately beneath roofing.

3.06 ADHERED ROOFING INSTALLATION

A. Adhere roof membrane over area to receive roofing in accordance with roofing system manufacturer's written instructions.

B. Unroll membrane roof membrane and allow to relax before installing.

C. Start installation of roofing in presence of roofing system manufacturer's technical personnel and Owner's testing and inspection agency.

D. Accurately align roof membrane and maintain uniform side and end laps of minimum dimensions required by manufacturer. Stagger end laps.

E. Bonding Adhesive: Apply to substrate and underside of roof membrane at rate required by manufacturer and allow to partially dry before installing roof membrane. Do not apply to splice area of roof membrane.

F. In addition to adhering, mechanically fasten roof membrane securely at terminations, penetrations, and perimeters.

G. Apply roof membrane with side laps shingled with slope of roof deck where possible.

H. Adhesive Seam Installation: Clean both faces of splice areas, apply splicing cement.
1. Firmly roll side and end laps of overlapping roof membrane to ensure a watertight seam installation.
2. Apply lap sealant and seal exposed edges of roofing terminations.
3. Apply a continuous bead of in-seam sealant before closing splice if required by roofing system manufacturer.

I. Tape Seam Installation: Clean and prime both faces of splice areas, apply splice tape.
1. Firmly roll side and end laps of overlapping roof membrane to ensure a watertight seam installation.
2. Apply lap sealant and seal exposed edges of roofing terminations.

J. Spread sealant or mastic bed over deck-drain flange at roof drains, and securely seal roof membrane in place with clamping ring.

K. Adhere protection sheet over roof membrane at locations indicated.

3.07 INSTALLATION OF BASE FLASHING

A. Install sheet flashings and preformed flashing accessories and adhere to substrates in accordance with roofing system manufacturer's written instructions.

B. Apply bonding adhesive to substrate and underside of sheet flashing at required rate and allow to partially dry. Do not apply to seam area of flashing.

C. Flash penetrations and field-formed inside and outside corners with cured or uncured sheet flashing.

D. Clean splice areas, apply splicing cement, and firmly roll side and end laps of overlapping sheets to ensure a watertight seam installation. Apply lap sealant and seal exposed edges of sheet flashing terminations.

E. Terminate and seal top of sheet flashings and mechanically anchor to substrate through termination bars.

3.08 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to inspect substrate conditions, surface preparation, roof membrane application, flashings, protection, and drainage components, and to furnish reports to Architect.

B. Final Roof Inspection: Arrange for roofing system manufacturer's technical personnel to inspect roofing installation on completion, in presence of Architect, and to prepare inspection report.

C. Repair or remove and replace components of roofing system where inspections indicate that they do not comply with specified requirements.

3.09 PROTECTING AND CLEANING

A. Protect roofing system from damage and wear during remainder of construction period. When remaining construction does not affect or endanger roofing system, inspect roofing system for deterioration and damage, describing its nature and extent in a written report, with copies to Engineer and Owner.

B. Correct deficiencies in or remove roofing system that does not comply with requirements, repair substrates, and repair or reinstall roofing system to a condition free of damage and deterioration at time of Substantial Completion and in accordance with warranty requirements.

C. Clean overspray and spillage from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

END OF SECTION

SECTION 07 62 00

SHEET METAL FLASHING AND TRIM

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Formed roof-drainage sheet metal fabrications.
   2. Formed steep-slope roof sheet metal fabrications.

1.02 ACTION SUBMITTALS

A. Product Data: For each of the following
   1. Elastomeric sealant.
   2. Butyl sealant.

B. Shop Drawings: For sheet metal flashing and trim.
   1. Include plans, elevations, sections, and attachment details.
   2. Detail fabrication and installation layouts, expansion-joint locations, and keyed details. Distinguish between shop- and field-assembled Work.
   3. Include identification of material, thickness, weight, and finish for each item and location in Project.
   4. Include details for forming, including profiles, shapes, seams, and dimensions.
   5. Include details for joining, supporting, and securing, including layout and spacing of fasteners, cleats, clips, and other attachments. Include pattern of seams.
   6. Include details of termination points and assemblies.
   7. Include details of expansion joints and expansion-joint covers, including showing direction of expansion and contraction from fixed points.
   8. Include details of roof-penetration flashing.
   9. Include details of edge conditions, including eaves, ridges, valleys, rakes, crickets, flashings, and counter-flashings.
   10. Include details of special conditions.
   11. Include details of connections to adjoining work.

C. Samples: For each exposed product and for each color and texture specified, 12 inches long by actual width.

1.03 INFORMATIONAL SUBMITTALS

A. Sample warranty.

1.04 CLOSEOUT SUBMITTALS

A. Maintenance data.

B. Special warranty.

1.05 QUALITY ASSURANCE

A. Fabricator Qualifications: Employs skilled workers who custom fabricate sheet metal flashing and trim similar to that required for this Project and whose products have a record of successful in-service performance.

1.06 WARRANTY

A. Special Warranty on Finishes: Manufacturer agrees to repair finish or replace sheet metal flashing and trim that shows evidence of deterioration of factory-applied finishes within specified warranty period.
   1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
      a. Color fading more than 5 Delta E units when tested in accordance with ASTM D2244.
      b. Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
      c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
   2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Sheet metal flashing and trim assemblies, including cleats, anchors, and fasteners, are to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Completed sheet metal flashing and trim are not to rattle, leak, or loosen, and are to remain watertight.

B. Sheet Metal Standard for Flashing and Trim: Comply with SMACNA's "Architectural Sheet Metal Manual" requirements for dimensions and profiles shown unless more stringent requirements are indicated.

C. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
   1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

2.02 SHEET METALS

A. Protect mechanical and other finishes on exposed surfaces from damage by applying strippable, temporary protective film before shipping.

B. Metallic-Coated Steel Sheet: Provide zinc-coated (galvanized) steel sheet in accordance with ASTM A653/A653M, G90 coating designation; pre-painted by coil-coating process to comply with ASTM A755/A755M.
   1.
   2. Surface: Smooth, flat.

3. Exposed Coil-Coated Finish:
    a. Two-Coat Fluoropolymer: AAMA 621. Fluoropolymer finish containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
4. Color: As selected by Engineer from manufacturer's full range.
5. Concealed Finish: Pretreat with manufacturer's standard white or light-colored acrylic or polyester backer finish, consisting of prime coat and wash coat with minimum total dry film thickness of 0.5 mil.

2.03 MISCELLANEOUS MATERIALS

A. Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation and as recommended by manufacturer of primary sheet metal unless otherwise indicated.

B. Fasteners: Wood screws, annular threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads and recommended by manufacturer of primary sheet metal.
    1. General: Blind fasteners or self-drilling screws, gasketed, with hex-washer head.
        a. Exposed Fasteners: Heads matching color of sheet metal using plastic caps or factory-applied coating. Provide metal-backed EPDM or PVC sealing washers under heads of exposed fasteners bearing on weather side of metal.
        b. Blind Fasteners: High-strength aluminum or stainless steel rivets suitable for metal being fastened.
        c. Spikes and Ferrules: Same material as gutter; with spike with ferrule matching internal gutter width.
    2. Fasteners for Zinc-Coated (Galvanized) Steel Sheet: Series 300 stainless steel or hot-dip galvanized steel in accordance with ASTM A153/A153M or ASTM F2329.

C. Sealant Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, non-sag, nontoxic, nonstaining tape 1/2 inch wide and 1/8 inch thick.

D. Elastomeric Sealant: ASTM C920, elastomeric polymer sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.

E. Butyl Sealant: ASTM C1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type expansion joints with limited movement.

F. Bituminous Coating: Cold-applied asphalt emulsion in accordance with ASTM D1187/D1187M.

G. Asphalt Roofing Cement: ASTM D4586, asbestos free, of consistency required for application.

2.04 FABRICATION, GENERAL

A. Custom fabricate sheet metal flashing and trim to comply with details indicated and recommendations in cited sheet metal standard that apply to design, dimensions, geometry, metal thickness, and other characteristics of item required.
   1. Fabricate sheet metal flashing and trim in shop to greatest extent possible.
   2. Fabricate sheet metal flashing and trim in thickness or weight needed to comply with performance requirements, but not less than that specified for each application and metal.
   3. Verify shapes and dimensions of surfaces to be covered and obtain field measurements for accurate fit before shop fabrication.
   4. Form sheet metal flashing and trim to fit substrates without excessive oil-canning, buckling, and tool marks; true to line, levels, and slopes; and with exposed edges folded back to form hems.
   5. Conceal fasteners and expansion provisions where possible. Do not use exposed fasteners on faces exposed to view.

B. Fabrication Tolerances:
   1. Fabricate sheet metal flashing and trim that is capable of installation to a tolerance of 1/4 inch in 20 feet on slope and location lines indicated on Drawings and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.
   2. Fabricate sheet metal flashing and trim that is capable of installation to tolerances specified.

C. Expansion Provisions: Form metal for thermal expansion of exposed flashing and trim.
   1. Form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with butyl sealant concealed within joints.
   2. Use lapped expansion joints only where indicated on Drawings.

D. Sealant Joints: Where movable, non-expansion-type joints are required, form metal in accordance with cited sheet metal standard to provide for proper installation of elastomeric sealant.

E. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal.

F. Seams:
   1. Fabricate nonmoving seams with flat-lock seams. Form seams and seal with elastomeric sealant unless otherwise recommended by sealant manufacturer for intended use. Rivet joints where necessary for strength.

2.05 ROOF-DRAINAGE SHEET METAL FABRICATIONS

A. Hanging Gutters:
   1. Fabricate to cross section required, complete with end pieces, outlet tubes, and other accessories as required.
   2. Fabricate in minimum 96-inch-long sections.

3. Furnish flat-stock gutter brackets and flat-stock gutter spacers and straps fabricated from same metal as gutters, of size recommended by cited sheet metal standard, but with thickness not less than twice the gutter thickness.
4. Fabricate expansion joints, expansion-joint covers, and gutter accessories from same metal as gutters.
5. Gutters with Girth up to 15 Inches: Fabricate from the following materials:
    a. Galvanized Steel: 0.028 inch thick.

B. Downspouts: Fabricate rectangular downspouts to dimensions indicated on Drawings, complete with mitered elbows. Furnish with metal hangers from same material as downspouts and anchors. Shop fabricate elbows.
1. Fabricate from the following materials:
    a. Galvanized Steel: 0.028 inch thick.

2.06 STEEP-SLOPE ROOF SHEET METAL FABRICATIONS

A. Drip Edges: Fabricate from the following materials:
1. Galvanized Steel: 0.028 inch thick.

B. Eave, Rake Flashing: Fabricate from the following materials:
1. Galvanized Steel: 0.028 inch thick.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Install sheet metal flashing and trim to comply with details indicated and recommendations of cited sheet metal standard that apply to installation characteristics required unless otherwise indicated on Drawings.
1. Install fasteners, protective coatings, separators, sealants, and other miscellaneous items as required to complete sheet metal flashing and trim system.
2. Install sheet metal flashing and trim true to line, levels, and slopes. Provide uniform, neat seams with minimum exposure of sealant.
3. Anchor sheet metal flashing and trim and other components of the Work securely in place, with provisions for thermal and structural movement.
4. Install sheet metal flashing and trim to fit substrates and to result in watertight performance.
5. Install continuous cleats with fasteners spaced not more than 12 inches o.c.
6. Space individual cleats not more than 12 inches apart. Attach each cleat with at least two fasteners. Bend tabs over fasteners.
7. Install exposed sheet metal flashing and trim with limited oil-canning, and free of buckling and tool marks.
8. Do not field cut sheet metal flashing and trim by torch.

B. Metal Protection: Where dissimilar metals contact each other, or where metal contacts pressure-treated wood or other corrosive substrates, protect against galvanic action or corrosion by painting contact surfaces with bituminous coating or by other permanent separation as recommended by sheet metal manufacturer or cited sheet metal standard.
   1. Coat concealed side of sheet metal flashing and trim with bituminous coating where flashing and trim contact wood, ferrous metal, or cementitious construction.
   2. Underlayment: Where installing sheet metal flashing and trim directly on cementitious or wood substrates, install underlayment and cover with slip sheet.

C. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim.
   1. Space movement joints at maximum of 10 feet with no joints within 24 inches of corner or intersection.
   2. Form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with sealant concealed within joints.
   3. Use lapped expansion joints only where indicated on Drawings.

D. Fasteners: Use fastener sizes that penetrate wood blocking or sheathing not less than 1-1/4 inches for nails and not less than 3/4 inch for wood screws.

E. Conceal fasteners and expansion provisions where possible in exposed work and locate to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.

F. Seal joints as required for watertight construction.
   1. Use sealant-filled joints unless otherwise indicated.
      a. Embed hooked flanges of joint members not less than 1 inch into sealant.
      b. Form joints to completely conceal sealant.
      c. When ambient temperature at time of installation is between 40 and 70 deg F, set joint members for 50 percent movement each way.
      d. Adjust setting proportionately for installation at higher ambient temperatures.
         1) Do not install sealant-type joints at temperatures below 40 deg F.
   2. Prepare joints and apply sealants to comply with requirements in Section 079200 "Joint Sealants."

3.02 INSTALLATION OF ROOF-DRAINAGE SYSTEM

A. Install sheet metal roof-drainage items to produce complete roof-drainage system in accordance with cited sheet metal standard unless otherwise indicated. Coordinate installation of roof perimeter flashing with installation of roof-drainage system.

B. Hanging Gutters:
   1. Join sections with joints sealed with sealant.
   2. Provide for thermal expansion.
   3. Attach gutters at eave or fascia to firmly anchor them in position.
   4. Provide end closures and seal watertight with sealant.
   5. Slope to downspouts.

6. Install gutter with expansion joints at locations indicated on Drawings, but not exceeding, 50 feet apart. Install expansion-joint caps.

C. Downspouts:
   1. Join sections with 1-1/2-inch telescoping joints.
   2. Provide hangers with fasteners designed to hold downspouts securely to walls.
   3. Locate hangers at top and bottom and at approximately 60 inches o.c.
   4. Provide elbows at base of downspout to direct water away from building.

3.03 INSTALLATION OF ROOF FLASHINGS

A. Install sheet metal flashing and trim to comply with performance requirements and cited sheet metal standard.
   1. Provide concealed fasteners where possible, and set units true to line, levels, and slopes.
   2. Install work with laps, joints, and seams that are permanently watertight and weather resistant.

B. Pipe or Post Counterflashing: Install counterflashing umbrella with close-fitting collar with top edge flared for elastomeric sealant, extending minimum of 4 inches over base flashing. Install stainless steel draw band and tighten.

C. Counterflashing: Coordinate installation of counterflashing with installation of base flashing.
   1. Insert counterflashing in reglets or receivers and fit tightly to base flashing.
   2. Extend counterflashing 4 inches over base flashing.
   3. Lap counterflashing joints minimum of 4 inches.

D. Roof-Penetration Flashing: Coordinate installation of roof-penetration flashing with installation of roofing and other items penetrating roof. Seal with elastomeric sealant and clamp flashing to pipes that penetrate roof.

3.04 INSTALLATION TOLERANCES

A. Installation Tolerances: Shim and align sheet metal flashing and trim within installed tolerance of 1/4 inch in 20 feet on slope and location lines indicated on Drawings and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

3.05 CLEANING

A. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

B. Clean and neutralize flux materials. Clean off excess solder.

C. Clean off excess sealants.

3.06 PROTECTION

A. Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed unless otherwise indicated in manufacturer's written installation instructions.

B. Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond successful repair by finish touchup or similar minor repair procedures, as determined by Engineer.

END OF SECTION

SECTION 07 72 53

SNOW GUARDS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

B. Rail-type, seam-mounted snow guards.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Include roof plans showing layouts and attachment details of snow guards.

C. Include details of rail-type snow guards.

D. Delegated-Design Submittal: For snow guards, include analysis reports signed and sealed by the qualified professional engineer responsible for their preparation.

E. Include calculation of number and location of snow guards.

1.03 INFORMATIONAL SUBMITTALS

A. Qualification Data: For professional engineer's experience with providing delegated design engineering services of the kind indicated, including documentation that the engineer is licensed in the jurisdiction in which the Project is located.

B. Product Test Reports: For each type of snow guard, for tests performed by a qualified testing agency, indicating load at failure of attachment to roof system identical to roof system used on this Project.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00 “Contractor Quality Control,” to design snow guards, including attachment to roofing material and roof deck, applicable for attachment method, based on the following:

B. Roof snow load.

C. Snow drifting

D. Roof slope.

E. Roof type.

F. Roof dimensions.

G. Roofing substrate type and thickness.

H. Snow guard type.

I. Snow guard fastening method and strength.

J. Snow guard spacing.

K. Coefficient of Friction Between Snow and Roof Surface: 0.

L. Factor of Safety: 2.

M. Performance Requirements: Provide snow guards that withstand exposure to weather and resist thermally induced movement without failure, rattling, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

N. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

O. Structural Performance: Snow guards shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.

P. Snow Loads: Refer to Section 01 73 24.

2.02 RAIL-TYPE SNOW GUARDS

A. Rail-Type, Seam-Mounted Snow Guards:

B. Basis-of-Design Product: Subject to compliance with requirements, provide S-5! Metal Roof Innovations, Ltd.; SnoRail/SnoFence or a comparable product by one of the following:
   a. Alpine SnowGuards.
   b. IceBlox Inc.
   c. LMCurbs.
   d. Rocky Mountain Snow Guards, Inc.
   e. TRA Snow and Sun, Inc.
   f. Or approved equal.

C. Description: Snow guard rails fabricated from metal pipes, bars, or extrusions, anchored to brackets and equipped with two rails.

D. Brackets and Baseplates: ASTM B209 aluminum, clear anodized.

E. Bars: ASTM B221 aluminum; mill finish.
   a. Profile: Round.

F. Seam clamps: ASTM B221 aluminum extrusion or ASTM B85/B85M aluminum casting with stainless steel set screws incorporating round nonpenetrating point; designed for use with applicable roofing system to which clamp is attached.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install snow guards according to manufacturer's written instructions.

B. Space rows as recommended by manufacturer.

C. Attachment for Standing-Seam Metal Roofing:

D. Do not use fasteners that will penetrate metal roofing or fastening methods that void metal roofing finish warranty.

E. Rail-Type, Seam-Mounted Snow Guards:
   a. Install brackets to vertical ribs in straight rows.
   b. Secure with stainless steel set screws, incorporating round nonpenetrating point, on same side of standing seam.
   c. Torque set screw according to manufacturer's instructions.
   d. Install cross members to brackets.

SECTION 07 91 26

JOINT FILLERS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies preformed joint fillers.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM D994	Preformed Expansion Joint Filler for Concrete (Bituminous Type)
ASTM D1752	Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction

PART 2 PRODUCTS

2.01 PREFORMED ASPHALT FIBERBOARD

A. Preformed asphalt fiberboard joint filler shall be in accordance with ASTM D994 and shall be 1/2 inch thick unless otherwise specified.

2.02 PREFORMED RESIN-BONDED CORK

A. Preformed resin-bonded cork joint filler shall be in accordance with ASTM D1752, Type II. Cork joint filler thickness shall match the specified joint width.

2.03 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's recommendations for handling and installation of the material.

PART 3 EXECUTION

3.01 GENERAL

A. Preformed joint fillers shall be placed into position before the concrete is poured. Where it is necessary for the filler to be fixed to existing concrete or other building materials, a suitable adhesive recommended by the filler manufacturer shall be used. Filler surfaces shall be clean and dry prior to the placement of the concrete.

3.02 PREFORMED ASPHALT FIBERBOARD

A. Preformed asphalt fiberboard joint fillers shall be used for expansion joints in concrete sidewalks, curbs, and roadways.

3.03 PREFORMED RESIN-BONDED CORK

A. Preformed resin-bonded cork joint filler shall be used for expansion joints in concrete structures. The expansion joint shall be sealed with backer rod and sealant as specified in Section 07 92 00.

END OF SECTION

SECTION 07 92 00

JOINT SEALANTS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Silicone joint sealants.
   2. Urethane joint sealants.
   3. Latex joint sealants.

1.02 ACTION SUBMITTALS

A. Product Data: For each joint-sealant product.

B. Samples: For each kind and color of joint sealant required.

C. Joint-Sealant Schedule: Include the following information:
   1. Joint-sealant application, joint location, and designation.
   2. Joint-sealant manufacturer and product name.
   3. Joint-sealant formulation.
   4. Joint-sealant color.

1.03 INFORMATIONAL SUBMITTALS

A. Product test reports.

B. Preconstruction laboratory test reports.

C. Preconstruction field-adhesion-test reports.

D. Field-adhesion-test reports.

E. Sample warranties.

1.04 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified according to ASTM C1021 to conduct the testing indicated.

1.05 WARRANTY

A. Special Installer's Warranty: Installer agrees to repair or replace joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.
   1. Warranty Period: Two years from date of Substantial Completion.

B. Special Manufacturer's Warranty: Manufacturer agrees to furnish joint sealants to repair or replace those joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 JOINT SEALANTS, GENERAL

A. Colors of Exposed Joint Sealants: As selected by Engineer from manufacturer's full range.

2.02 NONSTAINING SILICONE JOINT SEALANTS

A. Nonstaining Joint Sealants: No staining of substrates when tested according to ASTM C1248.

B. Silicone, Nonstaining, S, NS, 50, NT: Nonstaining, single-component, non-sag, plus 50 percent and minus 50 percent movement capability, nontraffic-use, neutral-curing silicone joint sealant; ASTM C920, Type S, Grade NS, Class 50, Use NT.

2.03 URETHANE JOINT SEALANTS

A. Urethane, S, NS, 25, NT: Single-component, non-sag, nontraffic-use, plus 25 percent and minus 25 percent movement capability, urethane joint sealant; ASTM C920, Type S, Grade NS, Class 25, Use NT.

B. Urethane, S, P, 25, T, NT: Single-component, pourable, plus 25 percent and minus 25 percent movement capability, traffic- and nontraffic-use, urethane joint sealant; ASTM C920, Type S, Grade P, Class 25, Uses T and NT.

C. Urethane, M, P, 50, T, NT: Multicomponent, pourable, plus 50 percent and minus 50 percent movement capability, traffic- and nontraffic-use, urethane joint sealant; ASTM C920, Type M, Grade P, Class 50, Uses T and NT.

2.04 MILDEW-RESISTANT JOINT SEALANTS

A. Mildew-Resistant Joint Sealants: Formulated for prolonged exposure to humidity with fungicide to prevent mold and mildew growth.

B. Silicone, Mildew Resistant, Acid Curing, S, NS, 25, NT: Mildew-resistant, single-component, nonsag, plus 25 percent and minus 25 percent movement capability, nontraffic-use, acid-curing silicone joint sealant; ASTM C920, Type S, Grade NS, Class 25, Use NT.

C. Acrylic Latex: Acrylic latex or siliconized acrylic latex, ASTM C834, Type OP, Grade NF.

2.05 JOINT-SEALANT BACKING

A. Cylindrical Sealant Backings: ASTM C1330, Type C (closed-cell material with a surface skin), and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

B. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer.

2.06 MISCELLANEOUS MATERIALS

A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials.

C. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 EXECUTION

3.01 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:
   1. Remove laitance and form-release agents from concrete.
   2. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion.

B. Joint Priming: Prime joint substrates where recommended by joint-sealant manufacturer or as indicated by preconstruction joint-sealant-substrate tests or prior experience.

C. Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces.

3.02 INSTALLATION OF JOINT SEALANTS

A. General: Comply with ASTM C1193 and joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Install sealant backings of kind indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

C. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.

D. Install sealants using proven techniques that comply with the following and at the same time backings are installed:
   1. Place sealants so they directly contact and fully wet joint substrates.
   2. Completely fill recesses in each joint configuration.
   3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

E. Tooling of Non-sag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants to form smooth, uniform beads of configuration indicated. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.
   1. Provide concave joint profile per Figure 8A in ASTM C1193 unless otherwise indicated.

3.03 JOINT-SEALANT SCHEDULE

A. Joint-Sealant Application: Exterior joints in horizontal traffic surfaces.
   1. Joint Locations:
      a. Isolation and contraction joints in cast-in-place concrete slabs.
      b. Other joints as indicated on Drawings.
   2. Joint Sealant: Urethane, M, P, 50, T, NT.
   3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

B. Joint-Sealant Application: Exterior joints in vertical surfaces and horizontal nontraffic surfaces.
   1. Joint Locations:
      a. Control and expansion joints in unit masonry.
      b. Other joints as indicated on Drawings.
   2. Joint Sealant: Silicone, nonstaining, S, NS, 50, NT.
   3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

C. Joint-Sealant Application: Interior joints in horizontal traffic surfaces.
   1. Joint Locations:
      a. Isolation joints in cast-in-place concrete slabs.
      b. Other joints as indicated on Drawings.
   2. Joint Sealant: Urethane, S, P, 25, T, NT.
   3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

D. Joint-Sealant Application: Interior joints in vertical surfaces and horizontal nontraffic surfaces.
   1. Joint Locations:
      a. Control and expansion joints on exposed interior surfaces of exterior walls.
      b. Vertical joints on exposed surfaces of unit masonry walls.
      c. Other joints as indicated on Drawings.
   2. Joint Sealant: Urethane, S, NS, 25, NT.
   3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

E. Joint-Sealant Application: Interior joints in vertical surfaces and horizontal nontraffic surfaces not subject to significant movement.
   1. Joint Locations:
      a. Control joints on exposed interior surfaces of exterior walls.
      b. Perimeter joints between interior wall surfaces and frames of interior doors windows.

c. Other joints as indicated on Drawings.

2. Joint Sealant: Acrylic latex.
3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

F. Joint-Sealant Application: Mildew-resistant interior joints in vertical surfaces and horizontal nontraffic surfaces.
   1. Joint Locations:
      a. Joints between plumbing fixtures and adjoining walls, floors, and counters.
      b. Other joints as indicated on Drawings.
   2. Joint Sealant: Silicone, mildew resistant, acid curing, S, NS, 25, NT.
   3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

G. Joint-Sealant Application: Concealed mastics.
   1. Joint Locations:
      a. Aluminum thresholds.
      b. Sill plates.
      c. Other joints as indicated on Drawings.
   2. Joint Sealant: Butyl-rubber based.
   3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

SECTION 08 11 13

HOLLOW METAL DOORS AND FRAMES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Interior standard steel doors and frames.
   2. Exterior standard steel doors and frames.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Include the following:
   1. Elevations of each door type.
   2. Details of doors, including vertical- and horizontal-edge details and metal thicknesses.
   3. Frame details for each frame type, including dimensioned profiles and metal thicknesses.

C. Product Schedule: For hollow-metal doors and frames, prepared by or under the supervision of supplier, using same reference numbers for details and openings as those on Drawings. Coordinate with final door hardware schedule.

1.03 INFORMATIONAL SUBMITTALS

A. Product test reports.

B. Field quality control reports.

1.04 CLOSEOUT SUBMITTALS

A. Record Documents: For fire-rated doors, list of door numbers and applicable room name and number to which door accesses.

1.05 QUALITY ASSURANCE

A. Fire-Rated Door Inspector Qualifications: Inspector for field quality control inspections of fire-rated door assemblies is to meet the qualifications set forth in NFPA 80, Section 5.2.3.1 and the following:
   1. Door and Hardware Institute Fire and Egress Door Assembly Inspector (FDAI) certification.

B. Egress Door Inspector Qualifications: Inspector for field quality control inspections of egress door assemblies is to meet the qualifications set forth in NFPA 101, Section 7.2.1.15.4 and the following:
   1. Door and Hardware Institute Fire and Egress Door Assembly Inspector (FDAI) certification.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Ceco Door; AADG, Inc.; ASSA ABLOY.
   2. Curries, AADG, Inc.; ASSA ABLOY Group.
   3. Custom Metal Products.
   4. National Custom Hollow Metal Doors & Frames.
   5. North American Door Corp.
   6. Republic Doors and Frames; a Allegion brand.
   7. Rocky Mountain Metals, Inc.
   8. Steelcraft; Allegion plc.
   9. Stiles Custom Metal, Inc.
   10. West Central Manufacturing, Inc.

2.02 PERFORMANCE REQUIREMENTS

A. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction for fire-protection ratings indicated on Drawings, based on testing at positive pressure in accordance with NFPA 252 or UL 10C.

B. Thermally Rated Door Assemblies: Provide door assemblies with U-factor of not more than 0.38 deg Btu/F x h x sq. ft. when tested in accordance with ASTM C1363 or ASTM E1423.

2.03 INTERIOR STANDARD STEEL DOORS AND FRAMES

A. Construct hollow-metal doors and frames to comply with standards indicated for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.

B. Heavy-Duty Doors and Frames: ANSI/SDI A250.8, Level 2; ANSI/SDI A250.4, Level B.
   1. Doors:
      a. Type: As indicated in the Door and Frame Schedule.
      b. Thickness: 1-3/4 inches.
      c. Face: Metallic-coated steel sheet, minimum thickness of 0.042 inch.

d. Edge Construction: Model 2, Seamless.
e. Core: Manufacturer's standard.
f. Fire-Rated Core: Manufacturer's standard core for fire-rated doors.

2. Frames:
a. Materials: Metallic-coated steel sheet, minimum thickness of 0.053 inch.
b. Transom Frames: Fabricated from same thickness material as adjacent door frame.
c. Construction: Full profile welded.

2.04 EXTERIOR STANDARD STEEL DOORS AND FRAMES

A. Construct hollow-metal doors and frames to comply with standards indicated for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.

B. Extra-Heavy-Duty Doors and Frames: ANSI/SDI A250.8, Level 3; ANSI/SDI A250.4, Level A.
1. Doors:
a. Type: As indicated in the Door and Frame Schedule.
b. Thickness: 1-3/4 inches.
c. Face: Metallic-coated steel sheet, minimum thickness of 0.053 inch, with minimum A60 coating.
d. Edge Construction: Model 2, Seamless.
e. Top Edge Closures: Close top edges of doors with flush closures of same material as face sheets. Seal joints against water penetration.
f. Bottom Edges: Close bottom edges of doors with end closures or channels of same material as face sheets. Provide weep-hole openings in bottoms of exterior doors to permit moisture to escape.
g. Core: Manufacturer's standard.
2. Frames:
a. Materials: Metallic-coated steel sheet, minimum thickness of 0.053 inch, with minimum A60 coating.
b. Construction: Full profile welded.

2.05 FRAME ANCHORS

A. Jamb Anchors:
1. Type: Anchors of minimum size and type required by applicable door and frame standard, and suitable for performance level indicated.
2. Quantity: Minimum of three anchors per jamb, with one additional anchor for frames with no floor anchor. Provide one additional anchor for each 24 inches of frame height above 7 feet.
3. Post installed Expansion Anchor: Minimum 3/8-inch-diameter bolts with expansion shields or inserts, with manufacturer's standard pipe spacer.

B. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor.

C. Floor Anchors for Concrete Slabs with Underlayment: Adjustable-type anchors with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at top of underlayment.

D. Material: ASTM A879/A879M, Commercial Steel (CS), 04Z coating designation; mill phosphatized.
   1. For anchors built into exterior walls, steel sheet complying with ASTM A1008/A1008M or ASTM A1011/A1011M; hot-dip galvanized in accordance with ASTM A153/A153M, Class B.

2.06 MATERIALS

A. Cold-Rolled Steel Sheet: ASTM A1008/A1008M, Commercial Steel (CS), Type B; suitable for exposed applications.

B. Hot-Rolled Steel Sheet: ASTM A1011/A1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.

C. Metallic-Coated Steel Sheet: ASTM A653/A653M, Commercial Steel (CS), Type B.

D. Inserts, Bolts, and Fasteners: Hot-dip galvanized in accordance with ASTM A153/A153M.

E. Power-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hollow-metal frames of type indicated.

F. Mineral-Fiber Insulation: ASTM C665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively; passing ASTM E136 for combustion characteristics.

G. Glazing: Comply with requirements in Section 08 80 00 "Glazing."

2.07 FABRICATION

A. Door Astragals: Provide overlapping astragal on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated. Extend minimum 3/4 inch beyond edge of door on which astragal is mounted or as required to comply with published listing of qualified testing agency.

B. Hollow-Metal Frames: Fabricate in one piece except where handling and shipping limitations require multiple sections. Where frames are fabricated in sections, provide alignment plates or angles at each joint, fabricated of metal of same or greater thickness as frames.
   1. Transom Bar Frames: Provide closed tubular members with no visible face seams or joints, fabricated from same material as door frame. Fasten members at crossings and to jambs by welding, or by rigid mechanical anchors.
   2. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.

3. Door Silencers: Except on weather-stripped frames, drill stops to receive door silencers as follows. Keep holes clear during construction.
    a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
    b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.

C. Hardware Preparation: Factory prepared hollow-metal doors and frames to receive templated mortised hardware, and electrical wiring; include cutouts, reinforcement, mortising, drilling, and tapping in accordance with ANSI/SDI A250.6, the Door Hardware Schedule, and templates.
    1. Reinforce doors and frames to receive non-templated, mortised, and surface-mounted door hardware.
    2. Comply with BHMA A156.115 for preparing hollow-metal doors and frames for hardware.

D. Glazed Lites: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with mitered-hairline joints.
    1. Provide stops and moldings flush with face of door, and with beveled stops unless otherwise indicated.
    2. Multiple Glazed Lites: Provide fixed and removable stops and moldings so that each glazed lite is capable of being removed independently.
    3. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames. Provide loose stops and moldings on inside of hollow-metal doors and frames.
    4. Coordinate rabbet width between fixed and removable stops with glazing and installation types indicated.
    5. Provide stops for installation with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches o.c. and not more than 2 inches o.c. from each corner.

2.08 STEEL FINISHES

A. Prime Finish: Clean, pretreat, and apply manufacturer's standard primer.
    1. Shop Primer: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with ANSI/SDI A250.10; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

PART 3 EXECUTION

3.01 PREPARATION

A. Remove welded-in shipping spreaders installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces. Touch up factory-applied finishes where spreaders are removed.

B. Drill and tap doors and frames to receive non-templated, mortised, and surface-mounted door hardware.

3.02 INSTALLATION

A. Hollow-Metal Frames: Comply with ANSI/SDI A250.11.
   1. Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces without damage to completed Work.
      a. Where frames are fabricated in sections, field splice at approved locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces. Touch-up finishes.
      b. Install frames with removable stops located on secure side of opening.
   2. Fire-Rated Openings: Install frames in accordance with NFPA 80.
   3. Floor Anchors: Secure with post-installed expansion anchors.
      a. Floor anchors may be set with power-actuated fasteners instead of post-installed expansion anchors if so indicated and approved on Shop Drawings.
   4. Solidly pack mineral-fiber insulation inside frames.
   5. In-Place Concrete or Masonry Construction: Secure frames in place with post-installed expansion anchors.
   6. Installation Tolerances: Adjust hollow-metal frames to the following tolerances:
      a. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
      b. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
      c. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
      d. Plumbness: Plus or minus 1/16 inch, measured at jambs at floor.

B. Hollow-Metal Doors: Fit and adjust hollow-metal doors accurately in frames, within clearances specified below.
   1. Non-Fire-Rated Steel Doors: Comply with ANSI/SDI A250.8.
   2. Fire-Rated Doors: Install doors with clearances in accordance with NFPA 80.

C. Glazing: Comply with installation requirements in Section 08 80 00 "Glazing" and with hollow-metal manufacturer's written instructions.

3.03 FIELD QUALITY CONTROL

A. Inspection Agency: Engage a qualified inspector to perform inspections and to furnish reports to Architect.

B. Inspections:
   1. Fire-Rated Door Inspections: Inspect each fire-rated door in accordance with NFPA 80, Section 5.2.
   2. Egress Door Inspections: Inspect each door equipped with panic hardware, each door equipped with fire exit hardware, each door located in an exit enclosure, each electrically controlled egress door, and each door equipped with special locking arrangements in accordance with NFPA 101, Section 7.2.1.15.

C. Repair or remove and replace installations where inspections indicate that they do not comply with specified requirements.

D. Reinspect repaired or replaced installations to determine if replaced or repaired door assembly installations comply with specified requirements.

3.04 REPAIR

A. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible air-drying, rust-inhibitive primer.

B. Metallic-Coated Surface Touchup: Clean abraded areas and repair with galvanizing repair paint according to manufacturer's written instructions.

C. Touchup Painting: Cleaning and touchup painting of abraded areas of paint are specified in painting Sections.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 31 20

FLOOR ACCESS DOORS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Factory-fabricated single or double leaf aluminum floor access doors and frames with water drainage. Include safety chain, telescoping ladder safety post, and fall protection grating system where indicated.

1.02 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ASTM B221	Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
ASTM B632	Aluminum-Alloy Rolled Tread Plate
ASTM A240	Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
ASTM F593	Stainless Steel Bolts, Hex Cap Screws, and Studs
ASTM F594	Stainless Steel Nuts
AASHTO	American Association of State Highway and Transportation Officials
OSHA	U.S. Dept. of Labor, Occupational Safety and Health Administration

1.03 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   4. Statement of experience for both manufacturer and installer.
   5. Fabrication drawings showing layouts, connections to structure, and anchoring details.
   6. Erection and installation drawings showing construction details, reinforcement, anchorage, and installation with relation to the building construction.

7. Drain pipe layout from the drain coupling to the discharge point.

B. Informational Submittals:
   1. Manufacturer's product data showing conformance to the specification.
   2. Structural calculations for the floor access door design provided by the manufacturer and sealed by a registered professional engineer registered in the State of Utah.
   3. Instructions for the storage, handling, installation, and operation.
   4. Manufacturer's warranty.

1.04 QUALITY ASSURANCE

A. Manufacturer: Minimum of 5 years' experience manufacturing similar products.

B. Installer: Minimum of 2 years' experience installing similar products.

1.05 DELIVERY, STORAGE AND HANDLING

A. Deliver materials in manufacturer's original packaging, stored in a dry, protected, well-vented area. Inspect product upon receipt and report damage to carrier and manufacturer.

1.06 SPECIAL WARRANTY

A. Materials shall be free of defects in material and workmanship for a period of 5 years from the date of purchase. Should a part fail to function in normal use within this period, manufacturer shall furnish a new part at no charge.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following manufacturers are acceptable. The manufacturer's standard product may require modification to conform to specified requirements.
   1. The Bilco Company.
   2. Babcock Davis.
   3. Halliday Products.
   4. East Jordan Iron Works (EJ).
   5. Approved Equivalent.

2.02 PERFORMANCE/DESIGN CRITERIA

A. Door leafs shall be reinforced to support a minimum live load of 300 psf with a maximum deflection of 1/150th of the span. See Floor Access Door Schedule at the end of this section, which indicates loading criteria required at each location.

B. Nominal opening sizes and hinge opening side shall be as noted on the Drawings and in the Floor Access Door Schedule.

2.03 MATERIALS

A. Access doors, single or double leaf: 1/4 inch minimum aluminum with diamond tread pattern; ASTM B632, 6061-T6.

B. Channel frame shall be 1/4 inch minimum extruded aluminum with bent down anchor tabs around the perimeter: ASTM B221, 6061-T6.

C. Hardware: ASTM A240 Type 316 stainless steel throughout.

D. Fasteners:
   1. Bolts: ASTM F593
   2. Nuts: ASTM F594

2.04 COMPONENTS/ FEATURES

A. Manufacturer shall provide the required number and size of compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled door leaf operation throughout the entire arc of opening; and to act as a check in retarding downward motion of the cover when closing.

B. Spring tubes shall be constructed of a reinforced nylon 6/6-based engineered composite material. The upper tube shall prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe fastened to a formed 1/4 inch gusset support plate.

C. Door leafs shall be equipped with a hold-open arm which automatically locks the door in the open position. A removable exterior turn/lift handle with a spring loaded ball detent shall be provided to open the door and the latch release shall be protected by a flush, gasketed, removable screw plug. A stainless steel snap lock with fixed handle shall be mounted on the underside of the door.

D. Provide heavy forged aluminum hinges with 1/4 inch minimum diameter stainless steel pins.
   1. Hinges must operate in such a manner to prevent the door leafs from protruding into the channel frame.
   2. Design hinges specifically for horizontal installation.
   3. Hinges shall be through-bolted to the cover with tamperproof stainless steel lock bolts and through-bolted to the frame with stainless steel bolts and locknuts.

E. A continuous ethylene propylene diene monomer (EPDM) gasket shall be mechanically attached to the aluminum frame to create a barrier around the entire perimeter of the cover and significantly reduce the amount of dirt and debris that may enter the channel frame.

F. A 1.5 inch drain coupling shall be provided.

G. Provide a continuous EPDM odor resistant gasket along the inside edge of the frame where indicated in the Floor Access Door Schedule. This gasket is in addition to the perimeter debris gasket.

H. Provide safety chain made of non-corrosive material that will span across the corners of double leaf access doors when open.

I. Provide telescoping ladder safety posts for easy, safe ladder access through the access door openings.
   1. Material: Stainless steel.
   2. Telescoping post to be permanently mounted to the top two rungs of fixed ladders.
   3. Post must automatically lock in the fully raised position to provide the user with a firm and steady hand-hold.
   4. Post to have release lever that allows the post to be easily lowered to its retracted position.

J. Provide a fall protection grating system where indicated in the Floor Access Door Schedule. Manufacturer shall install the grating system when the door is fabricated.
   1. Design Criteria: Meet OSHA 29 CFR 1910.23 requirements for fall protection.
   2. Grating panel material: Aluminum with powder coat paint finish.
   3. Grating panel color: High visibility OSHA safety yellow or orange.
   4. Grating panel shall lock automatically in the full open position.
   5. Grating panel shall lift open in the opposite direction as the door(s).
   6. Hold open feature: Stainless steel hold open device shall be provided to lock the cover in the fully open 90 degree position.
   7. Lift mechanism and hardware: Stainless steel lifting mechanisms as specified above for all fall protection panels that weigh over 50 pounds.
   8. Grating openings: Reinforced with easy-open aluminum covers for removal of instrumentation below access doors.

2.05 FINISHES

A. Door and frame: Mill finish aluminum with heavy bituminous coating where in contact with concrete.

B. Telescopic safety post: aluminum or stainless steel.

C. Springs: Electro-coated acrylic finish.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine substrates and openings for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Installation shall conform to the manufacturer’s recommendations.

B. Frame shall be accurately cast in place and securely anchored to concrete. Installation of access doors after concrete is placed is not allowed.

C. Set frame level, plumb and in proper alignment with adjacent work.

D. Contractor shall field route a 1.5 inch Schedule 80 PVC drain pipe from the 1.5 inch drain coupling on all access doors to the water or floor level below. Place drain pipe clear of the access area below the door and as approved by the Owner's Representative.

3.03 REPAIR/RESTORATION

A. Repair finishes damaged during installation.

B. Remove and replace doors that are warped, bowed, or otherwise damaged.

3.04 ADJUSTING

A. Adjust doors and hardware after installation for proper operation.

3.05 CLEANING

A. Clean exposed surfaces using methods acceptable to the manufacturer that will not damage finish.

3.06 FLOOR ACCESS DOOR SCHEDULE

A. See Structural Drawings.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 33 23

OVERHEAD COILING DOORS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Insulated service doors.

B. Related Requirements:
   1. Section 05 50 00 "Metal Fabrications" for miscellaneous steel supports, door-opening framing, corner guards, and bollards.

1.02 ACTION SUBMITTALS

A. Product Data: For each type and size of overhead coiling door and accessory.

B. Shop Drawings: For each installation and for special components not dimensioned or detailed in manufacturer's product data.
   1. Include points of attachment and their corresponding static and dynamic loads imposed on structure.
   2. Show locations of controls, locking devices detectors or replaceable fusible links, and other accessories.
   3. Include diagrams for power, signal, and control wiring.

C. Samples: For each exposed product and for each color and texture specified.

1.03 INFORMATIONAL SUBMITTALS

A. Sample warranty.

1.04 CLOSEOUT SUBMITTALS

A. Special warranty.
   1. Provide documentation of special warranty signed by manufacturer

B. Maintenance data.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer for both installation and maintenance of units required for this Project.

1.06 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of doors that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Two years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Structural Performance, Exterior Doors: Capable of withstanding the following design wind loads:
   1. Design Wind Load: As indicated on Drawings.
   2. Testing: According to ASTM E330/E330M.

2.02 DOOR ASSEMBLY

A. Insulated Service Door: Overhead coiling door formed with curtain of interlocking metal slats.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Clopay Building Products.
      b. Cookson; a CornellCookson company.
      c. Cornell; a CornellCookson company.
      d. Overhead Door Corporation.
      e. Raynor Garage Doors.
      f. Wayne Dalton; a division of Overhead Door Corporation.
      g. Or approved equal.

B. Operation Cycles: Door components and operators capable of operating for not less than 10,000.

C. Insulated Door Curtain R-Value: 4.5 deg F x h x sq. ft./Btu.

D. Door Curtain Material: Galvanized steel.

E. Door Curtain Slats: Flat profile slats of 1-7/8-inch center-to-center height.
   1. Insulated-Slat Interior Facing: Metal.

F. Bottom Bar: Two angles, each not less than 1-1/2 by 1-1/2 by 1/8 inch thick; fabricated from hot-dip galvanized steel and finished to match door.

G. Curtain Jamb Guides: Galvanized steel with exposed finish matching curtain slats.

H. Hood: Match curtain material and finish.
   1. Mounting: Face of wall.

I. Electric Door Operator:
   1. Usage Classification: Medium duty, up to 12 cycles per hour and up to 50 cycles per day.
   2. Safety: Listed according to UL 325 by a qualified testing agency for commercial or industrial use.
   3. Motor Exposure: Interior.
   4. Motor Electrical Characteristics:
      a. Horsepower: 1/2 hp.
      b. Voltage: 115 V ac, single phase, 60 Hz.
   5. Emergency Manual Operation: Chain type.
   6. Obstruction-Detection Device: Automatic electric sensor edge on bottom bar; self-monitoring type.
   7. Control Station(s): Interior mounted.

J. Curtain Accessories: Equip door with weather-seals.

K. Door Finish:
   1. Baked-Enamel or Powder-Coated Finish: Color as selected by Engineer from manufacturer's full range.
   2. Interior Curtain-Slat Facing: Match finish of exterior curtain-slat face.

2.03 MATERIALS, GENERAL

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.04 DOOR CURTAIN MATERIALS AND CONSTRUCTION

A. Door Curtains: Fabricate overhead coiling-door curtain of interlocking metal slats, designed to withstand wind loading indicated, in a continuous length for width of door without splices. Unless otherwise indicated, provide slats of thickness and mechanical properties recommended by door manufacturer for performance, size, and type of door indicated, and as follows:
   1. Insulation: Fill slats for insulated doors with manufacturer's standard thermal insulation complying with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, according to ASTM E84 or UL 723. Enclose insulation completely within slat faces.
   2. Metal Interior Curtain-Slat Facing: Match metal of exterior curtain-slat face, with minimum steel thickness of 0.010 inch.

B. Curtain Jamb Guides: Manufacturer's standard angles or channels and angles of same material and finish as curtain slats unless otherwise indicated, with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent overtravel of curtain.

2.05 HOODS

A. General: Form sheet metal hood to entirely enclose coiled curtain and operating mechanism at opening head. Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Form closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting that project beyond wall face. Equip hood with intermediate support brackets as required to prevent sagging.

2.06 CURTAIN ACCESSORIES

A. Weather-seals for Exterior Doors: Equip each exterior door with weather-stripping gaskets fitted to entire exterior perimeter of door for a weather-resistant installation unless otherwise indicated.

2.07 COUNTERBALANCE MECHANISM

A. General: Counterbalance doors by means of manufacturer's standard mechanism with an adjustable-tension, steel helical torsion spring mounted around a steel shaft and contained in a spring barrel connected to top of curtain with barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.

B. Brackets: Manufacturer's standard mounting brackets of either cast iron or cold-rolled steel plate.

2.08 ELECTRIC DOOR OPERATORS

A. General: Electric door operator assembly of size and capacity recommended and provided by door manufacturer for door and operation-cycles requirement specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, control stations, control devices, integral gearing for locking door, and accessories required for proper operation.
   1. Comply with NFPA 70.
   2. Control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24-V ac or dc.

B. Usage Classification: Electric operator and components capable of operating for not less than number of cycles per hour indicated for each door.

C. Motors: Reversible-type motor with controller (disconnect switch) for motor exposure indicated for each door assembly.
   1. Electrical Characteristics: Minimum as indicated for each door assembly. If not indicated, large enough to start, accelerate, and operate door in either direction from any position, at a speed not less than 8 in./sec. and not more than 12 in./sec., without exceeding nameplate ratings or service factor.
   2. Operating Controls, Controllers, Disconnect Switches, Wiring Devices, and Wiring: Manufacturer's standard unless otherwise indicated.

D. Obstruction-Detection Devices: External entrapment protection consisting of indicated automatic safety sensor capable of protecting full width of door opening. For non-fire-rated doors, activation of device immediately stops and reverses downward door travel.
   1. Electric Sensor Edge: Automatic safety sensor edge, located within astragal or weather stripping mounted to bottom bar. Contact with sensor activates device. Connect to control circuit using manufacturer's standard take-up reel or self-coiling cable.
      a. Self-Monitoring Type: Four-wire-configured device designed to interface with door operator control circuit to detect damage to or disconnection of sensor edge.

E. Control Station: Three-button control station in fixed location with momentary-contact push-button controls labeled "Open" and "Stop" and sustained- or constant-pressure push-button control labeled "Close."
   1. Interior-Mounted Units: Full-guarded, surface-mounted, heavy-duty type, with general-purpose NEMA ICS 6, Type 1 enclosure.

F. Emergency Manual Operation: Equip each electrically powered door with capability for emergency manual operation. Design manual mechanism so required force for door operation does not exceed 25 lbf.

G. Emergency Operation Disconnect Device: Equip operator with hand-operated disconnect mechanism for automatically engaging manual operator and releasing brake for emergency manual operation while disconnecting motor without affecting timing of limit switch. Mount mechanism so it is accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.

H. Motor Removal: Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency manual operation.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Install overhead coiling doors and operating equipment complete with necessary hardware, anchors, inserts, hangers, and equipment supports; according to manufacturer's written instructions and as specified.

B. Power-Operated Doors: Install automatic garage doors openers according to UL 325.

3.02 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and to furnish reports to Architect.

B. Repair or remove and replace installations where inspections indicate that they do not comply with specified requirements.

C. Reinspect repaired or replaced installations to determine if replaced or repaired door assembly installations comply with specified requirements.

3.03 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain overhead coiling doors.

END OF SECTION

SECTION 08 43 13

ALUMINUM-FRAMED STOREFRONTS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Aluminum-framed storefront systems.

1.02 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
   2. For recycled content, indicating post-consumer and pre-consumer
   3. recycled content and cost.

B. Shop Drawings: For aluminum-framed storefronts. Include plans, elevations, sections, full-size details, and attachments to other work.
   1. Show connection to and continuity with adjacent thermal, weather, air, and vapor barriers.

C. Samples: For each type of exposed finish required.

D. Delegated-Design Submittal: For aluminum-framed storefronts indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.04 INFORMATIONAL SUBMITTALS

A. Energy Performance Certificates: NFRC-certified energy performance values from manufacturer.

B. Product test reports. for tests performed by qualified testing agency

C. Source quality-control reports.

D. Field quality-control reports.

E. Sample warranties.

1.05 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer and that employs a qualified glazing contractor for this Project who is certified under the North American Contractor Certification Program (NACC) for Architectural Glass & Metal (AGM) contractors.

B. Testing Agency Qualifications: Qualified in accordance with ASTM E699 for testing indicated and acceptable to Owner and Architect.

C. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.
   1. Do not change intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If changes are proposed, submit comprehensive explanatory data to Architect for review.

1.07 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of aluminum-framed storefronts that do not comply with requirements or that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 10 years from date of Substantial Completion.

B. Special Finish Warranty, Anodized Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of anodized finishes within specified warranty period.
   1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Kawneer Company, Inc.; Arconic Corporation; Trifab Versaglaze 451T Framing System with GLASSvent Project-Out Windows or a comparable product by one of the following:
   1. Boyd Aluminum Mfg. Co.
   2. CMI Architectural Products, Inc.
   3. EFCO Corporation.
   4. Manko Window Systems, Inc.
   5. Pittco Architectural Metals, Inc.
   6. Trulite Glass & Aluminum Solutions, LLC.
   7. Tubelite Inc.
   8. U.S. Aluminum; C.R. Laurence Co., Inc.; CRH Americas, Inc.
   9. YKK AP America Inc.
   10. Or approved equal.

2.02 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00 "Contractor Quality Control," to design aluminum-framed storefronts.

B. General Performance: Comply with performance requirements specified, as determined by testing of aluminum-framed storefronts representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.
   1. Aluminum-framed storefronts shall withstand movements of supporting structure, including, but not limited to, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.
   2. Failure also includes the following:
      a. Thermal stresses transferring to building structure.
      b. Glass breakage.
      c. Noise or vibration created by wind and thermal and structural movements.
      d. Loosening or weakening of fasteners, attachments, and other components.
      e. Failure of operating units.

C. Structural Loads:
   1. Wind Loads: As indicated on Drawings.
   2. Other Design Loads: As indicated on Drawings.

D. Deflection of Framing Members Supporting Glass: At design wind load, as follows:
   1. Deflection Normal to Wall Plane: Limited to 1/175 of clear span for spans of up to 13 feet 6 inches and to 1/240 of clear span plus 1/4 inch for spans greater than 13 feet 6 inches
   2. Deflection Parallel to Glazing Plane: Limited to amount not exceeding that which reduces glazing bite to less than 75 percent of design dimension and that which reduces edge clearance between framing members and glazing or other fixed components to less than 1/8 inch.
      a. Operable Units: Provide a minimum 1/16-inch clearance between framing members and operable units.
   3. Cantilever Deflection: Limited to 2l/175 at unsupported cantilevers.

E. Structural: Test in accordance with ASTM E330/E330M as follows:
   1. When tested at positive and negative wind-load design pressures, storefront assemblies do not evidence deflection exceeding specified limits.
   2. When tested at 150 percent of positive and negative wind-load design pressures, storefront assemblies, including anchorage, do not evidence material failures, structural distress, or permanent deformation of main framing members exceeding 0.2 percent of span.
   3. Test Durations: As required by design wind velocity, but not less than 10 seconds.

F. Water Penetration under Static Pressure: Test in accordance with ASTM E331 as follows:
   1. No evidence of water penetration through fixed glazing and framing areas when tested in accordance with a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 6.24 lbf/sq. ft..

G. Energy Performance: Certified and labelled by manufacturer for energy performance as follows:
   1. Thermal Transmittance (U-factor):
      a. Fixed Glazing and Framing Areas: U-factor for the system of not more than 0.45 Btu/sq. ft. x h x deg F as determined in accordance with NFRC 100.
   2. Solar Heat Gain Coefficient (SHGC):
      a. Fixed Glazing and Framing Areas: SHGC for the system of not more than 0.38 as determined in accordance with NFRC 200.
   3. Air Leakage:
      a. Fixed Glazing and Framing Areas: Air leakage for the system of not more than 0.06 cfm/sq. ft. at a static-air-pressure differential of 6.24 lbf/sq. ft. when tested in accordance with ASTM E283.
   4. Condensation Resistance Factor (CRF):
      a. Fixed Glazing and Framing Areas: CRF for the system of not less than 55 as determined in accordance with AAMA 1503.

H. Thermal Movements: Allow for thermal movements resulting from ambient and surface temperature changes.
   1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

2.03 ALUMINUM-FRAMED STOREFRONT SYSTEMS

A. Framing Members: Manufacturer's extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.
   1. Exterior Framing Construction: Thermally broken.
   2. Glazing System: Retained mechanically with gaskets on four sides.
   3. Glazing Plane: Front.
   4. Finish: Clear anodic finish.
   5. Fabrication Method: Field-fabricated stick system.
   6. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
   7. Steel Reinforcement: As required by manufacturer.

B. Backer Plates: Manufacturer's standard, continuous backer plates for framing members, if not integral, where framing abuts adjacent construction.

C. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

2.04 WINDOW SYSTEM

A. GLASSvent Windows - Project-Out.

B. Hardware
   1. General: Provide manufacturer's standard hardware fabricated from aluminum, stainless steel, or other corrosion-resistant material compatible with aluminum; designed to smoothly operate, tightly close, and securely lock aluminum windows, and sized to accommodate sash weight and dimensions.

2. Project-Out Windows: Provide the following operating hardware:
    a. Stainless Steel 4-Bar Hinges
    b. Cast White Bronze Cam Locking Handles

C. Accessories
1. Spacers, Setting Blocks, Gaskets, and Bond Breakers: Manufacturer's standard permanent, non-migrating types in hardness recommended by manufacturer, compatible with sealants, and suitable for system performance requirements.
2. Framing system gaskets, sealants, and joint fillers as recommended by manufacturer for joint type.
3. Sealants and joint fillers for joints at perimeter of window system as specified in Section 07 92 00 “Joint Sealants”.
4. Insect Screens: Extruded aluminum frames, 6063-T6 alloy and temper, joined at corners: 18 x 16 mesh fiberglass screen cloth; frames finished to match aluminum windows; splines shall be extruded vinyl, removable to permit rescreening.

D. Fabrication
1. Window Vent and/or Vent Frame Joinery: Mitered and Mechanically clipped and/or staked. Factory sealed vent and /or vent frame and corner joints.
2. Fabricate aluminum windows in sizes indicated. Include a complete system for assembling components and anchoring windows.

2.05 GLAZING

A. Glazing: Comply with Section 08 80 00 "Glazing."

B. Glazing Gaskets: Manufacturer's standard sealed-corner pressure-glazing system of black, resilient elastomeric glazing gaskets, setting blocks, and shims or spacers.

C. Glazing Sealants: As recommended by manufacturer.

2.06 MATERIALS

A. Sheet and Plate: ASTM B209.

B. Extruded Bars, Rods, Profiles, and Tubes: ASTM B221.

C. Structural Profiles: ASTM B308/B308M.

D. Steel Reinforcement:
1. Structural Shapes, Plates, and Bars: ASTM A36/A36M.
2. Cold-Rolled Sheet and Strip: ASTM A1008/A1008M.
3. Hot-Rolled Sheet and Strip: ASTM A1011/A1011M.

E. Steel Reinforcement Primer: Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods in accordance with recommendations in SSPC-SP COM and prepare surfaces in accordance with applicable SSPC standard.

2.07 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Fabricate components that, when assembled, have the following characteristics:
   1. Profiles that are sharp, straight, and free of defects or deformations.
   2. Accurately fitted joints with ends coped or mitered.
   3. Physical and thermal isolation of glazing from framing members.
   4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
   5. Provisions for field replacement of glazing from exterior.
   6. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Mechanically Glazed Framing Members: Fabricate for flush glazing without projecting stops.

E. After fabrication, clearly mark components to identify their locations in Project in accordance with Shop Drawings.

2.08 ALUMINUM FINISHES

A. Clear Anodic Finish: AAMA 611, AA-M12C22A41, Class I, 0.018 mm or thicker.

PART 3 EXECUTION

3.01 INSTALLATION, GENERAL

A. Comply with manufacturer's written instructions.

B. Do not install damaged components.

C. Fit joints to produce hairline joints free of burrs and distortion.

D. Rigidly secure nonmovement joints.

E. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.

F. Seal perimeter and other joints watertight unless otherwise indicated.

G. Metal Protection:
   1. Where aluminum is in contact with dissimilar metals, protect against galvanic action by painting contact surfaces with materials recommended by manufacturer for this purpose or by installing nonconductive spacers.
   2. Where aluminum is in contact with concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

H. Set continuous sill members and flashing in full sealant bed, as specified in Section 07 92 00 "Joint Sealants," to produce weathertight installation.

I. Install joint filler behind sealant as recommended by sealant manufacturer.

J. Install components plumb and true in alignment with established lines and grades.

3.02 INSTALLATION OF GLAZING

A. Install glazing as specified in Section 08 80 00 "Glazing."

3.03 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Field Quality-Control Testing: Perform the following test on representative areas of aluminum-framed storefronts.
   1. Water-Spray Test: Before installation of interior finishes has begun, areas designated by Architect shall be tested in accordance with AAMA 501.2 and shall not evidence water penetration.
      a. Perform a minimum of three tests in areas as directed by Architect.
   2. Air Leakage: ASTM E783 at 1.5 times the rate specified for laboratory testing in "Performance Requirements" Article but not more than 0.09 cfm/sq. ft. at a static-air-pressure differential of 1.57 lbf/sq. ft..
      a. Perform a minimum of three tests in areas as directed by Architect.
   3. Water Penetration: ASTM E1105 at a minimum uniform and cyclic static-air-pressure differential of 0.67 times the static-air-pressure differential specified for laboratory testing in "Performance Requirements" Article, but not less than 6.24 lbf/sq. ft., and shall not evidence water penetration.

C. Aluminum-framed storefronts will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 45 13

FIBERGLASS WALL PANEL SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. Section includes the insulated translucent sandwich panel system and accessories, factory unitized, as shown and specified. Work includes providing and installing:
   1. Flat factory prefabricated structural insulated translucent sandwich panels
   2. Aluminum installation system
   3. Aluminum sill flashing

B. Related Requirements
   1. Section 07900: Joint Sealants

1.02 SUBMITTALS

A. Submit manufacturer's product data. Include construction details, material descriptions, profiles and finishes of components.

B. Submit shop drawings. Include elevations and details.

C. Submit manufacturer's color charts showing the full range of colors available for factory-finished aluminum.
   1. When requested, submit samples for each exposed finish required, in same thickness and material indicated for the work and in size indicated below. If finishes involve normal color variations, include sample sets consisting of two or more units showing the full range of variations expected.
      a. Sandwich panels: 14" x 28" units
      b. Factory finished aluminum: 5" long sections

D. Submit Installer Certificate, signed by installer, certifying compliance with project qualification requirements.

E. Submit product reports from a qualified independent testing agency indicating each type and class of panel system complies with the project performance requirements, based on comprehensive testing of current products. Previously completed reports will be acceptable if for current manufacturer and indicative of products used on this project.
   1. Reports required are:
      a. International Building Code Evaluation Report
      b. Flame Spread and Smoke Developed (UL 723) – Submit UL Card
      c. Burn Extent (ASTM D 635)
      d. Color Difference (ASTM D 2244)
      e. Impact Strength (UL 972)
      f. Bond Tensile Strength (ASTM C 297 after aging by ASTM D 1037)
      g. Bond Shear Strength (ASTM D 1002)

h. Beam Bending Strength (ASTM E 72)
i. Insulation U-Factor (NFRC 100)
j. NFRC System U-Factor Certification (NFRC 700)
k. Solar Heat Gain Coefficient (NFRC or Calculations)
l. Condensation Resistance Factor (AAMA 1503)
m. Air Leakage (ASTM E 283)
n. Structural Performance (ASTM E 330)
o. Water Penetration (ASTM E 331)
p. 1200°F Fire Resistance (SWRI)
q. ASTM E1886/1996 or TAS 201, 202 and 203
r. Performance for Windows (AAMA/WDMA/CSA-101/I.S.2/A440-05)

1.03 QUALITY ASSURANCE

A. Manufacturer's Qualifications

1. Material and products shall be manufactured by a company continuously and regularly employed in the manufacture of specified materials for a period of at least ten consecutive years and which can show evidence of those materials being satisfactorily used on at least six projects of similar size, scope and location. At least three of the projects shall have been in successful use for ten years or longer.
2. Panel system must be listed by an ANSI accredited Evaluation Service, which requires quality control inspections and fire, structural and water infiltration testing of sandwich panel systems by an accredited agency.
3. Quality control inspections shall be conducted at least once each year and shall include manufacturing facilities, sandwich panel components and production sandwich panels for conformance with AC177 “Translucent Fiberglass Reinforced Plastic (FRP) Faced Panel Wall, Roof and Skylight Systems” as issued by the ICC-ES.

B. Installer’s Qualifications: Installation shall be by an experienced installer, which has been in the business of installing specified panel systems for at least two consecutive years and can show evidence of satisfactory completion of projects of similar size, scope and type.

1.04 PERFORMANCE REQUIREMENTS

A. The manufacturer shall be responsible for the configuration and fabrication of the complete unitized panel system.
1. When requested, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
2. Standard panel system shall have less than 0.01 cfm/ft^2 air leakage by ASTM E 283 at 6.24 PSF (50 mph) and no water penetration by ASTM E 331 at 15 PSF; and structural testing by ASTM E 330.
3. Structural Loads; Provide system capable of handling the following loads:
a. Positive Wind Load: As indicated on Structural Drawings.
b. Negative Wind Load: As indicated on Structural Drawings.
c. Seismic Design Criteria: As indicated on Structural Drawings.

1.05 DELIVERY STORAGE AND HANDLING

A. Deliver panel system, components and materials in manufacturer's standard protective packaging.

B. Store panels on the long edge; several inches above the ground, blocked and under cover in accordance with manufacturer's storage and handling instructions.

1.06 WARRANTY

A. Submit manufacturer's and installer's written warranty agreeing to repair or replace panel system work, which fails in materials or workmanship within one year of the date of delivery. Failure of materials or workmanship shall include leakage, excessive deflection, deterioration of finish on metal in excess of normal weathering, defects in accessories, insulated translucent sandwich panels and other components of the work.

PART 2 PRODUCTS

2.01 MANUFACTURER

A. The basis for this specification is for products manufactured by Kalwall Corporation. Other manufacturers may bid this project provided they comply with all of the performance requirements of this specification and submit evidence thereof. Listing other manufacturers' names in this specification does not constitute approval of their products or relieve them of compliance with all the performance requirements contained herein.

B. Kalwall Corporation, Tel: (800) 258-9777 – Email: info@kalwall.com

2.02 PANEL COMPONENTS

A. Face Sheets
   1. Translucent faces: Manufactured from glass fiber reinforced thermoset resins, formulated specifically for architectural use.
      a. Thermoplastic (e.g. polycarbonate, acrylic) faces are not acceptable.
      b. Face sheets shall not deform, deflect or drip when subjected to fire or flame.
   2. Interior face sheets:
      a. Flame spread: Underwriters Laboratories (UL) listed, which requires periodic unannounced retesting, with flame spread rating no greater than 25 and smoke developed no greater than 250 when tested in accordance with UL 723.
      b. Burn extent by ASTM D 635 shall be no greater than 1".
   3. Exterior face sheets:
      a. Color stability: Full thickness of the exterior face sheet shall not change color more than 3 CIE Units DELTA E by ASTM D 2244 after 5 years outdoor South Florida weathering at 5° facing south, determined by the average of at least three white samples with and without a protective film or coating to ensure long-term color stability. Color stability shall be unaffected by abrasion or scratching.
      b. Strength: Exterior face sheet shall be uniform in strength, with panel meeting ASTM E1996 and ASTM E1886 or TAS 201, 202 and 203.

4. Appearance
    a. Exterior face sheets: Smooth 0.070” thick and Crystal in color.
    b. Interior face sheets: Smooth 0.045” thick and Crystal in color.
    c. Face sheets shall not vary more than ± 10% in thickness and be uniform in color.

B. Grid Core
1. Thermally Broken Composite I-beam grid core shall be of 6063-T6 or 6005-T5 alloy and temper with provisions for mechanical interlocking of muntin-mullion and perimeter. Width of I-beam shall be no less than 7/16”.
2. I-beam Thermal break: Minimum 1”, thermoset fiberglass composite.

C. Laminate Adhesive
1. Heat and pressure resin type adhesive engineered for structural sandwich panel use, with minimum 25-years field use. Adhesive shall pass testing requirements specified by the International Code Council “Acceptance Criteria for Sandwich Panel Adhesives”.
2. Minimum tensile strength of 750 PSI when the panel assembly is tested by ASTM C 297 after two exposures to six cycles each of the aging conditions prescribed by ASTM D 1037.
3. Minimum shear strength of the panel adhesive by ASTM D 1002 after exposure to four separate conditions:
    a. 50% Relative Humidity at 68° F: 540 PSI
    b. 182° F: 100 PSI
    c. Accelerated Aging by ASTM D 1037 at room temperature: 800 PSI
    d. Accelerated Aging by ASTM D 1037 at 182° F: 250 PSI

2.03 PANEL CONSTRUCTION

A. Provide sandwich panels of flat fiberglass reinforced translucent face sheets laminated to a grid core of mechanically interlocking I-beams. The adhesive bonding line shall be straight, cover the entire width of the I-beam and have a neat, sharp edge.
1. Thickness: 2-3/4”
2. Light transmission: 10%
3. Solar heat gain coefficient 0.13.
4. Panel U-factor by NFRC certified laboratory: 2-3/4” thermally broken grid 0.10 U-factor.
5. Grid pattern: Nominal size 8” x 20”; pattern Shoji.

B. Standard panels shall deflect no more than 1.9” at 30 PSF in 10’ 0” span without a supporting frame by ASTM E 72.

C. Standard panels shall withstand 1200° F fire for minimum one hour without collapse or exterior flaming.

D. Thermally broken panels: Minimum Condensation Resistance Factor of 80 by AAMA 1503 measured on the bond line.
   1. Manufacturer's factory applied finish, which meets the performance requirements of AAMA 2604. Color to be selected from manufacturer's standards.

E. Finish is to be coordinated with closure system.

PART 3 EXECUTION

3.01 EXAMINATION

A. Installer shall examine substrates, supporting structure and installation conditions.

B. Do not proceed with panel installation until unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Metal Protection
   1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.

   2. Where aluminum will contact concrete, masonry or pressure treated wood, protect against corrosion by painting contact surfaces with bituminous paint or method recommended by manufacturer.

3.03 INSTALLATION

A. Install the panel system in accordance with the manufacturer's suggested installation recommendations and approved shop drawings.
   1. Anchor component parts securely in place by permanent mechanical attachment system.
   2. Accommodate thermal and mechanical movements.
   3. Set perimeter framing in a full bed of sealant compound, or with joint fillers or gaskets to provide weather-tight construction

B. Install joint sealants at perimeter joints and within the panel system in accordance with manufacturer's installation instructions.

3.04 CLEANING

A. Clean the panel system interior and exterior, immediately after installation.

B. Refer to manufacturer's written recommendations.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 08 71 00

DOOR HARDWARE

PART 1 GENERAL

1.01 SECTION INCLUDES

A. Hardware for aluminum and hollow metal doors.

B. Hardware for fire-rated doors.

C. Electrically operated and controlled hardware.

D. Lock cylinders for doors with balance of hardware specified in other sections.

E. Thresholds.

F. Weatherstripping and gasketing.

1.02 RELATED REQUIREMENTS

A. Section 08 11 13 - Hollow Metal Doors and Frames.

B. Section 28 10 00 - Access Control: Electronic access control devices.

1.03 REFERENCE STANDARDS

A. ADA Standards - 2010 ADA Standards for Accessible Design; 2010.

B. ASTM E283/E283M - Standard Test Method for Determining Rate of Air Leakage Through Exterior Windows, Skylights, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen; 2019.

C. BHMA A156.1 - Standard for Butts and Hinges; 2021.

D. BHMA A156.2 - Bored and Preassembled Locks and Latches; 2022.

E. BHMA A156.3 - Exit Devices; 2020.

F. BHMA A156.4 - Door Controls - Closers; 2019.

G. BHMA A156.5 - Cylinders and Input Devices for Locks; 2020.

H. BHMA A156.6 - Standard for Architectural Door Trim; 2021.

I. BHMA A156.7 - Template Hinge Dimensions; 2016.

J. BHMA A156.16 - Auxiliary Hardware; 2018.

K. BHMA A156.18 - Materials and Finishes; 2020.

L. BHMA A156.21 - Thresholds; 2019.

M. BHMA A156.22 - Standard for Gasketing; 2021.

N. BHMA A156.28 - Standard for Recommended Practices for Mechanical Keying Systems; 2018.

O. BHMA A156.115 - Hardware Preparation in Steel Doors and Steel Frames; 2016.

P. BHMA A156.115W - Hardware Preparation in Wood Doors with Wood or Steel Frames; 2006.

Q. DHI (H&S) - Sequence and Format for the Hardware Schedule; 2019.

R. DHI (KSN) - Keying Systems and Nomenclature; 2019.

S. DHI (LOCS) - Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames; 2004.

T. DHI WDHS.3 - Recommended Locations for Architectural Hardware for Flush Wood Doors; 1993; also in WDHS-1/WDHS-5 Series, 1996.

U. ICC A117.1 - Accessible and Usable Buildings and Facilities; 2017.

V. ITS (DIR) - Directory of Listed Products; Current Edition.

W. MIL-STD-810 - Environmental Engineering Considerations and Laboratory Tests; 2019h.

X. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

Y. NFPA 80 - Standard for Fire Doors and Other Opening Protectives; 2022.

Z. NFPA 105 - Standard for Smoke Door Assemblies and Other Opening Protectives; 2022.

AA. NFPA 252 - Standard Methods of Fire Tests of Door Assemblies; 2022.

BB. UL (DIR) - Online Certifications Directory; Current Edition.

CC. UL 10C - Standard for Positive Pressure Fire Tests of Door Assemblies; Current Edition, Including All Revisions.

DD. UL 294 - Access Control System Units; Current Edition, Including All Revisions.

EE. UL 1784 - Standard for Air Leakage Tests of Door Assemblies; Current Edition, Including All Revisions.

1.04 ADMINISTRATIVE REQUIREMENTS

A. Coordinate the manufacture, fabrication, and installation of products that door hardware is installed on.

B. Sequence installation to ensure facility services connections are achieved in an orderly and expeditious manner.

C. Preinstallation Meeting: Convene a preinstallation meeting one week prior to commencing work of this section; require attendance by affected installers and the following:
   1. Engineer.
   2. Supplier's Architectural Hardware Consultant (AHC).
   3. Hardware Installer.
   4. Owner's Security Consultant.

D. Furnish templates for door and frame preparation to manufacturers and fabricators of products requiring internal reinforcement for door hardware.

E. Keying Requirements Meeting:
   1. Schedule meeting at project site prior to Contractor occupancy.
   2. Attendance Required:
      a. Owner.
   3. Agenda:
      a. Establish keying requirements.
      b. Verify locksets and locking hardware are functionally correct for project requirements.
      c. Verify that keying and programming complies with project requirements.
      d. Establish keying submittal schedule and update requirements.
   4. Incorporate "Keying Requirements Meeting" decisions into keying submittal upon review of door hardware keying system including, but not limited to, the following:
   5. Record minutes and distribute copies within two days after meeting to participants, with two copies to Architect, Owner, participants, and those affected by decisions made.
   6. Deliver established keying requirements to manufacturers.

1.05 SUBMITTALS

A. See Section 01 33 00 – Submittal Procedures for submittal procedures.

B. Product Data: Manufacturer's catalog literature for each type of hardware, marked to clearly show products to be furnished for this project, and includes construction details, material descriptions, finishes, and dimensions and profiles of individual components.

C. Shop Drawings - Door Hardware Schedule: A detailed listing that includes each item of hardware to be installed on each door.
   1. Prepared by or under supervision of Architectural Hardware Consultant (AHC).
   2. Comply with DHI (H&S) using door numbering scheme and hardware set numbers as indicated in Contract Documents.
      a. Submit in vertical format.
   3. Include complete description for each door listed.

D. Shop Drawings - Electrified Door Hardware: Include diagrams for power, signal, and control wiring for electrified door hardware that include details of interface with building safety and security systems. Provide elevations and diagrams for each electrified door opening as follows:
   1. Prepared by or under supervision of Architectural Hardware Consultant (AHC) and Electrified Hardware Consultant (EHC).
   2. Elevations: Include front and back elevations of each door opening showing electrified devices with connections installed and an operations narrative describing how opening operates from either side at any given time.
   3. Diagrams: Include point-to-point wiring diagrams that show each device in door opening system with related colored wire connections to each device.

E. Manufacturer's Installation Instructions: Indicate special procedures and perimeter conditions requiring special attention.

F. Manufacturer's qualification statement.

G. Installer's qualification statement.

H. Supplier's qualification statement.

I. Maintenance Data: Include data on operating hardware, lubrication requirements, and inspection procedures related to preventative maintenance.

J. Keying Schedule:
   1. Submit three (3) copies of Keying Schedule in compliance with requirements established during Keying Requirements Meeting unless otherwise indicated.

K. Warranty: Submit manufacturer's warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.

L. Project Record Documents: Record actual locations of concealed equipment, services, and conduit.

M. Maintenance Materials and Tools: Furnish the following for Owner's use in maintenance of project.

1.06 QUALITY ASSURANCE

A. Standards for Fire-Rated Doors: Maintain one copy of each referenced standard on site, for use by Architect and Contractor.

B. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section with minimum three years of documented experience.

C. Installer Qualifications: Company specializing in performing work of the type specified for commercial door hardware with at least three years of documented experience.

D. Supplier Qualifications: Company with certified Architectural Hardware Consultant (AHC) and Electrified Hardware Consultant (EHC) to assist in work of this section.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Package hardware items individually; label and identify each package with door opening code to match door hardware schedule.

1.08 WARRANTY

A. See Section 01 78 23 – Operation and Maintenance Data for additional warranty requirements.

B. Manufacturer Warranty: Provide manufacturer warranty against defects in material and workmanship for period indicated, from Date of Substantial Completion. Complete forms in Owner's name and register with manufacturer.
   1. Closers: Ten years, minimum.
   2. Exit Devices: Three years, minimum.
   3. Locksets and Cylinders: Lifetime
   4. Other Hardware: Two years, minimum.

PART 2 PRODUCTS

2.01 GENERAL REQUIREMENTS

A. Provide specified door hardware as required to make doors fully functional, compliant with applicable codes, and secure to extent indicated.

B. Provide individual items of single type, of same model, and by same manufacturer.

C. Locks: Provide a lock for each door, unless it's indicated that lock is not required.
   1. Lock Function: Provide lock and latch function numbers and descriptions of manufacturer's Series. As indicated in hardware sets.
   2. Trim: Provide lever handle or pull trim on outside of each lock, unless otherwise indicated.
   3. Strikes:
      a. Finish: To match lock or latch.
      b. Curved-Lip Strikes: Provide as standard, with extended lip to protect frame, unless otherwise indicated.
      c. Center Strike At Pairs of Doors: 7/8 inch (22.2 mm) lip.

D. Closers:
   1. Provide door closer on each exterior door, unless otherwise indicated.
   2. Provide door closer on each fire-rated and smoke-rated door.
   3. Spring hinges are not an acceptable self-closing device, unless otherwise indicated.

E. Overhead Stops and Holders (Door Checks):.
   1. Provide stop for every swinging door, unless otherwise indicated.
   2. Overhead Stop is not required if positive stop feature is specified for door closer; positive stop feature of door closer is not an acceptable substitute for a stop, unless otherwise indicated.

3. Overhead stop is not required if a floor or wall stop has been specified for the door.

F. Drip Guards: Provide at head of out-swinging exterior doors unless protected by roof or canopy directly overhead.

G. Thresholds:
   1. Exterior Applications: Provide at each exterior door, unless otherwise indicated.

H. Weatherstripping and Gasketing:
   1. Provide weatherstripping on each exterior door at head, jambs, and meeting stiles of door pairs, unless otherwise indicated.
   2. Provide door bottom sweep on each exterior door, unless otherwise indicated.

I. Electrically Operated and/or Controlled Hardware: Provide necessary power supplies, power transfer hinges, relays, and interfaces as required for proper operation; provide wiring between hardware and control components and to building power connection in compliance with NFPA 70.

J. See Section 28 10 00 for additional access control system requirements.

K. Fasteners:
   1. Provide fasteners of proper type, size, quantity, and finish that comply with commercially recognized standards for proposed applications.
      a. Aluminum fasteners are not permitted.
      b. Provide phillips flat-head screws with heads finished to match door surface hardware unless otherwise indicated.
   2. Provide machine screws for attachment to reinforced hollow metal and aluminum frames.
      a. Self-drilling (Tek) type screws are not permitted.
   3. Provide stainless steel machine screws and lead expansion shields for concrete and masonry substrates.
   4. Provide wall grip inserts for hollow wall construction.
   5. Fire-Resistance-Rated Applications: Comply with NFPA 80.
      a. Provide wood or machine screws for hinges mortised to doors or frames, strike plates to frames, and closers to doors and frames.
      b. Provide steel through bolts for attachment of surface mounted closers, hinges, or exit devices to door panels unless proper door blocking is provided.

2.02 PERFORMANCE REQUIREMENTS

A. Provide door hardware products that comply with the following requirements:
   1. Applicable provisions of federal, state, and local codes.
   2. Accessibility: ADA Standards and ICC A117.1.
   3. Fire-Resistance-Rated Doors: NFPA 80, listed and labeled by qualified testing agency for fire protection ratings indicated, based on testing at positive pressure in accordance with NFPA 252 or UL 10C.

4. Hardware on Fire-Resistance-Rated Doors: Listed and classified by UL (DIR), ITS (DIR), testing firm acceptable to authorities having jurisdiction, or as suitable for application indicated.
5. Hardware for Smoke and Draft Control Doors (Indicated as "S" on Drawings): Provide door hardware that complies with local codes, and requirements of assemblies tested in accordance with UL 1784.
6. Hardware Preparation for Steel Doors and Steel Frames: BHMA A156.115.
7. Hardware Preparation for Wood Doors with Wood or Steel Frames: BHMA A156.115W.
8. Products Requiring Electrical Connection: Listed and classified by UL (DIR) as suitable for the purpose specified.

2.03 HINGES

A. Manufacturers: Conventional butt hinges.
   1. BEST; Dormakaba Group: www.bestaccess.com/#sle.
   2. Or approved equal.

B. Properties:
   1. Butt Hinges: As applicable to each item specified.
      a. Standard Weight Hinges: Minimum of two (2) permanently lubricated non-detachable bearings.
      b. Heavy Weight Hinges: Minimum of four (4) permanently lubricated bearings on heavy weight hinges.
      c. Template screw hole locations.
      d. Bearing assembly installed after plating.
      e. Bearings: Exposed fully hardened bearings.
      f. Bearing Shells: Shapes consistent with barrels.
      g. Pins: Easily seated, non-rising pins.
         1) Fully plate hinge pins.
         2) Non-Removable Pins: Slotted stainless steel screws.
      h. UL 10C listed for fire-resistance-rated doors.

C. Sizes: See Door Hardware Schedule.
   1. Hinge Widths: As required to clear surrounding trim.
   2. Sufficient size to allow 180 degree swing of door.

D. Finishes: See Door Hardware Schedule.
   1. Fully polish hinges; front, back, and barrel.

E. Grades:
   1. Butt Hinges: Comply with BHMA A156.1 and BHMA A156.7 for templated hinges.
   2. Comply with BHMA A156.18 Materials and Finishes.

F. Material: Base metal as indicated for each item by BHMA material and finish designation.

G. Types:
   1. Butt Hinges: Include full mortise hinges.

H. Options: As applicable to each item specified.

I. Quantities:
   1. Butt Hinges: Three (3) hinges per leaves up to 90 inches (2286 mm) in height. Add one (1) for each additional 30 inches (762 mm) in height or fraction thereof.
      a. Hinge weight and size unless otherwise indicated in hardware sets:
         1) For doors up to 36 inches (914 mm) wide and up to 1-3/4 inches (44.5 mm) thick provide hinges with a minimum thickness of 0.134 inch (3.4 mm) and a minimum of 4-1/2 inches (114 mm) in height.
         2) For doors from 36 inches (914 mm) wide up to 42 inches (1067 mm) wide and up to 1-3/4 inches (44.5 mm) thick provide hinges with a minimum thickness of 0.145 inch (3.7 mm) and a minimum of 4-1/2 inches (114 mm) in height.
         3) For doors from 42 inches (1067 mm) wide up to 48 inches (1219 mm) wide and up to 1-3/4 inches (44.5 mm) thick provide hinges with a minimum thickness of 0.180 inch (4.6 mm) and a minimum of 5 inches (127 mm) in height.
         4) For doors greater than 1-3/4 inches (44.5 mm) thick provide hinges with a minimum thickness of 0.180 inch (4.6 mm) and a minimum of 5 inches (127 mm) in height.

J. Applications: At swinging doors.
   1. Provide non-removable pins at out-swinging doors with locking hardware and all exterior doors.

K. Products:
   1. Butt Hinges:
      a. Ball Bearing, Five (5) Knuckle.

2.04 BOLTS

A. Manufacturers:
   1. Trimco: www.trimcohardware.com/#sle.

B. Properties:
   1. Flush Bolts:
      a. Automatic Flush Bolts: Automatically latching upon closing of door leaf.
         1) Bolt Throw: 3/4 inch (19 mm), minimum.
   2. Dustproof Strikes: For bolting into floor, provide except at metal thresholds.

C. Options:
   1. Lever extensions: Provide for top bolt at oversized doors.

D. Products:
   1. Automatic flush bolts: 3810.

2.05 EXIT DEVICES

A. Manufacturers:
   1. BEST, dormakaba Group: www.bestaccess.com/#sle.
   2. Substitutions: Not permitted.

B. Properties:
   1. Actuation: Full-length touchpad.
   2. Touchpads: 'T" style metal touchpads and rail assemblies with matching chassis covers end caps.
   3. Latch Bolts: Stainless steel deadlocking with 3/4 inch (19 mm) projection using latch bolt.
   4. Lever Design: Match project standard lockset trims.
   5. Cylinder: Include where cylinder dogging or locking trim is indicated.
   6. Strike as recommended by manufacturer for application indicated.
   7. Sound dampening on touch bar.
   8. Dogging:
      a. Non-Fire-Resistance-Rated Devices: Cylinder 1/4 inch (6 mm) hex key dogging.
      b. Fire-Resistance-Rated Devices: Manual dogging not permitted.
   9. Touch bar assembly on wide style exit devices to have a 1/4 inch (6.3 mm) clearance to allow for vision frames.
   10. All exposed exit device components to be of architectural metals and "true" architectural finishes.
   11. Handing: Field-reversible.
   12. Fasteners on Back Side of Device Channel: Concealed - exposed fasteners not allowed.
   13. Vertical Latch Assemblies' Operation: Gravity, without use of springs.

C. Grades: Complying with BHMA A156.3, Grade 1.
   1. Provide exit devices tested and certified by UL or by a recognized independent laboratory for mechanical operational testing to 10 million cycles minimum with inspection confirming Grade 1 Loaded Forces have been maintained.

D. Options:
   1. Electrified Devices:
      a. Latchbolt Retraction: motorized latchbolt retraction.
   2. Furnish less bottom rod (LBR) at scheduled locations to eliminate use of floor mounted strikes.
   3. Weatherized True Architectural Finish: Provide where indicated in Door Hardware Schedule as 626W.
      a. Weatherized exterior components to include active case cover, touch bar, device channel, slide channel fillers, vertical rods, latch covers, and device end cap.
         1) Base Metal Material: Brass.
         2) Plated Finish: Satin nickel and chrome, using a double-dip, two-step process.

b. Performance Requirements:
   1) BHMA A156.18 Salt Spray Certified using 600 Hours of testing, 3 times longer than the Standard's requirements.
   2) MIL-STD-810G 509.6 Salt Fog Certified.
   3) MIL-STD-810G 510.6 Sand and Dust Certified.
   4) MIL-STD-810G 521.4 Icing or Freezing Rain Certified.
c. Compatible non-weatherized electrified options as specified in Door Hardware Schedule.

4. WTS touch bar switch.
5. WALW hardwired exit alarm.

E. Products:
1. 2000.

2.06 LOCK CYLINDERS

A. Manufacturers:
1. BEST, dormakaba Group: www.bestaccess.com/#sle.
2. Substitutions: Not permitted.

B. Properties:
1. Lock Cylinders: Provide key access on outside of each lock, unless otherwise indicated.
   a. Provide cylinders from same manufacturer as locking device.
   b. Provide cams and/or tailpieces as required for locking devices.
   c. Provide cylinders with appropriate format interchangeable cores where indicated.

C. Grades:
1. Standard Security Cylinders: Comply with BHMA A156.5.

D. Material:

E. Types: As applicable to each item specified.

F. Applications: At locations indicated in hardware sets, and as follows
1. As required for items with locking devices provided by other sections, including at elevator controls and cabinets.
   a. When provisions for lock cylinders are referenced elsewhere in the Project Manual to this Section, provide compatible type of lock cylinder, keyed to building keying system, unless otherwise indicated.

G. Products:
1. Rim/mortise: 12E-72 & 1E-74

2.07 MORTISE LOCKS

A. Manufacturers:
   1. BEST, dormakaba Group: www.bestaccess.com/#sle.
   2. Substitutions: Not permitted.

B. Properties:
   1. Mechanical Locks: Manufacturer's standard.
      a. Fitting modified ANSI A115.1 door preparation.
      b. Door Thickness Coordination Fitting 1-3/4 inch (44 mm) to 2-1/4 inch (57 mm) thick doors.
      c. Latch: Solid, one-piece, anti-friction, self-lubricating stainless steel.
         1) Latchbolt Throw: 3/4 inch (19 mm), minimum.
      d. Auxiliary Deadlatch: One piece stainless steel, permanently lubricated.
      e. Backset: 2-3/4 inch (70 mm).
      f. Lever Trim:
         1) Functionality: Allow the lever handle to move up to 45 degrees from horizontal position prior to engaging the latchbolt assembly.
         2) Strength: Locksets outside locked lever designed to withstand minimum 1,400 inch-lbs (158.2 Nm) of torque. In excess of that, a replaceable part will shear. Key from outside and/or inside lever will still operate lockset.
         3) Spindle: Designed to prevent forced entry from attacking of lever.
         4) Independent spring mechanism for each lever.
            a) Trim to be self-aligning and thru-bolted.
         5) Handles: Made of forged or cast brass, bronze, or stainless steel construction. Levers that contain a hollow cavity are not acceptable.
         6) Levers to operate a roller bearing spindle hub mechanism.
   2. Electrified Locks: Same properties as standard locks, and as follows:
      a. Voltage: 24 VAC.
      b. Function: Electrically locked (Fail Safe) or unlocked (Fail Secure), as indicated for each lock in Door Hardware Schedule.

C. Finishes: See Door Hardware Schedule.
   1. Core Faces: Match finish of lockset.

D. Grades:

E. Options:
   1. Provide locksets made in a manufacturing facility to compliant with ISO 9001-Quality Management and ISO 14001-Environmental Management.

F. Products: Mortise locks, including standard and electrified types.
   1. 40H.

2.08 COORDINATORS

A. Manufacturers:
   1. Trimco: www.trimcohardware.com/#sle.

B. Properties:
   1. General: Non-handed devices, with field-selectable active door leaf.
   2. Coordinators: Devices on pairs of doors with closers and self-latching or automatic flush bolts installed.
      a. Coordinator Operation: Only when inactive door is opened.

C. Grades:

D. Code Compliance: As required by authorities having jurisdiction in the State in which the Project is located.
   1. Meet UL 10C for Positive Pressure.

E. Types:
   1. Coordinators: Bar.

F. Installation:
   1. Mounting: Provide necessary mounting brackets and filler bars to ensure proper installation of coordinator and related hardware.
   2. Coordination: Properly sequence installation of other door hardware affected by placement of coordinators and carry bars.

G. Products:
   1. 3090 Series.

2.09 CLOSERS

A. Manufacturers:
   1. dormakaba; dormakaba Group: www.dormakaba.com/us-en/#sle.
   2. Substitutions: Not permitted.

B. Properties:
   1. Surface Mounted Closers: Manufacturer's standard.
      a. Construction: R14 high silicon aluminum alloy.
      b. Mechanism: Separate tamper-resistant adjusting valves for closing and latching speeds.
      c. Hydraulic Fluid: All-weather type.
      d. Arm Assembly: Standard for product specified.
         1) Include hold-open, integral stop, or spring-loaded stop feature, as specified in Door Hardware Schedule.
         2) Parallel arm to be a heavy-duty rigid arm.

3) Where “IS” or “S-IS” arms are specified in hardware sets, if manufacturer does not offer this arm provide a regular arm mount closer in conjunction with a heavy-duty overhead stop equal to a dormakaba 900 Series.

e. Covers:

1) Type: Standard for product selected.

a) Full.

2) Material: Plastic.

3) Finish: Painted.

C. Grades:

1. Closers: Comply with BHMA A156.4, Grade 1.

a. Underwriters Laboratories Compliance:

1) Product Listing: UL (DIR) and ULC for use on fire-resistance-rated doors.

a) UL 228 - Door Closers-Holders, With or Without Integral Smoke Detectors.

D. Code Compliance: As required by authorities having jurisdiction in the State in which the Project is located.

1. Devices listed with California Department of Forestry and Fire Protection, Office of the State Fire Marshal.

E. Types:

1. Rack-and-pinion, surface-mounted. 1-1/2 inches (38 mm) minimum bore.

F. Options:

1. Delayed action, adjustable with an independent valve.

G. Installation:

1. Mounting: Includes surface mounted installations.
2. Mount closers on non-public side of door and stair side of stair doors unless otherwise noted in hardware sets.
3. At out-swinging exterior doors, mount closer on interior side of door.
4. Provide adapter plates, shim spacers, and blade stop spacers as required by frame and door conditions.
5. Where an overlapping astragal is included on pairs of swinging doors, provide coordinator to ensure door leaves close in proper order.

H. Products:

1. Surface Mounted:

a. 8900.

2.10 PROTECTION PLATES

A. Manufacturers:

1. Trimco: www.trimcohardware.com/#sle.

B. Properties:
   1. Plates:
      a. Kick Plates: Provide along bottom edge of push side of every wood door with closer, except aluminum storefront and glass entry doors, unless otherwise indicated.
         1) Size: 10 inches (254 mm) high by 2 inch (51 mm) less door width (LDW) on push side of door.
      b. Edges: Beveled, on four (4) unless otherwise indicated.

C. Grades: Comply with BHMA A156.6.

D. Material: As indicated for each item by BHMA material and finish designation.
   1. Metal Properties: Stainless steel.
      a. Metal, Standard Duty: Thickness 0.050 inch (1.27 mm), minimum.

E. Installation:
   1. Fasteners: Countersunk screw fasteners

F. Products:

2.11 STOPS AND HOLDERS

A. Manufacturers:
   1. Trimco: www.trimcohardware.com/#sle.

B. General: Provide overhead stop/holder when wall or floor stop is not feasible.

C. Grades:
   1. Door Holders, Wall Bumpers, and Floor Stops: Comply with BHMA A156.16 and Resilient Material Retention Test as described in this standard.

D. Material: Base metal as indicated for each item by BHMA material and finish designation.

E. Types:
   1. Floor Stops: Provide with bumper floor stop.

F. Products:
   1. Floor Stops: 1209HA.

2.12 THRESHOLDS

A. Manufacturers:
   1. National Guard Products, Inc: www.ngpinc.com/#sle.

B. Properties:
   1. Threshold Surface: Fluted horizontal grooves across full width.

C. Grades: Thresholds: Comply with BHMA A156.21.

D. Types: As applicable to project conditions. Provide barrier-free type at every location where specified.
   1. Saddle Thresholds: Without thermal break.

E. Products: As listed in the hardware sets.

2.13 WEATHERSTRIPPING AND GASKETING

A. Manufacturers:
   1. National Guard Products, Inc: www.ngpinc.com/#sle.

B. Properties:
   1. Weatherstripping Air Leakage Performance: Not exceeding 0.3 cfm/sq ft of door opening at 0.3 inches of water pressure differential for single doors, and 0.5 cfm/sq ft of door area at 0.3 inches of water pressure differential for double doors for gasketing other than smoke control, as tested according to ASTM E283/E283M; with resilient or flexible seal strips that are easily replaceable and readily available from stocks maintained by manufacturer.
   2. Adhesive-Backed Perimeter Gasketing: Silicone gasket material applied to frame with self- adhesive.
   3. Rigid, Housed, Perimeter Gasketing: Sponge silicone gasket material held in place by aluminum housing; fastened to frame stop with screws.
   4. Overlapping Astragals for Meeting Stiles: Neoprene strip gasket material held in place by aluminum housing and overlapping when doors are closed; mounted to face of meeting stile with screws; surface mounted to door.
   5. Meeting Astragals for Meeting Stiles: Silicone bulb gasket material held in place by aluminum housing; mounted with screws.
      a. Mounting: Surface mounted on face of each door.
   6. Door Sweeps: Neoprene gasket material held in place by flat aluminum housing or flange; surface mounted to face of door with screws.

C. Grades: Comply with BHMA A156.22.

D. Products:
   1. Meeting Stile Seals: See Door Hardware Schedule.
   2. Door Bottom Seals:
      a. Door Sweeps: See Door Hardware Schedule.

2.14 MISCELLANEOUS ITEMS

A. Manufacturers:
   1. Trimco: www.trimcohardware.com/#sle.

B. Properties:
   1. Coat Hooks: Provide on room side of door, screw fastened.
      a. Material: Brass.

C. Products:
   1. Coat Hooks: 3071

2.15 ELECTRIFIED HARDWARE

A. Manufacturers:
   1. BEST, dormakaba Group: www.bestaccess.com/#sle.
   2. Substitutions: Not permitted.

B. Properties:
   1. Power Supply Units: Manufacturer's standard.
      a. Regulatory Compliance:
         1) United States Compliance:
            a) UL listed for Class II Output.
            b) Comply with UL 294 Standards incorporating enhanced Access Control. communications capabilities.
         2) Canada Compliance:
            a) Comply with ULC S-319 Electronic Access Control Systems.
      b. Enclosures: Lockable NEMA Type 1, with hinged cover and knockouts.
      c. Power: 24 VAC, 10 Amp; field-selectable.
      d. Emergency Release Terminals: Designed to release devices upon activation of fire alarm system.
      e. Auxiliary contacts for remote signaling.
      f. User-selectable time delay from 0 to 4 minutes.
      g. Fire Alarm System Interface: Standard.
         1) Fire alarm terminal with green LED indicating power is available.
      h. Output Distribution Board with indicator LEDs.
      i. On/Off LED power indicator.
   2. Power Transfers: Manufacturer's standard.
      a. Door Loops:
         1) Armored flex conduits 18 inches (450 mm) long.
         2) Capacity: Up to 1/4 inch (6.35 mm) diameter wire bundle.
   3. Wire Harnesses: Of sufficient length, with quick connectors.
      a. Wire Harness End Connection to Power Supply or Junction Box: One end with bare leads.

C. Products:
   1. Power Supplies:
      a. RPSMLR2.
   2. Power Transfers:
      a. EPT-12C.

2.16 KEYS AND CORES

A. Manufacturers:
   1. BEST, dormakaba Group: www.bestaccess.com/#sle.
   2. Substitutions: Not permitted.

B. Properties: Complying with guidelines of BHMA A156.28.
   1. Provide small format interchangeable core.
   2. Provide Patented CORMAX keys and cores.
   3. Provide keying information in compliance with DHI (KSN) standards.
   4. Keying Schedule: Arrange for a keying meeting, with Architect, Owner and hardware supplier, and other involved parties to ensure locksets and locking hardware, are functionally correct and keying complies with project requirements.
   5. Keying: Master keyed.
   6. Include construction keying and control keying with removable core cylinders.
   7. Supply keys in following quantities:
      a. Master Keys: 4 each.
      b. Construction Master Keys: 6 each.
      c. Construction Keys: 15 each.
      d. Construction Control Keys: 2 each.
      e. Control Keys if New System: 2 each.
   8. Provide key collection envelopes, receipt cards, and index cards in quantity suitable to manage number of keys.
   9. Deliver keys with identifying tags to Owner by security shipment direct from manufacturer.
   10. Permanent Keys and Cores: Stamped with applicable key marking for identification. Do not include actual key cuts within visual key control marks or codes. Stamp permanent keys "Do Not Duplicate."
   11. Include installation of permanent cores and return construction cores to hardware supplier. Construction cores and keys to remain property of hardware supplier.

C. Products:
   1. Patented:
      a. CORMAX.

2.17 FINISHES

A. Finishes: Identified in Hardware Sets.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that doors and frames are ready to receive this work; labeled, fire-rated doors and frames are properly installed, and dimensions are as indicated on shop drawings.

B. Correct all defects prior to proceeding with installation.

C. Verify that electric power is available to power operated devices and of correct characteristics.

3.02 INSTALLATION

A. Install hardware in accordance with manufacturer's instructions and applicable codes.

B. Install hardware using the manufacturer's fasteners provided. Drill and tap all screw holes located in metallic materials. Do not use "Riv-Nuts" or similar products.

C. Install hardware on fire-rated doors and frames in accordance with applicable codes and NFPA 80.

D. Install hardware for smoke and draft control doors in accordance with NFPA 105.

E. Use templates provided by hardware item manufacturer.

F. Do not install surface mounted items until application of finishes to substrate are fully completed.

G. Wash down masonry walls and complete painting or staining of doors and frames.

H. Complete finish flooring prior to installation of thresholds.

I. Door Hardware Mounting Heights: Distance from finished floor to center line of hardware item. As indicated in following list; unless noted otherwise in Door Hardware Schedule or on drawings.
   1. For Steel Doors and Frames: Install in compliance with DHI (LOCS) recommendations.
   2. Mounting heights in compliance with ADA Standards:
      a. Locksets: 40-5/16 inch (1024 mm).
      b. Push Plates/Pull Bars: 42 inch (1067 mm).
      c. Deadlocks (Deadbolts): 48 inch (1219 mm).
      d. Exit Devices: 40-5/16 inch (1024 mm).
      e. Door Viewer: 43 inch (1092 mm); standard height 60 inch (1524 mm).

J. Set exterior door thresholds with full-width bead of elastomeric sealant at each point of contact with floor providing a continuous weather seal; anchor thresholds with stainless steel countersunk screws.

K. Include in installation for existing doors and frames any necessary field modification and field preparation of doors and frames for new hardware. Provide necessary fillers, reinforcements, and fasteners for mounting new hardware and to cover existing door and frame preparations.

3.03 FIELD QUALITY CONTROL

A. Perform field inspection and testing under provisions of Section 01 45 00 - Contractor Quality Control.

B. Provide an Architectural Hardware Consultant (AHC) to inspect installation and certify that hardware and installation has been furnished and installed in accordance with manufacturer's instructions and as specified.

3.04 ADJUSTING

A. Adjust hardware for smooth operation.

B. Adjust gasketing for complete, continuous seal; replace if unable to make complete seal.

3.05 CLEANING

A. Clean finished hardware in accordance with manufacturer's written instructions after final adjustments have been made.

B. Clean adjacent surfaces soiled by hardware installation activities.

C. Replace items that cannot be cleaned to manufacturer's level of finish quality at no additional cost.

3.06 PROTECTION

A. Do not permit adjacent work to damage hardware or finish.

Manufacturer List

END OF SECTION

SECTION 08 80 00

GLAZING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Glass products.
   2. Insulating glass.
   3. Glazing tapes.
   4. Miscellaneous glazing materials.

1.02 COORDINATION

A. Coordinate glazing channel dimensions to provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances to achieve proper safety margins for glazing retention under each design load case, load case combination, and service condition.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Glass Samples: For each type of glass product other than clear monolithic vision glass; 12 inches square.

1.04 INFORMATIONAL SUBMITTALS

A. Product Certificates: For glass.

B. Product test reports.
   1. for tests
   2. performed by a qualified testing agency. For glazing sealants, provide test reports based on testing current sealant formulations within previous 36-month period.

C. Preconstruction adhesion and compatibility test report.

D. Sample warranties.

1.05 QUALITY ASSURANCE

A. Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C1021 to conduct the testing indicated.

1.06 WARRANTY

A. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer agrees to replace coated-glass units that deteriorate within specified warranty period. Deterioration of coated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in coating.
   1. Warranty Period: 10 years from date of Substantial Completion.

B. Manufacturer's Special Warranty for Insulating Glass: Manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period. Deterioration of insulating glass is defined as failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is obstruction of vision by dust, moisture, or film on interior surfaces of glass.
   1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design glazing.

B. Structural Performance: Glazing shall withstand the following design loads within limits and under conditions indicated determined in accordance with the IBC and ASTM E1300:
   1. Design Wind Pressures: As indicated on Drawings.
   2. Design Snow Loads: As indicated on Drawings.
   3. Thermal Loads: Design glazing to resist thermal stress breakage induced by differential temperature conditions and limited air circulation within individual glass lites and insulated glazing units.

C. Safety Glazing: Where safety glazing is indicated, provide glazing that complies with 16 CFR 1201, Category II.

D. Thermal and Optical Performance Properties: Provide glass with performance properties specified, as indicated in manufacturer's published test data, based on procedures indicated below:
   1. U-Factors: Center-of-glazing values, in accordance with NFRC 100 and based on most current non-beta version of LBL's WINDOW computer program, expressed as Btu/sq. ft. x h x deg F.
   2. SHGC and Visible Transmittance: Center-of-glazing values, in accordance with NFRC 200 and based on most current non-beta version of LBL's WINDOW computer program.
   3. Visible Reflectance: Center-of-glazing values, in accordance with NFRC 300.

2.02 GLASS PRODUCTS, GENERAL

A. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below unless more stringent requirements are indicated. See these publications for glazing terms not otherwise defined in this Section or in referenced standards.
   1. NGA Publications: "Glazing Manual."
   2. IGMA Publication for Insulating Glass: SIGMA TM-3000, "North American Glazing Guidelines for Sealed Insulating Glass Units for Commercial and Residential Use."

B. Safety Glazing Labeling: Where safety glazing is indicated, permanently mark glazing with certification label of the SGCC or another certification agency acceptable to authorities having jurisdiction or manufacturer. Label shall indicate manufacturer's name, type of glass, thickness, and safety glazing standard with which glass complies.

C. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of the IGCC.

D. Thickness: Where glass thickness is indicated, it is a minimum. Provide glass that complies with performance requirements and is not less than thickness indicated.

2.03 GLASS PRODUCTS

A. Fully Tempered Float Glass: ASTM C1048, Kind FT (fully tempered), Condition A (uncoated) unless otherwise indicated, Type I, Class 1 (clear) or Class 2 (tinted) as indicated, Quality-Q3.

B. Reflective- and Low-E-Coated Vision Glass: ASTM C1376.

2.04 INSULATING GLASS

A. Insulating-Glass Units: Factory-assembled units consisting of sealed lites of glass separated by a dehydrated interspace, qualified in accordance with ASTM E2190.
   1. Sealing System: Dual seal, with manufacturer's standard primary and secondary sealants.
   2. Perimeter Spacer: Manufacturer's standard spacer material and construction.
   3. Desiccant: Molecular sieve or silica gel, or a blend of both.

2.05 GLAZING TAPES

A. Back-Bedding Mastic Glazing Tapes: Preformed, butyl-based, 100 percent solids elastomeric tape; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; and complying with ASTM C1281 and AAMA 800 for products indicated below:
   1. AAMA 804.3 tape, where indicated.
   2. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.
   3. AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure.

B. Expanded Cellular Glazing Tapes: Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; and complying with AAMA 800 for the following types:
   1. AAMA 810.1, Type 1, for glazing applications in which tape acts as primary sealant.
   2. AAMA 810.1, Type 2, for glazing applications in which tape is used in combination with a full bead of liquid sealant.

2.06 MISCELLANEOUS GLAZING MATERIALS

A. Cleaners, Primers, and Sealers: Types recommended by sealant or gasket manufacturer.

B. Setting Blocks:
   1. EPDM with Shore A durometer hardness of 85, plus or minus 5.
   2. Type recommended in writing by sealant or glass manufacturer.

C. Spacers:
   1. Neoprene blocks or continuous extrusions of hardness required by glass manufacturer to maintain glass lites in place for installation indicated.
   2. Type recommended in writing by sealant or glass manufacturer.

D. Edge Blocks:
   1. EPDM with Shore A durometer hardness per manufacturer's written instructions.
   2. Type recommended in writing by sealant or glass manufacturer.

E. Cylindrical Glazing Sealant Backing: ASTM C1330, Type O (open-cell material), of size and density to control glazing sealant depth and otherwise produce optimum glazing sealant performance.

PART 3 EXECUTION

3.01 GLAZING, GENERAL

A. Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.

B. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass includes glass with edge damage or other imperfections that, when installed, could weaken glass, impair performance, or impair appearance.

C. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction testing.

D. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.

E. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.

F. Provide spacers for glass lites where length plus width is larger than 50 inches.

G. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and in accordance with requirements in referenced glazing publications.

3.02 TAPE GLAZING

A. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.

B. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.

C. Cover vertical framing joints by applying tapes to heads and sills first, then to jambs. Cover horizontal framing joints by applying tapes to jambs, then to heads and sills.

D. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.

E. Apply heel bead of elastomeric sealant.

F. Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.

G. Apply cap bead of elastomeric sealant over exposed edge of tape.

3.03 GASKET GLAZING (DRY)

A. Cut compression gaskets to lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.

B. Insert soft compression gasket between glass and frame or fixed stop so it is securely in place with joints miter cut and bonded together at corners.

C. Installation with Drive-in Wedge Gaskets: Center glass lites in openings on setting blocks and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended in writing by gasket manufacturer.

D. Installation with Pressure-Glazing Stops: Center glass lites in openings on setting blocks, and press firmly against soft compression gasket. Install dense compression gaskets and pressure-glazing stops, applying pressure uniformly to compression gaskets. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended in writing by gasket manufacturer.

E. Install gaskets so they protrude past face of glazing stops.

3.04 CLEANING AND PROTECTION

A. Immediately after installation, remove nonpermanent labels and clean surfaces.

B. Protect glass from contact with contaminating substances resulting from construction operations. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkaline deposits, or stains.
   1. If, despite such protection, contaminating substances do contact with glass, remove substances immediately as recommended in writing by glass manufacturer. Remove and replace glass that cannot be cleaned without damage to coatings.

C. Remove and replace glass that is damaged during construction period.

3.05 MONOLITHIC GLASS SCHEDULE: GL-1

A. Clear Glass Type: Fully tempered float glass.
   1. Minimum Thickness: 6 mm.
   2. Safety glazing required.

3.06 INSULATING GLASS SCHEDULE: GL-2

A. Low-E-Coated, Tinted Insulating Glass Type:
   1. Overall Unit Thickness: 1 inch.
   2. Minimum Thickness of Each Glass Lite: 6 mm.
   3. Outdoor Lite: Tinted fully tempered float glass.
   4. Tint Color: Blue-green.
   5. Interspace Content: Air.
   6. Indoor Lite: Clear fully tempered float glass.
   7. Low-E Coating: Pyrolytic on second surface.
   8. Safety glazing required.

END OF SECTION

SECTION 09 90 00

GENERAL COATING SPECIFICATION

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This Section specifies coating system materials, surface preparations, application, and quality control (QC) requirements.
   2. This Section includes:
      a. All substrates exposed to non-corrosive or moderately corrosive environment.
      b. Atmospheric, weathering exposure, non-corrosive building exposure conditions and piping, equipment, and structures not exposed to immersion services or corrosive headspace (gaseous) exposures, and
      c. internal building surfaces substrates for areas occupied by personnel.
   3. The Contractor is solely responsible for all aspects of QC inspections for the work covered by this Section. The QC inspection personnel and coating manufacturer technical representative (CTR) are provided by the General Contractor at no additional cost to the Owner. Inspections, testing, or other forms of quality checks may be provided by the Construction Manager for quality assurance (QA) checks but in no way relieve the Contractor of sole responsibility for quality and performance of the installed coating system.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 11 80 Environmental Conditions
   2. Section 01 33 00 Submittal Procedures
   3. Section 01 45 00 Contractor Quality Control
   4. Section 01 45 23 Testing and Inspection Services
   5. Section 01 61 45 Area Exposure Designations
   6. Section 01 66 00 Product Storage and Handling
   7. Section 01 99 00 Reference Forms
   8. Section 07 11 13 Bituminous Dampproofing
   9. Section 07 13 26 Self-Adhering Sheet Waterproofing
   10. Section 07 16 00 Cementitious Waterproofing
   11. Section 09 96 00 High Performance Protective Coatings for Wastewater
   12. Section 09 97 00 Potable Water Coatings

1.03 DEFINITIONS

A. Specific coating terminology used in this Section is in accordance with definitions contained in ASTM D16, ASTM D3960, and the following definitions.
   1. Abrasive: Material used for blast cleaning, such as sand, grit or shot.

2. Abrasive Blast Cleaning: Cleaning/surface preparation by abrasive propelled at high speed by compressed air.
3. AMPP: Association for Materials Protection and Performance (Merger of National Association of Corrosion Engineers and Society for Protective Coatings).
4. Anchor Pattern: Profile or texture of prepared surface(s).
5. ANSI: American National Standards Institute.
6. Bug Holes: Cavities or air voids resulting from entrapment of air bubbles in the surface of formed concrete during placement and compaction.
7. Coating Thickness: The total dry film thickness of primer, intermediate, and/or finish coats.
8. Coating System Applicator (CSA): A generic reference to the specialty subcontractor or subcontractors retained by the Contractor to install the coating systems specified in this Section.
9. Coating System Manufacturer (CSM): Refers to the acceptable coating system manufacturer, abbreviated as the CSM.
10. Coating System Manufacturer's Technical Representative(s) (CTR): Refers to the independent technical representative(s) of the acceptable Coating System Manufacturer and is abbreviated as CTR. This refers to a CSM technical representative and not a sales or marketing representative. The cost of this independent technical representative is the responsibility of the General Contractor.
11. Dew point: Temperature of a given air/water vapor mixture at which condensation starts.
12. Dry Film Thickness (DFT): Depth of cured film, usually expressed in mils (0.001 inch). DFT is the thickness of a coating as measured above the substrate.
13. Dry Spray: Dry, flat, probably textured coating surface when spray gun held too far from substrate.
14. Drying Time or curing time: Time interval between application and curing of material before exposure to service conditions.
15. Dry to Recoat: Time interval between application of material and ability to receive next coat.
16. Dry to Touch: Time interval between application of material and ability to touch lightly without damage.
17. Feather Edging: Reducing the thickness of the edge of paint.
18. Feathering: Operation of tapering off the edge of a point with a comparatively dry brush.
19. Field Coat: The application or the completion of application of the coating system after installation of the surface receiving coating at the site of the work.
20. Fish Eyes: Separation or pulling apart of wet film of coating to expose underlying film or substrate.
21. Flash Report: A report by email or text to the Construction Manager and Engineer identifying issues requiring immediate attention and approval.
22. Hold Point: A defined point, specified in this Section, at which work shall be halted for a quality inspection.
23. Holiday: A discontinuity, skip, or void in coating or coating system film that exposes the substrate.
24. Honeycomb: Segregated condition of hardened concrete due to non-consolidation.

25. ICRI: International Concrete Repair Institute.
26. Incompatibility: Inability of a coating to perform well over another coating because of lack of cure of prior coating, poor bonding, or lifting of old coating; inability of a coating to perform well on a substrate.
27. Laitance: A layer of weak, non-durable concrete containing cement fines that are brought to the surface through bleed water because of concrete finishing and/or over-finishing.
28. LEED: Leadership in Energy and Environmental Design certification program by the US Green Building Council.
29. Mil: 0.001 inch, one thousandth of an inch.
30. Mudcracking: Deep irregular cracks in coating that resemble dried mud caused by non-flexible coatings applied too thickly or built-up in corners.
31. NACE: National Association of Corrosion Engineers to be renamed Association of Materials Performance and Protection or AMPP.
32. NAPF: National Association of Pipe Fabricators.
33. Certified Coatings Inspector: Must be AMPP Certified to Level 3 and have at least 10 years' experience in wastewater coatings inspection.
34. Overspray: Coating spray, particularly such coating that failed to strike the intended surface and ended up on surfaces not to be coated.
35. Pinhole: A small diameter discontinuity in a coating or coating system film that is typically created by outgassing of air from a void in a concrete substrate resulting in exposure of the substrate or a void between coats.
36. Pot Life: Time interval after mixing of components during which the coating can be satisfactorily applied.
37. QA: Quality Assurance
38. QC: Quality Control
39. QCP: Quality Control Person representing the Contractor and responsible for QC Testing, Inspection and associated documentation.
40. Quality Control Testing and Inspection Plan (QCTIP).
41. Repair Mortars: Cementitious, polymer modified cementitious, or polymer-based mortars used to restore concrete or masonry substrates to overall continuous, coatable surfaces by filling voids and excess substrate profile that cannot be hidden by the DFT of the coating system.
42. Resurfacer/Resurfacing Material: A layer of cementitious and/or resin-base material used to fill or otherwise restore surface continuity to worn or damaged concrete surfaces at typically shallow depths up to 1/4 inch thick.
43. Shelf Life: Maximum storage time for which a material may be stored without losing its usefulness.
44. Shop Coat: One or more coats applied in a shop or plant prior to shipment to the site of the work, where the field or finishing coat is applied.
45. Spreading Rate: Area covered by a unit volume of paint at a specific thickness.
46. SSPC: The Society for Protective Coatings soon to become part of AMPP.
47. Stripe Coat: A separate coat of paint applied to all weld seems, pits, nuts/bolts/washers and edges by brush. This coat shall be applied prior to full coat application.

48. Saturated Surface Dry (SSD): Refers to concrete surface condition where the surface is saturated (damp) without the presence of standing water.
49. Tie Coat: An intermediate coat used to bond different types of paint coats. Coatings used to improve the adhesion of a succeeding coat.
50. Touch-Up Painting: The application of paint on areas of painted surfaces to repair marks, scratches, and areas where the coating has deteriorated to restore the coating film to an unbroken condition.
51. TPC: Technical Practice Committee.
52. Volatile Organic Compound (VOC) Content: The portion of the coating that is a compound of carbon, is photochemically reactive, and evaporates during drying or curing, expressed in grams per liter (g/l) or pounds per gallon (lb/gal).
53. Immersion: Refers to a service condition in which the substrate is below the waterline or submerged in a liquid such as water or wastewater at least intermittently if not constantly.
54. Weld Spatter: Beads of metal scattered near seam during welding.
55. Wet Film Thickness (WFT): The primer or coating film's thickness immediately following application. Wet film thickness is measured in mils or thousandths of an inch (0.001 inch) and is abbreviated WFT.

1.04 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, use the last version of the document before it was discontinued.

1.05 QUALITY ASSURANCE

A. Standardization:

1. Provide materials and supplies that are standard products of CSMs. Provide materials in each coating system from a single CSM.
2. The standard products of CSMs other than those specified may be acceptable when it is demonstrated to the Engineer that they are equal in generic resin type, composition, durability, range of film thickness, and usefulness, for the purpose intended. Requests for consideration of CSMs other than those specified in this Section will be considered, provided the following minimum conditions are met.
    a. The proposed coating system uses an equal or greater number of separate coats to achieve the required total DFT.
    b. The proposed coating system uses coatings of the same generic type as that specified including curing agent type.

c. Include information listed in paragraph 1.07, demonstrating that the proposed CSM's product is equal to the specified coating system.

d. Provide a list of Contractor and CSM references for the proposed product in similar situations where the coating of the same generic type has been applied. Include the project name, city, state, owner, phone number of owner; coating system reference and number from this Section 09 90 00; type of facility in which it was used, generic coating type, and year coating was applied.

e. Alternate coating systems submitted by the Contractor must be approved by the Engineer. There is no guarantee that alternate systems will be approved, and this is left exclusively up to the discretion of the Engineer. At least 3 competitive products have been provided in this Specification. The Contractor is encouraged to submit one of the specified coating systems.

f. At any time when there is conflict between the CSM's product data and the COAT SPEC requirements regarding surface preparation, material application, or any other coating details, the more stringent requirements will take precedent.

B. Shop and Field Contractors Quality Control Requirements:

1. Prior to any work, hold a pre-construction meeting with the coating subcontractor and coating system manufacturer's technical representatives (CTR) to review the scope of work, the accepted submittals and any comments, and review all surface preparation, application, curing, mixing, storage, and overall QC and testing requirements. Provide a minimum of 48 hours' notice to the Engineer and Owner in case they desire to attend the meeting.
2. The Contractor is solely responsible for the workmanship and quality of the coating system installation by the Contactor's CSA. Inspections by the Construction Manager, the Engineer, the Owner, or the CTR will not relieve or limit the Contractor's responsibilities for the quality of the coating system.
3. Conform to requirements of this specification and the standards referenced in this Section. Changes in the coating system installation requirements will be allowed only with the written acceptance by the Engineer and CSM before work commences.
4. Only personnel who are trained by the CTR specifically for this contract or who are approved by the CSM specifically for this contract shall be allowed to perform the coating system installation specified in this Section. The CTR to verify in writing that the Contractor's personnel installing the coating systems covered by this Section have the appropriate training and/or experience to properly perform the coating systems work.
5. Provide a Quality Control Person (QCP) who is a certified NACE, SSPC, or AAMP Coatings Inspector with at least 5 years of experience inspecting coating work similar to the work covered by this Section. The QCP to perform all QC inspection testing and inspection tasks while fully documenting all efforts required by these specifications and/or additional CSM's requirements.
6. Do not use contaminated, outdated, diluted materials, and/or materials from previously opened containers.
7. For repairs, I provide the same products, or products recommended by the CSM, as used for the original coating.
8. Identify the points of access for inspection by the Owner, Engineer and/or Construction Manager. Provide ventilation, ingress and egress, and other means necessary for the Engineer, Owner, or Construction Manager's personnel to safely access the work areas.

9. Contractor's CSA to conduct the work so that the coating system is installed as specified and inspect the work continually to ensure that the coating system is installed as specified. Correct coating system work that does not conform to the specifications or is otherwise not acceptable to the as-specified requirements at no additional cost to the Owner.
10. Provide full time inspection with trained and certified quality control (QC) inspectors performing all QC procedures as the coating work proceeds in accordance with the requirements of this section. Minimum qualifications for QC inspectors on concrete projects is AMPP-CCI Level 1 with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified CCI Level 2 Concrete Coatings Inspector. On non-concrete related project, the minimum QC inspector is AMPP Basic Coating Inspector (NACE/SSPC Level 1) with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified Coatings Inspector (NACE/SSPC Level 2) or AMPP Senior Coatings Inspector (NACE/SSPC Level 3) in good standing, with at least 10 years of similar coatings work experience. An AMPP Basic Coating Inspector (NACE/SSPC Level 1) with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified Coatings Inspector (NACE/SSPC Level 2) or AMPP Senior Coatings Inspector (NACE/SSPC Level 3) in good standing, with at least 10 years of similar coatings work experience may be acceptable providing the AMPP Basic, AMPP Certified and AMPP Senior coating inspectors can each can show verifiable proof of performing inspection successfully on 5 verifiable concrete projects similar in size and scope as the project that is part of this specification.
11. The Contractor's QC personnel to measure DFT of metal surfaces as per SSPC-PA2. Take measurements as often as necessary to ensure the DFT requirements of the specification are met. Measure DFT of metallic surfaces using Type II Magnetic (Ferrous) and Type II Eddy Current Non-Ferrous) Dry Film Thickness gauges. Use only gauges calibrated within 1 year of use. Perform testing of DFT on concrete substrates as per SSPC-PA9 using Ultrasonic DFT gauges or another suitable method (e.g., Calculating material usage vs square feet coverage) to ensure DFT requirements are met.
12. Contractor/CSA to submit for approval a QCTIP for the work covered by this Section (see 00 97 00A Inspection Check List). List all tests and inspection tasks in the QCTIP including referenced and applicable standards to be conducted and the frequency in which these tests or tasks will be performed. This frequency can be addressed for certain tests such as air and substrate temperature or dew point on an hourly per shift basis. Or this frequency can be addressed on a per number of square feet basis for tests and tasks such as wet and DFT tests or adhesion tests. Include in the QCTIP a written record which identified when (time and date) work not conforming to the specification requirements is identified, a written record of the proposed corrective actions for such non-conforming work and a record of when that action was performed (time and date). Describe all corrective action for non-conforming work in detail with referenced digital photographs taken of the re-work for subsequent review by the Owner's representative.

13. Complete the Coating System Quality Control Checklist, Form 09 90 00-A, included in Section 09 90 00 –Part 4 for coating system installations. Follow the sequential steps required for proper coating system installation as specified and as listed in the Coating System Quality Control Checklist. For each portion of the work, install the coating system, document all QC measures performed, and complete sign-offs as specified prior to proceeding with the next step. After completing each step as indicated on the Coating System Quality Control Checklist, sign the checklist indicating that the work has been installed and inspected as specified and attach a final copy of all individual QC checks or test results as applicable and required.
14. Submit a daily QC inspection report from the QCP that describes and documents all QC tests and inspection tasks performed including frequency of performance and test results (including test data) and referenced standard followed for each shift the CSA works. Submit these reports on the morning of the following day the work was performed to the Construction Manager. Include with the daily QC report a written account of all non-conforming work, subsequent corrective measures and annotated digital photographs. Submit a standard inspection form to be used for these reports for review by the Engineer. CSA's QC Inspector to use approved inspection report forms to record all QC inspection and testing throughout the performance of the coating work.

C. Quality Control Hold Points:
   1. The Contractor's QCP to conduct QC inspections of the coating work as it proceeds to meet all specified quality requirements. In addition, conduct inspection at Hold Points during the coating system installation and record the results on Form 09 90 00-A. Coordinate Hold Points with the CTR, Engineer and Construction Manager so they Construction Manager or Engineer may observe the Quality Control inspections on a scheduled basis. Provide the Construction Manager or Engineer a minimum of 1 days' notice prior to conducting Hold Point Inspections. The Hold Points shall be as follows:
      a. Environment and Site Conditions. Prior to commencing an activity associated with coating system installation, measure and record ambient air temperature and humidity as well as other conditions such as proper protective measures for surfaces not to be coated and safety requirements for personnel. Confirm the weather and/or environmental conditions within the structure comply with the requirements specified by the CSM.
      b. Conditions Prior to Surface Preparation. Prior to commencing surface preparation, perform cleaning to remove all oil, grease, dirt, soluble salts, and all other foreign contaminants from the surface.
      c. Monitoring of Surface Preparation. Spot check degree of cleanliness, surface profile, and surface pH testing, as required. Confirm compressed air used for surface preparation or blow down cleaning is free from oil and moisture.
      d. Post Surface Preparation. Upon completion of the surface preparation, measure and inspect for proper degree of cleanliness and surface profile as specified in this Section 09 90 00 and in the CSM's written instructions.
   2. After surface preparation and prior to the application of primer and coatings the surfaces the CSA must ensure that any remaining dust meets the acceptable level of the specification requirements.
      a. Monitoring of Coatings Application. Inspect, measure, and record the WFT and general film quality (visual inspection) for lack of runs, sags, pinholes, holidays, etc. as the application work proceeds.

b. Post Application Inspection. Identify defects in application work including pinholes, holidays, excessive runs or sags, inadequate or excessive film thickness, and other problems as may be observed.

c. Post Cure Evaluation. Measure and inspect the overall DFT. Conduct a DFT survey, and perform adhesion testing, holiday detection, or cure testing as required based on the type of project and the specific requirements in this Section 09 90 00 and/or in the CSM's written instructions.

d. Follow-up to Corrective Actions and Final Inspection. Measure and reinspect corrective coating work performed to repair defects identified at prior Hold Points. Include final visual inspection along with follow-up tests such as holiday detection, adhesion tests, and DFT surveys.

D. Responsibilities of the CTR:

1. General:

a. Provide the services of the CTR to be on site to routinely verify in writing that the application personnel have successfully performed representative portions of the surface preparation, filler/surface application, coating system application, and QC Inspection in accordance with this Section 09 90 00. Include testing or witnessing the contractors testing for the required degree of cleanliness, surface pH for concrete substrates, surface profile of substrates, proper mixing of coating materials, application (including checking the wet and DFT of the coating systems), proper cure of the coating systems, and proper treatment of coating systems at terminations, transitions, and joints and cracks in substrates. These inspections are not expected to be full-time, but rather to assure that inspections by the CTR are performed on representative portions of all major steps of the coating work to ensure the CSM approves those representative portions of the work to be in compliance with the CSM's recommendations and instructions. This inspection is in addition to the inspection performed by the Contractor in accordance with paragraph 1.05C of this section. The CTR shall provide a reasonable level of oversight of the contractor's QC processes to be representative of key steps in the work, at their discretion, to provide a final sign-off certification that the CSM's products have been properly installed.

2. Coating System Inspection:

a. The CTR shall verify representative steps of the coating work are performed properly per the manufacturer's instructions; the CTR shall coordinate and confirm the planned inspections by the Contractor's QCP are being performed per the QCTIP to assure quality of the work meets the requirements of both these specifications and any additional manufacturer's requirements; and the CTR shall verify or witness the contractors QC processes of the following QC steps at their discretion:

1) Inspect ambient conditions during various coating system installation at hold points for conformance with the specified requirements.

2) Inspect the surface preparation of the substrates where the coating system will terminate or will be applied for conformance to the specified application criteria.

3) Inspect preparation and application of coating detail treatment (for example, terminations at joints, metal embedments in concrete, and other terminations at different substrates).

4) Inspect application of the filler/surface materials for concrete and masonry substrates.
5) Inspect application of the primers and finish coats including WFT and DFT of the coatings.
6) Inspect coating systems for cure.
7) Review adhesion testing of the cured coating systems for conformance to specified criteria.
8) Inspect and record representative localized repairs made to discontinuities identified via continuity testing.
9) Conduct a final review of completed coating system installation for conformance to the specifications.
10) CTR to prepare and submit a site visit report following each site visit that documents the acceptability of the coating work in accordance with the CSM's recommendations.

3. Final Report:
   a. Upon completion of coating work for the project, the CTR shall prepare a letter summarizing the inspection findings and shall attach the site visit reports required in 1.05 D.2. a.10. Include a statement that the completed work was performed in accordance with the requirements of this Section 09 90 00 and the CSM's recommendations based on the inspections performed by the CTR.

1.06 DELIVERY AND STORAGE

A. General:
1. Procedures: In accordance with Section 01 66 00.
2. Deliver materials to the job site in their original, unopened containers. Properly label each container P. Handle and store materials to prevent damage to or loss of label, meeting the project requirements or the CSM's if more stringent.
3. Include the following information on material container labels.:
   a. Name or title of product
   b. CSM's batch number
   c. CSM's name
   d. Generic type of material
   e. Application and mixing instructions
   f. Hazardous material identification label
   g. Shelf-life expiration date
4. Store materials in enclosed structures protected from weather and excessive heat or cold in accordance with the CSM's recommendations. Store flammable materials in accordance with state and local requirements.
5. Clearly mark containers indicating personnel safety hazards associated with the use of or exposure to the materials.
6. Provide Safety Data Sheets (SDS) for each material to the Construction Manager.
7. Store and dispose of hazardous waste including waste solvents and coatings, according to federal, state and local requirements.

1.07 SUBMITTALS:

A. Action Submittals:

1. Provide in accordance with Section 01 33 00:

a. A copy of this specification section, with addendum updates included, and referenced and applicable sections, with addendum updates included, with each paragraph check-marked (☑) to indicate specification compliance or marked to indicate requested deviations from specification requirements or those parts which are to be provided by the Contractor or others. Check marks denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, underline each deviation and denote by a number in the margin to the right of the identified paragraph, and provide a detailed explanation of the reasons for requesting the deviation. Engineer is the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined signifies compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections along with justification(s) for requested deviations to the specification requirements is cause for rejection of the entire submittal and no further submittal material will be reviewed.

b. CSM's current printed recommendations and product data sheets for coating systems including:

1) VOC data
2) Surface preparation recommendations
3) Primer type, where required
4) Maximum dry and wet film mil thickness per coat
5) Minimum and maximum curing time between coats, including atmospheric conditions limitations for each (temperature, dewpoint difference from temperature, etc.)
6) Curing time before exposure to elements
7) Thinner to be used with each coating
8) Ventilation requirements
9) Minimum atmospheric conditions during which the paint shall be applied
10) Allowable application methods
11) Maximum allowable moisture content
12) Maximum shelf life

c. Affidavits signed and sealed by an officer of the CSM's corporation, attesting to full compliance of each coating system component with current and promulgated federal, state, and local air pollution control regulations and requirements.

d. Safety Data Sheets (SDS) for materials to be delivered to the job site, including coating system materials, solvents, and abrasive blast media.

e. List of cleaning and thinner solutions allowed by the CSMs.

f. Storage requirements including temperature, humidity, and ventilation for Coating System Materials as recommended by the CSMs.

g. CSM's detailed, written instructions for coating system treatment and graphic details for coating system terminations in the structures to be coated including, but not limited to, pipe penetrations, metal embedments, and other terminations to be determined from the contract drawings. Include detailed treatment for coating system at joints/terminations in concrete and concrete masonry unit assemblies.

h. CSM's detailed maximum chloride level tolerance for all coatings to be applied on metallic surfaces.

i. Provide a minimum of 5 project references each for the Contractor and CSA including contact name, address, and telephone number where similar coating work has been performed by their companies in the past 5 years.

j. The QCITP as specified in Article 1.05 D 2 and including all pertinent QC requirements covered in the Quality Control Table 09 90 00 – 1 found under Part 4 of this Section. Include:

   1) the QC Inspection Forms

   2) A list of who is responsible for performing and documenting all QC tests and inspection tasks.

k. Shop primer product data sheet and letter stating that shop primer is compatible with the field applied topcoats for all equipment on other items.

l. A daily QC inspection report from the QCP that documents all QC tests and inspections performed and their results for each day of the work. Document all non-compliant work for coating repair. Coordinate the report with the QCTIP provided per 1.05 C.1. Deliver daily QC report electronically to the Construction Manager and Engineer the morning of the following day.

m. Submit a Flash Report (see definitions section for Flash Report definition) from the QCP immediately identifying any items or issues that require immediate attention to the project Engineer

n. Letter from CTR confirming that Contractor's personnel to perform coating work have been trained or have appropriate experience to perform the work covered by this Section.

o. Resume of the Contractor's QCP responsible for performing the QC Testing and Inspection tasks delineated in the Contractor's Inspection and Testing Plan.

B. Informational Submittals:

1. Procedures: Section 01 33 00.
2. Prior to application of coatings, submit letter(s) from the CTR(s) identifying the application personnel who have satisfactorily completed training as specified in Article 1.05 or a letter from the CSM stating that personnel who shall perform the work are approved by the CSM without need for further or additional training.
3. Submit reports specified in Article 1.05 while the work is underway.

C. Closeout Submittals:

1. Procedures: Section 01 33 00
2. Submit the Coating System Quality Control Checklists using Form 09 90 00-A, for the coating work.

D. Product substitution requests:
   1. Refer to the General Conditions and/or General Requirements for substitution requests procedures for materials or requests to substitute other specification requirements, which are handled differently than the normal project submittal procedures.

PART 2 PRODUCTS

2.01 MATERIALS

A. General:
   1. Notwithstanding the listing of product names in this Section 09 90 00, provide affidavits, signed and sealed by an officer of the CSM's corporation, attesting to full compliance of each coating system component with current and promulgated federal, state, and local air pollution control regulations and requirements. See Section 1.05 for detailed QC requirements required by the contractor. Do not apply coatings to a surface until the specified affidavits have been submitted, reviewed and accepted. Failure to comply with this requirement is cause for rejection and removal of such materials from the site.
   2. The following list specifies the material requirements for coating systems. Coating systems are categorized by generic name followed by an identifying abbreviation. If an abbreviation has a suffix number, it is for identifying subgroups within the coating system.

Material Requirements for Coating Systems: All of the United States including California Except SCAQMD

Coating System	CSM	First Coat(s)	Finish Coat(s)
Epoxy Coatings			
E-1	AkzoNobel	Interseal 670HS	Interseal 670HS
	Carboline	Carboguard 890	Carboguard 890
	PPG	Amerlock 2/400 Series	Amerlock 2/400 Series
	Sherwin Williams	Macropoxy 646 FC	Macropoxy 646 FC
	Tnemec	Series V69	Series V69
E-1-G	AkzoNobel	Intergard 251HS	Interseal 670HS
	Carboline	Carboguard 890	Carboguard 890
	PPG	Amerlock 2/400 Series	Amerlock 2/400 Series
	Sherwin Williams	Macropoxy 646 FC	Macropoxy 646 FC
	Tnemec	Series V69	Series V69
E-2	AkzoNobel	Interseal 670HS	Interseal 670HS
	Carboline	Carboguard 890 series	Carboguard 890 series
	PPG	Amerlock 2/400 Series	Amerlock 2/400 Series
	Sherwin Williams	Dura-Plate 235	Dura-Plate 235
	Tnemec	Series V69	Series V69
E-2-C	AkzoNobel	Interseal 670HS	Interseal 670HS
	Carboline	Carboguard 890 series	Carboguard 890 series

Material Requirements for Coating Systems: All of the United States including California Except SCAQMD				
	PPG	Amercoat 253		Amercoat 253
	Sherwin Williams	Tank Clad HS		Tank Clad HS
	Tnemec	Series 104		Series 104
E-3	AkzoNobel	Interseal 670HS		Interseal 670HS
	Carboline	Carboguard 890 series		Carboguard 890 series
	PPG	Amerlock 2/400 Series		Amerlock 2/400 Series
	Sherwin Williams	Dura-Plate 235		Dura-Plate 235
	Tnemec	Series V69		Series V69
E-4	AkzoNobel	Interseal 670HS		Interseal 670HS
	Carboline	Carboguard 890		Carboguard 890

	Prosoco	Blockguard WB6	Blockguard WB6

**See CSM's Product Data Sheets for acceptable thinners for VOC compliance or do not thin.*

PART 3 EXECUTION

3.01 COATINGS

A. General:

1. Do not use coating products until the Engineer, Construction Manager, Owner, or Owner's Representative has accepted the affidavits specified in paragraphs 1.07 and 2.01 and the CTR has trained the Contractor and CSA in the surface preparation, mixing, and application of each coating system.
2. Erect and maintain protective enclosures as stipulated per SSPC-Guide 6 Guide for Containing Debris Generated During Paint Removal Operations.
3. Only use primers accepted as part of the coating submittal for the specific project components, including for shop applied primers.

B. Shop and Field Coats:

1. Shop Applied Prime Coat: Except as otherwise specified, prime coats may be shop-applied or field-applied. Use only shop-applied primers which have been identified and accepted as part of the coating submittal. It must be compatible with the specified coating system and applied at the minimum DFT recommended by the CSM. Provide data sheets identifying the shop primer as a Submitted for Approval as required in Article 1.07. All requirements for surface preparation, inspections and testing, and documentation apply to shop applied primers. Perform adhesion tests on the shop primer as specified in paragraph 3.01 B.3. Adhesion Confirmation. Remove damaged, deteriorated and poorly applied shop coatings that do not meet the requirements of this Section 09 90 00 and the surfaces recoated. If the shop primer coat meets the requirements of this Section 09 90 00, the field coating may consist of touching up the shop prime coat and then applying the finish coats to achieve the specified film thickness and continuity.
2. Field Coats: Apply field coats consisting of one or more prime coats and one or more finish coats to build up the coating to the specified coating system DFT. Unless otherwise specified, do not apply finish coats until other work in the area is complete and previous coats have been inspected.
3. Adhesion Confirmation: Perform an adhesion test after proper cure in accordance with ASTM D3359 to demonstrate that (1) the shop applied prime coat adheres to the substrate and (2) the specified field coatings adhere to the shop applied coat. Test results showing an adhesion rating of 4A or better on surfaces are required for coatings 5 mils or more in thickness (Method A). Test results showing an adhesion rating of 4B or better on other surfaces are acceptable for coating thicknesses less than 5 mils.
4. Test compatibility of coatings applied over existing coatings of different generic chemistry for compatibility through test patches applied and provided time for cure. After suitable cure time as per the CSM, perform adhesion testing as per 3.01.B.3 prior to proceeding.

C. Application Location Requirements:

1. Equipment, non-immersed, non-corrosive atmosphere: For items of equipment, or parts of equipment that are not immersed in service, shop prime and then finish coat in the field after installation with the specified or acceptable color. If the shop primer requires top coating within a specified period, finish coat the equipment in the shop and then touch-up paint after installation in the field. If equipment removal and reinstallation is required for the project, touch-up coating the field following reinstallation. [For equipment exposed to corrosive atmosphere or immersion, refer to specification [09 96 00] [09 97 00].]
2. For equipment that is partially or totally immersed, exposed to corrosive atmosphere, or chemical secondary containment, refer to specification 09 96 00 High Performance Coatings.
3. For equipment in potable water applications requiring NSF/ANSI/CAN 61/600 certified coatings refer to specification 09 97 00 Potable Water Coatings

3.02 PREPARATION

A. General:

1. Prepare each type of surface in accordance with the specific requirements of each coating specification sheet (COATSPEC) and the following. In the event of a conflict, the more stringent requirements shall take precedence.
2. Clean and dry surfaces to be coated. Before applying coating or surface treatments, remove oil, grease, dirt, rust, mill scale, old, weathered coatings, and other foreign substances. Remove oil and grease before mechanical cleaning. Where testing reveals chloride contamination, remove chlorides prior to blast cleaning or other mechanical surface preparation methods. Where mechanical cleaning is accomplished by blast cleaning, wash, grade, and free the abrasive from contaminants that might interfere with the adhesion of the coatings. Use air for blast cleaning that is free of oil and moisture so as not to cause detrimental contamination of the surfaces to be coated.
3. Protect all surfaces and equipment not to be coated from dust and overspray. Schedule cleaning and coating so that dust and spray from the cleaning process shall not fall on wet, newly coated surfaces. Remove or mask hardware, hardware accessories, nameplates, data tags, machined surfaces, sprinkler heads, electrical fixtures, and similar uncoated items which are in contact with coated surfaces prior to surface preparation and coating operations. Reinstall removed items following completion of coating. Disconnect and move equipment adjacent to walls to permit cleaning and coating of equipment and walls. Replace and reconnect items following coating.

B. Blast Cleaning:

1. Meet the following requirements for abrasive blast cleaning:
    a. Do not reuse blast abrasive. Do not use silica sand for the blast abrasive. Use blast abrasive media which provides the most efficient cutting action to achieve the profile and degree of cleanliness specified.
    b. Filter compressed air used for blast cleaning and ensure it contains no condensed water or oil. Clean moisture traps at least once every 4 hours or more frequently as required to prevent moisture from entering the supply air to the abrasive blasting equipment.
    c. Install oil separators just downstream of compressor discharge valves and at the discharge of the blast pot discharges. Check and clean oil separators on the same frequency as the moisture traps as defined above.
    d. Regulators, gauges, filters, and separators must be in use on compressor air lines to blasting nozzles at all times during this work.
    e. Install an air dryer or desiccant filter drying unit which dries the compressed air prior to blast pot connections. Use and maintain the dryer for the duration of surface preparation work.
    f. Use abrasive blast nozzles of the venturi or other high velocity type supplied with a minimum of 100 pounds per square in gauge (psig) air pressure and sufficient volume to obtain the blast cleaning production rates and cleanliness specified.
    g. Provide ventilation for airborne particulate evacuation (meeting pertinent safety standards) to optimize visibility for both blast cleaning and inspection of the substrate during surface preparation work.

h. If, between final surface preparation work and coating system application, contamination of prepared and cleaned metallic substrates occurs, or if the prepared substrates' appearance darkens or changes color, reclean the surface by water jetting and/or abrasive blast cleaning until the specified degree of cleanliness is reclaimed.

i. Protect mechanical, electrical, and other equipment adjacent to and surrounding the work area from dusts, overspray and general damage.

C. Solvent Cleaning:

1. Use emulsifying type solvent wash, solvent wipe, or cleaners , including but not limited to those used for surface preparation in accordance with SSPC-SP 1 Solvent Cleaning, which emit no more than [340 g/l VOCs for AIM regions], [250 g/l for CARB regions], [100 g/l for SCAQMD regions], contains no phosphates, is biodegradable and is compatible with the specified primer.
2. Use clean white cloths and clean fluids in solvent cleaning.

D. Metallic Surfaces:

1. Prepare metallic surfaces in accordance with applicable portions of surface preparation specifications of the Society for Protective Coatings (SSPC) and NACE International (NACE) specified for each coating system. See Coat Spec for each coating system in this Section 09 90 00. The profile depth of the surface to be coated shall be in accordance with the COATSPEC requirements in this Section measured by Method C of ASTM D4417. Select blast particle size to produce the specified surface profile. Use solvent in solvent cleaning operations as recommended by the CSM.
2. Take the following steps if soluble chloride contamination is suspected or is possible/plausible. Following initial blast cleaning of steel substrates, test for the presence of soluble chlorides using the retrieval and analysis method designated as Method 4.2.2. Adhesively Bonded Latex Patch or Cell as described in SSPC-TG15. Test accordance with ISO 8502-6/8502-9 at the rate of 4 tests per 1,000 sq. ft. of steel surface area to be coated, but no less than a total of 4 tests per component. The target threshold or tolerance conductivity level for soluble chloride contamination shall be approved in writing by the CSM's CTR for each product that is part of the application.
3. Prepare metallic surfaces based upon comparison with SSPC-VIS1-89 (ASTM D2200) and as described in the COATSPEC for each coating system. If dry abrasive blast cleaning is selected and to facilitate inspection, on the first day of cleaning operations, provide abrasive blast metal reference panels meeting the standards specified for acceptance by the Construction Manager. Plates shall measure a minimum of 8-1/2 inches by 11 inches. Panels accepted by the Construction Manager as meeting the requirements of the specifications shall be initialed by the Contractor and the Construction Manager and coated with a clear non-yellowing finish. Provide a reference panel for each type of abrasive blasting to be used as the comparison standard throughout the project.
4. Blast cleaning requirements for steel, ductile iron, and stainless steel substrates are as follows:
    a. Prepare steel piping in accordance with SSPC-SP 6/NACE#3 (Commercial Blast Cleaning) and prime before installation. Prepare ductile iron piping surfaces including fittings in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05.

b. Abrasive blast clean stainless steel surfaces in accordance with SSPC-SP 16 to leave a clean uniform appearance with a minimum uniform surface profile of 1.5 to 2.5 mils, unless required to be greater by the CSM.

c. Remove traces of grit, dust, dirt, rust scale, friable material, loose corrosion products or embedded abrasive from substrate by vacuum-cleaning prior to coating application. Blow down cleaning with compressed air is not permitted.

d. Prevent contamination of the surface after blasting from worker's fingerprints, deleterious substances on workers' clothing, or from atmospheric conditions.

e. Continuously monitor and maintain ambient environmental conditions in the enclosure to ensure the degree of cleanliness is held and no "rust back" occurs prior to coating material application.

5. Abrasive blast clean galvanized steel surfaces per SSPC SP 16 to produce a minimum surface profile of 1.0 to 1.5-mil profile and to remove all corrosion products. Caution–follow CSM's specific recommendations for surface prep, including abrasive blast cleaning.

6. Cleaning of soluble salt contamination shall be as follows:

a. and analysis method designated as Method 4.2.2. Adhesively Bonded Latex Patch or Cell as described in SSPC-TG15 (2013). Testing shall be in accordance with ISO 8502-6/8502-9 at the rate of 4 tests per 1,000 sq. ft. of steel surface area to be coated. The Contractor shall clean and prepare the surfaces to remove the soluble salts until acceptable test levels for conductivity are shown by further testing as required above.

b. b. Allowable concentrations of soluble chlorides shall be at the direction of the CSM for each individual product to be used

c. c. Cleaning for decontamination shall utilize a steam generator ("Jenny") capable of producing steam/hot water temperature of 150 degrees F minimum. Hot water pressure washing at 150 degrees F can also be utilized using clean, fresh, potable water only. The steam/hot water shall be applied using a lance with a nozzle providing a fan shaped spray pattern. The recommended discharge temperature is 140 degrees F for safety reasons. Contractor shall take appropriate safety precautions during use of hot water.

d. d. Steam/hot water shall be applied in a minimum of 2 passes over surfaces to be cleaned. Horizontal members on substrates shall be cleaned from end to end continuously and from top to bottom as this horizontal progression continues. Vertical pipes or substrates shall be cleaned around the circumference from top to bottom (crown to invert) to ensure complete solubility and rinsing of contaminants from top to bottom. As this cleaning proceeds, the surfaces of the steel shall be scrubbed using stiff bristle brushes.

e. e. Once completed, this cleaning shall be followed by repeated thorough rinsing. Rinsing can be accomplished using pressure water washing using unheated potable water. Once decontamination cleaning has been performed over a representative (small) area, the cleaned substrate shall be tested for soluble salt concentrations to ensure that the pattern and extent of cleaning shall be adequate. Testing shall be performed as defined above in 3.02 D.6.a.

E. Concrete Surfaces:

1. Inspect concrete surfaces prior to surface preparation and prepare concrete surfaces in accordance with SSPC-SP 13/SP CAB/NACE #6 (also called NACE 6).

2. Prior to surface preparation for degree of cleanliness and profile, prepare substrate cracks and areas requiring resurfacing and perform detail treatment including but not limited to, terminating edges per CSM recommendations.
3. Evaluate the surface profile for prepared concrete surfaces to be coated by comparing the profile of the prepared concrete with the profile of the ICRI 310.2 (molded surface profile replicas). Prepare surface profile in accordance with the COATSPEC requirements and the CSM's recommendations.
4. Inspect prepared concrete substrates for surface cleanliness after cleaning, preparation, and/or drying, but prior to making repairs or applying a coat in the coating system. Reinspect repaired concrete surfaces for cleanliness prior to application of the coating system.
5. Prepare concrete substrates using methods such as dry abrasive blast cleaning, high, or ultra-high-pressure water jetting in accordance with SSPC-SP 13 /SP CAB /NACE #6 to meet the following requirements:
    a. A clean substrate that is free of calcium sulfate, loose coarse or fine aggregate, laitance, loose hydrated cement paste, and otherwise deleterious substances.
    b. Open up air voids or bugholes to expose their complete perimeter by blast cleaning or other methods. Leaving shelled over, hidden air voids beneath the exposed concrete surface is not acceptable.
    c. Concrete substrate must be dry prior to the application of repair mortars, filler/surfaces, or coating system materials.
    d. Produce a concrete surface with a minimum pH of 9.0 to be confirmed by surface pH testing. If after surface preparation, the surface pH remains below 9.0, perform additional water blasting, cleaning, or abrasive blast cleaning until additional pH testing indicates an acceptable pH level.
    e. Following inspection of the concrete surface preparation, thoroughly vacuum clean concrete surfaces to be coated to remove loose dirt, and spent abrasive (if dry blast cleaning is used) leaving a dust free, sound concrete substrate.
    f. Remove debris produced by blast cleaning from the structures to be coated and dispose of legally off site.
6. Should abrasive blast cleaning or high or ultrahigh pressure water jetting not remove degraded concrete, use chipping or other appropriate tools to remove the deteriorated concrete until a sound, clean substrate is achieved which is free of calcium sulfate, loose coarse or fine aggregate, laitance, loose hydrated cement paste, and otherwise deleterious substances. Do not use equipment that will damage the underlying sound concrete such as pneumatic or electric chipping tools which will bruise or cause micro-cracking of the concrete substrate. Concrete substrates must be dry prior to the application of polymer based or mortars or filler/surfacers coating system materials.
7. Test moisture content of concrete to be coated in accordance with ASTM D4263, Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method at least once for every 500 sq. ft. of surface area to be coated. The presence of any moisture on plastic sheet following test period constitutes a non-acceptable test.
8. If moisture is detected, the CSA in cooperation with the CTR shall perform additional moisture testing vis ASTM F1869 or ASTM F2170 to determine the extent of the moisture vapor transmission. The acceptable limit for the application of barrier coatings for ASTM F1869 is < 3lbs/1,000 sq ft/24 hours. The acceptable limit as per ASTM F2170 is an RH value <70 percent.

F. Masonry Surfaces:
   1. Prepare masonry surfaces such as Concrete Masonry Units (CMU) to remove chalk, loose dirt, dried mortar splatter, dust, peeling, or loose existing coatings, or otherwise deleterious substances to leave a clean, sound substrate.
   2. Confirm masonry surfaces are dry prior to coating application. If pressure washing or low-pressure water blast cleaning or water jetting is used for preparation, allow the masonry to dry. Assess moisture content by the CTR to ensure moisture levels are in tolerance ranges suitable to the coating system being applied prior to coating application work proceeding. Provide Results and CTR to the Engineer or Construction Manager in writing from the CTR before proceeding with application.

G. Fiberglass Reinforced Plastic (FRP) Surfaces:
   1. Prepare FRP surfaces by first sanding to establish uniform surface roughness without any gloss remaining while minimizing any excessive removal of resin material. Second, vacuum clean to remove loose FRP dust, dirt, and other materials. Do not use compressed air. Then Solvent clean using clean white rags and allow solvent to evaporate completely before application of coating materials.

H. Existing Facilities:
   1. Existing equipment and metalwork shall be coated in accordance with the appropriate coating system specified for new work in paragraph 3.05.
   2. Modified work shall require the full coating system. Other work shall require cleaning and surface preparation as recommended by the CSM followed by 2 finish coats of the appropriate system.
   3. Contractor shall demonstrate that the existing coating is compatible with field coating by performing the adhesion test specified in paragraph 3.01 Adhesion Confirmation. Where unacceptable test results are obtained, the Contractor shall follow manufacturer's written instructions as to the necessity of a tie coat to provide a satisfactory bond between the existing coating, and the specified field coating or complete coating removal/recoating or further surface preparation work will be required until acceptable adhesion is achieved. The difference in cost between the specified coatings and that which is compatible with existing coatings, or work required to remove exiting coatings, will be paid for as extra work unless identified in the Scope of Work for the project already."
   4. If wall surfaces of structures are to be coated or recoated, the Owner shall be consulted and encouraged to determine actual surface conditions and clarify the requirements for surface repair. These requirements should then be specified by adding the following paragraph:
   5. "Abrasive blasting shall be used to clean wall surfaces of existing structures to be coated. Surfaces to be coated or recoated shall be repaired, cleaned, and finished to the standards as specified herein and in Section 03 30 00 for new concrete. Major repair work for wall surfaces of (specify surfaces) shall be as specified in Section 03 30 00."

3.03 APPLICATION

A. Workmanship:
   1. Apply coats to produce an even film of uniform thickness free from runs, drips, sags, ridges, waves, laps, and brush marks and completely coating corners and crevices.

2. Use equipment designed for application of the materials specified. Equip compressors with suitable traps and filters to remove water and oils from the air. Perform a paper blotter test when requested by the Construction Manager or Engineer to determine if the air is sufficiently free of oil and moisture so as not to produce deteriorating effects on the coating system. Limit the amount of oil and moisture in spray air to be less than the limits recommended by the CSM. Equip spray equipment with mechanical agitators, pressure gages, pressure regulators, and spray nozzles of the proper sizes.
3. Apply each coat evenly and sharply cut to line. Avoid over-spraying or spattering paint on surfaces not to be coated. Protect glass, hardware, floors, roofs, equipment, and all other adjacent areas and installations by taping, drop cloths, or other suitable masking measures.
4. Use coating applications method -- conventional or airless spray, plural component spray, brush or roller, or trowel -- as recommended by CSM.
5. Allow each coat to cure or dry thoroughly, according to CSM's printed instructions, prior to recoating.
6. Lightly sand glossy undercoats to provide a surface suitable for the proper application and adhesion of subsequent coats. Vary color for each successive coats for coating systems wherever possible to provide visual confirmation of coverage.
7. Prior to overall coating system application on complex steel shapes, stripe coat welds, edges of structural steel shapes, metal cut-outs, pits in steel surfaces, or rough surfaces as per SSPC PA Guide 11 with the primer coat material using brushes or rollers to ensure proper coverage. Stripe coat via spray application is not permitted.

B. Coating Properties, Mixing and Thinning:
   1. Coatings, when applied, shall provide a satisfactory film and smooth even surface. Thoroughly stir, strain, and keep at a uniform consistency all coating materials during application. Mix coating materials consisting of 2 or more components in accordance with the CSM's instructions. Where necessary to suit the conditions of the surface, temperature, weather, and method of application, the coating may be thinned but only as recommended by the CSM. The VOC of the coating as applied shall comply with prevailing air pollution control regulations. Unless otherwise specified, do not reduce coating materials more than necessary to obtain the proper application characteristics. Use thinner as recommended by the CSM.

C. Atmospheric Conditions:
   1. Apply coatings only to surfaces that are dry and only under conditions of evaporation rather than condensation. Do not apply coating systems during rainy, misty weather, or to surfaces upon which there is frost or moisture condensation. During damp weather, when the temperature of the surface to be coated is within 10 degrees F of the dew point, forced dehumidification equipment may be used to maintain a temperature of minimum 40 degrees F and 10 degrees F above the dew point for the surfaces to be coated, the coated surface, and the atmosphere in contact with the surface. Maintain these conditions for a period of at least 8 hours or as recommended by the CSM. Where conditions causing condensation are severe, use dehumidification equipment, fans, and/or heaters inside enclosed areas to maintain the required atmospheric and surface temperature for proper coating application and cure at no additional cost to the Owner.

D. Concrete Substrate Temperatures and Detail Treatment:
   1. When the surface temperatures of the concrete substrates to be coated are rising or when these substrates are in direct sunlight, outgassing of air from the concrete may result in bubbling, pinhole formations, and/or blistering in the coating system. The application of the filler/surface and the coating system will only be allowed during periods of falling temperature. This will require that application of the filler/surface and coating system only occur during the cooler evening hours. Include all cost for working outside of normal hours in the bid.
   2. Repair all bubbles, fish eyes, pinholes, or other discontinuities that form in the applied coating system material as recommended by the CSM. Repair pinholes that develop in the filler/surfacer material or in the first coat of the coating material in accordance with the CSM's recommendations prior to application of the next coat of material. Open up and fill completely all air voids behind or beneath the pinhole with the specified filler/surfacer/coating material. Abrade the coated area around the pinhole repair and recoat that area.
   3. Perform application detail work per CSM's current written recommendations and/or drawings.

E. Protection of Coated Surfaces:
   1. Do not handle, work on, or otherwise disturb items that have been coated until the coating is completely dry and hard. Recoat or retouch shop-coated items after delivery at the site, and upon permanent erection or installation with specified coating when it is necessary to maintain the integrity of the film.

F. Method of Coating Application:
   1. Where 2 or more coats are required, provide sufficient compatible color additive, or contrasting color, in alternate coats to act as indicator of coverage, or the alternate coats shall be of contrasting colors. Do not use color additives containing lead or lead compounds which may be destroyed or affected by hydrogen sulfide or other corrosive gas, and/or chromium.
   2. Mechanical equipment, on which the equipment manufacturer's coating is acceptable, touch-up prime and coat with 2 coats of the specified coating system to match the color scheduled. Do not apply coatings to a surface until it has been prepared as specified. Apply the primer or first coat by brush to ferrous surfaces that are not blast cleaned. Coats for blast-cleaned ferrous surfaces and subsequent coats for non-blast cleaned ferrous surfaces may be either brush or spray applied. After the prime coat is dry, visually inspect all surfaces, and mark all visible pinholes and/or holidays, repair in accordance with CSM's recommendations, and reinspect visually before applying succeeding coats. Unless otherwise specified, brush, roll, or trowel coats for concrete and masonry.

G. Film Thickness and Continuity:
   1. Confirm WFT following application of each coat.
   2. Do not exceed the surface area covered per gallon of coating for various types of surfaces recommended by the CSM. The first coat, referred to as the prime coat, on metal surfaces refers to the first full paint coat and not to solvent wash, grease emulsifiers, or other pretreatment applications. Apply coatings to the thickness specified and in accordance with these specifications.

3. Conduct visual observations of continuity of coating film quality at welds, projections (such as bolts and nuts), and crevices, to verify no holidays exist where the dry-mil thickness has been accepted. This continuity shall be the minimum required for these rough or irregular areas. Recoat pinholes and holidays to the required coverage.
4. The ability to obtain specified film thickness is generally compromised when brush or roller application methods are used and, therefore, more coats may need to be applied to achieve the specified DFT.
5. For concrete substrates, apply a complete skim coat of the specified filler/surfacer material over the entire substrate to produce a relatively flat continuous coatable surface prior to application of the coating system as required in the COATSPEC for the specific coating system. Apply the skim coat to the thickness recommended by the CSM and such that all open air voids and bugholes in the concrete substrate are completely filled prior to coating application.

H. Special Requirements:
1. Before erection, apply all but the final finish coat to interior surfaces of roof plates, roof rafters and supports, pipe hangers, piping in contact with hangers, and contact surfaces that are inaccessible after assembly. Apply the final coat after erection. Coat structural friction connections and high tensile bolts and nuts after erection. Hand clean or power-tool clean areas damaged during erection and recoat with primer coat prior to the application of subsequent coats. Touch-up surfaces after installation. Confirm surfaces to be coated are clean and dry at the time of application.
2. Except for those to be filled with epoxy grout, coat the underside of equipment bases and supports that have not been galvanized with at least 2 coats of primer specified for system E-2 prior to setting the equipment in place. Provide coating system terminations at leading edges and transitions to other substrates in accordance with the CSM's recommendations or detail drawings.

I. Electrical and Instrumentation Equipment and Materials:
1. Electrical and instrumentation equipment and materials shall be shop coated by the equipment manufacturer in compliance with the standard (IEEE, ANSI, NEMA, etc.) referenced in the individual equipment specification. Before final acceptance, the Contractor shall touch up scratches on equipment with identical color coating. Finish shall be smooth, free of runs, and match existing finish. Prior to touching up scratches, Contractor shall fill them with an appropriate filler material approved by the CSM so evidence of prior scratches is not visible in the finish surface

3.04 CLEANUP

A. General:
1. Upon completion of coating, remove surplus materials, protective coverings, and accumulated rubbish, and thoroughly clean surfaces and repair overspray or other coating-related damage.

3.05 COATING SYSTEM SPECIFICATION SHEETS (COATSPEC)

A. General:

1. Coating systems for different types of surfaces and general service conditions for which these systems are normally applied are specified on the following COATSPEC sheets. Coat surfaces in accordance with the COATSPEC to the system thickness specified. Use coating systems as specified in paragraph 3.06. In case of conflict between the schedule and the COATSPECS, the requirements of the schedule take precedence.
2. Coating Specification Sheets included in Table A are included this paragraph 3.05.

Table A Coating Specification Sheets

Coating System ID	Coating Material	Surface	Service Condition
E-1	Epoxy	Metal	Interior; exterior, covered, not exposed to direct sunlight, non-corrosive exposure.
E-1-G	Epoxy	Galvanized Steel	Interior; exterior, covered non-corrosive exposure. Do not use in immersion service.
E-2	Epoxy	Metal	Exposed to high humidity, condensing conditions moderately corrosive vapors.
E-2-C	Epoxy	Concrete or masonry	Exposed to high humidity, condensing conditions moderately corrosive vapors.
E-3	Epoxy	Concrete or masonry	Non-immersed, moderately corrosive vapor environment, color required.
E-4	Epoxy	Concrete, masonry, plaster, gypsum board	Interior of buildings.
E-5	Epoxy	Metal or concrete	Below grade (buried).
WBPU-1	Clear finish	Wood	Interior
ELA-1	Elastomeric Acrylic	Concrete or dense masonry block where existing crack or joint movement is suspected due to thermal conditions and would propagate through rigid epoxy coating systems and for exterior protection and aesthetics.	Exterior direct sunlight. Concrete or dense masonry block where existing crack or joint movement is suspected due to thermal conditions and would propagate through rigid epoxy coating systems and for exterior protection and aesthetics.
EU-1	Zinc-epoxy-polyurethane system	Ferrous Metal	Exterior, exposed to direct sunlight, moderately corrosive non-immersed – vapor exposure.
EFL-1	Chemical Resistant Novolac Epoxy Flooring with Anti-Slip Broadcast	Concrete	Interior areas subjected to chemical splash and spill. (NOT SECONDARY CONTAINMENT). For Secondary Containment see Section 09 96 00
EFL-2	Epoxy Flooring with Anti-Slip Broadcast	Concrete	Interior areas such as electrical Rooms, mechanical rooms, storage rooms, washrooms and other common Areas of foot or light cart traffic. Not subjected to chemical or UV exposure.
EFL-3	Epoxy Flooring with Anti-Slip and UV protective Topcoat	Concrete	Flooring with Exterior Exposure or other forms of UV exposure such as interior areas with lots of windows.
EU-1-FRP	Specialty Primer plus Polyurethane Finish Coat	Exterior of FRP pipe and tanks, etc.	Exterior, exposed to direct sunlight, non-immersed.
G	Grease	Metal	Ferrous Metal: Ferrous metal surfaces shall be prepared in accordance with SSPC-SP 1 (Solvent Cleaning.)

Table A Coating Specification Sheets

Coating System ID	Coating Material	Surface	Service Condition
HH-1	Next Generation Epoxy Phenolic	Metal	Temperature to 400 degrees F.
HH-2	TMIC – Titanium Modified Inorganic Co-polymer	Metal	Temperature to 1200 degrees F.
L-1	100% Acrylic Latex	Concrete, masonry, plaster, gypsum board	Interior including existing coated concrete.
L-2	100% Acrylic Latex	PVC and CPVC pipe	Exterior, direct sunlight exposure.
L-3	100% Acrylic- to Metal	Ferrous Metal	Interior or Exterior
L-4	Acrylic Latex	Wood	Interior
M-1	Petrolatum based mastic or wax based wrapping tapes	Metal	Below grade (buried) or where little to no surface preparation can be performed on piping or structural steel.
M-2	Epoxy mastic or equal	Ferrous Metal	Interior moderately, corrosive environment, confined enclosures, where minimal surface preparation is possible. Non-immersed.
S-1	Penetrating acrylic stain, color required	Concrete	Non-immersed, exposure to moisture and sunlight.
S-2	Silane or Siloxane or Blended Siloxane & Silane Sealer	Concrete Floors	Non-immersed, non-corrosive. Interior or exterior for waterproofing.
S-3	Silane or Siloxane or Blended Siloxane & Silane Sealer	Concrete or Masonry Walls	Exterior or Interior – Weathering Exposure, Non-Corrosive.
AG1	Single Component Silicone Clear	Anti-Graffiti	Exterior Concrete or Steel or previously coated surfaces.

Coating System Specification Sheets (COATSPEC)

Coating System Identification: E-1

1. Coating Material:	Epoxy
2. Surface:	Metal
3. Service Condition:	Interior; exterior, covered, not exposed to direct sunlight, non-corrosive exposure.
4. Surface Preparation:	
a. General:	Shop primed surfaces which are to be incorporated in the work where recoat times have been exceeded shall be prepared in the field by cleaning surfaces by sanding to produce uniform profile of .5 to 1.0 mils and solvent cleaned per SSPC-SP 1. Damaged shop coated areas shall be cleaned in accordance with SSPC-SP6/NACE #3 Commercial Abrasive Blast Cleaning or SSPC-SP 11 to achieve a uniform surface profile of 2.0 to 2.5 mils in the metal substrate and spot primed with the primer specified. Shop epoxy primed surfaces shall require light abrasive sanding and vacuum cleaning prior to receiving finish coats.
b. Ferrous Metal:	Bare ferrous metal surfaces shall be prepared in accordance with SSPC-SP 6/NACE#3 (Commercial Blast Cleaning) to achieve a uniform, surface profile of 2.0 to 2.5 mils.

Coating System Specification Sheets (COATSPEC)	
c. Nonferrous and Galvanized Metal:	Ferrous metal with rust bleeding shall be cleaned in accordance with SSPC-SP 1. Areas of rust penetration shall be spot blasted to SSPC-SP6/NACE#3 Commercial blast (to achieve the 2.0- to 2.5-mil surface profile) and spot primed with the specified primer. For ductile iron surfaces, refer to the requirements in paragraph 3.02 Metallic Surfaces.
5. Application	Field
a. General:	Prime coat may be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
b. Ferrous Metal:	Prime coats shall be an epoxy primer compatible with the specified finish coats and applied in accordance with the written instructions of the CSM.
c. Nonferrous and Galvanized Metal:	Nonferrous and galvanized metal shall be cleaned prior to the application of the prime coat in accordance with SSPC-SP 1 (Solvent Cleaning).
6. System Thickness:	10 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	One or more coats at CSM's recommended DFT per coat to achieve the specified system thickness.
Coating System Identification: E-1-G	
1. Coating Material:	Epoxy
2. Surface:	Galvanized Steel
3. Service Condition:	Interior; exterior, covered, non-corrosive exposure.
4. Surface Preparation:	
a. General:	Damaged galvanized steel areas with exposed ferrous metal and/or rusted shall be cleaned in accordance with SSPC-SP 16 to achieve a uniform 1.0- to 1.5-mil profile and spot primed with the primer specified.
b. Galvanized Metal:	Nonferrous and galvanized metal shall be prepared in accordance with SSPC-SP 16 to impart a 1- to 2-mil profile to the galvanized steel surfaces. Where this cannot be performed due to access limits, prepare by abrading in accordance with SSPC-SP 3, Power Tool Cleaning to impart a 1.0- to 1.5-mil profile uniformly to the galvanized steel surfaces.
5. Application:	Field
a. General:	Prime coat may be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
b. Galvanized Metal:	Nonferrous and galvanized metal shall be cleaned prior to the application of the prime coat in accordance with SSPC-SP 1 (Solvent Cleaning).
6. System Thickness:	5 to 8 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	One or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: E-2	
1. Coating Material:	Epoxy
2. Surface:	Metal
3. Service Condition:	Non-immersed, moderately corrosive environment, color required.
4. Surface Preparation:	

Coating System Specification Sheets (COATSPEC)	
a. Ferrous Metal:	Ferrous metal surfaces shall be prepared in accordance with SSPC-SP 5 (White Metal Blast Cleaning) to achieve a uniform surface profile of 2.0 to 2.5 mils.
	Damaged shop coating shall be cleaned in accordance with SSPC-SP6/NACE #3 Commercial Blast Cleaning or SSPC-SP 11 and vacuum cleaning and spot primed with the primer specified. Shop epoxy primed surfaces shall require light abrasive blasting or abrading prior to receiving finish coats if the maximum recoat time for the primer has been exceeded. This cleaning must produce a uniform 1.0- to 1.5-mil profile in the intact shop primer. For ductile iron surfaces, refer to the requirements in paragraph 3.02 Metallic Surfaces.
b. Nonferrous and Galvanized Metal:	Nonferrous and galvanized metal shall be prepared in accordance with SSPC-SP 16 to achieve a uniform surface profile of 1.0 to 1.5 mils. Galvanized steel with this E-2 coating system shall not be used in routinely wet exposures.
5. Application:	Field
a. General:	Prime coat may be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
b. Ferrous Metal:	Prime coat shall be an epoxy primer compatible with the specified finish coats.
c. Nonferrous and Galvanized Metal:	Nonferrous and galvanized metal, non-immersed, shall be coated prior to the application of the prime coat with a grease emulsifying agent in accordance with the CSM's written instructions. Nonferrous metal to be immersed shall not be painted. Galvanized metal shall not be immersed even if it is painted. If non-ferrous metals are not to be immersed, prepare in accordance with SSPC-SP 16.
6. System Thickness:	16 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: E-2-C	
1. Coating Material:	Epoxy
2. Surface:	Concrete or masonry
3. Service Condition:	Non-immersed, lightly corrosive vapor environment, color required.
4. Surface Preparation:	
a. Concrete:	Concrete surfaces shall be allowed to cure for at least 28 days following initial concrete placement and allowed to dry to the moisture content recommended by the CSM before coating work proceeds. Moisture content shall be tested per ASTM D4263, Moisture Test by Plastic Sheet Method. Any moisture on back of plastic sheet means coating application cannot proceed until the concrete or masonry has dried out. See section 3.02 for further testing requirements. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting and chipping, and voids and cracks shall be repaired as specified in Section 03 30 00. Cleaning can be performed using abrasive blast cleaning as per SSPC-SP 13/NACE #6 and SSPC SP CAB 1 or water blast cleaning methods to produce a minimum concrete surface profile of CSP 3 in accordance with ICRI 310.2. After cleaning, all air voids or bugholes in the concrete shall be filled with a surfacer or block filler compatible with the specified primer and finish coats.

Coating System Specification Sheets (COATSPEC)	
b. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping.
	Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances.
	Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Application:	Field
a. General:	Apply filler/surfacer as recommended by CSM to fill bugholes and air voids or block texture, etc. leaving a uniformly filled surface that does not produce blowholes or outgassing causing pinholes in the coating system.
	All concrete or masonry surfaces shall be in an SSD condition during all cementitious repair processes meeting most stringent requirements identified by repair product manufacturer.
	Filler/Surfacers shall dry a minimum of 48 hours prior to application of prime coat or as required by the CSM.
	Prime coat shall be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
	Drying time between coats shall be as recommended by CSM.
6. System Thickness:	16 to 20 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: E-3	
1. Coating Material:	Epoxy
2. Surface:	Concrete or masonry
3. Service Condition:	Non-immersed, moderately corrosive vapor environment, color required.
4. Surface Preparation:	
a. Concrete:	Concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM before coating work proceeds. Moisture testing shall be performed in accordance with ASTM D4263, Moisture by Plastic Sheet Test. Any moisture on back of plastic sheet means coating application cannot proceed until the concrete or masonry has dried out. See section 3.02 for further testing requirements. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting and chipping, and voids and cracks shall be repaired as specified in Section 03 30 00. Surface preparation can be performed by abrasive blast cleaning as per SSPC-SP 13/NACE #6 and SSPC SP CAB 1 or high pressure water jet cleaning and must achieve a uniform concrete surface profile of CSP 3 in accordance with ICRI 310.2. After cleaning, air voids or bugholes in the concrete shall be filled with a surfacer or block filler compatible with the specified primer and finish coats.

Coating System Specification Sheets (COATSPEC)	
b. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping.
	Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign, loose, and deleterious substances.
	Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Application:	Field
a. General:	Apply filler/surfacer as recommended by CSM to fill bugholes and air voids or block texture, etc. leaving a uniformly filled surface that does not produce blowholes or outgassing causing pinholing of the coating system. Filler/surfacers shall dry a minimum of 48 hours prior to application of prime coat or as required by the CSM.
	Prime coat shall be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
	Drying time between coats shall be as recommended by CSM.
6. System Thickness:	15 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: E-4	
1. Coating Material:	Epoxy
2. Surfaces:	Concrete, masonry, plaster, gypsum board
3. Service Condition:	Interior
4. Surface Preparation:	
a. Concrete:	Concrete surfaces shall be allowed to age for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content of gypsum and plaster surfaces may be tested with a Delmhorst Instrument Company moisture detector, or equal. Moisture levels of concrete and masonry shall be tested as per section 3.02. Moisture coated as recommended by the CSM must be met prior to coating application. Loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces, and voids and cracks shall be repaired as specified in Section 03 30 00. Surface preparation shall produce a concrete surface profile of CSP 2 in accordance with ICRI 310.2. After cleaning, air voids or bugholes in the concrete shall be filled with a surfacer or block filler compatible with the specified primer and finish coats.
b. Masonry:	Masonry surfaces shall be allowed to age for at least 28 days. Holes or other joint defects shall be filled with mortar and repointed. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, exterior masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.

Coating System Specification Sheets (COATSPEC)	
c. Plaster:	Plaster surfaces shall be dry, clean, and free from grit, loose plaster, and surface irregularities. Cracks and holes shall be repaired with acceptable patching materials, keyed to existing surfaces, and sandpapered smooth. Surfaces shall be cleaned with clean water by washing and scrubbing to remove foreign and deleterious substances.
5. Application:	Field
a. General:	Block Filler shall be multiple component epoxy block filler or an acrylic based or waterborne epoxy based block filler and shall dry a minimum of 48 hours prior to primer application or as required by the CSM.
	Prime coat shall be thinned and applied as recommended by CSM, provided the coating as applied complies with prevailing air pollution control regulations.
	Drying time between coats shall be as recommended by CSM.
6. System Thickness:	10 mils dry film, excluding block filler and sealer.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	One or more coats at CSM's recommended DFT per coat to the specified system thickness
Coating System Identification: E-5	
1. Coating Material:	Polyamidoamine epoxy
2. Surface:	Metal or concrete
3. Service Condition:	Below grade (buried, exterior) in contact with soil.
4. Surface Preparation:	
a. Ferrous Metal:	Ferrous metal surfaces shall be prepared in accordance with SSPC-SP 10 (Near White Metal Blast Cleaning).
b. Nonferrous Metal:	Nonferrous and galvanized metal shall be prepared in accordance with SSPC-SP 16 to achieve a uniform surface profile of 2.0 to 2.5 mils.
c. Concrete:	Concrete surfaces shall be allowed to age for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested in accordance with ASTM D4263, Moisture by Plastic Sheet Method. Any moisture on back of plastic sheet means coating cannot proceed until the concrete or masonry has dried out. Except as otherwise specified, loose concrete and laitance shall be removed from surfaces by abrasive blasting as per SSPC CAB #1 and SSPC SP 13/NACE #6 and chipping. Voids and cracks shall be repaired as specified in Section 03 30 00. Concrete surface preparation can be performed using abrasive blast cleaning or water blast cleaning methods and must achieve a concrete surface profile of CSP 3 in accordance with ICRI 310.2.
5. Application:	Field
6. System Thickness:	16 mils
7. Coating:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: WBPU-1	
1. Coating Material:	Clear Polyurethane
2. Surface:	Wood
3. Service Condition:	Interior

Coating System Specification Sheets (COATSPEC)	
4. Surface Preparation:	Wood surfaces shall be cleaned of dirt, oil or other foreign substances with mineral spirits, scrapers, sandpaper, or wire brush. Finished surfaces exposed to view shall be smoothed by planing or sandpapering. Millwork shall be sandpapered and given a coat on sides and raw edges before installation. Built-in surfaces of windowsills shall be double coated. Glazing rabbets and beads in exterior sash and doors shall be double coated. Small, dry, seasoned knots shall be surface scraped, sandpapered, and thoroughly cleaned and shall be given a thin coat of a clear knot sealer before application of the first coat. Large, open, unseasoned knots, and beads or streaks of pitch shall be scraped off; however, if the pitch is still soft, it shall be removed with mineral spirits or turpentine, and the resinous area shall be coated with knot sealer prior to coating. After the first coat, holes and imperfections shall be filled with putty or plastic wood, allowed to dry and sandpapered smooth.
5. Application:	Field
a. General:	Prime coat shall be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
6. System Thickness:	2-3 Coats as per CSM Instructions.
7. Coatings:	
a. Primer:	One coat at CSM's recommended application instructions.
b. Finish:	One or more coats at CSM's recommended application instructions.
Coating System Identification: ELA-1	
1. Coating Material:	Elastomeric Acrylic
2. Surface:	Concrete or Dense Masonry where existing crack or joint movement is suspected due to thermal conditions and would propagate through rigid epoxy coating systems and for exterior weathering protection, breathability and aesthetics.
3. Service Condition:	Interior or exterior, above grade, non-submerged direct sunlight – moderately corrosive due to vapor corrosion environment.
4. Surface Preparation:	
	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party.
	If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials.

Coating System Specification Sheets (COATSPEC)	
a. Concrete:	Concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested per ASTM D4263, Moisture by Plastic Sheet Test. Any moisture on back of plastic sheet means coating cannot proceed until the concrete or masonry has dried out. See section 3.02 for further testing requirements. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by Low Pressure Water Cleaning (LPWC with Pressures < 5000 psi) or by abrasive blasting and chipping as per SSPC-SP 13/NACE #6/SSPC-CAB #1-3. Voids and cracks shall be repaired as specified in Section 03 30 00. Surface Preparation may open up all shelled-over air voids or bugholes to expose fully the void's depth, width, and length. Filling materials may be required to provide the best aesthetic appeal. If abrasive blasting, the concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 1-2 in accordance with ICRI 310.2.
5. Application:	Field
a. General:	Surfacer or fillers can be applied with these coating systems per CSM's recommendations prior to application of prime coat to fill bugholes and voids. These materials must be compatible with the primers and finish coats or preferably, a more textured version of this coating system can be selected to fill air voids (bugholes), etc. All cementitious products shall be applied to surfaces in an SSD condition.
	Prime coat shall be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
6. System Thickness:	16 to 24 mils DFT
7. Coatings:	
a. Primer:	One coat at 3-5 mils DFT
b. Finish:	One or more coats at CSM's recommended DFT per coat to the specified system thickness
c. Testing:	Visual inspection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes that must be repaired.
d. Pinhole and Holiday Repair Procedure:	Pinholes or holidays identified by visual inspection shall be repaired per the CSM's recommendations.
Coating System Identification: EU-1	
1. Coating Material:	Zinc-Epoxy-Polyurethane System
2. Surface:	Ferrous Metal
3. Service Condition:	Exterior, exposed to direct sunlight, moderately corrosive, non-immersed.
4. Surface Preparation:	
a. General:	Undamaged shop primed surfaces which have exceeded recoat times which are to be incorporated in the work shall be prepared in the field by sanding to produce a uniform surface profile followed by Solvent Cleaning per SSPC-SP 1. Damaged shop coated areas shall be cleaned in accordance with SSPC-SP 11 and recoated with the primer specified.
b. Ferrous Metal:	Bare ferrous metal surfaces shall be prepared in accordance with SSPC-SP 6 (Commercial Blast Cleaning) 2.0–2.5 mils. Ductile iron surfaces to be coated shall be abrasive blast cleaned in accordance with paragraph 3.02 Metallic Surfaces.
	Ferrous metal with rust bleeding shall be cleaned in accordance with SSPC-SP 11 (Power Tool Cleaning to Bare Metal). Areas of rust penetration shall be spot blasted to SSPC-SP 6/NACE #3 10 (Commercial Near White Blast Cleaning) and spot primed with the specified primer.

Coating System Specification Sheets (COATSPEC)	
c. Galvanized Metal:	Damaged galvanized steel areas with exposed ferrous metal and/or rusted shall be cleaned in accordance with SSPC-SP 165 (White Metal Brush Off Abrasive Blast Cleaning for Galvanized and Non-Ferrous metal) or Power Tool Cleaned to Bare Metal in accordance with SSPC-SP 11 to achieve a uniform 1.0- to 1.5-mil profile. The zinc primer is NOT used on galvanized steel but is spot primed with the primer specified for galvanized metal as recommended by the CSM.
	Nonferrous and galvanized metal shall be prepared in accordance with SSPC-SP 16 (Brush Off Abrasive Blast Cleaning for Galvanized and Non-Ferrous metal) to impart a 1.0- to 2.0-mil profile to the galvanized or non-ferrous steel surfaces. Where this cannot be performed, prepare by abrading in accordance with SSPC-SP 113, Power Tool Cleaning to bare metal to impart a 1.0- to 1.5-mil profile uniformly to the galvanized steel surfaces.
	For EU-1 over galvanized steel, **DELETE the zinc rich primer**.
5. Application:	Field
a. General:	Prime coat may be thinned and applied as recommended by the CSM, provided the coating as applied complies with prevailing air pollution control regulations.
b. Ferrous Metal:	Prime coats shall be a zinc rich epoxy or polyurethane primer compatible for use with urethane finish coats and applied in accordance with written instructions of the CSM or in the case of CARB or SCAQMD applications, prime with specified primer that is not zinc rich. In these cases, only a 2-coat system is applied.
6. System Thickness:	3-4 mils of zinc rich primer, one intermediate or primer epoxy coat at 5-6 mils and one finish coat of polyurethane at 2-3 mils DFT.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT
b. Intermediate:	One coat at CSM's recommended DFT
c. Finish:	One coat at CSM's recommended DFT per coat to meet the specified system thickness
Coating System Identification: EFL-1	
1. Coating Material:	100% Solids Chemical Resistant Novolac Epoxy with Anti-Slip Aggregate Broadcast
2. Surface	Concrete
3. Service Condition	Interior areas subject to chemical splash and spill (NOT SECONDARY CONTAINMENT)
4. Surface Preparation:	
a. General	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedment's in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party.

Coating System Specification Sheets (COATSPEC)	
b. Concrete	Concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested per ASTM D4263, Moisture by Plastic Sheet Test. Any moisture on back of plastic sheet means coating cannot proceed until the concrete has dried out. See section 3.02 for further testing requirements. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces. Prepare all surfaces by shot blasting as per SSPC SP-13/NACE#6 M-SB. Filling materials may be required to provide the best aesthetic appeal. If abrasive blasting, the concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 3 in accordance with ICRI 310.2. unless otherwise directed by the CSM.
5. Application	Field
a. General	Surfacers, fillers or leveling/sloping materials can be applied with these coating systems per CSM's recommendations prior to application of prime coat to fill voids, holes or to appropriately slope or level the floors. These materials must be compatible with primers and finish coats. All cementitious products shall be applied to surfaces in an SSD condition.
	All materials shall be applied as per the strict instructions of the CSM.
6. System Thickness	26-40 mils (Varies Depending on CSM) The various CSM's have different approaches and film thickness requirements for the system. The CSA shall consult the CSM for total film thickness requirements
7. Coatings	
a. Primer	One Coat at 8-10 mils
b. Body Coat	One Coat at 12-15 mils with 20/40 mesh Anti-Slip Aggregate Broadcast into the wet coating at sufficient volume to provide the desired anti-slip profile through the topcoat. A mockup of the level of anti-slip must be performed to ensure the level of anti-slip is acceptable to the owner. Overly aggressive anti-slip aggregate can make cleaning the floor difficult. When the anti-slip aggregate is added by broadcast the CSA shall backroll the material to ensure encapsulation of the aggregate into the material. The Tnemec system uses 50/70 mesh aggregate rather than the 20/40 mesh aggregate used by PPG and Sherwin Williams.
c. Finish	6-15 mils (Varies Depending on CSM) The various CSM's have different approaches and film thickness requirements for the topcoat. The CSA shall consult the CSM for topcoat film thickness requirements.
8. Testing	Visual inspection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes that must be repaired. Visual inspection to ensure proper application and film quality and level of acceptable anti-slip agreed upon in the mockup.
9. Pinhole and Holiday Repair Procedure:	Pinholes, holidays and other film defects identified by visual inspection shall be repaired per the CSM's recommendations.
Coating System Identification: EFL-2	
1. Coating Material	100% Solids Epoxy Floor Coating
2. Surface	Concrete
3. Service Conditions	Interior Floors in Common Areas not subjected to chemical exposure or UV.
4. Surface Preparation	

Coating System Specification Sheets (COATSPEC)	
a. General	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedment's in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party.
b. Concrete	Concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested per ASTM D4263, Moisture by Plastic Sheet Test. Any moisture on back of plastic sheet means coating cannot proceed until the concrete has dried out. See section 3.02 for further testing requirements. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces. Prepare all surfaces by shot blasting as per SSPC SP-13/NACE#6 M-SB. Filling materials may be required to provide the best aesthetic appeal. If abrasive blasting, the concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 3 in accordance with ICRI 310.2. unless otherwise directed by the CSM.
5. Application	Field
a. General	Surfacers, fillers or leveling/sloping materials can be applied with these coating systems per CSM's recommendations prior to application of prime coat to fill voids, holes or to appropriately slope or level the floors. These materials must be compatible with primers and finish coats. All cementitious products shall be applied to surfaces in an SSD condition.
	All materials shall be applied as per the strict instructions of the CSM.
6. System Thickness	26-40 mils (Varies Depending on CSM) The various CSM's have different approaches and film thickness requirements for the system. The CSA shall consult the CSM for total film thickness requirements
7. Coatings	
a. Primer	One Coat at 8-10 mils
b. Body Coat	One Coat at 12-15 mils with 20/40 mesh Anti-Slip Aggregate Broadcast into the wet coating at sufficient volume to provide the desired anti-slip profile through the topcoat. A mockup of the level of anti-slip must be performed to ensure the level of anti-slip is acceptable to the owner. Overly aggressive anti-slip aggregate can make cleaning the floor difficult. When the anti-slip aggregate is added by broadcast the CSA shall backroll the material to ensure encapsulation of the aggregate into the material. The Tnemec system uses 50/70 mesh aggregate rather than the 20/40 mesh aggregate used by PPG and Sherwin Williams.
c. Finish	One Coat at 6-15 mils (Varies Depending on CSM) The various CSM's have different approaches and film thickness requirements for the topcoat. The CSA shall consult the CSM for topcoat film thickness requirements.
8. Testing	Visual inspection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes that must be repaired. Visual inspection to ensure proper application and film quality and level of acceptable anti-slip agreed upon in the mockup.
9. Pinhole and Holiday Repair Procedure.	Pinholes, holidays and other film defects identified by visual inspection shall be repaired per the CSM's recommendations.
Coating System Identification: EFL-3	

Coating System Specification Sheets (COATSPEC)	
1. Coating Material	100% Solids Epoxy Floor Coating /UV Resistant Polyurethane/Polyaspartic
2. Surface	Concrete
3. Service Condition	Exterior concrete floor surfaces subjected to UV but not subjected to chemical exposure, or interior concrete floor surfaces with UV exposure
4. Surface Preparation	
a. General	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedment's in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party.
b. Concrete	Concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested per ASTM D4263, Moisture by Plastic Sheet Test. Any moisture on back of plastic sheet means coating cannot proceed until the concrete has dried out. See section 3.02 for further testing requirements. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces. Prepare all surfaces by shot blasting as per SSPC SP-13/NACE#6 M-SB. Filling materials may be required to provide the best aesthetic appeal. If abrasive blasting, the concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 3 in accordance with ICRI 310.2. unless otherwise directed by the CSM.
5. Application	Field
a. General	Surfacers, fillers or leveling/sloping materials can be applied with these coating systems per CSM's recommendations prior to application of prime coat to fill voids, holes or to appropriately slope or level the floors. These materials must be compatible with primers and finish coats. All cementitious products shall be applied to surfaces in an SSD condition.
	All materials shall be applied as per the strict instructions of the CSM.
6. System Thickness	26-52 mils (Varies Depending on CSM) The various CSM's have different approaches and film thickness requirements for the system. The CSA shall consult the CSM for total film thickness requirements
7. Coatings	
a. Primer	One Coat at 8-10 mils
b. Body Coat	One Coat at 12-15 mils with 20/40 mesh Anti-Slip Aggregate Broadcast into the wet coating at sufficient volume to provide the desired anti-slip profile through the topcoat. A mockup of the level of anti-slip must be performed to ensure the level of anti-slip is acceptable to the owner. Overly aggressive anti-slip aggregate can make cleaning the floor difficult. When the anti-slip aggregate is added by broadcast the CSA shall backroll the material to ensure encapsulation of the aggregate into the material. The Tnemec system uses 50/70 mesh aggregate rather than the 20/40 mesh aggregate used by PPG and Sherwin Williams.
c. Finish	One Coat at 2 - 9.6 mils (Varies Depending on CSM) The various CSM's have different approaches and film thickness requirements for the topcoat. The CSA shall consult the CSM for topcoat film thickness requirements.
8. Testing	Visual inspection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes that must be repaired.

	Visual inspection to ensure proper application and film quality and level of acceptable anti-slip agreed upon in the mockup.
9. Pinhole and Holiday Repair Procedure	Pinholes, holidays and other film defects identified by visual inspection shall be repaired per the CSM's recommendations.
Coating System Identification: EU-1-FRP	
1. Coating Material:	Epoxy Primer plus Polyurethane Finish Coat.
2. Surface:	Exterior of FRP Pipe and Tanks, etc.
3. Service Condition:	Exterior, exposed to direct sunlight, non-immersed.
4. Surface Preparation:	
a. General:	Clean to remove loose dirt, dust, or other contaminants.
	Prepare surfaces by sanding to produce roughness to achieve a uniform, minimum surface profile of 1.5 to 2.0 mils. Abrasive Sweep blasting can also be used providing care is taken not to over blast.
	Solvent clean thoroughly using solvent as recommended by the CSM.
	Thoroughly clean to remove loose debris by vacuum cleaning.
5. Application:	Field
a. General:	Apply primer coat and thin as recommended by the CSM provided the coating applied complies with prevailing air pollution control regulations.
	Apply finish coat as recommended by the CSM.
6. System Thickness:	Primer to 2-4 mils and finish coat is 2-3 mils DFT.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	One coat at CSM's recommended DFT per coat to meet the specified system thickness.
Coating System Identification: G	
1. Coating Material:	Grease
2. Surface:	Metal
3. Surface Preparation:	
a. Ferrous Metal:	Ferrous metal surfaces shall be prepared in accordance with SSPC-SP 1 (Solvent Cleaning).
4. Application:	Field
	Coating shall be applied with stiff brush, hand swab, or airless spray gun.
5. System Thickness:	50 square feet per gallon.
6. Coating:	One coat of grease coating.
Coating System Identification: HH-1	
1. Coating Material:	Formulations vary by manufacturer.
2. Surface:	Metal
3. Service Condition:	Temperature to 400 degrees F.
4. Surface Preparation:	Metal surfaces shall be prepared in accordance with SSPC-SP 10 (Near White Metal Blast Cleaning) to achieve a uniform surface profile of 2.0 to 2.5 mils.
5. Application:	Field
	Curing as required by CSM.
6. System Thickness:	6.5 to 10 mils dry film varies by manufacturer.

Coating System Specification Sheets (COATSPEC)	
7. Coating:	DFT varies by manufacturer.
Coating System Identification: HH-2	
1. Coating Material:	Formulations vary by manufacturer.
	TMIC – Titanium Modified Inorganic Co-polymer.
2. Surface:	Metal
3. Service Condition:	Temperature to 1200 degrees F
4. Surface Preparation:	Metal surfaces shall be prepared in accordance with SSPC-SP 10 (Near White Metal Blast Cleaning) to achieve a uniform surface profile of 2.0 to 2.5 mils.
5. Application:	Field
	Curing as required by CSM.
6. System Thickness:	6.5 to 10 mils dry film varies by manufacturer.
7. Coating:	DFT varies by manufacturer.
Coating System Identification: L-1	
1. Coating Material:	100 percent Acrylic Latex.
2. Surfaces:	Concrete, masonry, plaster, gypsum board.
3. Service Condition:	Interior including existing coated concrete.
4. Surface Preparation:	
a. Concrete:	Concrete surfaces shall be allowed to age for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content of gypsum and plaster surfaces shall be tested with a Delmhorst Instrument Company moisture detector, or equal. Moisture levels of concrete and masonry shall be tested as per ASTM D4263, Plastic Sheet Method and section 3.02. Moisture content must meet CSM's recommendation for coating work to proceed. Loose concrete and laitance shall be removed from surfaces, and voids and cracks shall be repaired as specified in Section 03 30 00.
b. Existing Coated Concrete:	Remove all loose coating down to a sound substrate or intact, well-adhered existing coating by scraping or other means. Then, abrade all surfaces to achieve a 0.5 to 1.5-mil uniform profile and vacuum clean to remove all loose dirt, paint chips, and dirt.
c. Masonry:	Masonry surfaces shall be allowed to age for at least 28 days. Holes or other joint defects shall be filled with mortar and repointed. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be filled with block filler compatible with the specified primer.
d. Plaster:	Plaster surfaces shall be dry, clean, and free from grit, loose plaster, and surface irregularities. Cracks and holes shall be repaired with acceptable patching materials, keyed to existing surfaces, and sandpapered smooth. Surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. After cleaning, surfaces shall be sealed with a compatible sealer.
e. Gypsum Wallboard:	Tape joints and spackled nail heads shall be sanded smooth and dusted. Seal with PVA sealer for interior uses only.
5. Application:	Field
a. General:	Sealer or filler shall dry a minimum of 48 hours prior to primer application.
	Drying time between coats shall be as recommended by CSM.

Coating System Specification Sheets (COATSPEC)	
6. System Thickness:	4 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: L-2	
1. Coating Material:	100 percent Acrylic Latex.
2. Surface:	PVC and CPVC pipe.
3. Service Condition:	Interior and Exterior non-corrosive to mildly corrosive atmospheres suitable for direct sunlight exposure.
4. Surface Preparation:	Plastic pipe shall be cleaned with solvent compatible with the specified primer and sanded to roughen surfaces to achieve a uniform surface profile of 1.0 to 1.5 mils. Vacuum clean or wipe with a damp rag after sanding to remove all loose dust, plastic particles, and dirt.
5. Application:	Field
6. System Thickness:	3 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	One or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: L-3	
1. Coating Material:	100 percent Acrylic – Direct to Metal or with a Primer.
2. Surface:	Ferrous Metal, Galvanized Metal and Non-Ferrous Metals.
3. Service Condition:	Interior or Exterior
4. Surface Preparation:	
a. Ferrous Metals:	Bare ferrous metal surfaces shall be prepared in accordance with SSPC-SP 6/NACE #3 (Commercial Blast Cleaning) unless specified otherwise. Impart a 1.5- to 2.0-mil profile to substrate.
	Ferrous metal with rust bleeding shall be cleaned in accordance with SSPC-SP 1 (Solvent Cleaning). Areas of rust penetration shall be spot blasted to SSPC-SP 10/NACE #2 (Near White Blast) and spot primed with the specified primer.
	Shop primed surfaces which are to be incorporated in the work shall be prepared in the field by cleaning surfaces in accordance with SSPC-SP 2 (Hand Tool Cleaning) or SSPC-SP 3 (Power Tool Cleaning).
b. Nonferrous and Galvanized Metal:	Galvanized or nonferrous surfaces shall be prepared in accordance with SSPC-SP 1 (Solvent Cleaning) for doors and frames and other general usage or SSPC-SP 16 in areas where a more robust surface preparation is required. Solvent clean as per SSPC-SP 1 or vacuum clean after Brush Blast Cleaning in accordance with SSPC-SP 16.
5. Application:	Field
6. System Thickness:	4 to 6 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: L-4	

Coating System Specification Sheets (COATSPEC)	
1. Coating Material:	Acrylic Latex
2. Surface:	Wood
3. Service Condition:	Interior
4. Surface Preparation:	Wood surfaces shall be cleaned of dirt, oil or other foreign substances with mineral spirits, scrapers, sandpaper, or wire brush. Finished surfaces exposed to view shall be smoothed by planing or sandpapering. Millwork shall be sandpapered and given a coat of the specified primer on all sides before installation. Built-in surfaces of windowsills shall be double primed. Glazing rabbets and beads in exterior sash and doors shall be double primed. Small, dry, seasoned knots shall be surface scraped, sandpapered, and thoroughly cleaned and shall be given a thin coat of an acceptable knot sealer before application of the priming coat. Large, open, unseasoned knots, and beads or streaks of pitch shall be scraped off; however, if the pitch is still soft, it shall be removed with mineral spirits or turpentine, and the resinous area shall be coated with knot sealer prior to priming. After priming, holes and imperfections shall be filled with putty or plastic wood, colored to match the finish coat, allowed to dry, and sandpapered smooth.
5. Application:	Field
6. System Thickness:	4.0- 6.0 mils dry film.
7. Coatings:	
a. Primer:	One coat at CSM's recommended DFT.
b. Finish:	Two or more coats at CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: M-1	
1. Coating Material:	Petrolatum based mastic or wax based wrapping tapes.
2. Surfaces:	Metal
3. Service Condition:	Below grade (buried) or where little to no surface preparation can be performed on piping or structural steel.
4. Surface Preparation:	Remove loose scale, rust, dirt, excessive moisture, or frost from the surface in accordance with SSPC-SP 2 (Hand Tool Cleaning).
5. Application:	All surfaces shall be hand rubbed or brushed with a priming paste recommended by the CSM. Sharp projections such as threads, irregular contours, or badly pitted areas shall receive a liberal amount of priming paste to ensure maximum protection of metal throughout.
	On irregular shaped surfaces, (i.e., nuts, bolts, flanges, valves, etc.) the Contractor shall use either of the following systems recommended by the CSM.
	A. Apply recommended mastic by hand in sufficient quantity to build an even contour over entire surface. The Contractor shall pay particular attention to ensure that folds and air pockets within the mastic layer are thoroughly pressed out prior to subsequent application of tape.
	OR:
	B. An extra layer of tape shall be cut and carefully molded around sharp projections, nuts, bolts, etc., before final application of tape, in order to meet specified system thickness.
	Tape shall be spirally wrapped with a 55-percent overlap and sufficient tension and pressure to provide continuous adhesion without stretching the tape. Edges of tape must be continuously smoothed and sealed by hand during wrapping. On vertical application, contractor shall begin at bottom and proceed upward creating a weatherboard overlap.
6. System Thickness:	Smooth contours shall have a minimum thickness of 50 mils while nuts, bolts, and sharp projections shall be 100 mils.

Coating System Specification Sheets (COATSPEC)	
7. Tape:	Number and types of tape wraps shall be in accordance with the CSM's written instructions.
Coating System Identification: M-2	
1. Coating Material:	Epoxy mastic or equal
2. Surface:	Ferrous Metal
3. Service Condition:	Interior, corrosive environment, confined enclosures, where minimal surface preparation is possible.
4. Surface Preparation:	
a. Ferrous Metal:	All uncoated ferrous metal surfaces shall be prepared in accordance with SSPC-SP 3 (Power Tool Cleaning), or SSPC-SP 11 (Power to Cleaning to Bare Metal) and SSPC Hand Tool Cleanings prior to assembly. Surface preparation to achieve a uniform surface profile of 2.0 to 2.5 mils. Shop primed ferrous metal surfaces and fabricated assemblies shall be clean and dry prior to the application of field coats. Following assembly, the Contractor shall smooth welds and prominences using power tools prior to the application of the field applied coatings.
5. Application:	Field
a. General:	Prior to the application of field applied coatings, welds, back-to-back angles, sharp or rough edges and weld splatter shall be brushed with the specified prime coat and allowed to cure overnight.
6. System Thickness:	10-15 mils dry film.
7. Coatings:	
a. Prime:	One coat of the CSM's recommended DFT.
b. Finish:	One or more coats of CSM's recommended DFT per coat to the specified system thickness.
Coating System Identification: S-1	
1. Coating Material:	Penetrating acrylic stain, color required.
2. Surface:	Concrete
3. Service Condition:	Non-immersed, exposure to moisture and sunlight.
4. Surface Preparation:	Low pressure water cleaning (LPWC at pressures <5000 psi or industry standard acid etch or other preparation as approved by the CSM).
5. Application:	
a. General:	Drying time between coats shall be as specified by the CSM for the site conditions.
b. Coatings:	Minimum of two coats overall (coat as many times as required to achieve desired color).
6. System Thickness:	200 square feet per gallon maximum or as recommended by the CSM
7. Color Selection:	As approved by the Owner.
Coating System Identification: S-2	
1. Coating Material:	Penetrating Water Repellent (Clear and Non-Film Building).
2. Surface:	Concrete Floors
3. Service Condition:	Exterior and Interior
4. Surface Preparation:	Clean surfaces of all traces of dirt, dust, efflorescence, mold, salt, grease, oil, asphalt, laitance, curing compounds, paint, coatings, and other foreign materials by low pressure water cleaning (LPWC at pressures <5000 psi) and/or chemical cleaners or other preparation as approved by the CSM.

Coating System Specification Sheets (COATSPEC)	
a. Concrete	Concrete surfaces shall be allowed to age for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested with a Delmhorst Instrument Company moisture detector or equal. Acceptable content for coating application to be recommended by CSM. Loose concrete and laitance shall be removed from surfaces, and voids and cracks shall be repaired as specified in Section 03 30 00.
5. Application:	
a. General:	As per CSM's instructions. Drying time before placing into service shall be as recommended by the CSM for site conditions.
6. System Coverage:	Follow CSM's recommendations.
7. Color Selection:	Clear
Coating System Identification: S-3	
1. Coating Material:	Penetrating Water Repellent (Clear & Non-Film Building).
2. Surface:	Concrete and Masonry Walls
3. Service Condition:	Exterior and Interior
4. Surface Preparation:	Clean surfaces of all traces of dirt, dust, efflorescence, mold, salt, grease, oil, asphalt, laitance, curing compounds, paint, coatings, and other foreign materials by brush-off blast, low pressure water cleaning (LPWC at pressures <5000 psi) and/or chemical cleaners or other preparation as approved by the CSM.
a. Concrete	Concrete surfaces shall be allowed to age for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested with a Delmhorst Instrument Company moisture detector or equal. Acceptable moisture content to be as recommended by the CSM. Loose concrete and laitance shall be removed from surfaces, and voids and cracks shall be repaired as specified in Section 03 30 00.
b. Masonry:	Masonry surfaces shall be allowed to age for at least 28 days. Holes or other joint defects shall be filled with mortar and repointed. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used.
5. Application:	
a. General:	Drying time before placing into service shall be as recommended by the CSM for site conditions.
6. System Coverage:	Follow CSM's recommendations.
7. Color Selection:	Clear
Coating System Identification: AG1	
1. Coating Material:	Single Component Silicone (Clear)
2. Surface:	Concrete and Steel
3. Service Condition:	Exterior
4. Surface Preparation:	Clean surfaces of all traces of dirt, dust, efflorescence, mold, salt, grease, oil, asphalt, laitance, curing compounds, and other foreign materials by, Low Pressure Water Cleaning (LPWC at pressures <5000 psi) and/or chemical cleaners or other preparation as approved by the CSM.
a. Concrete	Concrete surfaces shall be allowed to age for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested with a Delmhorst Instrument Company moisture detector or equal. Acceptable moisture content to be as recommended by the CSM. Loose concrete and laitance shall be removed from surfaces, and voids and cracks shall be repaired as specified in Section 03 30 00.

Coating System Specification Sheets (COATSPEC)	
b. Metals & Coated Surfaces	Previously coated metals and bare non-ferrous metals shall be cleaned by Low Pressure Water Cleaning (LPWC using pressures <5000 psi) to remove all oil, grease, dust, dirt and other foreign contaminants. All surfaces must be dry.
5. Application:	
a. General:	Drying time before placing into service shall be as recommended by the CSM for site conditions.
b. Coatings:	Apply as per CSM instructions.
6. System Thickness:	Follow CSM's recommendations.
7. Color Selection:	Clear

3.06 COATING SYSTEMS SCHEDULE (FINISH SCHEDULE)

A. General:

1. Specific coating systems, colors, and finishes for rooms, galleries, piping, equipment, and other items that are coated are specified in the following coating system schedule. Unless otherwise specified in the coating system schedule, the word "interior" shall mean the inside of a building or structure, and the word "exterior" shall mean outside exposure to weather elements.

Coating Systems Schedule (Finish Schedule)		
Location/Surface	**Coating System Identification**	**Standard Color**
General: All Surfaces not Specified by Area or Structure		
1. Structural Steel and Metal Decking	E-2 or EU-1	Note 2
2. Galvanized metal	Uncoated unless noted otherwise	
3. Stainless steel	Uncoated unless noted otherwise	
4. Equipment and Metal Appurtenances		
a. Equipment, non-immersed, unless otherwise specified		
1) Interior	E-1	Note 2
2) Exterior	EU-1	Note 2
b. High temperature equipment operable at		
1) 200 to 400 degrees F	HH-1	Note 2
2) above 400 degrees F to 1200 degrees F	HH-2	Aluminum or Black
c. Existing equipment		
1) Not damaged nor modified by work in this contract	Uncoated	--
2) Damaged, exposed, or modified by work in this contract		Note 3
a) Interior	E-1	Note 3, Match existing color
b) Exterior	EU-1 without primer	Note 3, Match existing color
d. Diffusers and grilles on coated surfaces, unless otherwise specified		
1) Interior	E-1	Match background color

Coating Systems Schedule (Finish Schedule)

Location/Surface	Coating System Identification	Standard Color
2) Exterior	EU-1	Match background color
e. Diffusers and grilles on uncoated surfaces, unless otherwise specified		
1) Interior	E-1	Match background color
2) Exterior	EU-1	Match background color
f. Existing diffusers and grilles		
1) Not damaged not modified by work in this contract	Uncoated	--
2) Damaged, exposed, or modified by work in this contract		
a) Interior	E-1	Match existing color
b) Exterior	EU-1 without primer	Match existing color
g. Electrical switchgear panels, unit substations, motor control centers, power transformers, distribution centers, and relay panels; interior and exterior	See paragraph 3.03 Electrical and Instrumentation Equipment and Materials	ANSI 61 Grey (outside) FS 27880 White (inside)
h. Instrumentation panels, graphic indicating panels, indicating and transmitting field panels, unless otherwise specified		
1) Interior		FS 26306 Grey (outside) FS 27880 White (inside)
2) Exterior		FS 27722 White (outside) FS 27880 White (inside)
i. Existing electrical and instrumentation panels		
1) Not damaged by work in this contract	Uncoated	--
2) Damaged or exposed to outside surfaces by work in this contract		
a) Interior	E-1	FS 26306 Grey
b) Exterior	EU-1 without primer	FS 26306 Grey (Electrical) FS 27722 White (Instrumentation)
5. Conduit, Piping and Ductwork		
a. Ferrous, non-ferrous and galvanized piping, and appurtenant hangers and supports, non-immersed, unless otherwise specified.		
1) Interior – noncorrosive	E-1	FS 26306 Grey
2) Exterior – noncorrosive	EU-1	FS 26306 Grey
3) Buried piping	M-1 or M-2	Not required
b. Ferrous piping, appurtenant and supports, non-immersed	E-2	To be determined

Coating Systems Schedule (Finish Schedule)

Location/Surface	Coating System Identification	Standard Color
c. Conduit, outlet and junction boxes, lighting transformers, lighting, communication and small power panels, control stations, piping, lagged ductwork, appurtenant hangers, clamps, and supports on coated surfaces, unless otherwise specified.		
1) Interior	E-1	Match background color
2) Exterior	EU-1	Match background color
d. Conduit, outlets and junction boxes, lighting transformers, lighting, communication and small power panels, control stations, piping, lagged ductwork, appurtenant hangers, clamps and supports on uncoated surfaces, unless otherwise specified		
1) Interior	E-1	FS 26306 Grey
2) Exterior	EU-1	FS 26306 Grey
e. Existing conduit, outlet and junction boxes, lighting transformers, lighting communication and small power panels, control stations, piping, lagged ductwork, appurtenant hangers, clamps, and supports		
1) Not damaged nor modified by work in this contract	Uncoated	--
2) Damaged, exposed, or modified by work in this contract		
a) Interior	E-1	Match existing color
b) Exterior	EU-1	Match existing color
f. Racked conduits and cable trays	Uncoated	--
g. Insulated pipe jacketing	Uncoated	--
h. Plastic, fiberglass and flexible conduit and piping		
1) Unless otherwise specified	Uncoated	--
2) PVC and CPVC Piping	L-2	FS 26306 Grey
a) Exposed to direct sunlight	L-2	FS 26306 Grey
b) Not exposed to direct sunlight	L-2	FS 26306 Grey
i. High temperature piping operable at		
1) 200 to 750 degrees F	HH-1	FS 26306 Grey
2) Above 750 degrees F to 1,200 degrees F	HH-2	Aluminum or Black
j. Exposed ductwork, unless otherwise specified	Uncoated	--
6. Concrete, Grout, Masonry and Plaster		
a. Immersed tank and channel walls and bottoms unless otherwise specified in 09 96 00.	In accordance with Section 07 16 00	--
b. Outside concrete walls below grade common with dry area or room	In accordance with Section 07 11 13 and 07 13 26	--
c. Walls and ceilings		
1) Precast concrete or colored masonry	Uncoated	--
2) Exterior, unless otherwise specified	Uncoated	--
3) Interior, unless otherwise specified	E-4	Note 2
d. Concrete equipment bases unless otherwise specified	E-4	Match equipment color

Coating Systems Schedule (Finish Schedule)

Location/Surface	Coating System Identification	Standard Color
e. Floors unless otherwise specified	S-2	Note 2
f. Existing coated surfaces.	L-1	Match existing color
7. Door and Door Frames		
a. Doors unless otherwise specified		
1) Ferrous metal		
a) Interior	E-1	Note 2
b) Exterior	EU-1	Note 2
2) Aluminum	Uncoated	--
3) Other	Plastic laminate	Formica 947 Brown
4) Existing		
a) Not damaged by work in this contract	Uncoated	--
b) Damaged, exposed, or modified by work in this contract		
(1) Interior	E-1 (see paragraph 3.02 Masonry Surfaces)	Match existing color
(2) Exterior	EU-1	Match existing color
b. Door frames unless otherwise specified		
1) Adjacent wall coated		
a) Interior	E-1	Match wall color
b) Exterior	EU-1	Match wall color
2) Adjacent wall uncoated		
a) Interior	E-1	Note 2
b) Exterior	EU-1	Note 2
3) Aluminum	Uncoated	--
4) Existing		
a) Not damaged by work in this contract	Uncoated	--
b) Damaged, exposed, or modified by work in this contract		
(1) Interior	E-1	Match existing color
(2) Exterior	EU-1 without primer	Match existing color
8. Handrails, Gratings, Floor Plates, Manhole Covers, and Hatches		
a. Unless otherwise specified	Uncoated	
b. Existing		
1) Not damaged by work in this contract	Uncoated	--
2) Damaged, exposed, or modified by work in this contract		
a) Interior	E-1	Match existing color
b) Exterior	EU-1 without primer	Match existing color

Coating Systems Schedule (Finish Schedule)

Location/Surface	Coating System Identification	Standard Color
9. Metal Stairs, Ladders, Platforms, and Supports Except Tread and Grating		
a. Interior	Uncoated	
b. Exterior	Uncoated	
c. Existing		
1) Not damaged nor modified by work in this contract	Uncoated	--
2) Damaged, exposed, or modified by work in this contract		
a) Interior	Uncoated	
b) Exterior	Uncoated	
10. Aluminum Flashing, Light Standards, Supports, and Louvers		
a. Interior and exterior, unless otherwise specified	Uncoated	--
11. Precast Concrete Metalwork		
a. Fasteners, anchors, supports, etc.	EU-1	Match wall
12. Other		
a. Fire hydrants	EU-1	FS 21302 Red
b. Flap gates	EA-1	Beige
c. Aluminum slide gates	Uncoated	--
d. Sluice gates		
1) Gate	--	--
2) Stem, except potable	G	--
3) Operator		
a) Interior	E-2	Note 2
b) Exterior	EU-1	Note 2
e. Tanks - refer to 09 96 00 (or 09 97 00)		
f. Pipe, ductwork, equipment and appurtenances made from fiberglass, plastic, rubber, including flexible hose, conduit, and plastic coated tubing, in areas not exposed to view (interior) (metal hangers and supports are coated with E-1)	Uncoated	--
g. Buried, sleeve-type and flanged pipe, couplings, valves, mechanical and electrical penetrations	M-1 or M-2	Manufacturer's color
Fluoride Building		
1. Interior		
h. Floors	EFL-2	Note1

Notes:

1. *Owner will select color from coating manufacturer's list of EPA approved colors for potable water.*
2. *Owner to select color from coating manufacturer's full range of standard colors.*
3. *Recoat existing equipment to provide a uniform appearance. Color shall remain the same unless otherwise noted in the Contract Documents.*

3.07 QUALITY ASSURANCE INSPECTION

A. General:

1. Inspection by the Owner or others does not limit the Contractor's or CSA's responsibilities for quality workmanship or sole responsibility for QC as specified by this Section or as required by the CSM's instructions. Inspection by the Owner is optional and is additional to any inspection required to be performed by the Contractor.
2. The Owner may perform, or contract with an inspection agency to perform, QA inspection and testing of the coating work covered by this Section. These inspections may include the following:
    a. Inspect materials upon receipt to ensure that all are supplied by the same CSM.
    b. Inspect to verify that specified storage conditions for the coating system materials, solvents, and abrasives are provided.
    c. Inspect and record findings for the degree of cleanliness of substrates.
    d. Inspect and record the pH of concrete and metal substrates.
    e. Inspect and record substrate profile (anchor pattern).
    f. Measure and record ambient air and substrate temperature.
    g. Measure and record relative humidity.
    h. Check for the presence of substrate moisture in the concrete.
    i. Inspect to verify that correct mixing of coating system materials is performed in accordance with CSM's instructions.
    j. Inspect, confirm, and record that the "pot life" of coating system materials is not exceeded during installation. Inspect to verify that recoat limitations for coating materials are not exceeded.
    k. Perform adhesion testing.
    l. Measure and record the thickness of the coating system.
    m. Inspect to verify proper curing of the coating system in accordance with the CSM's instructions.
    n. Limited visual observations for defects.

3.08 FINAL INSPECTION

A. General
1. Contractor shall conduct a final inspection to determine whether coating system work meets the requirements of the specifications.
2. The Construction Manager or Owner's Representative will subsequently conduct a final observation with the Contractor to observe the completed work.
3. Any obvious defects or non-conforming work shall be marked. Such areas shall be recleaned and repaired as specified at no additional cost to the Owner.

PART 4 PROJECT QUALITY CONTROL CHECKLIST

09 90 00-A COATING SYSTEM QUALITY CONTROL CHECKLIST

Project Name

Owner		**Coating System Manufacturer Technical CTR**	
General Contractor (GC)		**Coating System Applicator (CSA)**	
Area or Structure		**Location within Structure**	
Coating System (e.g., E-1)		**Coating Type (e.g., Epoxy, etc.)**	

Coating System Quality Control Checklist

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
1	Completion of cleaning and substrate decontamination prior to abrasive blast cleaning.	Visual Inspection- Contaminant Free	GC QC			
		ASTM F22 – Concrete-Contaminant Free	CTR QC			
		Blacklight Testing- Contaminant Free	CSA QC			
2	Installation of protective enclosure of structure or area and protection of adjacent surfaces or structures that are not to be coated.	As Per SSPC Guide 6	GC QC			
		As per Specification	CTR QC			
			CSA QC			
3	Ambient condition control in structure or building area and acceptance of ventilation methods in structure or Area.	Negative Pressure in Enclosures	GC QC			
		Testing Every 2 hrs Minimum	CTR QC			
		Substrate temp 5°above the dewpoint and stabilized.	CSA QC			
4	Ensuring compressed air for abrasive blasting or coating/lining application is free of oil and moisture	ASTM D4285- Free of all oil & moisture	GC QC			
		1 blotter test per 2 hrs of compressed air usage	CTR QC			
			CSA QC			
5	Completion of Surface Preparation for Substrates to Be Coated. (Steel & Concrete)	Compliance with Sited SSPC/NACE Standards	GC QC			
		Compliance with Specification	CTR QC			
			CSA QC			
	Steel- Dust Level Testing- After surface preparation and prior to application of primers/coatings	ISO 8502-3 (Part 3)	GC QC			
		Dust Rating-1	CTR QC			
		Dust Particle Size - 0	CSA QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
6	Soluble Chloride Testing (If needed) as per SSPC-Guide 15 (Steel Only)	AS Per CTR allowable limits per product.	GC QC			
			CTR QC			
			CSA QC			
7	Completion of Concrete Repairs If Required and Related Surface Preparation Rework Prior to Coating System Application.	Compliance with Specification	GC QC			
			CTR QC			
			CSA QC			
8	Completion of Concrete Filler/ Surface Application to Concrete.	Bughole/Void Free	GC QC			
		Flush with Existing Surface	CTR QC			
			CSA QC			
9	Completion of Primer Application.	SSPC-PA 2- Steel	GC QC			
		SSPC-PA 9- Concrete	CTR QC			
		Meets Specified DFT	CSA QC			
10	Completion of intermediate Coat Application and of Detail Treatment at Transitions or Terminations.	SSPC-PA 2- Steel	GC QC			
		SSPC-PA 9- Concrete	CTR QC			
		Meets Specified DFT	CSA QC			
11	Completion of Finish Coat Application and of Detail Treatment at Transitions and Terminations.	SSPC-PA 2- Steel	GC QC			
		SSPC-PA 9- Concrete	CTR QC			
		Meets Specified DFT	CSA QC			
12	Completion of Full and Proper Cure of Coating System.	ASTM D5402- Solvent Based Materials - No material transfer-	GC QC			
		Visual Inspection-Defect Free	CTR QC			
			CSA QC			
13	Completion of Testing of Cured Coating System including Adhesion, Holiday (Continuity) Testing and Dry Film Thickness.	ASTM D5402- Solvent Based Materials - No material transfer-	GC QC			
		Visual Inspection-Defect Free	CTR QC			
		As per Specification	CSA QC			
14	Completion of Localized Repairs to Coating System Following Testing.	Visual Inspection-Defect Free	GC QC			
			CTR QC			
			CSA QC			
15	Final Acceptance of Coating System Installation Including Final Clean-Up Complying	Visual Inspection-Defect Free	GC QC			
			CTR QC			
			CSA QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
	with Specification Requirements and the CTR's Quality Requirements.					

END OF SECTION

SECTION 09 96 00

HIGH PERFORMANCE PROTECTIVE COATINGS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This Section specifies coating systems, surface preparation, and application requirements for high performance protective coating systems applied to both concrete and metal substrates.

B. This section includes coatings systems for:
   1. Surfaces exposed to corrosive chemicals including various acids, sodium hydroxide, sodium hypochlorite, ferric chloride, hydrofluorosilicic acid, and sodium bisulfite, etc. whether vapor or immersion exposure.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 11 80 Environmental Conditions
   2. Section 01 33 00 Submittal Procedures
   3. Section 01 45 00 Contractor Quality Control
   4. Section 01 45 23 Testing and Inspection Services
   5. Section 01 61 45 Area Exposure Designations
   6. Section 01 66 00 Product Storage and Handling
   7. Section 01 99 00 Reference Forms
   8. Section 07 11 13 Bituminous Damproofing
   9. Section 09 90 00 General Coating Specification
   10. Section 09 97 00 Potable Protective Coatings

1.03 DEFINITIONS:

A. Coating terminology used in this Section is in accordance with definitions contained in ASTM D16, ASTM D3960, and the following definitions.
   1. Abrasive: Material used for blast cleaning, such as sand, grit or shot.
   2. Abrasive Blast Cleaning: Cleaning/surface preparation by abrasive propelled at high speed.
   3. AMPP: Association for Materials Protection and Performance (Merger of NACE and SSPC).
   4. Anchor Pattern: Profile or texture of prepared surface(s).
   5. ANSI: American National Standards Institute.
   6. Bugholes: Small cavities, usually not exceeding 15 millimeters in diameter, resulting from entrapment of air bubbles in the surface of formed concrete during placement and compaction.

7. Biogenic Sulfide Corrosion: Sulfuric acid corrosion of metal and concrete substrates caused by the formation of sulfuric acid by the metabolic process of sulfurs oxidizing bacteria metabolizing hydrogen sulfide.
8. Coating/Paint/Lining Thickness: The total thickness of primer, intermediate and/or finish coats.
9. Coating System Applicator (CSA): A generic reference to the specialty subcontractor or subcontractors retained by the Contractor to install the coating systems specified in this Section.
10. Coating System Manufacturer (CSM): Refers to the acceptable coating system manufacturer, abbreviated as the CSM.
11. Coating System Manufacturer's Technical Representative(s) (CTR): Refers to the technical representative(s) of the acceptable Coating System Manufacturer and is abbreviated as CTR.
12. Continuous film or continuity of film: refers to coating layer/system without holidays, pinholes or other discontinuities.
13. CQC: Coating System Applicator (CSA) Quality Control.
14. Dehumidification: The removal of moisture, humidity or dampness from the air
15. Dew point: Temperature of a given air/water vapor mixture at which condensation starts.
16. Dry Film Thickness (DFT): Depth of cured film, usually expressed in mils (0.001 inch).
17. Drying/Cure Time: Time interval between application and curing of material before exposure to service conditions.
18. Dry to Recoat: Time interval between application of material and ability to receive next coat.
19. Dry to Touch: Time interval between application of material and ability to touch lightly without damage.
20. Feather Edging: Reducing the thickness of the edge of paint.
21. Feathering: Operation of tapering off the edge of a point with a comparatively dry brush.
22. Field Coat: The application or the completion of application of the coating system after installation of the surface at the site of the work.
23. Hold Point: A defined point, specified in this Section, at which work shall be halted for inspection.
24. Holiday: A discontinuity, skip, or void in coating or coating system film that exposes the substrate.
25. Honeycomb: Segregated condition of hardened concrete due to non-consolidation
26. ICRI: International Concrete Repair Institute.
27. Incompatibility: Inability of a coating to perform well over another coating because of bleeding, poor bonding, or lifting of old coating; inability of a coating to perform well on a substrate.
28. Laitance: A layer of weak, non-durable concrete containing cement fines that are brought to the surface through bleed water because of concrete finishing and/or over-finishing.
29. Mil: 0.001 inch.
30. NACE: National Association of Corrosion Engineers.
31. NSF International: National Sanitation Foundation.

32. Overspray: Dry spray, particularly such paint that failed to strike the intended surface.
33. Owner's Quality Assurance Representative: Person or persons designated by the Owner to perform QA review of the Contractor's QC reports and inspection and testing work.
34. Pinhole: A small diameter discontinuity in a coating or coating system film that is typically created by outgassing of air from a void in a concrete substrate resulting in exposure of the substrate or a void between coats.
35. Pot Life: Time interval after mixing of components during which the coating can be satisfactorily applied.
36. QCP: Quality Control Person representing the Contractor and responsible for QC Testing, Inspection and associated documentation.
37. QCTIP: Quality Control Testing and Inspection Plan.
38. QP-1 AMPP: Accredited program that evaluates the practices of field painting.
39. QP-3- AMPP: Accredited program that evaluates the practices of shop painting facilities.
40. Resurfacer/Resurfacing Material: A layer of cementitious and/or resin-base material used to fill or otherwise restore surface continuity to worn or damaged concrete surfaces.
41. Shelf Life: Maximum storage time for which a material may be stored without losing its usefulness.
42. Shop Coat: One or more coats applied in a shop or plant prior to shipment to the site of the work, where the field or finishing coat is applied.
43. Spreading Rate: Area covered by a unit volume of paint at a specific thickness.
44. SSPC: The Society for Protective Coatings.
45. Stripe Coat: A separate coat of paint applied to all weld seems, pits, nuts/bolts/washers and edges by brush. This coat shall not be applied until any previous coat(s) have cured and once applied, shall be allowed to cure prior to the application of the subsequent coat(s).
46. Surface Saturated Dry (SSD): Refers to concrete surface condition where the surface is saturated (damp) without the presence of standing water.
47. Tie Coat: An intermediate coat used to bond different types of paint coats; coatings used to improve the adhesion of a succeeding coat.
48. Touch-Up Coating: The application of paint on areas of painted surfaces to repair marks, scratches, and areas where the coating has deteriorated to restore the coating film to an unbroken condition.
49. TPC: Technical Practice Committee.
50. Volatile Organic Compound (VOC) Content: The portion of the coating that is a compound of carbon, is photochemically reactive, and evaporates during drying or curing, expressed in grams per liter (g/l) or pounds per gallon (lb/gal).
51. Immersion: Refers to a service condition in which the substrate is below the waterline or submerged in water or wastewater at least intermittently if not constantly.
52. Weld Spatter: Beads of metal scattered near seam during welding.
53. Wet Film Thickness (WFT): The primer or coating film's thickness immediately following application; wet film thickness is measured in mils or thousandths of an inch (0.001 inch) and is abbreviated WFT.

1.04 REFERENCES:

A. This section contains references to the following documents listed and described below. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed and described documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued, or replaced.

SSPC-VIS 3	Visual Standard for Power and Hand – Tool Cleaned Steel
SSPC-VIS 4	Visual Standards (Water-jetting)
SSPC-VIS 5	Visual Standards (Wet Abrasive Blast Cleaning)

1.05 QUALITY ASSURANCE

A. General Requirements:

1. Provide materials and supplies provided that are standard products of CSMs. Provide materials in each coating system from a single CSM.
2. The standard products of CSMs other than those specified may be acceptable when it is demonstrated to the Construction Manager that they are equal in composition, durability, usefulness, and convenience for the purpose intended. Requests for consideration of CSMs other than those specified in this Section will be considered in accordance with the requirements of the General Conditions and provided the following minimum conditions are met. Such requests are not a substitution for submittals after the alternative CSMs have been considered and accepted.
    a. The proposed coating system uses an equal or greater number of separate coats to achieve the required total DFT.
    b. The proposed coating system uses coatings of the same generic type as that specified including curing agent type.

c. Include information listed in paragraph 1.07, demonstrating that the proposed CSM's product is equal to the specified coating system.

d. Provide a list of Contractor and CSM references for the proposed product where the coating of the same generic type has been applied. Include the project name, city, state, owner, and phone number of owner; coating system reference and number from this Section 09 96 00; type of facility in which it was used, generic type, and year coating was applied.

e. At any time when there is a conflict between the CSM's product data and the COATSPEC requirements regarding surface preparation, material application or any other coating details that provides the more stringent requirements will take precedent.

B. Shop and Field Quality Control Requirements:

1. The Contractor is solely responsible for the workmanship and quality of the coating system installation by the CSA. Inspections by the Owner, Engineer, a Construction Manager, the CTR, or any other party will not relieve or limit the Contractor's responsibilities for the quality of the coating system.
2. Conform to requirements of this specification and the standards referenced in this Section. Changes in the coating system installation requirements will be allowed only with the written acceptance of the Engineer before work commences.
3. Only personnel who are trained by the CTR specifically for this contract or who are approved by the CSM specifically for this contract shall be allowed to perform the coating system installation specified in this Section.
4. Perform all field surface preparation and coating applications by a AMPP QP8 Certified field painting Contractor in good standing for all concrete applications, and AMPP QP-1 for all applications on surfaces other than concrete. Should the contractor working on concrete substrates not have an AMPP QP-8 certification, the QP-1 contractor certification may be acceptable providing the QP-1 contractor can show verifiable proof of performing work successfully on 5 verifiable concrete projects similar in size and scope as the project that is part of this specification.
5. Perform all shop surface preparation and coating applications by a AMPP QP3 Certified blast and painting shop in good standing.
6. Do not use contaminated, outdated, diluted materials, and/or materials from previously opened containers.
7. For repairs, provide the same products, or products recommended by the CSM, as used for the original coating.
8. Identify the points of access for inspection by the Owner, the Engineer, or the Owner's Representative. Provide ventilation, ingress and egress, and other safe means necessary for the Owner's or Engineer's personnel or designated representative to safely access the work areas.
9. Contractor and CSA to conduct the work so that the coating system is installed as specified and inspect the work continually to ensure that the coating system is installed as specified. Correct coating system work that does not conform to the specifications or is otherwise not acceptable to the as-specified requirements.
10. Provide full time inspection with trained and certified quality control (QC) inspectors performing all QC procedures as the coating work proceeds in accordance with the requirements of this section. Minimum qualifications for QC inspectors on concrete projects are AMPP-CCI Level 1 with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified

CCILevel 2 Concrete Coatings Inspector. On non-concrete related project, the minimum QC inspector is AMPP Basic Coating Inspector (NACE/SSPC Level 1) with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified Coatings Inspector (NACE/SSPC Level 2) or AMPP Senior Coatings Inspector (NACE/SSPC Level 3) in good standing, with at least 10 years of similar coatings work experience. An AMPP Basic Coating Inspector (NACE/SSPC Level 1) with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified Coatings Inspector (NACE/SSPC Level 2) or AMPP Senior Coatings Inspector (NACE/SSPC Level 3) in good standing, with at least 10 years of similar coatings work experience may be acceptable providing the AMPP Basic, AMPP Certified and AMPP Senior coating inspectors can each can show verifiable proof of performing inspection successfully on 5 verifiable concrete projects similar in size and scope as the project that is part of this specification.

11. Submit for approval a Quality Control Testing and Inspection Plan (QCTIP) for the work covered by this Section. List all tests and inspection tasks in the QCTIP including referenced and applicable standards to be conducted and the frequency in which these tests or tasks will be performed. This frequency can be addressed for certain tests such as air and substrate temperature or Dew Point measurements on an hourly per shift basis. Or this frequency can be addressed on a per number of square feet basis for tests and tasks such as WFT and DFT tests or adhesion tests. Include in the QCTIP a written record which identifies when (time and date) work not conforming to the specification requirements is identified a written record of the proposed corrective actions for such non-conforming work and a record of when that action was performed (time and date). Describe all corrective action for non-conforming work in detail with referenced digital photographs taken of that re-work.
12. Submit a daily QC inspection report from the QCP that describes and documents all QC tests and inspection tasks performed including frequency of performance and test results (including test data) and referenced standard followed for each shift the Contractor works. Submit these reports on the morning of the following day the work was performed to the Construction Manager. Include with the daily QC report, a written account of all non-conforming work, subsequent corrective measures and annotated digital photographs of such work. Submit a standard inspection form to be used for these reports for review by the Engineer. The approved inspection report forms shall be used by the Contractor's QC Inspector to record all QC inspection and testing throughout the performance of the coating work.
13. The CSA, with Contractor's oversite, shall complete the COATING SYSTEM QUALITY CONTROL CHECKLIST, see 3.12 Form 09 90 00-A, included in 01 99 90, for coating system installations. Follow the sequential steps required for proper coating system installation as specified and as listed in the COATING SYSTEM QUALITY CONTROL CHECKLIST. For each portion of the work, install the coating system and complete sign-offs as specified prior to proceeding with the next step. After completing each step as indicated on the COATING SYSTEM QUALITY CONTROL CHECKLIST, the Contractor shall sign the checklist indicating that the work has been installed and inspected as specified.

C. Quality Control Hold Points:
    1. Conduct QC inspections per the QCP as the coating work progresses, including surface preparation. In addition, conduct inspection at Hold Points with sign off by all involved parties (GC, CSA, CSM) on the project Quality Control Checklist, Form 09 96 00-A. QC inspections and testing shall be performed as often as needed to ensure

full compliance to this specification. Coordinate schedule of all Hold Points with the CTR, Engineer and Construction Manager so they may observe the QC inspections. The minimum QC inspection Hold Points include but are not limited to the following:

a. Environment and Site Conditions: Prior to commencing an activity associated with coating system installation, measure and record ambient air temperature and humidity as well as other conditions such as proper protective measures for surfaces not to be coated and safety requirements for personnel. Confirm weather and/or environmental conditions within the structure comply with the requirements specified by the CSM.

b. Conditions Prior to Surface Preparation: Prior to commencing surface preparation, observe, record, and confirm that oil, grease, and/or soluble salts have been eliminated from the surface.

c. Monitoring of Surface Preparation: Spot check degree of cleanliness, surface profile, and surface pH testing, where applicable. Confirm the compressed air used for surface preparation or vacuum or wash-down cleaning is free from oil and moisture.

d. Post Surface Preparation: Upon completion of the surface preparation, measure and inspect for proper degree of cleanliness and surface profile as specified in this Section and in the CSM's written instructions.

e. Ensure any remaining dust meets acceptable level of the specification requirements after surface preparation and prior to the application of primer and coatings.

f. Monitoring of Coatings Application: Inspect, measure, and record the WFT and general film quality (visual inspection) for lack of runs, sags, pinholes, holidays, etc. as the application work proceeds.

g. Post Application Inspection: Identify defects in application work including pinholes, holidays, excessive runs or sags, inadequate or excessive film thickness, and other problems as may be observed.

h. DFT Measurements: Take DFT measurements after each coat and record them in the daily QC inspection reports. Take DFT readings for steel surface in accordance with SSPC- PA2 using Type II Magnetic DFT Gauges for ferrous surfaces and Type II Eddy Current Gauges for non-ferrous surfaces. DFT readings for concrete surface may be taken as per SSPC- PA9 using Ultra Sonic DFT Gauges or by proving materials usage versus square foot coverage. Use only gauges calibrated by the manufacturer or approved agent within 1 year of use. Following SSPC- PA2 and SSPC-PA9, take as many DFT measurements necessary, which may exceed the SSPC-PA2 and SSPC-PA9 to ensure full compliance to this specification.

i. Post Cure Evaluation: Measure and inspect the overall DFT, conduct a DFT survey, perform adhesion testing, holiday detection, or cure testing as required based on the type of project and the specific requirements in this Section and/or in the CSM's written instructions.

j. Follow-up to Corrective Actions and Final Inspection: Measure and reinspect corrective coating work performed to repair defects identified at prior Hold Points. Includes final visual inspection along with follow-up tests such as holiday detection, adhesion tests, and DFT surveys.

D. Quality Assurance Inspection:

1. The Owner and Engineer reserve the right to retain the services of a Quality Assurance Inspection firm to perform random audits of the CSA's QC processes and documentation at any time during the project's progress including the various Hold Points. Any inspections by the Owner, Engineer, or other owner related representatives do not relieve the Contractor from having sole responsibility for the quality of the installed coating system.
2. Coordinate Hold Points with the Owner's Quality Assurance representative such that this representative may observe the CSA's QC inspections on a scheduled basis. Provide the Owner's Quality Assurance representative a minimum of 48 hours' notice prior to conducting Hold Point Inspections.

E. Responsibilities of the CTR:
   1. General:
      a. Provide the services of the CTR to be on site to perform the Contractor and/or CSA application training and to routinely verify in writing that the application personnel have successfully performed representative portions of the surface preparation work, filler/surface application, coating system application, and QC Inspection in accordance with this Section. Include testing, checking, or witnessing the contractors testing for the required degree of cleanliness, surface pH for concrete substrates, surface profile of substrates, proper mixing of coating materials, application (including checking the WFT and DFT of the coating systems), proper cure of the coating systems, and proper treatment of coating systems at terminations, transitions, and joints and cracks in substrates. This verification is in addition to the inspection performed by the Contractor in accordance with this Section. The CTR must be a technical representative of the CSM's Technical Service Department and not a local sales representative. The CTR shall provide an adequate level of oversight of the contractor's QC processes, at their discretion, to provide sign off that the CSM's products have been properly installed.
   2. Coating System Installation Training:
      a. Provide a minimum of 8 hours of classroom and off-site training for application and supervisory personnel of the Contractor (CSA). Provide training to a minimum of 2 supervisory personnel from the CSA. Alternatively, provide a written letter from the CSM stating that the application personnel (listed by name) who will perform coating work are approved by the CSM without further or additional training.
      b. The same CTR shall provide training for all application and supervisory personnel. Include the following as a minimum:
         1) A detailed explanation of mixing, application, curing, and termination details.
         2) Hands-on demonstration of how to mix and apply the coating systems.
            a) A detailed explanation of the ambient condition requirements (temperature and humidity) and surface preparation requirements for application of the coating system as well as a detailed explanation of re-coat times, cure times, and related ambient condition requirements.
         3) Provide a letter stating that training was satisfactorily completed by the personnel listed by name in the letter.
   3. Representative Coating System Inspections:
      a. While on site to verify or witness the QC processes of the contractor, the CTR shall verify representative steps of the coating work are performed properly per

the manufacturer's instructions, the CTR shall coordinate and confirm the planned inspections by the Contractor's QC person are being performed per the QCTIP to assure quality of the work meets the requirements of both these specifications and any additional manufacturer's requirements

b. The CTR shall verify or witness the following QC processes, at their discretion and as delineated above in 1.05.C.
   1) Inspect ambient conditions during various coating system installation at hold points for conformance with the specified requirements.
   2) Inspect the surface preparation of the substrates where the coating system will terminate or will be applied for conformance to the specified application criteria.
   3) Inspect preparation and application of coating detail treatment (for example, terminations at joints, metal embedments in concrete, etc.).
   4) Inspect application of the filler/surface materials for concrete and masonry substrates.
   5) Inspect application of the primers and finish coats including WFT and DFT of the coatings.
   6) Inspect coating systems for cure.
   7) Review adhesion testing of the cured coating systems for conformance to specified criteria.
   8) Review coating system discontinuity testing for conformance to specified criteria.
   9) Observe adhesion testing work to assure it meets specification requirements.
   10) Inspect and record representative localized repairs made to discontinuities identified via continuity testing.
   11) Conduct a final review of completed coating system installation for conformance to the specifications.

c. Prepare and submit a site visit report following each site visit that documents the acceptability of the coating work observed and inspected in accordance with the CSM's Recommendations.

4. Final Report:
   a. Upon completion of coating work for the project, the CTR shall prepare a letter summarizing the inspection findings and shall attach the site visit reports required in 1.05. Include a statement that the completed work was performed in accordance with the requirements of this Section 09 96 00 and the CSM's recommendations based on the inspections performed by the CTR.

1.06 DELIVERY AND STORAGE

A. General:
   1. Conform to the requirements of Section 01 66 00, Product Storage and Handling Requirements.
   2. Deliver materials to the job site in their original, unopened containers. Properly label each container shall be properly labeled. Handle and store to prevent damage to or loss of label.
   3. Include the following information on material container labels:

a. Name or title of product
b. CSM's batch number
c. CSM's name
d. Generic type of material
e. Application and mixing instructions
f. Hazardous material identification label
g. Shelf life expiration date

4. Store materials in enclosed structures protected from weather and excessive heat or cold in accordance with the CSM's recommendations. Store flammable materials in accordance with state and local requirements.
5. Clearly mark containers indicating personnel safety hazards associated with the use of or exposure to the materials.
6. Provide Safety Data Sheets (SDS) for each material to the Construction Manager, Owner, Contractor, and CSA.
7. Store and dispose of hazardous waste including waste solvents and coatings according to federal, state and local requirements.

1.07 SUBMITTALS:

A. Action Submittals:
1. Procedures: Section 01 33 00.
2. A copy of this specification section, with addendum updates included, and referenced and applicable sections, with addendum updates included, with each paragraph check-marked (☐) to indicate specification compliance or marked to indicate requested deviations from specification requirements or those parts which are to be provided by the Contractor or others. Check marks denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, underline each deviation and denote by a number in the margin to the right of the identified paragraph, provide a detailed explanation of the reasons for requesting the deviation. Engineer is the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined signifies compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for requested deviations to the specification requirements, is cause for rejection of the entire submittal and no further submittal material will be reviewed.
3. CSM's current printed recommendations and product data sheets for coating systems including:
a. Volatile organic compound (VOC) data
b. Surface preparation recommendations
c. Primer type, where required
d. Maximum dry and wet-mil thickness per coat
e. Minimum and maximum curing time between coats, including atmospheric conditions for each
f. Curing time before submergence in liquid
g. Thinner to be used with each coating

h. Ventilation requirements
i. Minimum atmospheric conditions during which the paint shall be applied
j. Allowable application methods
k. Maximum allowable moisture content
l. Maximum shelf life

4. Affidavits signed and sealed by an officer of the CSM's corporation, attesting to full compliance of each coating system component with current and promulgated federal, state, and local air pollution control regulations and requirements.
5. Safety Data Sheets (MSDS) for materials to be delivered to the job site, including coating system materials, solvents, and abrasive blast media.
6. Written list of cleaning and thinner solutions allowed by the CSMs.
7. Storage requirements including temperature, humidity, and ventilation for Coating System Materials as recommended by the CSMs.
8. CSM's detailed, written instructions for coating system treatment and graphic details for coating system terminations in the structures to be coated including pipe penetrations, metal embedments, gate frames, and other terminations to be determined from the contract drawings. Include detail treatment for coating system at joints and cracks in concrete.
9. Provide a minimum of 5 project references each for the Contractor and CSA including contact name, address, and telephone number where similar coating work has been performed by their companies in the past 5 years.
10. Written certification that the Contractor's QC person for the work is a Certified SSPC or NACE Coatings Inspector with the requisite experience identified in 1.05.B.8.
11. Written Quality Control Testing and Inspection Plan (QCTIP) for the coating work covered by the Contract for this project and as specified in this Section.
12. Sample Daily QC Inspection Report Forms to be used by the Contractor's QC person assigned to the work covered by this Section.
13. Written letter from CSM signed by a Company officer that the Contractor's personnel who will perform the coating work have successfully been trained to apply the specified and approved coating materials.
14. Signed Affidavit from CSM that all products provided for the coating work covered by this Section are compliant with applicable VOC regulations.
15. Completed, signed and dated Quality Control Checklists.

B. Informational Submittals:
1. Procedures: Section 01 33 00.
2. Prior to application of coatings, submit letter(s) from the CTR(s) identifying the application personnel who have satisfactorily completed training as specified in article 1.05 or a letter from the CSM stating that personnel who shall perform the work are approved by the CSM without need for further or additional training.
3. Submit reports specified in article 1.05. while the work is underway.

C. Closeout Submittals:
1. Procedures: Section 01 33 00.
2. Submit the COATING SYSTEM QUALITY CONTROL CHECKLIST using Form 09 96 00-A, included in this Section, for the coating work.

PART 2 PRODUCTS

2.01 MATERIALS

A. General:

1. Notwithstanding the listing of product names in this Section, provide affidavits, signed and sealed by an officer of the CSM's corporation, attesting to full compliance of each coating system component with current and promulgated federal, state, and local air pollution control regulations and requirements. Do not apply coatings until the specified affidavits have been submitted and reviewed and accepted. Failure to comply with this requirement is cause for rejection and removal of such materials from the site.
2. Coating Systems are designated as "HP" for general high performance systems used in various treatment plant, and industrial applications, corrosive environments, and moisture vapor transmission suppression systems, and "SC" for use in secondary containment associated with specific corrosive chemicals.

B. Description of Standard High Performance Coating Systems. The list below provides, for each system, a brief description of the coating material, appropriate substrate and exposure. For the specific Finish Schedule, refer to Section 09 90 00 Article 3.08.

Coating systems Designation	Description
HP-1	Not used
HP-2	Not used
HP-3	Not used
HP-4	Not used
HP-5	Not used
HP-6	Not used
HP-7	Not used
HP-8	Not used
HP-9	Not used
HP-10	Not used
HP-11	Not used
HP 12	Moisture Vapor Transmission (MVT) Suppression System for Use Under Tank Linings on Concrete. (Unlimited MVT Resistance)
HP-13	Moisture Vapor Transmission Suppression System for Use Under Tank Linings on Concrete. (up to 20 lbs/1000 Sq/24 hrs.) as Per ASTM F1869
HP-14	Moisture Vapor Transmission Suppression System for Use Under Tank Linings on Concrete. (up to 10 lbs/1000 Sq/24 hrs.) as Per ASTM F1869
SC-1	Not used
SC-2	Not used
SC-3	Novolac Epoxy, Vinyl Ester Novolac Epoxy, Vinyl Ester- Secondary Containment for 12.5% Sodium Hypochlorite

SC-26	Not used

C. Material Requirements for Standard High Performance Coating Systems. The table below provides, for each system, acceptable Coating System Manufacturers and products for each coat.

Material Requirements for Standard Coating Systems for United States and Canada, except for California SCAQMD:

Coating Systems Designation	CSM	Pit Filler/Mortar Repair	Primer/Intermediate Coats	Finish Coats
HP-1	Carboline	Carboguard 501	Plasite 4500S	Plasite 4500S
	Sauereisen	#209 Filler	Conoweld 501	Sewergard 210X
	Sherwin Williams	Steel Seam FT 910	Dura-Plate UHS	Dura-Plate UHS
	Tnemec Company	Series 215 Filler	Perma-Glaze G435	Perma-Glaze G435

Material Requirements for Standard Coating Systems for United States and Canada, except for California SCAQMD:

Coating Systems Designation	CSM	Pit Filler/Mortar Repair	Primer/Intermediate Coats	Finish Coats
HP-2	Carboline	Carboguard 501	Carboguard 890 (2 coats)	Carbothane 134VOC
	Sauereisen	#209 Filler	Conoweld 510-Primer x 1C Sewergard 210X- Inter x 1C	Conothane 310
	Sherwin Williams	Steel Seam FT 910	Macropoxy 5500LT 9 (1-2 Coats)	High Solids Polyurethane 250
	Tnemec Company	Series 215 Filler	Epoxoline 141	Endurashield II Series 1075
HP-3	Carboline	Carboguard 510	Carboguard 690 (Optional)	Plasite 4500S (2 coats may be required)
	Sauereisen	Series #208 Series F120 or F121	PenePrime 500 (optional)	Sewergard 210X
	Sherwin Williams	Dura-Plate 2300 AW Cook MSM	Macropoxy 5000 (Optional)	Cor-Cote FRE
	Tnemec Company	Series 218 Series 217	Series 201 (optional)	Perma-Shield G436
HP-4	Carboline	Carboguard 510	Carboguard 690 (Optional)	Plasite 4500S
	Sauereisen	Series #208 Series F120 or F121	ConoPrime 502 (optional)	Sewergard 210X
	Sherwin Williams	Dura-Plate 2300 AW Cook MSM	Macropoxy 5000 (Optional)	Cor-Cote FRE
	Tnemec Company	Series 218 Series 217	Series 201 (optional)	Perma-Shield G436
HP-5	Carboline	Carboguard 501	Plasite 4500S	Plasite 4500S
	Sauereisen	#209 Filler	Conoweld 501	Sewergard 210X
	Sherwin Williams	Steel Seam FT 910	NA	Cor-Cote FRE
	Tnemec Company	Series 215 Filler	NA	Perma-Shield G436
HP-6	Carboline	Carboguard 510	NA	Plasite 5371
	Sauereisen	Series #208 Series F120 or F121	Series 210T	Series 210X (Seal Coat)
	Sherwin Williams	Dura-Plate 2300 AW Cook MSM	NA	Dura-Plate 5900 Mortar
	Tnemec Company	Series 218 Series 217	NA	Perma-Shield 434
HP-7	Carboline	Carboguard 501	Phenoline Tank Shield FP	Plasite 4500S
	Sauereisen	#209 Filler	Conoweld 501	Sewergard 210X
	Sherwin Williams	Steel Seam FT 910		Cor-Cote FRE
	Tnemec Company	Series 215 Filler	NA	Perma-Shield G436
HP-8	Carboline	Carboguard 501	Phenoline Tank Shield FP	Plasite 4500S
	Sauereisen	Series #208 Series F120 or F121	ConoPrime 502 (optional)	Sewergard 210X

Material Requirements for Standard Coating Systems for United States and Canada, except for California SCAQMD:

Coating Systems Designation	CSM	Pit Filler/Mortar Repair	Primer/Intermediate Coats	Finish Coats
	Sherwin Williams	Steel Seam FT 910	Macropoxy 5000 (Optional)	Cor-Cote FRE
	Tnemec Company	Series 218 Series 217	Series 201 (optional)	Perma-Shield G436
HP-9	Carboline	Carboguard 501	Phenoline Tank Shield FP	Plasite 4500S
	Sauereisen	#209 Filler	#560 High Temp	Series 210GN (Multiple Coats)
	Sherwin Williams	Steel Seam FT 910	Dura-Plate 8200	Dura-Plate 8200
HP-10	Carboline	Carboguard 501	Phenoline Tank Shield FP	Plasite 4500S
	Sauereisen	Series F120 or F121	NA	Series 210TN
	Sherwin Williams	Steel Seam FT 910	Dura-Plate 8200	Dura-Plate 8200
HP-11	PPG	PPG Raven 760 EMC	Raven 175 Optional	Raven 405
	Sauereisen	Series F120 or F121	PenePrime 500 (optional)	Series 210XHB
	Sherwin Williams	Dura-Plate 2300 AW Cook MSM	Macropoxy 5000 (Optional)	Dura-Plate 6100

Material Requirements for Standard Moisture Vapor Transmission (MVT) Suppression Coating Systems for United States and Canada, Except for California SCAQMD

System	CSM	Step 1	Step 2	Step 3	Step 4	Finish Coat
*HP-12 UL MVT	PPG	Raven 760 EMC	Series 900 LVT at 12 mils	PPG Flooring Urethane Cement Cove Base at 3/16"	Broadcast 20/40 clean dry silica sand to rejection	The specified topcoat at the specified mils
	Sherwin Williams	Dura-Plate 2300 AW Cook MSM	Resufloor Aqua 3477 at 2.0-4.5 mils	Fastop 4050 Slurry at 3/16"	Broadcast - 5310-8 Silica Sand (20-40 mesh) to saturation	The specified topcoat at the specified mils
*HP-13 <20 lbs. MVT	PPG	Raven 760 EMC	Series 912LV at 20 mils	NA	NA	The specified topcoat at the specified mils
	Sherwin Williams	Dura-Plate 2300 AW Cook MSM	Resufloor Aqua 3477	Fastop 4050 Slurry at 3/16"	Broadcast - 5310-8 Silica Sand (20-40 mesh) to saturation	The specified topcoat at the specified mils
*HP-14 <10lbs MVT	Carboline	Carboguard 510 or Carboguard 4010	Vapor Stop at 10-15 mils	Vapor Stop at 10-15 mils	Vapor Stop at 10-15 mils	The specified topcoat at the specified mils
	PPG	Raven 760 EMC	Series 912LV at 10 mils	NA	NA	The specified topcoat at the specified mils

Material Requirements for Secondary Containment Systems for United States and Canada, except for California SCAQMD:

System	CSM	Step 1	Step 2	Step 3	Step 4	Finish Coat
SC-1 50% Sodium Hydroxide	Akzo Nobel	Ceilcote 6640 + S1 Powder As required	Ceilcote 380 at 2-5 mils	Ceilcote 6640 at 32 mils/ Mat Reinforcement	NA	Ceilcote 6640 + S1 powder at 60 mils
	Carboline	Carboguard 510 or 501 as required	Semstone 110 Primer at 8-10 mils	Semstone 145 at 20-25 mils/Reinforcing Mat	Semstone 145 at 25-30 mils/20/40 Mesh Aggregate Broadcast	Semstone 145 at 15-20 mils
	Sherwin Williams	Steel Seam FT910 (as needed for patch and fill)	Corobond 100 at 4 – 6 mils	Duraplate UHS Laminate at 20 – 25 mils with 1 oz. fiberglass mat	Duraplate UHS Epoxy at 8 – 10 mils with 20/40 mesh aggregate broadcast	Duraplate UHS Epoxy at 12 – 25 mils
	Tnemec Company	Series 215 or Series 217 or N218 Mortar As required	Series 201 Epoxoprime at 6-10 mils	237SC Chembloc (neat) at 8-12 mils with /211-215 Mat	237 SC Chembloc (neat) at 16-24 mils	Tneme-Glaze Series 280 at 8-12 mils
SC-2 18% Sodium Hypochlorite	Akzo Nobel	Ceilcote 6640 + S1 Powder As required	Ceilcote 380 at 2-5 mils	Ceilcote 6640 at 32 mils/ Mat Reinforcement	NA	Ceilcote 6640 + S1 powder at 60 mils
	Carboline	Semstone Series 800 PM As required	Dudick 27 Primer at 8-10 mils	Semstone 870AFRC at 25-30 mils with Semstone scrim cloth	Semstone 870AFRC at 25-30 mils /20/40 Mesh Aggregate Broadcast	Semstone 870AFRC at 15-20 mils
	Sherwin Williams	Steel Seam FT910 (as needed for patch and fill)	Corobond 100 at 4 – 6 mils	Cor Cote HCR Clear at 20 – 25 mils with 1 oz. fiberglass mat	Resuflor 3741 at 8 – 10 mils with 20/40 mesh aggregate broadcast	Resuflor 3741 at 12 – 25 mils
	Tnemec Company	Series 215 or Series 217 or N218 Mortar As required	Series 201 Epoxoprime at 6-10 mils	239SC Chembloc Mortar at 60-80 mils with 211-215 Mat	239 SC Chembloc (neat) at 16-24 mils	Tneme-Glaze Series 282 at 8-12 mils
SC-3 12.5% Sodium Hypochlorite	Akzo Nobel	Ceilcote 6640 + S1 Powder As required	Ceilcote 380 at 2-5 mils	Ceilcote 6640 at 32 mils/ Mat Reinforcement	NA	Ceilcote 6640 + S1 powder at 60 mils
	Carboline	Semstone Series 800 PM As required	Dudick 27 Primer at 8-10 mils	Semstone 870AFRC at 25-30 mils with Semstone scrim cloth	Semstone 870AFRC at 25-30 mils /20/40 Mesh Aggregate Broadcast	Semstone 870AFRC at 15-20 mils
	Sherwin Williams	Steel Seam FT910 (as needed for patch and fill)	Corobond 100 at 4 – 6 mils	Cor Cote HCR Clear at 20 – 25 mils with 1 oz. fiberglass mat	Resuflor 3741 at 8 – 10 mils with 20/40 mesh aggregate broadcast	Resuflor 3741 at 12 – 25 mils
	Tnemec Company	Series 215 or Series 217 or N218 Mortar As required	Series 201 Epoxoprime at 6-10 mils	239SC Chembloc Mortar at 60-80 mils with 211-215 Mat	239 SC Chembloc (neat) at 8-12 mils	Tneme-Glaze Series 282 at 6-12 mils
SC-4 25% Hydrofluorosilicic Acid	Akzo Nobel	Ceilcote 6640B + S1 Powder As required	Ceilcote 380 at 2-5 mils	Ceilcote 6640B at 32 mils/ Mat Reinforcement	NA	Ceilcote 6640 + B1 powder at 60 mils
	Carboline	Carboguard 510 or 501 as required	Semstone 110 Primer at 8-10 mils	Semstone 145 at 20-25 mils/Reinforcing Mat	Semstone 145 at 25-30 mils/20/40	Semstone 145 at 15-20 mils

Material Requirements for Secondary Containment Systems for United States and Canada, except for California SCAQMD:

System	CSM	Step 1	Step 2	Step 3	Step 4	Finish Coat
					Mesh Aggregate Broadcast	
	Sherwin Williams	Steel Seam FT910 (as needed for patch and fill)	Corobond 100 at 4 – 6 mils	Cor Cote HCR Clear at 20 – 25 mils with 1 oz. fiberglass mat	Resuflor 3741 at 8 – 10 mils with 20/40 mesh aggregate broadcast	Resuflor 3741 at 12 – 25 mils
	Tnemec Company	Series 215 or Series 217 or N218 Mortar As required	Series 251SC Primer at 6 -12 mils	252 SC Mortar at 60-80 mils with 211-215 Mat	252 SC (Neat) at 8-12 mils	252 SC (Neat) at 8-12 mils
SC-5 56% Acetic Acid	Akzo Nobel	Ceilcote 6640 + S1 Powder As required	Ceilcote 380 at 2-5 mils	Ceilcote 6640 at 32 mils/ Mat Reinforcement	NA	Ceilcote 6640 + S1 powder at 60 mils
	Carboline	Carboguard 510 or 501 as required	Semstone 110 Primer at 8-10 mils	Semstone 145 at 20-25 mils/Reinforcing Mat	Semstone 145 at 25-30 mils/20/40 Mesh Aggregate Broadcast	Semstone 145 at 15-20 mils
	Sherwin Williams	Steel Seam FT910 (as needed for patch and fill)	Corobond 100 at 4 – 6 mils	Cor Cote HCR Clear at 20 – 25 mils with 1 oz. fiberglass mat	Resuflor 3741 at 8 – 10 mils with 20/40 mesh aggregate broadcast	Resuflor 3741 at 12 – 25 mils
	Tnemec Company	Series 215 or Series 217 or N218 Mortar As required	Series 251SC at 6-12 mils	Series 252 SC Mortar at 60-80 mils	Series 252 SC (neat) at 8-12 mils	Series 252 SC (neat) at 8-12 mils
SC-6 50% Aluminum Chlorohydrate	Akzo Nobel	Ceilcote 6640 + S1 Powder As required	Ceilcote 380 at 2-5 mils	Ceilcote 6640 at 32 mils/ Mat Reinforcement	NA	Ceilcote 6640 + S1 powder at 60 mils
	Carboline	Carboguard 510 or 501 as required	Semstone 110 Primer at 8-10 mils	Semstone 145 at 20-25 mils/Reinforcing Mat	Semstone 145 at 25-30 mils/20/40 Mesh Aggregate Broadcast	Semstone 145 at 15-20 mils

PART 3 EXECUTION

3.01 COATINGS

A. Workmanship:

1. Do not use coating products until the Engineer or Owner's Representative has accepted the affidavits specified in paragraphs 1.07 and 2.01, and inspected the materials, and the CTR has trained the Contractor in the surface preparation, mixing, and application of each coating system.
2. Erect and maintain protective enclosures as stipulated per SSPC-Guide 6 Guide for Containing Debris Generated During Paint Removal Operations.

B. Shop and Field Coats:

1. Shop Applied Prime Coat: Except as otherwise specified, prime coats may be shop-applied or field-applied. Use only Shop-applied primer compatible with the specified coating system and applied at the minimum DFT recommended by the CSM. Provide data sheets identifying the shop primer to the on-site coating application personnel. Perform adhesion tests on the shop primer as specified in paragraph 3.01 B.3. Adhesion Confirmation. Remove damaged, deteriorated, and poorly applied shop coatings that do not meet the requirements of this Section and recoat the surfaces. If the shop primer coat meets the requirements of this Section, the field coating may consist of touching up the shop prime coat and then applying the finish coats to achieve the specified film thickness and continuity.
2. Field Coats: Apply field coats consisting of one or more prime coats and one or more finish coats to build up the coating to the specified DFT. Unless otherwise specified, do not apply finish coats until other work in the area is complete and previous coats have been inspected.
3. Adhesion Confirmation: Perform an adhesion test after proper cure in accordance with ASTM D3359 to demonstrate that (1) the shop applied prime coat adheres to the substrate, and (2) the specified field coatings adhere to the shop coat. Test results showing an adhesion rating of 5A on immersed surfaces and 4A or better on other surfaces are required for coatings 5 mils or more in thickness (Method A). Test results showing an adhesion rating of 5B on immersed surfaces and 4B or better on other surfaces are acceptable for coating thicknesses less than 5 mils.
4. The same QC and quality assurance inspection requirements are applicable for shop applications as for field applications.

C. Application Location Requirements:
1. For equipment, Non-immersed: Items of equipment, or parts of equipment that are not immersed in service, and then finish coated in the field after installation with the specified or acceptable color. If the shop primer requires topcoating within a specified period, finish coat the equipment in the shop and then touch-up paint after installation. If equipment removal and reinstallation is required for the project, perform touch-up coating work in the field following installation.
2. Equipment, Immersed: Perform all surface preparation and coating work in the field for all items of equipment parts or fabrications that are immersed when in service, with the exception of manufacturer-finished pumps and valves. Coating systems applied to immersed equipment shall be pinhole free, which can only be verified by holiday/spark testing.

3.02 PREPARATION

A. General:
1. Prepare each type of in accordance with the specific requirements of each coating specification sheet (COATSPEC) and the following. In the event of a conflict, the COATSPEC sheets shall take precedence.
2. Clean and dry surfaces to be coated. Before applying coating or surface treatments remove oil, grease, dirt, rust, loose mill scale, old weathered coatings, and other foreign substances. Remove oil and grease before mechanical cleaning is started. Where mechanical cleaning is accomplished by blast cleaning, wash, grade, and free the abrasive from contaminants that might interfere with the adhesion of the coatings. Use air for blast cleaning that is sufficiently free of oil and moisture so as not to cause detrimental contamination of the surfaces to be coated.

3. QCP to review surfaces to be coated before application of a coating. Correct surface defects identified by the inspector at no additional cost to the Owner.
4. Schedule cleaning and coating so that dust and spray from the cleaning process does not fall on wet, newly coated surfaces. Remove or mask hardware, hardware accessories, nameplates, data tags, machined surfaces, sprinkler heads, electrical fixtures, and similar uncoated items which are in contact with coated surfaces prior to surface preparation and coating operations. Reinstall removed following completion of coating. Disconnect and move equipment adjacent to walls to permit cleaning and coating of equipment and walls. Replace and reconnect items following coating.

B. Blast Cleaning:
   1. Meet the following requirements for abrasive blast cleaning:
      a. Do not reuse used or spent blast abrasive on this project.
      b. Filter compressed air for blast cleaning and ensure it contains no condensed water and no oil. Clean moisture traps at least once every 4 hours or more frequently as required to prevent moisture from entering the supply air to the abrasive blasting equipment.
      c. Install oil separators just downstream of compressor discharge valves and at the discharge of the blast pot discharges. Check and clean on the same frequency as the moisture traps as defined above.
      d. Regulators, gauges, filters, and separators must be in use on compressor air lines to blasting nozzles at all times during this work.
      e. Install an air dryer or desiccant filter drying unit which dries the compressed air prior to blast pot connections. Use and maintain the dryer for the duration of surface preparation work.
      f. Use abrasive blast nozzles of the venturi or other high velocity type supplied with a minimum of 100 pounds per square in gauge (psig) air pressure and sufficient volume to obtain the blast cleaning production rates and cleanliness/specified.
      g. Provide ventilation for airborne particulate evacuation (meeting pertinent safety standards) to optimize visibility for both blast cleaning and inspection of the substrate during surface preparation work.
      h. If, between final surface preparation work and coating system application, contamination of prepared and cleaned metallic substrates occurs, or if the prepared substrates' appearance darkens or changes color, reclean the surface by water blasting, reblasting, and abrasive blast cleaning until the specified degree of cleanliness is reclaimed.
      i. Protect mechanical, electrical, and other equipment adjacent to and surrounding the work area.

C. Solvent Cleaning:
   1. Use emulsifying type solvent wash, solvent wipe, or cleaner, including but not limited to those used for surface preparation in accordance with SSPC SP1 Solvent Cleaning which emits no more than 340 g/l VOCs for AIM regions, contains no phosphates, is biodegradable, removes no zinc, and is compatible with the specified primer.
   2. Use clean white cloths and clean fluids in solvent cleaning.

D. Metallic Surfaces:

1. Prepare metallic surfaces in accordance with applicable portions of surface preparation specifications of the Society for Protective Coatings (SSPC) specified for each coating system. See COATSPEC for each coating system in this Section. The profile depth of the surface to be coated shall be in accordance with the COATSPEC requirements in this Section measured by Method C of ASTM D4417. Select blast particle size to produce the specified surface profile. Use the solvent in solvent cleaning operations as recommended by the CSM.
2. Prepare metallic surfaces for degree of cleanliness based upon comparison with SSPC-VIS1-89 (ASTM D2200), and as described in the COATSPEC for each coating system. If dry abrasive blast cleaning is selected and to facilitate inspection, on the first day of cleaning operations, provide abrasive blast metal reference panels to the standards specified for acceptance by the Construction Manager. Plates shall measure a minimum of 8-1/2 inches by 11 inches. Panels accepted by the Construction Manager as meeting the requirements of the specifications shall be initialed by the Contractor and coated with a clear non-yellowing finish. Provide a reference panel for each type of abrasive blasting to be used as the comparison standard throughout the project.
3. Blast cleaning requirements for steel, ductile iron, and stainless steel substrates are as follows:
    a. Prepare external surfaces of steel piping shall in accordance with SSPC SP10 (Near White Metal Blast Cleaning) and prime before installation. Prepare ductile iron piping surfaces including fittings in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05. Prepare all other steel surfaces to white metal blast cleaning per SSPC SP5.
    b. Abrasive blast stainless steel surfaces in accordance with SSPC SP16 to leave a clean uniform appearance with a minimum uniform surface profile of 1.5 to 2.5 mils.
    c. Remove traces of grit, dust, dirt, rust scale, friable material, loose corrosion products or embedded abrasive from substrate by vacuum cleaning prior to coating application.
    d. Prevent contamination of the surface after blasting from worker's fingerprints, deleterious substances on workers' clothing, or from atmospheric conditions.
    e. Continuously monitor maintain ambient environmental conditions in the enclosure to ensure the degree of cleanliness is held and no "rust back" occurs prior to coating material application.

E. Concrete Surfaces:
1. Inspect concrete surfaces prior to surface preparation and prepare concrete surfaces in accordance with SSPC-SP13 (also called NACE 6).
2. Prior to surface preparation for cleanliness and profile, prepare substrate cracks and areas requiring resurfacing and perform detail treatment including but not limited to, terminating edges, per CSM recommendations.
3. Evaluate the surface profile for prepared concrete surfaces to be coated by comparing the profile of the prepared concrete with the profile of graded abrasive paper, as described in ANSI B74.18 or by comparing the profile with the ICRI 310.2 (surface profile replicas). Prepare surface profile in accordance with the COATSPEC requirements and the CSM's recommendations.
4. Inspect surface cleanliness of prepared concrete substrates after cleaning, preparation, and/or drying, but prior to making repairs or applying a coat in the

coating system. Reinspect repaired concrete surfaces for cleanliness prior to application of the coating system.

5. Prepare concrete substrates using methods such as dry abrasive blast cleaning, high, or ultra high-pressure water blast cleaning in accordance with SSPC SP13 and to meet the following requirements:
   a. A clean substrate that is free of calcium sulfate, loose coarse or fine aggregate, laitance, loose hydrated cement paste, and otherwise deleterious substances.
   b. Open up air voids or bugholes to expose their complete perimeter by blast cleaning or other methods. Leaving shelled over, hidden air voids beneath the exposed concrete surface is not acceptable. Concrete substrate must be dry prior to the application of filler/surface or coating system materials.
   c. Produce a concrete surface with a minimum pH of 9.0 to be confirmed by surface pH testing. If after surface preparation, the surface pH remains below 9.0, perform additional water blasting, cleaning, or abrasive blast cleaning until additional pH testing indicates an acceptable pH level.
   d. Following inspection of the concrete surface preparation, thoroughly vacuum clean concrete surfaces to be coated to remove loose dirt, and spent abrasive (if dry blast cleaning is used) leaving a dust free, sound concrete substrate.
   e. Remove debris produced by blast cleaning from the structures to be coated and disposed of legally off site by the Contractor.
6. Should abrasive blast cleaning or high or ultrahigh pressure water jetting not remove degraded concrete, use chipping or other abrading tools shall be used to remove the deteriorated concrete until a sound, clean substrate is achieved which is free of calcium sulfate, loose coarse or fine aggregate, laitance, loose hydrated cement paste, and otherwise deleterious substances. Concrete substrates must be dry prior to the application of filler/surfacers or coating system materials.
7. Test moisture content of concrete to be coated in accordance with ASTM D4263, Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method at least once for every 500 sq ft of surface area to be coated or more often if required by the CSM. The presence of any moisture on plastic sheet following test period constitutes a non-acceptable test.
8. If moisture is detected the CSA in cooperation with the CTR shall perform additional moisture testing vis ASTM F1869 or ASTM F2170 to determine the extent of the moisture vapor transmission. Acceptable limits for the application of barrier coatings for ASTM F1869 is <3 pounds/1,000 sq ft/24 hours. Acceptable limits as per ASTM F2170 is an RH value <70 percent.

F. Masonry Surfaces:
   1. Prepare masonry surfaces such as Concrete Masonry Units (CMU) to remove chalk, loose dirt, dried mortar splatter, dust, peeling, or loose existing coatings, or otherwise deleterious substances to leave a clean, sound substrate.
   2. Confirm masonry surfaces are dry prior to coating application. If pressure washing or low-pressure water blast cleaning is used for preparation, allow the masonry to dry for at least 5 days under dry weather conditions or when the minimum ambient temperature is 70 degrees F prior to coating application work.

G. Existing Facilities
   1. Contractor shall demonstrate that the existing coating is compatible with field coating by performing a test over the existing coating to be abraded per the CSM's

recommendations to assure good adhesion. Where unacceptable test results (like lifting, blistering, or cracking) are obtained, the Contractor shall follow manufacturer's written instructions as to the necessity of existing coating removal or the need for a tie coat to provide a satisfactory bond between the existing coating and the specified field coating

3.03 APPLICATION

A. Workmanship:
   1. Apply coats to produce an even film of uniform thickness free from runs, drips, ridges, waves, laps, and brush marks and completely coating corners and crevices.
   2. Use equipment designed for application of the materials specified. Equip compressors with suitable traps and filters to remove water and oils from the air. Perform a paper blotter test when requested by the Construction Manager to determine if the air is sufficiently free of oil and moisture so as not to produce deteriorating effects on the coating system. Limit the amount of oil and moisture in spray air to less than the amount recommended by the CSM. Equip spray equipment with mechanical agitators, pressure gages, and pressure regulators, and spray nozzles of the proper sizes.
   3. Apply each coat evenly and sharply cut to line. Avoid over-spraying or spattering coating on surfaces not to be coated. Protect glass, hardware, floors, roofs, and other adjacent areas and installations by taping, drop cloths, or other suitable measures.
   4. Use coating applications method -- conventional or airless spray, brush or roller, or trowel -- as recommended by CSM.
   5. Allow each coat to cure or dry thoroughly, according to CSM's printed instructions, prior to recoating.
   6. Lightly sand glossy undercoats to provide a surface suitable for the proper application and adhesion of subsequent coats. Vary color for each successive coat for coating systems when possible.
   7. Prior to overall coating system application on complex steel shapes, stripe coat welds, edges of structural steel shapes, metal cut-outs, pits in steel surfaces, or rough surfaces with the primer coat material using brushes or rollers to ensure proper coverage. Stripe coat via spray application is not permitted.

B. Coating Properties, Mixing and Thinning:
   1. Coatings shall provide a satisfactory film and smooth even surface. Thoroughly stir, strain, and keep coating materials at a uniform consistency during application. Mix coating materials consisting of 2 or more components in accordance with the CSM's instructions. Where necessary to suit the conditions of the surface, temperature, weather, and method of application, the coating may be thinned as recommended by the CSM immediately prior to use. The volatile organic content (VOC) of the coating as applied shall comply with prevailing air pollution control regulations. Unless otherwise specified, do not reduce coating materials more than necessary to obtain the proper application characteristics. Use thinner as recommended by the CSM.

C. Atmospheric Conditions:
   1. Apply coatings only to surfaces that are dry, and only under conditions of evaporation rather than condensation. Do not apply coating systems during rainy, misty weather, or to surfaces upon which there is frost or moisture condensation. During damp

weather, when the temperature of the surface to be coated is within 10 degrees F of the dew point, forced dehumidification equipment may be used to maintain a temperature of minimum 40 degrees F and 10 degrees F above the dew point for the surfaces to be coated, the coated surface, and the atmosphere in contact with the surface. Maintain these conditions for a period of at least 8 hours or as recommended by the CSM to assure proper coating cure. Where conditions causing condensation are severe, use dehumidification equipment, fans, and/or heaters inside enclosed areas to maintain the required atmospheric and surface temperature requirements for proper coating application and cure.

D. Concrete Substrate Temperatures and Detail Treatment:
   1. When the surface temperatures of the concrete substrates to be coated are rising or when these substrates are in direct sunlight, outgassing of air from the concrete may result in bubbling, pinhole formations, and/or blistering in the coating system. The application of the filler/surfacer or restoration mortar and the coating system will only be allowed during periods of falling temperature. This will require that application of the filler/surfacer and coating system only occur during the cooler evening hours in most cases. Include any cost for working outside of normal hours in the bid.
   2. Repair all bubbles, pinholes, or discontinuities that form in the applied coating system material as recommended by the CSM. Repair pinholes in the filler/surfacer material or in the first coat of the coating material in accordance with the CSM's recommendations prior to application of the next coat of material. Open up and fill completely air voids behind or beneath the pinhole with the specified filler/surfacer material. Abrade the coated area around the pinhole repair and reapply the coating over that area.
   3. Perform application detail work per CSM's current written recommendations and/or drawings.

E. Protection of Coated Surfaces:
   1. Do not handle, work on, or otherwise disturb items that have been coated until the coating is completely dry and hard. Recoat or touch-up shop-coated items after delivery at the site, and upon permanent erection or installation with specified coating when it is necessary to maintain the integrity of the film.

F. Method of Coating Application:
   1. Where 2 or more coats are required, provide sufficient compatible color additive or contrasting color in alternate coats to act as indicator of coverage. Do not use color additives containing lead, or lead compounds, which may be destroyed or affected by hydrogen sulfide or other corrosive gas, and/or chromium.
   2. Mechanical equipment, on which the equipment manufacturer's coating is acceptable, touch-up prime and coat with 2 coats of the specified coating system to match the color scheduled.
   3. Do not apply coating to a surface until it has been prepared as specified. Apply the primer or first coat by brush to ferrous surfaces that are not blast cleaned. Coats for blast cleaned ferrous surfaces and subsequent coats for nonblast cleaned ferrous surfaces may be either brush or spray applied. After the prime coat is dry, mark all pinholes and holidays., repair in accordance with CSM's recommendations, and retest before succeeding coats are applied. Unless otherwise specified, brush, roll, or trowel coats for concrete and masonry.

G. Film Thickness and Continuity:
   1. Confirm WFT following application of each coat.
   2. Do not exceed the surface area covered per gallon of coating for various types of surfaces as recommended by the CSM. The first coat, referred to as the prime coat, on metal surfaces refers to the first full paint coat and not to solvent wash, grease emulsifiers, or other pretreatment applications. Apply coatings to the thickness specified, and in accordance with these specifications.
   3. The ability to obtain specified film thickness is generally compromised when brush or roller application methods are used and, therefore, more coats may need to be applied to achieve the specified DFT.
   4. For concrete substrates, apply a complete skim coat of the specified filler/surfacer material over the entire substrate prior to application of the coating system such that all open air voids and bugholes in the concrete substrate are completely filled prior to coating application.

H. Special Requirements:
   1. Before erection, apply all but the final finish coat to interior surfaces of steel supports, pipe hangers, piping in contact with hangers, and contact surfaces that are inaccessible after assembly. Apply the final coat after erection. Hand clean or power-tool clean areas damaged during erection and recoat with primer coat prior to the application of subsequent coats. Touch-up surfaces after installation. Confirm surfaces to be coated are clean and dry at the time of application.

I. Electrical and Instrumentation Equipment and Materials:
   1. Electrical and instrumentation equipment and materials shall be shop coated by the equipment manufacturer in compliance with the standard (IEEE, ANSI, NEMA, etc.) referenced in the individual equipment specification. Before final acceptance, the Contractor shall touch up scratches on equipment with identical color coating. Finish shall be smooth, free of runs, and match existing finish. Prior to touching up scratches, Contractor shall fill them with an appropriate filler material approved by the CSM so evidence of prior scratches is not visible in the finish surface. Electrical and instrumentation equipment and materials shall be coated in accordance with Section 09 90 00.

J. General:
   1. Upon completion of coating, remove surplus materials, protective coverings, and accumulated rubbish, and thoroughly clean surfaces and repair overspray or other coating-related damage.

3.04 QUALITY CONTROL DOCUMENTATION .

A. Compile all required QC documentation, test reports, checklists, signoffs as required with appropriate signoffs by the Contractor, CSA, CTR, quality inspectors, etc. and submit to Construction Manager.

3.05 COATING SYSTEM SPECIFICATION SHEETS (COATSPEC)

A. General:
   1. Coating systems for different types of surfaces and general service conditions for which these systems are normally applied are specified on the following COATSPEC

sheets. Coat surfaces in accordance with the COATSPEC to the system thickness specified. Use Coating systems as specified in [Finish Schedule in 09 90 00] (or)[paragraph 3.08]. In case of conflict between the Finish Schedule and the COATSPECS, the requirements of the schedule shall prevail.

2. Table A provides a list of Coating Systems included in the project, the type of coating material, and the general surfaces and service conditions for which each system is used. COATSPECS for HP designated systems are included this paragraph 3.06 and COATSPECS for SC designated systems are included in paragraph 3.07.

Table A Coating Specification Sheets

Coating System ID	Coating Material	Surface	Service Condition
HP-1	Amine Cured Epoxy or Modified Amine Cured Epoxy	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel	Continuous Immersion in Wastewater or Wastewater Sludge
HP-2	Epoxy First Coat with Acrylic Aliphatic Polyurethane Finish Coat (for U.V. Light Resistance)	Carbon Steel, Ductile Iron, Cast Iron	Weathering exposure including U.V. sunlight direct exposure. Apply above splash or spray zone.
HP-3	Modified Amine or Blended Amine Cured Epoxy	Concrete and Concrete Block Masonry	Continuous Immersion in Wastewater or Wastewater Sludge
HP-4	Blended Amine Cure Epoxy Linings	Concrete and Masonry (Non-Brick)	Headspace Exposure to Biogenic Sulfide Corrosion and Related Sulfuric Acid Attack
HP-5	Blended Amine Cured Epoxy	Carbon Steel, Ductile Iron or Cast Iron	Headspace Exposure to Biogenic Sulfide Corrosion and Related Sulfuric Acid Exposure
HP-6	Blended Amine Cured Epoxy Trowel Applied System	Concrete and Concrete Block Masonry	Intermittent Immersion in Wastewater or Wastewater Sludge and Biogenic Sulfide Corrosion – Headspace Exposure and Abrasive Conditions
HP-7	Blended Amine Cured Epoxy	Carbon Steel, Ductile Iron or Cast Iron	Steel Substrate in Mesophilic Anaerobic Digester Service
HP-8	Blended Amine Cured Epoxy System	Concrete	Concrete Substrates in Mesophilic Anaerobic Digesters
HP-9	High Temp Novolac or Acceptable Alternative	Carbon Steel, Ductile Iron or Cast Iron	Steel Substrate in Thermophilic Anaerobic Digester Service
HP-10	High Temp Novolac or Acceptable Alternative	Concrete	Concrete Substrates in Thermophilic Anaerobic Digesters
HP-11	High Build High Strength Semi Structural Blended Amine Cured Epoxy System	Concrete and Concrete Block Masonry	Intermittent Immersion in Wastewater or Wastewater Sludge and Biogenic Sulfide Corrosion – Headspace Exposure and Abrasive Conditions
HP-12	Urethane Cement	Concrete Tank Floors and 4-7-ft Seamlessly onto Tanks Walls	Moisture Vapor Transmission (MVT) Suppression System with Unlimited Potential to block MVT for Wastewater Immersion. MVT systems are to be used in conjunction with the appropriate specified topcoat depending on the system requirements.
HP-13	Urethane Cement or Epoxy Based Specialty MVT Primers	Concrete Tank Floors and 4-7-ft onto Tanks Walls	Moisture Vapor Transmission (MVT) Suppression System to block MVT up to 20 lbs./1,000 sq ft/24 hours as per ASTM F1869 for Wastewater Immersion. MVT systems are to be used in conjunction with the appropriate specified topcoat depending on the system requirements.

Coating System Specification Sheets (COATSPEC)

Coating System Identification–HP-1

1.	Coating Material:	Amine Cured Epoxy or Modified Amine Cured Epoxy
2.	Surfaces:	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel
3.	Service Conditions:	Continuous Immersion in Wastewater or Wastewater Sludge
4.	Surface Preparation:	
a.	Carbon Steel:	Abrasive blast clean to Near White Metal Blast Degree of Cleanliness per SSPC SP10 to achieve a minimum surface profile of 3.0 to 4.0 mils. Vacuum clean to remove all dust, dirt, loose material (including all existing coatings if a complete recoating project).
b.	Shop Primed Metals:	DO NOT USE SHOP PRIMED COMPONENTS IN THIS SERVICE unless the shop primer's maximum recoat time has not been exceeded. If there is damage to the shop primer, power tool clean to bare metal all damaged areas in accordance with SSPC SP11 or SSPC SP3 and abrade the peripheral intact coating area around the bare metal by 1-1/2 inches all around for re-priming. Abrading the intact primer must produce a 1.0 to 1.5 mil profile in the existing primer. Vacuum clean to remove all loose dust, dirt, and loose coating material.
c.	Galvanized Steel:	DO NOT USE GALVANIZED STEEL in Wastewater or Sludge Immersion Service.
d.	Cast Iron or Ductile Iron:	Abrasive blast clean these surfaces in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05. Vacuum clean as required for carbon steel.
e.	Stainless Steel Component Surfaces:	Abrasive blast clean in accordance with SSPC SP16 using only aluminum oxide abrasive blast media to produce a minimum, uniform surface profile of 1.5 to 2.5 mils. Vacuum clean the same as for carbon steel surfaces. Stainless steel is only to be prepared and coated when galvanic corrosion (dissimilar metal corrosion) is a concern.
f.	Stainless Steel Fastener Surfaces: when stainless steel fasteners	Solvent clean all bolts, nuts, washers, etc. in accordance with SSPC SP1 to remove all traces of cutting oil. Stainless steel fasteners should be field coated with the ferrous metal components that the fasteners connect. Also, these

Coating System Specification Sheets (COATSPEC)

Coating System Identification–HP-1

	are electrically continuous with coated carbon steel	fasteners shall be completely sealed with a polysulfide sealant to prevent future galvanic corrosion between the fasteners and the coated steel or other coated ferrous metal surfaces. The installation of the sealant shall be continued onto the coated ferrous metal surfaces by at least 2 inches in all directions.
5.	Field Application:	
a.	Coating System Thickness:	30-40 DFT.
b.	Coatings:	Primer or First Coats - One coat at CSM's recommended DFT.
c.	Finish Coats:	One or more coats at CSM's recommended DFT per coat to achieve the total system DFT.
d.	Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e.	Post Cure QC Testing:	Perform Holiday Detection over 100 percent of the coated surface area in accordance with ASTM D5162. Acceptance Criteria shall be no pinholes or holidays. Perform Adhesion Testing in accordance with ASTM D4541 at a minimum of 24 locations representative of all components making up the internal mechanisms of the clarifiers or sludge thickness or DAFT units, etc. If coating applied to other metal equipment or components, perform number of adhesion tests per the CSM's recommendations. Acceptance Criteria: minimum 850 psi with failure plane at substrate for 75 percent of load fixture surface area.
f.	Pinhole, Holiday or Defect Repair Procedure:	Using a grinder or flapper wheel tool, remove the coating at defect or adhesion test area on areas of 1-1/2 inches in diameter to bare metal. Abrade the coating in area comprising periphery of bare metal to 1 inch all around the bare metal area to achieve a 1.5- to 2.0-mil profile in the existing intact coating in periphery area. Vacuum clean the prepared area to remove all loose dust, dirt, and loose coating materials leaving a clean, sound area for coating repair. Tape to mask the peripheral area at the edge of the roughened existing coating. Apply the coating system in 2 or 3 coats as necessary to achieve the total system DFT over the defect and coating prepared area feathering the coatings onto the roughened existing coating around the periphery of the repair area. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification–HP-2

1.	Coating Material:	Epoxy First Coat with Acrylic Aliphatic Polyurethane Finish Coat (for U.V. Light Resistance)
2.	Surfaces:	Carbon Steel, Ductile Iron, Cast Iron
3.	Service Conditions:	Weathering exposure including U.V. sunlight direct exposure. Apply above splash or spray zone.
4.	Surface Preparation:	Abrasive blast clean to Near White Metal Blast Degree of Cleanliness per SSPC SP10 to achieve a minimum surface profile of 2.0-2.5 mils. Vacuum clean to remove all dust, dirt, and spent abrasive and other loose material. (Including removal of all existing coatings if it is a complete recoating project.)
a.	Shop Primed Steel:	DO NOT USE SHOP PRIMED COMPONENTS in this service unless the shop primer's maximum recoat time has not been exceeded. If there is damage to the shop primer, power tool clean to bare metal all damaged areas in accordance with SSPC SP11 or SSPC SP3 and abrade the peripheral intact coating area the bare metal by 1-1/2 inches all around for re-priming. Abrading the intact primer must produce a 1.0- to 1.5 mil profile in the existing primer.

Coating System Specification Sheets (COATSPEC)

Coating System Identification–HP-2

	Vacuum clean to remove all loose dust, dirt, coatings, or other materials.
b. Galvanized Steel:	DO NOT USE GALVANIZED STEEL in these service conditions.
c. Cast Iron or Ductile Iron:	Abrasive blast clean these surfaces in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05. Vacuum clean as required for carbon steel.
d. Stainless Steel Surfaces:	Above waterline or splash zone, no surface preparation required. Same for stainless steel fasteners – no surface preparation required.
5. Field Application:	
a. Coating System Thickness:	13-20 mils DFT.
b. Coatings:	Primer or First Coat: 1-2 Coats for 10-15 mils DFT. Finish Coat: 3-5 mils DFT.
c. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
d. Post Cure QC Testing:	Perform Holiday Detection over 100 percent of the coated surface area in accordance with ASTM D5162. Acceptance Criteria: no pinholes or holidays. Perform Adhesion Testing in accordance with ASTM D4541 at a minimum of 12 locations representative of all components making up the weather exposed mechanisms of the clarifiers or sludge thickness or DAFT units. If other structures are to be coated, perform tests at a number of locations recommended by the CSM. Acceptance Criteria: minimum 850 psi with substrate for 75 percent load fixtures surface area.
e. Pinhole, Holiday or Defect Repair Procedure:	Using a grinder or flapper wheel tool, remove the coating at defect or adhesion test area un areas of 1-1/2 inches in diameter to bare metal. Abrade the coating in area comprising periphery of bare metal to 1 inch all around the bare metal area to achieve a 1.5- to 2.0-mil profile in the existing intact coating in periphery area. Vacuum clean the prepared area to remove all loose dust, dirt, and loose coating materials leaving a clean, sound area for coating repair. Tape to mask the peripheral area at the edge of the roughened existing coating. Apply the coating system in 2 or 3 coats as necessary to achieve the total system DFT over the defect and coating prepared area feathering the coatings onto the roughened existing coating around the periphery of the repair area. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-3

1. Coating Material:	Modified Amine or Blended Amine Cured Epoxy
2. Surfaces:	Concrete and Concrete Block Masonry
3. Service Conditions:	Continuous Immersion in Wastewater or Wastewater Sludge
4. Surface Preparation:	Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating. All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard

	details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
a. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in Section 03 30 00. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 6 in accordance with ICRI 310.2R. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 4 in accordance with ICRI 310.2R prior to coating application.
b. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate, and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b. Coating System Thickness:	100-125 mils dry film in addition to the parge coat.
c. Coatings:	Finish: One or more coats at CSM's recommended DFT per coat to the specified system thickness.
d. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e. Post Cure QC Testing:	Holiday Detection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-3

	of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria is average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed at least at one location for every 1,000 sq ft of area to be coated and be performed at areas representative of the entire area to be coated if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
f. Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 125 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

4. Surface Preparation:	Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating. All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
a. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled-over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 4 in accordance with ICRI 310.2R prior to coating application.
b. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate, and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-6

		If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b.	Coating System Thickness:	100-125 mils dry film in addition to the parge coat.
c.	Coatings:	Primer: Optional to control outgassing. Finish: One coat at 125 mils Trowel Applied.
d.	Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e.	Post Cure QC Testing:	Holiday Detection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria is average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed at least at one location for every 1,000 sq ft of area to be coated and be performed at areas representative of the entire area to be coated if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
f.	Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 125 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-7

1.	Coating Material:	Blended Amine Cured Epoxy
2.	Surfaces:	Carbon Steel, Ductile Iron or Cast Iron
3.	Service Conditions:	Steel Substrate in Mesophilic Anaerobic Digester Service
4.	Surface Preparation:	
a.	Carbon Steel:	Abrasive blast clean to White Metal Blast Degree of Cleanliness per SSPC SP10 to achieve a minimum surface profile of 3.0 mils. Vacuum clean to remove all dust, dirt, loose material (including all existing coatings if a complete recoating project).
b.	Shop Primed Metals:	DO NOT USE SHOP PRIMED COMPONENTS IN THIS SERVICE unless the shop primer's maximum recoat time has not been exceeded. If there is damage to the shop primer, power tool clean to bare metal all damaged areas in accordance with SSPC SP11 or SSPC SP3 and abrade the peripheral intact coating area around the bare metal by 1-1/2 inches all around for re-priming. Abrading the intact primer must produce a 1.0- to 1.5-mil profile in the existing primer. Vacuum clean to remove all loose dust, dirt, and loose coating material.
c.	Galvanized Steel:	DO NOT USE GALVANIZED STEEL IN THIS SERVICE.
d.	Cast Iron or Ductile Iron:	Abrasive blast clean these surfaces in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05. Vacuum clean as required for carbon steel.
5.	Field Application:	
a.	Coating System Thickness:	60-80 mils DFT.
b.	Coatings:	Primer or First Coat: One coat at CSM's recommended DFT.
c.	Finish Coats:	One or more coats at CSM's recommended DFT per coat to achieve the total system DFT.
d.	Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e.	Post Cure QC Testing:	Perform Holiday Detection over 100 percent of the coated surface area in accordance with ASTM D5162. Acceptance Criteria: no pinholes or holidays. Perform Adhesion Testing in accordance with ASTM D4541 at a minimum of 12 locations representative of all components making up the surface area to be coated. Acceptance Criteria: minimum 850 psi with adhesion failure plane at metal substrates at 75 percent of load fixture surface area
f.	Pinhole, Holiday or Defect Repair Procedure:	Using a grinder or flapper wheel tool, remove the coating at defect or adhesion test area un areas of 1-1/2 inches in diameter to bare metal. Abrade the coating in area comprising periphery of bare metal to 1 inch all around the bare metal area to achieve a 1.5- to 2.0-mil profile in the existing intact coating in periphery area. Vacuum clean the prepared area to remove all loose dust, dirt, and loose coating materials leaving a clean, sound area for coating repair. Tape to mask the peripheral area at the edge of the roughened existing coating. Apply the coating system in 2 or 3 coats as necessary to achieve the total system DFT over the defect and coating prepared area feathering the coatings onto the roughened existing coating around the periphery of the repair area. Allow to cure properly.

Coating System Identification – HP-11

1. Coating Material:	High Build High Strength Semi Structural Blended Amine Cured Epoxy System
2. Surfaces:	Concrete and Concrete Block Masonry
3. Service Conditions:	Intermittent Immersion in Wastewater or Wastewater Sludge and Biogenic Sulfide Corrosion – Headspace Exposure and Abrasive Conditions
4. Surface Preparation:	Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating. All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
a. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 4 in accordance with ICRI 310.2R prior to coating application.
b. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-11

	Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b. Coating System Thickness:	100-125 mils dry film in addition to the parge coat.
c. Coatings:	Primer: Optional to control outgassing. Finish: One coat at 125 mils.
d. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e. Post Cure QC Testing:	Holiday Detection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria is average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed at least at one location for every 1,000 sq ft of area to be coated and be performed at areas representative of the entire area to be coated if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
f. Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-11

	• Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 125 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-12

1. Coating Material:	Urethane Cement
2. Surfaces:	Concrete Tank Floors and 4-7-ft Seamlessly onto Tanks Walls
3. Service Conditions:	Moisture Vapor Transmission (MVT) Suppression System with Unlimited Potential to block MVT for Wastewater Immersion. MVT systems are to be used in conjunction with the appropriate specified topcoat depending on the system requirements.
4. Surface Preparation:	Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating. All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
a. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in Section 03 30 00. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 6 in accordance with ICRI 310.2R. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 4 in accordance with ICRI 310.2R prior to coating application.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of MVT system to fill all bugholes and voids and create a complete parge coat of

Coating System Identification – HP-12

		the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions. The CSA shall engage the CSM and CTR for specific application instruction for the MVT systems for both horizontal and vertical applications.
b.	MVT System Thickness:	System DFT as per CSM System Instructions above parge coat.
c.	Coatings:	Finish: With the appropriate specified topcoat to meet the service requirements.
d.	Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e.	Post Cure QC Testing:	Holiday Detection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed at least at 1 location for every 1,000 sq ft of area to be coated and be performed at areas representative of the entire area to be coated if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
f.	Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations.

	• Apply the coating system in the number of coats necessary to achieve the specified 125 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-13

1. Coating Material:	Urethane Cement or Epoxy Based Specialty MVT Primers
2. Surfaces:	Concrete Tank Floors and 4-7-ft onto Tanks Walls
3. Service Conditions:	Moisture Vapor Transmission (MVT) Suppression System to block MVT up to 20 lbs./1,000 sq ft/24 hours as per ASTM F1869 for Wastewater Immersion. MVT systems are to be used in conjunction with the appropriate specified topcoat depending on the system requirements.
4. Surface Preparation:	Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating. All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
a. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in Section 03 30 00. Surface Preparation must open up all shelled-over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 6 in accordance with ICRI 310.2R. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces, and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 4 in accordance with ICRI 310.2R prior to coating application.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of MVT system to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness.

Coating System Identification – HP-13

	Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions. The CSA shall engage the CSM and CTR for specific application instruction for the MVT systems for both horizontal and vertical applications.
b. MVT System Thickness:	System DFT as per CSM System Instructions above parge coat.
c. Coatings:	With the appropriate specified topcoat to meet the service requirements.
d. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e. Post Cure QC Testing:	Holiday Detection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed on at least at one location for every 1,000 sq ft of area to be coated and be performed at areas representative of the entire area to be coated if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
f. Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 125 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – HP-14

1. Coating Material:	Epoxy Based Specialty MVT Primers
2. Surfaces:	Concrete Tank Floors and 4-7-ft onto Tanks Walls
3. Service Conditions:	Moisture Vapor Transmission (MVT) Suppression System to block MVT up to 10 lbs./1,000 sq ft/24 hours as per ASTM F1869 for Wastewater Immersion. MVT systems are to be used in conjunction with the appropriate specified topcoat depending on the system requirements.
4. Surface Preparation:	Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating. All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum-cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
a. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in Section 03 30 00. Surface Preparation must open up all shelled-over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP 6 in accordance with ICRI 310.2R. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces, and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer) material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 4 in accordance with ICRI 310.2R prior to coating application.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of MVT system to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions. The CSA shall engage the CSM and CTR for specific application instruction for the MVT systems for both horizontal and vertical applications.
b. MVT System Thickness:	System DFT as per CSM System Instructions above parge coat.

Coating System Specification Sheets (COATSPEC)		
Coating System Identification – HP-14		
c.	Coatings:	With the appropriate specified topcoat to meet the service requirements.
d.	Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
e.	Post Cure QC Testing:	Holiday Detection shall be performed over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583: Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed on at least at one location for every 1,000 sq ft of area to be coated and be performed at areas representative of the entire area to be coated if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
f.	Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 125 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

3.06 SECONDARY CONTAINMENT COATSPECS - SC SYSTEMS SC1 THROUGH SC26

This section contains all the information for surface preparation, field application, coating system thickness, routine QC inspection tasks, Post cure QC testing and Pinhole, Holiday, or Defect Repair

Procedure for all the listed Secondary containment systems in COATSPEC. See each individual system for acceptable surfaces and service conditions.

A. Surface Preparation;
   1. General
      a. Confirm that the exterior of buried concrete structures will be waterproofed in accordance with Section 07 10 00 prior to application of this coating.
      b. Prepare all coating termination and transition details in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedment's in the concrete substrate, and other details. Submit CSM's standard detail drawings for all such coating applications. If standard details are not available for a given detail treatment, provide special details prepared by the CSM at no additional cost to the Owner, the Engineer, or any other party.
      c. If wet abrasive or water jetting surface preparation methods were used, allow the concrete substrate to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application except when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, vacuum clean all surfaces to be coated to remove all loose dirt, dust, or other loose materials. Thorough washdown of prepared concrete by water rinsing may be used in place of vacuum cleaning.
   2. Concrete
      a. Allow new concrete surfaces to cure for at least 28 days and to dry to the moisture content recommended by the CSM. Test moisture content as specified in paragraph 3.02. Except as otherwise specified, remove loose concrete, form oils, surface hardeners, curing compounds, and laitance from surfaces by abrasive blasting and chipping, and repair voids repaired as specified in Section 03 30 00. Perform crack treatment per the CSM's Standard Detail Drawings. Abrade concrete to achieve a uniform minimum concrete surface profile of CSP 6. If the parge coat (filler/surfacer material) is non-polymer modified, brush blast following adequate cure per the CSM's instructions to produce a uniform concrete surface profile of CSP 4 in accordance with ICRI 310.2R prior to coating application. After cleaning, fill air voids or bugholes with a surfacer or block filler. Apply the filler/surfacer material as a complete parge coat of the substrate.
      b. For existing concrete that has been degraded, apply a skim coat of a surfacer or filler material to restore the substrate to a coatable condition. Confirm the filler or surfacer material is compatible with the coating system.
   3. Masonry
      a. Allow new masonry surfaces to age for at least 28 days. Fill and repoint holes or other joint defects with mortar and repointed. Remove loose or splattered mortar by scraping and chipping. Test masonry surfaces for moisture content in accordance with the CSM's recommendations.
      b. Clean masonry surfaces with clear water by washing and scrubbing to remove foreign and deleterious substances.
      c. Do not use muriatic acid shall. After cleaning, fill or seal masonry surfaces with a sealer or block filler compatible with the specified primer.

B. Field Application

1. General
    a. Apply surfacer or filler per CSM's recommendations prior to application of coating.
    b. Allow drying time between filler/surfacer and secondary containment system as specified by the CSM for the site conditions.
    c. If the maximum recoat time is exceeded, prepare surface by solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
    d. Completely fill all bugholes and voids in the substrate, and completely cover the substrate with the parge coat unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness.
2. Coating System Thickness
    a. System DFT as per CSM System Instructions above parge coat.
3. Coatings
    a. Primer: As required by CSM system application instructions.
    b. Reinforcement as required by CSM system application instructions.
    c. Finish: As required by CSM system application instructions.
4. Routine QC Inspection Tasks
    a. Refer to Tables in paragraph 3.09.
5. Post Cure QC Testing
    a. Perform Holiday Detection over 100 percent of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Perform holiday testing after application and adequate cure of the spray applied coating material. Perform holiday detection in accordance with ASTM D4787.
    b. Acceptance Criteria for Holiday Detection is no pinholes or holidays.
    c. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate.
    d. Acceptance Criteria for adhesion testing is minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (Provide MOCK-UP of 200 sq ft for verification purposes prior to commencing with production coating work), perform adhesion testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. Perform coating system adhesion tests at least at one location for every 1,000 sq ft of area to be coated and at areas representative of the entire area to be coated. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75 percent of failure plane on back of load fixture within the concrete substrate.
6. Pinhole, Holiday, or Defect Repair Procedure
    a. Repair pinholes and holidays identified by Holiday Detection as follows:

1) Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate.
2) Chip out and remove the concrete to exposure the full dimensions in all 3 directions of the air void responsible for the defect.
3) Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system.
4) Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces.
5) Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area.
6) Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations.

b. Apply the coating system in the number of coats necessary to achieve the specified DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. DFT thickness as per the manufacturer's written instructions. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-1

1.	Coating Material:	Amine Cured/Novolac/Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 50% Percent Sodium Hydroxide Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-2

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 18% Percent Sodium Hypochlorite Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-3

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 12.5% Percent Sodium Hypochlorite Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-4

1.	Coating Material:	Amine Cured/Novolac/Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 25% Percent Hydrofluorosilicic Acid Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-5

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 56% Percent Acetic Acid Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-6

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 50% Percent Aluminum Chlorohydrate Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-7

1.	Coating Material:	Amine Cured/Novolac/Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 30% Percent Aluminum Oxide Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-8

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 50% Percent Citric Acid Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-9

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 100 % Percent Defoaming Solution Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-10

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 50% Percent Ferric Chloride Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-11

1.	Coating Material:	Amine Cured/Novolac/Vinyl Ester Epoxy
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 12% Percent Ferric/Ferrous Sulfate Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-12

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 25% Percent Hydrogen Peroxide Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-13

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 34% Percent Hydrogen Peroxide Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-14

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 50% Percent Hydrogen Peroxide Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-15

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 100% Percent Methanol Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-16

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 15% Percent Peracetic Acid Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-17

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 35% Percent Peracetic Acid Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-18

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 75% Percent Phosphoric Acid Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-19

1.	Coating Material:	Amine Cured/Novolac/Vinyl Ester Epoxy
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 30% Percent Aluminum Chloride Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-20

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 35% Percent Sodium Bisulfite Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-21

1.	Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2.	Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3.	Service Conditions:	Secondary Containment Area for 38% Percent Sodium Bisulfite Handling and Storage
4.	Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-22

1. Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2. Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3. Service Conditions:	Secondary Containment Area for 93% Percent Sulfuric Acid Handling and Storage
4. Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-23

1. Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2. Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3. Service Conditions:	Secondary Containment Area for 98% Percent Sulfuric Acid Handling and Storage
4. Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-24

1. Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2. Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3. Service Conditions:	Secondary Containment Area for 32% Percent Urea Ammonium Nitrate Handling and Storage
4. Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-25

1. Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2. Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3. Service Conditions:	Secondary Containment Area for Secondary Containment 40% Ammonium Sulfate
4. Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

Coating System Specification Sheets (COATSPEC)

Coating System Identification – SC-26

1. Coating Material:	Novolac/ Vinyl Ester Novolac Epoxy/Vinyl Ester
2. Surfaces:	Concrete and Concrete Block Masonry (Non-Brick)
3. Service Conditions:	Secondary Containment Area for Secondary Containment 100% Scale Inhibitor
4. Surface Preparation, Substrate Repair, Coating System Thickness, QC Inspection and Testing and Holiday/Defect Repair	See section 3.07.A for details

3.07 FINISH SCHEDULE

Insert a partial copy of the 09 90 00 finish schedule here and populate. This is only to be used when 09 96 00 is a standalone spec and the project is not relying on the finish schedule from 09 90 00. If using 09 90 00 and its finish schedule, insert the following here:

A: Refer to 09 90 00 for the Finish Schedule.

3.08 ROUTINE QUALITY CONTROL INSPECTION/TESTING REQUIREMENTS

A. The routine QC inspection tasks and tests listed below are required for all standard High Performance Coating Systems covered in this Section. All findings to be compared for compliance with this Section and the referenced product data sheets from the CSM. All of the QC tasks/tests listed below are to be included in the Contractor's QC Testing and Inspection Plan as required in this Section and documented on Form 09 96 00A. The frequency of any test or inspection task may need to be adjusted based upon consistent or inconsistent quality results. Key tests/verifications are required for 100% all surfaces. Measurement/testing should be adjusted as required to confirm 100% of the coating is in compliance with the requirements.

Routine Quality Control Inspection/Testing Requirements Table

Inspection Task or Test	Referenced Standard or Practice	Acceptance Criteria	Frequency of Test or Inspection Task
Inspect compressed air to be free of oil and moisture.	ASTM D4285	Free of Oil and Moisture	Every 2 hours per shift worked.

Routine Quality Control Inspection/Testing Requirements Table

Inspection Task or Test	Referenced Standard or Practice	Acceptance Criteria	Frequency of Test or Inspection Task
Check pressure gauge for water jetting or test pressure for abrasive blast cleaning compressed air.	Needle Gage No Standard	As Specified	Every 4 hours per shift worked.
Measure ambient air and substrate temperature.	Electronic Hygrometer Positector or Elcometer DPM	As per CSM Product data Sheets	Every 2 hours per shift worked.
Measure relative humidity and dew point of air in coating area.	Electronic Hygrometer Positector or Elcometer DPM	Surface Temperature 5°F above the Dew Point and Stabilized	Every 2 hours per shift worked.
Test concrete substrate for moisture.	Phase 1- ASTM D4263 (Qualitative) Phase 2 (If Moisture Present) – ASTM F1869 or ASTM F2170	ASTM F1869-<3lbs per 1000 Sq Ft/24 Hrs ASTM F2170 70% RH or less	Twice per shift worked and prior to coating application.
Test moisture content in concrete block with moisture meter.	Per CSM's Recommendations	<6% Moisture Content	Every 25 sq. f.t to be coated prior to coating application.
Inspect steel or other ferrous Metals for Degree of Cleanliness in Carbon Steels.	SSPC VIS-1 (ASTM D2200) SSPC VIS-3 SSPC VIS-4 SSPC VIS-5	As per the Specification	All surfaces checked prior to coating – 100% surface in compliance as per SSPC SP standards.
Cast and Ductile Iron Degree of Cleanliness.	NAPF 500-03 NAPF 500-03-04 NAPF 500-03-05	As per the Specification	All surfaces checked prior to coating – 100% surface in compliance as per NAPF standards.
Inspect steel or other ferrous metals for degree of dust left on the surface.	ISO 8502-3	Dust Rating 1 Dust Particle Size 0	100% of all surfaces checked prior to coating.
Metal Surface Profile of Steel – Abrasive Blast cleaned.	ASTM D4417 Method A or C (Same for ductile and cast iron and stainless steel)	As per the Specification	100% surface in compliance with manufacturers surface profile requirements
Inspect Concrete Surface Profile by Comparison to Replicas.	ICRI 310.2R	As per the Specification	100% surface in compliance with manufacturers surface profile requirements
Inspect Concrete for Soundness with Hammer Testing	N/A	No Hollow Concrete Areas	Check for soundness visually 100% and hammer test every 10 sq ft or where cracked or loose concrete is apparent visually.
Inspect Surface pH of Prepared Concrete.	ASTM D4262	Min 9 pH	Every 100 sq. ft to be coated.
Calculate Coverage of Filler/Surfacers or Mortars based on CSM's Coverage Robes and Measure Thickness with Needle or Calibrated Wire.	N/A	As per Specification	For all surfaces to be surfaced and filled with parge coat of mortar.
Measure WFT of Coatings Over Metal.	ASTM D4414	As per CSM Product Data Sheets	Every 10 sq ft to be coated.

Routine Quality Control Inspection/Testing Requirements Table

Inspection Task or Test	Referenced Standard or Practice	Acceptance Criteria	Frequency of Test or Inspection Task
Measure WFT of Coatings Over Parge Coats – Troweled Over Concrete or Masonry.	ASTM D4414	As per CSM Product Data Sheets	Every 10 sq ft to be coated.
Visually Inspect All Coating Film for Film Quality e.g. Pinholes, Holidays, Runs, Sags, etc.	N/A	Pinhole Free surface and free of runs and sags	100% of all surfaces to be coated.
Measure DFT of Coatings on Ferrous Metals.	SSPC PA2 Level 3	As Specified	As prescribed by SSPC PA2
Measure DFT of Coatings on Concrete Substrates.	SSPC PA9 Level 3	As Specified	As prescribed by SSPC PA9
Discontinuity Testing (Holiday Detection) on Metal Surfaces.	ASTM D5162 >- 20 mils Method B < - 20mils Method A	Pinhole Free Surface	Addressed in Applicable COATSPECS
Discontinuity Testing (Holiday Detection) on Concrete Substrates.	ASTM D4787	Pinhole Free Surface	Addressed in Applicable COATSPECS
Adhesion Testing on Metallic Substrates.	ASTM D4541	800 psi Min	Addressed in Applicable COATSPECS
Adhesion Testing on Concrete Substrates.	ASTM C4583 ASTM D7234	250 Psi Min	Addressed in Applicable COATSPECS
Reinspect for Rework from all Non-Compliant Issues Identified from QC Inspection listed above.	N/A	Meets all Specified standards	As needed.

3.09 OPTIONAL OWNER QUALITY ASSURANCE REVIEW

A. General:
   1. Inspection by the Owner or others does not limit the Contractor's or CSA's responsibilities for quality workmanship or sole responsibility for QC as specified by this Section or as required by the CSM's instructions. Inspection by the Owner is optional and is additional to any inspection required to be performed by the Contractor.
   2. The Owner may perform, or contract with an inspection agency to perform, QA inspection and testing of the coating work covered by this Section. These inspections may include the following:
      a. Inspect materials upon receipt to ensure that all are supplied by the same CSM.
      b. Inspect to verify that specified storage conditions for the coating system materials, solvents, and abrasives are provided.
      c. Inspect and record findings for the degree of cleanliness of substrates.
      d. Inspect and record the pH of concrete and metal substrates.
      e. Inspect and record substrate profile (anchor pattern).
      f. Measure and record ambient air and substrate temperature.
      g. Measure and record relative humidity.
      h. Check for the presence of substrate moisture in the concrete.

i. Inspect to verify that correct mixing of coating system materials is performed in accordance with CSM's instructions.

j. Inspect, confirm, and record that the "pot life" of coating system materials is not exceeded during installation. Inspect to verify that recoat limitations for coating materials are not exceeded.

k. Perform adhesion testing.

l. Measure and record the thickness of the coating system.

m. Inspect to verify proper curing of the coating system in accordance with the CSM's instructions.

n. Limited visual observations for defects.

3.10 FINAL INSPECTION

A. General

1. Conduct a final inspection to determine whether coating system work meets the requirements of the specifications.
2. The Construction Manager or Owner's Representative will subsequently conduct a final observation with the Contractor to observe the completed work.
3. Mark all obvious defects or non-conforming work. Reclean and repair as specified at no additional cost to the Owner.

3.11 COATING SYSTEM QUALITY CONTROL CHECKLIST

09 96 00-A COATING SYSTEM QUALITY CONTROL CHECKLIST

Project Name

Owner		**Coating System Manufacturer Technical CTR**	
General Contractor (GC)		**Coating System Applicator (CSA)**	
Area or Structure		**Location within Structure**	
Coating System (e.g., E-1)		**Coating Type (e.g., Epoxy, etc.)**	

Coating System Quality Control Checklist

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
1	Completion of pre-cleaning and substrate decontamination prior to abrasive blast cleaning. (Concrete)	Surface free of all oil, grease, form release agents and all other foreign contaminants	GC QC			
		Host Substrate Min pH of 9 per ASTM D4262	CTR QC			
		ASTM F22- No Moisture Lens Formation	CSA QC			
2	Completion of pre-cleaning and substrate decontamination prior to abrasive blast cleaning (steel/metal)	Surface free of all oil, grease and all other foreign contaminants.	GC QC			
			CTR QC			
			CSA QC			
3	Moisture Testing of Concrete	Step 1- Initial Testing as Per ASTM D4263- if moisture present move to step 2	GC QC			
		Step 2- ASTM F1869- < 3lbs/1000 sq. ft/24 hours If moisture present move to step 2 or 3	CTR QC			
		Step 2 Alternate- ASTM F2170- Substrate RH 70% or less. If moisture present move to step 2 or 3	CSA QC			
4	Soluble Salt Testing (Steel/Metal)	Max 30 micro siemens as per ISO 8502-6/8502-9	GC QC			
			CTR QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
			CSA QC			
5	Ensuring compressed air for abrasive blasting or coating/lining application is free of oil and moisture	ASTM D4285- Free of all oil & moisture	GC QC			
		1 blotter test per 2 hours of compressed air usage	CTR QC			
			CSA QC			
6	Installation of protective enclosure of structure or area and protection of adjacent surfaces or structures that are not to be coated.	Conforms to SSPC Guide 6 Guidelines and specification requirements.	GC QC			
			CTR QC			
			CSA QC			
7	Completion of ambient condition control in structure or building area and acceptance of ventilation methods in structure or Area.	Substrate min of 5 degrees above the dew point and stabilized.	GC QC			
		Recording ambient conditions, a minimum of 4 times per shift/day at 2-hour intervals	CTR QC			
		Negative pressure of enclosure. Visual inspection of enclosure tarps indicating negative pressure.	CSA QC			
8	Completion of Surface Preparation for concrete deep repair applications. (If required)	SSPC SP CAB 1 and SSPC-SP13/NACE #6	GC QC			
		Surface Profile- ICRI CSP#5 minimum	CTR QC			
			CSA QC			
9	Completion of Concrete Deep Repairs (If required) and Related Surface Preparation Rework Prior to Concrete Filler/Re-surfacer/Parge.	SSD Maintained throughout application	GC QC			
		SSPC SP CAB 1 and SSPC-SP13/NACE #6	CTR QC			
		Surface Profile- ICRI CSP#5 minimum	CSA QC			
10	Adhesion testing of host concrete as per ASTM C1583. Conduct tests in three (3) representative locations. Three (3) tests per location. Glue failures are not considered a completed test.	Report all adhesion values measured	GC QC			
		Report average results of test areas.	CTR QC			
			CSA QC			
11	Completion of Concrete Filler/ Re-surfacer/Parge Coat Application to Concrete Prior to Coating System	SSD Maintained throughout application	GC QC			
		Visual inspection of uniformity	CTR QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
	Application.	of fill and dispersal	CSA QC			
12	Concrete - Completion of Surface Preparation for coating & lining applications.	SSPC SP CAB 1 and SSPC-SP13/NACE #6	GC QC			
		Surface Profile- ICRI CSP#4 minimum	CTR QC			
			CSA QC			
13	Concrete- Adhesion testing on installed repair mortar (after min 72-hour cure) as per ASTM C1583. Conduct tests in 3 representative locations. 3 tests per location. Glue failures are not considered a completed test.	Minimum 250 psi	GC QC			
		75% minimum host concrete failure	CTR QC			
			CSA QC			
14	Steel - Completion of Surface Preparation for coating & lining applications.	SSPC-SP10/NACE#2 (CS)	GC QC			
		NAPF 500-03 (04&05)	CTR QC			
		ASTM D4417 Method C-Surface Profile ?_mils	CSA QC			
15	Steel- Dust Level Testing- After surface preparation and prior to application of primers/coatings	ISO 8502-3 (Part 3)	GC QC			
		Dust Rating-1	CTR QC			
		Dust Particle Size - 0	CSA QC			
16	Concrete- Completion of Primer Application. (If required)	DFT meets specifications as per SSPC PA9	GC QC			
		Visual Inspection- Film free of coating defects, pinholes and debris.	CTR QC			
			CSA QC			
17	Steel- Completion of primer/1st coat application (only required if using a primer or for multicoat coat applications)	DFT meets specifications as per SSPC PA2	GC QC			
		Visual Inspection- Film free of coating defects, pinholes and debris.	CTR QC			
			CSA QC			
18	Concrete- Completion of Intermediate Coat Application and of Detail Treatment at Transitions or Terminations. (Only applicable in 2 coat applications)	DFT meets specifications as per SSPC PA9	GC QC			
		Visual Inspection- Film free of coating defects, pinholes and debris.	CTR QC			
			CSA QC			
19	Steel- Completion of Intermediate Coat Application and of Detail Treatment at Transitions or	DFT meets specifications as per SSPC PA2	GC QC			
		Visual Inspection- Film free of	CTR QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
	Terminations. (Only applicable in 2 coat applications)	coating defects, pinholes and debris.	CSA QC			
20	Concrete - Completion of Finish Coat Application and of Detail Treatment at Transitions and Terminations.	DFT meets specifications as per SSPC PA9	GC QC			
		Visual Inspection- Film free of coating defects, pinholes and debris.	CTR QC			
			CSA QC			
21	Steel- Completion of Finish Coat Application and of Detail Treatment at Transitions or Terminations.	DFT meets specifications as per SSPC PA2	GC QC			
		Visual Inspection- Film free of coating defects, pinholes and debris.	CTR QC			
			CSA QC			
22	Completion of Full and Proper Cure of Lining System.	ASTM D5402- No material transfer	GC QC			
		ASTM D2240- Shore D- Must match value stated on CTR PDS data.	CTR QC			
			CSA QC			
23	Concrete - Completion of Testing of Cured Lining System including Adhesion, Holiday (Continuity) Testing.	ASTM D4787- Pinhole/holiday free	GC QC			
		ASTM D7234- TBD by results of ASTM C1583 testing of host concrete and repair mortar	CTR QC			
			CSA QC			
24	Steel - Completion of Testing of Cured coating System including Adhesion, Holiday (Continuity) Testing.	ASTM D5162- Pinhole/holiday free	GC QC			
		ASTM D4541- min 800 psi	CTR QC			
			CSA QC			
25	Concrete- Completion of Localized Repairs to Lining System Following Testing.	ASTM D4787- Pinhole/holiday free	GC QC			
		Visual inspection for film quality- no runs, sags or other defects	CTR QC			
			CSA QC			
26	Steel- Completion of Localized Repairs to Coating System Following Testing.	ASTM D5162- Pinhole/holiday free	GC QC			
		Visual inspection for film quality- no runs, sags or other defects	CTR QC			
			CSA QC			
27	Final Acceptance of Coating/Lining System Installation Including Final	Coatings/linings meet all specification requirements	GC QC			
			CTR QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
	Clean-Up Complying with Specification Requirements and the CTR's Quality Requirements.		CSA QC

SECTION 09 97 00

POTABLE WATER PROTECTIVE COATINGS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This Section specifies coating system materials, surface preparation, and application of ANSI/NSF/CAN 61-600 coating systems to both interior concrete and steel substrates of equipment, tanks, and other components required by regulation to be treated with NSF 61 compliant coatings, and steel tank exteriors to be coated in compliance with AWWA D102, including , but not limited to:
    a. All materials that may come in contact with drinking water, including pipes, gaskets, lubricants and O-Rings, shall be ANSI-certified as meeting the requirements of ANSI/NSF Standard 61, Drinking Water System Components - Health Effects. To permit field-verification of this certification, all components shall be appropriately stamped with the NSF logo. Per Utah Administrative Code R309-550-6
2. This Section Includes coating systems to finish all water tank components, unless otherwise indicated. Without restricting volume or generality, work to be performed under this section may include, but is not limited to:
    a. Interior steel wet areas (Immersion, Roof Structures) and dry areas (Dry Risers and other areas not in immersion or condensation zones).
    b. Exterior steel.
    c. Piping, hangers, and supports.
    d. Repairing surface defects in the tank that may affect performance of the installed Interior Lining (as per NACE SP0178) and Exterior Protective Coating. This will include pitted steel, sharp edges, and any other surface defect that may affect the performance of the linings or coatings.
    e. Overcoating system option for both concrete and steel tanks.
    f. Lining system terminations, necessary environmental controls and the legal collection, temporary storage, removal, and disposal of all debris.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.

1. Section 01 11 80 Environmental Conditions
2. Section 01 33 00 Submittal Procedures
3. Section 01 45 00 Contractor Quality Control
4. Section 01 45 23 Testing and Inspection Services
5. Section 01 61 45 Area Exposure Designations
6. Section 01 66 00 Product Storage and Handling
7. Section 01 99 00 Reference Forms
8. Section 07 10 00 Dampproofing and Waterproofing
9. Section 09 90 00 General Coating Specifications

10. Section 09 96 00 High Performance Protective Coatings

1.03 DEFINITIONS

A. Specific coating terminology used in this Section is in accordance with definitions contained in ASTM D16, ASTM D3960, and the following definitions.
   1. Abrasive: Material used for blast cleaning, such as sand, grit, or shot.
   2. Abrasive Blast Cleaning: Cleaning/surface preparation by abrasive propelled at high speed.
   3. AMPP: Association for Materials Protection and Performance (Merger of National Association of Corrosion Engineers (NACE) and The Society for Protective Coatings (SSPC).
   4. Anchor Pattern: Profile or texture of prepared surface(s).
   5. ANSI: American National Standards Institute.
   6. Bugholes: Small cavities, usually not exceeding 15 millimeters in diameter, resulting from entrapment of air bubbles in the surface of formed concrete during placement and compaction.
   7. Coating/Paint/Lining Thickness: The total thickness of primer, intermediate and/or finish coats.
   8. Coating System Applicator (CSA): A generic reference to the specialty coating/lining applicator retained by the General Contractor to install the coating systems specified in this Section. All requirements listed for the CSA ultimately fall under the General Contractor's quality control responsibility to confirm the CSA is meeting all specification requirements.
   9. Coating System Manufacturer (CSM): Refers to the acceptable coating system manufacturer, abbreviated as the CSM.
   10. Coating System Manufacturer's Technical Representative(s) (CTR): Refers to the technical representative(s) of the acceptable CSM and is abbreviated as CTR.
   11. Continuous film or continuity of film: refers to coating layer/system without holidays, pinholes, or other discontinuities.
   12. CQC: Coating System Applicator (CSA) Quality Control Inspector.
   13. Dehumidification: The removal of moisture, humidity, or dampness from the air.
   14. Dew point: Temperature of a given air/water vapor mixture at which condensation starts.
   15. Dry Film Thickness (DFT): Depth of cured film, usually expressed in mils (0.001 inch).
   16. Drying/Cure Time: Time interval between application and curing of material before exposure to service conditions.
   17. Dry to Recoat: Time interval between application of material and ability to receive next coat.
   18. Dry to Touch: Time interval between application of material and ability to touch lightly without damage.
   19. Feather Edging: Reducing the thickness of the edge of paint.
   20. Feathering: Operation of tapering off the edge of a point with a comparatively dry brush.
   21. Field Coat: The application or the completion of application of the coating system after installation of the surface at the site of the work.

22. Hold Point: A defined point, specified in this Section, at which work shall be halted for inspection.
23. Holiday: A discontinuity, skip, or void in coating or coating system film that exposes the substrate.
24. Honeycomb: Segregated condition of hardened concrete due to non-consolidation.
25. ICRI: International Concrete Repair Institute.
26. Incompatibility: Inability of a coating to perform well over another coating because of bleeding, poor bonding, or lifting of old coating; inability of a coating to perform well on a substrate.
27. Laitance: A layer of weak, non-durable concrete containing cement fines that is brought to the surface through bleed water because of concrete finishing and/or over-finishing.
28. Mil: 0.001 inch.
29. NACE: National Association of Corrosion Engineers.
30. NSF International: National Sanitation Foundation.
31. Overspray: Dry spray, particularly such paint that failed to strike the intended surface.
32. Owner's Quality Assurance Representative: Person or persons designated by the Owner to perform Quality Assurance (QA) review of the CSA's Quality Control (QC) reports and inspection and testing work.
33. Pinhole: A small diameter discontinuity in a coating or coating system film that is typically created by outgassing of air from a void in a concrete substrate resulting in exposure of the substrate or a void between coats.
34. Pot Life: Time interval after mixing of components during which the coating can be satisfactorily applied.
35. QA: Quality Assurance.
36. QC: Quality Control.
37. QCTIP: Quality Control Testing and Inspection Plan.
38. QP P3: AMPP-accredited program that evaluates the practices of shop painting facilities.
39. QP1: AMPP-accredited program that evaluates the practices of field painting.
40. Resurfacer/Resurfacing Material: A layer of cementitious and/or resin-base material used to fill or otherwise restore surface continuity to worn or damaged concrete surfaces.
41. Shelf Life: Maximum storage time for which a material may be stored without losing its usefulness.
42. Shop Coat: One or more coats applied in a shop or plant prior to shipment to the site of the work, where the field or finishing coat is applied.
43. Spreading Rate: Area covered by a unit volume of paint at a specific thickness.
44. SSPC: The Society for Protective Coatings.
45. Stripe Coat: A separate coat of paint applied to all weld seams, pits, nuts/bolts/washers, and edges by brush. This coat shall not be applied until any previous coat(s) have cured and once applied, shall be allowed to cure prior to the application of the subsequent coat(s).
46. Surface Saturated Dry (SSD): Refers to concrete surface condition where the surface is saturated (damp) without the presence of standing water.

47. Tie Coat: An intermediate coat used to bond different types of paint coats. Coatings used to improve the adhesion of a succeeding coat.
48. Touch-Up Coating: The application of paint on areas of painted surfaces to repair marks, scratches, and areas where the coating has deteriorated to restore the coating film to an unbroken condition.
49. TPC: Technical Practice Committee.
50. Volatile Organic Compound (VOC) Content: The portion of the coating that is a compound of carbon, is photochemically reactive, and evaporates during drying or curing, expressed in grams per liter (g/l) or pounds per gallon (lb/gal).
51. Immersion: Refers to a service condition in which the substrate is below the waterline or submerged in water or wastewater at least intermittently if not constantly.
52. Weld Splatter: Beads of metal scattered near seam during welding.
53. Wet Film Thickness (WFT): The primer or coating film's thickness immediately following application. Wet film thickness is measured in mils or thousandths of an inch (0.001 inch) and is abbreviated WFT.

1.04 REFERENCES

A. This section contains references to the following documents listed and described below. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed and described documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued, or replaced.

1.05 QUALITY ASSURANCE

A. General Requirements:
   1. Provide materials and supplies that are standard products of CSMs. Provide materials in each coating system from a single CSM.
   2. The standard products of CSMs other than those specified may be acceptable when it is demonstrated to the Construction Manager that they are equal in composition, durability, usefulness, and convenience for the purpose intended. Requests for consideration of CSMs other than those specified in this Section will be considered in accordance with the requirements of the General Conditions and provided the following minimum conditions are met. Such requests are not a substitution for submittals after the alternative CSMs have been considered and accepted.
      a. The proposed coating system uses an equal or greater number of separate coats to achieve the required total dry film thickness.
      b. The proposed coating system uses coatings of the same generic type as that specified including curing agent type.
      c. Include information listed in paragraph 1.05, demonstrating that the proposed CSM's product is equal to the specified coating system.
      d. Provide a list of Contractor and CSM references for the proposed product where the coating of the same generic type has been applied. Include the project name, city, state, owner, phone number of owner; coating system reference and number from this Section 09 97 00; type of facility in which it was used, generic type, and year coating was applied.
      e. At any time when there is conflict between the CSM's product data and the COAT SPEC requirements regarding surface preparation, material application or any other coating details, the data that provides the more stringent requirements will take precedent.

B. Shop and Field Quality Control Requirements:
   1. The Contractor is solely responsible for the workmanship and quality of the coating system installation by the Contractor's CSA. Inspections by the Owner, Engineer, a Construction Manager, the CTR, or any other party will not relieve or limit the Contractor's responsibilities for the quality of the coating system.
   2. Conform to requirements of this specification and the standards referenced in this Section. Changes in the coating system installation requirements will be allowed only with the written acceptance of the Engineer and CSM before work commences.

3. Only personnel who are trained by the CTR specifically for this contract or who are approved by the CSM specifically for this contract will be allowed to perform the coating system installation specified in this Section.
4. Provide full time inspection with trained and certified quality control (QC) inspectors performing all QC procedures as the coating work proceeds in accordance with the requirements of this section. Minimum qualifications for QC inspectors on concrete projects is AMPP-CCI Level 1 with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified CCI Level 2 Concrete Coatings Inspector. On non-concrete related project the minimum QC inspector is AMPP Basic Coating Inspector (NACE/SSPC Level 1) with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified Coatings Inspector (NACE/SSPC Level 2) or AMPP Senior Coatings Inspector (NACE/SSPC Level 3) in good standing, with at least 10 years of similar coatings work experience. An AMPP Basic Coating Inspector (NACE/SSPC Level 1) with a minimum of 3 years' experience in QC processes, providing they are under the direct supervision of a AMPP Certified Coatings Inspector (NACE/SSPC Level 2) or AMPP Senior Coatings Inspector (NACE/SSPC Level 3) in good standing, with at least 10 years of similar coatings work experience may be acceptable providing the AMPP Basic, AMPP Certified and AMPP Senior coating inspectors can each can show verifiable proof of performing inspection successfully on 5 verifiable concrete projects similar in size and scope as the project that is part of this specification.
5. Perform all shop surface preparation and coating applications by an AMPP QP3 Certified blast and painting shop in good standing.
6. Perform all field surface preparation and coating applications by a AMPP QP8 ~~1~~ Certified field painting Contractor in good standing for all concrete applications, and AMPP QP-1 for all applications on surfaces other than concrete. Should the contractor working on concrete substrates not have an AMPP QP-8 certification, the QP-1 contractor certification may be acceptable providing the QP-1 contractor can show verifiable proof of performing work successfully on 5 verifiable concrete projects similar in size and scope as the project that is part of this specification.
7. Do not use contaminated, outdated, diluted materials, and/or materials from previously opened containers.
8. For repairs, provide the same products, or products recommended by the CSM, as used for the original coating.
9. Identify the points of access for inspection by the Owner, the Engineer, or the Owner's Representative. Provide ventilation, ingress and egress, and other safe means necessary for the Owner's or Engineer's personnel or designated representative to safely access the work areas.
10. Conduct the work so that the coating system is installed as specified and inspect the work continually to ensure that the coating system is installed as specified. Correct coating system work that does not conform to the specifications or is otherwise not acceptable to the as-specified requirements at no additional cost to the Owner.
11. Contractor/CSA to submit for approval a Quality Control Testing and Inspection Plan (QCTIP) for the work covered by this Section (see 09 97 00 Quality Control Check List). Include a list all tests and inspection tasks including referenced and applicable standards to be conducted and the frequency in which these tests or tasks will be performed. This frequency can be addressed for certain tests, such as air and substrate temperature or Dew Point, on an hourly per shift basis. Or this frequency can be addressed on a per number of square feet (sq ft) basis for tests and tasks such as wet and dry film thickness tests or adhesion tests. Include in the QCTIP a

written record which identified when (time and date) work not conforming to the specification requirements is identified, a written record of the proposed corrective actions for such non-conforming work and a record of when that action was performed (time and date). Describe all corrective action for non-conforming work described in detail with referenced digital photographs taken of the re-work for subsequent review by the Owner's representative.

12. Submit a daily Quality Control inspection report from the QCP that describes and documents all Quality Control tests and inspection tasks performed including frequency of performance and test results (including test data) and referenced standard followed for each shift the CSA works. Submit these reports on the morning of the following day the work was performed to the Engineer or Owner's Quality Assurance representative for review. Include with the daily QC report a written account of all non-conforming work with annotated digital photographs and subsequent corrective measures. Submit a standard inspection form to be used for these reports for review by the Engineer. The CSA's QC inspector to use the approved inspection report forms to record all quality control inspection and testing throughout the performance of the coating work.
13. Complete the Coating System Quality Control Checklist, Form 09 97 00-A for coating system installations. Follow the sequential steps required for proper coating system installation as specified and as listed in the Coating System Quality Control Checklist. For each portion of the work, install the coating system, document all QC measures and complete sign-offs, as specified, prior to proceeding with the next step. After completing each step as indicated on the Coating System Quality Control Checklist, sign the checklist indicating that the work has been installed and inspected as specified. All signoffs on final checklist must be supported by daily reports indicating the appropriate inspections, documentation (daily), and corrective actions where performed on specific components/pieces.

C. Quality Control Hold Points:
   1. The QCP shall conduct QC inspections at Hold Points during the coating system installation and record the results on Form 09700-A. Coordinate Hold Points with the CTR, Engineer and Construction Manager so they may observe the Quality Control inspections on a scheduled basis. Provide the CTR, Engineer and Construction Manager a minimum of 2 days of notice prior to each Hold Point Inspections. Representative portions of the overall coating work on the project shall be observed by the CTR. The minimum quality control Hold Points shall be as follows:
      a. Environment and Site Conditions. Prior to commencing an activity associated with coating system installation, measure, record, and confirm acceptability of ambient air temperature and humidity as well as other conditions such as proper protective measures for surfaces not to be coated and safety requirements for personnel. The acceptability of the weather and/or environmental conditions within the structure to be determined by the requirements specified by the CSM of the coating system being used.
      b. Conditions Prior to Surface Preparation. Prior to commencing surface preparation, observe, record, and confirm that oil, grease, and/or soluble salts have been eliminated from the surface.
      c. Monitoring of Surface Preparation. Spot check of degree of cleanliness, surface profile, and surface pH testing, as required. Check the compressed air used for surface preparation, vacuum or blow--down cleaning to confirm it is free from oil and moisture.

d. Post Surface Preparation–Upon completion of the surface preparation, measure and inspect for proper degree of cleanliness and surface profile as specified in this Section and in the CSM's written instructions (Product Data Sheets).

e. After surface preparation and prior to the application of primer and coatings the surfaces the CSA must ensure that the acceptable level of remaining dust meets the specification requirements.

f. Steel Pit Fillers & Concrete Repair Mortars; Inspect all pit filling and concrete repair processes to ensure compliance with the specification.

g. Monitoring of Coatings Application–Inspect, measure, and record the wet film thickness and general film quality (visual inspection) for lack of runs, sags, pinholes, holidays, etc. as the application work proceeds.

h. Exterior Post Application Inspection–Identify defects in application work including pinholes, holidays, excessive runs or sags, inadequate or excessive film thickness and other problems as may be observed.

i. Dry Film Thickness Measurements- Measure DFT after each coat and record in the daily QC inspection reports. DFT readings for steel surface to be per SSPC-PA2 using Type II Magnetic DFT Gauges for ferrous surfaces and Type II Eddy Current Gauges for non-ferrous surfaces. DFT readings for concrete surface to be taken as per SSPC-PA9 using Ultra Sonic DFT Gauges or by proving materials usage versus square foot coverage. All gauges to be calibrated by the manufacturer or approved agent within 1 year of use. Following SSPC-PA2 and SSPC-PA9 minimum measurement standards may not provide the Quality Control personnel adequate measurement intervals to ensure full compliance to the specification. QC personnel are required to take as many measurements necessary to ensure full compliance to this specification.

j. Interior Post Cure Evaluation – Measure and inspect the overall dry film thickness. Conduct a DFT survey, and perform adhesion testing, holiday detection (spark testing), or cure testing as required based on the type of project and the specific requirements in this Section and/or in the CSM's written instructions. 100 percent of all immersed coatings shall be holiday detection tested, marked and appropriately repaired (partial testing is not an acceptable substitution).

k. Follow-up to Corrective Actions and Final Inspection. Measure and reinspect corrective coating work performed to repair defects identified at prior Hold Points. Include final visual inspection along with follow-up tests such as holiday detection, adhesion tests, and DFT surveys.

D. Optional Owner Quality Assurance Inspection:

1. The Owner and Engineer reserve the right to retain the services of a Quality Assurance Inspection firm to perform random audits of the CSA's Quality Control processes and documentation at any time during the project's progress. Any inspections by the Owner, Engineer, or other owner-related representatives do not relieve the Contractor from retaining sole responsibility for the quality of the installed coating system.

2. Quality Assurance Hold Point Inspections may include, but are not limited to the following processes:

   a. Conditions Prior to Surface Preparation

   b. Environment and Site Conditions

   c. Post Surface Preparation

d. Post Primer Application (If Applicable)
e. Post Intermediate Coat Application (If Applicable)
f. Post Final Coat Application
g. Final Cure & Testing (Including Holiday Detection)
h. Follow-up to Corrective Actions and Final Inspection

3. Coordinate Hold Points with the Owner's Quality Assurance representative so they may observe the CSA's Quality Control inspections on a scheduled basis. Provide the Owner's Quality Assurance representative a minimum of 48 hours of notice prior to conducting Hold Point Inspections.

E. Responsibilities of the CTR:
1. General:
a. Retain or obtain the services of the CTR to be on site to perform the Contractor and/or CSA application training and to routinely inspect and verify in writing that the application personnel have successfully performed representative portions of the surface preparation work, filler/surface application, coating system application, and Quality Control Inspection in accordance with this Section. Include testing or witnessing the contractors testing for the required degree of cleanliness, surface pH for concrete substrates, surface profile of substrates, proper mixing of coating materials, application (including checking the wet and dry film thickness of the coating systems), proper cure of the coating systems, and proper treatment of coating systems at terminations, transitions, and joints and cracks in substrates. Refer to paragraph 1.05 F for Coating System Installation Training for further details on these CTR requirements. These Quality Control verifications are not expected to be full-time, but rather to assure that verifications by the CTR are performed on representative portions of all major steps of the coating work to ensure the CSM approves those representative portions of the work to be in compliance with the CSM's recommendations and instructions. This inspection is in addition to the inspection performed by the Contractor in accordance with paragraph 1.05C of this section. The CTR shall provide an adequate level of oversight of the contractor's quality control processes, at their discretion, to provide sign off that the CSM's products have been properly installed and to fulfill all project warranty requirements.

2. Coating System Installation Training:
a. Provide a minimum of 8 hours of classroom and off-site training for application and supervisory personnel of the CSA. Provide training to a minimum of two supervisory personnel from the CSA, and document compliance with this requirement. Alternatively, the CTR shall provide a written letter from the CSM stating that the application personnel (listed by name) who shall perform coating work are approved by the CSM without further or additional training.
b. Provide training for all application personnel and three supervisory personnel. The training shall include the following as a minimum:
1) A detailed explanation of mixing, application, curing, and termination details.
2) Hands-on demonstration of how to mix and apply the coating systems.
3) A detailed explanation of the ambient condition requirements (temperature and humidity) and surface preparation requirements for application of the coating system as well as a detailed explanation of re-coat times, cure times, and related ambient condition requirements.

c. CTR shall provide a written statement that training was satisfactorily completed by the personnel named in the letter.

3. Representative Coating System Inspections:
   a. The CTR shall perform or witness the following activities to confirm acceptability and conformance with the specifications for representative portions of coating work to be performed by the CSA. The CTR shall verify or witness the contractors QC processes of the following QC steps at their discretion:
      1) Inspect ambient conditions during various coating system installation at hold points for conformance with the specified requirements.
      2) Inspect the surface preparation of the substrates where the coating system will terminate or will be applied for conformance to the specified application criteria.
      3) Inspect preparation and application of coating detail treatment (for example, terminations at joints, metal embedment's in concrete, etc.).
      4) Inspect application of the filler/surface materials for concrete and masonry substrates.
      5) Inspect application of the primers, stripe coats, and finish coats including wet and dry film thickness of the coatings.
      6) Inspect coating systems for cure.
      7) Review adhesion testing of the cured coating systems for conformance to specified criteria.
      8) Review coating system discontinuity testing for conformance to specified criteria.
      9) Observe adhesion testing work to assure it meets specification requirements.
      10) Inspect and record representative localized repairs made to discontinuities identified via continuity testing.
      11) Conduct a final review of completed coating system installation for conformance to the specifications.
   b. Prepare and submit a site visit report following each site visit that documents the acceptability of the coating work observed and inspected in accordance with the CSM's Recommendations.
4. Final Report:
   a. Upon completion of coating work for the project, the CTR shall prepare a letter summarizing the inspection findings and shall attach the site visit reports required in 1.05. Include a statement that the completed work was performed in accordance with the requirements of this Section 09 97 00 and the CSM's recommendations based on the inspections performed by the CTR.

1.06 DELIVERY AND STORAGE

A. General:
   1. Deliver materials to the job site in their original, unopened containers. Properly label each container. Handle and store materials to prevent damage to or loss of label.
   2. Include the following information on material container labels:
      a. Name or title of product.
      b. CSM's batch number.

c. CSM's name.
d. Generic type of material.
e. Application and mixing instructions.
f. Hazardous material identification label.
g. Shelf-life expiration date.

3. Store materials in enclosed structures and protect from weather and excessive heat or cold in accordance with the CSM's recommendations. Store flammable materials in accordance with state and local requirements.
4. Clearly mark containers shall indicating personnel safety hazards associated with the use of or exposure to the materials.
5. Provide Safety Data Sheets (SDS) for each material to the Construction Manager.

1.07 SUBMITTALS:

A. Action Submittals: Refer to related sections in this specification for additional details.
1. Procedures: Section 01 33 00.
2. A copy of this specification section, with addendum updates included, and referenced and applicable sections, with addendum updates included, with each paragraph check-marked (☑) to indicate specification compliance or marked to indicate requested deviations from specification requirements or those parts which are to be provided by the CSA or others. Check marks shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the CSA, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Owner's representative shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined shall signify compliance on the part of the CSA with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for requested deviations to the specification requirements shall be cause for rejection of the entire submittal and no further submittal material will be reviewed. *Unapproved field deviations to project requirements may be deemed as non-conforming work.*
3. CSM's current printed recommendations and product data sheets for coating systems including:
a. Volatile organic compound (VOC) data.
b. Surface preparation recommendations.
c. Primer type, where required.
d. Maximum dry and wet-mil thickness per coat.
e. Minimum and maximum curing time between coats, including atmospheric conditions for each.
f. Curing time before submergence in liquid.
g. Thinner to be used with each coating.
h. Ventilation requirements.
i. Minimum atmospheric conditions during which the paint shall be applied.
j. Allowable application methods.
k. Maximum allowable moisture content.

l. Maximum shelf life.

4. Affidavits signed and sealed by an officer of the CSM's corporation, attesting to full compliance of each coating system component with current and promulgated federal, state, and local air pollution control regulations and requirements.
5. Safety Data Sheets (SDS) for materials to be delivered to the job site, including coating system materials, solvents, and abrasive blast media.
6. Written list of cleaning and thinner solutions allowed by the CSMs.
7. Storage requirements including temperature, humidity, and ventilation for Coating System Materials as recommended by the CSMs.
8. CSM's detailed, written instructions for coating system treatment and graphic details for coating system terminations in the structures to be coated including pipe penetrations, metal embedment's, gate frames, and other terminations to be determined from the contract drawings. This information shall also include detail treatment for coating system at joints and cracks in concrete.
9. List of a minimum of five project references each for Contractor and CSA including contact name, address, and telephone number where similar coating work has been performed by their companies in the past five years.
10. Resume of and written certification that the CSA's Quality Control Person is a AMMP (SSPC or NACE) Certified Coatings Inspector who has the requisite experience identified in Article 1.05.
11. Written Quality Control Testing and Inspection Plan (QCTIP) as required in Article 1.05.
12. Sample Daily Quality Control Inspection Report Forms to be used by the CSA's QCP.
13. Written letter from the CTR that the CSA's personnel who will perform the coating work have been trained to perform the work covered by this section.
14. Signed Affidavit from CSM that all products provided for the coating work covered by this Section are compliant with applicable VOC regulations.

B. Informational Submittals:
   1. Procedures: Section 01 33 00.
   2. Prior to application of coatings, submit letter(s) from the CTR(s) identifying the application personnel who have satisfactorily completed training as specified in Article 1.05 or a letter from the CSM stating that personnel who shall perform the work are approved by the CSM without need for further or additional training.
   3. Submit reports specified in Article 1.05 when the work is underway.

C. Closeout Submittals:
   1. Procedures: Section 01 33 00.
   2. Submit the Coating System Quality Control Checklists, using Form 09 97 00-A, for the coating work.

PART 2 PRODUCTS

2.01 MATERIALS

A. General:
   1. Notwithstanding the listing of product names in this Section, provide affidavits, signed and sealed by an officer of the CSM's corporation, attesting to full compliance

of each coating system component with current and promulgated federal, state, and local air pollution control regulations and requirements. Do not apply coatings to a surface until the specified affidavits have been submitted, reviewed and accepted. Failure to comply with this requirement shall be cause for rejection and removal of such materials from the site.

2. The following list specifies the material requirements for coating systems. Coating systems are categorized by generic name followed by an identifying abbreviation. If an abbreviation has a suffix number, it is for identifying subgroups within the coating system.

B. For the specific Finish Schedule, refer to [Section 09 90 00] [Article 3.08].

Material Requirements for Potable Water Coating Systems for Steel Tanks: All North America Except SCAQMD in California

Coating System	CSM	Pit Filler	Primer Coat(s)	Stripe Coat(s)/ Intermediate	Finish Coats
INT-PWS-1 (AWWA D102-21 ICS#3)	Carboline	Carboguard 501	**No zinc primer available	Hydroplate 1100	Hydroplate 1100
	Induron	*Aquatapoxy A6 (Thick)	Indurazinc MC67 (Optional)	PE -70	Perma-Clean 100
	PPG	Aquatapoxy A6 (Thick)	Amercoat 68HS (Optional)	Amerlock 2/400	Aquatapoxy A6
	Sherwin Williams	Steel Seam FT910	Corothane Galvapac 1K (Optional)	SherPlate 600	Sherplate PW or Dura-Plate UHS
	Tnemec	Series 215	Hydro-Zinc 94-H20 (Optional)	Epoxoline Series 21	Epoxoline FC22 or Epoxoline 22
INT-PWS-2 (AWWA D102-21 ICS#4)	Carboline	Carboguard 501	**No zinc primer available	Reactamine 760	Reactamine 760
	PPG	Aquatapoxy A6 (Thick)	Amercoat 68HS (Optional)	Amerlock 2/400	AquataFlex 505
	Sherwin Williams	Steel Seam FT910	Corothane Galvapac 1K (Optional)	SherPlate 600	Poly-Cote 115
	Tnemec	Series 215	Hydro-Zinc 94-H20 (Optional)	Epoxoline Series 21	Elasto-Shield Series 406
INT-PWS-3 (AWWA D102-21 ICS#5)	Carboline	Carboguard 501	Carbozinc 621PW	Hydroplate 1086	Hydroplate 1086
	Induron	*Aquatapoxy A6 (Thick)	Indurazinc MC67	**PE-70	PE-70
	PPG	Aquatapoxy A6 (Thick)	Amercoat 68HS	Amerlock 2/400	Amerlock 2/400
	Sherwin Williams	Steel Seam FT910	Corothane Galvapac 1K	SherPlate 600	SherPlate 600
	Tnemec	Series 215	Hydro-Zinc 94-H20	Epoxoline Series 21	Epoxoline Series 21
INT-PWS-4 (AWWA D102-21 ICS#6)	Carboline	Carboguard 501	Carbozinc 621 PW	Hydroplate 1086 (Stripe Coat)	Hydroplate 1086

PART 3 EXECUTION

3.01 COATINGS

A. General:
   1. Do not use coating products until the Owner's Representative has accepted the affidavits specified in articles 1.04 and 2.01, and inspected the materials, and the CTR has trained the CSA in the surface preparation, mixing and application of each coating system.
   2. Erect and maintain protective enclosures as stipulated per SSPC-Guide 6 Guide for Containing Debris Generated During Paint Removal Operations.

B. Shop and Field Coats:
   1. Shop Applied Prime Coat: Except as otherwise specified, prime coats may be shop-applied or field-applied. Use only shop-applied primer compatible with the specified coating system and apply at the minimum dry film thickness recommended by the CSM. Provide data sheets identifying the shop primer used to the CTR and the CSA. Performa adhesion tests on the shop primer as specified in Article 3.01.. Remove damaged, deteriorated, and poorly applied shop coatings that do not meet the requirements of this Section and the surfaces recoated. If the shop primer coat meets the requirements of this Section, the field coating may consist of touching up the shop prime coat and then applying the finish coats to achieve the specified film thickness and continuity. The same quality control and quality assurance inspections are applicable for shop applications as for field applications.
   2. Field Coats: Apply field coats consisting of one or more prime coats and one or more finish coats to build up the coating to the specified dry film thickness. Unless otherwise specified, do not apply finish coats until other work in the area is complete and previous coats have been inspected.
   3. Adhesion Confirmation: Perform an adhesion test after proper cure in accordance with ASTM D3359 to demonstrate that (1) the shop applied prime coat adheres to the substrate, and (2) the specified field coatings adhere to the shop coat. Test results showing an adhesion rating of 5A on immersed surfaces and 4A or better on other surfaces are required for coatings 5 mils or more in thickness (Method A). Test results showing an adhesion rating of 5B on immersed surfaces and 4B or better on other surfaces are required for coating thicknesses less than 5 mils.

C. Application Location Requirements:
   1. Equipment, Non-immersed: Items of equipment, or parts of equipment that are not immersed in service, shop prime and then finish coat in the field after installation

with the specified or acceptable color. If the shop primer requires top coating within a specified period, finish coat the equipment in the shop and then touch-up paint after installation. If equipment removal and reinstallation is required for the project, touch-up coat in the field following reinstallation.

2. Equipment, Immersed: Items of equipment, or parts and surfaces of equipment that are immersed when in service, with the exception of pumps and valves, shall have surface preparation and coating work performed in the field. Coating systems applied to immersed equipment shall be pinhole free.

3.02 PREPARATION

A. General:

1. Prepare surfaces for each type of surface in accordance with the specific requirements of each coating specification sheet (COATSPEC) and the following. In the event of a conflict, the COATSPEC sheets shall take precedence.
2. Clean and dry surfaces to be coated. Before applying coating or surface treatments, remove oil, grease, dirt, rust, loose mill scale, old weathered coatings, and other foreign substances. Remove oil and grease before mechanical cleaning is started. Where mechanical cleaning is accomplished by blast cleaning, wash, grade, and free the abrasive from contaminants that might interfere with the adhesion of the coatings. Use air for blast cleaning that is sufficiently free of oil and moisture so as not to cause detrimental contamination of the surfaces to be coated.
3. Where deemed necessary by the Owner's Quality Assurance representative, an AMPP (Formerly NACE/SSPC) Coatings Inspector with a minimum current Certified (Formerly Level 2) or Senior (Formerly Level 3) designation in good standing, provided by the Owner, will review surfaces to be coated before application of a coating. Surface defects identified by the inspector shall be corrected by the CSA at no additional cost to the Owner.
4. Protect all surfaces and equipment not to be coated from dust and overspray. Schedule cleaning and coating so that dust and spray from the cleaning process shall not fall on wet, newly coated surfaces. Remove or mask hardware, hardware accessories, nameplates, data tags, machined surfaces, sprinkler heads, electrical fixtures, and similar uncoated items which are in contact with coated surfaces prior to surface preparation and coating operations. Reinstall removed items following completion of coating. Disconnect and move equipment adjacent to walls to permit cleaning and coating of equipment and walls. Replace and reconnect items following coating.
5. Heating and Dehumidification: Install weather protection, including Dehumidification and heating devices, in compliance comply with all safety regulations including provisions for adequate ventilation and fire protection devices. Do not use heating devices which may cause damage to finish surfaces. Use indirect, fired diesel operated heating equipment or approved equivalent.
6. Dehumidification equipment shall be sized by the manufacturer of the equipment to ensure optimum operation and environmental control.
7. Quality Assurance Inspector Access: Provide all points of access for inspection by the Owner's Inspector. Provide ventilation, ingress and egress, and other means necessary for the Owner's Inspector personnel to safely access the work areas.
8. Ventilation: Provide ventilation in accordance with ANSI/ASC 29.4. Provide ventilation taking into account of the Lower Explosive Limit (LEL) of the product being applied

and comply with applicable regulations. (The LEL is the minimum concentration of vapor in air, expressed as a percentage, that will ignite). Provide ventilation during abrasive blasting operations to ensure adequate visibility. Use flexible trunking to allow the point of extraction to be reasonably close to the personnel carrying out the blasting. During and after coating application, arrange the ventilation system and trunking such that "dead spaces" do not exist – especially from lower areas of tanks where solvent vapors will tend to accumulate. Ensure adequate fresh air is being introduced into the tank. Do not re-introduce abrasive dust, solvent vapor, etc. into the tank. Maintain a positive pressure, above normal atmospheric pressure, inside the tank. As a "rule of thumb", minimum fresh air supply/extraction should be in the approximate ratio of 4:3 but actual determination of need and related health and safety considerations are the responsibility of the Contractor.

B. Steel Repairs to Existing Structures:
   1. After the initial abrasive blast cleaning, conduct a condition assessment in conjunction with the Owner or Owner's Representative to assess any repair needs. All surfaces to be lined on the tank interior shall meet NACE SP0178-Section 5 Surface Finish Practices Standards.
   2. Pit Filling: Treat All pits designated for pit filling in the following manner:
      a. Back-roll or fill pit to produce a holiday free coating. Shallow pits treated by back-rolling the coating after it has been spray applied.
      b. Fill pits up to 1/4-inch deep using the specified pit filler material. Sand pit filler material smooth and prepare to ensure adhesion of lining material.
      c. Repair pits greater than 1/4-inch by plug welding or welding steel plates onto the surface depending on the size of the affected area. If welding a patch plate, use the same thickness as the tank plate over the spot to be repaired. Grind edges of holes smooth prior to installation of the plate. Use patch plates no smaller than 6-inch by 6-inch or 6 inches in diameter. Lap edges of the plate shall a minimum of 2 inches from the edge of the hole. Grind all patch plate edges to a 1/16-inch radius. Do not leave plates with sharp edges. Welding practices shall be acceptable to the Engineer. Install plates in accordance with API 653. Locate plates a minimum of 3 inches from existing weld seams. If the plate must overlap a weld seam, provide rectangular plates with radius corners and extend a minimum of 6 inches beyond the existing weld seam. Fully weld all plate repairs on all sides with continuous fillet welds. Use appropriate welding procedures (electrode size and heat input) at all repair areas considering the potential for those areas to be thin and subject to damage from welding.
   3. Clean all apparently deteriorated weld seams by an initial blast clean for inspection and notify the Engineer of all suspected area of corrosion, apparent losses, or undercut welds to determine if any weld requires repair prior to coating.

C. Interior Chipping and/or Grinding:
   1. All interior surfaces to be lined shall conform to NACE SP0178 Design, Fabrication, and Surface Finish Practices for Tanks and Vessels to Be Lined for Immersion Service. Eliminate all irregular surfaces on the interior of the tank and appurtenances, including but not limited to surface protrusions, burrs, scars, sharp edges or corners, weld spatter, weld overlap, and rough weld beads, by chipping and/or grinding these irregular surfaces to a smooth curve to the satisfaction of the Construction Manager. Remove and grind flush the protruding parts of lugs or brackets. The objective of chipping and/or grinding is to eliminate irregular surfaces

to provide a surface that is sufficiently smooth for the application of a uniform thickness coating without voids and free from defects. This chipping and/or grinding is also intended to make it easier for the interior coating to pass the holiday test.

D. Blast Cleaning:
   1. Meet the following requirements for abrasive blast cleaning:
      a. Do not reuse blast abrasive.
      b. Filter compressed air used for blast cleaning and ensure it contains no condensed water and no oil. Clean moisture traps at least once every four hours or more frequently as required to prevent moisture from entering the supply air to the abrasive blasting equipment as per ASTM D4285.
      c. Install oil separators just downstream of compressor discharge valves and at the discharge of the blast pot discharges. Check and clean oil separators on the same frequency as the moisture traps as defined above per ASTM D4285.
      d. Regulators, gauges, filters, and separators must in use on compressor air lines to blasting nozzles at all times during this work.
      e. Install an air dryer or desiccant filter drying unit which dries the compressed air prior to blast pot connections. Use and maintain the dryer for the duration of surface preparation work.
      f. Use abrasive blast nozzles of the venturi or other high velocity type supplied with a minimum of 100 pounds per square inch gauge (psig) air pressure and sufficient volume to obtain the blast cleaning production rates and cleanliness specified.
      g. Provide ventilation for airborne particulate evacuation (meeting pertinent safety standards) to optimize visibility for both blast cleaning and inspection of the substrate during surface preparation work.
      h. If, between final surface preparation work and coating system application, contamination of prepared and cleaned metallic substrates occurs, or if the prepared substrates' appearance darkens or changes color, reclean the surface by water blasting, re-blasting and abrasive blast cleaning until the specified degree of cleanliness is reclaimed.
      i. The Contractor is responsible for dust control and for protection of mechanical, electrical, and other equipment adjacent to and surrounding the work area.

E. Solvent Cleaning:
   1. Use emulsifying type solvent wash, solvent wipe, or cleaners , including but not limited to those used for surface preparation in accordance with SSPC SP-1 Solvent Cleaning, which emit no more than 340 g/l VOCs for Architectural and Industrial Maintenance (AIM) regions, 250 g/l for CARB regions, and 100 g/l for SCAQMD regions, contain no phosphates, is biodegradable, remove no zinc, and is compatible with the specified primer.
   2. Use only clean white cloths and clean fluids in solvent cleaning.

F. Metallic Surfaces:
   1. Internal Metallic surfaces intended for immersion shall meet NACE SP0178 regarding surface defects, weld spatter, and weld condition prior to abrasive blasting.
   2. Prepare metallic surfaces in accordance with applicable portions of the joint surface preparation specifications of the SSPC and NACE specified for each coating system.

See CoatSpec for each coating system in this Section. The profile depth of the surface to be coated shall be in accordance with the COATSPEC requirements in this Section measured by Method C of ASTM D4417. Select Blast particle size to produce the specified surface profile. Use solvent in solvent cleaning operations as recommended by the CSM.

3. Take the following steps if soluble chloride contamination is suspected or possible/plausible. Following initial blast cleaning of steel substrates, test for the presence of soluble chlorides using the retrieval and analysis method designated as Method 4.2.2. Adhesively Bonded Latex Patch or Cell as described in SSPC-TG15. Test in accordance with ISO 8502-6/8502-9 at the rate of 4 tests per 1,000 sq ft of steel surface area to be coated. The target threshold or tolerance conductivity level for soluble chloride contamination shall be approved in writing by the CSM's CTR for each product that is part of the application. Any interior areas of notable pitting shall be tested for chlorides.
4. Prepare metallic surfaces for degree of cleanliness shall be based upon comparison with SSPC-VIS1-89 (ASTM D2200), and as described in the COATSPEC for each coating system. If dry abrasive blast cleaning is selected and to facilitate inspection\, provide on the first day of cleaning operations abrasive blast metal reference panels to the standards specified for acceptance by the Construction Manager. Plates shall measure a minimum of 8-1/2 inches by 11 inches. Panels accepted by the Construction Manager as meeting the requirements of the specifications shall be initialed by the CSA and Construction Manager and coated with a clear non-yellowing finish. One of these panels shall be prepared for each type of abrasive blasting to be used as the comparison standard throughout the project.
5. Blast cleaning requirements for steel, ductile iron, and stainless steel substrates are as follows:
    a. Prepare internal steel surfaces, including all areas subjected to splashing, intermittent immersion and continuous condensation such as the roof structure for immersion service in accordance with SSPC SP 10/NACE #2 (Near White Metal Blast Cleaning).
    b. Prepare internal dry areas (non-immersion) and external steel in accordance with SSPC SP 6/NACE #3 (Commercial Blast Cleaning).
    c. Prepare ductile iron piping surfaces, including fittings, in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05.
    d. Prepare stainless steel surfaces by abrasive blast cleaning in accordance with SSPC-SP16 to leave a clean uniform appearance with a minimum uniform surface profile of 1.5 to 2.5 mils.
    e. Remove traces of grit, dust, dirt, rust scale, friable material, loose corrosion products, or embedded abrasive from substrate by vacuum cleaning to meet ISO 8502-3 Particle size 1 dust rating 1 prior to coating application.
    f. Test areas of pitting per this specification for the presence of soluble chloride contamination in accordance with SSPC Guide 15 with a maximum allowable conductivity of 30 micro-siemens/centimeters (cm) in accordance with current United States Coast Guard requirements.
    g. Prevent contamination of the surface after blasting from worker's fingerprints, deleterious substances on workers' clothing, or from atmospheric conditions.
    h. Continuously monitor and maintain ambient environmental conditions in the enclosure to ensure the degree of cleanliness is held and no "rust back" occurs prior to coating material application. Maintain surface temperatures a minimum

of 5 degrees Fahrenheit (F) above the dew point, and improving, at all times during final blasting and coating application.

G. Concrete Surfaces:

1. Inspect concrete surfaces prior to surface preparation and prepare concrete surfaces in accordance with SSPC-SP13/SPCAB1/NACE #6.
2. Prior to surface preparation for degree of cleanliness and profile, prepare substrate cracks, areas requiring resurfacing and perform detail treatment including but not limited to, terminating edges, per CSM recommendations.
3. Evaluate the surface profile for prepared concrete surfaces to be coated by comparing the profile of the prepared concrete to the profile with the ICRI 310.2 (surface profile replicas). Prepare surface profile in accordance with the COATSPEC requirements and the CSM's recommendations.
4. Inspect prepared concrete substrates for surface cleanliness after cleaning, preparation, and/or drying, but prior to making repairs or applying a coat in the coating system. Reinspect repaired concrete surfaces for cleanliness prior to application of the coating system.
5. Prepare concrete substrates using methods such as dry abrasive blast cleaning, high, or ultra-high-pressure water blast cleaning in accordance with SSPC-SP-13/SP CAB1/NACE #6 to meet the following requirements:
    a. A clean substrate that is free of calcium sulfate, loose coarse or fine aggregate, laitance, loose hydrated cement paste, and otherwise deleterious substances .
    b. Open up air voids or bug holes to expose their complete perimeter by blast cleaning or other methods. Leaving shelled over, hidden air voids beneath the exposed concrete surface is not acceptable.
    c. Concrete substrate must be dry prior to the application of filler/surface or coating system materials.
    d. Produce a concrete surface with a minimum pH of 9.0 to be confirmed by surface pH testing. If after surface preparation, the surface pH remains below 9.0, perform additional water blasting, cleaning, or abrasive blast cleaning until additional pH testing indicates an acceptable pH level.
    e. Following inspection of the concrete surface preparation, thoroughly vacuum clean concrete surfaces to be coated to remove loose dirt and spent abrasive (if dry blast cleaning is used) leaving a dust free, sound concrete substrate.
    f. Remove debris produced by blast cleaning from the structures to be coated and disposed of legally off site.
6. Should abrasive blast cleaning or high or ultrahigh pressure water jetting not remove degraded concrete, use chipping or other abrading tools to remove the deteriorated concrete until a sound, clean substrate is achieved which is free of calcium sulfate, loose coarse or fine aggregate, laitance, loose hydrated cement paste, and otherwise deleterious substances. Concrete substrates must be dry prior to the application of filler/surfacers or coating system materials.
7. Test moisture content of concrete to be coated in accordance with ASTM D4263, Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method at least once for every 500 sq ft of surface area to be coated or more often if required by the CSM. The presence of any moisture on plastic sheet following test period constitutes a non-acceptable test.

8. If moisture is detected the CSA in cooperation with the CTR shall perform additional moisture testing vis ASTM F1869 or ASTM F2170 to determine the extent of the moisture vapor transmission. Acceptable limits for the application of barrier coatings for ASTM F1869 is <3 pounds/1,000 sq ft/24 hours. Acceptable limits as per ASTM F2170 is an RH value <70 percent.

3.03 APPLICATION

A. Workmanship:
   1. Coated surfaces shall be free from runs, drips, ridges, waves, laps, and brush marks. Apply coats to produce an even film of uniform thickness completely coating corners and crevices.
   2. Use equipment designed for application of the materials specified. Equip compressors with suitable traps and filters to remove water and oils from the air. Perform a paper blotter test when requested by the Construction Manager to determine if the air is sufficiently free of oil and moisture so as not to produce deteriorating effects on the coating system. Control the amount of oil and moisture in spray air to be less than the amount recommended by the CSM. Equip spray equipment with mechanical agitators, pressure gages, and pressure regulators, and spray nozzles of the proper sizes.
   3. Apply each coat evenly and sharply cut to line. Avoid over-spraying or spattering paint on surfaces not to be coated. Protect glass, hardware, floors, roofs, and other adjacent areas and installations by taping, drop cloths, or other suitable measures.
   4. Use coating applications method recommended by CSM.
   5. Allow each coat to cure or dry thoroughly, according to CSM's printed instructions, prior to recoating.
   6. Vary color for each successive coat for coating systems when possible.
   7. When coating complex steel shapes, prior to overall coating system application, stripe coat welds, edges of structural steel shapes, metal cut-outs, pits in steel surfaces, or rough surfaces with the primer coat as a separate coat using brushes or rollers to ensure proper coverage. Stripe coat via spray application is not permitted.

B. Coating Properties, Mixing and Thinning:
   1. Coatings, when applied, shall provide a satisfactory film and smooth even surface. Sand glossy undercoats to provide a surface suitable for the proper application and adhesion of subsequent coats. Thoroughly stir, strain, and keep at a uniform consistency all coating materials during application. Mix Coating materials consisting of 2 or more components in accordance with the CSM's instructions. Where necessary to suit the conditions of the surface, temperature, weather and method of application, the coating may be thinned immediately prior to use as recommended by the CSM. The VOC of the coating as applied shall comply with prevailing air pollution control regulations. Unless otherwise specified, do not reduce coatings more than necessary to obtain the proper application characteristics. Use thinner as recommended by the CSM.

C. Atmospheric Conditions:
   1. Apply coatings only to surfaces that are dry, and only under conditions of evaporation rather than condensation. Do not apply coatings systems during rainy, misty weather, or to surfaces upon which there is frost or moisture condensation. During damp

weather, when the temperature of the surface to be coated is within 5 degrees F of the dew point or risk of this within 4 hours of completion, forced dehumidification equipment may be used to maintain a surface temperature of minimum 40 degrees F and 5 degrees F above the dew point for the surfaces to be coated, the coated surface, and the atmosphere in contact with the surface, unless approved in writing from the CSM's technical department. Maintain these conditions for a period of at least 8 hours or as recommended by the CSM. Where conditions causing condensation are severe, use dehumidification equipment, fans, and/or heaters inside enclosed areas to maintain the required atmospheric and surface temperature requirements for proper coating application and cure.

D. Concrete Substrate Temperatures and Detail Treatment:
   1. When the surface temperatures of the concrete substrates to be coated are rising or when these substrates are in direct sunlight, outgassing of air from the concrete may result in bubbling, pinhole formations, and/or blistering in the coating system. The application of the filler/surface and the coating system will only be allowed during periods of falling temperature. This will require that application of the filler/surface and coating system only occur during the cooler evening hours. Include all cost for working outside of normal hours in the bid.
   2. Repair all bubbles, pinholes, or discontinuities that form in the applied coating system material as recommended by the CSM prior to installation of any additional coats. Should pinholes develop in the filler/surfacer material or in the first coat of the coating material, the pinholes shall be repaired in accordance with the CSM's recommendations prior to application of the next coat of material. Open up and completely fill air voids behind or beneath each with the specified filler/surfacer material. Abrade the coated area around the pinhole repair recoat that area.
   3. Perform application detail work per CSM's current written recommendations and/or drawings.

E. Protection of Coated Surfaces:
   1. Do not handle, work on, or otherwise disturb, until the coating is completely dry and hard. Recoat or retouch shop-coated items after delivery at the site, and upon permanent erection or installation with specified coating when it is necessary to maintain the integrity of the film.

F. Method of Coating Application:
   1. Use equipment and methods for applying coatings and linings approved in writing by the CSM.
   2. Where two or more coats are required, provide sufficient compatible color additive, or contrasting color, in alternate coats to act as indicator of coverage.
   3. Do not apply coatings to a surface until it has been prepared as specified.

G. Film Thickness and Continuity:
   1. Verify WFT of the first coat of the coating system and subsequent coats , following application of each coat.
   2. Do not exceed the surface area covered per gallon of coating for various types of surfaces recommended by the CSM. The first coat, referred to as the prime coat, on metal surfaces refers to the first full paint coat and not to solvent wash, grease

emulsifiers, or other pretreatment applications. Apply coatings to the thickness specified, and in accordance with these specifications.

3. The ability to obtain specified film thickness is generally compromised when brush or roller application methods are used and, therefore, more coats may need to be applied to achieve the specified dry film thickness.
4. For concrete substrates, appropriately prepare the surface per requirements and apply a complete skim coat of the specified filler/surfacer material over the entire substrate prior to application of the coating system where necessary. Apply the skim coat as recommended by the CSM such that all open-air voids and bug-holes in the concrete substrate are completely filled prior to coating application.

H. Special Requirements:

1. Before erection, apply all coats to interior surfaces of steel supports, pipe hangers, piping in contact with hangers, and contact surfaces that are inaccessible after assembly. Hand clean or power-tool clean areas damaged during erection and recoat with primer coat prior to the application of subsequent coats. Touch-up surfaces after installation. Verify surfaces to be coated are clean and dry at the time of application.

I. Electrical and Instrumentation Equipment and Materials:

1. Electrical and instrumentation equipment and materials shall be coated in accordance with Section 09 90 00.

3.04 CLEANUP

A. General:

1. Upon completion of coating, remove surplus materials, protective coverings, and accumulated rubbish, and thoroughly clean surfaces and repair overspray or other coating-related damage.

3.05 FINAL TESTING

A. QC/QA Verification Steps:

1. Complete all testing after full cure and prior to disinfection of tank.
2. All final testing is subject to observation by the Owner/Owner's Representative at the Owner's discretion. Inform the Engineer/Owner for scheduled final testing providing a minimum of 48 hours' notice.

B. Testing includes but is not limited to the following:

1. Visual inspection for complete hiding of previously applied coats
2. No excessive runs, sags, protrusions, or depressions
3. No dry spray or other surface defects
4. Solvent rub test as per ASTM D4752-20 to verify cure
5. Ensure no off-ratio material has been applied
6. Dry film thickness testing as per SSPC PA2 Level 3 (Steel) SSPC PA 9 Level (Concrete)
7. High Voltage holiday testing as per ASTM D5162-21 (Interior Lining Only, or other where exposed to liquid or vapor headspace – 100 percent of exposed surface area)
8. Finish texture of coatings shall be uniform

3.06 TANK DISINFECTION PROCEDURES

A. References:
   1. American Water Works Association (AWWA) Standards
   2. ANSI/AWWA C652-11, Disinfection of Water-Storage Facilities

B. Sequencing and Scheduling:
   1. The interior coating shall be properly cured.
   2. The interior coating shall be washed with potable water.
   3. CSA shall flush and disinfect the tank.
   4. The Owner shall take and send in the samples to the laboratory for testing.
   5. The Owner shall pay for the testing of the initial set of samples. The CSA shall pay for all subsequent samples and testing, if required.

3.07 COATING SYSTEM SPECIFICATION SHEETS (COATSPEC)

A. General:
   1. Coating systems for different types of surfaces and general service conditions for which these systems are normally applied are specified on the following COATSPEC sheets. Coat surfaces in accordance with the COATSPEC to the system thickness specified. Use coating systems as specified in paragraph 3.07. In case of conflict between the schedule and the COATSPECS, the requirements of the schedule take precedence.
   2. Coating Specification Sheets included in Table A are included in this paragraph 3.07.

Table A Coating Specification Sheets

Coating System ID	Coating Material	Surface	Service Conditions
INT-PWS-(Meets AWAA D102 21 ICS#3)	(Optional) Zinc Rich Primer with 100% Solids Amine Cured Epoxy Finish Coat	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel	Continuous Immersion in Potable Water Including tank shell, floor, roof structure, wet riser and other areas subjected to immersion or continuous Condensation.
INT-PWS-2 (Meets AWWA D102-21-ICS #4)	Optional Zinc Rich Primer with 100% Solids Aromatic Elastomeric Polyurethane Finish Coat.	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel	Continuous Immersion in Potable Water Including tank shell, floor, roof structure, wet riser and other areas subjected to immersion or continuous Condensation.
INT-PWS-35 (Meets AWWA D102-21-ICS#5)	Zinc Rich Primer with Polyamide or Polyamine or Modified Polyamine Cured Epoxy	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel	Continuous Immersion in Potable Water Including tank shell, floor, roof structure, wet riser and other areas subjected to immersion or continuous Condensation.
INT-PWS-4 (Meets AWWA D102-21-ICS#6)	Zinc Rich Primer with Polyamide or Polyamine or Modified Polyamine Cured Epoxy	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel	Continuous Immersion in Potable Water Including tank shell, floor, roof structure, wet riser and other areas subjected to immersion or continuous Condensation
EXT-PWS-1 (Meets AWWA D102-21-OCS#4)	Zinc Rich Primer/Aliphatic Urethane/Fluoropolymer Urethane	Carbon Steel, Ductile Iron or Cast Iron, Galvanized Steel, Stainless Steel	Atmospheric exposure of Tank Exterior for corrosion and UV protection.
EXT-PWS-2 (Meets AWWA D102-21-OCS #5)	Polyamide or Polyamine or Modified Polyamine Cured Epoxy/Aliphatic Urethane	Carbon Steel, Ductile Iron or Cast Iron, Galvanized Steel, Stainless Steel	Atmospheric exposure of Tank Exterior for corrosion and UV protection.

Table A Coating Specification Sheets

Coating System ID	Coating Material	Surface	Service Conditions
EXT-PWS-3 (Meets AWWA D102-21-OCS #6)	Zinc Rich Primer/ Polyamide or Polyamine or Modified Polyamine Cured Epoxy/Aliphatic Urethane	Carbon Steel, Ductile Iron or Cast Iron, Galvanized Steel, Stainless Steel	Atmospheric exposure of Tank Exterior for corrosion and UV protection.
EXT-OCS-1 (Exterior Overcoat System on Previously Coated Steel Tanks)	Epoxy Spot Prime/Epoxy Penetrating Sealer/Urethane or Polysiloxane	Previously Coated Steel Surfaces	Atmospheric exposure of Tank Exterior for corrosion and UV protection.
EXT-OCS-2 (Exterior Overcoat System on Previously Coated Steel Tanks)	Epoxy Spot Prime/Epoxy Intermediate/Urethane or Polysiloxane	Previously Coated Steel Surfaces	Atmospheric exposure of Tank Exterior for corrosion and UV protection.
EXT-OCS-3 (Exterior Overcoat System on Previously Coated Steel Tanks)	Epoxy Spot Prime/Epoxy Penetrating Sealer/Acrylic	Previously Coated Steel Surfaces	Atmospheric exposure of Tank Exterior for corrosion and UV protection.
INT-PWC-1	Amine or Novolac Cured Epoxy System	Concrete	Concrete Substrates Subject to Constant Immersion In Potable Water
INT-PWC-2	Aromatic Elastomeric Polyurethane	Concrete	Concrete Substrates Subject to Constant Immersion In Potable Water
INT-PWC-3	Amine Cured Epoxy Fiberglass Layup System	Concrete	Concrete Substrates Subject to Constant Immersion in Potable Water in Membrane Filtration Systems.
EXT-PWC-1	Acrylic Elastomeric	Concrete	Concrete Substrates Subject to Exterior Exposures and UV
EXT-PWC-2	Acrylic	Concrete	Concrete Substrates Subject to Exterior Exposures and UV
EXT-OCC-1	Acrylic Elastomeric	Previously Painted/Coated Concrete	Concrete Substrates Subject to Exterior Exposures and UV
EXT-OCC-2	Acrylic	Previously Painted/Coated Concrete	Concrete Substrates Subject to Exterior Exposures and UV

Coating System Specification Sheets (COATSPEC)

Coating System Identification—INT-PWS-(Meets AWAA D102 21 ICS#3)

1. Coating Material:	(Optional) Zinc Rich Primer with 100% Solids Amine Cured Epoxy Finish Coat
2. Surface:	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel
3. Service Conditions:	Continuous Immersion in Potable Water Including tank shell, floor, roof structure, wet riser and other areas subjected to immersion or continuous Condensation.
4. Surface Preparation:	
a. Carbon Steel:	Abrasive blast clean to Near White Metal Blast Degree of Cleanliness per SSPC SP10.If applying finish coat direct to metal with no primer, achieve a minimum surface profile of 3.0 to 4.0 mils. If using a zinc primer, achieve a minimum surface profile of 2.0-3.0 mils. Vacuum clean to remove all dust, dirt, and loose material (including all existing coatings if a complete recoating project).
b. Shop Primed Metals:	DO NOT USE SHOP PRIMED COMPONENTS IN THIS SERVICE unless the shop primer's maximum recoat time has not been exceeded. If there is damage to the shop primer, power tool clean to bare metal all damaged areas in accordance with SSPC SP11 and abrade the peripheral intact coating area around the bare metal by 1-1/2 inches all around for re-priming. Abrading the intact primer must produce a

Coating System Specification Sheets (COATSPEC)

Coating System Identification—INT-PWS-(Meets AWAA D102 21 ICS#3)

		1.0 to 1.5 mil profile in the existing primer. Vacuum clean to remove all loose dust, dirt, and loose coating material.
	c. Galvanized Steel:	DO NOT USE GALVANIZED STEEL in Potable Water Immersion Service.
	d. Cast Iron or Ductile Iron:	Abrasive blast clean these surfaces in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05. Vacuum clean as required for carbon steel.
	e. Stainless Steel Component Surfaces:	Abrasive blast clean in accordance with SSPC SP16 using only aluminum oxide abrasive blast media to produce a minimum, uniform surface profile of 1.5 to 2.5 mils. Vacuum clean the same as for carbon steel surfaces. Stainless steel is only to be prepared and coated when galvanic corrosion (dissimilar metal corrosion) is a concern.
	f. Stainless Steel Fastener Surfaces: When stainless steel fasteners are electrically continuous with coated carbon steel.	Solvent clean all bolts, nuts, washers, etc. in accordance with SSPC SP1 to remove all traces of cutting oil. Stainless steel fasteners should be field coated with the ferrous metal components that the fasteners connect. Also, these fasteners shall be completely sealed with an NSF 600/61 approved polysulfide or polyurethane sealant to prevent future galvanic corrosion between the fasteners and the coated steel or other coated ferrous metal surfaces. The installation of the sealant shall be continued onto the coated ferrous metal surfaces by at least 2 inches in all directions.
5.	Field Application:	
	a. Coating System Thickness:	20-40 DFT (22.5–42.5 if Zinc Primer Used).
	b. Coatings:	1 or 2 coat system (If using Zinc Primer).
	c. Primer (Optional):	One coat of zinc rich primer at 2.5 mils or per CSM's recommended DFT.
	d. Finish Coats:	One coat at CSM's recommended DFT to achieve the total system DFT.
	e. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
	f. Post Cure QC Testing:	Perform Holiday Detection over 100% of the coated surface area in accordance with ASTM D5162. Acceptance Criteria–no pinholes or holidays. Perform Adhesion Testing in accordance with ASTM D4541 at a minimum of 4 locations representative of all components making up the internal area of the tank. If coating applied to other metal equipment or components, perform number of adhesion tests per the CSM's recommendations. Acceptance Criteria–minimum 850 psi with failure plane at substrate for 75% of load fixture surface area. Areas damaged by adhesion testing shall be repaired by the CSA at no additional cost to the Owner.
	g. Pinhole, Holiday or Defect Repair Procedure:	Using a grinder or flapper wheel tool, remove the coating at defect or adhesion test area on areas of 1-1/2 inches in diameter to bare metal. Abrade the coating in area comprising periphery of bare metal to 1 inch all around the bare metal area to achieve a 1.5 to 2.0 mil profile in the existing intact coating in periphery area. Vacuum clean the prepared area to remove all loose dust, dirt, and loose coating materials leaving a clean, sound area for coating repair. Tape to mask the peripheral area at the edge of the roughened existing coating. Apply the coating system in 2 or 3 coats as necessary to achieve the total system DFT over the defect and coating prepared area, feathering the coatings onto the roughened existing coating around the periphery of the repair area. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – INT-PWS-2 (Meets AWWA D102-21-ICS #4)

1.	Coating Material:	Optional Zinc Rich Primer with 100% Solids Aromatic Elastomeric Polyurethane Finish Coat.
2.	Surfaces:	Carbon Steel, Ductile Iron or Cast Iron, Stainless Steel
3.	Service Conditions:	Continuous Immersion in Potable Water Including tank shell, floor, roof structure, wet riser and other areas subjected to immersion or continuous Condensation.

2.	Surfaces:	Carbon Steel, Ductile Iron or Cast Iron, Galvanized Steel, Stainless Steel
3.	Service Conditions:	Atmospheric exposure of Tank Exterior for corrosion and UV protection.
4.	Surface Preparation:	
a.	Carbon Steel:	Abrasive blast clean to Near White Metal Blast Degree of Cleanliness per SSPC SP6 to achieve a minimum surface profile of 2.0 to 3.0 mils. Vacuum clean to remove all dust, dirt, loose material (including all existing coatings if a complete recoating project).
b.	Shop Primed Metals:	Components Shop Primed with a Pre-Construction weldable zinc primer are acceptable providing verification that the pre-construction primer was applied to SSPC-SP6/NACE#3 blast cleaned steel surface. All welds and any areas damaged or affected by erection shall be blasted to meet a minimum SSPC-SP6/NACE#3 blast cleanliness standard. Sweep blasting is required if the shop primer's maximum recoat time has been exceeded. Surface profile for bare metal shall be 2.0-3.0 mils. Abrading the intact primer must produce a 1.0 to 1.5 mil profile in the existing primer. Vacuum clean to remove all loose dust, dirt, and loose coating material.
c.	Galvanized Steel:	Prepare all galvanized steel to be coated as per SSPC-SP16.
d.	Cast Iron or Ductile Iron:	Abrasive blast clean these surfaces in accordance with NAPF 500-03, NAPF 500-03-04, and NAPF 500-03-05. Vacuum clean as required for carbon steel.
e.	Stainless Steel Component Surfaces:	Abrasive blast clean in accordance with SSPC SP16 using only aluminum oxide abrasive blast media to produce a minimum, uniform surface profile of 1.5 to 2.5 mils. Vacuum clean the same as for carbon steel surfaces. Stainless steel is only to be prepared and coated when galvanic corrosion (dissimilar metal corrosion) is a concern.
f.	Stainless Steel Fastener Surfaces: When stainless steel fasteners are electrically continuous with coated carbon steel.	Solvent clean all bolts, nuts, washers, etc. in accordance with SSPC SP1 to remove all traces of cutting oil. Stainless steel fasteners should be field coated with the ferrous metal components that the fasteners connect. Also, these fasteners shall be completely sealed with a polyurethane sealant to prevent future galvanic corrosion between the fasteners and the coated steel or other coated ferrous metal surfaces. The installation of the sealant shall be continued onto the coated ferrous metal surfaces by at least 2 inches in all directions.
5.	Field Application:	
a.	Coating System Thickness:	6.5–10.0 mils DFT.
b.	Coatings:	3 Coat System.
c.	Primer:	Primer-1 coat of zinc rich primer at minimum 2.5 mils or as per CSM's recommended DFT.
d.	Intermediate:	1 coat of aliphatic urethane at minimum 2.0 mils or as per CSM's recommended DFT.
e.	Finish Coat:	1 coat of fluoropolymer urethane at minimum 2.0 mils or as per CSM's recommended DFT.
f.	Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
g.	Post Cure QC Testing:	Perform Adhesion Testing in accordance with ASTM D4541 at a minimum of 4 locations representative of all components making up the internal area of the tank. If coating applied to other metal equipment or components, perform number of adhesion tests per the CSM's recommendations. Acceptance Criteria–minimum 850 psi with failure plane at substrate for 75% of load fixture surface area. Areas damaged by adhesion testing shall be repaired by the CSA at no additional cost to the Owner.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-PWS-1 (Meets AWWA D102-21-OCS#4)

h. Pinhole, Holiday or Defect Repair Procedure:	Using a grinder or flapper wheel tool, remove the coating at defect or adhesion test area on areas of 1-1/2 inches in diameter to bare metal. Abrade the coating in area comprising periphery of bare metal to 1 inch all around the bare metal area to achieve a 1.5 to 2.0 mil profile in the existing intact coating in periphery area. Vacuum clean the prepared area to remove all loose dust, dirt, and loose coating materials leaving a clean, sound area for coating repair. Tape to mask the peripheral area at the edge of the roughened existing coating. Apply the coating system in 2 or 3 coats as necessary to achieve the total system DFT over the defect and coating prepared area feathering the coatings onto the roughened existing coating around the periphery of the repair area. Allow to cure properly.

Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – INT-PWC-1

1. Coating Material:	Amine or Novolac Cured Epoxy System
2. Surfaces:	Concrete
3. Service Conditions:	Concrete Substrates Subject to Constant Immersion In Potable Water
4. Surface Preparation:	
a. General Considerations:	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
b. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP-6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete

Coating System Identification – INT-PWC-1

	surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified), it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP4 in accordance with ICRI 310.2R prior to coating application.
c. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats, or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate, and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b. Coating System Thickness:	50-60 mils dry film in addition to the parge coat.
c. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
d. Post Cure QC Testing:	Holiday Detection shall be performed over 100% of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 SF for verification purposes prior to commencing with production coating work), perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to be coated, if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75% of failure plane on back of load fixture within the concrete substrate.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – INT-PWC-1

e. Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6-to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 30-40 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – INT-PWC-2

1. Coating Material:	Aromatic Elastomeric Polyurethane
2. Surfaces:	Concrete
3. Service Conditions:	Concrete Substrates Subject to Constant Immersion In Potable Water
4. Surface Preparations:	
a. General Considerations:	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
b. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length.

Coating System Identification – INT-PWC-2

	Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP-6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP4 in accordance with ICRI 310.2R prior to coating application.
c. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate, and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b. Coating System Thickness:	50-60 mils dry film in addition to the parge coat.
c. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
d. Post Cure QC Testing:	Holiday Detection shall be performed over 100% of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (Do mock-up of 200 square feet for verification purposes prior to commencing with production coating work),perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to

Coating System Specification Sheets (COATSPEC)

Coating System Identification – INT-PWC-2

	be coated, if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75% of failure plane on back of load fixture within the concrete substrate.
e. Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6-to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 30-40 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Identification – INT-PWC-3

1. Coating Material:	Amine Cure Epoxy with Embedded Fiberglass Matt Reinforcement
2. Surfaces:	Concrete
3. Service Conditions:	Concrete Substrates Subject to Constant Immersion In Potable Water for Membrane Filtration Systems
4. Surface Preparations:	
a. General Considerations:	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
b. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be

		removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP-6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, a complete skim coat of the specified filler surfacer shall be applied over all concrete surfaces and all bugholes (air voids) shall be completely filled using this same material. The filler/surfacer material shall be applied as a complete parge coat of the substrate. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP4 in accordance with ICRI 310.2R prior to coating application.
	c. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5.	Field Application:	
	a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids and create a complete parge coat of the prepared substrate. This parge coat shall completely fill all bugholes and voids in the substrate, and will also completely cover the substrate unless specified otherwise above such filled voids by 1/8 inch (125 mils) of thickness. Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
	b. Coating System Thickness:	100-125 mils dry film including Fiberglass Matt, in addition to the parge coat. System installation as per manufactures instructions as the systems application varies between manufacturers.
	c. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
	d. Post Cure QC Testing:	Holiday Detection shall be performed over 100% of the coated surface area to identify any holidays or pinholes which could compromise coating system performance. Holiday testing to be performed after application and adequate cure of the spray applied epoxy coating material. Holiday detection shall be performed in accordance with ASTM D4787. Acceptance Criteria for Holiday Detection is no pinholes or holidays. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (Do mock-up of 200 square feet for verification purposes prior to commencing with production coating work),perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D7234. The target acceptance criteria are average of pull-off values of 250 psi, but actual acceptable value to be established by ASTM C1583 tests performed on substrate as required above. The coating system

	adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to be coated, if that is greater. The acceptance criteria for coating pull-off adhesion testing shall also be failure plane percentage of minimum of 75% of failure plane on back of load fixture within the concrete substrate.
e. Pinhole, Holiday or Defect Repair Procedure:	Pinholes and holidays identified by Holiday Detection shall be repaired as follows: • Using a grinder or other suitable power tool, remove the coating system at all pinholes or holidays in an area at least 2 inches in diameter or in both dimensions around the defect back to the concrete substrate. • Chip out and remove the concrete to expose the full dimensions in all 3 directions of the air void responsible for the defect. • Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6-to 8-mil profile in the intact coating system. • Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. • Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. • Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. • Apply the coating system in the number of coats necessary to achieve the specified 30-40 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-PWC-1

1. Coating Material:	Acrylic Elastomeric
2. Surfaces:	Concrete
3. Service Conditions:	Concrete Substrates Subject to Exterior Exposures and UV
4. Surface Preparations:	
a. General Considerations:	All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. If wet abrasive or water jetting surface preparation methods were used, the concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) for at least 5 days prior to coating application. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. b. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP-6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, repair all bugholes and voids that will be visible through the dried film using the specified filler surfacer. The filler surfacer shall be applied to a smooth transition to sound existing concrete with no obvious protruding edges. If the parge coat (filler/surfacer material is non-polymer modified), it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP2-3 in accordance with ICRI 310.2R prior to coating application.
c. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids. All bugholes and voids in the substrate shall be filled so they are not visible through the dried coating film. Note to Specifier: If the project is retrofit of existing structures and concrete restoration is deeper than 1/4 inch (covered by Filler/Surfacer Parge Coats), specify here the deeper restoration mortar from the CSM compatible with the coating system that can be used to restore concrete to depths up to 2 inches (between 1/4 inch and 2 inches). Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b. Prime Coat	1 Coat at 6-8 mils DFT.
c. Finish Coat	1 Coat at 6-8 mils DFT.
d. Coating System Thickness:	Total System 12-16 mils DFT.
e. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-PWC-1

f. Post Cure QC Testing:	Acceptance Criteria for Exterior Surfaces-Surfaces shall be free of bugholes and voids and the coating film will be applied in a continuous manner with full coverage over previous coats. The dried film will be free of runs, sags, drips, debris in film and excessive roller nap and brush strokes. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (DO MOCK-UP of 200 SF for verification purposes prior to commencing with production coating work). Perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D3359 Method A-X Cut. The target acceptance criteria are an average of 4A or better. The coating system adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to be coated if that is greater.
g. Defect Repair Procedure:	Runs, Sags and Drips-Aggressively abrade, sand, or scrape to remove the defective coating in the area. Abrade the intact coating system surface at least 3 inches beyond the removal area in all directions to remove the produce a uniform profile in the intact coating system suitable to the directions provided on the CSM product data sheets. Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. Apply the coating system in the number of coats necessary to achieve the specified 50-60 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-PWC-2

1. Coating Material:	Acrylic

	adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. Alternatively, the prepared substrate can be thoroughly washed down with potable water to remove all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
b. Concrete:	New concrete surfaces shall be allowed to cure for at least 28 days and allowed to dry to the moisture content recommended by the CSM. Moisture content shall be tested as specified herein in 3.09. Except as otherwise specified, loose concrete, form oils, surface hardeners, curing compounds, and laitance shall be removed from surfaces by abrasive blasting surface or ultrahigh pressure water jetting. Large voids or spalls and cracks shall be repaired as specified in the CSM's Crack Treatment Details. Surface Preparation must open up all shelled over air voids or bugholes to expose fully the void's depth, width, and length. Concrete shall be abraded to achieve a uniform minimum concrete surface profile of CSP-6 in accordance with ICRI 310.2R. Surface preparation must produce minimum concrete surface pH of 9.0. After surface preparation has been accepted, repair all bugholes and voids that will be visible through the dried film using the specified filler surfacer. The filler surfacer shall be applied to a smooth transition to sound existing concrete with no obvious protruding edges. If the parge coat (filler/surfacer material is non-polymer modified, it must be brush blast cleaned following adequate cure per CSM's instructions to produce a uniform anchor pattern of CSP 1-2 in accordance with ICRI 310.2R prior to coating application.
c. Masonry:	Masonry surfaces shall be allowed to cure for at least 28 days after being constructed and be allowed to dry to the moisture content recommended by the CSM. Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure for at least 28 days. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, masonry surfaces shall be sealed or filled with a sealer or block filler compatible with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes and voids. All bugholes and voids in the substrate shall be filled so they are not visible through the dried coating film. Note to Specifier: If the project is retrofit of existing structures and concrete restoration is deeper than 1/4 inch (covered by Filler/Surfacer Parge Coats), specify here the deeper restoration mortar from the CSM compatible with the coating system that can be used to restore concrete to depths up to 2 inches (between 1/4 inch and 2 inches). Drying time between coats shall be as specified by the CSM for the site conditions. If the maximum recoat time is exceeded, surface preparation shall require solvent washing, light abrasive blasting, or other procedures per CSM's instructions.
b. Prime Coat	1 coat at 1.5-2.0 mils DFT.
c. Finish Coat	1 coat at 1.5-2.0 mils DFT.
d. Coating System Thickness:	Total System Thickness 3.0-4.0 mils DFT.
e. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-PWC-2

f. Post Cure QC Testing:	Acceptance Criteria for Exterior Surfaces-Surfaces shall be free of bugholes and voids and the coating film will be applied in a continuous manner with full coverage over previous coats. The dried film will be free of runs, sags, drips, debris in film and excessive roller nap and brush strokes. Perform Adhesion Testing on concrete substrate after surface preparation prior to resurfacing mortar application in accordance with ASTM C1583. Perform at 10 representative locations (3 tests per location) to determine the tensile strength of the concrete substrate. Acceptance Criteria shall be minimum average target pull-off tensile strength of 250 psi. Based on the average ASTM C1583 test values, the acceptance criteria for tensile pull-off strength for coating adhesion can be established. When coating system mock-up application has been performed (Do mock-up of 200 square feet for verification purposes prior to commencing with production coating work), perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D3359 Method A-X Cut. The target acceptance criteria are an average of 4A or better. The coating system adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to be coated if that is greater.
g. Defect Repair Procedure:	Runs, Sags and Drips-Aggressively abrade, sand, or scrape to remove the defective coating in the area. Abrade the intact coating system surface at least 3 inches beyond the removal area in all directions to remove the produce a uniform profile in the intact coating system suitable to the directions provided on the CSM product data sheets. Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. Apply the coating system in the number of coats necessary to achieve the specified 3.0-4.0 mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-OCC-1

1. Coating Material:	Acrylic Elastomeric
2. Surfaces:	Previously Painted/Coated Concrete
3. Service Conditions:	Concrete Substrates Subject to Exterior Exposures and UV
4. Surface Preparations:	
a. General Preparations:	Prior to proceeding with coating applications, it is imperative to perform adhesion testing and compatibility testing on the existing coating to assess the existing condition of the surface. Perform adhesion testing of coating system of the existing coating in accordance with ASTM D3359 Method A-X Cut. The target acceptance criteria are an average of 4A or better. Adhesion testing should be performed on a representative area of each surface to be coated (roof, walls etc.). All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be

	submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to produce one at no additional cost to the Owner, the Engineer, or any other party. The surface shall be prepared using Low Pressure Water Cleaning (LPWC) with a minimum pressure of 3,500 psi using a spin jet nozzle. Wet abrasive/Vapor Blasting or water jetting surface preparation methods can be used if deemed necessary for certain aspects of the project. The concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) until suitable substrate conditions exist as per the CSM's Technical Data Sheets for the application of primers or coatings. The exception to this is when filler/surfacers or mortars require pre-wetted substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. The prepared substrate shall be free of all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
b. Concrete:	Only tightly adherent existing material is allowed to remain on the surface after surface preparation. Tightly adherent coatings shall be identified by using the "Dull Putty Knife" Method. Areas where existing coating has been removed, either to bare concrete or to a previous tightly adherent layer shall have all edges feathered using the appropriate grit of sandpaper to create a gradual and smooth transition to the next layer. Special attention shall be given to ensure all edges of existing coating are tightly adhered and locked down. Edges that show lifting after the application of primers, intermediate or finish coats shall be further prepared to eliminate all chances of lifting or peeling. After surface preparation has been accepted, repair all bugholes and voids that will be visible through the dried film using the specified filler surfacer. The filler surfacer shall be applied to a smooth transition to sound existing concrete with no obvious protruding edges. Large cracks (>1/8 inch) shall be filled using the specified cementitious or epoxy-based filler material as per the CSM's instructions. The filler material shall be sufficiently dried as per the CSM's instructions prior to application of primer. Cracks <1/8 inch can be filled using a polyurethane sealant provided by the CSM. The Polyurethane Sealant shall be installed in a neat manner and struck flush with the surface. Surface preparation must produce minimum concrete surface pH of 9.0 on any bare concrete exposed during surface preparation. Bare concrete shall have a minimum surface profile of CSP 1-2 in accordance with ICRI 310.2R prior to coating application. After cleaning, concrete surfaces shall be sealed with the specified primer.
c. Masonry:	Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure sufficiently as per CSM's instructions before the application of primers or coatings. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, bare masonry surfaces shall be sealed with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes, voids and cracks. All bugholes and voids in the substrate shall be filled so they are not visible through the dried coating film.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-OCC-1

	Drying time between coats shall be as specified by the CSM for the site conditions.
b. Coating System Thickness:	Spot Prime all bare concrete and masonry surfaces to a DFT of 2-3 mils. Minimum 2 finish coats at 6-8 mils per coat dry film in addition to the primer and filler material.
c. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
d. Post Cure QC Testing:	Acceptance Criteria for Exterior Surfaces-Surfaces shall be free of bugholes and voids and the coating film will be applied in a continuous manner with full coverage over previous coats. The dried film will be free of runs, sags, drips, debris in film and excessive roller nap and brush strokes. When coating system mock-up application has been performed (DO MOCK-UP of 200 SF for verification purposes prior to commencing with production coating work), perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D3359 Method A-X Cut. The target acceptance criteria are an average of 4A or better. The coating system adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to be coated if that is greater.
e. Defect Repair Procedure:	Runs, Sags and Drips-Aggressively abrade, sand, or scrape to remove the defective coating in the area. Abrade the intact coating system surface at least 3-inches beyond the removal area in all directions to remove the produce a uniform profile in the intact coating system suitable to the directions provided on the CSM product data sheets. Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. Apply the coating system in the number of coats necessary to achieve the specified mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

Coating System Specification Sheets (COATSPEC)

Coating System Identification – EXT-OCC-2

1. Coating Material:	Acrylic
2. Surfaces:	Previously Painted/Coated Concrete
3. Service Conditions:	Concrete Substrates Subject to Exterior Exposures and UV
4. Surface Preparations:	
a. General Considerations:	Prior to proceeding with coating applications, it is imperative to perform adhesion testing and compatibility testing on the existing coating to assess the existing condition of the surface. Perform Adhesion Testing of coating system of the existing coating in accordance with ASTM D3359 Method A-X Cut. The target acceptance criteria are an average of 4A or better. Adhesion testing should be performed on a representative area of each surface to be coated (roof, walls etc.). All coating termination and transition details shall be prepared in accordance with the CSM's standard detail drawings. This includes coating termination details, coating transitions at vertical and vertical to horizontal corners, coating terminations at joints, concrete crack treatment, coating terminations at metal embedments in the concrete substrate, and other details. The CSM's standard detail drawings shall be submitted for all such coating applications. If standard details are not available for a given detail treatment, the CSM shall be required to

	produce one at no additional cost to the Owner, the Engineer, or any other party. The surface shall be prepared using Low Pressure Water Cleaning (LPWC) with a minimum pressure of 3,500 psi using a spin jet nozzle. Wet abrasive/Vapor Blasting or water jetting surface preparation methods can be used if deemed necessary for certain aspects of the project. The concrete substrate shall be allowed to dry under warm conditions (minimum of 75 degrees F) until suitable substrate conditions exist as per the CSM's Technical Data Sheets for the application of primers or coatings. The exception to this is when filler/surfacers or mortars require pre-wetted (SSD) substrates to assure proper adhesion. Following surface preparation work and dry-out, all surfaces to be coated shall be vacuum cleaned to remove all loose dirt, dust, or other loose materials. The prepared substrate shall be free of all loose debris, dust, and other materials leaving a clean sound substrate that is dust-free.
b. Concrete:	Only tightly adherent existing material is allowed to remain on the surface after surface preparation. Tightly adherent coatings shall be identified by using the "Dull Putty Knife" Method. Areas where existing coating has been removed, either to bare concrete or to a previous tightly adherent layer shall have all edges feathered using the appropriate grit of sandpaper to create a gradual and smooth transition to the next layer. Special attention shall be given to ensure all edges of existing coating are tightly adhered and locked down. Edges that show lifting after the application of primers, intermediate or finish coats shall be further prepared to eliminate all chances of lifting or peeling. After surface preparation has been accepted, repair all bugholes and voids that will be visible through the dried film using the specified filler surfacer. The filler surfacer shall be applied to a smooth transition to sound existing concrete with no obvious protruding edges. Large cracks (>1/8 inch) shall be filled using the specified cementitious or epoxy-based filler material as per the CSM's instructions. The filler material shall be sufficiently dried as per the CSM's instructions prior to application of primer. Cracks <1/8 inch can be filled using a polyurethane sealant provided by the CSM. The Polyurethane Sealant shall be installed in a neat manner and struck flush with the surface. Surface preparation must produce minimum concrete surface pH of 9.0 on any bare concrete exposed during surface preparation. Bare concrete shall have a minimum surface profile of CSP 1-2 in accordance with ICRI 310.2R prior to coating application. After cleaning, concrete surfaces shall be sealed with the specified primer.
c. Masonry:	Holes or other joint defects shall be filled with a material compatible with the primers and finish coats or shall be filled with masonry mortar that shall cure sufficiently as per CSM's instructions before the application of primers or coatings. Loose or splattered mortar shall be removed by scraping and chipping. Masonry surfaces shall be tested for moisture content in accordance with the CSM's recommendations. Masonry surfaces shall be cleaned with clear water by washing and scrubbing to remove foreign and deleterious substances. Muriatic acid shall not be used. After cleaning, bare masonry surfaces shall be sealed with the specified primer.
5. Field Application:	
a. General:	Surfacer or filler shall be applied per CSM's recommendations prior to application of coating to fill all bugholes, voids and cracks. All bugholes and voids in the substrate shall be filled so they are not visible through the dried coating film. Drying time between coats shall be as specified by the CSM for the site conditions.

Coating System Specification Sheets (COATSPEC)	
Coating System Identification – EXT-OCC-2	
b. Coating System Thickness:	Spot Prime all bare concrete & masonry surfaces to a DFT of 1.5 -2 mils. 2 finish coats may be required at 1.5-2.0 mils per coat dry film in addition to the primer and filler material to achieve uniform coverage.
c. Routine QC Inspection Tasks:	Refer to Tables in 3.09 of this Section.
d. Post Cure QC Testing:	Acceptance Criteria for Exterior Surfaces-Surfaces shall be free of bugholes and voids and the coating film will be applied in a continuous manner with full coverage over previous coats. The dried film will be free of runs, sags, drips, debris in film and excessive roller nap and brush strokes. When coating system mock-up application has been performed (DO MOCK-UP of 200 SF for verification purposes prior to commencing with production coating work). Perform Adhesion Testing of coating system on mock-up area (6 tests total) in accordance with ASTM D3359 Method A-X Cut. The target acceptance criteria are an average of 4A or better. The coating system adhesion tests shall be performed at least at one location for every 1,000 SF of area to be coated and be performed at areas representative of the entire area to be coated if that is greater.
e. Defect Repair Procedure:	Runs, Sags and Drips-Aggressively abrade, sand, or scrape to remove the defective coating in the area. Abrade the intact coating system surface at least 3 inches beyond the removal area in all directions to remove the produce a uniform profile in the intact coating system suitable to the directions provided on the CSM product data sheets. Vacuum clean the prepared area to remove all dust, dirt, etc. leaving clean sound surfaces. Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area. Using a putty knife or other suitable tool, fill the opened void with the approved filler/surfacer material completely and strike-off. Allow to cure per CSM's recommendations. Apply the coating system in the number of coats necessary to achieve the specified mils DFT over the defect and coating removal areas and feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline. Allow to cure properly.

3.08 FINISH SCHEDULE

A. Refer to 09 90 00 for the Finish Schedule.

3.09 ROUTINE QUALITY CONTROL INSPECTION/TESTING REQUIREMENTS

A. The routine QC inspection tasks and tests listed below are required for all standard High Performance Coating Systems covered in this Section. All findings to be compared for compliance with this Section and the referenced product data sheets from the CSM. All of the QC tasks/tests listed below are to be included in the Contractor's QC Testing and Inspection Plan as required in this Section and documented on Form 09 97 00 A and/or 09 97 00 B. The frequency of any test or inspection task may need to be adjusted based upon consistent or inconsistent quality results. Key tests/verifications are that required for 100% all surfaces. Measurement/testing should be adjusted as required to confirm 100% of the coating is in compliance with the requirements.

Routine Quality Control Inspection/Testing Requirements Table

Inspection Task or Test	Referenced Standard or Practice	Acceptance Criteria	Frequency of Test or Inspection Task
Inspect compressed air to be free of oil and moisture.	ASTM D4285	Free of Oil and Moisture	Every 2 hours per shift worked.
Check pressure gauge for water jetting or test pressure for abrasive blast cleaning compressed air.	Needle Gage No Standard	As Specified	Every 4 hours per shift worked.
Measure ambient air and substrate temperature.	Electronic Hygrometer Positector or Elcometer DPM	As per CSM Product data Sheets	Every 2 hours per shift worked.
Measure relative humidity and dew point of air in coating area.	Electronic Hygrometer Positector or Elcometer DPM	Surface Temperature 5°F above the Dew Point and Stabilized	Every 2 hours per shift worked.
Test concrete substrate for moisture.	Phase 1- ASTM D4263 (Qualitative) Phase 2 (If Moisture Present) – ASTM F1869 or ASTM F2170	ASTM F1869-<3lbs per 1000 Sq Ft/24 Hrs ASTM F2170 70% RH or less	Twice per shift worked and prior to coating application.
Inspect steel or other ferrous metals for Degree of Cleanliness in Carbon Steels.	SSPC VIS-1 (ASTM D2200) SSPC VIS-3 SSPC VIS-4 SSPC VIS-5	As per the Specification	All surfaces checked prior to coating – 100% surface in compliance as per SSPC SP standards
Cast and Ductile Iron Degree of Cleanliness.	NAPF 500-03 NAPF 500-03-04 NAPF 500-03-05	As per the Specification	All surfaces checked prior to coating – 100% surface in compliance as per SSPC SP standards
Inspect steel or other ferrous Metals for degree of dust left on the surface.	ISO 8502-3	Dust Rating 1 Dust Particle Size 0	100% of all surfaces checked prior to coating.
Metal Surface Profile of Steel – Abrasive Blast cleaned.	ASTM D4417 Method A or C (Same for ductile and cast iron and stainless steel)	As per the Specification	100% surface in compliance with manufacturers surface profile requirements
Inspect Concrete Surface Profile by Comparison to Replicas.	ICRI 310.2R	As per the Specification	100% surface in compliance with manufacturers surface profile requirements.
Inspect Concrete for Soundness with Hammer Testing	N/A	No Hollow Concrete Areas	Check for soundness visually 100% and hammer test every 10 sq ft or where cracked or loose concrete is apparent visually.
Inspect Surface pH of Prepared Concrete.	ASTM D4262	Min 9 pH	Every 100 sq. ft to be coated.
Calculate Coverage of Filler/Surfacers or Mortars based on CSM's Coverage Robes and Measure Thickness with Needle or Calibrated Wire.	N/A	As per Specification	For all surfaces to be surfaced and filled with parge coat of mortar.
Measure WFT of Coatings Over Metal.	ASTM D4414	As per CSM Product Data Sheets	Every 10 sq ft to be coated.
Measure WFT of Coatings Over Parge Coats – Troweled Over	ASTM D4414	As per CSM Product Data Sheets	Every 10 sq ft to be coated.

Routine Quality Control Inspection/Testing Requirements Table

Inspection Task or Test	Referenced Standard or Practice	Acceptance Criteria	Frequency of Test or Inspection Task
Concrete or Masonry.			
Visually Inspect All Coating Film for Film Quality e.g. Pinholes, Holidays, Runs, Sags, etc.	N/A	Pinhole Free surface and free of runs and sags	100% of all surfaces to be coated.
Measure DFT of Coatings on Ferrous Metals.	SSPC PA2 Level 3	As Specified	As prescribed by SSPC PA2
Measure DFT of Coatings on Concrete Substrates.	SSPC PA9 Level 3	As Specified	As prescribed by SSPC PA9
Discontinuity Testing (Holiday Detection) on Metal Surfaces.	ASTM D5162 >- 20 mils Method B < - 20mils Method A	Pinhole Free Surface	Addressed in Applicable COATSPECS
Discontinuity Testing (Holiday Detection) on Concrete Substrates.	ASTM D4787	Pinhole Free Surface	Addressed in Applicable COATSPECS
Adhesion Testing on Metallic Substrates.	ASTM D4541	800 psi Min	Addressed in Applicable COATSPECS
Adhesion Testing on Concrete Substrates.	ASTM C4583 ASTM D7234	250 Psi Min	Addressed in Applicable COATSPECS
Reinspect for Rework from all Non-Compliant Issues Identified from QC Inspection listed above.	N/A	Meets all Specified standards	As needed.

3.10 OPTIONAL OWNER QUALITY ASSURANCE REVIEW

A. General:
   1. Inspection by the Owner or others does not limit the Contractor's or CSA's responsibilities for quality workmanship or sole responsibility for QC as specified by this Section or as required by the CSM's instructions. Inspection by the Owner is optional and is additional to any inspection required to be performed by the Contractor.
   2. The Owner may perform, or contract with an inspection agency to perform, QA inspection and testing of the coating work covered by this Section. These inspections may include the following:
      a. Inspect materials upon receipt to ensure that all are supplied by the same CSM.
      b. Inspect to verify that specified storage conditions for the coating system materials, solvents, and abrasives are provided.
      c. Inspect and record findings for the degree of cleanliness of substrates.
      d. Inspect and record the pH of concrete and metal substrates.
      e. Inspect and record substrate profile (anchor pattern).
      f. Measure and record ambient air and substrate temperature.
      g. Measure and record relative humidity.
      h. Check for the presence of substrate moisture in the concrete.

i. Inspect to verify that correct mixing of coating system materials is performed in accordance with CSM's instructions.

j. Inspect, confirm, and record that the "pot life" of coating system materials is not exceeded during installation. Inspect to verify that recoat limitations for coating materials are not exceeded.

k. Perform adhesion testing.

l. Measure and record the thickness of the coating system.

m. Inspect to verify proper curing of the coating system in accordance with the CSM's instructions.

n. Limited visual observations for defects.

3.11 FINAL INSPECTION

A. General

1. Contractor shall conduct a final inspection to determine whether coating system work meets the requirements of the specifications.
2. The Construction Manager or Owner's Representative will subsequently conduct a final observation with the Contractor to observe the completed work.
3. Any obvious defects or non-conforming work shall be marked. Such areas shall be recleaned and repaired as specified at no additional cost to the Owner.

09 97 00-A STEEL PW COATING SYSTEM QUALITY CONTROL CHECKLIST

Project Name

Owner		**Coating System Manufacturer Technical CTR**	
General Contractor (GC)		**Coating System Applicator (CSA)**	
Area or Structure		**Location within Structure**	
Coating System (e.g., INT PWS#1)		**Coating Type (e.g., Epoxy, etc.)**	

Coating System Quality Control Checklist

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
1	Completion of pre-cleaning and substrate decontamination prior to abrasive blast cleaning	Surface free of all oil, grease and all other foreign contaminants.				
2	Soluble Chloride Testing	Max 30 micro siemens as per ISO 8502-6/8502-9	GC QC			
			CTR QC			
			CSA QC			
3	Ensuring compressed air for abrasive blasting or coating/lining application is free of oil and moisture	ASTM D4285- Free of all oil & moisture	GC QC			
		1 blotter test per 2 hours of compressed air usage	CTR QC			
			CSA QC			
4	Installation of protective enclosure of structure or area and protection of adjacent surfaces or structures that are not to be coated.	Conforms to SSPC Guide 6 Guidelines and specification requirements.	GC QC			
			CTR QC			
			CSA QC			
5	Completion of ambient condition control in structure or building area and acceptance of ventilation methods in structure or Area.	Substrate minimum of 5 degrees above the dew point and stabilized.	GC QC			
		Recording ambient conditions, a minimum of 4 times per shift/day at 2-hour intervals	CTR QC			
		Negative pressure of enclosure. Visual inspection of enclosure tarps indicating negative pressure.	CSA QC			
6	Check pressure gauge for water jetting or test pressure for	As Specified	GC QC			
			CTR QC			

Step	Description	Acceptance Criteria	Parties	Name	Signature	Date
	abrasive blast cleaning compressed air.		CSA QC			
7	Interior Tank Steel - Completion of Surface Preparation for Interior lining applications.	SSPC-SP10/NACE#2 (CS)	GC QC			
		NAPF 500-03 (04&05)	CTR QC			
		ASTM D4417 Method C- Surface Profile ?_mils	CSA QC			
8	Steel- Dust Level Testing- After surface preparation and prior to application of primers/coatings	ISO 8502-3 (Part 3)	GC QC			
		Dust Rating-1	CTR QC			
		Dust Particle Size - 0	CSA QC

END OF SECTION

SECTION 10 14 00

SIGNAGE

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies informational and accident prevention signs.

1.02 OPERATING AND DESIGN REQUIREMENTS

A. General:
   1. Accident prevention signs shall conform as to design with OSHA Section 1910.145 of Subpart J, Part 1910, Chapter XVII, Title 29 of the Code of Federal Regulations. Exit signs shall conform with Section 1910.37(g) of the OSHA Safety and Health Standard for General Industry, Article 10, Section 10.113 of the Uniform Fire Code, and where applicable with local fire regulations.
   2. In addition to the signs identified on the schedule in Part 3 of this section, the following shall be provided:
      a. Exit signs shall be provided in accordance with Section 26 50 00.
      b. "Caution Automatic Equipment May Start at Any Time" signs shall be provided in accordance with paragraph 43 05 11-2.07.

B. Design Requirements:
   1. Size:
      a. Sign size shall be as follows:
         1) 14 inch x 20 inch
         2) 10 inch x 14 inch
         3) 7 inch x 10 inch
   2. Type:
      a. The sign type shall be as follows:

Type	Message
[	
	]

PART 2 PRODUCTS

2.01 GENERAL

A. Sign lettering shall be single stroke and shall contrast in color with the background. For those messages for which there are international symbols, the international symbols shall be used. Chain mounted signs shall have lettering on both sides.

2.02 MATERIALS

A. Signs shall be 0.100-inch thick fiberglass with embedded fadeproof legends.

PART 3 EXECUTION

3.01 GENERAL

A. Signs shall be distributed as follows:

Location	Number	Size	Message	Mount
[				
				]

END OF SECTION

SECTION 10 28 00

TOILET, BATH, AND LAUNDRY ACCESSORIES

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Public-use washroom accessories.
   2. Underlavatory guards.
   3. Custodial accessories.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Samples: For each exposed product and for each finish specified, full size.
   1. Approved full-size Samples will be returned and may be used in the Work.

C. Delegated Design Submittal: For grab bars.
   1. Include structural design calculations indicating compliance with specified structural-performance requirements.

1.03 INFORMATIONAL SUBMITTALS

A. Sample warranties.

1.04 CLOSEOUT SUBMITTALS

A. Maintenance data.

B. Warranties.

1.05 WARRANTY

A. Manufacturer's Special Warranty for Mirrors: Manufacturer agrees to repair or replace mirrors that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Structural Performance: Design accessories and fasteners to comply with the following requirements:
   1. Grab Bars: Installed units are able to resist 250 lbf concentrated load applied in any direction and at any point.

C. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   a. ASI-American Specialties, Inc.
   b. Bobrick Washroom Equipment, Inc.
   c. Bradley Corporation.
   d. Or approved equal.

2.02 PUBLIC-USE WASHROOM ACCESSORIES

A. Toilet Tissue (Roll) Dispenser:
   1. Description: Double-roll dispenser.
   2. Mounting: Surface mounted.
   3. Operation: Non-control delivery with standard spindle.
   4. Capacity: Designed for 4-1/2- or 5-inch- diameter tissue rolls.
   5. Material and Finish: Stainless steel, ASTM A480/A480M No. 4 finish (satin).

B. Combination Towel (Folded) Dispenser/Waste Receptacle:
   1. Description: Combination unit for dispensing C-fold or multifold towels, with removable waste receptacle.
   2. Mounting: Surface mounted.
   3. Minimum Towel-Dispenser Capacity: 600 C-fold or 800 multifold paper towels.
   4. Minimum Waste-Receptacle Capacity: 4 gal.
   5. Material and Finish: Stainless steel, ASTM A480/A480M No. 4 finish (satin).
   6. Liner: Reusable, vinyl waste-receptacle liner.
   7. Lockset: Tumbler type for towel-dispenser compartment.

C. Soap Dispenser:
   1. Description: Designed for manual operation and dispensing soap in liquid or lotion form.
   2. Mounting: Vertically oriented, surface mounted.
   3. Lockset: Tumbler type.
   4. Refill Indicator: Window type.

D. Grab Bar:
   1. Mounting: Flanges with concealed fasteners.
   2. Material: Stainless steel, 0.05 inch thick.
      a. Finish: Smooth, ASTM A480/A480M No. 4 finish (satin).
   3. Outside Diameter: 1-1/2 inches.
   4. Configuration and Length: As indicated on Drawings.

E. Mirror Unit:
   1. Frame: Stainless steel angle, 0.05 inch thick.
      a. Corners: Welded and ground smooth.
   2. Size: As indicated on Drawings.
   3. Shelf:
      a. Type: Integral, welded.
      b. Depth: 5 inches.
   4. Hangers: Manufacturer's standard rigid, tamper and theft resistant.

F. Hook:
   1. Description: Double-prong unit.
   2. Mounting: Exposed.
   3. Material and Finish: Stainless steel, ASTM A480/A480M No. 4 finish (satin).

2.03 UNDERLAVATORY GUARDS

A. Under-lavatory Guard:
   1. Description: Insulating pipe covering for supply and drain piping assemblies that prevents direct contact with and burns from piping; allow service access without removing coverings.
   2. Material and Finish: Antimicrobial, molded plastic, white.

2.04 CUSTODIAL ACCESSORIES

A. Custodial Mop and Broom Holder:
   1. Description: Unit with shelf, hooks, holders, and rod suspended beneath shelf.
   2. Length: 36 inches.
   3. Hooks: Four.
   4. Mop/Broom Holders: Three, spring-loaded, rubber hat, cam type.
   5. Material and Finish: Stainless steel, ASTM A480/A480M No. 4 finish (satin).
      a. Shelf: Not less than nominal 0.05-inch-thick stainless steel.
      b. Rod: Approximately 1/4-inch-diameter stainless steel.

2.05 FABRICATION

A. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Owner's representative.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install accessories in accordance with manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.
   1. Remove temporary labels and protective coatings.

B. Grab Bars: Install to comply with specified structural-performance requirements.

END OF SECTION

SECTION 10 44 16

FIRE EXTINGUISHERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes portable, hand-carried fire extinguishers and mounting brackets for fire extinguishers.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.03 INFORMATIONAL SUBMITTALS

A. Warranty: Sample of special warranty.

1.04 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.05 COORDINATION

A. Coordinate type and capacity of fire extinguishers with fire-protection cabinets to ensure fit and function.

1.06 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace fire extinguishers that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Six years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."

B. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.

2.02 PORTABLE, HAND-CARRIED FIRE EXTINGUISHERS

A. Fire Extinguishers: Type, size, and capacity for each mounting bracket indicated.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Amerex Corporation.
      b. Ansul; brand of Johnson Controls International plc, Building Solutions North America.
      c. Babcock-Davis.
      d. Badger Fire Protection; a Carrier company.
      e. Guardian Fire Equipment, Inc.
      f. J. L. Industries, Inc.; Activar Construction Products Group, Inc.
      g. Kidde; Carrier Global Corporation.
      h. Larsen's Manufacturing Company.
      i. Nystrom, Inc.
      j. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B.

B. Multipurpose Dry-Chemical Type: UL-rated 4A:80B:C, 10 lb. nominal capacity, with monoammonium phosphate-based dry chemical in manufacturer's standard enameled container.

2.03 MOUNTING BRACKETS

A. Mounting Brackets: Manufacturer's standard galvanized steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated, with plated or red baked-enamel finish.

B. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Architect.
   1. Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.
      a. Orientation: Vertical.

PART 3 EXECUTION

3.01 INSTALLATION

A. Examine fire extinguishers for proper charging and tagging.
   1. Remove and replace damaged, defective, or undercharged fire extinguishers.

B. Install fire extinguishers and mounting brackets in locations indicated and in compliance with requirements of authorities having jurisdiction.

C. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.
   1. Mounting Height: Top of fire extinguisher to be at 42 inches above finished floor.

SECTION 10 51 13

METAL LOCKERS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Welded corridor lockers.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For metal lockers.
   1. Include plans, elevations, sections, and attachment details.
   2. Include locker identification system and numbering sequence.

C. Samples: For each color specified.

1.03 INFORMATIONAL SUBMITTALS

A. Sample warranty.

1.04 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.05 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of metal lockers that fail in materials or workmanship, excluding finish, within specified warranty period.
   1. Warranty Period for Welded Metal Lockers: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 WELDED CORRIDOR LOCKERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. ASI Storage Solutions.
   2. Lyon LLC.
   3. Olympus Lockers & Storage Products, Inc.
   4. Penco Products, Inc.
   5. Republic Storage Systems, LLC.

B. Doors: One piece; fabricated from 0.075-inch nominal-thickness steel sheet; formed into channel shape with double bend at vertical edges and with right-angle single bend at horizontal edges.
   1. Reinforcement: Manufacturer's standard reinforcing angles, channels, or stiffeners for doors more than 15 inches wide; welded to inner face of doors.
   2. Door Style: Vented panel as follows:

      a. Louvered Vents: No fewer than three louver openings at top and bottom for double-tier lockers.

C. Body: Assembled by welding body components together. Fabricate from unperforated steel sheet with thicknesses as follows:
   1. Tops, Bottoms, and Sides: 0.060-inch nominal thickness.
   2. Backs: 0.048-inch nominal thickness.
   3. Shelves: 0.060-inch nominal thickness, with double bend at front and single bend at sides and back.

D. Frames: Channel formed; fabricated from 0.060-inch nominal-thickness steel sheet; lapped and factory welded at corners; with top and bottom main frames factory welded into vertical main frames. Form continuous, integral, full-height door strikes on vertical main frames.

E. Hinges:
   1. Knuckle Hinges: Steel, full loop, five or seven knuckles, tight pin; minimum 2 inches high. Provide no fewer than three hinges for each door more than 42 inches high.
   2. Continuous Hinges: Manufacturer's standard, steel, full height.
   3. Hinges: Manufacturer's standard, steel, continuous or knuckle type.

F. Recessed Door Handle and Latch: Stainless steel cup with integral door pull, recessed so locking device does not protrude beyond door face; pry and vandal resistant.
   1. Multipoint Latching: Finger-lift latch control designed for use with built-in combination locks or padlocks; positive automatic latching and prelocking.

      b. Latch Hooks: Equip doors 48 inches and higher with three latch hooks and doors less than 48 inches high with two latch hooks; fabricated from 0.120-inch nominal-thickness steel sheet; welded to full-height door strikes; with resilient silencer on each latch hook.

      c. Latching Mechanism: Manufacturer's standard, rattle-free latching mechanism.

G. Identification Plates: Manufacturer's standard, etched, embossed, or stamped aluminum plates, with numbers and letters at least 3/8 inch high.

H. Hooks: Manufacturer's standard ball-pointed, aluminum or steel; zinc plated.

I. Coat Rods: Manufacturer's standard.

J. Continuous Zee Base: Fabricated from, manufacturer's standard thickness, but not less than 0.060-inch nominal-thickness steel sheet.
   1. Height: 4 inches.

K. Continuous Sloping Tops: Fabricated from 0.048-inch nominal-thickness steel sheet, with a pitch of approximately 20 degrees.
   1. Closures: Vertical-end type.

L. Filler Panels: Fabricated from 0.048-inch nominal-thickness steel sheet.

M. Finished End Panels: Fabricated from 0.024-inch nominal-thickness steel sheet to cover unused penetrations and fasteners, except for perimeter fasteners, at exposed ends of nonrecessed metal lockers; finished to match lockers.

N. Materials:
   1. Cold-Rolled Steel Sheet: ASTM A1008/A1008M, Commercial Steel (CS), Type B, suitable for exposed applications.
   2. Metallic-Coated Steel Sheet: ASTM A653/A653M, Commercial Steel (CS), Type B; with A60 zinc-iron, alloy (galvannealed) coating designation.

O. Finish: Baked enamel or powder coat.
   1. Color: As selected by Architect from manufacturer's full range.

2.02 FABRICATION

A. Fabricate metal lockers square, rigid, without warp, and with metal faces flat and free of dents or distortion. Make exposed metal edges safe to touch and free of sharp edges and burrs.

B. Fabricate each metal locker with an individual door and frame; individual top, bottom, and back; and common intermediate uprights separating compartments.

C. Equipment: Provide each locker with an identification plate and the following equipment:
   1. Double-Tier Units: One double-prong ceiling hook and two single-prong wall hooks.

D. Welded Construction: Factory preassemble metal lockers by welding all joints, seams, and connections; with no bolts, nuts, screws, or rivets used in assembly of main locker groups. Factory weld main locker groups into one-piece structures. Grind exposed welds smooth and flush.

E. Continuous Zee Base: Fabricated in lengths as long as practical to enclose base and base ends; finished to match lockers.

F. Continuous Sloping Tops: Fabricated in lengths as long as practical, without visible fasteners at splice locations; finished to match lockers.

G. Filler Panels: Fabricated in an unequal leg angle shape; finished to match lockers. Provide slip-joint filler angle formed to receive filler panel.

H. Finished End Panels: Fabricated to conceal unused penetrations and fasteners, except for perimeter fasteners, at exposed ends of nonrecessed metal lockers; finished to match lockers.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install lockers level, plumb, and true; shim as required, using concealed shims.
   1. Anchor locker runs at ends and at intervals recommended by manufacturer, but not more than 36 inches o.c. Using concealed fasteners, install anchors through backup reinforcing plates, channels, or blocking as required to prevent metal distortion.
   2. Anchor single rows of metal lockers to walls near top and bottom of lockers.

B. Welded Lockers: Connect groups together with manufacturer's standard fasteners, with no exposed fasteners on face frames.

C. Trim: Fit exposed connections of trim, fillers, and closures accurately together to form tight, hairline joints, with concealed fasteners and splice plates.
   1. Attach recess trim to recessed metal lockers with concealed clips.
   2. Attach filler panels with concealed fasteners.
   3. Attach sloping-top units to metal lockers, with closures at exposed ends.
   4. Attach finished end panels using fasteners only at perimeter to conceal exposed ends of nonrecessed metal lockers.

END OF SECTION

SECTION 13 33 13

GEODESIC DOMES

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies design, fabrication, and erection of aluminum geodesic dome covers on clarifier, connections, sealing system to existing wall, access and associated details to support ducts and other equipment illustrated on the Drawings.

B. Type:

1. The covers shall be all aluminum, fully triangulated space trusses with noncorrugated closure panels, and shall be substantially air-tight as noted below. Covers shall be clear-span domes designed to be self-supported with integral tension and compression rings. The integral tension ring at the perimeter of the cover shall resist all gravity lateral loads and ensure that only vertical gravity reactions are transmitted to the structure. Wind and seismic lateral forces may be transmitted primarily as shear, along with vertical component from overturning and/or wind uplift. Loads may only be transmitted to the existing structure at the top of tank walls as shown on the Drawings.
2. The aluminum closure panels shall be attached continuously along their edges to the structural members by batten bars which engage the panels in an interlocking joint. The batten bars shall also secure a gasket along the panel edge to form a continuous water-tight surface over the entire dome structure. The use of panel attachment fasteners which penetrate both the panel and the flange of the structural member is expressly prohibited. The dome covers shall be provided with a substantially airtight membrane seal between the tank wall and the cover panels.

C. Unit Responsibility

1. The responsible manufacturer shall coordinate selection and design of all system components, and either install same or approve installer, such that all equipment furnished under the specification for the geodesic dome system, including items specified elsewhere but referenced in the specification, are compatible and operate properly to achieve the performance requirements specified. Agents, representatives or other entities who are not a direct component of the manufacturing corporation will not be acceptable as a substitute for the manufacturer's corporation in meeting this requirement. This requirement for unit responsibility shall in no way relieve the Contractor of his responsibility to the Owner for performance of all systems.
2. The Contractor shall assure that all geodesic dome systems provided for the project are products for which unit responsibility has been accepted by the responsible manufacturer. Unit Responsibility Certificate shall conform to the content, form and style of Form 43 05 11-C specified in Section 01 99 90, shall be signed by an officer of the manufacturer's corporation and shall be notarized. No other submittal material will be processed until a Certificate of Unit Responsibility has been received and has been found to be satisfactory. Failure to provide acceptable proof that the unit responsibility requirement has been satisfied will result in withholding approval of progress payments for the subject equipment even though the equipment may have been installed in the work.

D. Performance and Design Requirements

1. Dimensions:

a. Tank covers shall be provided in accordance with the following dimensions:

1)	Tank inside diameter	58'-0" *
2)	Cover outside diameter of flashing	TBD *
3)	Cover center height above base of cover	TBD

[- Field verify against existing structure prior to submission of shop drawings.]*

2. Structural Requirements

a. Each cover shall be designed for full dead-load of cover and attached mechanical equipment, ducts and electrical items, plus the following live-load conditions:

1) Symmetrical downward (gravity) snow loading over the total area. See General Structural Notes in the Drawings.

a)	Ground Snow Load	70 psf
b)	Snow Exposure Factor, Ce	1.0
c)	Importance Factor, Is	1.2
d)	Thermal Factor, Ct	1.2
e)	Slope Factor, Cs	1.0
f)	FM Global Ground to Roof Snow factor	0.8

2) Snow drift per ASCE 7 as required.

3) Symmetrical outward HVAC overpressure of 5 pounds per square foot over the total area, netted against the full dead load of the cover.

4) Asymmetrical downward (gravity) live roof loading of 20 pounds per square foot over the projected area of one-half of the cover, but not to be combined with snow loading.

5) Wind loading (See General Structural Notes)

a)	Basic Design Wind Speed, V	120 mph
b)	Velocity pressure exponent coefficient, Kd	0.85
c)	Ground elevation factor, Ke	0.85
d)	Exposure category	C
e)	Internal Pressure Coefficient, GCpi	0.18
f)	Topographic Factor, Kzt	1.0

6) Seismic loading as described in Specification Section 01 73 24.

7) Each aluminum panel shall be secured to the dome frame and capable of withstanding two concentrated loads of 250 pounds each, applied simultaneously on two separate one square foot areas of the panel or 60 psf distributed over the total panel area

8) The full wind load (Item 5) in combination with the asymmetrical load (Item 4) acting on the leeward half of the cover.

9) The full seismic load (Item 6) in combination with the asymmetrical load (Item 4).

10) Full provisions shall be made to allow for thermal expansion and contraction.

b. The above conditions shall be otherwise combined per IBC 2021 load combinations.

3. Design Standards
    a. Aluminum covers shall be designed in compliance with the IBC and Aluminum Association including all associated standards, references and specifications.

E. Sealing:
    1. The perimeter, access hatch, manway door and all panels of each dome cover shall be sealed to the clarifier walls or to other dome components to provide a substantially air tight enclosure. The cover seal at wall shall be as detailed on the drawings. Alternate methods may be proposed for review. Engineer shall judge equivalency based upon all design requirements, environmental conditions, design life, and experience with similar systems in operation.

F. Corrosion:
    1. Protection shall be provided between dissimilar metals using coatings, dialectic tapes, non-conductive washers, or other means to prevent contact. Aluminum materials proposed for use shall be proven as corrosion resistant in similar installations.
    2. Coatings shall not be used for hardware-contact surfaces, such as nuts, bolts or screws. Coatings shall not be used for bearing surfaces subject to movement due to thermal, wind, construction or other sources.

1.02 QUALITY ASSURANCE

A. References:
    1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Manufacturer's Experience:
   1. The aluminum geodesic domes and appurtenances manufacturer shall be one who is regularly engaged in the business of designing, building, and installing aluminum geodesic domes of the type specified in this section. All aluminum geodesic domes and appurtenances provided for this contract shall be designed, coordinated, and supplied by a single manufacturer. The manufacturer must have installed and had in satisfactory use for a period of not less than 5 years, at least 5 domes of the size and type specified.

C. Warranty
   1. In addition to the guarantee requirements specified in the General Provisions, a manufacturer's warranty shall be provided for each dome system. The dome manufacturer shall warrant that the work described herein shall be free from defects in workmanship and material. The dome manufacturer shall replace or repair any faulty workmanship or defective material furnished by it that is reported to it within 1 year from the date of completion.

1.03 SUBMITTALS

A. The following submittals shall be provided as specified in Section 01 33 00:
   1. Data giving a full description of the geodesic domes and accessories proposed by the Contractor.
   2. Shop drawings showing critical dimensions, penetration sizes and locations, framing and connection details, access hatch and natural lighting panel details, perimeter seal details, and fastener and anchor bolt details. Shop drawings shall also be considered design drawings, and sealed by a Professional Engineer licensed in the State of Utah.
   3. A complete listing of materials of construction.
   4. Certified membrane material test results and a 6-inch by 6-inch sample of the membrane material as specified in paragraph 2.03 Synthetic Rubber Membrane.
   5. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. If deviations from the specifications are indicated and, therefore requested by the Contractor, the submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification for any requested deviations to the specification requirements, with the submittal shall be cause for rejection of the entire submittal with no further consideration.
   6. Complete calculations demonstrating conformance with the design requirements and sealed by a Professional Engineer licensed in the State of Utah.
   7. Proposed testing protocol to demonstrate conformance with this specification section, and all associated plant process and support utility specification sections.

8. Summary of corrosion resistant measures taken to ensure expected design life. Discuss suitability of aluminum alloys proposed for this use which have been successfully used in similar environments, including project contact name and telephone number. Identify all areas where stainless steel hardware or other dissimilar metals may contact aluminum and what protective measures have been provided.

1.04 ENVIRONMENTAL CONDITIONS

A. The dome cover system provided under this section shall be designed for use at a water treatment plant with environmental conditions described in Section 01 11 80.

1.05 SHIPMENT AND STORAGE

A. Mechanical equipment provided with the dome covers shall be handled and protected during shipment and storage as specified in Section 01 66 00. All piping and other cover openings shall be capped with metal or wood for shipping and while in storage. Each system and all components and mounting hardware shall be delivered at the same time.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Acceptable manufacturers include but not limited to:
   1. CST Industries, modified to meet requirements of this specification.

2.02 MATERIALS

A. Materials for components shall be as follows:

Component	Material
Triangulated space truss	ASTM B308, 6061-T6 Aluminum struts and gussets, 6-inch minimum depth or 6005A-T61 Aluminum
Triangular closure panels	ASTM B209, 3003-H16 aluminum sheet, 16-gage minimum
Triangular natural lighting panels	1/4-inch translucent plexiglass or acrylic, full triangulated panel
Tension ring	ASTM B308, 6061-T6 aluminum, 6-inch minimum depth or 6005A-T61 Aluminum
Fasteners	ASTM F593 series 316 stainless steel
Gaskets	Neoprene ASTM C509 or silicone GE SE44/88, ozone and ultra-violet light resistant
Sealant	EPDM Dow 790 silicone, Pecora 864 silicone, or equal, ozone and ultraviolet light resistant
Support bearing pads	Teflon-faced neoprene
Anchor bolts	See Sections 05 05 20
Dormers	ASTM B308, 6061-T6 or ASTM B209, 5052-H36 aluminum, 0.09 inch minimum thickness
Doors and Hatches	5052-H36 aluminum or Type 316 stainless steel

2.03 COMPONENTS

A. General:
   1. No galvanized, painted, or plated steel shall be used anywhere in the dome.

B. Plates and Sheets:
   1. Plate and sheet material shall be mill finished on the interior and exterior. Dome shall not exhibit a bright, shiny, polished exterior which may reflect sunlight intensely. Tension ring gussets shall be 0.375-inch minimum thickness.

C. Tension Ring
   1. Design of the tension ring shall be based on the net cross section of the members and shall not include top flange protrusions, bolt holes, or structural tee legs without fasteners.

D. Gaskets:
   1. Gaskets shall be neoprene, meeting all requirements of ASTM C509.

E. Sealant:
   1. Sealants shall be resistant to ozone and ultraviolet light in accordance with Federal Specification TT-S-00230C.

F. Support Bearings:
   1. Teflon or neoprene support pads shall bear directly against stainless steel, or aluminum contact surfaces suitably protected from direct contact. Teflon shall not bear on aluminum surfaces directly. Supports may utilize a stainless steel pin in order to accommodate unleveled support conditions. Bearing support shoes shall be welded from aluminum or stainless steel plate. Support geometry and materials shall take into consideration the corrosion resistant requirements described in paragraph 1.01 Sealing.

G. Weldments:
   1. The design and fabrication of welded aluminum parts shall be in accordance with the Aluminum Association and the AWS D1.2.
   2. All structural welds and weld-affected structural components shall be inspected by the Liquid Penetrant Inspection method of examination in accordance with ASTM E165. The inspector shall be an AWS Certified Welding Inspector (CWI) in accordance with AWS D1.2. Personnel performing nondestructive testing shall be qualified as required by AWS D1.2.
   3. All structural welding of aluminum shall be performed prior to field erection of the dome.

H. Synthetic Rubber Membrane
   1. Fiberglass Reinforced 70 Durometer Grey Silicone Sheet, AMS3315, .032" +/- .005" Thick x 36" Wide Untrimmed.

I. Manway Dormers, Doors and Hardware

1. Dormers may be overbuilds with 7'-0" clear walkable area. Manway doors may either be a manufacturer-fabricated element or purchased item such as CECO (or equal). Door and frame shall either be aluminum or stainless steel, and shall be gasketed to achieve the specified degree of air-tightness. Door size shall be 3'-0" wide by 7'-0" tall, clear opening within the dormers. Door hardware shall consist of fixed hand lever inside and out (ADA conforming geometry), deadbolt keyed outside and thumb-turn inside, standard hinges, and open-limit chain with spring. Deadbolt shall be stainless steel with brass interior, and support Schlage with keying to match system currently used on site. Other hardware shall be aluminum or stainless steel per Contractor's option.

J. Bid Item

1. This Bid Item describes an exterior finish coating for all exposed elements of the dome which differs from the mill finish described above as typical. Bid Item coating shall be:
   a. Kynar 500, 1 mil DFT, color as selected by Owner.
2. Bid Item shall include prices for coatings listed above, as well as technical data regarding the coating system proposed. Technical data submitted with bid shall include coating material, application process, coating thickness and warranty against failure and fading.
3. Items to coat include dome panels, battens, manway doormer, manway door (but not hardware or steps), flashings and any visible struts or miscellaneous pieces (when viewed from the outside). Coating is not required for the hatch, roof vents, or exterior duct supports.

2.04 CONNECTIONS

A. Joints shall be designed to sustain a total resultant shear force no greater than that which would be allowed by summing the allowable shear force of the individual fasteners, based on their net cross-sectional area through the shear plane and the allowable shear stress of the material. The use of manufacturer's test data to rationalize an increase in assumed fastener strengths is prohibited. In no case shall values greater than the minimums published by the Aluminum Association and ASTM F593 for aluminum and stainless fasteners, respectively, be used.

B. A minimum of four fasteners per flange shall be used to connect the structural members to the gusset plates. No welding or thermal cutting of aluminum structural members, supports, or connections shall be allowed except for fabrication of bearing support shoes and center compression ring at the hatch due to their adverse effects on the strength of aluminum alloys. No design shall be allowed that does not bolt structural member flanges to the gusset plates at the joints.

2.05 ACCESSORIES

A. Access Hatches

1. Framing for access hatches shall be provided in the cover of the size and in the locations shown on the drawings.

B. Air Duct Connections

1. The cover manufacturer shall provide connections in the cover for attachment of the ventilation air ducts and associated exhaust fans and intake louvers as needed to achieve design ventilation of 6 air changes per hour. Duct supports shall be mounted on and/or inside the cover.
    a. Provide a full ventilation system with the delegated design of the dome. Provide delegated design plans and specifications documenting the exhaust fan, ductwork, exhaust and intake louvers.
        1) Provide with controls necessary to enable and disable ventilation system remotely.
        2) Provide DT sensor at exhaust fan to monitor.
        3) Provide with automatic dampers at intake and discharge. Interlock with exhaust fan.

C. Triangular Natural Lighting Panels:

1. Glazing shall be provided to allow daytime natural illumination within the cover as shown on the drawings. Glazing shall consist of translucent plexiglass of thickness sufficient to provide strength equivalent to nonglazed panels, minimum 1/4-inch.

2.06 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:

1. Applicable operation and maintenance information as specified in Section 01 78 23.
2. Manufacturer's written recommendations for installation and startup.
3. Installation Certification Form 43 05 11-A as specified in paragraph 3.01.
4. Training Certification Form 43 05 11-B as specified in paragraph 3.03.
5. A full set of satisfactory weld examination records as specified in paragraph 2.03 Weldments.

PART 3 EXECUTION

3.01 INSTALLATION

A. Covers complete with all accessories and system components shall be installed as specified and in conformance with the manufacturer's written instructions.

B. While it is not impossible to coat the existing structure before installing the cover, it is strongly recommended that the coating be applied first. Contractor shall take care not to damage or compromise the coating, and shall repair same at its own expense if damaged during installation or completion of the work.

C. The membrane shall be installed in continuous strips which are as long as practicable to minimize the need for field joints. The minimum length of membrane strips shall be 100 feet. Lap joints between sections of membrane shall be made with contact cement recommended by the membrane manufacturer. Joints between the membrane and aluminum structures shall be made with mechanical fasteners as shown on the drawings.

D. Dielectric and heat seal techniques may be used as an alternate to adhesives.

E. Installation shall be performed by mechanics skilled in work of this kind. The equipment shall be checked, aligned, and approved by the manufacturer's factory trained representatives. The installation and initial operation of all components shall be certified on Form 43 05 11-A specified in Section 01 99 90.

3.02 PERFORMANCE TESTING

A. Covers shall be tested for substantial air-tightness and other requirements as noted herein. Method of testing shall be as submitted in accordance with Section 01 33 00. Contractor shall coordinate testing with Owner and Engineer a minimum of two weeks in advance.

3.03 CLEANUP AND CLOSEOUT

A. Contractor shall clean up all excess and leftover materials from the jobsite and leave the domes, their attachment points and seals and all associated plant features in a clean, neat, serviceable condition. Maintenance supply parts shall be delivered to jobsite and stored as directed by the Owner.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 21 11 16

FACILITY FIRE HYDRANTS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies fire hydrants.

B. Type:
   1. Fire hydrants provided under this section shall be two-piece standpipe and stem, compression shutoff, dry-barrel type.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
AWWA C502	Dry-Barrel Fire Hydrants
UL 246	Hydrants for Fire-Protection Service

B. Design Requirements:
   1. Fire hydrants shall conform to AWWA C502 and shall be listed by Underwriters Laboratories Inc. in accordance with UL 246.

C. Testing:
   1. Fire hydrants shall meet the factory and field test provisions of AWWA C502.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Fire hydrants shall be Dresser, Kennedy, or equal, modified to meet specified requirements.

B. Fire hydrants shall be painted "fire hydrant red" in accordance with AWWA C502.

2.02 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Affidavit of compliance with AWWA C502.
   2. Records of standard tests.

PART 3 EXECUTION

3.01 INSTALLATION

A. Fire hydrants shall be installed in accordance with detail G on Drawing No. GC 22.

END OF SECTION

SECTION 21 13 13

FIRE SPRINKLER SYSTEM

PART 1 GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and General Requirements, apply to the work specified in this section.

B. Requirements of Mechanical General Provisions Sections govern the work specified in this section except the standards of NFPA #13 shall take precedence.

1.02 DESCRIPTION OF WORK:

A. Furnish all materials, equipment and supplies and perform all work and operations to design, construct and make functional a fire sprinkler system as specified herein, to provide fire protection of all areas of the City Creek Treatment Plant. The design of the fire sprinkler system shall meet the requirements of NFPA 13, 2019 edition and be in accordance with the drawings and specifications.

1.03 QUALITY ASSURANCE:

A. Materials, devices and equipment shall be Underwriters Laboratories listed or Factory Mutual approved for use in fire protection systems.

B. Shop drawings shall be prepared by an engineering technician or senior engineering technician (Level III or Level IV) NICET certified for fire sprinkler design. Include NICET certification number on the drawings. Drawings will be signed by the technician and submitted for approval under his name.

C. Fire sprinkler contractor shall be licensed as a fire sprinkler contractor in the State of Utah.

1.04 SUBMITTALS:

A. Descriptive Data: Descriptive data shall be submitted on the following items of material and/or equipment. Such data shall consist of manufacturer's or supplier's catalog information in sufficient detail to allow verification that the material and/or equipment meets the specification requirements, or is equal to that specified.

1. All control valves, backflow preventers, check valves, pipe, fittings, couplings, sprinklers, FDC, valve tamper and water flow alarm devices.

B. Prior to fabrication, prepare shop drawings for submittal to Owner. Submit four sets of drawings and hydraulic calculations to the Owner for review. After review and acceptance by the Owner, submit to any state or local jurisdiction for review. Any review comments, and associated drawing revisions, from state or local approving authorities that affect the system design shall be approved by the Owner prior to installation.

C. Upon completion of system installation the contractor shall document a 2-inch drain test, inspect the general system installation and verify the installation is complete and installed according to the approved drawings and specifications. Minor corrections and/or additions to the drawings should be “red-lined” on the As-Built drawings. Contractor shall submit As-Built drawings, and test certificates to Owner.

D. Fabrication or installation shall not proceed until all required approvals have been obtained.

1.05 SYSTEM DESCRIPTION:

A. Provide an automatic fire sprinkler system per NFPA 13 (2019 edition) to provide fire protection of all areas of the building. Work includes but is not limited to the following:
   1. Provide a new fire sprinkler riser in space provided in northeast utility room. Riser shall incorporate a double check backflow preventer, pressure gauges, 2” main drain with discharge to the exterior, water flow and valve tamper switches. See detail in paragraph 3.08.
   2. Provide a 2-1/2” x 2-1/2” x 4” wall mounted FDC near fire sprinkler riser. Mount FDC 24” to 36” above exterior grade. Connect the FDC downstream of the backflow preventer at the fire sprinkler riser.
   3. Provide an electric water flow bell on the exterior of the building near the location of the wall mounted FDC. Coordinate location and mounting height of water flow bell with Owner. Existing water flow bell may be re-used if present and functional.
   4. Provide fire sprinklers to protect all areas of the building including any combustible concealed spaces.
   5. Water filled piping shall be installed in areas where the temperature will be reliably maintained at or above 40° F. Where piping must be installed in areas with temperatures below 40°F, fill piping with antifreeze solution and isolate antifreeze solution from water filled piping with a reduced pressure zone backflow preventer.
   6. Piping shall be concealed above ceilings where ceilings are present and may be run exposed in areas without ceilings. Coordinate elevation and layout of piping with mechanical, structural, electrical, process piping and equipment. Offset piping as necessary to avoid conflicts.
   7. Install piping pitched to drain back to main riser where possible. Where trapped piping is unavoidable, provide auxiliary drain per NFPA 13.

1.06 SYSTEM DESIGN:

A. Design densities and areas of application.
   1. All areas: Ordinary hazard group 2, 0.20 gpm/sq. ft over 1,500 sq ft with 250 gpm hose allowance.
   2. The size of the remote area may be decreased in accordance with NFPA 13 11.2.3.2.3.1 where quick response sprinklers are used and the ceiling height is less than 20’.

B. Maximum coverage per sprinkler head.
   1. Ordinary Hazard: 130 sq. ft.
   2. Light Hazard: 225 sq. ft. (areas of non-combustible unobstructed construction or

3. combustible unobstructed construction with structural members more than 3’ on center)
4. Extended coverage fire sprinklers may be used where installed in accordance with NFPA 13 and manufacturer’s recommendations. Maximum spacing for extended coverage fire sprinklers shall not exceed 400 sq. ft.

c. The Fire Protection subcontractor shall perform a fire hydrant flow test in accordance with NFPA 291 after award of the contract but before beginning design of the fire sprinkler system.

D. Apply appropriate reduction factors to account for seasonal variations. Schedule all flow tests with Spanish Fork personnel. Submit a copy of the flow test report to the project engineer.

E. A minimum 10% pressure cushion shall be provided in all hydraulic calculations.

1.07 WARRANTY:

A. Materials, equipment, and workmanship shall be free from defects for 12 months from the"Date Left in Service with All Control Valves Open," shown on "Contractor's Material and Test Certificate." If any Work is found to be defective, Contractor shall promptly, without cost to Owner, and in accordance with Owner's instructions, either correct such defective Work, or if it has been rejected by Owner, remove it from the site and replace it with non-defective Work. Submit two copies of Warranty Certificates to Owner.

1.08 REFERENCES:

A. NFPA (National Fire Protection Association) 13, "Installation of Sprinkler Systems," 2019.

B. IBC (International Building Code), 2021.

C. IFC (International Fire Code), 2021 and any local amendments.

D. Underwriters Laboratories "Fire Protection Equipment Directory," current edition.

E. Factory Mutual Systems "Approval Guide," current edition.

PART 2 PRODUCTS

Materials, devices and equipment shall be Underwriters Laboratories listed or Factory Mutual approved for use in fire protection systems.

2.01 PIPE:

A. Interior Piping:
1. All piping shall be steel and shall meet or exceed the following standards: ASTM A795, ANSI/ASTM A53, ASTM A135, ANSI B36-10M, UL CRR (Corrosion Resistance Rating) minimum 1.0 for threaded pipe.

2.02 FITTINGS:

A. Interior Piping:
   1. Cast iron threaded, ANSI B16.4.
   2. Cast iron flanged, ANSI B16.1.
   3. Malleable iron threaded, ANSI B16.3.
   4. Forged steel fittings, socket welded and threaded, ANSI B16.11.
   5. Plain end couplings and fittings, saddle couplings, and clamp type couplings are not acceptable.
   6. Other types of fittings may be used, but only those investigated and listed for this service **and** approved by the project engineer.

2.03 HANGERS:

A. Hangers shall conform to the minimum requirements of NFPA 13.

2.04 SEISMIC FITTINGS AND BRACES:

A. Earthquake bracing is required and shall conform to the minimum requirements of NFPA 13.

2.05 SPRINKLER HEADS:

A. Areas without ceilings: Small frame upright, ordinary temperature, brass, glass bulb.

B. Areas with white or off-white ceilings: White (factory painted) recessed pattern fire sprinklers and escutcheons shall be used in all areas with finished ceilings. Locate sprinkler heads to minimize discharge obstructions in accordance with NFPA 13.

C. Sprinklers of intermediate and high temperature ratings shall be installed near skylights and/or other specific locations as required by NFPA 13.

D. Provide one spare head of each type for spare head cabinet and one head wrench for each type sprinkler.

E. Sprinklers in rooms/areas where chemicals produce a humid or corrosive atmosphere shall be UL listed as corrosion resistant.

2.06 VALVES:

A. Main Riser:
   1. OS&Y or butterfly pattern control valves with installed supervisory switches. Control valves shall be part of UL listed backflow prevention assembly.
   2. USC approved double check backflow preventer.
   3. 2” angle valve for main drain. Extend discharge from main drain to building exterior and terminate with a 45° galvanized elbow.

B. Fire Department Connection:
   1. Swing pattern, grooved end check valve.

2. 1/2" automatic ball drip.

2.07 FIRE DEPARTMENT CONNECTION:

A. Provide a polished brass, 2-way 2-1/2" wall mounted fire department connection with national standard threads, breakable caps and permanent escutcheon labeled "Auto. Spkr". FDC to be mouthed between 24" and 36" above finished exterior grade. Locate FDC within 150' of a fire hydrant. Coordinate with adjacent equipment and landscaping to ensure that the FDC is unobstructed. Connect FDC downstream of backflow preventer on fire riser with 4" supply line.

2.08 ALARM DEVICES:

A. Note: Devices are furnished and installed by fire sprinkler contractor and wired by electrical contractor.

B. Sprinkler Riser:
   1. Valve tamper switches: The valve tamper switches shall be SPDT electrical switches rated for 125 Vac for monitoring the position of control valves, UL listed, and FM approved.
   2. Water flow switch: Furnish and install a water flow detector on the fire sprinkler riser, designed for wet pipe sprinkler systems, listed by UL and approved by Factory Mutual. Detector shall be a vane type water flow switch installed on the system piping downstream of control valve. Activation of switch shall provide actuation of two SPDT switches rated for 125 Vac at water flows of 10 gpm or greater.

C. Exterior:
   1. Provide and install a 6" electric bell on the exterior of the building near the fire department connection. Coordinate location and mounting height with Owner. Device to be wired to power supply and flow switch by contractor.

PART 3 EXECUTION

3.01 INSPECTION:

A. Examine areas and conditions under which fire sprinkler system is to be installed and notify General Contractor in writing of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in an acceptable manner.

3.02 INSTALLATION:

A. Install system in compliance with methods detailed in NFPA 13, including seismic requirements for potential for earthquake damage.

B. Offset as needed for other trades. Avoid conflict in areas of tight construction. Do not obstruct access to air control boxes, access doors, lights or other ceiling mounted equipment.

C. Close pipe openings with caps or plugs during installation. Cover and protect components of the system against dirt and chemical or mechanical injury.

D. Provide concrete splash blocks for drains and test valve discharge, etc. unless they discharge to asphalt or concrete paving. Concrete splash blocks shall be pre-fabricated, 2-1/2" thick, Amcor or Engineer approved equal.

E. Water filled piping shall only be installed in areas where temperatures will not drop below 40ºF. If piping must be installed in unheated areas, provide an antifreeze loop and fill the piping with an antifreeze solution per the requirements of NFPA 13.

F. E. Contractor is responsible for making his own job check and any necessary adjustments in the design prior to fabrication. Make final coordination with other trades and offset piping and heads as necessary. Major conflicts shall be brought to the attention of the General Contractor for resolution by the Owner.

3.03 FIELD QUALITY CONTROL:

A. Obtain permits and post bonds as required by state and local AHJ's (Authorities Having Jurisdiction).

B. Inform AHJ's of job progress. Request presence of AHJ's, perform tests, and document results using Contractor's Material and Test Certificates.

3.04 TESTING:

A. Make and pay for all tests required by applicable codes during and after completion of the work and correct and defects in the systems indicated by the tests.

B. Hydrostatically test all system piping for two hours at 200 psi with no loss in pressure and no visible leakage. Conduct the testing after all of the fire sprinkler heads and piping are installed. Have the tests witnessed by the AHJ's and Engineer. Submit a Contractor's Material and Test Certificate to the Owner upon successful completion of the testing.

C. Train the Owner's maintenance personnel in the proper operation, testing and maintenance of all installed equipment.

3.05 DISINFECTION:

A. Disinfect piping when and as required by local jurisdiction

3.06 CLEANING:

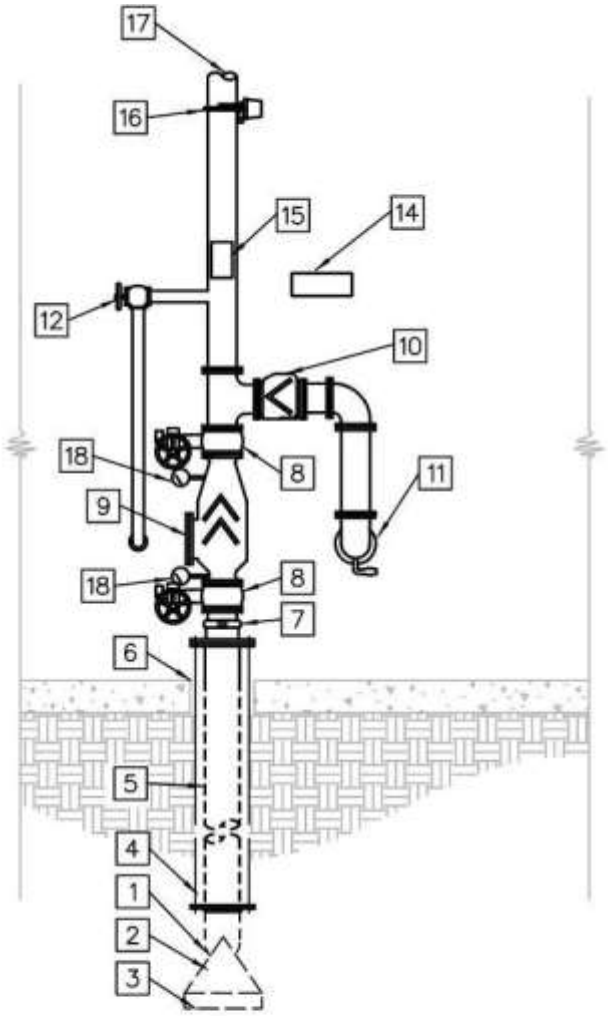
A. Remove oil, scale, debris, and foreign substances from interior and exterior of devices, equipment, and materials prior to installation.

B. Upon job completion, remove tools, surplus materials and equipment, leaving all areas broom clean.

3.07 ACCEPTANCE:

A. Acceptance of installation is subject to final inspection and approval by:
   1. Salt Lake City Fire Department.
   2. Owner or his representative.

3.08 FIRE SPRINKLER RISER SCHEMATIC:



1 — 6" UNDERGROUND SUPPLY PIPING (BEYOND)

2 — 90° M.J. BEND

3 — CONCRETE THRUST BLOCK, SIZED PER NFPA #24

4 — ANCHOR RODS, PER NFPA #24 - PROVIDE CORROSION PROTECTION

5 — CEMENT LINED DUCTILE IRON FLANGE X SPIGOT PIECE - TRANSITION FROM UNDERGROUND SUPPLY TO INTERIOR PIPING

6 — SLEEVE AT FLOOR SPACE WITH 2" CLEAR SPACE AROUND PIPE - FILL SPACE WITH MASTIC

7 — FLEXIBLE COUPLING

8 — BUTTERFLY CONTROL VALVE WITH BUILT-IN TAMPER SWITCH AND ATTACHED LOCKING CHAIN

9 — AMES COLT SERIES C200BFG DOUBLE CHECK ASSEMBLY (OR EQUAL)

10 — SWING CHECK VALVE

11 — 4" OUT TO 2-WAY FIRE DEPT. CONNECTION. PROVIDE AUTOMATIC BALL DRIP. LOCATE F.D.C 18" TO 36" ABOVE EXTERIOR GRADE.

12 — ANGLE VALVE FOR MAIN DRAIN. EXTEND DISCHARGE TO BUILDING EXTERIOR. SIZE DRAIN LINE PER NFPA 13.

13 — NOT USED

14 — SPARE SPRINKLER HEAD CABINET, PER NFPA 13

15 — HYDRAULIC CALCULATION INFORMATION SIGN.

16 — VANE TYPE WATER FLOW SWITCH

17 — SUPPLY TO FIRE SPRINKLERS

18 — PRESSURE GAUGE

FIRE SPRINKLER RISER SCHEMATIC

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 01 00

GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 GENERAL

A. General Conditions and Division 01 apply to this Division.

1.02 SCOPE

A. Includes -
   1. Furnish all labor, materials, and equipment necessary for the completion of the mechanical and plumbing scope of work.
   2. Furnish and install all motors specified in this Division and be responsible for the proper operation of electrical powered equipment furnished by this Division.
   3. Furnish exact location of electrical connections and information on motor controls to Division 26.
   4. Mechanical Contractor shall obtain the services of independent Test and Balance Agency.
   5. Placing the air conditioning, heating, ventilating, and exhaust systems into full operation and continuing their operation during each working day of testing and balancing.
   6. Making changes in pulleys, belts, and dampers, or adding dampers, as required for the correct balance as recommended by Balancing Contractor at no additional cost to Owner.
   7. Air balance, final adjustment and test run.
   8. The satisfactory performance of the completed systems is a requirement of this specification.
   9. Comply with FM Global requirements and recommendations for owner's insurance policy.

B. Related Work Specified Elsewhere
   1. Conduit, line voltage wiring, outlets, and disconnect switches specified in Division 26.
   2. Magnetic starters and thermal protective devices (heaters) not a factory mounted integral part of packaged equipment are specified in Division 26.

1.03 SITE OBSERVATION

A. The Contractor shall examine the site and understand the conditions which may affect the performance of work of this Division before submitting proposals for this work.

B. No subsequent allowance for time or money will be considered for any consequence related to failure to examine existing site conditions.

1.04 DRAWINGS

A. Mechanical drawings show general arrangement of piping, ductwork, equipment, etc; however, locations are to be regarded as shown diagrammatically only. Follow as closely as actual building construction and work of other trades will permit.

B. Because of the small scale of mechanical drawings, it is not possible to indicate all offsets, fittings, and accessories which may be required. Investigate existing structural and finished conditions affecting this work and arrange work accordingly, providing such fittings, valves, and accessories required to meet conditions.

C. If changes in location of piping, equipment, ducts, etc. are required due to lack of coordination of work under this division, such changes shall be made without charge. Contractor shall review drawings with local and state agencies having jurisdiction and any changes required by them shall be brought to the attention of the Engineer prior to bidding or commencement of work. It is understood that while Drawings are to be followed as closely as circumstances permit, this Division will be held responsible for the installation of systems according to the true intent and meaning of the Contract Documents. Anything not clear or in conflict will be explained by making application to the Engineer in writing. Should conditions arise where certain changes would be advisable, secure Owner's and Engineer approval for these changes before proceeding with work.

1.05 COORDINATION OF WORK:

A. Coordinate work of various trades in installing interrelated work. Before installation of mechanical items, make proper provision to avoid interferences in a manner approved by Engineer. Changes required in work specified in Division 22 and 23 caused by neglect to secure approval shall be made at no cost to Owner.

B. Arrange piping, ductwork, and equipment to permit ready access to valves, unions, starters, motors, control components, and to clear openings of doors and access panels. Contractor shall provide all necessary access doors and/or panels to provide complete access to all mechanical equipment, dampers, or accessories. Doors for dampers, etc. shall be minimum 12" x 12" and doors for mechanical equipment shall be minimum 24" x 24".

C. Furnish and install inserts and supports required by Division 22 and 23 unless otherwise noted. Furnish sleeves, inserts, supports, and equipment that are an integral part of other Divisions involved in sufficient time to be built into the construction as the Work proceeds. Locate these items and see that they are properly installed. Expense resulting from improper location or installation of items above shall be borne by Contractor.

D. Be responsible for required digging, cutting, and patching incident to work of this Division and make required repairs afterwards to satisfaction of Owner and Architect. Cut carefully to minimize necessity for repairs to existing work. Do not cut beams, columns, or trusses.
   1. Patch and repair walls, floors and roofs with materials of same quality and appearance as adjacent surfaces unless otherwise shown. Surface finishes shall exactly match existing finishes of same materials.

2. This Division shall bear expense of cutting, patching, repairing, and replacing of work of other Divisions because of its fault, error, tardiness, or because of damage done by it.
3. Provide the necessary cutting, patching, repairing, and replacing pavements, sidewalks, etc. to permit installation of work of this Division.

E. Adjust locations of piping, ductwork, equipment, etc, to accommodate work from interferences anticipated and encountered. Determine exact route and location of each pipe and cut prior to fabrication.
1. Make offsets, transitions, and changes in direction of piping, ductwork, and electrical raceways as required to maintain proper head room and pitch of sloping lines whether or not indicated on Drawings.

F. Slots and openings through floors, walls and roofs shall be provided by this Division.

G. This Contractor shall schedule his work, store his equipment and materials, and work in harmony with other Contractors so as to not delay or jeopardize the construction.

H. This Division shall coordinate with electrical contractor to insure that all required components of control work are included and fully understood. Any discrepancies shall be called to the attention of the Engineer before completion of bids. No additional cost shall accrue to the Owner as a result of lack of such coordination.

1.06 EQUIPMENT & MATERIALS:

A. Requests for substitution shall be received in writing a minimum of seven days prior to bidding. Prior acceptance shall be by Manufacturer's name only. Items not listed in this specification or subsequent addendums shall not be considered. No oral approvals will be acceptable. Manufacturers listed in this specification are acceptable only for items listed. All other items manufacturer wishes to bid must be prior approved. All equipment shall be subject to final review in accordance with "Project Submittals".

B. Product Approvals -
1. If approval is received to use other than specified items, responsibility for specified capacities and insuring that items to be furnished will fit space available lies with this Division.
2. In the event other than specified equipment is used and will not fit job site conditions, this Division assumes responsibility for replacement with items named in Specification.

C. Use <u>domestic made</u> pipe, pipe fittings, and motors on Project.

D. Motor and equipment name plates as well as applicable UL labels shall be in place when Project is turned over to Owner.

E. Insure that items to be furnished fit spaces available. Make necessary field measurements to ascertain space requirements including those for connections and furnish and install equipment of size and shape so final installation shall suit true intent and meaning of Contract Documents. Do not scale off drawings.

F. All materials shall be of the best commercial quality obtainable, consistent with specified materials and for the purpose or function intended. Materials shall be new unless specifically excepted.

G. Equipment catalog or model numbers shown define the basic equipment types and quality standard only. Catalog numbers shall not be considered as all inclusive and shall be verified to include all devices, controls, operators, and appurtenances necessary for the satisfactory and complete operation of the equipment.

H. Follow manufacturer's directions in delivery, storage, protection, and installation of equipment and materials.
   1. Promptly notify Engineer in writing of conflicts between requirements of Contract Documents and Manufacturer's directions and obtain Engineer's written instructions before proceeding with work. Contractor shall bear all expenses arising from correcting deficiencies of work that does not comply with Manufacturer's directions or such written instructions.

I. Deliver equipment and material to site and tightly cover and protect against dirt, water, and chemical or mechanical injury but have readily accessible for inspection. Store items subject to moisture damage (such as controls) in a dry, heated space.

1.07 PROJECT SUBMITTALS:

A. Furnish complete catalog data for manufactured items of equipment to be used in the Work to for review within 15 days after award of Contract.

B. Submittal shall include, but not be limited to the following:
   1. equipment scheduled
   2. balancing contractor
   3. insulation
   4. grilles, and diffusers
   5. automatic temperature controls
   6. certificates of guarantee
   7. valves
   8. plumbing fixtures, accessories, and specialties
   9. any item for which more than one manufacturer is mentioned

C. Submit a minimum of five copies of data in binders and index in same order and name as they appear in Specification. - Optional: Provide electronic submittals. Electronic submittals shall be in .pdf format, and shall be compiled into a single file, with bookmarks for each piece of equipment.
   1. State sizes, capacities, brand names, motor HP, electrical requirements, accessories, materials, gauges, dimensions, and other pertinent information.
   2. List on catalog covers page numbers of submitted items.
   3. Underline or highlight applicable data.

D. If material or equipment is not as specified or submittal is not complete, it will be rejected.

E. Catalog data or shop drawings for equipment which are noted as approved shall not supersede Contract Documents.

F. Review comments shall not relieve this Division from responsibility for deviations from Contract Documents unless attention has been called to such deviations in writing at time of submission, nor shall they relieve this Division from responsibility for errors in items submitted.

G. Check work described by catalog data with Contract Documents for deviations and errors.

H. All items other than first named specified equipment shall show and state all exceptions and deviations taken and shall include design calculations and drawing layouts.

I. The Contractor shall review the submittals prior to submission to make sure that the submittals are complete in all details. No submittal will be reviewed which does not bear the contractor's notation that such checking has been made.

J. No partial submittals will be considered unless approved by the Engineer.

K. Manufacturers' names shall be mentioned as acceptable prior to bidding.

L. Contractor shall verify equipment dimensions to fit the spaces provided with sufficient clearance for servicing the equipment.

M. Contractor shall review equipment submittals for compliance with schedules, specifications, and drawing plans and details. Equipment submittal shall show the proper arrangements to suit installation and maintenance such as motor location, access doors, filter removal, piping connections, etc.

N. Equipment submittal sheets shall be clearly marked indicating equipment symbol and exact selection of proposed equipment. Submittals shall clearly indicate name of manufacturer of each item.

O. For unacceptable items, the right shall be reserved to require the first named specified items.

P. Where submittals are sent with any of the above listed information missing or are incomplete they will be returned to the contractor unchecked to be completed and resubmitted. No additional time or money shall be allowed for failure to provide complete submittals on the first review.

Q. If an item requiring submittal review is ordered, purchased, shipped, or installed prior to the submittal review the item shall be removed from the job site and replaced with an approved item at contractors expense.

1.08 CLEANING & FINISHING:

A. Contractor shall, at all times, keep the premises free from waste material and rubbish. Upon completion of this Section of the work, Contractor shall remove all surplus materials and rubbish; clean all spots resulting from the mechanical work from hardware, floors, glass, walls, etc.; do all required patching up and repair all work of other trades damaged by Contractor under this Section of the work, and leave the premises in a clean orderly condition. Clean heating and cooling coils, internally and externally, and replace all air filters prior to final mechanical inspection. Remove rust, plaster, dirt, grease and oil before painting, insulating, or exposing to view the equipment, piping, ductwork, etc. in completed structure. Refinish any damaged surfaces and leave in proper working order at final completion.

1.09 EQUIPMENT SERVICING:

A. Prior to starting mechanical equipment, all motors, bearings and moving parts shall be properly oiled, greased and lubricated as required. Full and adequate maintenance service shall be given and upon completion all equipment shall be cleaned and checked and placed in perfect condition for the Owner.

B. Amount and type of lubricant shall be per manufacturer's specification.

1.10 SUPERVISION:

A. The Contractor shall supervise and direct the work with his best skill and attention. He will be solely responsible for the means, methods, techniques, sequences and procedures of construction. The Contractor will be responsible to see that the finished work complies accurately with the Contract Documents.

1.11 SAFETY REGULATIONS:

A. Contractor shall provide equipment, supervision, construction, procedures, and everything necessary to assure safety of life or property.

B. Refer also to General Condition and Special Conditions for protection clauses.

1.12 LEAK DAMAGE:

A. Contractor shall be responsible for damages to the work of other Contractors or to the building, or to its contents, people, etc., caused by leaks in any of the equipment or piping installed by him through equipment or material failures, leaking joints or disconnected pipes, fittings, or by overflows and shall make at his own expense all repairs to fixtures, building interior, contents, paint, rugs, furniture, ceiling tile, and equipment so damaged.

1.13 TOOLS AND STORAGE OF EQUIPMENT:

A. The Contractor shall furnish all necessary tools, staging and whatever may be necessary for the installation of this work and shall at all times protect this work and others, and the materials to be used therein from damage by the weather, accident and other causes, and shall repair and make good any damage thus occurring.

1.14 WORKMANSHIP:

A. Workmanship shall be the best quality of its kind for respective industries, trades, crafts and practices and shall be acceptable in every respect to the Owner and Engineer. Nothing contained herein shall relieve the Contractor from performing good work, perfect in all details of construction.

1.15 TEMPORARY FACILITIES:

A. Furnishing of temporary water, space heating, sanitary facilities, drainage lines, light and power will be as specified in Division 01 General Conditions. Contractor shall arrange to bring facilities to required location of premises. All expenses involved shall be paid by the Contractor as described in General and Special Conditions.

1.16 PAINTING BY CONTRACTOR:

A. See section 09900 for painting requirements. See also section 22 and 23 for color code requirements.

B. Painting shall be by persons experienced in painting.

C. All exposed, insulated, and bare piping, equipment, metal stands and supports shall be painted as follows:
   1. The prime coat on equipment shall be factory applied. The finish coats shall be applied under Section 09900 of these specifications.
   2. All equipment which is to be furnished in finished painted condition by Contractor shall be left without mark, scratch or impairment to finish upon completion and acceptance of job. Any necessary refinishing to match original shall be done by Contractor. Do not paint over name plates, serial numbers or other identifying marks.
   3. All new piping shall be painted as required in Section 22 and 23. Paint colors shall conform to color code requirements as specified "Identification of Piping and Equipment".

1.17 EQUIPMENT BASES:

A. Provide reinforced concrete bases under boilers, chillers, pumps, air handling units, and other equipment as necessary or as indicated on the drawings. Coordinate work with Division 03.

B. Bases shall be 6" high, above the finish floor. The base shall extend beyond the equipment 6" in all directions, where possible. Inserts and vibration isolation systems shall be provided and installed by the Mechanical Contractor at the time the concrete is poured to accommodate and anchor the equipment used. Coordinate with vibration isolation manufacturer's requirements and Section 22 and 23. Provide a one inch beveled edge all around.

1.18 BELT GUARDS:

A. Shall be provided, properly enclosing each belt drive system. Guards shall be easily removable, constructed of expanded metal with suitable frames corresponding with SMACNA standard and with tachometer openings. Coordinate with equipment suppliers to avoid duplication of belt guards supplied with equipment. Guards shall comply with OSHA Regulations.

1.19 ELECTRICAL WORK:

A. Power wiring to all electrically driven apparatus shall be done under the electrical contract. See Electrical Specifications.

B. Unless specifically noted otherwise on documents, Electrical Contractor shall furnish and install all magnetic starters including properly sized heaters, and disconnect switches as indicated on drawings or required by code.

C. The Contractor shall verify the proper operation of equipment furnished by him. Costs for repair, replacing, re-wiring and retesting shall be borne by the Contractor without additional costs to the Owner.

D. Motors shall be as specified.

1.20 CONTRACTOR'S USE OF BUILDING EQUIPMENT:

A. The Contractor may use equipment such as electric motors, fans, filters, etc. when permanently installed as part of the project and with the written permission of the Owner. As each piece of equipment is used, maintenance procedures approved by the manufacturer shall be followed, a careful record shall be kept of the time used, maintenance procedure following and of any difficulty experienced with equipment. The Contractor's records on the equipment shall be submitted to the Owner upon acceptance of project. All fan belts and filter media shall be new at the beginning of the Mechanical System Operating Test Run and System Balancing. Wearing surfaces (such as bearings) shall be carefully inspected just prior to acceptance. Any excessive wear noted shall require replacement.

1.21 INSPECTION NOTICE:

A. The following is a basic list of guideline items so that the Architect, district building inspector/Owner's representative can be at job site for these inspections as the building progresses. Mechanical Contractor shall inform these people one week in advance of test time.
   1. Water tests on all sewer, waste, and rainwater piping prior to piping being concealed.
   2. Pressure tests on all water service piping.
   3. Pressure tests on hot, chilled, and condenser water supply and return piping.
   4. All duct work prior to installation of finished ceilings, including ductwork pressure testing.
   5. The initial start-up of mechanical equipment, etc.
   6. Any changes or problems occurring at job site.
   7. Inspect all vent flashings on roof prior to roofing.

8. Periodic inspection at their discretion will be made to insure compliance to Contract Documents and codes. Contractor shall provide ladders, access and other assistance as requested during inspections.
9. Control piping pressure tests.
10. Final inspection before giving approval for final payment.

1.22 EXCAVATION AND BACKFILLING:

A. Trench for the underground gas pipe line shall be excavated to the required depth. Rocks, trash, or other debris will not be allowed in trench or backfill and shall be removed before pipe is laid in place. After piping has been tested, inspected and approved, piping shall be backfilled. All landscaping, concrete, etc., damaged by this Contractor shall be replaced by him to the satisfaction of Owner's Representative.

1.23 WARRANTY GUARANTEE:

A. The Contractor shall warrant all materials and equipment to be of quality consistent with specifications as represented by manufacturer's published data.

B. The Contractor shall guarantee that the installation and operation of the equipment shall be free from defects for a period of one year beginning at date of substantial completion and acceptance. The Contractor shall replace or repair any part of the installation that is found to be defective or incomplete within the guarantee period.

C. The one year guarantee on equipment and systems shall commence when equipment has been demonstrated to work and has been accepted. (Example: If an equipment item fails to perform and it takes 9 months after substantial completion to correct, then the guarantee shall commence after the item has been demonstrated to perform and has been accepted.)

D. Substantial completion and acceptance in no way relieves the Contractor from providing the systems and equipment as specified.

1.24 COMPLETION SCHEDULE:

A. Start-up and verification of basic equipment items shall be done prior to the date of substantial completion with sufficient time to allow balancing and adjusting to be performed.

B. At the time of the final inspection a date shall be agreed upon for completion of any remaining items. At least double the estimated cost of the work will be withheld from the Contractor's payment.

1.25 CODE REQUIREMENTS, FEES, AND PERMITS

A. The work shall be installed in accordance with the following applicable codes, ordinances and standards unless otherwise specified. The codes and standards shall include but not be limited to and be of the latest and current editions.
1. American Boiler and Affiliated Industries (AB and AI)
2. American Gas Association (AGA)
3. Air Movement and Control Association (AMCA)

4. American National Standards Institute (ANSI)
5. Air Conditioning & Refrigeration Institute (ARI)
6. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) - ASHRAE 90.1-2019
7. American Society of Mechanical Engineers (ASME)
8. American Society of Testing Materials (ASTM)
9. American Standards Association (ASA)
10. American Water Works Association (AWWA)
11. American Welding Society (AWS)
12. Associated Air Balance Council (AABC)
13. Hydraulic Institute (HI)
14. National Electrical Code (NEC)
15. National Fire Protection Association (NFPA)
16. Sheet Metal and Air Conditioning contractors National Association (SMACNA)
17. Underwriters Laboratories (UL)
18. International Building Code (IBC) 2021 Ed
19. International Mechanical Code (IMC) 2018 Ed
20. International Plumbing Code (IPC) with Utah Amendments 2021 Ed
21. International Energy Conservation Code (IECC) 2021 Ed
22. Utah State Safety Orders (OSHA/UOSH)
23. Utah Fire Rating Bureau
24. Utah Boiler and Pressure Vessel Law
25. Utah Air Conservation Regulations/Waste Disposal regulations.
26. ASHRAE Ventilation STD.62-2019
27. FM Global Current Publications and Requirements

B. Should drawings conflict with any code, the code shall govern. If drawings and specifications establish a quality exceeding the code, the drawings and specifications shall govern. If conflicts do exist among the drawings, specifications and codes, the same shall be brought to the attention of the Engineer in writing prior to bidding, otherwise Contractor shall comply with applicable codes.

C. The latest edition of all codes shall be used.

D. Contractor shall give all notices, obtain all necessary permits, file necessary plans, prepare documents and obtain approvals, and pay all fees required for completion of the mechanical and plumbing work outlined in this Division of the specifications and shown on the Mechanical Drawings.

1.26 OPERATION AND MAINTENANCE MANUAL FOR MECHANICAL SYSTEMS

A. Upon completion of work and before final payment, Contractor shall furnish and deliver to the Owner, through the Engineer, installation, operation and maintenance manuals with instructions for all new materials and equipment used in the building. The contractor shall provide three (2) hard copies of the manuals, and two (2) electronic copies of the manuals on CD or USB drive. Electronic information shall be .PDF format. The CD's shall include the same information as the hard copies, and shall be organized in the same manner with a table of contents and electronic bookmarks for each section. CD or USB drive itself shall be labeled the same as the hard copies of the manuals. Manuals may be assembled by the Div 22 or 23 contractor, by the TAB contractor, or by a third party such as Wasatch Manuals at Office: (801) 849-0442, Cell: (801) 674-9926, or Email: wasatchmanuals@gmail.com.

B. Bind Operation and Maintenance Manual for Mechanical Systems in a hard-backed three ring binder with strong sturdy cover. The project name shall be on the spine and the front of the binder. The front of the binder shall include the following information:

OPERATION

AND

MAINTENANCE

MANUAL

for MECHANICAL SYSTEMS of

(Name of Project)

(Location of Project)

(Date of Project Award)

(Name of Architect)

C. Introduction
   1. Title page including name of project, project number, date awarded and date of substantial completion.
   2. Second page shall contain the names, phone numbers and addresses of Architect, Consulting Engineers, Mechanical Contractor, and General Contractor.
   3. Third page shall include a Table of Contents for the entire manual.

D. First Section - Summary information including:
   1. First page shall contain the contractor's warranties.
   2. Second page shall contain a list of names, addresses and phone numbers of contractors and all sub-contractors and work to which each was assigned.
   3. Final page or pages shall contain an equipment list. The list shall contain each item of equipment or material for which a submittal was required giving ID or tag no as contained on the drawings make and model No. Serial No. Identification No. Location in building, function along with the name, address, and phone number of the supplier.

E. Second Section - Mechanical Equipment O&M data including:
   1. Mechanical maintenance schedule, including a lubrication list when necessary.

2. Mechanical Equipment Operation and Maintenance Data including:
    a. Equipment descriptions
    b. Detailed installation instruction, operating and maintenance instructions. Instructions include in a step by step manner identifying start-up, operating, shutdown and emergency action sequence sufficiently clear so a person unfamiliar with the equipment could perform its operations.
    c. Equipment drawings, performance curves, operating characteristics, etc.
    d. Name addresses and phone number of manufacturer, fabricator and local vender clearly printed or stamped on cover.
    e. Complete parts listing which include catalog number, serial number, contract number or other accurate provision for ordering replacement and spare parts.
    f. Certified drawings, where applicable, showing assembly of parts and general dimensions.
3. Approved Mechanical submittals

F. Third Section - Plumbing Equipment O&M data including:
1. Section shall contain general product catalog cuts, as well as exploded view drawings with parts lists for all valves and other items with multiple parts.
2. Approved Plumbing submittals

G. Fourth Section - Controls O&M data including:
1. Sequence of Operation
2. Description of each operating system included location of switches, breakers, thermostats, and control devices. Provide a single line diagram, showing set points, normal operating parameters for all loads, pressures, temperatures and flow check points; Describe all alarms and cautions for operation.
3. Provide schematic control diagrams, panel diagrams, wiring diagrams, etc. for each separate fan system, chilled water system, hot water system, exhaust air system, pumps, etc. Each control diagram shall show a schematic representation of mechanical equipment and location of start-stop switches, insertion thermostats, thermometers, pressure gauges, automatic valves, etc. The correct reading for each control instrument shall be marked on the diagram.

H. The Fifth Section shall contain a complete air and water test and balance report. The report shall contain the name, address and phone number of the agency. It shall also include:
1. Floor plans showing all air openings and thermometer locations clearly marked and cross referenced with data sheets. Format may be 8 1/2 x 11 or 11x14 if legible.
2. Data sheets showing amount of air and water at each setting. See sections 230593.
3. List of equipment with date of last calibration.

I. Drawings and reproducible masters of drawings as required in individual specification sections, are not to be bound in volumes but are to be delivered separate with the maintenance manuals.

J. See the following checklist for assistance in assembling manual:

Item #	Description	Y, N, or NA
1.	3 ring heavy duty binder with Project name, number and date on cover and project name on spine.	
2.	O&M manual on CD (with label on CD matching label on manual). Electronic copy shall be a PDF file with bookmarks that match the tabs in the hard copy.	
3.	Title Page [including project name, number, address, date awarded, date of substantial completion]	
4.	Second Page Contact List [including architect (if applicable), mechanical engineer, mechanical contractor, and general contractor (if applicable)]	
5.	Table of Contents	
6.	**Section 1 - Summary**	
A.	Warranty	
B.	Mechanical's Sub-contractor List	
C.	Vendor List	
D.	Equipment List	
7.	**Section 2 – Mechanical Equipment**	
A.	Maintenance Schedule (including lubrication list)	
B.	Mechanical Equipment O&M Data (for each piece of equipment submitted) per specifications	
C.	Approved mechanical submittals	
8.	**Section 3 – Plumbing Equipment**	
A.	Plumbing equipment O&M data	
B.	Approved plumbing submittals	
9.	**Section 4 - Controls**	
A.	Sequence of Operation	
B.	Controls diagrams	
C.	Controls Equipment	
10.	**Section 5 – Test and Balance Report**	
A.	Complete Test and Balance Report per specifications	

1.27 OPERATION AND MAINTENANCE INSTRUCTIONS

A. Contractor shall instruct building maintenance personnel in the operation and maintenance of the installed mechanical systems utilizing the Operation and Maintenance Manual when so doing.

B. Minimum instruction periods shall be as follows -
   1. Mechanical - Two hours.
   2. Plumbing - Two hours.
   3. Temperature Control - Two hours.

C. Instruction periods shall occur before final site observation when systems are properly working and before final payment is made.

D. None of these instructional periods shall overlap each other.

E. An additional four hours of instruction will be provided by each contractor, after 60 days of system operation by owner to insure proper system operation and answer questions.

1.28 RECORD DRAWINGS

A. Contractor shall keep an up-to-date set of mechanical and plumbing drawings in his custody showing all changes in red, clearly defined and neatly drafted by him. At the end of construction, he shall turn these drawings over to the Engineer. Record drawings must be completed and submitted prior to final site observation

PART 2 PRODUCTS

(Not Used)

PART 3 EXECUTION

(Not Used)

END OF SECTION

SECTION 22 05 00

BASIC PLUMBING AND HVAC MATERIALS AND METHODS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following:
   1. Piping materials and installation instructions common to most piping systems.
   2. Dielectric fittings.
   3. Mechanical sleeve seals.
   4. Sleeves.
   5. Wall and floor penetrations
   6. Escutcheons.
   7. Mechanical demolition.
   8. Equipment installation requirements common to equipment sections.

1.03 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for plastic materials:
   1. ABS: Acrylonitrile-butadiene-styrene plastic.
   2. CPVC: Chlorinated polyvinyl chloride plastic.
   3. PVC: Polyvinyl chloride plastic.

1.04 SUBMITTALS

A. Product Data: For the following:
   1. Dielectric fittings.
   2. Mechanical sleeve seals.

B. Welding certificates.

1.05 QUALITY ASSURANCE

A. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

B. All materials, piping, etc. shall be new, and domestically made of the best commercial quality obtainable, consistent with specified materials and for the purpose or function intended unless specifically approved in writing prior to bid.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.07 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces.

PART 2 PRODUCTS

2.01 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 22 and 23 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.02 JOINING MATERIALS

A. Refer to individual Division 22 and 23 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

H. Solvent Cements for Joining Plastic Piping:
   1. ABS Piping: ASTM D 2235.
   2. CPVC Piping: ASTM F 493.
   3. PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
   4. PVC to ABS Piping Transition: ASTM D 3138.

2.03 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
   1. Available Manufacturers:
      a. Capitol Manufacturing Co.
      b. Central Plastics Company.
      c. Eclipse, Inc.
      d. Epco Sales, Inc.

e. Hart Industries, International, Inc.
f. Watts Industries, Inc.; Water Products Div.
g. Zurn Industries, Inc.; Wilkins Div.
h. Prior Approved Equal.

2.04 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Available Manufacturers:
      a. Advance Products & Systems, Inc.
      b. Calpico, Inc.
      c. Metraflex Co.
      d. Pipeline Seal and Insulator, Inc.
      e. Linkseal.
      f. Prior Approved Equal.
   2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   3. Pressure Plates: Carbon steel. Include two for each sealing element.
   4. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.05 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.

E. PVC Pipe: ASTM D 1785, Schedule 40.

2.06 PENETRATIONS

A. Floor and wall penetrations of fire rated assemblies shall be protected with FM approved fire stop systems.

2.07 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Stamped-Steel Type: With set screw or spring clips and chrome-plated finish.

2.08 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
   1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, non-gaseous, and recommended for interior and exterior applications.
   2. Design Mix: 5000-psi, 28-day compressive strength.
   3. Packaging: Premixed and factory packaged.

PART 3 EXECUTION

3.01 MECHANICAL DEMOLITION

A. Disconnect, demolish, and remove mechanical systems, equipment, and components indicated to be removed.
   1. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
   2. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material.
   3. Ducts to Be Removed: Remove portion of ducts indicated to be removed and plug remaining ducts with same or compatible ductwork material.
   4. Ducts to Be Abandoned in Place: Cap or plug ducts with same or compatible ductwork material.
   5. Equipment to Be Removed: Disconnect and cap services and remove equipment.
   6. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
   7. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.

B. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, remove damaged or unserviceable portions and replace with new products of equal capacity and quality.

C. Coordinate with controls contractor prior to removal of any control devices.

3.02 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 and 23 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Drawings do not show every offset, or bend that may be required. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors where indicated on drawings and where penetrating will be visible to public.

M. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
   1. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
   2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
   3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
   4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint.

N. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

O. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

P. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials.

Q. Verify final equipment locations for roughing-in.

R. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.03 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 and 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
   3. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
   4. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
   5. PVC Nonpressure Piping: Join according to ASTM D 2855.
   6. PVC to ABS Nonpressure Transition Fittings: Join according to ASTM D 3138 Appendix.

J. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D 3212.

3.04 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
   3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
   4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.05 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

END OF SECTION

SECTION 22 05 23

GENERAL- DUTY VALVES FOR PLUMBING PIPING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following general-duty valves:
   1. Bronze ball valves.
   2. Ferrous-alloy ball valves.
   3. Bronze check valves.

B. Related Sections include the following:
   1. Division 22 and 23 Section "Mechanical Identification" for valve tags and charts.
   2. Division 22 and 23 Section "HVAC Instrumentation and Controls" for control valves and actuators.
   3. Division 22 and 23 piping Sections for specialty valves applicable to those Sections only.

1.03 DEFINITIONS

A. The following are standard abbreviations for valves:
   1. CWP: Cold working pressure.
   2. EPDM: Ethylene-propylene-diene terpolymer rubber.
   3. NRS: Nonrising stem.
   4. OS&Y: Outside screw and yoke.
   5. PTFE: Polytetrafluoroethylene plastic.
   6. SWP: Steam working pressure.
   7. TFE: Tetrafluoroethylene plastic.

1.04 SUBMITTALS

A. Product Data: For each type of valve indicated. Include body, seating, and trim materials; valve design; pressure and temperature classifications; end connections; arrangement; dimensions; and required clearances. Include list indicating valve and its application. Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.

1.05 QUALITY ASSURANCE

A. ASME Compliance: ASME B31.9 for building services piping valves.
   1. Exceptions: Domestic hot- and cold-water piping valves unless referenced.

B. ASME Compliance for Ferrous Valves: ASME B16.10 and ASME B16.34 for dimension and design criteria.

C. NSF Compliance: NSF 61 for valve materials for potable-water service.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
   1. Protect internal parts against rust and corrosion.
   2. Protect threads, flange faces, grooves, and weld ends.
   3. Set angle, gate, and globe valves closed to prevent rattling.
   4. Set ball and plug valves open to minimize exposure of functional surfaces.
   5. Set butterfly valves closed or slightly open.
   6. Block check valves in either closed or open position.

B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher than ambient dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.02 VALVES, GENERAL

A. Refer to Part 3 "Valve Applications" Article for applications of valves.

B. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.

C. Bronze Valves: NPS 2 and smaller with threaded ends, unless otherwise indicated.

D. Ferrous Valves: NPS 2-1/2 and larger with flanged ends, unless otherwise indicated.

E. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

F. Valve Sizes: Same as upstream pipe, unless otherwise indicated.

G. Valve Actuators:
   1. Chainwheel: For attachment to valves, of size and mounting height, as indicated in the "Valve Installation" Article in Part 3.
   2. Gear Drive Operator: For quarter-turn valves NPS 8 and larger.
   3. Handwheel: For valves other than quarter-turn types.
   4. Lever Handle: For quarter-turn valves NPS 6 and smaller, except plug valves.
   5. Wrench: For plug valves with square heads. Furnish Owner with 1 wrench for every 10 plug valves, for each size square plug head.

H. Valves in Insulated Piping: Valves shall have 2-inch stem extensions and the following features:
   1. Ball Valves: Shall have extended operating handle of non-thermal-conductive material, protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation, and memory stops that are fully adjustable after insulation is applied.
      a. Manufactures: NIBCO Nib-seal handle extension or a comparable product by one of the following:
         1) Conbraco Industries, Inc.; Apollo Div.
         2) American.
         3) Crane.
         4) Grinnel.
         5) Kitz.
         6) Watts.
         7) Prior approved equal.
   2. Butterfly Valves: Shall have extended necks.

I. Valve Flanges: ASME B16.1 for cast-iron valves, ASME B16.5 for steel valves, and ASME B16.24 for bronze valves.

J. Valve Grooved Ends: AWWA C606.

K. Solder Joint: With sockets according to ASME B16.18.
   1. Caution: Use solder with melting point below 840 deg F for angle, check, gate, and globe valves; below 421 deg F for ball valves.

L. Threaded: With threads according to ASME B1.20.1.

M. Valve Bypass and Drain Connections: MSS SP-45.

2.03 BRONZE BALL VALVES

A. Bronze Ball Valves, General: MSS SP-110 and have bronze body complying with ASTM B 584, except for Class 250 which shall comply with ASTM B 61, full-depth ASME B1.20.1 threaded or solder ends, and blowout-proof stems.

B. Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim: Chrome-plated bronze ball and bronze stem and; reinforced TFE seats; threaded body packnut design (no threaded stem designs allowed) with adjustable stem packing, solder or threaded ends; and 150 psig SWP 600-psigCWP rating.
   1. Manufacturers: NIBCO Model S-585-70 or T-585-70, or a comparable product by one of the following:
      a. NIBCO Model S-585-70 or T-585-70
      b. American Valve, Inc.
      c. Conbraco Industries, Inc.; Apollo Div.
      d. Crane Co.; Crane Valve Group; Jenkins Valves.
      e. Crane Co.; Crane Valve Group; Stockham Div.
      f. Grinnell Corporation.
      g. Kitz Corporation of America.
      h. NIBCO INC.
      i. Watts Industries, Inc.; Water Products Div.

C. Two-Piece, Full-Port, Bronze Ball Valves with Stainless-Steel Trim: Type 316 stainless-steel vented ball and stem, reinforced TFE seats, threaded body packnut design (no threaded stem designs allowed) with adjustable stem packing, soldered or threaded ends; 150 psig SWP and 600-psig CWP ratings.
   1. Manufacturers: NIBCO Model S-585-70-66 or T-585-70-66, or a comparable product by one of the following:
      a. Conbraco Industries, Inc.; Apollo Div.
      b. American Valve, Inc.
      c. Conbraco Industries, Inc.; Apollo Div.
      d. Crane Co.; Crane Valve Group; Jenkins Valves.
      e. Crane Co.; Crane Valve Group; Stockham Div.
      f. Grinnell Corporation.
      g. Kitz Corporation of America.
      h. NIBCO INC.
      i. Watts Industries, Inc.; Water Products Div.
      j.

2.04 FERROUS-ALLOY BALL VALVES

A. Ferrous-Alloy Ball Valves, General: MSS SP-72, with ASTM A-216 Type WCB, carbon-steel body; ASTM A-351, Type CF8M vented stainless-steel ball; and ASTM A-276, Type 316 stainless-steel stem; fire rated according to API 607 (4th edition); and having flanged ends and blowout-proof stem.

B. Class 150, Full-Port, Ferrous-Alloy Ball Valves: Split-body construction, carbon-filled TFE seats; 285 psig CWP rating.
   1. Manufacturers:
      a. NIBCO Model F-515-CS-F-66-FS.
      b. American Valve, Inc.
      c. Conbraco Industries, Inc.; Apollo Div.

d. Cooper Cameron Corp.; Cooper Cameron Valves Div.
e. Crane Co.; Crane Valve Group; Stockham Div.
f. Foster Valve Co.
g. Hammond Valve.
h. Jomar International, LTD.
i. Kitz Corporation of America.
j. Milwaukee Valve Company.
k. Watts.

2.05 BRONZE CHECK VALVES

A. Bronze Check Valves, General: MSS SP-80.

B. Class 125, Bronze, Lift Check Valves with TFE Disc: ASTM B-584 bronze body and integral seat with soldered or threaded end connections, and having 250-psig CWP rating.
   1. Manufacturers: NIBCO Model S-480-Y or T-480-Y, or a comparable product by one of the following:
      a. Cincinnati Valve Co.
      b. Crane Co.; Crane Valve Group; Crane Valves.
      c. Crane Co.; Crane Valve Group; Stockham Div.
      d. Red-White Valve Corp.
      e. Walworth Co.

C. Class 125, Bronze, Lift Check Valves with BUNA Disc: ASTM B-584 bronze body and integral seat with nonmetallic BUNA disc, soldered or threaded end connections, and having 250-psig CWP rating.
   1. Manufacturers: NIBCO Model S-480 or T-480, or a comparable product by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Powell, Wm. Co.

D. Class 300, Bronze, Swing Check Valves with Bronze Disc: ASTM B-61 bronze body and seat with regrinding-type bronze disc, Y-pattern design, threaded end connections, and having 600 psig CWP rating.
   1. Manufacturers: NIBCO Model T-473-B, or a comparable product by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Powell, Wm. Co.

E. Class 125, Bronze, Swing Check Valves with TFE Disc: ASTM B-62 bronze body and seat with TFE disc in bronze seat holder, Y-pattern design, soldered or threaded end connections, and having 200 psig CWP rating.
   1. Manufacturers: NIBCO Model S-413-Y or T-413-Y, or a comparable product by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Powell, Wm. Co.

F. Class 125, Bronze, Swing Check Valves with BUNA Disc: ASTM B-62 bronze body and seat with BUNA disc in bronze seat holder, Y-pattern design, soldered or threaded end connections, and having 200 psig CWP rating.
   1. Manufacturers: NIBCO Model S-413-W or T-413-W, or a comparable product by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Powell, Wm. Co.

G. Class 150, Bronze, Swing Check Valves with TFE Disc: ASTM B-62 bronze body and seat with TFE disc in bronze seat holder, Y-pattern design, soldered or threaded end connections, and having 300 psig CWP rating.
   1. Manufacturers: NIBCO Model S-433-Y or T-433-Y, or a comparable product by one of the following:
      a. Crane Co.; Crane Valve Group; Crane Valves.
      b. Powell, Wm. Co.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine piping system for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

C. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

D. Examine threads on valve and mating pipe for form and cleanliness.

E. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

F. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE APPLICATIONS

A. Refer to piping Sections for specific valve applications. If valve applications are not indicated, use the following:
   1. Shutoff Service: Ball or butterfly valves.
   2. Throttling Service: Angle, ball, butterfly, or globe valves.
   3. Pump Discharge: Spring-loaded, lift-disc or dual-plate check valves; lever and weight swing check valves; or lever and spring swing check valves.

B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP class or CWP ratings may be substituted.

C. Domestic Water Piping: Use the following types of valves:
   1. Ball Valves, NPS 2 and Smaller: Two -piece, full port, stainless-steel trim, bronze.
   2. Ball Valves, NPS 2-1/2 and Larger: Class 150, full -port, ferrous alloy.
   3. Butterfly Valves, NPS 2 to NPS 12 Single-flange, full lug, 200-psig CWP rating, bronze disc, EPDM liner, ferrous alloy.
   4. Lift Check Valves, NPS 2 and Smaller: Class 125 , bronze with TFE disc.

D. Select valves, except wafer and flangeless types, with the following end connections:
   1. For Copper Tubing, NPS 2 and Smaller: Solder-joint or threaded ends, except provide valves with threaded ends for heating hot water.
   2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged ends.
   3. For Copper Tubing, NPS 5 and Larger: Flanged ends.
   4. For Steel Piping, NPS 2 and Smaller: Threaded ends.
   5. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends.
   6. For Steel Piping, NPS 5 and Larger: Flanged ends.

3.03 VALVE INSTALLATION

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

C. Locate valves for easy access and provide separate support where necessary.

D. Install valves in horizontal piping with stem at or above center of pipe. Butterfly valves may be installed with stem horizontal to allow support for the disc and the cleaning action of the disc.

E. Install valves in position to allow full stem movement.

F. Install check valves for proper direction of flow and as follows:
   1. Swing Check Valves: In horizontal position with hinge pin level.
   2. Dual-Plate Check Valves: In horizontal or vertical position, between flanges.
   3. Lift Check Valves: With stem upright and plumb.

G. Butterfly valves shall be installed with stems horizontal.

3.04 JOINT CONSTRUCTION

A. Refer to Division 22 and 23 Section "Basic Mechanical Materials and Methods" for basic piping joint construction.

B. Grooved Joints: Assemble joints with keyed coupling housing, gasket, lubricant, and bolts according to coupling and fitting manufacturer's written instructions.

C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

3.05 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

END OF SECTION

SECTION 22 05 53

IDENTIFICATION FOR MECHANICAL AND PLUMBING PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:
   1. Equipment nameplates.
   2. Equipment signs.
   3. Access panel and door markers.
   4. Pipe markers.
   5. Warning tags.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Valve numbering scheme.

D. Valve Schedules: For each piping system. Furnish extra copies (in addition to mounted copies) to include in maintenance manuals.

1.04 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

1.05 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 PRODUCTS

2.01 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal, with data engraved or stamped, for permanent attachment on equipment.
   1. Data:
      a. Manufacturer, product name, model number, and serial number.
      b. Capacity, operating and power characteristics, and essential data.
      c. Labels of tested compliances.
   2. Location: Accessible and visible.
   3. Fasteners: As required to mount on equipment.

B. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.
   1. Data: Instructions for operation of equipment and for safety procedures.
   2. Engraving: Manufacturer's standard letter style, 1/4” or larger with terms to match equipment identification.
   3. Thickness: 1/8 inch, unless otherwise indicated.
   4. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

C. Access Panel and Door Markers: 1/16” thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8” center hole for attachment.
   1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.02 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Bradley.
      b. Kolbi.
      c. Prior approved.
   2. Colors: Comply with ASME A13.1, unless otherwise indicated.
   3. Lettering: Use piping system terms indicated and abbreviate only as necessary for each application length.
   4. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.
   5. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers at least three times letter height and of length required for label.
   6. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Self-Adhesive Pipe Markers: Plastic with pressure-sensitive, permanent-type, self-adhesive back.

PART 3 EXECUTION

3.01 APPLICATIONS, GENERAL

A. Products specified are for applications referenced in other Division 22 and 23 Sections. If more than single-type material, device, or label is specified for listed applications, selection is Installer's option.

3.02 EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:
   1. Fuel-burning units, including boilers, furnaces, heaters, etc.
   2. Pumps, compressors, chillers, condensers, and similar motor-driven units.
   3. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
   4. Fans, blowers, primary balancing dampers, and mixing boxes.
   5. Packaged HVAC central-station and zone-type units.

B. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.
   1. Identify mechanical equipment with black equipment markers with white lettering.
   2. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
   3. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
   4. Include signs for the following general categories of equipment:
      a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
      b. Fuel-burning units, including boilers, furnaces, heaters, etc.
      c. Pumps, compressors, chillers, condensers, and similar motor-driven units.
      d. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
      e. Fans, blowers, primary balancing dampers, and mixing boxes.
      f. Packaged HVAC central-station and zone-type units.
      g. Tanks and pressure vessels.
      h. Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

C. Install access panel markers with screws on equipment access panels.

3.03 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

B. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations as follows:
   1. Near each valve and control device.
   2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
   3. Near penetrations through walls, floors, ceilings, and nonaccessible enclosures.
   4. At access doors, manholes, and similar access points that permit view of concealed piping.
   5. Near major equipment items and other points of origination and termination.
   6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
   7. On piping above removable acoustical ceilings. Omit intermediately spaced markers.

C. Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.04 ADJUSTING

A. Relocate mechanical identification materials and devices that have become visually blocked by other work.

3.05 CLEANING

A. Clean faces of mechanical identification devices and glass frames of valve schedules.

END OF SECTION

SECTION 22 07 00

HVAC AND PLUMBING INSULATION

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Insulation Materials:
      a. Mineral fiber.
   2. Insulating cements.
   3. Adhesives.
   4. Lagging adhesives.
   5. Factory-applied jackets.
   6. Field-applied jackets.
   7. Tapes.
   8. Securements.
   9. Corner angles.

B. Related Sections:
   1. Division 23 Section "Metal Ducts" for duct liners.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, thickness, and jackets (both factory and field applied, if any).

B. Qualification Data: For qualified Installer.

C. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

D. Field quality-control reports.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Fire-Test-Response Characteristics: FM Approved insulation and related materials shall have fire-test-response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
   2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.06 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 22 and 23 Section "Hangers and Supports."

B. Coordinate clearance requirements with piping Installer for piping insulation application, duct Installer for duct insulation application, and equipment Installer for equipment insulation application. Before preparing piping and ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

1.07 SCHEDULING

A. Schedule insulation application after pressure testing systems. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 PRODUCTS

2.01 INSULATION MATERIALS

A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type I. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Duct insulation shall have a minimum R value = 5 for installation in an unconditioned space, and a minimum R value = 8 for installation outdoors. Provide a weather protective sheet metal jacket for outdoor installation.
   2. Products: Subject to compliance with requirements, provide one of the following:
      a. CertainTeed Corp.; Duct Wrap.
      b. Johns Manville; Microlite.
      c. Knauf Insulation; Duct Wrap.
      d. Manson Insulation Inc.; Alley Wrap.
      e. Owens Corning; All-Service Duct Wrap.
      f. Prior approved equal.

G. Mineral-Fiber, Preformed Pipe Insulation:
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Fibrex Insulations Inc.; Coreplus 1200.
      b. Johns Manville; Micro-Lok.
      c. Knauf Insulation; 1000 Pipe Insulation.
      d. Manson Insulation Inc.; Alley-K.
      e. Owens Corning; Fiberglas Pipe Insulation.
      f. Prior approved equal.
   2. Type I, 850 deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A.

2.02 INSULATING CEMENTS

A. Mineral-Fiber Insulating Cement: Comply with ASTM C 195.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Insulco, Division of MFS, Inc.; Triple I.
      b. P. K. Insulation Mfg. Co., Inc.; Super-Stik.
      c. Prior approved equal.

2.03 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.

B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Childers Products, Division of ITW; CP-127.
      b. Foster Products Corporation, H. B. Fuller Company; 85-60/ 85-70.
      c. Marathon Industries, Inc.; 225.
      d. Mon-Eco Industries, Inc.; 22-25.
      e. Prior approved equal.

2.04 LAGGING ADHESIVES

A. Description: Comply with MIL-A-3316C Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Childers Products, Division of H.B. Fuller; CR 50 AHV2.
      b. Foster Products Corporation, H. B. Fuller Company; 30-36.
      c. Vimasco Corporation; 713 and 714.
      d. Prior approved equal.
   2. Service Temperature Range: Minus 50 to plus 180 deg F.
   3. Color: White.

2.05 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
   1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
   2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
   3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.

2.06 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0836.
      b. Compac Corp.; 104 and 105.
      c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
      d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
      e. Prior approved equal.
   2. Width: 3 inches.
   3. Thickness: 11.5 mils.
   4. Adhesion: 90 ounces force/inch in width.
   5. Elongation: 2 percent.
   6. Tensile Strength: 40 lbf/inch in width.
   7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
      b. Compac Corp.; 110 and 111.

c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
e. Prior approved equal.

2. Width: 3 inches.
3. Thickness: 6.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
8. Adhesion: 64 ounces force/inch in width.
9. Elongation: 500 percent.
10. Tensile Strength: 18 lbf/inch in width.

C. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Products: Subject to compliance with requirements, provide one of the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
b. Compac Corp.; 120.
c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF.
d. Venture Tape; 3520 CW.
e. Prior approved equal.
2. Width: 2 inches.
3. Thickness: 3.7 mils.
4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

2.07 SECUREMENTS

A. Bands:
1. Products: Subject to compliance with requirements, provide one of the following:
a. Childers Products; Bands.
b. PABCO Metals Corporation; Bands.
c. RPR Products, Inc.; Bands.
d. Prior approved equal.
2. Stainless Steel: ASTM A 167 or ASTM A 240/A 240M, Type 304 or Type 316; 0.015 inch thick, 1/2 inch wide.
3. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 1/2 inch wide.
4. Springs: Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application.

2.08 CORNER ANGLES

A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D 1784, Class 16354-C. White or color-coded to match adjacent surface.

B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B 209, Alloy 3003, 3005, 3105 or 5005; Temper H-14.

C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A 167 or ASTM A 240/A 240M, Type 304 or 316.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.
   1. Verify that systems and equipment to be insulated have been tested and are free of defects.
   2. Verify that surfaces to be insulated are clean and dry.
   3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Surface Preparation: Clean and prepare surfaces to be insulated.

C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.03 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment, ducts and fittings, and piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment, duct system, and pipe system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during application and finishing.

H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

I. Install insulation with least number of joints practical.

J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:
   1. Draw jacket tight and smooth.
   2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
   3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
      a. For below ambient services, apply vapor-barrier mastic over staples.
   4. Cover joints and seams with tape as recommended by insulation material manufacturer to maintain vapor seal.
   5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct and pipe flanges and fittings.

M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

P. For above ambient services, do not install insulation to the following:
   1. Vibration-control devices.
   2. Testing agency labels and stamps.
   3. Nameplates and data plates.
   4. Manholes.
   5. Handholes.
   6. Cleanouts.

3.04 GENERAL PIPE INSULATION INSTALLATION

A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
   1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated.
   2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
   3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
   4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
   5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.
   6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
   7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below ambient services and a breather mastic for above ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.

8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
9. Stencil or label the outside insulation jacket of each union with the word "UNION." Match size and color of pipe labels.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
3. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body.
4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.05 MINERAL-FIBER INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above ambient surfaces, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below ambient surfaces, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:
   1. Install preformed pipe insulation to outer diameter of pipe flange.
   2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
   3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
   4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:
   1. Install preformed sections of same material as straight segments of pipe insulation when available.
   2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:
   1. Install preformed sections of same material as straight segments of pipe insulation when available.
   2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
   3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
   4. Install insulation to flanges as specified for flange insulation application.

E. Blanket Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
   1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
   2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
   3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
      a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
      b. On duct sides with dimensions larger than 18 inches, place pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
      c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
      d. Do not overcompress insulation during installation.
      e. Impale insulation over pins and attach speed washers.
      f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from 1 edge and 1 end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
    a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
    b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to 2 times the insulation thickness but not less than 3 inches.
5. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of 18 inches o.c.
6. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
7. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch- wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.06 FIELD-APPLIED JACKET INSTALLATION

A. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.
    1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

3.07 FIELD QUALITY CONTROL

A. Tests and Inspections:
    1. Inspect ductwork, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location(s) for each duct system defined in the "Duct Insulation Schedule, General" Article.
    2. Inspect field-insulated equipment, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location(s) for each type of equipment defined in the "Equipment Insulation Schedule" Article. For large equipment, remove only a portion adequate to determine compliance.
    3. Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, two locations of threaded strainers, two locations of welded strainers, three locations of threaded valves, and three locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.

B. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.08 DUCT INSULATION SCHEDULE, GENERAL

A. Plenums and Ducts Requiring Insulation:
   1. Indoor, concealed supply and outdoor air.
   2. Indoor, exposed supply and outdoor air.
   3. Indoor, concealed return, Air.
   4. Indoor, exposed return, Air.
   5. Indoor, concealed, Type I, commercial, kitchen hood exhaust.
   6. Indoor, concealed exhaust.
   7. Indoor, exposed exhaust.

B. Items Not Insulated:
   1. Fibrous-glass ducts.
   2. Metal ducts with duct liner of sufficient thickness to comply with energy code and ASHRAE/IESNA 90.1.
   3. Factory-insulated flexible ducts.
   4. Factory-insulated plenums and casings.
   5. Flexible connectors.
   6. Vibration-control devices.
   7. Factory-insulated access panels and doors.

3.09 INDOOR DUCT AND PLENUM INSULATION SCHEDULE

A. Concealed, round and flat-oval duct insulation shall be the following:
   1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density.

B. Concealed, low pressure, round rectangular, and flat-oval exhaust-air duct insulation shall be the following:
   1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density.

C. Rectangular, low pressure, supply-air duct insulation shall be lined per Section “Metal Ducts”.

D. Rectangular, return-air duct insulation shall be lined per Section “Metal Ducts”.

E. Concealed, Type I, Commercial, Kitchen Hood Exhaust Duct and Plenum Insulation: Fire-rated blanket or board; thickness as required to achieve 2-hour fire rating.

F. Exposed or medium pressure, round and flat-oval, supply-air, and return air duct insulation shall be a perforated linear. See Section “Metal Ducts”.

3.10 PIPING INSULATION SCHEDULE, GENERAL

A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
   1. Drainage piping located in crawl spaces.
   2. Underground piping.
   3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.
   4. Vertical roof drain piping.

C. Piping System insulation:
   1. Hydronic Piping - Mineral Fiber, per chart.
   2. Domestic Cold Water Piping -Mineral Fiber, ½"
   3. Domestic Hot Water Piping -Mineral Fiber, per chart
   4. Horizontal Roof Drain Piping - Mineral Fiber, 1/2".
   5. Refrigerant Piping - Flexible elastomeric, 1".

3.11 INDOOR PIPING INSULATION SCHEDULE

A. Minimum Pipe Insulation Thickness per 2021 IECC

Fluid Operating Temperature Range and usage (F°)	Insulation Conductivity		Nominal Pipe or Tube Size (inches)				
	Conductivity Btu-in./(h-ft²-F°)	Mean Rating Temp. F°	<1	1 to <1-1/2	1-1/2 to <4	4 to <8	≥8
Heating Systems (Steam, Steam Condensate, and Hot Water)							
>350	0.32-0.34	250	4.5	5.0	5.0	5.0	5.0
251-350	0.29-0.32	200	3.0	4.0	4.5	4.5	4.5
201-250	0.27-0.30	150	2.5	2.5	2.5	3.0	3.0
141-200	0.25-0.29	125	1.5	1.5	2.0	2.0	2.0
105-140	0.21-0.28	100	1.0	1.0	1.5	1.5	1.5
Cooling Systems (Chilled Water, Brine, and Refrigerant)							
40-60	0.21-0.27	75	0.5	0.5	1.0	1.0	1.0
<40	0.20-0.26	50	0.5	1.0	1.0	1.0	1.5

3.12 INDOOR, FIELD-APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Piping, Exposed:
   1. PVC: 20 mils thick.

D. Minimum Pipe Insulation Thickness from ANSI/ASHRAE/IESNA Standard 90.1-2019, with modifications per 2021 IECC

3.13 DUCT INSULATION SCHEDULE

A. Minimum Duct Insulation R-Value, Cooling and Heating Supply Ducts and Return Ducts ANSI/ASHRAE/IES Standard 90.1-2019.

Duct Location							
Climate Zone	Exterior	Ventilated Attic	Unvented Attic Above Insulated Ceiling	Unvented Attic with Roof Insu-lation	Unconditioned Space	Indirectly Conditioned Space	Buried
Heating- Only Ducts							
5	R-6	R-3.5	none	none	none	none	R-3.5
Cooling-Only Ducts							
5,6	R-3.5	R-1.9	R-3.5	R-1.9	R-1.9	none	none
Return Ducts							
1 to 8	R-3.5	R-3.5	R-3.5	none	none	none	none
Combine Heating and Cooling							
Supply Ducts							
5	R-6	R-6	R-6	R-1.9	R-3.5	none	R-3.5
Return Ducts							
1 to 8	R-3.5	R-3.5	R-3.5	none	none	none	none

3.14 OUTDOOR, FIELD APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Exterior piping, Exposed:
   1. Aluminum jacket.

END OF SECTION

SECTION 22 11 16

DOMESTIC WATER PIPING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Under-building slab and aboveground domestic water pipes, tubes, fittings, and specialties inside the building.
   2. Flexible connectors.
   3. Escutcheons.
   4. Sleeves and sleeve seals.
   5. Wall penetration systems.

1.03 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Domestic water piping and support and installation shall withstand effects of earthquake motions determined according to 2012 IBC.

1.04 SUBMITTALS

A. Product Data: For the following products:
   1. Specialty valves.
   2. Transition fittings.
   3. Dielectric fittings.
   4. Escutcheons.
   5. Sleeves and sleeve seals.

B. Water Samples: Specified in "Cleaning" Article.

C. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 61 for potable domestic water piping and components.

1.06 PROJECT CONDITIONS

A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
   1. Notify Owner no fewer than two days in advance of proposed interruption of water service.
   2. Do not proceed with interruption of water service without Owner's written permission.

1.07 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

PART 2 PRODUCTS

2.01 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 COPPER TUBE AND FITTINGS

A. Hard Copper Tube: ASTM B 88, Type L water tube, drawn temper.
   1. Cast-Copper Solder-Joint Fittings: ASME B16.18, pressure fittings.
   2. Wrought-Copper Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
   3. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.
   4. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

2.03 PIPING JOINING MATERIALS

A. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

B. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.

2.04 ESCUTCHEONS

A. General: Manufactured ceiling, floor, and wall escutcheons and floor plates.

B. One Piece, Cast Brass: Polished, chrome-plated finish with setscrews.

C. One Piece, Deep Pattern: Deep-drawn, box-shaped brass with chrome-plated finish.

D. One Piece, Stamped Steel: Chrome-plated finish with setscrew or spring clips.

E. Split Casting, Cast Brass: Polished, chrome-plated finish with concealed hinge and setscrew.

F. Split Plate, Stamped Steel: Chrome-plated finish with concealed hinge, setscrew or spring clips.

G. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.

H. Split-Casting Floor Plates: Cast brass with concealed hinge.

2.05 SLEEVES

A. Cast-Iron Wall Pipes: Fabricated of cast iron, and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Galvanized-Steel-Sheet Sleeves: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

C. Molded-PE Sleeves: Reusable, PE, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

D. Molded-PVC Sleeves: Permanent, with nailing flange for attaching to wooden forms.

E. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.

F. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc-coated, with plain ends.

G. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
   1. Underdeck Clamp: Clamping ring with setscrews.

2.06 SLEEVE SEALS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Advance Products & Systems, Inc.
   2. Calpico, Inc.
   3. Metraflex, Inc.
   4. Pipeline Seal and Insulator, Inc.
   5. Prior approved equal.

B. Description: Modular sealing element unit, designed for field assembly, used to fill annular space between pipe and sleeve.
   1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   2. Pressure Plates: Carbon steel.
   3. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, of length required to secure pressure plates to sealing elements.

2.07 GROUT

A. Standard: ASTM C 1107, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

B. Characteristics: Nonshrink; recommended for interior and exterior applications.

C. Design Mix: 5000-psi, 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

PART 3 EXECUTION

3.01 EARTHWORK

A. Comply with requirements in Division 2 Section "Earthwork" for excavating, trenching, and backfilling.

3.02 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install copper tubing under building slab according to CDA's "Copper Tube Handbook."

C. Install ductile-iron piping under building slab with restrained joints according to AWWA C600 and AWWA M41.

D. Install underground copper tube and ductile-iron pipe in PE encasement according to ASTM A 674 or AWWA C105.

E. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve, inside the building at each domestic water service entrance. Comply with requirements in Division 22 and 23 Section "Meters and Gages for Plumbing Piping" for pressure gages and Division 22 Section "Domestic Water Piping Specialties" for drain valves and strainers.

F. Install shutoff valve immediately upstream of each dielectric fitting.

G. Install water-pressure-reducing valves downstream from shutoff valves. Comply with requirements in Division 22 Section "Domestic Water Piping Specialties" for pressure-reducing valves.

H. Install domestic water piping level without pitch and plumb.

I. Rough-in domestic water piping for water-meter installation according to utility company's requirements.

J. Install seismic restraints on piping. Comply with requirements in Division 22 and 23 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

K. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

L. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

M. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.

N. Install piping adjacent to equipment and specialties to allow service and maintenance.

O. Install piping to permit valve servicing.

P. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than system pressure rating used in applications below unless otherwise indicated.

Q. Install piping free of sags and bends.

R. Install fittings for changes in direction and branch connections.

S. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.

T. Install thermostats in hot-water circulation piping. Comply with requirements in Division 22 Section "Domestic Water Pumps" for thermostats.

U. Install thermometers on outlet piping from each water heater. Comply with requirements in Division 22 and 23 Section "Meters and Gages for Plumbing Piping" for thermometers.

3.03 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

D. Brazed Joints: Join copper tube and fittings according to CDA's "Copper Tube Handbook," "Brazed Joints" Chapter.

E. Soldered Joints: Apply ASTM B 813, water-flushable flux to end of tube. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."

F. Flanged Joints: Select appropriate asbestos-free, nonmetallic gasket material in size, type, and thickness suitable for domestic water service. Join flanges with gasket and bolts according to ASME B31.9.

G. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.04 VALVE INSTALLATION

A. General-Duty Valves: Comply with requirements in Division 22 and 23 Section "General-Duty Valves for Plumbing Piping" for valve installations.

B. Install shutoff valve close to water main on each branch and riser serving plumbing fixtures or equipment, on each water supply to equipment, and on each water supply to plumbing fixtures that do not have supply stops. Use ball or gate valves for piping NPS 2 and smaller. Use butterfly or gate valves for piping NPS 2-1/2 and larger.

C. Install drain valves for equipment at base of each water riser, at low points in horizontal piping, and where required to drain water piping. Drain valves are specified in Division 22 Section "Domestic Water Piping Specialties."
   1. Hose-End Drain Valves: At low points in water mains, risers, and branches.
   2. Stop-and-Waste Drain Valves: Instead of hose-end drain valves where indicated.

D. Install balancing valve in each hot-water circulation return branch and discharge side of each pump and circulator. Set balancing valves partly open to restrict but not stop flow. Use ball valves for piping NPS 2 and smaller and butterfly valves for piping NPS 2-1/2 and larger. Comply with requirements in Division 22 Section "Domestic Water Piping Specialties" for balancing valves.

3.05 TRANSITION FITTING INSTALLATION

A. Install transition couplings at joints of dissimilar piping.

B. Transition Fittings in Underground Domestic Water Piping:
   1. NPS 1-1/2 and Smaller: Fitting-type coupling.
   2. NPS 2 and Larger: Sleeve-type coupling.

3.06 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements in Division 22 and 23 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

B. Comply with requirements in Division 22 and 23 Section "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support products and installation.
   1. Vertical Piping: MSS Type 8 or 42, clamps.

2. Individual, Straight, Horizontal Piping Runs:
   a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
   b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
   c. Longer Than 100 Feet If Indicated: MSS Type 49, spring cushion rolls.
3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced one size for double-rod hangers, to a minimum of 3/8 inch.

E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 3/4 and Smaller: 60 inches with 3/8-inch rod.
2. NPS 1 and NPS 1-1/4: 72 inches with 3/8-inch rod.
3. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
4. NPS 2-1/2: 108 inches with 1/2-inch rod.
5. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.
6. NPS 6: 10 feet with 5/8-inch rod.
7. NPS 8: 10 feet with 3/4-inch rod.

F. Install supports for vertical copper tubing every 10 feet.

G. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 1-1/4 and Smaller: 84 inches with 3/8-inch rod.
2. NPS 1-1/2: 108 inches with 3/8-inch rod.
3. NPS 2: 10 feet with 3/8-inch rod.
4. NPS 2-1/2: 11 feet with 1/2-inch rod.
5. NPS 3 and NPS 3-1/2: 12 feet with 1/2-inch rod.
6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod.
7. NPS 6: 12 feet with 3/4-inch rod.
8. NPS 8 to NPS 12: 12 feet with 7/8-inch rod.

H. Install supports for vertical steel piping every 15 feet.

I. Support piping and tubing not listed in this article according to MSS SP-69 and manufacturer's written instructions.

3.07 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.

D. Connect domestic water piping to water-service piping with shutoff valve; extend and connect to the following:
   1. Domestic Water Booster Pumps: Cold-water suction and discharge piping.
   2. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
   3. Plumbing Fixtures: Cold- and hot-water supply piping in sizes indicated, but not smaller than required by plumbing code. Comply with requirements in Division 15 plumbing fixture Sections for connection sizes.
   4. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 and larger.

3.08 ESCUTCHEON INSTALLATION

A. Install escutcheons for penetrations of walls, ceilings, and floors.

B. Escutcheons for New Piping:
   1. Piping with Fitting or Sleeve Protruding from Wall: One piece, deep pattern.
   2. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish.
   3. Bare Piping at Ceiling Penetrations in Finished Spaces: One piece, cast brass with polished chrome-plated finish.
   4. Bare Piping in Unfinished Service Spaces: One piece, stamped steel with set screw or spring clips.
   5. Bare Piping in Equipment Rooms: One piece, stamped steel with set screw or spring clips.
   6. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece floor plate.

C. Escutcheons for Existing Piping:
   1. Chrome-Plated Piping: Split casting, cast brass with chrome-plated finish.
   2. Insulated Piping: Split plate, stamped steel with concealed or exposed-rivet hinge and spring clips.
   3. Bare Piping at Wall and Floor Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish.
   4. Bare Piping at Ceiling Penetrations in Finished Spaces: Split casting, cast brass with chrome-plated finish.
   5. Bare Piping in Unfinished Service Spaces: Split plate, stamped steel with exposed-rivet hinge and set screw or spring clips.
   6. Bare Piping in Equipment Rooms: Split plate, stamped steel with set screw or spring clips.
   7. Bare Piping at Floor Penetrations in Equipment Rooms: Split-casting floor plate.

3.09 SLEEVE INSTALLATION

A. General Requirements: Install sleeves for pipes and tubes passing through penetrations in floors, partitions, roofs, and walls.

B. Sleeves are not required for core-drilled holes.

C. Permanent sleeves are not required for holes formed by removable PE sleeves.

D. Cut sleeves to length for mounting flush with both surfaces unless otherwise indicated.

E. Install sleeves in new partitions, slabs, and walls as they are built.

F. For interior wall penetrations, seal annular space between sleeve and pipe or pipe insulation using joint sealants appropriate for size, depth, and location of joint.

G. For exterior wall penetrations above grade, seal annular space between sleeve and pipe using joint sealants appropriate for size, depth, and location of joint.

H. For exterior wall penetrations below grade, seal annular space between sleeve and pipe using sleeve seals specified in this Section.

I. Seal space outside of sleeves in concrete slabs and walls with grout.

J. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation unless otherwise indicated.

K. Install sleeve materials according to the following applications:
   1. Sleeves for Piping Passing through Concrete Floor Slabs: Steel pipe.
   2. Sleeves for Piping Passing through Concrete Floor Slabs of Mechanical Equipment Areas or Other Wet Areas: Steel pipe.
      a. Extend sleeves 2 inches above finished floor level.
      b. For pipes penetrating floors with membrane waterproofing, extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Comply with requirements in Division 7 Section "Sheet Metal Flashing and Trim" for flashing.
   3. Sleeves for Piping Passing through Gypsum-Board Partitions:
      a. PVC pipe sleeves for pipes smaller than NPS 6.
      b. Galvanized-steel sheet sleeves for pipes NPS 6 and larger.
      c. Exception: Sleeves are not required for water supply tubes and waste pipes for individual plumbing fixtures if escutcheons will cover openings.
   4. Sleeves for Piping Passing through Concrete Roof Slabs: Steel pipe Insert type.
   5. Sleeves for Piping Passing through Exterior Concrete Walls:
      a. Steel pipe sleeves for pipes smaller than NPS 6.
      b. Cast-iron wall pipe sleeves for pipes NPS 6 and larger.
      c. Install sleeves that are large enough to provide 1-inch annular clear space between sleeve and pipe or pipe insulation when sleeve seals are used.
      d. Do not use sleeves when wall penetration systems are used.

6. Sleeves for Piping Passing through Interior Concrete Walls:
    a. Steel pipe sleeves for pipes smaller than NPS 6.
    b. Galvanized-steel sheet sleeves for pipes NPS 6 and larger.

L. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements in Division 7 Section "Through-Penetration Firestop Systems" for firestop materials and installations.

3.10 SLEEVE SEAL INSTALLATION

A. Install sleeve seals in sleeves in exterior concrete walls at water-service piping entries into building.

B. Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble sleeve seal components and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.11 WALL PENETRATION SYSTEM INSTALLATION

A. Install wall penetration systems in new, exterior concrete walls.

B. Assemble wall penetration system components with sleeve pipe. Install so that end of sleeve pipe and face of housing are flush with wall. Adjust locking devices to secure sleeve pipe in housing.

3.12 IDENTIFICATION

A. Identify system components. Comply with requirements in Division 22 and 23 Section "Identification for Plumbing Piping and Equipment" for identification materials and installation.

B. Label pressure piping with system operating pressure.

3.13 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Piping Inspections:
    1. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
    2. During installation, notify authorities having jurisdiction at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
        a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
        b. Final Inspection: Arrange final inspection for authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

3. Reinspection: If authorities having jurisdiction find that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

C. Piping Tests:
1. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
2. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
3. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
4. Cap and subject piping to static water pressure of 100 psig, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
5. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
6. Prepare reports for tests and for corrective action required.

D. Domestic water piping will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.14 ADJUSTING

A. Perform the following adjustments before operation:
1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.
   a. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide flow of hot water in each branch.
   b. Adjust calibrated balancing valves to flows indicated.
5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
8. Check plumbing specialties and verify proper settings, adjustments, and operation.

3.15 CLEANING

A. Clean and disinfect potable and non-potable domestic water piping as follows:
   1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
   2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
      a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
      b. Fill and isolate system according to either of the following:
         1) Fill system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
         2) Fill system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for three hours.
      c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
      d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

B. Clean non-potable domestic water piping as follows:
   1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
   2. Use purging procedures prescribed by authorities having jurisdiction or; if methods are not prescribed, follow procedures described below:
      a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
      b. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

C. Prepare and submit reports of purging and disinfecting activities.

D. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

3.16 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.

B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.

C. Aboveground domestic water piping shall be the following:
   1. Hard copper tube, ASTM B 88, Type L; cast- or wrought- copper solder-joint fittings; and soldered joints.

3.17 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
   1. Shutoff Duty: Use ball valves for piping NPS 2 and smaller. Use butterfly, ball, or gate valves with flanged ends for piping NPS 2-1/2 and larger.
   2. Throttling Duty: Use ball or globe valves for piping NPS 2 and smaller. Use butterfly or ball valves with flanged ends for piping NPS 2-1/2 and larger.
   3. Hot-Water Circulation Piping, Balancing Duty: Memory-stop balancing valves.
   4. Drain Duty: Hose-end drain valves.

B. Use check valves to maintain correct direction of domestic water flow to and from equipment.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 11 19

DOMESTIC WATER PIPING SPECIALTIES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following domestic water piping specialties:
   1. Vacuum breakers.
   2. Strainers.
   3. Hose bibbs.
   4. Drain valves.
   5. Circuit Setters
   6. Backflow Preventers
   7. Pressure Reducing Valves
   8. Mixing Valves
   9. Hammer Arrestors
   10. Air Vents

1.03 PERFORMANCE REQUIREMENTS

A. Minimum Working Pressure for Domestic Water Piping Specialties: 125 psig, unless otherwise indicated.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For domestic water piping specialties to include in operation, and maintenance manuals.

1.05 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. NSF Compliance:
   1. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9."

PART 2 PRODUCTS

2.01 VACUUM BREAKERS

A. Pipe-Applied, Atmospheric-Type Vacuum Breakers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Ames Co.
      b. Cash Acme.
      c. Conbraco Industries, Inc.
      d. FEBCO; SPX Valves & Controls.
      e. Rain Bird Corporation.
      f. Toro Company (The); Irrigation Div.
      g. Watts Industries, Inc.; Water Products Div.
      h. Zurn Plumbing Products Group; Wilkins Div.
      i. Prior approved equal.
   2. Standard: ASSE 1001.
   3. Size: NPS 1/4 to NPS 3, as required to match connected piping.
   4. Body: Bronze.
   5. Inlet and Outlet Connections: Threaded.
   6. Finish: Rough bronze.

B. Hose-Connection Vacuum Breakers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Arrowhead Brass Products, Inc.
      b. Cash Acme.
      c. Conbraco Industries, Inc.
      d. Legend Valve.
      e. MIFAB, Inc.
      f. Prier Products, Inc.
      g. Watts Industries, Inc.; Water Products Div.
      h. Woodford Manufacturing Company.
      i. Zurn Plumbing Products Group; Light Commercial Operation.
      j. Zurn Plumbing Products Group; Wilkins Div.
      k. Prior approved equal.
   2. Standard: ASSE 1011.
   3. Body: Bronze, nonremovable, with manual drain.
   4. Outlet Connection: Garden-hose threaded complying with ASME B1.20.7.
   5. Finish: Chrome or nickel plated.

2.02 STRAINERS FOR DOMESTIC WATER PIPING

A. Y-Pattern Strainers:
   1. Pressure Rating: 125 psig minimum, unless otherwise indicated.
   2. Body: Bronze for NPS 2 and smaller; cast iron with interior lining complying with AWWA C550 or FDA-approved, epoxy coating and for NPS 2-1/2 and larger.
   3. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
   4. Screen: Stainless steel with round perforations, unless otherwise indicated.
   5. Drain: Factory-installed, hose-end drain valve.

2.03 HOSE BIBBS

A. Hose Bibbs:
   1. Standard: ASME A112.18.1 for sediment faucets.
   2. Body Material: Bronze.
   3. Seat: Bronze, replaceable.
   4. Supply Connections: NPS 1/2 or NPS 3/4 threaded or solder-joint inlet.
   5. Outlet Connection: Garden-hose thread complying with ASME B1.20.7.
   6. Pressure Rating: 125 psig.
   7. Vacuum Breaker: Integral nonremovable, drainable, hose-connection vacuum breaker complying with ASSE 1011.
   8. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
   9. Finish for Service Areas: Chrome or nickel plated.
   10. Finish for Finished Rooms: Chrome or nickel plated.
   11. Operation for Equipment Rooms: Wheel handle or operating key.
   12. Operation for Service Areas: Wheel handle.
   13. Operation for Finished Rooms: Operating key.
   14. Include operating key with each operating-key hose bibb.
   15. Include integral wall flange with each chrome- or nickel-plated hose bibb.

2.04 DRAIN VALVES

A. Ball-Valve-Type, Threaded-End Drain Valves:
   1. Standard: MSS SP-110 for standard-port, two-piece ball valves.
   2. Pressure Rating: 400-psig minimum CWP.
   3. Size: 1.5”
   4. Body: Copper alloy.
   5. Ball: Chrome-plated brass.
   6. Seats and Seals: Replaceable.
   7. Handle: Vinyl-covered steel.
   8. Inlet: Threaded or solder joint.
   9. Outlet: Threaded, short nipple cap with brass chain.

2.05 CIRCUIT SETTERS

A. Domestic Hot Water Recirc circuit setters shall be thermostatic balance valve. Shall be one of the following manufacturers.
   1. Bell and Gossett Temp Setter or equal by:
   2. Caleffi
   3. Prior approved equal.

2.06 BACKFLOW PREVENTERS

A. Reduced-Pressure-Principle Backflow Preventers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Ames Co.
      b. Conbraco Industries, Inc.
      c. FEBCO; SPX Valves & Controls.
      d. Flomatic Corporation.
      e. Watts Industries, Inc.; Water Products Div.
      f. Zurn Plumbing Products Group; Wilkins Div.
      g. Prior approved equal.
   2. Standard: ASSE 1013.
   3. Operation: Continuous-pressure applications.
   4. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range.
   5. Body: Bronze for NPS 2 and smaller; steel with interior lining complying with AWWA C550 or that is FDA approved for NPS 2-1/2 and larger.
   6. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
   7. Accessories:
      a. Valves: Ball type with threaded ends on inlet and outlet ofNPS 2 and smaller; outside screw and yoke gate-type with flanged ends on inlet and outlet of NPS 2-1/2 and larger.
      b. Air-Gap Fitting: ASME A112.1.2, matching backflow-preventer connection.

B. Hose-Connection Backflow Preventers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Conbraco Industries, Inc.
      b. Watts Industries, Inc.; Water Products Div.
      c. Woodford Manufacturing Company.
      d. Prior approved equal.
   2. Standard: ASSE 1052.
   3. Operation: Up to 10-foot head of water back pressure.
   4. Inlet Size: NPS 1/2 or NPS 3/4.
   5. Outlet Size: Garden-hose thread complying with ASME B1.20.7.
   6. Capacity: At least 3-gpm flow.

2.07 WATER PRESSURE-REDUCING VALVES

A. Water Regulators:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Cash Acme.
      b. Conbraco Industries, Inc.
      c. Honeywell Water Controls.
      d. Watts Industries, Inc.; Water Products Div.
      e. Zurn Plumbing Products Group; Wilkins Div.
      f. Prior approved equal.
   2. Standard: ASSE 1003.
   3. Pressure Rating: Initial working pressure of 150 psig.
   4. Body: Bronze for NPS 2 and smaller; cast iron with interior lining complying with AWWA C550 or that is FDA approved for NPS 2-1/2 and NPS 3.
   5. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and NPS 3.

2.08 TEMPERATURE-ACTUATED WATER MIXING VALVES

A. Primary, Electronic, Water Mixing Valves:
   1. Approved Manufacturers:
      a. Acorn Basyc
      b. Armstrong Brain
      c. Caleffi
      d. Watts
      e. Prior approved equal
   2. Standard: ASSE 1017.
   3. Pressure Rating: 125 psig minimum unless otherwise indicated.
   4. Type: Exposed, electronically controlled, water mixing valve.
   5. Material: Bronze body with corrosion-resistant interior components.
   6. Connections: Threaded or solder joint inlets and outlet.
   7. Accessories: Manual temperature override control, check stops on hot- and cold-water supplies, and automatic hot- and cold-water shutoff upon inlet supply failure.
   8. Tempered-Water Setting: 120 .
   9. Pressure Drop at Design Flow Rate: 10 .
   10. Valve Finish: Bronze.
   11. Digital temperature control and monitoring module.
      a. Controls temperature within plus or minus 2 deg F.
      b. User programmable at module or through BAS.
      c. ASHRAE 188 compliance.
      d. Local and remote monitoring.
      e. BACNet protocol language(s).
      f. 115 V ac, 60 Hz.

g. Battery backup.

B. Individual-Fixture, Water Tempering Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Sloan.
b. Watts.
c. Prior approved equal.
2. Standard: ASSE 1016, thermostatically controlled water tempering valve.
3. Pressure Rating: 125 psig (860 kPa) minimum, unless otherwise indicated.
4. Body: Bronze body with corrosion-resistant interior components.
5. Temperature Control: Adjustable.
6. Inlets and Outlet: Threaded.
7. Finish: Rough or chrome-plated bronze.
8. Tempered-Water Setting: 110E F.

2.09 WALL HYDRANTS

A. Nonfreeze Wall Hydrants:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. MIFAB, Inc.
b. Josam Company.
c. Prier Products, Inc.
d. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
e. Tyler Pipe; Wade Div.
f. Watts Drainage Products Inc.
g. Woodford Manufacturing Company.
h. Zurn Plumbing Products Group; Light Commercial Operation.
i. Zurn Plumbing Products Group; Specification Drainage Operation.
j. Or equal by.

B. Standard: ASME A112.21.3M for concealed-outlet, self-draining wall hydrants.
1. Pressure Rating: 125 psig (860 kPa).
2. Operation: Loose key.
3. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
4. Inlet: NPS 3/4 or NPS 1 (DN 20 or DN 25).
5. Outlet: Concealed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
6. Box: Deep, flush mounting with cover.
7. Box and Cover Finish: Chrome plated.
8. Outlet: Exposed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.

9. Nozzle and Wall-Plate Finish: Polished nickel bronze.
10. Operating Keys(s): Two with each wall hydrant.

C. Vacuum Breaker Wall Hydrants:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Arrowhead Brass Products, Inc.
      b. Mansfield Plumbing Products LLC.
      c. McDonald, A. Y. Mfg. Co.
      d. Prier Products, Inc.
      e. Smith, Jay. R. Mfg. Co.; Division of Smith Industries, Inc.
      f. Watts Industries, Inc.; Water Products Div.
      g. Woodford Manufacturing Company.
      h. Zurn Plumbing Products Group; Light Commercial Operation.
      i. Or equal by.
   2. Standard: ASSE 1019, Type A or Type B.
   3. Type: Freeze-resistant, automatic draining with integral air-inlet valve.
   4. Classification: Type B, for automatic draining with hose removed or with hose attached and nozzle closed.
   5. Pressure Rating: 125 psig (860 kPa).
   6. Operation: Loose key.
   7. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
   8. Inlet: NPS 1/2 or NPS 3/4 (DN 15 or DN 20).
   9. Outlet: Exposed with garden-hose thread complying with ASME B1.20.7.

2.10 WATER HAMMER ARRESTERS

A. Water Hammer Arresters:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. AMTROL, Inc.
      b. Josam Company.
      c. MIFAB, Inc.
      d. PPP Inc.
      e. Sioux Chief Manufacturing Company, Inc.
      f. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
      g. Tyler Pipe; Wade Div.
      h. Watts Drainage Products Inc.
      i. Zurn Plumbing Products Group; Specification Drainage Operation.
      j. Or equal by.
   2. Standard: ASSE 1010 or PDI-WH 201.
   3. Type: Metal bellows Copper tube with piston.
   4. Size: ASSE 1010, Sizes AA and A through F or PDI-WH 201, Sizes A through F.

2.11 AIR VENTS

A. Bolted-Construction Automatic Air Vents:
   1. Body: Bronze.
   2. Pressure Rating: 125-psig minimum pressure rating at 140 deg F.
   3. Float: Replaceable, corrosion-resistant metal.
   4. Mechanism and Seat: Stainless steel.
   5. Size: NPS 1/2 minimum inlet.
   6. Inlet and Vent Outlet End Connections: Threaded.

2.12 CIRCUIT SETTERS

A. Domestic Hot Water Recirc circuit setters shall be thermostatic balance valve. Shall be one of the following manufacturers.
   a. Bell and Gossett Temp Setter or equal by:
   b. Caleffi
   c. Prior approved equal.

PART 3 EXECUTION

3.01 INSTALLATION

A. Refer to Division 22 and 23 Section "Common work results" for piping joining materials, joint construction, and basic installation requirements.

B. Revise remaining paragraphs and subparagraphs in this Article to include specific installation requirements.

C. Install air vents at high points of water piping. Install drain piping and discharge onto floor drain.

3.02 CONNECTIONS

A. Coordinate piping installations and specialty arrangements with schematics on Drawings and with requirements specified in piping systems. If Drawings are explicit enough, these requirements may be reduced or omitted.

B. Piping installation requirements are specified in other Division 22 and 23 Sections.

C. Drawings indicate general arrangement of piping and specialties

3.03 FIELD QUALITY CONTROL

A. Perform the following tests and prepare test reports:

B. Test each reduced-pressure-principle backflow preventer according to authorities having jurisdiction and the device's reference standard.

C. Remove and replace malfunctioning domestic water piping specialties and retest as specified above.

3.04 ADJUSTING

A. Set field-adjustable pressure set points of water pressure-reducing valves.

B. Set field-adjustable flow set points of balancing valves.

C. Set field-adjustable temperature set points of temperature-actuated water mixing valves.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 13 16

SANITARY WASTE AND VENT PIPING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Pipe, tube, and fittings.
   2. Specialty pipe fittings.

B. Related Sections:
   1. Division 2 Section "Sanitary Sewerage" for sanitary sewerage piping and structures outside the building.

1.03 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:
   1. Soil, Waste, and Vent Piping: 10-foot head of water.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated.\

B. Shop Drawings: For sovent drainage system. Include plans, elevations, sections, and details.

C. Seismic Qualification Certificates: For waste and vent piping, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Detailed description of piping anchorage devices on which the certification is based and their installation requirements.

D. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF/ANSI 14, "Plastics Piping Systems Components and Related Materials," for plastic piping components. Include marking with "NSF-dwv" for plastic drain, waste, and vent piping and "NSF-sewer" for plastic sewer piping.

1.06 PROJECT CONDITIONS

A. Interruption of Existing Sanitary Waste Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
   1. Notify Owner no fewer than 72 hours in advance of proposed interruption of sanitary waste service.
   2. Do not proceed with interruption of sanitary waste service without Owner's written permission.

PART 2 PRODUCTS

2.01 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 74, Service and Extra Heavy class(es).

B. Gaskets: ASTM C 564, rubber.

2.03 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 888 or CISPI 301.

B. CISPI, Hubless-Piping Couplings:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. ANACO-Husky.
      b. Fernco Inc.
      c. MIFAB, Inc.
      d. Tyler Pipe.
      e. Ideal
      f. Prior approved equal.
   2. Standards: ASTM C 1277 and CISPI 310.
   3. Description: Stainless-steel corrugated shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.

C. Heavy-Duty, Hubless-Piping Couplings:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. ANACO-Husky.
      b. MIFAB, Inc.
      c. Tyler Pipe.

d. Ideal
e. Prior approved equal.

2. Standards: ASTM C 1277 and ASTM C 1540.
3. Description: Stainless-steel shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.

2.04 PVC PIPE AND FITTINGS

A. Solid-Wall PVC Pipe: ASTM D 2665, drain, waste, and vent.

B. PVC Socket Fittings: ASTM D 2665, made to ASTM D 3311, drain, waste, and vent patterns and to fit Schedule 40 pipe.

C. Adhesive Primer: ASTM F 656.
1. Use adhesive primer that has a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Solvent Cement: ASTM D 2564.
1. Use PVC solvent cement that has a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.05 SPECIALTY PIPE FITTINGS

A. Transition Couplings:
1. General Requirements: Fitting or device for joining piping with small differences in OD's or of different materials. Include end connections same size as and compatible with pipes to be joined.
2. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
3. Unshielded, Nonpressure Transition Couplings:
a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1) Dallas Specialty & Mfg. Co.
2) Fernco Inc.
3) Mission Rubber Company; a division of MCP Industries, Inc.
4) Plastic Oddities; a division of Diverse Corporate Technologies, Inc.
5) Prior approved equal.
b. Standard: ASTM C 1173.
c. Description: Elastomeric, sleeve-type, reducing or transition pattern. Include shear ring and corrosion-resistant-metal tension band and tightening mechanism on each end.
d. Sleeve Materials:
1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.

4. Shielded, Nonpressure Transition Couplings:
    a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
        1) Cascade Waterworks Mfg. Co.
        2) Mission Rubber Company; a division of MCP Industries, Inc.
        3) Prior approved equal.
    b. Standard: ASTM C 1460.
    c. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
5. Pressure Transition Couplings:
    a. Manufacturers: Subject to compliance with requirements, provide products by one of the following.
        1) Cascade Waterworks Mfg. Co.
        2) Dresser, Inc.
        3) EBAA Iron, Inc.
        4) JCM Industries, Inc.
        5) Romac Industries, Inc.
        6) Smith-Blair, Inc; a Sensus company.
        7) The Ford Meter Box Company, Inc.
        8) Viking Johnson.
        9) Prior approved equal.

PART 3 EXECUTION

3.01 EARTH MOVING

A. Comply with requirements for excavating, trenching, and backfilling specified in Division 2 Section "Earthwork."

3.02 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Division 22 and 23 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment."

K. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

L. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

M. Install soil and waste drainage and vent piping at the following minimum slopes unless otherwise indicated:
   1. Building Sanitary Drain: 2 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger.
   2. Horizontal Sanitary Drainage Piping: 2 percent downward in direction of flow.
   3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.

N. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
   1. Install encasement on underground piping according to ASTM A 674 or AWWA C105/A 21.5.

O. Install aboveground ABS piping according to ASTM D 2661.

P. Install aboveground PVC piping according to ASTM D 2665.

Q. Install underground ABS and PVC piping according to ASTM D 2321.

R. Install engineered soil and waste drainage and vent piping systems as follows:
   1. Combination Waste and Vent: Comply with standards of authorities having jurisdiction.
   2. Sovent Drainage System: Comply with ASSE 1043 and sovent fitting manufacturer's written installation instructions.

3. Reduced-Size Venting: Comply with standards of authorities having jurisdiction.

S. Plumbing Specialties:
   1. Install backwater valves in sanitary waste gravity-flow piping. Comply with requirements for backwater valves specified in Division 22 and 23 Section "Sanitary Waste Piping Specialties."
   2. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers in sanitary drainage gravity-flow piping. Install cleanout fitting with closure plug inside the building in sanitary drainage force-main piping. Comply with requirements for cleanouts specified in Division 22 and 23 Section "Sanitary Waste Piping Specialties."
   3. Install drains in sanitary drainage gravity-flow piping. Comply with requirements for drains specified in Division 22 and 23 Section "Sanitary Waste Piping Specialties."

T. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

U. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Division 22 and 23 Section "Sleeves and Sleeve Seals for Plumbing Piping."

V. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Division 22 and 23 Section "Sleeves and Sleeve Seals for Plumbing Piping."

W. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Division 22 and 23 Section "Escutcheons for Plumbing Piping."

3.03 JOINT CONSTRUCTION

A. Join hub-and-spigot, cast-iron soil piping with gasket joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.

B. Join hub-and-spigot, cast-iron soil piping with calked joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead-and-oakum calked joints.

C. Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. Plastic, Nonpressure-Piping, Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
   3. PVC Piping: Join according to ASTM D 2855 and ASTM D 2665 Appendixes.

3.04 SPECIALTY PIPE FITTING INSTALLATION

A. Transition Couplings:
   1. Install transition couplings at joints of piping with small differences in OD's.
   2. In Drainage Piping: Shielded, nonpressure transition couplings.
   3. In Aboveground Force Main Piping: Fitting-type transition couplings.
   4. In Underground Force Main Piping:
      a. NPS 1-1/2 and Smaller: Fitting-type transition couplings.
      b. NPS 2and Larger: Pressure transition couplings.

B. Dielectric Fittings:
   1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

3.05 VALVE INSTALLATION

A. General valve installation requirements are specified in Division 22 and 23 Section "General-Duty Valves for Plumbing Piping."

B. Shutoff Valves:
   1. Install shutoff valve on each sewage pump discharge.
   2. Install gate or full-port ball valve for piping NPS 2 and smaller.
   3. Install gate valve for piping NPS 2-1/2 and larger.

C. Check Valves: Install swing check valve, between pump and shutoff valve, on each sewage pump discharge.

D. Backwater Valves: Install backwater valves in piping subject to backflow.
   1. Horizontal Piping: Horizontal backwater valves.
   2. Floor Drains: Drain outlet backwater valves unless drain has integral backwater valve.
   3. Install backwater valves in accessible locations.
   4. Comply with requirements for backwater valve specified in Division 22 and 23 Section "Sanitary Waste Piping Specialties."

3.06 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices specified in Division 22 and 23 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger and support devices and installation specified in Division 22 and 23 Section "Hangers and Supports for Plumbing Piping and Equipment."
   1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
   2. Install stainless-steel pipe hangers for horizontal piping in corrosive environments.
   3. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
   4. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
   5. Vertical Piping: MSS Type 8 or Type 42, clamps.
   6. Install individual, straight, horizontal piping runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet if Indicated: MSS Type 49, spring cushion rolls.
   7. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   8. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within 12 inches of each fitting[, valve,] and coupling.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
   2. NPS 3: 60 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
   4. NPS 6 and NPS 8: 60 inches with 3/4-inch rod.
   5. NPS 10 and NPS 12: 60 inches with 7/8-inch rod.
   6. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

G. Install supports for vertical cast-iron soil piping every 15 feet.

H. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.07 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect drainage and vent piping to the following:
   1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.
   2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
   3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code.
   4. Install test tees (wall cleanouts) in conductors near floor and floor cleanouts with cover flush with floor.
   5. Comply with requirements for backwater valves cleanouts and drains specified in Division 22 and 23 Section "Sanitary Waste Piping Specialties."
   6. Equipment: Connect drainage piping as indicated. Provide shutoff valve if indicated and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

D. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

E. Make connections according to the following unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.08 IDENTIFICATION

A. Identify exposed sanitary waste and vent piping. Comply with requirements for identification specified in Division 22 and 23 Section "Identification for Plumbing Piping and Equipment."

3.09 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test sanitary drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
   1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
   2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping except outside leaders on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
   4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg. Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
   5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
   6. Prepare reports for tests and required corrective action.

3.10 CLEANING AND PROTECTION

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

D. Exposed ABS and PVC Piping: Protect plumbing vents exposed to sunlight with two coats of water-based latex paint.

3.11 PIPING SCHEDULE

A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.

B. Aboveground, soil and waste and vent piping shall be any of the following:
   1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
   2. Hubless, cast-iron soil pipe and fittings; CISPI hubless-piping couplings; and coupled joints.

C. Underground, soil, waste, and vent piping shall be any of the following:
   1. Extra Heavy class, cast-iron soil piping; calking materials; and calked joints.

2. Hubless, cast-iron soil pipe and fittings; heavy-duty hubless-piping couplings; and coupled joints.
3. Solid wall PVC pipe, PVC socket fittings, and solvent-cemented joints.
4. Dissimilar Pipe-Material Couplings: Shielded, nonpressure transition couplings.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 13 19

SANITARY WASTE PIPING SPECIALTIES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following sanitary drainage piping specialties:
   1. Cleanouts.
   2. Floor drains.
   3. Air-admittance valves.
   4. Trap Guards.
   5. Roof flashing assemblies.
   6. Miscellaneous sanitary drainage piping specialties.
   7. Flashing materials.

1.03 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. FRP: Fiberglass-reinforced plastic.

C. HDPE: High-density polyethylene plastic.

D. PE: Polyethylene plastic.

E. PVC: Polyvinyl chloride plastic.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated. Include manufacturer, rated capacities, operating characteristics, and accessories for the following:
   1. Cleanouts.
   2. Floor drains.
   3. Air admittance valves.

1.05 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NSF 14, "Plastics Piping Components and Related Materials," for plastic sanitary piping specialty components.

1.06 COORDINATION

A. Coordinate size and location of roof penetrations.

PART 2 PRODUCTS

2.01 CLEANOUTS

A. Exposed Metal Cleanouts:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Josam Company; Josam Div.
      b. MIFAB, Inc.
      c. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
      d. Tyler Pipe; Wade Div.
      e. Watts Drainage Products Inc.
      f. Zurn Plumbing Products Group; Specification Drainage Operation.
      g. Prior approved equal.
   2. Standard: ASME A112.36.2M for cast iron for cleanout test tee.
   3. Size: Same as connected drainage piping
   4. Body Material: Hub-and-spigot, cast-iron soil pipe T-branch or Hubless, cast-iron soil pipe test tee as required to match connected piping.
   5. Closure: Countersunk or raised-head, cast-iron plug.
   6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

2.02 FLOOR DRAINS

A. Cast-Iron Floor Drains:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Commercial Enameling Co.
      b. Josam Company; Josam Div.
      c. MIFAB, Inc.
      d. Prier Products, Inc.
      e. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
      f. Tyler Pipe; Wade Div.
      g. Watts Drainage Products Inc.
      h. Zurn Plumbing Products Group; Light Commercial Operation.
      i. Zurn Plumbing Products Group; Specification Drainage Operation.
      j. Prior approved equal.
   2. Standard: ASME A112.6.3.
   3. Pattern: Floor drain.

4. Body Material: Gray iron.
5. Clamping Device: Required.
6. Outlet: Bottom.
7. Top or Strainer Material: Chrome plate
8. Top or Strainer Material: Stainless steel for shower drains
9. Top Shape: Round.
10. Top Loading Classification: Medium Duty.
11. Inlet Fitting: Gray iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
12. Trap Pattern: Deep-seal P-trap.
13. Trap Features: Trap-seal primer valve drain connection.

2.03 AIR-ADMITTANCE VALVES

A. Wall Box:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Durgo, Inc.
      b. Oatey.
      c. RectorSeal.
      d. Studor, Inc.
      e. Prior approved equal.
   2. Description: White plastic housing with white plastic grille, made for recessed installation. Include bottom pipe connection and space to contain one air-admittance valve.
   3. Size: About 9 inches wide by 8 inches high by 4 inches deep.

2.04 ROOF FLASHING ASSEMBLIES

A. Roof Flashing Assemblies:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Acorn Engineering Company; Elmdor/Stoneman Div.
      b. Thaler Metal Industries Ltd.
      c. Prior approved equal.

B. Description: Manufactured assembly made of 4.0-lb/sq. ft., 0.0625-inch- thick, lead flashing collar and skirt extending at least 8 inches from pipe, with galvanized-steel boot reinforcement and counterflashing fitting.
   1. Open-Top Vent Cap: Without cap.
   2. Low-Silhouette Vent Cap: With vandal-proof vent cap.
   3. Extended Vent Cap: With field-installed, vandal-proof vent cap.

2.05 MISCELLANEOUS SANITARY DRAINAGE PIPING SPECIALTIES

A. Deep-Seal Traps:
   1. Description: Cast-iron or bronze casting, with inlet and outlet matching connected piping and cleanout trap-seal primer valve connection.
   2. Size: Same as connected waste piping.
      a. NPS 2: 4-inch- minimum water seal.
      b. NPS 2-1/2 and Larger: 5-inch- minimum water seal.

B. Floor-Drain, Trap-Seal Primer Fittings:
   1. Description: Cast iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
   2. Size: Same as floor drain outlet with NPS 1/2 side inlet.

C. Trap Guard
   1. Description: Trap guard shall have flexible elastomeric material open on top, with curl closure on bottom as needed to allow water to flow, but not allow sewer gases to escape.
   2. Trap guards by Proset or prior approved equal.

2.06 FLASHING MATERIALS

A. Copper Sheet: ASTM B 152/B 152M, of the following minimum weights and thicknesses, unless otherwise indicated:
   1. General Applications: 12 oz./sq. ft. thickness.
   2. Vent Pipe Flashing: 8 oz./sq. ft. thickness.

B. Zinc-Coated Steel Sheet: ASTM A 653/A 653M, with 0.20 percent copper content and 0.04-inch minimum thickness, unless otherwise indicated. Include G90 hot-dip galvanized, mill-phosphatized finish for painting if indicated.

C. Elastic Membrane Sheet: ASTM D 4068, flexible, chlorinated polyethylene, 40-mil minimum thickness.

D. Fasteners: Metal compatible with material and substrate being fastened.

E. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed.

F. Solder: ASTM B 32, lead-free alloy.

G. Bituminous Coating: SSPC-Paint 12, solvent-type, bituminous mastic.

PART 3 EXECUTION

3.01 INSTALLATION

A. Refer to Division 22 and 23 Section "Common Work Results for Plumbing" for piping joining materials, joint construction, and basic installation requirements.

B. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:
   1. Size same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
   2. Locate at each change in direction of piping greater than 45 degrees.
   3. Locate at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
   4. Locate at base of each vertical soil and waste stack.

C. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

D. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

E. Install floor drains at low points of surface areas to be drained. Set grates of drains flush with finished floor, unless otherwise indicated.
   1. Position floor drains for easy access and maintenance.
   2. Set floor drains below elevation of surrounding finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:
      a. Radius, 30 Inches or Less: Equivalent to 1 percent slope, but not less than 1/4-inch total depression.
      b. Radius, 30 to 60 Inches: Equivalent to 1 percent slope.
      c. Radius, 60 Inches or Larger: Equivalent to 1 percent slope, but not greater than 1-inch total depression.
   3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
   4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.

F. Install trench drains at low points of surface areas to be drained. Set grates of drains flush with finished surface, unless otherwise indicated.

G. Install air-admittance-valve wall boxes recessed in wall where indicated on drawings.

H. Install roof flashing assemblies on sanitary stack vents and vent stacks that extend through roof.

I. Install flashing fittings on sanitary stack vents and vent stacks that extend through roof.

J. Install deep-seal traps on all floor drains.

K. Install trap guards at floor drains that require trap-seal.
   1. Size: Same as floor drain inlet.

L. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.

M. Install sleeve flashing device with each riser and stack passing through floors with waterproof membrane.

N. Install escutcheons at wall, floor, and ceiling penetrations in exposed finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding pipe fittings.

3.02 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

3.03 FLASHING INSTALLATION

A. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required. Join flashing according to the following if required:
   1. Lead Sheets: Burn joints of lead sheets 6.0-lb/sq. ft., 0.0938-inch thickness or thicker. Solder joints of lead sheets 4.0-lb/sq. ft., 0.0625-inch thickness or thinner.
   2. Copper Sheets: Solder joints of copper sheets.

B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
   1. Pipe Flashing: Sleeve type, matching pipe size, with minimum length of 10 inches, and skirt or flange extending at least 8 inches around pipe.
   2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least 8 inches around sleeve.
   3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least 8 inches around specialty.

C. Set flashing on floors and roofs in solid coating of bituminous cement.

D. Secure flashing into sleeve and specialty clamping ring or device.

E. Install flashing for piping passing through roofs with counterflashing or commercially made flashing fittings, according to Division 7 Section "Sheet Metal Flashing and Trim."

F. Extend flashing up vent pipe passing through roofs and turn down into pipe, or secure flashing into cast-iron sleeve having calking recess.

G. Fabricate and install flashing and pans, sumps, and other drainage shapes.

3.04 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.05 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION

SECTION 22 33 00

ELECTRIC WATER HEATERS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following electric water heaters:
   1. Flow-control, instantaneous electric water heaters.
   2. Light-commercial electric water heaters.
   3. Compression tanks.
   4. Water heater accessories.

1.03 SUBMITTALS

A. Product Data: For each type and size of water heater indicated. Include rated capacities, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Product Certificates: For each type of commercial and instantaneous electric water heater, signed by product manufacturer.

D. Manufacturer Seismic Qualification Certification: Submit certification that commercial water heaters, accessories, and components will withstand seismic forces defined in Division 22 and 23 Section "Mechanical Vibration and Seismic Controls." Include the following:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
      b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Source quality-control test reports.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For electric water heaters to include in emergency, operation, and maintenance manuals.

H. Warranty: Special warranty specified in this Section.

1.04 QUALITY ASSURANCE

A. Source Limitations: Obtain same type of electric water heaters through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of electric water heaters and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. ASME Compliance: Where indicated, fabricate and label commercial water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

E. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9," for all components that will be in contact with potable water.

1.05 COORDINATION

A. Coordinate size and location of concrete bases with Architectural and Structural Drawings.

1.06 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of electric water heaters that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including storage tank and supports.
      b. Faulty operation of controls.
      c. Deterioration of metals, metal finishes, and other materials beyond normal use.
   2. Warranty Period(s): From date of Substantial Completion:
      a. Instantaneous Electric Water Heaters: One year.
      b. Light-Commercial Electric Water Heaters:
         1) Storage Tank: Five years.
         2) Controls and Other Components: Two years.
      c. Compression Tanks: One year.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 INSTANTANEOUS ELECTRIC WATER HEATERS

A. Flow-Control, Instantaneous Electric Water Heaters: Comply with UL 499 for tankless electric (water heater) heating appliance.
   1. Manufacturers:
      a. Chronomite Laboratories, Inc.
      b. Controlled Energy Corporation.
      c. Eemax, Inc.
      d. Hot Aqua, Inc.
      e. IMI Waterheating, Ltd.
      f. Stiebel Eltron, Inc.
      g. HTP
      h. Bock
      i. Prior approved equal.
   2. Construction: Copper piping or tubing complying with NSF 61 barrier materials for potable water, without storage capacity.
      a. Connections: ASME B1.20.1 pipe thread.
      b. Pressure Rating: 150 psig.
      c. Heating Element: Resistance heating system.
      d. Temperature Control: Flow-control fitting.
      e. Safety Control: High-temperature-limit cutoff device or system.
      f. Jacket: Aluminum or steel with enameled finish or plastic.
   3. Support: Bracket for wall mounting.
   4. Capacity and Characteristics:
      a. Temperature Control: Flow-control fitting.
      b. See drawings for capacity, electrical service, etc.

2.03 LIGHT-COMMERCIAL ELECTRIC WATER HEATERS

A. Description: Comply with UL 174 for household, storage electric water heaters.
   1. Manufacturers:
      a. American Water Heater Company.
      b. Bradford White Corporation.
      c. Electric Heater Company (The); Hubbell Heaters Division.
      d. GSW Water Heating Company.
      e. Heat Transfer Products, Inc.

f. Lochinvar Corporation.
g. Rheem Water Heater Div.; Rheem Manufacturing Company.
h. Ruud Water Heater Div.; Rheem Manufacturing Company.
i. Smith, A. O. Water Products Company.
j. State Industries, Inc.
k. Prior approved equal.

2. Storage-Tank Construction: Steel, vertical arrangement.
   a. Tappings: ASME B1.20.1 pipe thread.
   b. Pressure Rating: 150 psig.
   c. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending lining material into tappings.
3. Factory-Installed Storage-Tank Appurtenances:
   a. Anode Rod: Replaceable magnesium.
   b. Dip Tube: Provide unless cold-water inlet is near bottom of tank.
   c. Drain Valve: ASSE 1005.
   d. Insulation: Comply with ASHRAE/IESNA 90.1 or ASHRAE 90.2.
   e. Jacket: Steel with enameled finish.
   f. Heat Trap Fittings: Inlet type in cold-water inlet and outlet type in hot-water outlet.
   g. Heating Elements: Two; electric, screw-in immersion type; wired for simultaneous operation, unless otherwise indicated.
   h. Temperature Control: Adjustable thermostat for each element.
   i. Safety Control: High-temperature-limit cutoff device or system.
   j. Relief Valve: ASME rated and stamped and complying with ASME PTC 25.3 for combination temperature and pressure relief valves. Include relieving capacity at least as great as heat input, and include pressure setting less than water heater working-pressure rating. Select relief valve with sensing element that extends into storage tank.
4. Special Requirements: NSF 5 construction with legs for off-floor installation.
5. Capacity and Characteristics:
   a. See drawings for size, capacity, electrical characteristics, etc.

2.04 COMPRESSION TANKS

A. Description: Steel pressure-rated tank constructed with welded joints and factory-installed butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.
   1. Manufacturers:
      a. AMTROL Inc.
      b. Armstrong Pumps, Inc.
      c. Flexcon Industries.
      d. Honeywell Sparco.
      e. Myers, F. E.; Pentair Pump Group (The).
      f. Smith, A. O.; Aqua-Air Div.

g. State Industries, Inc.
h. Taco, Inc.
i. Watts Regulator Co.
j. Wessels Co.
k. Prior approved equal.

2. Construction:
   a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1, pipe thread.
   b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
   c. Air-Charging Valve: Factory installed.
3. Capacity and Characteristics: See drawings.

2.05 WATER HEATER ACCESSORIES

A. Combination Temperature and Pressure Relief Valves: ASME rated and stamped and complying with ASME PTC 25.3. Include relieving capacity at least as great as heat input, and include pressure setting less than water heater working-pressure rating. Select relief valves with sensing element that extends into storage tank.

B. Pressure Relief Valves: ASME rated and stamped and complying with ASME PTC 25.3. Include pressure setting less than water heater working-pressure rating.

C. Water Heater Stand and Drain-Pan Units: High-density-polyethylene-plastic, 18-inch-high, enclosed-base stand complying with IAPMO PS 103 and IAS No. 2. Include integral or separate drain pan with raised edge and NPS 1 drain outlet with ASME B1.20.1 pipe thread.

D. Water Heater Stands: Water heater manufacturer's factory-fabricated steel stand for floor mounting and capable of supporting water heater and water. Include dimension that will support bottom of water heater a minimum of 18 inches above the floor.

E. Water Heater Mounting Brackets: Water heater manufacturer's factory-fabricated steel bracket for wall mounting and capable of supporting water heater and water.

F. Drain Pans: Corrosion-resistant metal with raised edge. Include dimensions not less than base of water heater and include drain outlet not less than NPS 3/4.

G. Piping Manifold Kits: Water heater manufacturer's factory-fabricated inlet and outlet piping arrangement for multiple-unit installation. Include piping and valves for field assembly that are capable of isolating each water heater and of providing balanced flow through each water heater.

H. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1 or ASHRAE 90.2.

I. Water Regulators: ASSE 1003, water-pressure reducing valve. Set at 25-psig- maximum outlet pressure, unless otherwise indicated.

J. Shock Absorbers: ASSE 1010 or PDI WH 201, Size A water hammer arrester.

PART 3 EXECUTION

3.01 WATER HEATER INSTALLATION

A. Install water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

B. Install seismic restraints for light-commercial and commercial water heaters. Anchor to substrate.

C. Install combination temperature and pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

D. Install combination temperature and pressure relief valves in water piping for water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

E. Install water-heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for water heaters that do not have tank drains. Refer to Division 22 and 23 Section "Plumbing Specialties" for hose-end drain valves.

F. Install thermometer on outlet piping of water heaters. Refer to Division 22 and 23 Section "Meters and Gages" for thermometers.

G. Install thermometers on inlet and outlet piping of household, collector-to-tank, solar-electric water heaters. Refer to Division 22 and 23 Section "Meters and Gages" for thermometers.

H. Install pressure gage(s) on inlet and outlet of commercial electric water- heater piping. Refer to Division 22 and 23 Section "Meters and Gages" for pressure gages.

I. Assemble and install inlet and outlet piping manifold kits for multiple water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each water heater. Include shutoff valve, thermometer in each water heater inlet and outlet, and throttling valve in each water heater outlet. Refer to Division 22 and 23 Section "Valves" for general-duty valves and to Division 22 and 23 Section "Meters and Gages" for thermometers.

J. Install water regulator, with integral bypass relief valve, in booster-heater inlet piping and water hammer arrester in booster-heater outlet piping.

K. Install piping-type heat traps on inlet and outlet piping of water heater storage tanks without integral or fitting-type heat traps.

L. Fill water heaters with water.

M. Charge compression tanks with air.

3.02 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to water heaters to allow service and maintenance. Arrange piping for easy removal of water heaters.

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Connect wiring according to Division 26 Section "Conductors and Cables."

3.03 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, confirm proper operation.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace water heaters that do not pass tests and inspections and retest as specified above.

3.04 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain commercial and instantaneous electric water heaters. Refer to Division 1 Section "Closeout Procedures Demonstration and Training."

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 34 00

FUEL-FIRED WATER HEATERS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following fuel-fired water heaters:
   1. Commercial, high-efficiency, gas water heaters.
   2. Compression tanks.
   3. Water heater accessories.

1.03 DEFINITIONS

A. LP Gas: Liquefied-petroleum fuel gas.

1.04 SUBMITTALS

A. Product Data: For each type and size of water heater indicated. Include rated capacities, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Product Certificates: For each type of commercial water heater, signed by product manufacturer.

D. Manufacturer Seismic Qualification Certification: Submit certification that commercial water heaters, accessories, and components will withstand seismic forces defined in Division 22 and 23 Section "Mechanical Vibration and Seismic Controls." Include the following:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
      b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Source quality-control test reports.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For water heaters to include in operation, and maintenance manuals.

H. Warranty: Special warranty specified in this Section.

1.05 QUALITY ASSURANCE

A. Source Limitations: Obtain same type of water heaters through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of water heaters and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. ASME Compliance:
   1. Where ASME-code construction is indicated, fabricate and label commercial water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
   2. Where ASME-code construction is indicated, fabricate and label commercial, finned-tube water heaters to comply with ASME Boiler and Pressure Vessel Code: Section IV.

E. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9" for all components that will be in contact with potable water.

1.06 COORDINATION

A. Coordinate size and location of concrete bases with Architectural and Structural Drawings.

1.07 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of fuel-fired water heaters that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including storage tank and supports.
      b. Faulty operation of controls.
      c. Deterioration of metals, metal finishes, and other materials beyond normal use.
   2. Warranty Period(s): From date of Substantial Completion:
      a. Household, Gas Water Heaters:
         1) Storage Tank: Five years.
         2) Controls and Other Components: Two years.

b. Commercial, Gas Water Heaters:
   1) Storage Tank: Three years.
   2) Controls and Other Components: Three years.
c. Compression Tanks: One year(s).

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 COMMERCIAL, GAS WATER HEATERS

A. Commercial, High-Efficiency, Gas Water Heaters: Comply with ANSI Z21.10.3/CSA 4.3.
   1. Manufacturers:
      a. AERCO International.
      b. Bradford White Corporation.
      c. Lochinvar Corporation.
      d. Patterson-Kelley.
      e. Raypak
      f. RBI Water Heaters; a Mestek, Inc. Company.
      g. Rheem Water Heater Div.; Rheem Manufacturing Company.
      h. Ruud Water Heater Div.; Rheem Manufacturing Company.
      i. Smith, A. O. Water Products Company.
      j. State Industries, Inc.
      k. HTP
      l. Bock
      m. Prior approved equal.
   2. Description: Manufacturer's proprietary design to provide at least 95 percent combustion efficiency at optimum operating conditions. Following features and attributes may be modified or omitted if water heater otherwise complies with requirements for performance.
   3. Factory-Installed, Storage-Tank Appurtenances:
      a. Anode Rod: Replaceable magnesium.
      b. Dip Tube: Provide unless cold-water inlet is near bottom of tank.
      c. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.
      d. Insulation: Comply with ASHRAE/IESNA 90.1. Surround entire storage tank except connections and controls.
      e. Jacket: Steel with enameled finish.

f. Combination Temperature and Pressure Relief Valves: ANSI Z21.22/CSA 4.4. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than water heater working-pressure rating. Select one relief valve with sensing element that extends into storage tank.

4. Burner or Heat Exchanger: Comply with UL 795 or approved testing agency requirements for high-efficiency water heaters and for natural-gas fuel.
5. Temperature Control: Adjustable thermostat.
6. Safety Controls: Automatic, high-temperature-limit and low-water cutoff devices or systems.
7. Energy Management System Interface: Normally closed dry contacts for enabling and disabling water heater.
8. Capacity and Characteristics: See Drawings

2.03 COMPRESSION TANKS

A. Description: Steel, pressure-rated tank constructed with welded joints and factory-installed, butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.

1. Available Manufacturers:
   a. AMTROL Inc.
   b. Armstrong Pumps, Inc.
   c. Flexcon Industries.
   d. Honeywell Sparco.
   e. Smith, A. O.; Aqua-Air Div.
   f. State Industries, Inc.
   g. Taco, Inc.
   h. Watts Regulator Co.
   i. Wessels Co.
   j. Prior approved equal.
2. Construction:
   a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1 pipe thread.
   b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
   c. Air-Charging Valve: Factory installed.
3. Capacity and Characteristics: See Drawings

2.04 WATER HEATER ACCESSORIES

A. Gas Shutoff Valves: ANSI Z21.15/CGA 9.1, manually operated. Furnish for installation in piping.

B. Gas Pressure Regulators: ANSI Z21.18, appliance type. Include pressure rating, capacity, and pressure differential required between gas supply and water heater.

C. Gas Automatic Valves: ANSI Z21.21, appliance, electrically operated, on-off automatic valve.

D. Combination Temperature and Pressure Relief Valves: Include relieving capacity at least as great as heat input, and include pressure setting less than water heater working-pressure rating. Select each relief valve with sensing element that extends into storage tank.

1. Gas Water Heaters: ANSI Z21.22/CSA 4.4.

E. Pressure Relief Valves: Include pressure setting less than working-pressure rating of water heater.

1. Gas Water Heaters: ANSI Z21.22/CSA 4.4.

F. Water Heater Stand and Drain Pan Units: High-density-polyethylene-plastic, 18-inch-high, enclosed-base stand complying with IAPMO PS 103 and IAS No. 2. Include integral or separate drain pan with raised edge and NPS 1 drain outlet with ASME B1.20.1 pipe thread.

G. Water Heater Stands: Water heater manufacturer's factory-fabricated steel stand for floor mounting and capable of supporting water heater and water. Provide dimension that will support bottom of water heater a minimum of 18 inches above the floor.

H. Water Heater Mounting Brackets: Water heater manufacturer's factory-fabricated steel bracket for wall mounting and capable of supporting water heater and water.

I. Drain Pans: Corrosion-resistant metal with raised edge. Provide dimensions not less than base of water heater and include drain outlet not less than NPS 3/4.

J. Piping Manifold Kits: Water heater manufacturer's factory-fabricated inlet and outlet piping arrangement for multiple-unit installation. Include piping and valves for field assembly that is capable of isolating each water heater and of providing balanced flow through each water heater.

K. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1 or ASHRAE 90.2.

2.05 SOURCE QUALITY CONTROL

A. Test and inspect water heater storage tanks, specified to be ASME-code construction, according to ASME Boiler and Pressure Vessel Code.

B. Hydrostatically test commercial water heater storage tanks before shipment to minimum of one and one-half times pressure rating.

C. Prepare test reports.

PART 3 EXECUTION

3.01 WATER HEATER INSTALLATION

A. Install commercial water heaters on concrete bases.
   1. Exception: Omit concrete bases for commercial water heaters if installation on stand, bracket, suspended platform, or direct on floor is indicated.
   2. Concrete base construction requirements are specified in Division 22 and 23 Section "Basic Mechanical Materials and Methods."

B. Install water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

C. Install seismic restraints for commercial water heaters. Anchor to substrate.

D. Install gas water heaters according to NFPA 54.

E. Install gas shutoff valves on gas supplies to gas water heaters without shutoff valves.

F. Install gas pressure regulators on gas supplies to gas water heaters without gas pressure regulators if gas pressure regulators are required to reduce gas pressure at burner.

G. Install automatic gas valves on gas supplies to gas water heaters, if required for operation of safety control.

H. Install combination temperature and pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend commercial-water-heater, relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

I. Install combination temperature and pressure relief valves in water piping for water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

J. Install water heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for water heaters that do not have tank drains. Refer to Division 22 and 23 Section "Plumbing Specialties" for hose-end drain valves.

K. Install thermometer on outlet piping of water heaters. Refer to Division 22 and 23 Section "Meters and Gages" for thermometers.

L. Install pressure gage(s) on inlet and outlet piping of commercial, fuel-fired water heater piping. Refer to Division 22 and 23 Section "Meters and Gages" for pressure gages.

M. Assemble and install inlet and outlet piping manifold kits for multiple water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each water heater. Include shutoff valve and thermometer in each water heater inlet and outlet, and throttling valve in each water heater outlet. Refer to Division 22 and 23 Section "Valves" for general-duty valves and to Division 22 and 23 Section "Meters and Gages" for thermometers.

N. Install piping-type heat traps on inlet and outlet piping of water heater storage tanks without integral or fitting-type heat traps.

O. Fill water heaters with water.

P. Charge compression tanks with air.

3.02 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to water heaters to allow service and maintenance. Arrange piping for easy removal of water heaters.

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Connect wiring according to Division 26 Section "Conductors and Cables."

3.03 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
   1. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, confirm proper operation.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace water heaters that do not pass tests and inspections and retest as specified above.

3.04 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain commercial water heaters. Refer to Division 1 Section "Closeout Procedures Demonstration and Training."

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 34 10

HIGH EFFICIENCY GAS TANKLESS DOMESTIC WATER HEATERS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes packaged, factory-fabricated and assembled, gas-fired, high efficiency condensing domestic water heaters, trim and accessories for generating hot potable water.

1.03 SUBMITTALS

A. Product Data: Include performance data, operating characteristics, furnished specialties and accessories.

B. Pressure Drop Curve: Submit pressure drop curve for flows ranging from 0 GPM to maximum value of water heater.

C. Shop Drawings: For water heaters, water heater trim and accessories, include:
   1. Elevations, sections, details
   2. Wiring Diagrams for power

D. Operation and Maintenance Data: Data to be included in water heater emergency, operation, and maintenance manuals.

E. Warranty: Standard warranty specified in this Section.

F. Buy America Certification

1.04 QUALITY ASSURANCE

A. ETL Compliance. Condensing water heaters must be tested for compliance with ETL, "Commercial-Industrial Gas Heating Equipment." Condensing water heaters shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.

B. NOx Emission Standards. When installed and operated in accordance with manufacturer’s instructions.

1.05 COORDINATION

A. Coordinate size and location of installation materials.

1.06 WARRANTY

A. Standard Warranty: Water heaters shall include manufacturer's standard form in which manufacturer agrees to repair or replace components of water heaters that fail in materials or workmanship within specified warranty period.
   1. Commercial Warranty Period for Condensing Water heaters:
      a. The pressure vessel shall carry a 6 year from shipment, non-prorated, limited warranty against any failure due to waterside corrosion, mechanical defects, or workmanship. The heat exchanger shall carry a 6 year from com- missioning, non-prorated, limited warranty against any failure due to con- densate corrosion, thermal stress, mechanical defects, or workmanship.
      b. Manufacturer labeled control panels are conditionally warranted against failure for one (1) year from commissioning.
      c. All other components are conditionally guaranteed against any failure for 1 year from commissioning.

PART 2 PRODUCTS

2.01 MANUFACTURES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

B. Intellihot Model i200, Gen II; or a comparable product by one of the following:
   1. Intellihot i200 or equal
   2. A.O. Smith Cyclone
   3. Triangle Tube Keystone Series
   4. Lochinvar Armor Series
   5. Prior approved equal

2.02 CONSTRUCTION

A. Each water heater shall incorporate a negative Pressure gas valve on each exchanger. Each unit shall operate with a minimum Combustion Efficiency of 98% at full fire.

B. Turndown ratio 7:1, CO emissions of less than 400 ppm.)

C. Description: Water heater shall be direct fired, fully condensing, water-tube design. Power burner shall have full modulation. The minimum firing rate shall not exceed 30,000 BTU/Hr input. Water heaters that have an input greater than 30,000 BTU/Hr at minimum fire will not be considered equal. The water heater shall have the capability of discharging into a positive pressure vent. Water heater thermal efficiency shall increase with decreasing load (output), while maintaining set point. The water heater shall have an operational set point capability of 90 ºF to 185 ºF and shall maintain the outlet temperature within an accuracy of +/- 2 oF during load changes of up to 100% rated capacity. The heater shall operate quietly, less than 55 dba. Water heater shall be factory-fabricated, factory-assembled, and factory-tested, water-tube condensing water heater with heat exchanger sealed pressure-tight, built on a steel base, including a sealed insulated sheet metal enclosure that acts as combustion-air intake plenum.

D. Heat Exchanger: The heat exchanger shall be constructed with 316L stainless steel helical water tubes, fully floating with no welded joints in the exchanger. The exchanger will have a single-pass combustion gas flow design. The water tubes shall be 3/4" ID, with no less than 0.0469" wall thickness.

E. Hybrid Tank: The shell assembly of the hybrid tank vessel shall have a maximum water volume of less than .6 gallon. The water heater water connections shall be 3/4-inch Flanged O Ring connections. The shell assembly shall be constructed of 316L stainless steel of 0.0488-inch wall thickness or above.

F. Modulating Air/Fuel Valve and Burner: The water heater burner shall be capable of a 7 to 1 turndown ratio of the firing rate without loss of combustion efficiency or staging of gas valves. The burner shall be stainless fiber mesh covering a stainless-steel body with spark ignition and flame rectification. All burner material exposed to the combustion zone shall be of stainless-steel construction. There shall be no moving parts within the burner itself. A modulating air/fuel valve shall meter the air and fuel input. A variable frequency drive (VFD) controlled pre-mix blower shall be used to ensure the optimum mixing of air and fuel between the air/fuel valve and the burner.

G. The exhaust manifold shall be of PVC, CPVC, polypropylene, stainless steel (AL29- 4C) with a 3-inch diameter flue connection.

H. Ignition: Ignition shall be via spark ignition with 100 percent main-valve shutoff and electronic flame supervision.

2.03 CONTROLS

A. Refer to Division 23, Section "Instrumentation and Control of HVAC."

B. The water heater control system shall be a Masterless Cascading design. Lead Lag – Master / Slave control systems will not be permitted. The entire system shall be ETL recognized.

C. The control panel shall consist of one individual circuit board using state-of-the-art surface-mount technology in a single enclosure. The circuit boards shall include:
   1. A Digital touch display to indicate temperature and status.
   2. 2. A CPU board housing all control functions

D. Each board shall be individually field replaceable.

E. The combustion safeguard/flame monitoring system shall use spark ignition and a rectification-type flame sensor.

F. The unit shall have a selectable exhaust temperature limit suitable for venting with PVC or CPVC/Polypropylene/Stainless Steel (AL29-4C).

G. The controls shall annunciate water heater and sensor status and include extensive self-diagnostic capabilities.

H. The water heater control system shall incorporate the following additional features for enhanced external system interface:
   1. Temperature set point.
   2. High Exhaust temp monitor and control. Turn down the Gas valve until the exhaust temp is kept below selected material (PVC, CPVC).
   3. Cascading via RS232
   4. Error Code Display / Error Code History
      a. Blower Fault
      b. Blocked Flue Fault
      c. Ignition Failure
      d. Temp Sensor Short
      e. Temp Sensor Wiring Fault
      f. Flue Temp Fault
      g. Heat Exchanger Temp Fault
      h. Cascading Fault
      i. Water Valve Fault
      j. Pump Fault
      k. Software Fault
   5. Monitor and access to daily, weekly, monthly water usages data.
   6. Monitor inlet/outlet temperatures, flow rates, flue gas temperatures, combustion rates via onboard touchscreen.

2.04 ELECTRICAL POWER

A. Controllers, Electrical Devices and Wiring: Electrical devices and connections are specified in Division 26 sections.

B. Single-Point Field Power Connection: Factory-installed and factory-wired switches, motor controllers, transformers and other electrical devices shall provide a single-point field power connection to the water heater.

2.05 CONDENSATE

A. Condensate traps, manufactured from only non-corrosive materials.

B. Optional Accessory: Smart condensate neutralizer with capability of monitoring pH levels through included IoT app. Smart Neutralizer to also include:
   1. Monitor water temperatures.
   2. CO detection, flue gas detection, water leak detection of boiler room w/ audible/visual alarms and alerts via app.
   3. Water flow recording/monitoring.
   4. View history of above parameters via app.

2.06 VENTING

A. The exhaust vent must be for use UL Listed for use with positive pressure, condensing flue gas service. Vents of PVC, CPVC, PP, SS (AL29-4C) must be used with water heaters.

B. The minimum exhaust vent duct size for each water heater is three-inch diameter.

C. Combustion-Air Intake: Water heaters shall be capable of drawing combustion air from the outdoors via a metal or PVC, CPVC or Polypropylene duct connected between the water heater and the outdoors.

D. The minimum sealed combustion air duct size for each water heater is three-inch diameter.

E. Common Vent and Common Combustion Air up to 10 heat exchangers. Consult manufacturer for common vent and combustion air sizing.

2.07 SOURCE QUALITY CONTROL

A. Burner and Hydrostatic Test: Factory adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions and carbon monoxide in flue gas, and to achieve combustion efficiency. Perform hydrostatic testing.

B. Test and inspect factory-assembled water heaters, before shipping.,

C. Allow Owner access to source quality-control testing of water heaters. Notify Architect fourteen days in advance of testing.

PART 3 EXECUTION

3.01 EXAMINTATION

A. Before water heater installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations. Examine piping and electrical connections to verify actual locations, sizes and other conditions affecting water heater performance, maintenance and operations.
   1. Final water heater locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.

B. Examine mechanical spaces for suitable conditions where water heaters will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 WATER HEATER INSTALLATION

A. Install gas-fired water heaters in accordance with
   1. Local, stats provincial, and national codes, laws, regulations, and ordinances.
   2. National Fuel Gas Code, ANSI Z223.1/NFPA 54 – latest edition.
   3. National Electrical Code, ANSI/NFPA 70 - latest edition.
   4. Canada only: CAN/CGA B149 Installation Code and CSA C22.1 CEC Part 1.
   5. Manufacturer’s installation instructions, including required service clearances and venting guidelines.

B. Assemble and install water heater trim.

C. Install electrical devices furnished with water heater but not specified to be factory mounted.

D. Install control wiring to field-mounted electrical devices.

3.03 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to the water heater to permit service and maintenance.

C. Install piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection. Provide an isolation valve if required.

D. Connect gas piping to water heater gas valve with unions. Piping shall be at least the full size of gas train connection. Provide a reducer if required.

E. Connect hot-water piping to supply and return water heater tapping's with shutoff valve and union or flange at each connection.

F. Multiple heaters shall be piped such that all cold water entering the system will go through the heat exchanger first. A series of approved piping installation examples are shown in the installation and maintenance manuals provided with the unit. Each water heater shall have individual isolation valves for servicing and a hot water hose connection for start-up and field testing.

G. Install piping from safety relief valves to nearest floor drain.

H. Water heater Venting

I. Install flue venting kit and combustion-air intake.

J. Connect venting full size to water heater connections. Comply with requirements in Division 23 Section "Breechings, Chimneys and Stacks."

K. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

L. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.04 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections
   1. Installation and Startup Test: Perform installation and startup checks according to manufacturer's written instructions.

2. Leak Test: Perform hydrostatic test. Repair leaks and retest until no leaks exist.
3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion, if necessary.
4. Controls and Safeties: Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
    a. Check and adjust initial operating set points and high- and low-limit safety set points of fuel supply, water level and water temperature.
    b. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Remove and replace malfunctioning units and retest as specified above.

D. Occupancy Adjustments: When requested within 2 months of the date of Substantial Completion, provide on-site assistance adjusting system to suit actual occupied conditions. Provide up to two visits to the project during other than normal occupancy hours for this purpose.

E. Performance Tests
1. The water heater manufacturer is expected to provide partial load thermal efficiency curves. These thermal efficiency curves must include at least three separate curves at various BTU input levels. If these curves are not available, it is the responsibility of the water heater manufacturer to complete the following performance tests:
    a. Engage a factory-authorized service representative to inspect component assemblies and equipment installations, including connections, and to conduct performance testing.
    b. Water heaters shall comply with performance requirements indicated, as determined by field performance tests. Adjust, modify, or replace equipment to comply.
    c. Perform field performance tests to determine capacity and efficiency of water heaters.
        1) Test for full capacity.
        2) Test for water heater efficiency at low fire, 20, 40, 60, 80, 100, 80, 60, 40 and 20 percent of full capacity. Determine efficiency at each test point.
        3)
2. Repeat tests until results comply with requirements indicated.
3. Provide analysis equipment required to determine performance.
4. Provide temporary equipment and system modifications necessary to dissipate the heat produced during tests if building systems are not adequate.
5. Notify Architect in advance of test dates.
6. Document test results in a report and submit to Architect.

END OF SECTION

SECTION 22 40 00

PLUMBING FIXTURES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following conventional plumbing fixtures and related components:
   1. Lavatories.
   2. Lavatory Faucets.
   3. Water closets.
   4. Toilet seats.
   5. Flushometers - Water Closets.
   6. Fixture supports.
   7. Protective shielding guards.

B. Related Sections include the following:
   1. Division 22 Section "Plumbing Specialties" for backflow preventers, floor drains, and specialty fixtures not included in this Section.

1.03 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

C. Cast Polymer: Cast-filled-polymer-plastic material. This material includes cultured-marble and solid-surface materials.

D. Cultured Marble: Cast-filled-polymer-plastic material with surface coating.

E. Fitting: Device that controls the flow of water into or out of the plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

F. FRP: Fiberglass-reinforced plastic.

G. PMMA: Polymethyl methacrylate (acrylic) plastic.

H. PVC: Polyvinyl chloride plastic.

I. Solid Surface: Nonporous, homogeneous, cast-polymer-plastic material with heat-, impact-, scratch-, and stain-resistance qualities.

1.04 SUBMITTALS

A. Product Data: For each type of plumbing fixture indicated. Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports. Indicate materials and finishes, dimensions, construction details, and flow-control rates.

B. Operation and Maintenance Data: For plumbing fixtures to include in operation, and maintenance manuals.

C. Warranty: Special warranty specified in this Section.

1.05 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.
   1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; and Public Law 101-336, "Americans with Disabilities Act"; for plumbing fixtures for people with disabilities.

D. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

E. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

F. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

G. Comply with the following applicable standards and other requirements specified for plumbing fixtures:
   1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
   2. Porcelain-Enameled, Formed-Steel Fixtures: ASME A112.19.4M.
   3. Solid-Surface-Material Lavatories and Sinks: ANSI/ICPA SS-1.
   4. Stainless-Steel Commercial, Handwash Sinks: NSF 2 construction.
   5. Vitreous-China Fixtures: ASME A112.19.2M.
   6. Water-Closet, Flush Valve, Tank Trim: ASME A112.19.5.
   7. Water-Closet, Flushometer Tank Trim: ASSE 1037.

H. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:
   1. Backflow Protection Devices for Faucets with Side Spray: ASME A112.18.3M.
   2. Backflow Protection Devices for Faucets with Hose-Thread Outlet: ASME A112.18.3M.
   3. Diverter Valves for Faucets with Hose Spray: ASSE 1025.
   4. Faucets: ASME A112.18.1.
   5. Hose-Connection Vacuum Breakers: ASSE 1011.
   6. Hose-Coupling Threads: ASME B1.20.7.
   7. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
   8. NSF Potable-Water Materials: NSF 61.
   9. Pipe Threads: ASME B1.20.1.
   10. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
   11. Supply Fittings: ASME A112.18.1.
   12. Brass Waste Fittings: ASME A112.18.2.

I. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
   1. Atmospheric Vacuum Breakers: ASSE 1001.
   2. Brass and Copper Supplies: ASME A112.18.1.
   3. Manual-Operation Flushometers: ASSE 1037.
   4. Plastic Tubular Fittings: ASTM F 409.
   5. Brass Waste Fittings: ASME A112.18.2.
   6. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.

J. Comply with the following applicable standards and other requirements specified for miscellaneous components:
   1. Disposers: ASSE 1008 and UL 430.
   2. Flexible Water Connectors: ASME A112.18.6.
   3. Floor Drains: ASME A112.6.3.
   4. Grab Bars: ASTM F 446.
   5. Hose-Coupling Threads: ASME B1.20.7.
   6. Hot-Water Dispensers: ASSE 1023 and UL 499.
   7. Off-Floor Fixture Supports: ASME A112.6.1M.
   8. Pipe Threads: ASME B1.20.1.
   9. Plastic Toilet Seats: ANSI Z124.5.
   10. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.06 WARRANTY

A. Special Warranties: Manufacturer's standard form in which manufacturer agrees to repair or replace components of whirlpools that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures of unit shell.
      b. Faulty operation of controls, blowers, pumps, heaters, and timers.
      c. Deterioration of metals, metal finishes, and other materials beyond normal use.
   2. Warranty Period: One year from date of Substantial Completion.

1.07 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Faucet Washers and O-Rings: Equal to 10 percent of amount of each type and size installed.
   2. Faucet Cartridges and O-Rings: Equal to 5 percent of amount of each type and size installed.
   3. Flushometer Valve, Repair Kits: Equal to 10 percent of amount of each type installed, but no fewer than 2 of each type.
   4. Provide hinged-top wood or metal box, or individual metal boxes, with separate compartments for each type and size of extra materials listed above.

PART 2 PRODUCTS

2.01 LAVATORIES

A. Lavatories:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. American Standard Companies, Inc.
      b. Commercial Enameling Company.
      c. Eljer.
      d. Kohler Co.
      e. Crane.
      f. Sloan
      g. Zurn.
   2. Description: Accessible, wall-mounting, vitreous-china fixture.
      a. Type: With back.
      b. Size: 20 by 18 inches rectangular.
      c. Faucet Hole Punching: Three holes, 4-inch centers.

d. Color: White.
e. Supplies: NPS 3/8 chrome-plated copper with stops.
f. Drain: Grid with offset waste.
1) Location: Near back of bowl.

B. Lavatories, Counter Mounted:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Commercial Enameling Company.
b. Eljer.
c. Kohler Co.
d. American Standard.
e. Crane.
f. Sloan
g. Zurn.
h. Prior approved equal.
2. Description: Accessible Counter-mounting, vitreous-china fixture.
a. Type: Self-rimming.
b. Oval Lavatory Size: 20 by 17 inches.
c. Faucet Hole Punching: Three holes, 4-inch centers.
d. Color: White.
e. Supplies: NPS 3/8 chrome-plated copper with stops.
f. Drain: Grid with offset waste.
1) Location: Near back of bowl.

C. Mixing valve:
1. Valve shall be thermostatic and pressure mixing valve with maximum 5 degree approach temperature.
2. Approved Manufacturers -
a. Powers hydroguard TP or equal by
b. Sloan
c. Prior approved equal

2.02 LAVATORY FAUCETS

A. Lavatory Faucets:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Standard Companies, Inc.
b. Bradley Corporation.
c. Chicago Faucets.
d. Delta Faucet Company.
e. Eljer.
f. Elkay Manufacturing Co.

g. Fisher Manufacturing Co.
h. Just Manufacturing Company.
i. Kohler Co.
j. Moen, Inc.
k. Royal Brass Mfg. Co.
l. Sayco; a Briggs Plumbing Products, Inc. Company.
m. Speakman Company.
n. Sloan
o. T & S Brass and Bronze Works, Inc.
p. Zurn Plumbing Products Group; Commercial Brass Operation.
q. Prior approved equal.

2. Description: Sensor. Coordinate faucet inlets with supplies and fixture holes; coordinate outlet with spout and fixture receptor.
   a. Body Material: Commercial, solid brass.
   b. Finish: Polished chrome plate.
   c. Maximum Flow Rate: 0.5 gpm.
   d. Centers: 4 inches.
   e. Mounting: Deck, concealed.
   f. Spout: Rigid type.
   g. Spout Outlet: Aerator.
   h. Drain: Grid.
   i. Tempering Device: Thermostatic.

2.03 WATER CLOSETS

A. Water Closets, Wall Mounted Flush Valve:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Kohler Co. K-4330-ET or equal by
         1) Zurn.
         2) American Standard Companies, Inc. AFT Wall Water Saver 2257.103.
         3) Crane Plumbing, L.L.C./Fiat Products.
         4) Eljer.
         5) Sloan
         6) Toto
         7) Prior approved equal.
   2. Description Accessible, Where indicated on drawings, wall Wall-mounting, back-outlet, vitreous-china fixture designed for flushometer valve operation.
      a. Style: Flushometer valve.
         1) Bowl Type: Elongated with siphon-jet design.
         2) Design Consumption: 1.6 gal./flush.
         3) Color: White.
      b. Flushometer.

B. Water Closets, Floor mounted-flushvalve:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. American Standard Companies, Inc. 3043.001 (ADA), 2234.001 (standard) or equal by
         1) Briggs Plumbing Products, Inc.
         2) Crane Plumbing, L.L.C./Fiat Products.
         3) Eljer.
         4) Kohler Co.
         5) TOTO USA, Inc.
         6) Sloan
         7) Zurn.
   2. Description: Accessible where indicated on drawings, Floor-mounting, floor-outlet, vitreous-china fixture designed for flushometer valve operation.
         1) Bowl Type: Elongated front with siphon-jet design. Include bolt caps matching fixture.
         2) Height: Accessible where indicated on drawings.
         3) Design Consumption: 1.6 gal./flush.
         4) Color: White.

C. Water Closets, Floor mounted-tank type:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. American Standard Companies, Inc. Cadet 2292.100 or Cadet 2168.100.
      b. Crane Plumbing, L.L.C./Fiat Products.
      c. Eljer.
      d. Kohler Co.
      e. Sloan
      f. Zurn.
      g. Toto
      h. Prior approved equal.
   2. Description Accessible, where indicated on drawings, Floor-mounting, back-outlet, vitreous-china fixture designed for gravity-tank operation.
      a. Style:
         1) Bowl Type: Elongated with siphon-jet design. Include bolt caps matching fixture.
         2) Height: Accessible, where indicated on drawings.
         3) Design Consumption.
         4) Tank: Gravity type with trim. Include cover.
         5) Trip Mechanism: Lever-handle actuator.
         6) Color: White.

2.04 TOILET SEATS

A. Toilet Seats:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Comfort seats C108SSCAM or equal.
      b. American Standard Companies, Inc.
      c. Bemis Manufacturing Company.
      d. Church Seats.
      e. Eljer.
      f. Kohler Co.
      g. Olsonite Corp.
   2. Description: Toilet seat for water-closet-type fixture.
      a. Material: Molded, heavy duty, solid, anti-microbial plastic.
      b. Configuration: Open front without cover.
      c. Hinge Type: Stainless Steel, self-sustaining.
      d. Class: Standard commercial.
      e. Color: White.

2.05 FLUSHOMETERS-WATER CLOSETS

A. Flushometers, Water Closets:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Coyne & Delany Co.
      b. Sloan Valve Company.
      c. Zurn Plumbing Products Group.
      d. Prior approved equal
   2. Description: Flushometer for water closet fixture. Include brass body with corrosion-resistant internal components, non-hold-open feature, control stop with check valve, vacuum breaker, copper or brass tubing, and polished chrome-plated finish on exposed parts.
      a. Internal Design: Diaphragm operation.
      b. Style: Exposed.
      c. Inlet Size: NPS 1".
      d. Trip Mechanism: Battery-operated sensor actuator.
      e. Consumption: 1.6 gal./flush.

2.06 FIXTURE SUPPORTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Josam Company.
   2. MIFAB Manufacturing Inc.
   3. Smith, Jay R. Mfg. Co.

4. Tyler Pipe; Wade Div.
5. Watts Drainage Products Inc.; a div. of Watts Industries, Inc.
6. Zurn Plumbing Products Group; Specification Drainage Operation.
7. Prior approved equal.

B. Water-Closet Supports:
1. Description: Combination carrier designed for accessible or standard mounting height as required of wall-mounting, water-closet-type fixture. Include single or double, vertical or horizontal, hub-and-spigot or hubless waste fitting as required for piping arrangement; faceplates; couplings with gaskets; feet; and fixture bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

C. Urinal Supports:
1. Description: Type I, urinal carrier with fixture support plates and coupling with seal and fixture bolts and hardware matching fixture for wall-mounting, urinal-type fixture. Include steel uprights with feet.
2. Accessible-Fixture Support: Include rectangular steel uprights.

D. Lavatory Supports:
1. Description: Type II, lavatory carrier with concealed arms and tie rod for wall-mounting, lavatory-type fixture. Include steel uprights with feet.
2. Accessible-Fixture Support: Include rectangular steel uprights.

E. Sink Supports:
1. Description: Type II, sink carrier with hanger plate, bearing studs, and tie rod for sink-type fixture. Include steel uprights with feet.

2.07 PROTECTIVE SHIELDING GUARDS

A. Protective Shielding Piping Enclosures:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. TRUEBRO, Inc.
b. Plumberex.
c. McGuire.
d. Proflo.
e. Prior approved equal.
2. Description: Manufactured plastic enclosure for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with ADA requirements.

2.08 SERVICE SINKS

A. Service Sinks:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. American Standard Companies, Inc.

b. Commercial Enameling Company.
c. Eljer.
d. Kohler Co.

2. Description: Floor-mounting, enameled, cast-iron fixture with front apron, raised back, and coated, wire rim guard.
   a. Size: 28 by 28 inches.
   b. Color: White.
   c. Faucet: Sink American Standard 8344.111 with threaded spout and48 inch hose and damp or equal by
      1) Eljer.
      2) Kohler.
      3) Speakman.
   d. Drain: Grid with NPS 2 outlet.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before plumbing fixture installation.

B. Examine cabinets, counters, floors, and walls for suitable conditions where fixtures will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Assemble plumbing fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. Install off-floor supports, affixed to building substrate, for wall-mounting fixtures.
   1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
   2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
   3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

C. Install back-outlet, wall-mounting fixtures onto waste fitting seals and attach to supports.

D. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.

E. Install wall-mounting fixtures with tubular waste piping attached to supports.

F. Install floor-mounting, back-outlet water closets attached to building floor substrate and wall bracket and onto waste fitting seals.

G. Install counter-mounting fixtures in and attached to casework.

H. Install fixtures level and plumb according to roughing-in drawings.

I. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

1. Exception: Use ball, gate, or globe valves if supply stops are not specified with fixture. Valves are specified in Division 22 and 23 Section "Valves."

J. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

K. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

L. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.

M. Install tanks for accessible, tank-type water closets with lever handle mounted on wide side of compartment.

N. Install toilet seats on water closets.

O. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

P. Install water-supply flow-control fittings with specified flow rates in fixture supplies at stop valves.

Q. Install faucet flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

R. Install traps on fixture outlets.

1. Exception: Omit trap on fixtures with integral traps.
2. Exception: Omit trap on indirect wastes, unless otherwise indicated.

S. Install disposer in outlet of each sink indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

T. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Escutcheons are specified in Division 22 and 23 Section "Basic Mechanical Materials and Methods."

U. Seal joints between fixtures and walls, floors, and countertops using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color.

3.03 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Connect wiring according to Division 26 Section "Conductors and Cables."

3.04 FIELD QUALITY CONTROL

A. Verify that installed plumbing fixtures are categories and types specified for locations where installed.

B. Check that plumbing fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed plumbing fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

3.05 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Operate and adjust all fixtures. Replace damaged and malfunctioning units and controls.

C. Adjust water pressure at faucets and flushometer valves to produce proper flow and stream.

D. Replace washers and seals of leaking and dripping faucets and stops.

E. Install fresh batteries in sensor-operated mechanisms.

3.06 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:
   1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
   2. Remove sediment and debris from drains.

B. After completing installation of exposed, factory-finished fixtures, faucets, and fittings, inspect exposed finishes and repair damaged finishes.

3.07 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of plumbing fixtures for temporary facilities unless approved in writing by Owner.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 45 00

EMERGENCY PLUMBING FIXTURES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Eye/face wash equipment.
   2. Combination units.
   3. Supplemental equipment.
   4. Water-tempering equipment.

1.03 DEFINITIONS

A. Accessible Fixture: Emergency plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Plumbed Emergency Plumbing Fixture: Fixture with fixed, potable-water supply.

C. Self-Contained Emergency Plumbing Fixture: Fixture with flushing-fluid-solution supply.

D. Tepid: Moderately warm.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated. Include flow rates and capacities, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Product Certificates: Submit certificates of performance testing specified in "Source Quality Control" Article.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For emergency plumbing fixtures to include in operation and maintenance manuals.

1.05 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ANSI Standard: Comply with ANSI Z358.1, "Emergency Eyewash and Shower Equipment."

C. NSF Standard: Comply with NSF 61, "Drinking Water System Components - Health Effects," for fixture materials that will be in contact with potable water.

D. Regulatory Requirements: Comply with requirements in ICC/ANSI A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act"; for plumbing fixtures for people with disabilities.

PART 2 PRODUCTS

2.01 EYE/FACE WASH EQUIPMENT

A. Accessible, Freestanding, Plumbed, Eye/Face Wash Units,:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Acorn Safety; a division of Acorn Engineering Company.
      b. Bradley Corporation.
      c. Guardian Equipment Co.
      d. Stingray Systems
      e. Prior approved equal
   2. Capacity: Not less than 3 gpm for at least 15 minutes.
   3. Supply Piping: NPS 1/2 chrome-plated brass or stainless steel with flow regulator and stay-open control valve.
   4. Control-Valve Actuator: Paddle.
   5. Spray-Head Assembly: Two or four receptor-mounted spray heads.
   6. Receptor: Plastic bowl.
   7. Drain Piping: NPS 1-1/4 minimum, chrome-plated brass, receptor drain, P-trap, waste to wall, and wall flange complying with ASME A112.18.2/CSA B125.2.
   8. Mounting: Offset pedestal.
   9. Special Construction: Comply with ICC/ANSI A117.1.

2.02 COMBINATION UNITS

A. Accessible, Plumbed Emergency Shower with Eyewash Combination Units,:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Acorn Safety; a division of Acorn Engineering Company.
      b. Bradley Corporation.
      c. Guardian Equipment Co.
      d. Stingray Systems
      e. Prior approved equal
   2. Piping:
      a. Material: PVC.

b. Unit Supply: NPS 1-1/2.
c. Unit Drain: Outlet at back or side near bottom.

3. Shower:
   a. Capacity: Not less than 20 gpm for at least 15 minutes.
   b. Supply Piping: NPS 1 with flow regulator and stay-open control valve.
   c. Control-Valve Actuator: Pull rod.
   d. Shower Head: 8-inch- minimum diameter, plastic.
   e. Mounting: Pedestal.
4. Eyewash Unit:
   a. Capacity: Not less than 0.4 gpm for at least 15 minutes.
   b. Supply Piping: NPS 1/2 with flow regulator and stay-open control valve.
   c. Control-Valve Actuator: Paddle.
   d. Spray-Head Assembly: Two receptor-mounted spray heads.
   e. Receptor: Plastic bowl.
   f. Mounting: Attached shower pedestal.
   g. Drench-Hose Option: May be provided instead of eyewash unit.
      1) Capacity: Not less than 0.4 gpm for at least 15 minutes.
      2) Drench Hose: Hand-held spray head with squeeze-handle actuator and hose.
      3) Mounting: Bracket on shower pedestal.

2.03 WATER-TEMPERING EQUIPMENT

A. Hot- and Cold-Water, Water-Tempering Equipment,:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Acorn Safety; a division of Acorn Engineering Company.
      b. Armstrong International, Inc.
      c. Bradley Corporation.
      d. Encon Safety Products.
      e. Guardian Equipment Co.
      f. Haws Corporation.
      g. Lawler Manufacturing Co., Inc.
      h. Leonard Valve Company.
      i. Powers; a division of Watts Water Technologies, Inc.
      j. Speakman Company.
      k. Prior approved equal
   2. Description: Factory-fabricated equipment with thermostatic mixing valve.
      a. Thermostatic Mixing Valve: Designed to provide 85 deg F tepid, potable water at emergency plumbing fixtures, to maintain temperature at plus or minus 5 deg F throughout required 15-minute test period, and in case of unit failure to continue cold-water flow, with union connections, controls, metal piping, and corrosion-resistant enclosure.
      b. Supply Connections: For hot and cold water.

2.04 SOURCE QUALITY CONTROL

A. Certify performance of emergency plumbing fixtures by independent testing organization acceptable to authorities having jurisdiction.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before plumbed emergency plumbing fixture installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 EMERGENCY PLUMBING FIXTURE INSTALLATION

A. Assemble emergency plumbing fixture piping, fittings, control valves, and other components.

B. Install fixtures level and plumb.

C. Fasten fixtures to substrate.

D. Install shutoff valves in water-supply piping to fixtures. Use ball, gate, or globe valve if specific type valve is not indicated. Install valves chained or locked in open position if permitted. Install valves in locations where they can easily be reached for operation. Comply with requirements for valves specified in Division 22 and 23 Section "General-Duty Valves for Plumbing Piping."

1. Exception: Omit shutoff valve on supply to group of plumbing fixtures that includes emergency equipment.
2. Exception: Omit shutoff valve on supply to emergency equipment if prohibited by authorities having jurisdiction.

E. Install shutoff valve and strainer in steam piping and shutoff valve in condensate return piping. Comply with requirements for steam and condensate piping specified in Division 22 and 23 Section "Steam and Condensate Piping."

F. Install dielectric fitting in supply piping to emergency equipment if piping and equipment connections are made of different metals. Comply with requirements for dielectric fittings specified in Division 22 and 23 Section "Domestic Water Piping."

G. Install thermometers in supply and outlet piping connections to water-tempering equipment. Comply with requirements for thermometers specified in Division 22 and 23 Section "Meters and Gages for Plumbing Piping."

H. Install trap and waste piping on drain outlet of emergency equipment receptors that are indicated to be directly connected to drainage system. Comply with requirements for waste piping specified in Division 22 and 23 Section "Sanitary Waste and Vent Piping."

I. Install indirect waste piping on drain outlet of emergency equipment receptors that are indicated to be indirectly connected to drainage system. Comply with requirements for waste piping specified in Division 22 and 23 Section "Sanitary Waste and Vent Piping."

J. Install escutcheons on piping wall and ceiling penetrations in exposed, finished locations. Comply with requirements for escutcheons specified in Division 22 and 23 Section "Escutcheons for Plumbing Piping."

K. Fill self-contained fixtures with flushing fluid.

3.03 CONNECTIONS

A. Connect cold-water-supply piping to plumbed emergency plumbing fixtures not having water-tempering equipment. Comply with requirements for cold-water piping specified in Division 22 and 23 Section "Domestic Water Piping."

B. Connect hot- and cold-water-supply piping to hot- and cold-water, water-tempering equipment. Connect output from water-tempering equipment to emergency plumbing fixtures. Comply with requirements for hot- and cold-water piping specified in Division 22 Section "Domestic Water Piping."

C. Connect steam and cold-water-supply and condensate return piping to steam and cold water-tempering equipment. Connect output from water-tempering equipment to emergency plumbing fixtures. Comply with requirements for cold-water piping specified in Division 22 Section "Domestic Water Piping" and comply with requirements for steam and condensate piping specified in Division 22 and 23 Section "Steam and Condensate Piping."

D. Connect cold water and electrical power to electric heating water-tempering equipment. Comply with requirements for cold-water piping specified in Division 22 Section "Domestic Water Piping."

E. Directly connect emergency plumbing fixture receptors with trapped drain outlet to sanitary waste and vent piping. Comply with requirements for waste piping specified in Division 22 Section "Sanitary Waste and Vent Piping."

F. Indirectly connect emergency plumbing fixture receptors without trapped drain outlet to sanitary waste or storm drainage piping.

G. Where installing piping adjacent to emergency plumbing fixtures, allow space for service and maintenance of fixtures.

3.04 IDENTIFICATION

A. Install equipment nameplates or equipment markers on emergency plumbing fixtures and equipment and equipment signs on water-tempering equipment. Comply with requirements for identification materials specified in Division 22 and 23 Section "Identification for Plumbing Piping and Equipment."

3.05 FIELD QUALITY CONTROL

A. Mechanical-Component Testing: After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve indicated capacities.

B. Tests and Inspections:

1. Perform each visual and mechanical inspection.

2. Leak Test: After installation, charge system and test for leaks. Repair leaks and re-test until no leaks exist.
3. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Emergency plumbing fixtures and water-tempering equipment will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.06 ADJUSTING

A. Adjust or replace fixture flow regulators for proper flow.

B. Adjust equipment temperature settings.

END OF SECTION

SECTION 23 01 00

GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 GENERAL

A. General Conditions and Division 01 apply to this Division.

1.02 SCOPE

A. Includes:
   1. Furnish all labor, materials, and equipment necessary for the completion of the mechanical and plumbing scope of work.
   2. Furnish and install all motors specified in this Division and be responsible for the proper operation of electrical powered equipment furnished by this Division.
   3. Furnish exact location of electrical connections and information on motor controls to Division 26.
   4. Mechanical Contractor shall obtain the services of independent Test and Balance Agency.
   5. Placing the air conditioning, heating, ventilating, and exhaust systems into full operation and continuing their operation during each working day of testing and balancing.
   6. Making changes in pulleys, belts, and dampers, or adding dampers, as required for the correct balance as recommended by Balancing Contractor at no additional cost to Owner.
   7. Air balance, final adjustment and test run.
   8. The satisfactory performance of the completed systems is a requirement of this specification.

B. Related Work Specified Elsewhere
   1. Conduit, line voltage wiring, outlets, and disconnect switches specified in Division 26.
   2. Magnetic starters and thermal protective devices (heaters) not a factory mounted integral part of packaged equipment are specified in Division 26.

1.03 SITE OBSERVATION

A. The Contractor shall examine the site and understand the conditions which may affect the performance of work of this Division before submitting proposals for this work.

B. No subsequent allowance for time or money will be considered for any consequence related to failure to examine existing site conditions.

1.04 DRAWINGS

A. Mechanical drawings show general arrangement of piping, ductwork, equipment, etc; however, locations are to be regarded as shown diagrammatically only. Follow as closely as actual building construction and work of other trades will permit.

B. Because of the small scale of mechanical drawings, it is not possible to indicate all offsets, fittings, and accessories which may be required. Investigate existing structural and finished conditions affecting this work and arrange work accordingly, providing such fittings, valves, and accessories required to meet conditions.

C. If changes in location of piping, equipment, ducts, etc. are required due to lack of coordination of work under this division, such changes shall be made without charge. Contractor shall review drawings with local and state agencies having jurisdiction and any changes required by them shall be brought to the attention of the Engineer prior to bidding or commencement of work. It is understood that while Drawings are to be followed as closely as circumstances permit, this Division will be held responsible for the installation of systems according to the true intent and meaning of the Contract Documents. Anything not clear or in conflict will be explained by making application to the Engineer in writing. Should conditions arise where certain changes would be advisable, secure Owner's and Engineer approval for these changes before proceeding with work.

1.05 COORDINATION OF WORK:

A. Coordinate work of various trades in installing interrelated work. Before installation of mechanical items, make proper provision to avoid interferences in a manner approved by Engineer. Changes required in work specified in Division 22 and 23 caused by neglect to secure approval shall be made at no cost to Owner.

B. Arrange piping, ductwork, and equipment to permit ready access to valves, unions, starters, motors, control components, and to clear openings of doors and access panels. Contractor shall provide all necessary access doors and/or panels to provide complete access to all mechanical equipment, dampers, or accessories. Doors for dampers, etc. shall be minimum 12" x 12" and doors for mechanical equipment shall be minimum 24" x 24".

C. Furnish and install inserts and supports required by Division 22 and 23 unless otherwise noted. Furnish sleeves, inserts, supports, and equipment that are an integral part of other Divisions involved in sufficient time to be built into the construction as the Work proceeds. Locate these items and see that they are properly installed. Expense resulting from improper location or installation of items above shall be borne by Contractor.

D. Be responsible for required digging, cutting, and patching incident to work of this Division and make required repairs afterwards to satisfaction of Owner and Architect. Cut carefully to minimize necessity for repairs to existing work. Do not cut beams, columns, or trusses.
   1. Patch and repair walls, floors and roofs with materials of same quality and appearance as adjacent surfaces unless otherwise shown. Surface finishes shall exactly match existing finishes of same materials.
   2. This Division shall bear expense of cutting, patching, repairing, and replacing of work of other Divisions because of its fault, error, tardiness, or because of damage done by it.
   3. Provide the necessary cutting, patching, repairing, and replacing pavements, sidewalks, etc. to permit installation of work of this Division.

E. Adjust locations of piping, ductwork, equipment, etc, to accommodate work from interferences anticipated and encountered. Determine exact route and location of each pipe and cut prior to fabrication.

1. Make offsets, transitions, and changes in direction of piping, ductwork, and electrical raceways as required to maintain proper head room and pitch of sloping lines whether or not indicated on Drawings.

F. Slots and openings through floors, walls and roofs shall be provided by this Division.

G. This Contractor shall schedule his work, store his equipment and materials, and work in harmony with other Contractors so as to not delay or jeopardize the construction.

H. This Division shall coordinate with electrical contractor to insure that all required components of control work are included and fully understood. Any discrepancies shall be called to the attention of the Engineer before completion of bids. No additional cost shall accrue to the Owner as a result of lack of such coordination.

1.06 EQUIPMENT & MATERIALS:

A. Requests for substitution shall be received in writing a minimum of seven days prior to bidding. Prior acceptance shall be by Manufacturer's name only. Items not listed in this specification or subsequent addendums shall not be considered. No oral approvals will be acceptable. Manufacturers listed in this specification are acceptable only for items listed. All other items manufacturer wishes to bid must be prior approved. All equipment shall be subject to final review in accordance with "Project Submittals".

B. Product Approvals -

1. If approval is received to use other than specified items, responsibility for specified capacities and insuring that items to be furnished will fit space available lies with this Division.
2. In the event other than specified equipment is used and will not fit job site conditions, this Division assumes responsibility for replacement with items named in Specification.

C. Use <u>domestic made</u> pipe, pipe fittings, and motors on Project.

D. Motor and equipment name plates as well as applicable UL labels shall be in place when Project is turned over to Owner.

E. Insure that items to be furnished fit spaces available. Make necessary field measurements to ascertain space requirements including those for connections and furnish and install equipment of size and shape so final installation shall suit true intent and meaning of Contract Documents. Do not scale off drawings.

F. All materials shall be of the best commercial quality obtainable, consistent with specified materials and for the purpose or function intended. Materials shall be new unless specifically excepted.

G. Equipment catalog or model numbers shown define the basic equipment types and quality standard only. Catalog numbers shall not be considered as all inclusive and shall be verified to include all devices, controls, operators, and appurtenances necessary for the satisfactory and complete operation of the equipment.

H. Follow manufacturer's directions in delivery, storage, protection, and installation of equipment and materials.
   1. Promptly notify Engineer in writing of conflicts between requirements of Contract Documents and Manufacturer's directions and obtain Engineer's written instructions before proceeding with work. Contractor shall bear all expenses arising from correcting deficiencies of work that does not comply with Manufacturer's directions or such written instructions.

I. Deliver equipment and material to site and tightly cover and protect against dirt, water, and chemical or mechanical injury but have readily accessible for inspection. Store items subject to moisture damage (such as controls) in a dry, heated space.

1.07 PROJECT SUBMITTALS:

A. Furnish complete catalog data for manufactured items of equipment to be used in the Work to for review within 15 days after award of Contract.

B. Submittal shall include, but not be limited to the following:
   1. equipment scheduled
   2. balancing contractor
   3. insulation
   4. grilles, and diffusers
   5. automatic temperature controls
   6. certificates of guarantee
   7. valves
   8. plumbing fixtures, accessories, and specialties
   9. any item for which more than one manufacturer is mentioned

C. Submit a minimum of five copies of data in binders and index in same order and name as they appear in Specification. - Optional: Provide electronic submittals. Electronic submittals shall be in .pdf format, and shall be compiled into a single file, with bookmarks for each piece of equipment.
   1. State sizes, capacities, brand names, motor HP, electrical requirements, accessories, materials, gauges, dimensions, and other pertinent information.
   2. List on catalog covers page numbers of submitted items.
   3. Underline or highlight applicable data.

D. If material or equipment is not as specified or submittal is not complete, it will be rejected.

E. Catalog data or shop drawings for equipment which are noted as approved shall not supersede Contract Documents.

F. Review comments shall not relieve this Division from responsibility for deviations from Contract Documents unless attention has been called to such deviations in writing at time of submission, nor shall they relieve this Division from responsibility for errors in items submitted.

G. Check work described by catalog data with Contract Documents for deviations and errors.

H. All items other than first named specified equipment shall show and state all exceptions and deviations taken and shall include design calculations and drawing layouts.

I. The Contractor shall review the submittals prior to submission to make sure that the submittals are complete in all details. No submittal will be reviewed which does not bear the contractor's notation that such checking has been made.

J. No partial submittals will be considered unless approved by the Engineer.

K. Manufacturers' names shall be mentioned as acceptable prior to bidding.

L. Contractor shall verify equipment dimensions to fit the spaces provided with sufficient clearance for servicing the equipment.

M. Contractor shall review equipment submittals for compliance with schedules, specifications, and drawing plans and details. Equipment submittal shall show the proper arrangements to suit installation and maintenance such as motor location, access doors, filter removal, piping connections, etc.

N. Equipment submittal sheets shall be clearly marked indicating equipment symbol and exact selection of proposed equipment. Submittals shall clearly indicate name of manufacturer of each item.

O. For unacceptable items, the right shall be reserved to require the first named specified items.

P. Where submittals are sent with any of the above listed information missing or are incomplete they will be returned to the contractor unchecked to be completed and resubmitted. No additional time or money shall be allowed for failure to provide complete submittals on the first review.

Q. If an item requiring submittal review is ordered, purchased, shipped, or installed prior to the submittal review the item shall be removed from the job site and replaced with an approved item at contractors expense.

1.08 CLEANING & FINISHING:

A. Contractor shall, at all times, keep the premises free from waste material and rubbish. Upon completion of this Section of the work, Contractor shall remove all surplus materials and rubbish; clean all spots resulting from the mechanical work from hardware, floors, glass, walls, etc.; do all required patching up and repair all work of other trades damaged by Contractor under this Section of the work, and leave the premises in a clean orderly condition. Clean heating and cooling coils, internally and externally, and replace all air filters prior to final mechanical inspection. Remove rust, plaster, dirt, grease and oil before painting, insulating, or exposing to view the equipment, piping, ductwork, etc. in completed structure. Refinish any damaged surfaces and leave in proper working order at final completion.

1.09 EQUIPMENT SERVICING:

A. Prior to starting mechanical equipment, all motors, bearings and moving parts shall be properly oiled, greased and lubricated as required. Full and adequate maintenance service shall be given and upon completion all equipment shall be cleaned and checked and placed in perfect condition for the Owner.

B. Amount and type of lubricant shall be per manufacturer's specification.

1.10 SUPERVISION:

A. The Contractor shall supervise and direct the work with his best skill and attention. He will be solely responsible for the means, methods, techniques, sequences and procedures of construction. The Contractor will be responsible to see that the finished work complies accurately with the Contract Documents.

1.11 SAFETY REGULATIONS:

A. Contractor shall provide equipment, supervision, construction, procedures, and everything necessary to assure safety of life or property.

B. Refer also to General Condition and Special Conditions for protection clauses.

1.12 LEAK DAMAGE:

A. Contractor shall be responsible for damages to the work of other Contractors or to the building, or to its contents, people, etc., caused by leaks in any of the equipment or piping installed by him through equipment or material failures, leaking joints or disconnected pipes, fittings, or by overflows and shall make at his own expense all repairs to fixtures, building interior, contents, paint, rugs, furniture, ceiling tile, and equipment so damaged.

1.13 TOOLS AND STORAGE OF EQUIPMENT:

A. The Contractor shall furnish all necessary tools, staging and whatever may be necessary for the installation of this work and shall at all times protect this work and others, and the materials to be used therein from damage by the weather, accident and other causes, and shall repair and make good any damage thus occurring.

1.14 WORKMANSHIP:

A. Workmanship shall be the best quality of its kind for respective industries, trades, crafts and practices and shall be acceptable in every respect to the Owner and Engineer. Nothing contained herein shall relieve the Contractor from performing good work, perfect in all details of construction.

1.15 TEMPORARY FACILITIES:

A. Furnishing of temporary water, space heating, sanitary facilities, drainage lines, light and power will be as specified in Division 01 General Conditions. Contractor shall arrange to bring facilities to required location of premises. All expenses involved shall be paid by the Contractor as described in General and Special Conditions.

1.16 PAINTING BY CONTRACTOR:

A. Painting shall be by persons experienced in painting.

1.17 EQUIPMENT BASES:

A. Provide reinforced concrete bases under boilers, chillers, pumps, air handling units, and other equipment as necessary or as indicated on the drawings. Coordinate work with Division 03.

B. Bases shall be 6" high, above the finish floor. The base shall extend beyond the equipment 6" in all directions, where possible. Inserts and vibration isolation systems shall be provided and installed by the Mechanical Contractor at the time the concrete is poured to accommodate and anchor the equipment used. Coordinate with vibration isolation manufacturer's requirements and Section 22 and 23. Provide a one inch beveled edge all around.

1.18 BELT GUARDS:

A. Shall be provided, properly enclosing each belt drive system. Guards shall be easily removable, constructed of expanded metal with suitable frames corresponding with SMACNA standard and with tachometer openings. Coordinate with equipment suppliers to avoid duplication of belt guards supplied with equipment. Guards shall comply with OSHA Regulations.

1.19 ELECTRICAL WORK:

A. Power wiring to all electrically driven apparatus shall be done under the electrical contract. See Electrical Specifications.

B. Unless specifically noted otherwise on documents, Electrical Contractor shall furnish and install all magnetic starters including properly sized heaters, and disconnect switches as indicated on drawings or required by code.

C. The Contractor shall verify the proper operation of equipment furnished by him. Costs for repair, replacing, re-wiring and retesting shall be borne by the Contractor without additional costs to the Owner.

D. Motors shall be as specified.

1.20 CONTRACTOR'S USE OF BUILDING EQUIPMENT:

A. The Contractor may use equipment such as electric motors, fans, filters, etc. when permanently installed as part of the project and with the written permission of the Owner. As each piece of equipment is used, maintenance procedures approved by the manufacturer shall be followed, a careful record shall be kept of the time used, maintenance procedure following and of any difficulty experienced with equipment. The Contractor's records on the equipment shall be submitted to the Owner upon acceptance of project. All fan belts and filter media shall be new at the beginning of the Mechanical System Operating Test Run and System Balancing. Wearing surfaces (such as bearings) shall be carefully inspected just prior to acceptance. Any excessive wear noted shall require replacement.

1.21 INSPECTION NOTICE:

A. The following is a basic list of guideline items so that the Architect, district building inspector/Owner’s representative can be at job site for these inspections as the building progresses. Mechanical Contractor shall inform these people one week in advance of test time.
   1. Water tests on all sewer, waste, and rainwater piping prior to piping being concealed.
   2. Pressure tests on all water service piping.
   3. Pressure tests on hot, chilled, and condenser water supply and return piping.
   4. All duct work prior to installation of finished ceilings, including ductwork pressure testing.
   5. The initial start-up of mechanical equipment, etc.
   6. Any changes or problems occurring at job site.
   7. Inspect all vent flashings on roof prior to roofing.
   8. Periodic inspection at their discretion will be made to insure compliance to Contract Documents and codes. Contractor shall provide ladders, access and other assistance as requested during inspections.
   9. Control piping pressure tests.
   10. Final inspection before giving approval for final payment.

1.22 EXCAVATION AND BACKFILLING:

A. Trench for the underground gas pipe line shall be excavated to the required depth. Rocks, trash, or other debris will not be allowed in trench or backfill and shall be removed before pipe is laid in place. After piping has been tested, inspected and approved, piping shall be backfilled. All landscaping, concrete, etc., damaged by this Contractor shall be replaced by him to the satisfaction of Owner's Representative.

1.23 WARRANTY GUARANTEE:

A. The Contractor shall warrant all materials and equipment to be of quality consistent with specifications as represented by manufacturer's published data.

B. The Contractor shall guarantee that the installation and operation of the equipment shall be free from defects for a period of one year beginning at date of substantial completion and acceptance. The Contractor shall replace or repair any part of the installation that is found to be defective or incomplete within the guarantee period.

C. The one year guarantee on equipment and systems shall commence when equipment has been demonstrated to work and has been accepted. (Example: If an equipment item fails to perform and it takes 9 months after substantial completion to correct, then the guarantee shall commence after the item has been demonstrated to perform and has been accepted.)

D. Substantial completion and acceptance in no way relieves the Contractor from providing the systems and equipment as specified.

1.24 COMPLETION SCHEDULE:

A. Start-up and verification of basic equipment items shall be done prior to the date of substantial completion with sufficient time to allow balancing and adjusting to be performed.

B. At the time of the final inspection a date shall be agreed upon for completion of any remaining items. At least double the estimated cost of the work will be withheld from the Contractor's payment.

1.25 CODE REQUIREMENTS, FEES, AND PERMITS

A. The work shall be installed in accordance with the following applicable codes, ordinances and standards unless otherwise specified. The codes and standards shall include but not be limited to and be of the latest and current editions.
   1. American Boiler and Affiliated Industries (AB and AI)
   2. American Gas Association (AGA)
   3. Air Movement and Control Association (AMCA)
   4. American National Standards Institute (ANSI)
   5. Air Conditioning & Refrigeration Institute (ARI)
   6. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) - ASHRAE 90.1-2019
   7. American Society of Mechanical Engineers (ASME)

8. American Society of Testing Materials (ASTM)
9. American Standards Association (ASA)
10. American Water Works Association (AWWA)
11. American Welding Society (AWS)
12. Associated Air Balance Council (AABC)
13. Heat Exchange Institute (HEI)
14. Hydraulic Institute (HI)
15. National Electrical Code (NEC)
16. National Fire Protection Association (NFPA)
17. Sheet Metal and Air Conditioning contractors National Association (SMACNA)
18. Underwriters Laboratories (UL)
19. International Building Code (IBC) 2021 Ed
20. International Mechanical Code (IMC) 2021 Ed
21. International Plumbing Code (IPC) with Utah Amendments 2021 Ed
22. International Energy Conservation Code (IECC) 2021 Ed
23. Utah State Safety Orders (OSHA/UOSH)
24. Utah Fire Rating Bureau
25. Utah Boiler and Pressure Vessel Law
26. Utah Air Conservation Regulations/Waste Disposal regulations.
27. ASHRAE Ventilation STD.62-2019
28. FM Global Requirements and Regulations

B. Should drawings conflict with any code, the code shall govern. If drawings and specifications establish a quality exceeding the code, the drawings and specifications shall govern. If conflicts do exist among the drawings, specifications and codes, the same shall be brought to the attention of the Engineer in writing prior to bidding, otherwise Contractor shall comply with applicable codes.

C. The latest edition of all codes shall be used.

D. Contractor shall give all notices, obtain all necessary permits, file necessary plans, prepare documents and obtain approvals, and pay all fees required for completion of the mechanical and plumbing work outlined in this Division of the specifications and shown on the Mechanical Drawings.

1.26 OPERATION AND MAINTENANCE MANUAL FOR MECHANICAL SYSTEMS

A. Upon completion of work and before final payment, Contractor shall furnish and deliver to the Owner, through the Engineer, installation, operation and maintenance manuals with instructions for all new materials and equipment used in the building. The contractor shall provide three (3) hard copies of the manuals, and three (3) CD's with electronic copies of the manuals. Electronic information shall be .PDF format. The CD's shall include the same information as the hard copies, and shall be organized in the same manner with electronic bookmarks for each section. CD case and the CD itself shall be labeled the same as the hard copies of the manuals.

B. Bind Operation and Maintenance Manual for Mechanical Systems in a hard-backed piano hinge loose-leaf binder with strong sturdy cover. The project name shall be on the spine and the front of the binder. The front of the binder shall include the following information:

OPERATION

AND

MAINTENANCE

MANUAL

for MECHANICAL SYSTEMS of

(Name of Project)

(Location of Project)

(Date of Project Award)

(Name of Architect)

C. Introduction
   1. Title page including name of project, project number, date awarded and date of substantial completion.
   2. Second page shall contain the names, phone numbers and addresses of Architect, Consulting Engineers, Mechanical Contractor, and General Contractor.
   3. Third page shall include a Table of Contents for the entire manual.

D. First Section - Summary information including:
   1. First page shall contain the contractor's warranties.
   2. Second page shall contain a list of names, addresses and phone numbers of contractors and all sub-contractors and work to which each was assigned.
   3. Final page or pages shall contain an equipment list. The list shall contain each item of equipment or material for which a submittal was required giving ID or tag no as contained on the drawings make and model No. Serial No. Identification No. Location in building, function along with the name, address, and phone number of the supplier.

E. Second Section - Mechanical Equipment O&M data including:
   1. Mechanical maintenance schedule, including a lubrication list when necessary.
   2. Mechanical Equipment Operation and Maintenance Data including:
      a. Equipment descriptions
      b. Detailed installation instruction, operating and maintenance instructions. Instructions include in a step by step manner identifying start-up, operating, shutdown and emergency action sequence sufficiently clear so a person unfamiliar with the equipment could perform its operations.
      c. Equipment drawings, performance curves, operating characteristics, etc.
      d. Name addresses and phone number of manufacturer, fabricator and local vender clearly printed or stamped on cover.
      e. Complete parts listing which include catalog number, serial number, contract number or other accurate provision for ordering replacement and spare parts.

f. Certified drawings, where applicable, showing assembly of parts and general dimensions.

3. Approved Mechanical submittals

F. Third Section - Controls O&M data including:

1. Sequence of Operation
2. Description of each operating system included location of switches, breakers, thermostats, and control devices. Provide a single line diagram, showing set points, normal operating parameters for all loads, pressures, temperatures and flow check points; Describe all alarms and cautions for operation.
3. Provide schematic control diagrams, panel diagrams, wiring diagrams, etc. for each separate fan system, chilled water system, hot water system, exhaust air system**,** pumps, etc. Each control diagram shall show a schematic representation of mechanical equipment and location of start-stop switches, insertion thermostats, thermometers, pressure gauges, automatic valves, etc. The correct reading for each control instrument shall be marked on the diagram.

G. The Fourth Section shall contain a complete air and water test and balance report. The report shall contain the name, address and phone number of the agency. It shall also include:

1. Floor plans showing all air openings and thermometer locations clearly marked and cross referenced with data sheets. Format may be 8 1/2 x 11 or 11x14 if legible.
2. Data sheets showing amount of air and water at each setting. See sections 22 and 23.
3. List of equipment with date of last calibration.

H. Drawings and reproducible masters of drawings as required in individual specification sections, are not to be bound in volumes but are to be delivered separate with the maintenance manuals.

I. See the following checklist for assistance in assembling manual:

Item #	Description	Y, N, or NA
1.	3 ring heavy duty binder with Project name, number and date on cover and project name on spine.	
2.	O&M manual on CD (with label on CD matching label on manual). Electronic copy shall be a PDF file with bookmarks that match the tabs in the hard copy.	
3.	Title Page [including project name, number, address, date awarded, date of substantial completion]	
4.	Second Page Contact List [including architect (if applicable), mechanical engineer, mechanical contractor, and general contractor (if applicable)]	
5.	Table of Contents	
6.	**Section 1 - Summary**	
A.	Warranty	
B.	Mechanical's Sub-contractor List	
C.	Vendor List	
D.	Equipment List	
7.	**Section 2 – Mechanical Equipment**	
A.	Maintenance Schedule (including lubrication list)	

B.	Mechanical Equipment O&M Data (for each piece of equipment submitted) per specifications	
C.	Approved mechanical submittals	
8.	**Section 3 - Controls**	
A.	Sequence of Operation	
B.	Controls diagrams	
C.	Controls Equipment	
9.	**Section 4 – Test and Balance Report**	
A.	Complete Test and Balance Report per specifications	

1.27 OPERATION AND MAINTENANCE INSTRUCTIONS

A. Contractor shall instruct building maintenance personnel in the operation and maintenance of the installed mechanical systems utilizing the Operation and Maintenance Manual when so doing.

B. Minimum instruction periods shall be as follows:
   1. Mechanical - Two hours.
   2. Temperature Control - Two hours.

C. Instruction periods shall occur before final site observation when systems are properly working and before final payment is made.

D. None of these instructional periods shall overlap each other.

E. An additional four hours of instruction will be provided by each contractor, after 60 days of system operation by owner to insure proper system operation and answer questions.

1.28 RECORD DRAWINGS

A. Contractor shall keep an up-to-date set of mechanical and plumbing drawings in his custody showing all changes in red, clearly defined and neatly drafted by him. At the end of construction, he shall turn these drawings over to the Engineer. Record drawings must be completed and submitted prior to final site observation

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 05 00

BASIC MECHANICAL AND HVAC MATERIALS AND METHODS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following:
   1. Adjust list below to suit Project.
   2. Piping materials and installation instructions common to most piping systems.
   3. Dielectric fittings.
   4. Mechanical sleeve seals.
   5. Sleeves.
   6. Penetrations
   7. Escutcheons.
   8. Mechanical demolition.
   9. Equipment installation requirements common to equipment sections.

1.03 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for plastic materials:
   1. Retain abbreviations that remain after this Section has been edited.
   2. ABS: Acrylonitrile-butadiene-styrene plastic.
   3. CPVC: Chlorinated polyvinyl chloride plastic.
   4. PVC: Polyvinyl chloride plastic.

1.04 SUBMITTALS

A. Product Data: For the following:
   1. Adjust list below to suit Project.
   2. Dielectric fittings.
   3. Mechanical sleeve seals.

B. Welding certificates.

1.05 QUALITY ASSURANCE

A. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

B. All materials, piping, etc. shall be new, and domestically made of the best commercial quality obtainable, consistent with specified materials and for the purpose or function intended unless specifically approved in writing prior to bid.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.07 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces.

PART 2 PRODUCTS

2.01 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 22 and 23 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.02 JOINING MATERIALS

A. Refer to individual Division 22 and 23 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

H. Solvent Cements for Joining Plastic Piping:
   1. ABS Piping: ASTM D 2235.
   2. CPVC Piping: ASTM F 493.
   3. PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
   4. PVC to ABS Piping Transition: ASTM D 3138.

2.03 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
   1. Coordinate subparagraph and associated subparagraphs below with Part 2 "Manufacturers" Article. Retain "Available" for nonproprietary and delete for semiproprietary specifications.
   2. Available Manufacturers:
      a. Capitol Manufacturing Co.

b. Central Plastics Company.
c. Eclipse, Inc.
d. Epco Sales, Inc.
e. Hart Industries, International, Inc.
f. Watts Industries, Inc.; Water Products Div.
g. Zurn Industries, Inc.; Wilkins Div.
h. Prior Approved Equal.

2.04 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Coordinate first subparagraph and associated subparagraphs below with Part 2 "Manufacturers" Article. Retain "Available" for nonproprietary and delete for semi-proprietary specifications.
   2. Available Manufacturers:
      a. Advance Products & Systems, Inc.
      b. Calpico, Inc.
      c. Metraflex Co.
      d. Pipeline Seal and Insulator, Inc.
      e. Linkseal.
      f. Prior Approved Equal.
   3. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   4. Pressure Plates: Carbon steel. Include two for each sealing element.
   5. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.05 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.

E. PVC Pipe: ASTM D 1785, Schedule 40.

2.06 PENETRATIONS

A. Floor and wall penetrations of fire rated assemblies shall be protected with FM approved fire stop systems.

2.07 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Stamped-Steel Type: With set screw or spring clips and chrome-plated finish.

2.08 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
   1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, non-gaseous, and recommended for interior and exterior applications.
   2. Design Mix: 5000-psi, 28-day compressive strength.
   3. Packaging: Premixed and factory packaged.

PART 3 EXECUTION

3.01 MECHANICAL DEMOLITION

A. Disconnect, demolish, and remove mechanical systems, equipment, and components indicated to be removed.
   1. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
   2. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material.
   3. Ducts to Be Removed: Remove portion of ducts indicated to be removed and plug remaining ducts with same or compatible ductwork material.
   4. Ducts to Be Abandoned in Place: Cap or plug ducts with same or compatible ductwork material.
   5. Equipment to Be Removed: Disconnect and cap services and remove equipment.
   6. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
   7. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.

B. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, remove damaged or unserviceable portions and replace with new products of equal capacity and quality.

3.02 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 and 23 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Drawings do not show every offset, or bend that may be required. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors where indicated on drawings and where penetrating will be visible to public.

M. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
   1. Edit first subparagraph and associated subparagraph below as required for 2-inch (50-mm) extension above floor.
   2. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
   3. Install sleeves in new walls and slabs as new walls and slabs are constructed.
   4. Edit subparagraph below as required for seismic design conditions. Coordinate sleeve requirements with Division 15 Section "Pipe Insulation."
   5. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
   6. Edit pipe size range in first two subparagraphs below to suit Project. Confirm that PVC materials are allowed for sleeves by fire authorities having jurisdiction.
   7. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint.

N. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

O. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

P. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials.

Q. Verify final equipment locations for roughing-in.

R. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.03 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 and 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
   3. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
   4. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
   5. PVC Nonpressure Piping: Join according to ASTM D 2855.
   6. PVC to ABS Nonpressure Transition Fittings: Join according to ASTM D 3138 Appendix.

J. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D 3212.

3.04 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
   3. Edit dielectric connection types in two subparagraphs below for each fluid.
   4. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
   5. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.05 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

END OF SECTION

SECTION 23 05 13

COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section includes general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on ac power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation.

1.03 COORDINATION

A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
   1. Motor controllers.
   2. Torque, speed, and horsepower requirements of the load.
   3. Ratings and characteristics of supply circuit and required control sequence.
   4. Ambient and environmental conditions of installation location.

PART 2 PRODUCTS

2.01 GENERAL MOTOR REQUIREMENTS

A. Comply with requirements in this Section except when stricter requirements are specified in HVAC equipment schedules or Sections.

B. Comply with NEMA MG 1 unless otherwise indicated.

C. Comply with IEEE 841 for severe-duty motors.

2.02 MOTOR CHARACTERISTICS

A. Duty: Continuous duty at ambient temperature of 40 deg C and at altitude of 3300 feet above sea level.

B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.03 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Energy efficient, as defined in NEMA MG 1.

C. Service Factor: 1.15.

D. Multispeed Motors: Variable torque.
   1. For motors with 2:1 speed ratio, consequent pole, single winding.
   2. For motors with other than 2:1 speed ratio, separate winding for each speed.

E. Multispeed Motors: Separate winding for each speed.

F. Rotor: Random-wound, squirrel cage.

G. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

H. Temperature Rise: Match insulation rating.

I. Insulation: Class F.

J. Code Letter Designation:
   1. Starting codes in first subparagraph below are adequate for most variable-torque loads encountered in HVAC applications; 15 hp is a common breakpoint in rating among manufacturers when Code F and Code G apply. Retain both subparagraphs and options unless Project conditions or equipment characteristics dictate otherwise.
   2. Motors 15 HP and Larger: NEMA starting Code F or Code G.
   3. Motors Smaller than 15 HP: Manufacturer's standard starting characteristic.

K. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.04 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Reduced-Voltage and Multispeed Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
   1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
   2. Energy- and Premium-Efficient Motors: Class B temperature rise; Class F insulation.
   3. Inverter-Duty Motors: Class F temperature rise; Class H insulation.

4. See "Multispeed and Variable-Speed Considerations" Article in the Evaluations for discussion of thermally protected motors. Thermal protection is not usually required for HVAC equipment and energy- or premium-efficient motors specified in this Section. Retain subparagraph below to require the added protection from overheating or if inverter-duty motors are required.
5. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.
6. Retain paragraph below only if Project requires severe-duty motors, based on environmental conditions.
7. Severe-Duty Motors: Comply with IEEE 841, with 1.15 minimum service factor.

2.05 SINGLE-PHASE MOTORS

A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:
   1. See Evaluations for a comparison of single-phase motor types.
   2. Permanent-split capacitor.
   3. Split phase.
   4. Capacitor start, inductor run.
   5. Capacitor start, capacitor run.

B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.

C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 EXECUTION

(Not Used)

END OF SECTION

SECTION 23 05 48

VIBRATION AND SEISMIC CONTROLS FOR HVAC PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. This project shall also meet all of the Seismic Bracing requirements and recommendations from FM Global. Submit to FM Global for approval.

C. This specification shall include all components in both Division 22 and 23.

1.02 SUMMARY

A. This Section includes the following:
   1. Isolation pads.
   2. Freestanding and restrained spring isolators.
   3. Seismic snubbers.
   4. Restraining braces and cables.

1.03 SCOPE

A. Provide letter of design intent.

B. Provide full set of seismic submittals.

C. Provide final letter of compliance completion.

1.04 DEFINITIONS

A. IBC: International Building Code.

B. ICC-ES: ICC-Evaluation Service.

1.05 PERFORMANCE REQUIREMENTS

A. Wind-Restraint Loading:
   1. Basic Wind Speed: Per owner's design standards.
   2. Building Classification Category: As defined in the IBC.
   3. Minimum 10 lb/sq. ft. multiplied by the maximum area of the HVAC component projected on a vertical plane that is normal to the wind direction, and 45 degrees either side of normal.

B. Seismic-Restraint Loading:
   1. Site Class: As defined in the IBC.
   2. Assigned Seismic Use Group or Building Category: As defined in the IBC.
      a. Retain first three subparagraphs below if these values are not included in the HVAC Vibration-Control and Seismic-Restraint Device Schedule on Drawings. Factors below often vary among supported equipment. However, it is possible to specify maximum values for these factors for various classes of equipment or for all equipment instead of scheduling each piece of equipment.
      b. Component Importance Factor: 1.5.

1.06 SUBMITTALS

A. Product Data: For the following:
   1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.
   2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic-restraint component used.
      a. See Evaluations for a discussion on seismic-restraint capacities and rating services.
      b. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an evaluation service member of ICC-ES or an agency acceptable to authorities having jurisdiction.
      c. Annotate to indicate application of each product submitted and compliance with requirements.
   3. Interlocking Snubbers: Include ratings for horizontal, vertical, and combined loads.

B. Letter of Design intent, stating company, design criteria, compliance with specifications and only exceptions that will apply. Letter shall be stamped and signed by a licensed and qualified professional engineer in this jurisdiction.

C. Delegated-Design Submittal: For vibration isolation and seismic-restraint details indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Design Calculations: Calculate static and dynamic loading due to equipment weight and operation, seismic and wind forces required to select vibration isolators, seismic and wind restraints, and for designing vibration isolation bases.
      a. Coordinate design calculations with wind load calculations required for equipment mounted outdoors. Comply with requirements in other Division 22 and 23 Sections for equipment mounted outdoors.
   2. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system has been examined for excessive stress and that none will exist.
   3. Vibration Isolation Base Details: Detail overall dimensions, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment, and cantilever loads.

4. Seismic- and Wind-Restraint Details:
    a. Design Analysis: To support selection and arrangement of seismic and wind restraints. Include calculations of combined tensile and shear loads.
    b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacing's. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.
    c. Retain first subparagraph below if Project includes equipment mounted outdoors.
    d. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Division 22 and 23 Sections for equipment mounted outdoors.
    e. Preapproval and Evaluation Documentation: By an evaluation service member of ICC-ES or an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

D. Coordination Drawings: Show coordination of seismic bracing for HVAC piping and equipment with other systems and equipment in the vicinity, including other supports and seismic restraints.

E. Welding certificates.

F. Qualification Data: For professional engineer and testing agency.

G. Field quality-control test reports.

1.07 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

B. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.

C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

D. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval OPA number from OSHPD, preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

E. FM Global review and acceptance.

F. Upon project completion provide a final letter of acceptance for seismic restraints system and installation.

PART 2 PRODUCTS

2.01 VIBRATION ISOLATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Amber/Booth Company, Inc.
   2. Vibro-acoustics.
   3. ISAT
   4. Mason Industries.
   5. Caddy
   6. Prior approved equal.

B. Pads: Arranged in single or multiple layers of sufficient stiffness for uniform loading over pad area, molded with a nonslip pattern and galvanized-steel baseplates, and factory cut to sizes that match requirements of supported equipment.
   1. Resilient Material: Oil- and water-resistant neoprene or rubber.

C. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic or limit-stop restraint.
   1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to weight being removed; factory-drilled baseplate bonded to 1/4-inch- thick, neoprene or rubber isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
   2. Restraint: Seismic or limit stop as required for equipment and authorities having jurisdiction.
   3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
   4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
   5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
   6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

2.02 SEISMIC-RESTRAINT DEVICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Amber/Booth Company, Inc.
   2. Hilti, Inc.
   3. ISAT
   4. Kinetics Noise Control.
   5. Mason Industries.

6. Vibro-acoustics.
7. Unistrut; Tyco International, Ltd.
8. Prior approved equal.

B. General Requirements for Restraint Components: Rated strengths, features, and applications shall be as defined in reports by an evaluation service member of ICC-ES or an agency acceptable to authorities having jurisdiction.
   1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.

C. Snubbers: Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
   1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
   2. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.
   3. Maximum 1/4-inch air gap, and minimum 1/4-inch- thick resilient cushion.

D. Channel Support System: MFMA-3, shop- or field-fabricated support assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; and rated in tension, compression, and torsion forces.

E. Restraint Cables: -steel cables with end connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; and with a minimum of two clamping bolts for cable engagement.

F. Hanger Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections or Reinforcing steel angle clamped to hanger rod.

G. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

H. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

I. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

J. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488. Minimum length of eight times diameter.

K. Adhesive Anchor Bolts: Drilled-in and capsule anchor system containing polyvinyl or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

2.03 FACTORY FINISHES

A. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.
   1. Powder coating on springs and housings.
   2. All hardware shall be galvanized. Hot-dip galvanize metal components for exterior use.
   3. Baked enamel or powder coat for metal components on isolators for interior use.
   4. Color-code or otherwise mark vibration isolation and seismic- and wind-control devices to indicate capacity range.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic- and wind-control devices for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS

A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by an evaluation service member of ICC-ES or an agency acceptable to authorities having jurisdiction.

B. Hanger Rod Stiffeners: Install hanger rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits.

3.03 VIBRATION-CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION

A. Equipment Restraints:
   1. Install seismic snubbers on HVAC equipment mounted on vibration isolators. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.
   2. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.
   3. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES or an agency acceptable to authorities having jurisdiction providing required submittals for component.

B. Piping Restraints:
   1. Comply with requirements in MSS SP-127.
   2. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.
   3. Brace a change of direction longer than 12 feet.

C. Install cables so they do not bend across edges of adjacent equipment or building structure.

D. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES or an agency acceptable to authorities having jurisdiction providing required submittals for component.

E. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.

F. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

G. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

H. Drilled-in Anchors:
   1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
   2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
   3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
   4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
   5. Set anchors to manufacturer's recommended torque, using a torque wrench.
   6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.04 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment. Comply with requirements in Division 23 Section "Hydronic Piping" for piping flexible connections.

3.05 FIELD QUALITY CONTROL

A. Testing Agency: Leave a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:
   1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
   2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.
   3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.
   4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
   5. Test to 90 percent of rated proof load of device.
   6. Measure isolator restraint clearance.
   7. Measure isolator deflection.
   8. Verify snubber minimum clearances.
   9. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

3.06 ADJUSTING

A. Adjust isolators after piping system is at operating weight.

B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

C. Adjust air-spring leveling mechanism.

D. Adjust active height of spring isolators.

E. Adjust restraints to permit free movement of equipment within normal mode of operation.

3.07 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-mounting systems. Refer to Division 1 Section "Demonstration and Training."

END OF SECTION

SECTION 23 05 53

IDENTIFICATION FOR MECHANICAL AND PLUMBING PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:
   1. Adjust list below to suit Project.
   2. Equipment nameplates.
   3. Equipment signs.
   4. Access panel and door markers.
   5. Pipe markers.
   6. Warning tags.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Valve numbering scheme.

D. Valve Schedules: For each piping system. Furnish extra copies (in addition to mounted copies) to include in maintenance manuals.

1.04 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

1.05 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 PRODUCTS

2.01 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal, with data engraved or stamped, for permanent attachment on equipment.
   1. Data:
      a. Manufacturer, product name, model number, and serial number.
      b. Capacity, operating and power characteristics, and essential data.
      c. Labels of tested compliances.
   2. Location: Accessible and visible.
   3. Fasteners: As required to mount on equipment.

B. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.
   1. Data: Instructions for operation of equipment and for safety procedures.
   2. Engraving: Manufacturer's standard letter style, 1/4” or larger with terms to match equipment identification.
   3. Thickness: 1/8 inch, unless otherwise indicated.
   4. Retain and edit subparagraph above or first subparagraph below.
   5. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

C. Access Panel and Door Markers: 1/16” thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8” center hole for attachment.
   1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.02 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Bradley.
      b. Kolbi.
      c. Prior approved.
   2. Colors: Comply with ASME A13.1, unless otherwise indicated.
   3. Lettering: Use piping system terms indicated and abbreviate only as necessary for each application length.
   4. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.
   5. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers at least three times letter height and of length required for label.
   6. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Self-Adhesive Pipe Markers: Plastic with pressure-sensitive, permanent-type, self-adhesive back.

PART 3 EXECUTION

3.01 APPLICATIONS, GENERAL

A. Products specified are for applications referenced in other Division 22 and 23 Sections. If more than single-type material, device, or label is specified for listed applications, selection is Installer's option.

3.02 EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:
   1. Edit five subparagraphs below to suit Project.
   2. Fuel-burning units, including boilers, furnaces, heaters, etc.
   3. Pumps, compressors, chillers, condensers, and similar motor-driven units.
   4. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
   5. Fans, blowers, primary balancing dampers, and mixing boxes.
   6. Packaged HVAC central-station and zone-type units.

B. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.
   1. Identify mechanical equipment with black equipment markers with white lettering.
   2. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
   3. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
   4. Include signs for the following general categories of equipment:
      a. Edit eight subparagraphs below to suit Project.
      b. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
      c. Fuel-burning units, including boilers, furnaces, heaters, etc.
      d. Pumps, compressors, chillers, condensers, and similar motor-driven units.
      e. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.

f. Fans, blowers, primary balancing dampers, and mixing boxes.
g. Packaged HVAC central-station and zone-type units.
h. Tanks and pressure vessels.
i. Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

C. Install access panel markers with screws on equipment access panels.

3.03 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

B. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations as follows:
1. Near each valve and control device.
2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
3. Near penetrations through walls, floors, ceilings, and nonaccessible enclosures.
4. At access doors, manholes, and similar access points that permit view of concealed piping.
5. Near major equipment items and other points of origination and termination.
6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
7. On piping above removable acoustical ceilings. Omit intermediately spaced markers.

C. Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.04 ADJUSTING

A. Relocate mechanical identification materials and devices that have become visually blocked by other work.

3.05 CLEANING

A. Clean faces of mechanical identification devices and glass frames of valve schedules.

END OF SECTION

SECTION 23 05 93

TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes TAB to produce design objectives for the following:
   1. Air Systems:
      a. Constant-volume air systems.
      b. Variable-air-volume systems.
   2. HVAC equipment quantitative-performance settings.
   3. Existing systems TAB.
   4. Verifying that automatic control devices are functioning properly.
   5. Reporting results of activities and procedures specified in this Section.

1.03 DEFINITIONS

A. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

B. Balance: To proportion flows within the distribution system, including submains, branches, and terminals, according to indicated quantities.

C. Barrier or Boundary: Construction, either vertical or horizontal, such as walls, floors, and ceilings that are designed and constructed to restrict the movement of airflow, smoke, odors, and other pollutants.

D. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated.

E. NC: Noise criteria.

F. Procedure: An approach to and execution of a sequence of work operations to yield repeatable results.

G. RC: Room criteria.

H. Report Forms: Test data sheets for recording test data in logical order.

I. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

J. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

K. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

L. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

M. TAB: Testing, adjusting, and balancing.

N. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

O. Test: A procedure to determine quantitative performance of systems or equipment.

P. Testing, Adjusting, and Balancing (TAB) Firm: The entity responsible for performing and reporting TAB procedures.

1.04 SUBMITTALS

A. Qualification Data: Within 15 days from Contractor's Notice to Proceed, submit 4 copies of evidence that TAB firm and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article.

B. Contract Documents Examination Report: Within 30 days from Contractor's Notice to Proceed, submit 4 copies of the Contract Documents review report as specified in Part 3.

C. Strategies and Procedures Plan: Within 60 days from Contractor's Notice to Proceed, submit 4 copies of TAB strategies and step-by-step procedures as specified in Part 3 "Preparation" Article. Include a complete set of report forms intended for use on this Project.

D. Certified TAB Reports: Submit two copies of reports prepared, as specified in this Section, on approved forms certified by TAB firm.

E. Sample Report Forms: Submit two sets of sample TAB report forms.

F. Warranties specified in this Section.

1.05 QUALITY ASSURANCE

A. TAB Firm Qualifications: Engage a TAB firm certified by AABC or NEBB.

B. TAB Conference: Meet with Owner's and Architect's representatives on approval of TAB strategies and procedures plan to develop a mutual understanding of the details. Ensure the participation of TAB team members, equipment manufacturers' authorized service representatives, HVAC controls installers, and other support personnel. Provide seven days' advance notice of scheduled meeting time and location.

1. Agenda Items: Include at least the following:
    a. Submittal distribution requirements.

b. The Contract Documents examination report.
c. TAB plan.
d. Work schedule and Project-site access requirements.
e. Coordination and cooperation of trades and subcontractors.
f. Coordination of documentation and communication flow.

C. Certification of TAB Reports: Certify TAB field data reports. This certification includes the following:
1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
2. Certify that TAB team complied with approved TAB plan and the procedures specified and referenced in this Specification.

D. TAB Report Forms: Use standard forms from AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems."

E. Instrumentation Type, Quantity, and Accuracy: As described in AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems," Section II, "Required Instrumentation for NEBB Certification."

F. Instrumentation Calibration: Calibrate instruments at least every six months or more frequently if required by instrument manufacturer.
1. Keep an updated record of instrument calibration that indicates date of calibration and the name of party performing instrument calibration.

G. Approved TAB agencies:
1. Bonneville Test and Balance.
2. BTC Services.
3. Certified Test and Balance.
4. Environmental Systems Balancing
5. Intermountain Test and Balance.
6. RS Analysis.
7. Tempco
8. Prior approved equal

1.06 PROJECT CONDITIONS

A. Full Owner Occupancy: Owner will occupy the site and existing building during entire TAB period. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

B. Partial Owner Occupancy: Owner may occupy completed areas of building before Substantial Completion. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

1.07 COORDINATION

A. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist TAB activities.

B. Notice: Provide seven days' advance notice for each test. Include scheduled test dates and times.

C. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

1.08 WARRANTY

A. National Project Performance Guarantee: Provide a guarantee on AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" forms stating that AABC will assist in completing requirements of the Contract Documents if TAB firm fails to comply with the Contract Documents. Guarantee includes the following provisions:

1. The certified TAB firm has tested and balanced systems according to the Contract Documents.
2. Systems are balanced to optimum performance capabilities within design and installation limits.

PART 2 PRODUCTS (NOT APPLICABLE)

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.

1. Contract Documents are defined in the General and Supplementary Conditions of Contract.
2. Verify that balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are required by the Contract Documents. Verify that quantities and locations of these balancing devices are accessible and appropriate for effective balancing and for efficient system and equipment operation.

B. Examine approved submittal data of HVAC systems and equipment.

C. Examine Project Record Documents described in Division 1 Section "Project Record Documents."

D. Examine design data, including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.

E. Examine equipment performance data including fan and pump curves. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system. Calculate system effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from those presented when the equipment was performance tested at the factory. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," Sections 7 through 10; or in SMACNA's "HVAC Systems--Duct Design," Sections 5 and 6. Compare this data with the design data and installed conditions.

F. Examine system and equipment installations to verify that they are complete and that testing, cleaning, adjusting, and commissioning specified in individual Sections have been performed.

G. Examine system and equipment test reports.

H. Examine HVAC system and equipment installations to verify that indicated balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are properly installed, and that their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation.

I. Examine systems for functional deficiencies that cannot be corrected by adjusting and balancing.

J. Examine HVAC equipment to ensure that clean filters have been installed, bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

K. Examine terminal units, such as variable-air-volume boxes, to verify that they are accessible and their controls are connected and functioning.

L. Examine plenum ceilings used for supply air to verify that they are airtight. Verify that pipe penetrations and other holes are sealed.

M. Examine strainers for clean screens and proper perforations.

N. Examine three-way valves for proper installation for their intended function of diverting or mixing fluid flows.

O. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

P. Examine system pumps to ensure absence of entrained air in the suction piping.

Q. Examine equipment for installation and for properly operating safety interlocks and controls.

R. Examine automatic temperature system components to verify the following:
   1. Dampers, valves, and other controlled devices are operated by the intended controller.
   2. Dampers and valves are in the position indicated by the controller.

3. Integrity of valves and dampers for free and full operation and for tightness of fully closed and fully open positions. This includes dampers in multizone units, mixing boxes, and variable-air-volume terminals.
4. Automatic modulating and shutoff valves, including two-way valves and three-way mixing and diverting valves, are properly connected.
5. Thermostats and humidistats are located to avoid adverse effects of sunlight, drafts, and cold walls.
6. Sensors are located to sense only the intended conditions.
7. Sequence of operation for control modes is according to the Contract Documents.
8. Controller set points are set at indicated values.
9. Interlocked systems are operating.
10. Changeover from heating to cooling mode occurs according to indicated values.

S. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.02 PREPARATION

A. Prepare a TAB plan that includes strategies and step-by-step procedures.

B. Complete system readiness checks and prepare system readiness reports. Verify the following:
1. Permanent electrical power wiring is complete.
2. Hydronic systems are filled, clean, and free of air.
3. Automatic temperature-control systems are operational.
4. Equipment and duct access doors are securely closed.
5. Balance, smoke, and fire dampers are open.
6. Isolating and balancing valves are open and control valves are operational.
7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
8. Windows and doors can be closed so indicated conditions for system operations can be met.

3.03 GENERAL PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" and this Section.

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to insulation Specifications for this Project.

C. Mark equipment and balancing device settings with paint or other suitable, permanent identification material, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, to show final settings.

D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.04 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Determine the best locations in main and branch ducts for accurate duct airflow measurements.

E. Check airflow patterns from the outside-air louvers and dampers and the return- and exhaust-air dampers, through the supply-fan discharge and mixing dampers.

F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

G. Verify that motor starters are equipped with properly sized thermal protection.

H. Check dampers for proper position to achieve desired airflow path.

I. Check for airflow blockages.

J. Check condensate drains for proper connections and functioning.

K. Check for proper sealing of air-handling unit components.

L. Check for proper sealing of air duct system.

3.05 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
   1. Measure fan static pressures to determine actual static pressure as follows:
      a. Measure outlet static pressure as far downstream from the fan as practicable and upstream from restrictions in ducts such as elbows and transitions.
      b. Measure static pressure directly at the fan outlet or through the flexible connection.
      c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from flexible connection and downstream from duct restrictions.
      d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.

2. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
    a. Simulate dirty filter operation and record the point at which maintenance personnel must change filters.
3. Measure static pressures entering and leaving other devices such as sound traps, heat recovery equipment, and air washers, under final balanced conditions.
4. Compare design data with installed conditions to determine variations in design static pressures versus actual static pressures. Compare actual system effect factors with calculated system effect factors to identify where variations occur. Recommend corrective action to align design and actual conditions.
5. Obtain approval from Architect for adjustment of fan speed higher or lower than indicated speed. Make required adjustments to pulley sizes, motor sizes, and electrical connections to accommodate fan-speed changes.
6. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full cooling, full heating, economizer, and any other operating modes to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
1. Measure static pressure at a point downstream from the balancing damper and adjust volume dampers until the proper static pressure is achieved.
    a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.
2. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

C. Measure terminal outlets and inlets without making adjustments.
1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

D. Adjust terminal outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using volume dampers rather than extractors and the dampers at air terminals.
1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.06 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a maximum set-point airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
   1. Set outside-air dampers at minimum, and return- and exhaust-air dampers at a position that simulates full-cooling load.
   2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
   3. Measure total system airflow. Adjust to within indicated airflow.
   4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
   5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.
      a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.
   6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.
   7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
   8. Record the final fan performance data.

3.07 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
   1. Manufacturer, model, and serial numbers.
   2. Motor horsepower rating.
   3. Motor rpm.
   4. Efficiency rating.
   5. Nameplate and measured voltage, each phase.
   6. Nameplate and measured amperage, each phase.
   7. Starter thermal-protection-element rating.

B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass for the controller to prove proper operation. Record observations, including controller manufacturer, model and serial numbers, and nameplate data.

3.08 PROCEDURES FOR TESTING DUCT SYSTEMS

A. Duct system will be considered defective if it does not pass initial tests and inspections. The sheet metal contractor shall be responsible to make corrections and repairs as necessary to pass the tests. TAB contractor shall include initial test and 1 follow up test. Any additional follow up tests required due to system not passing shall be performed by the TAB contractor at the Division 22 and 23 contractor's expense.

3.09 TEMPERATURE-CONTROL VERIFICATION

A. Verify that controllers are calibrated and commissioned.

B. Check transmitter and controller locations and note conditions that would adversely affect control functions.

C. Record controller settings and note variances between set points and actual measurements.

D. Check the operation of limiting controllers (i.e., high- and low-temperature controllers).

E. Check free travel and proper operation of control devices such as damper and valve operators.

F. Check the sequence of operation of control devices. Note air pressures and device positions and correlate with airflow and water flow measurements. Note the speed of response to input changes.

G. Check the interaction of electrically operated switch transducers.

H. Check the interaction of interlock and lockout systems.

I. Check main control supply-air pressure and observe compressor and dryer operations.

J. Record voltages of power supply and controller output. Determine whether the system operates on a grounded or nongrounded power supply.

K. Note operation of electric actuators using spring return for proper fail-safe operations.

3.10 TOLERANCES

A. Set HVAC system airflow and water flow rates within the following tolerances:
   1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus 5 to plus 10 percent.
   2. Air Outlets and Inlets: 0 to minus 10 percent.
   3. Heating-Water Flow Rate: 0 to minus 10 percent.
   4. Cooling-Water Flow Rate: 0 to minus 5 percent.

3.11 REPORTING

A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.

B. Status Reports: As Work progresses, prepare reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

3.12 FINAL REPORT

A. General: Typewritten, or computer printout in letter-quality font, on standard bond paper, in three-ring binder, tabulated and divided into sections by tested and balanced systems.

B. Include a certification sheet in front of binder signed and sealed by the certified testing and balancing engineer.
   1. Include a list of instruments used for procedures, along with proof of calibration.

C. Provide final report on standard AABC or NEBB forms.

3.13 INSPECTIONS

A. Initial Inspection:
   1. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the Final Report.
   2. Randomly check the following for each system:
      a. Measure airflow of at least 10 percent of air outlets.
      b. Measure water flow of at least 5 percent of terminals.
      c. Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
      d. Measure sound levels at two locations.
      e. Measure space pressure of at least 10 percent of locations.
      f. Verify that balancing devices are marked with final balance position.
      g. Note deviations to the Contract Documents in the Final Report.

B. Final Inspection:
   1. After initial inspection is complete and evidence by random checks verifies that testing and balancing are complete and accurately documented in the final report, request that a final inspection be made by Architect.
   2. TAB firm test and balance engineer shall conduct the inspection in the presence of Architect.

3. Architect shall randomly select measurements documented in the final report to be rechecked. The rechecking shall be limited to either 10 percent of the total measurements recorded, or the extent of measurements that can be accomplished in a normal 8-hour business day.
4. If the rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
5. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.
6. TAB firm shall recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes and resubmit the final report.
7. Request a second final inspection. If the second final inspection also fails, Owner shall contract the services of another TAB firm to complete the testing and balancing in accordance with the Contract Documents and deduct the cost of the services from the final payment.

3.14 ADDITIONAL TESTS

A. Within 90 days of completing TAB, perform additional testing and balancing to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional testing, inspecting, and adjusting during near-peak summer and winter conditions.

END OF SECTION

SECTION 23 09 00

INSTRUMENTATION AND CONTROLS FOR HVAC

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Provide the installation of the controls components furnished with the equipment. This shall include the control wiring, conduit, installation, set up, programming, adjusting, and training of the different control components.

1.03 SUBMITTALS

A. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

B. Qualification Data: For Installer and manufacturer.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: Automatic control system manufacturer's authorized representative who is trained and approved for installation of system components required for this Project.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.05 COORDINATION

A. Coordinate location of thermostats and other exposed control sensors with plans and room details before installation.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Thermostats, sensors, and equipment controllers shall be provided with the equipment. See individual specification sections for specific equipment.

2.02 ACTUATORS

A. Electronic Actuators: Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque.
   1. Manufacturers:
      a. Belimo Aircontrols (USA), Inc.
      b. Or equal by.

2.03 DAMPERS

A. Manufacturers:
   1. Air Balance Inc.
   2. Don Park Inc.; Autodamp Div.
   3. TAMCO (T. A. Morrison & Co. Inc.).
   4. United Enertech Corp.
   5. Vent Products Company, Inc.
   6. Ruskin.
   7. Pottorf.
   8. Or equal by.

B. Dampers: AMCA-rated, opposed-blade design; 0.108-inch- minimum thick, galvanized-steel or 0.125-inch- minimum thick, extruded-aluminum frames with holes for duct mounting; damper blades shall not be less than 0.064-inch- thick galvanized steel with maximum blade width of 8 inches and length of 48 inches.
   1. Secure blades to 1/2-inch- diameter, zinc-plated axles using zinc-plated hardware, with oil-impregnated sintered bronze or nylon blade bearings, blade-linkage hardware of zinc-plated steel and brass, ends sealed against spring-stainless-steel blade bearings, and thrust bearings at each end of every blade.
   2. Operating Temperature Range: From minus 40 to plus 200 deg F.
   3. Edge Seals, Standard Pressure Applications: Closed-cell neoprene.
   4. Edge Seals, Low-Leakage Applications: Use inflatable blade edging or replaceable rubber blade seals and spring-loaded stainless-steel side seals, rated for leakage at less than 10 cfm per sq. ft. of damper area, at differential pressure of 4-inch wg when damper is held by torque of 50 in. x lbf; when tested according to AMCA 500D.

2.04 CONTROL CABLE

A. Electronic and fiber-optic cables for control wiring are specified in Division 26 Section "Voice and Data Communication Cabling."

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that conditioned power supply is available to control units and operator workstation.

3.02 INSTALLATION

A. Connect and configure equipment and software to achieve sequence of operation specified.

B. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation. Install devices 48 inches above the floor.

C. Install automatic dampers according to Division 22 and 23 Section "Duct Accessories."

D. Install damper motors on outside of duct in warm areas, not in locations exposed to outdoor temperatures.

E. Install labels and nameplates to identify control components according to Division 22 and 23 Section "Mechanical Identification."

3.03 ELECTRICAL WIRING AND CONNECTION INSTALLATION

A. Install raceways, boxes, and cabinets according to Division 26 Section "Raceways and Boxes."

B. Install building wire and cable according to Division 26 Section "Conductors and Cables."

C. Install signal and communication cable according to Division 26 Section "Voice and Data Communication Cabling."
   1. Conceal cable, except in mechanical rooms and areas where other conduit and piping are exposed.
   2. Install exposed cable in raceway.
   3. Install concealed cable in raceway.
   4. Bundle and harness multiconductor instrument cable in place of single cables where several cables follow a common path.
   5. Fasten flexible conductors, bridging cabinets and doors, along hinge side; protect against abrasion. Tie and support conductors.
   6. Number-code or color-code conductors for future identification and service of control system, except local individual room control cables.
   7. Install wire and cable with sufficient slack and flexible connections to allow for vibration of piping and equipment.

D. Connect manual-reset limit controls independent of manual-control switch positions. Automatic duct heater resets may be connected in interlock circuit of power controllers.

E. Connect hand-off-auto selector switches to override automatic interlock controls when switch is in hand position.

3.04 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Replace damaged or malfunctioning controls and equipment and repeat testing procedures.

3.05 ADJUSTING

A. Adjust initial set points and schedules.

B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to three visits to Project during other than normal occupancy hours for this purpose.

3.06 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC instrumentation and controls. Refer to Division 1 Section "Demonstration and Training."

END OF SECTION

SECTION 23 11 23

FACILITY NATURAL-GAS PIPING

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Pipes, tubes, and fittings.
   2. Piping specialties.
   3. Piping and tubing joining materials.
   4. Valves.
   5. Pressure regulators.

1.03 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

1.04 PERFORMANCE REQUIREMENTS

A. Minimum Operating-Pressure Ratings:
   1. Piping and Valves: 100 psig minimum unless otherwise indicated.

1.05 SUBMITTALS

A. Product Data: For each type of the following:
   1. Piping specialties.
   2. Valves. Include pressure rating, capacity, settings, and electrical connection data of selected models.
   3. Pressure regulators. Indicate pressure ratings and capacities.

B. Welding certificates.

C. Field quality-control reports.

D. Operation and Maintenance Data: For pressure regulators to include in operation, and maintenance manuals.

1.06 QUALITY ASSURANCE

A. Steel Support Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Handling Flammable Liquids: Remove and dispose of liquids from existing natural-gas piping according to requirements of authorities having jurisdiction.

B. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

C. Store and handle pipes and tubes having factory-applied protective coatings to avoid damaging coating, and protect from direct sunlight.

D. Protect stored PE pipes and valves from direct sunlight.

1.08 PROJECT CONDITIONS

A. Perform site survey, research public utility records, and verify existing utility locations. Contact utility-locating service for area where Project is located.

B. Interruption of Existing Natural-Gas Service: Do not interrupt natural-gas service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide purging and startup of natural-gas supply according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of natural-gas service.
2. Do not proceed with interruption of natural-gas service without Owner's written permission.

1.09 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

B. Coordinate requirements for access panels and doors for valves installed concealed behind finished surfaces. Comply with requirements in Division 8 Section "Access Doors and Frames."

PART 2 PRODUCTS

2.01 PIPES, TUBES, AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.
   1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern.
   2. Wrought-Steel Welding Fittings: ASTM A 234/A 234M for butt welding and socket welding.
   3. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends.
   4. Forged-Steel Flanges and Flanged Fittings: ASME B16.5, minimum Class 150, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
      a. Material Group: 1.1.
      b. End Connections: Threaded or butt welding to match pipe.
      c. Lapped Face: Not permitted underground.
      d. Gasket Materials: ASME B16.20, metallic, flat, asbestos free, aluminum o-rings, and spiral-wound metal gaskets.
      e. Bolts and Nuts: ASME B18.2.1, carbon steel aboveground and stainless steel underground.
   5. Protective Coating for Underground Piping: Factory-applied, three-layer coating of epoxy, adhesive, and PE.
      a. Joint Cover Kits: Epoxy paint, adhesive, and heat-shrink PE sleeves.

2.02 PIPING SPECIALTIES

A. Appliance Flexible Connectors:
   1. Indoor, Fixed-Appliance Flexible Connectors: Comply with ANSI Z21.24.
   2. Indoor, Movable-Appliance Flexible Connectors: Comply with ANSI Z21.69.
   3. Outdoor, Appliance Flexible Connectors: Comply with ANSI Z21.75.
   4. Corrugated stainless-steel tubing with polymer coating.
   5. Operating-Pressure Rating: 0.5 psig.
   6. End Fittings: Zinc-coated steel.
   7. Threaded Ends: Comply with ASME B1.20.1.
   8. Maximum Length: 72 inches.

2.03 JOINING MATERIALS

A. Joint Compound and Tape: Suitable for natural gas.

B. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.04 MANUAL GAS SHUTOFF VALVES

A. See "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles for where each valve type is applied in various services.

B. General Requirements for Metallic Valves, NPS 2 and Smaller: Comply with ASME B16.33.
   1. CWP Rating: 125 psig.
   2. Threaded Ends: Comply with ASME B1.20.1.
   3. Dryseal Threads on Flare Ends: Comply with ASME B1.20.3.
   4. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
   5. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction for valves 1 inch and smaller.
   6. Service Mark: Valves 1-1/4 inches to NPS 2 shall have initials "WOG" permanently marked on valve body.

C. General Requirements for Metallic Valves, NPS 2-1/2 and Larger: Comply with ASME B16.38.
   1. CWP Rating: 125 psig.
   2. Flanged Ends: Comply with ASME B16.5 for steel flanges.
   3. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
   4. Service Mark: Initials "WOG" shall be permanently marked on valve body.

D. One-Piece, Bronze Ball Valve with Bronze Trim: MSS SP-110.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. BrassCraft Manufacturing Company; a Masco company.
      b. Conbraco Industries, Inc.; Apollo Div.
      c. Lyall, R. W. & Company, Inc.
      d. McDonald, A. Y. Mfg. Co.
      e. Perfection Corporation; a subsidiary of American Meter Company.
      f. Prior approved equal..
   2. Body: Bronze, complying with ASTM B 584.
   3. Ball: Chrome-plated brass.
   4. Stem: Bronze; blowout proof.
   5. Seats: Reinforced TFE; blowout proof.
   6. Packing: Separate packnut with adjustable-stem packing threaded ends.
   7. Ends: Threaded, flared, or socket as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
   8. CWP Rating: 600 psig.
   9. Listing: Valves NPS 1 and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
   10. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

2.05 EARTHQUAKE VALVES

A. Earthquake Valves: Comply with ASCE 25 current ed.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Vanguard Valves, Inc.
      b. Safe-T-Quake.
      c. Koso
      d. Trembler Tech
      e. Prior approved equal.
   2. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction.
   3. Maximum Operating Pressure: 5 psig.
   4. Cast-aluminum body with nickel-plated chrome steel internal parts.
   5. Nitrile-rubber valve washer.
   6. Sight windows for visual indication of valve position.
   7. Threaded end connections complying with ASME B1.20.1.
   8. Wall mounting bracket with bubble level indicator.

2.06 PRESSURE REGULATORS

A. General Requirements:
   1. Single stage and suitable for natural gas.
   2. Steel jacket and corrosion-resistant components.
   3. Elevation compensator.
   4. End Connections: Threaded for regulators NPS 2 and smaller; flanged for regulators NPS 2-1/2 and larger.

B. Pressure Regulators: Comply with ANSI Z21.80.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Actaris.
      b. American Meter Company.
      c. Fisher Control Valves and Regulators; Division of Emerson Process Management.
      d. Invensys.
      e. Richards Industries; Jordan Valve Div.
      f. Prior approved equal.
   2. Body and Diaphragm Case: Cast iron or die-cast aluminum.
   3. Springs: Zinc-plated steel; interchangeable.
   4. Diaphragm Plate: Zinc-plated steel.
   5. Seat Disc: Nitrile rubber resistant to gas impurities, abrasion, and deformation at the valve port.
   6. Orifice: Aluminum; interchangeable.
   7. Seal Plug: Ultraviolet-stabilized, mineral-filled nylon.

8. Single-port, self-contained regulator with orifice no larger than required at maximum pressure inlet, and no pressure sensing piping external to the regulator.
9. Pressure regulator shall maintain discharge pressure setting downstream, and not exceed 150 percent of design discharge pressure at shutoff.
10. Overpressure Protection Device: Factory mounted on pressure regulator.
11. Atmospheric Vent: Factory- or field-installed, stainless-steel screen in opening if not connected to vent piping.
12. Maximum Inlet Pressure: 100 psig.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine roughing-in for natural-gas piping system to verify actual locations of piping connections before equipment installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Close equipment shutoff valves before turning off natural gas to premises or piping section.

B. Inspect natural-gas piping according to the International Fuel Gas Code to determine that natural-gas utilization devices are turned off in piping section affected.

C. Comply with the International Fuel Gas Code requirements for prevention of accidental ignition.

3.03 OUTDOOR PIPING INSTALLATION

A. Comply with the International Fuel Gas Code for installation and purging of natural-gas piping.

B. Install underground, natural-gas piping buried at least 36 inches below finished grade. Comply with requirements in Division 2 Section "Earthwork" for excavating, trenching, and backfilling.
   1. If natural-gas piping is installed less than 36 inches below finished grade, install it in containment conduit.

C. Install underground, PE, natural-gas piping according to ASTM D 2774.

D. Install fittings for changes in direction and branch connections.

E. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Install steel pipe for sleeves smaller than 6 inches in diameter.
   2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.

F. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

G. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

H. Install pressure gage upstream and downstream from each service regulator. Pressure gages are specified in Division 22 and 23 Section "Meters and Gages."

3.04 INDOOR PIPING INSTALLATION

A. Comply with the International Fuel Gas Code for installation and purging of natural-gas piping.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Arrange for pipe spaces, chases, slots, sleeves, and openings in building structure during progress of construction, to allow for mechanical installations.

D. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

E. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

F. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

G. Locate valves for easy access.

H. Install natural-gas piping at uniform grade of 2 percent down toward drip and sediment traps.

I. Install piping free of sags and bends.

J. Install fittings for changes in direction and branch connections.

K. Install escutcheons at penetrations of interior walls, ceilings, and floors.
   1. New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      c. Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, stamped-steel type.

d. Piping at Ceiling Penetrations in Finished Spaces: One-piece or split-casting, cast-brass type with polished chrome-plated finish.
e. Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished chrome-plated or rough-brass finish.

L. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements in Division 7 Section "Through-Penetration Firestop Systems."

M. Verify final equipment locations for roughing-in.

N. Comply with requirements in Sections specifying gas-fired appliances and equipment for roughing-in requirements.

O. Drips and Sediment Traps: Install drips at points where condensate may collect, including service-meter outlets. Locate where accessible to permit cleaning and emptying. Do not install where condensate is subject to freezing.
1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use nipple a minimum length of 3 pipe diameters, but not less than 3 inches long and same size as connected pipe. Install with space below bottom of drip to remove plug or cap.

P. Extend relief vent connections for service regulators, line regulators, and overpressure protection devices to outdoors and terminate with weatherproof vent cap.

Q. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings, below grade or floors, and in floor channels unless indicated to be exposed to view.

R. Concealed Location Installations: Except as specified below, install concealed natural-gas piping and piping installed under the building in containment conduit constructed of steel pipe with welded joints as described in Part 2. Install a vent pipe from containment conduit to outdoors and terminate with weatherproof vent cap.
1. Above Accessible Ceilings: Natural-gas piping, fittings, valves, and regulators may be installed in accessible spaces without containment conduit.
2. In Floors: Install natural-gas piping with welded or brazed joints and protective coating in cast-in-place concrete floors. Cover piping to be cast in concrete slabs with minimum of 1-1/2 inches of concrete. Piping may not be in physical contact with other metallic structures such as reinforcing rods or electrically neutral conductors. Do not embed piping in concrete slabs containing quick-set additives or cinder aggregate.
3. In Floor Channels: Install natural-gas piping in floor channels. Channels must have cover and be open to space above cover for ventilation.
4. In Walls or Partitions: Protect tubing installed inside partitions or hollow walls from physical damage using steel striker barriers at rigid supports.
a. Exception: Tubing passing through partitions or walls does not require striker barriers.
5. Prohibited Locations:
a. Do not install natural-gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts.

b. Do not install natural-gas piping in solid walls or partitions.

S. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

T. Connect branch piping from top or side of horizontal piping.

U. Install unions in pipes NPS 2 and smaller, adjacent to each valve, at final connection to each piece of equipment. Unions are not required at flanged connections.

V. Do not use natural-gas piping as grounding electrode.

W. Install strainer on inlet of each line-pressure regulator and automatic or electrically operated valve.

X. Install pressure gage upstream and downstream from each line regulator. Pressure gages are specified in Division 22 and 23 Section "Meters and Gages."

3.05 VALVE INSTALLATION

A. Install manual gas shutoff valve for each gas appliance ahead of corrugated stainless-steel tubing, aluminum, or copper connector.

B. Install underground valves with valve boxes.

C. Install regulators and overpressure protection devices with maintenance access space adequate for servicing and testing.

D. Install earthquake valves aboveground outside buildings according to listing.

E. Install anode for metallic valves in underground PE piping.

3.06 PIPING JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Threaded Joints:
1. Thread pipe with tapered pipe threads complying with ASME B1.20.1.
2. Cut threads full and clean using sharp dies.
3. Ream threaded pipe ends to remove burrs and restore full inside diameter of pipe.
4. Apply appropriate tape or thread compound to external pipe threads unless dryseal threading is specified.
5. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Welded Joints:
1. Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators.

2. Bevel plain ends of steel pipe.
3. Patch factory-applied protective coating as recommended by manufacturer at field welds and where damage to coating occurs during construction.

3.07 HANGER AND SUPPORT INSTALLATION

A. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Division 22 and 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."

B. Comply with requirements for pipe hangers and supports specified in Division 22 and 23 Section "Hangers and Supports."

C. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:
   1. NPS 1 and Smaller: Maximum span, 96 inches; minimum rod size, 3/8 inch.
   2. NPS 1-1/4: Maximum span, 108 inches; minimum rod size, 3/8 inch.
   3. NPS 1-1/2 and NPS 2: Maximum span, 108 inches; minimum rod size, 3/8 inch.
   4. NPS 2-1/2 to NPS 3-1/2: Maximum span, 10 feet; minimum rod size, 1/2 inch.
   5. NPS 4 and Larger: Maximum span, 10 feet; minimum rod size, 5/8 inch.

3.08 CONNECTIONS

A. Connect to utility's gas main according to utility's procedures and requirements.

B. Install natural-gas piping electrically continuous, and bonded to gas appliance equipment grounding conductor of the circuit powering the appliance according to NFPA 70.

C. Install piping adjacent to appliances to allow service and maintenance of appliances.

D. Connect piping to appliances using manual gas shutoff valves and unions. Install valve within 72 inches of each gas-fired appliance and equipment. Install union between valve and appliances or equipment.

E. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance.

3.09 LABELING AND IDENTIFYING

A. Comply with requirements in Division 22 and 23 Section "Mechanical Identification" for piping and valve identification.

B. Install detectable warning tape directly above gas piping, 12 inches below finished grade, except 6 inches below subgrade under pavements and slabs.

3.10 PAINTING

A. Comply with requirements in Division 9 painting Sections for painting interior and exterior natural-gas piping.

B. Paint exposed, exterior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.
   1. Alkyd System: MPI EXT 5.1D.
      a. Prime Coat: Alkyd anticorrosive metal primer.
      b. Intermediate Coat: Exterior alkyd enamel matching topcoat.
      c. Topcoat: Exterior alkyd enamel (flat).
      d. Color: By owner.

C. Paint exposed, interior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.
   1. Latex Over Alkyd Primer System: MPI INT 5.1Q.
      a. Prime Coat: Quick-drying alkyd metal primer.
      b. Intermediate Coat: Interior latex matching topcoat.
      c. Topcoat: Interior latex (semigloss).
      d. Color: By owner.

D. Damage and Touchup: Repair marred and damaged factory-applied finishes with materials and by procedures to match original factory finish.

3.11 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
   1. Test, inspect, and purge natural gas according to the International Fuel Gas Code and authorities having jurisdiction.

C. Natural-gas piping will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.12 OUTDOOR PIPING SCHEDULE

A. Aboveground natural-gas piping shall be the following:
   1. Steel pipe with malleable-iron fittings and threaded joints.

3.13 INDOOR PIPING SCHEDULE

A. Aboveground, branch piping shall be the following:
   1. Steel pipe with malleable-iron fittings and threaded joints.

B. Aboveground, distribution piping 2” and larger shall be the following:
   1. Steel pipe with wrought-steel fittings and welded joints.

3.14 ABOVEGROUND MANUAL GAS SHUTOFF VALVE SCHEDULE

A. Valves for pipe sizes NPS 2 and smaller at service meter shall be the following:
   1. One-piece, bronze ball valve with bronze trim.

B. Valves for pipe sizes NPS 2-1/2 and larger at service meter shall be one of the following:
   1. Two-piece, full-port, bronze ball valves with bronze trim.
   2. Bronze plug valve.
   3. Cast-iron, nonlubricated plug valve.

C. Distribution piping valves for pipe sizes NPS 2 and smaller shall be one of the following:
   1. One-piece, bronze ball valve with bronze trim.

D. Distribution piping valves for pipe sizes NPS 2-1/2 and larger shall be one of the following:
   1. Two-piece, full-port, bronze ball valves with bronze trim.
   2. Bronze plug valve.
   3. Cast-iron, lubricated plug valve.

END OF SECTION

SECTION 23 31 13

METAL DUCTS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Single-wall rectangular ducts and fittings.
   2. Single-wall round and flat-oval ducts and fittings.
   3. Sheet metal materials.
   4. Duct liner.
   5. Sealants and gaskets.
   6. Hangers and supports.
   7. Seismic-restraint devices.

B. Related Sections:
   1. Division 22 and 23 Section "Duct Accessories" for dampers, sound-control devices, duct-mounting access doors and panels, turning vanes, and flexible ducts.
   2. Division 22 and 23 Section "Testing, Adjusting, and Balancing" for testing, adjusting, and balancing requirements for metal ducts.

1.03 PERFORMANCE REQUIREMENTS

A. Delegated Duct Design: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and performance requirements and design criteria indicated.
   1. Static-Pressure Classes:
      a. Supply Ducts (except in Mechanical Rooms): 2-inch wg.
      b. Supply Ducts (Upstream from Air Terminal Units): 3-inch wg.
      c. Supply Ducts (Downstream from Air Terminal Units): 1-inch wg.
      d. Supply Ducts (in Mechanical Equipment Rooms): 2-inch wg.
      e. Return Ducts (Negative Pressure): 1-inch wg.
      f. Exhaust Ducts (Negative Pressure): 1-inch wg.
   2. Leakage Class:
      a. Round Supply-Air Duct: 3 cfm/100 sq. ft. at 1-inch wg.
      b. Flat-Oval Supply-Air Duct: 3 cfm/100 sq. ft. at 1-inch wg.
      c. Rectangular Supply-Air Duct: 6 cfm/100 sq. ft. at 1-inch wg.
      d. Flexible Supply-Air Duct: 6 cfm/100 sq. ft. at 1-inch wg.

B. Structural Performance: Duct hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems."
   1. Seismic Hazard Level A: Seismic force to weight ratio, 0.48.
   2. Seismic Hazard Level B: Seismic force to weight ratio, 0.30.
   3. Seismic Hazard Level C: Seismic force to weight ratio, 0.15.

1.04 SUBMITTALS

A. Product Data: For each type of the following products:
   1. Liners and adhesives.
   2. Sealants and gaskets.
   3. Seismic-restraint devices.

B. Welding certificates.

C. Field quality-control reports.

1.05 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.
   2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports.
   3. AWS D9.1M/D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.

PART 2 PRODUCTS

2.01 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-4, "Transverse (Girth) Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-5, "Longitudinal Seams - Rectangular Ducts," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 2, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.02 SINGLE-WALL ROUND AND FLAT-OVAL DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Lindab Inc.
      b. McGill AirFlow LLC.
      c. SEMCO Incorporated.
      d. Sheet Metal Connectors, Inc.
      e. Spiral Manufacturing Co., Inc.
      f. Metco.
      g. Prior approved equal.

B. Flat-Oval Ducts: Indicated dimensions are the duct width (major dimension) and diameter (diameter of the round sides connecting the flat portions of the duct).

C. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Transverse Joints - Round Duct," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   1. Transverse Joints in Ducts Larger Than 60 Inches in Diameter: Flanged.

D. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Seams - Round Duct and Fittings," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   1. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
   2. Fabricate flat-oval ducts larger than 72 inches in width (major dimension) with butt-welded longitudinal seams.

E. Tees and Laterals: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.03 SHEET METAL MATERIALS

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
   1. Galvanized Coating Designation: G60.
   2. Finishes for Surfaces Exposed to View: Mill phosphatized.

C. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
   1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

D. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.04 DUCT LINER

A. Fibrous-Glass Duct Liner: Comply with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. CertainTeed Corporation; Insulation Group.
      b. Johns Manville.
      c. Knauf Insulation.
      d. Owens Corning.
      e. Prior approved equal.
      f. Maximum Thermal Conductivity:
         1) Type I, Flexible: 0.27 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
         2) Type II, Rigid: 0.23 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
   2. Antimicrobial Erosion-Resistant Coating: Apply to the surface of the liner that will form the interior surface of the duct to act as a moisture repellent and erosion-resistant coating. Antimicrobial compound shall be tested for efficacy by an NRTL and registered by the EPA for use in HVAC systems.
   3. Solvent-Based Liner Adhesive: Comply with NFPA 90A or NFPA 90B and with ASTM C 916.
   4. Duct insulation shall have a minimum R value = 5 for installation in an unconditioned space, and a minimum R value = 8 for installation outdoors.

B. Insulation Pins and Washers:
   1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick galvanized steel; with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.

C. Shop Application of Duct Liner: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-19, "Flexible Duct Liner Installation."
   1. Adhere a single layer of indicated thickness of duct liner with at least 90 percent adhesive coverage at liner contact surface area. Attaining indicated thickness with multiple layers of duct liner is prohibited.
   2. Apply adhesive to transverse edges of liner facing upstream that do not receive metal nosing.
   3. Butt transverse joints without gaps, and coat joint with adhesive.
   4. Fold and compress liner in corners of rectangular ducts or cut and fit to ensure butted-edge overlapping.
   5. Do not apply liner in rectangular ducts with longitudinal joints, except at corners of ducts, unless duct size and dimensions of standard liner make longitudinal joints necessary.
   6. Apply adhesive coating on longitudinal seams in ducts with air velocity of 2500 fpm.
   7. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
   8. Secure transversely oriented liner edges facing the airstream with metal nosings that have either channel or "Z" profiles or are integrally formed from duct wall. Fabricate edge facings at the following locations:
      a. Fan discharges.
      b. Intervals of lined duct preceding unlined duct.
      c. Upstream edges of transverse joints in ducts where air velocities are higher than 2500 fpm or where indicated.
   9. Secure insulation between perforated sheet metal inner duct of same thickness as specified for outer shell. Use mechanical fasteners that maintain inner duct at uniform distance from outer shell without compressing insulation.
      a. Sheet Metal Inner Duct Perforations: 3/32-inch diameter, with an overall open area of 23 percent.
   10. Terminate inner ducts with buildouts attached to fire-damper sleeves, dampers, turning vane assemblies, or other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to duct walls with bolts, screws, rivets, or welds.

2.05 SEALANT AND GASKETS

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.

B. Water-Based Joint and Seam Sealant:
   1. Application Method: Brush on.
   2. Solids Content: Minimum 65 percent.
   3. Shore A Hardness: Minimum 20.

4. Water resistant.
5. Mold and mildew resistant.
6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

C. Flanged Joint Sealant: Comply with ASTM C 920.
1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.

D. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

E. Round Duct Joint O-Ring Seals:
1. Seal shall provide maximum leakage class of 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for 10-inch wg static-pressure class, positive or negative.
2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.
3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

2.06 HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct."

D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.

E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A 492.

F. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:
1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.

2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.
3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

PART 3 EXECUTION

3.01 DUCT INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.

B. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

C. Install round and flat-oval ducts in maximum practical lengths.

D. Install ducts with fewest possible joints.

E. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.

F. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.

G. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

H. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.

I. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.

J. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.

K. Where ducts pass through fire-rated interior partitions and exterior walls, install fire dampers. Comply with requirements in Division 22 Section "Duct Accessories" for fire and smoke dampers.

L. Protect duct interiors from moisture, construction debris and dust, and other foreign materials. Comply with SMACNA's "Duct Cleanliness for New Construction Guidelines."

3.02 SEAM AND JOINT SEALING

A. Seal duct seams and joints for duct static-pressure and leakage classes specified in "Performance Requirements" Article, according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 1-2, "Standard Duct Sealing Requirements," unless otherwise indicated.
   1. For static-pressure classes 1- and 1/2-inch wg, comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Seal Class C, except as follows:
      a. Ducts that are located directly in zones they serve.

3.03 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
   1. Where practical, install concrete inserts before placing concrete.
   2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
   3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
   4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.
   5. Do not use powder-actuated concrete fasteners for seismic restraints.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet.

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.04 CONNECTIONS

A. Make connections to equipment with flexible connectors complying with Division 22 and 23 Section "Duct Accessories."

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.05 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Leakage Tests:
   1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual."
   2. Test the following systems:
      a. Supply air.
   3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
   4. Test for leaks before insulation application.
   5. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test entire system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure. Give seven days' advance notice for testing.

C. Duct System Cleanliness Tests:
   1. Visually inspect duct system to ensure that no visible contaminants are present.
   2. Test sections of metal duct system, chosen randomly by Owner, for cleanliness according to "Vacuum Test" in NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."
      a. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.

D. Duct system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.06 DUCT CLEANING

A. Clean new duct system(s) before testing, adjusting, and balancing.

B. Use service openings for entry and inspection.
   1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Division 22 and 23 Section "Duct Accessories" for access panels and doors.
   2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
   3. Remove and reinstall ceiling to gain access during the cleaning process.

C. Particulate Collection and Odor Control:
   1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
   2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.

D. Clean the following components by removing surface contaminants and deposits:
   1. Air outlets and inlets (registers, grilles, and diffusers).
   2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
   3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
   4. Coils and related components.
   5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.
   6. Supply-air ducts, dampers, actuators, and turning vanes.
   7. Dedicated exhaust and ventilation components and makeup air systems.

E. Mechanical Cleaning Methodology:
   1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
   2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
   3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
   4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
   5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
   6. Provide drainage and cleanup for wash-down procedures.
   7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removal of surface deposits and debris.

3.07 DUCT SCHEDULE

A. Fabricate ducts with galvanized sheet steel:

B. Intermediate Reinforcement:
   1. Galvanized-Steel Ducts: Galvanized steel.
   2. Stainless-Steel Ducts: Galvanized steel.
   3. Aluminum Ducts: Aluminum or galvanized sheet steel coated with zinc chromate.

C. Liner:
   1. Supply- and Return-Air Ducts: Fibrous glass, Type I.

D. Double-Wall Duct Interstitial Insulation:
   1. Supply- and Return-Air Ducts: 1 inch thick.

E. Elbow Configuration:
   1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Elbows."
      a. Velocity 1000 fpm or Lower:
         1) Radius Type RE 1 with minimum 0.5 radius-to-diameter ratio.
         2) Mitered Type RE 4 without vanes.
      b. Velocity 1000 to 1500 fpm:
         1) Radius Type RE 1 with minimum 1.0 radius-to-diameter ratio.
         2) Radius Type RE 3 with minimum 0.5 radius-to-diameter ratio and two vanes.
         3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
      c. Velocity 1500 fpm or Higher:
         1) Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
         2) Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.
         3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
   2. Round Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-3, "Round Duct Elbows."
      a. Minimum Radius-to-Diameter Ratio and Elbow Segments: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 3-1, "Mitered Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments.
         1) Velocity 1000 fpm or Lower: 0.5 radius-to-diameter ratio and three segments for 90-degree elbow.
         2) Velocity 1000 to 1500 fpm: 1.0 radius-to-diameter ratio and four segments for 90-degree elbow.
         3) Velocity 1500 fpm or Higher: 1.5 radius-to-diameter ratio and five segments for 90-degree elbow.
      b. Round Elbows, 12 Inches and Smaller in Diameter: Stamped or pleated.
      c. Round Elbows, 14 Inches and Larger in Diameter: Standing seam.

F. Branch Configuration:
   1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-6, "Branch Connections."
      a. Rectangular Main to Rectangular Branch: 45-degree entry.
      b. Rectangular Main to Round Branch: Spin in.
   2. Round and Flat Oval: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees." Saddle taps are permitted in existing duct.
      a. Velocity 1000 fpm or Lower: 90-degree tap.
      b. Velocity 1000 to 1500 fpm: Conical tap.
      c. Velocity 1500 fpm or Higher: 45-degree lateral.

G. Duct Schedule
    1. Rectangular duct with liner:
        a. Low pressure supply and return.
    2. Rectangular duct wrapped with insulation:
        a. Low pressure exhaust and fresh air.
    3. Single wall round with wrapped insulation.
        a. Low pressure supply and return.

END OF SECTION

SECTION 23 33 00

DUCT ACCESSORIES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following:
   1. Volume dampers.
   2. High Efficiency Take-Offs.
   3. Motorized control dampers.
   4. Fire dampers.
   5. Combination fire and smoke dampers.
   6. Turning vanes.
   7. Duct-mounting access doors.
   8. Flexible connectors.
   9. Flexible ducts.
   10. Duct accessory hardware.

B. Related Sections include the following:
   1. Division 22 and 23 Section "HVAC Instrumentation and Controls" for electric and pneumatic damper actuators.

1.03 SUBMITTALS

A. Product Data: For the following:
   1. Volume dampers.
   2. High Efficiency Take-Offs.
   3. Motorized control dampers.
   4. Fire dampers.
   5. Combination fire and smoke dampers.
   6. Turning vanes.
   7. Duct-mounting access doors.
   8. Flexible connectors.
   9. Flexible ducts.

1.04 QUALITY ASSURANCE

A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."

1.05 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 SHEET METAL MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards–Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated.

B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653/A 653M and having G60 coating designation; ducts shall have mill-phosphatized finish for surfaces exposed to view.

C. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

D. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.03 VOLUME DAMPERS

A. Manufacturers:
   1. Air Balance, Inc.
   2. American Warming and Ventilating.
   3. Clifco
   4. Flexmaster U.S.A., Inc.
   5. Leader
   6. McGill AirFlow Corporation.
   7. METALAIRE, Inc.
   8. Nailor Industries Inc.
   9. Penn Ventilation Company, Inc.
   10. Ruskin Company.

11. Vent Products Company, Inc.
12. Air Rite.
13. Greenheck.
14. Prior approved equal.

B. General Description: Factory fabricated, with required hardware and accessories. Stiffen damper blades for stability. Include locking device to hold single-blade dampers in a fixed position without vibration. Close duct penetrations for damper components to seal duct consistent with pressure class.
   1. Pressure Classes of 3-Inch wg or Higher: End bearings or other seals for ducts with axles full length of damper blades and bearings at both ends of operating shaft.

C. Standard Volume Dampers: Opposed-blade design, standard leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications.
   1. Steel Frames: Hat-shaped, galvanized sheet steel channels, minimum of 0.064 inch thick, with mitered and welded corners; frames with flanges where indicated for attaching to walls and flangeless frames where indicated for installing in ducts.
   2. Roll-Formed Steel Blades: 0.064-inch- thick, galvanized sheet steel.
   3. Aluminum Frames: Hat-shaped, 0.10-inch- thick, aluminum sheet channels; frames with flanges where indicated for attaching to walls; and flangeless frames where indicated for installing in ducts.
   4. Roll-Formed Aluminum Blades: 0.10-inch- thick aluminum sheet.
   5. Extruded-Aluminum Blades: 0.050-inch- thick extruded aluminum.
   6. Blade Axles: Galvanized steel.
   7. Bearings: Oil-impregnated bronze.
   8. Tie Bars and Brackets: Aluminum.
   9. Tie Bars and Brackets: Galvanized steel.

D. Damper Hardware: Zinc-plated, die-cast core with dial and handle made of 3/32-inch-thick zinc-plated steel, and a 3/4-inch hexagon locking nut. Include center hole to suit damper operating-rod size. Include elevated platform for insulated duct mounting.

2.04 HIGH EFFICIENCY TAKE-OFF

A. Factory-manufactured rectangular-to-round or round-to-round 45 degree leading tap fabricated of 24 ga zinc-coated lockforming quality steel sheets meeting requirements of ASTM A 653, with G-90 coating.

B. One inch wide mounting flange with die formed corner clips, pre-punched mounting holes, and adhesive coated gasket.

C. Manual Volume Damper:
   1. Single blade, 22 ga minimum.
   2. 3/8 inch minimum square rod with brass damper bearings at each end.
   3. Heavy duty locking quadrant on 1-1/2 inch high stand-off mounting bracket attached to side of round duct.

D. Approved Manufacturers:
   1. HETD-L by Daniel Manufacturing.
   2. STO by Flexmaster USA Inc.
   3. HET by Sheet Metal Connectors Inc.
   4. Hercules.
   5. Clifco
   6. Air-Rite.
   7. Prior approved equal.

2.05 MOTORIZED CONTROL DAMPERS

A. Manufacturers:
   1. Air Balance, Inc.
   2. American Warming and Ventilating.
   3. CESCO Products.
   4. Duro Dyne Corp.
   5. Greenheck.
   6. McGill AirFlow Corporation.
   7. METALAIRE, Inc.
   8. Nailor Industries Inc.
   9. Penn Ventilation Company, Inc.
   10. Ruskin Company.
   11. Tamco
   12. Vent Products Company, Inc.
   13. Air Rite.
   14. Prior approved equal.

B. General Description: AMCA-rated, opposed-blade design; minimum of 0.1084-inch- thick, galvanized-steel frames with holes for duct mounting; minimum of 0.0635-inch- thick, galvanized-steel damper blades with maximum blade width of 8 inches.
   1. Secure blades to 1/2-inch- diameter, zinc-plated axles using zinc-plated hardware, with nylon blade bearings, blade-linkage hardware of zinc-plated steel and brass, ends sealed against spring-stainless-steel blade bearings, and thrust bearings at each end of every blade.
   2. Operating Temperature Range: From minus 40 to plus 200 deg F.
   3. Provide closed-cell neoprene edging.

2.06 FIRE DAMPERS

A. Manufacturers:
   1. Air Balance, Inc.
   2. CESCO Products.
   3. Greenheck.
   4. McGill AirFlow Corporation.
   5. METALAIRE, Inc.

6. Nailor Industries Inc.
7. Penn Ventilation Company, Inc.
8. Prefco Products, Inc.
9. Ruskin Company.
10. Vent Products Company, Inc.
11. Ward Industries, Inc.
12. Prior approved equal.

B. Fire dampers shall be labeled according to UL 555.

C. Fire Rating: 1-1/2 hours.

D. Frame: Curtain type with blades outside airstream; fabricated with roll-formed, 0.034-inch- thick galvanized steel; with mitered and interlocking corners.

E. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.
1. Minimum Thickness: 0.052 or 0.138 inch thick as indicated and of length to suit application.
2. Exceptions: Omit sleeve where damper frame width permits direct attachment of perimeter mounting angles on each side of wall or floor, and thickness of damper frame complies with sleeve requirements.

F. Mounting Orientation: Vertical or horizontal as indicated.

G. Blades: Roll-formed, interlocking, 0.034-inch- thick, galvanized sheet steel. In place of interlocking blades, use full-length, 0.034-inch- thick, galvanized-steel blade connectors.

H. Horizontal Dampers: Include blade lock and stainless-steel closure spring.

I. Fusible Links: Replaceable, 165 deg F rated.

2.07 SMOKE AND COMBINATION FIRE AND SMOKE DAMPERS

A. Manufacturers:
1. Air Balance, Inc.
2. CESCO Products.
3. Greenheck.
4. Leader
5. Nailor Industries Inc.
6. Penn Ventilation Company, Inc.
7. Ruskin Company.
8. Prior approved equal.

B. General Description: Labeled according to UL 555S. Combination fire and smoke dampers shall be labeled according to UL 555 for 1-1/2-hour rating.

C. Fusible Links: Replaceable, 165 deg F rated.

D. Frame and Blades: 0.064-inch- thick, galvanized sheet steel.

E. Mounting Sleeve: Factory-installed, 0.052-inch- thick, galvanized sheet steel; length to suit wall or floor application.

F. Damper Motors: Modulating and two-position action.
   1. Comply with requirements in Division 22 and 23 Section "Motors."
   2. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
   3. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
   4. Outdoor Motors and Motors in Outside-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
   5. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.
   6. Electrical Connection: 115 V, single phase, 60 Hz.

2.08 TURNING VANES

A. Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for vanes and vane runners. Vane runners shall automatically align vanes.

B. Manufactured Turning Vanes: Fabricate 1-1/2-inch- wide, single-vane, curved blades of galvanized sheet steel set 3/4 inch o.c.; support with bars perpendicular to blades set 2 inches o.c.; and set into vane runners suitable for duct mounting.
   1. Available Manufacturers:
      a. Ductmate Industries, Inc.
      b. Duro Dyne Corp.
      c. METALAIRE, Inc.
      d. Ward Industries, Inc.
      e. Prior approved equal.

C. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.

2.09 DUCT-MOUNTING ACCESS DOORS

A. General Description: Fabricate doors airtight and suitable for duct pressure class.

B. Door: Double wall, duct mounting, and rectangular; fabricated of galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class. Include vision panel where indicated. Include 1-by-1-inch butt or piano hinge and cam latches.
   1. Manufacturers:
      a. American Warming and Ventilating.
      b. CESCO Products.

c. Ductmate Industries, Inc.
d. Flexmaster U.S.A., Inc.
e. Greenheck.
f. McGill AirFlow Corporation.
g. Nailor Industries Inc.
h. Ventfabrics, Inc.
i. Ward Industries, Inc.
j. Air Rite.
k. Prior approved equal.

2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
3. Provide number of hinges and locks as follows:
   a. Less Than 12 Inches Square: Secure with two sash locks.
   b. Up to 18 Inches Square: Two hinges and two sash locks.
   c. Up to 24 by 48 Inches: Three hinges and two compression latches.
   d. Sizes 24 by 48 Inches and Larger: One additional hinge.

C. Seal around frame attachment to duct and door to frame with neoprene or foam rubber.

D. Insulation: 1-inch- thick, fibrous-glass or polystyrene-foam board.

2.10 FLEXIBLE CONNECTORS

A. Manufacturers:
1. Ductmate Industries, Inc.
2. Duro Dyne Corp.
3. Flex-Weld
4. Ventfabrics, Inc.
5. Ward Industries, Inc.
6. Prior approved equal.

B. General Description: Flame-retardant or noncombustible fabrics, coatings, and adhesives complying with UL 181, Class 1.

C. Metal-Edged Connectors: Factory fabricated with a fabric strip 3-1/2 inches wide attached to two strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Select metal compatible with ducts.

D. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
1. Minimum Weight: 26 oz./sq. yd..
2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
3. Service Temperature: Minus 40 to plus 200 deg F.

E. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
1. Minimum Weight: 24 oz./sq. yd..
2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling.

3. Service Temperature: Minus 50 to plus 250 deg F.

2.11 FLEXIBLE DUCTS

A. Manufacturers:
   1. Flexmaster U.S.A., Inc.
   2. Hart & Cooley, Inc.
   3. McGill AirFlow Corporation.
   4. Themaflex.
   5. Quietflex
   6. Prior approved equal.

B. Insulated-Duct Connectors: UL 181, Class 1, multiple layers of aluminum laminate supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene or aluminized vapor barrier film.
   1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
   2. Maximum Air Velocity: 4000 fpm.
   3. Temperature Range: Minus 20 to plus 210 deg F.

2.12 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 EXECUTION

3.01 APPLICATION AND INSTALLATION

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.

B. Provide duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Install backdraft dampers on exhaust fans or exhaust ducts nearest to outside and where indicated.

D. Install volume dampers in ducts with liner; avoid damage to and erosion of duct liner.

E. Provide balancing dampers at points on supply, return, and exhaust systems where branches lead from larger ducts as required for air balancing. Install at a minimum of two duct widths from branch takeoff.

F. Provide test holes at fan inlets and outlets and elsewhere as indicated.

G. Install fire and smoke dampers, with fusible links, according to manufacturer's UL-approved written instructions.

H. Install duct access doors to allow for inspecting, adjusting, and maintaining accessories and terminal units as follows:
   1. On both sides of duct coils.
   2. Adjacent to fire or smoke dampers, providing access to reset or reinstall fusible links.
   3. To interior of ducts for cleaning; before and after each change in direction, at maximum 50-foot spacing.
   4. On sides of ducts where adequate clearance is available.

I. Install the following sizes for duct-mounting, rectangular access doors:
   1. One-Hand or Inspection Access: 8 by 5 inches.
   2. Two-Hand Access: 12 by 6 inches.
   3. Head and Hand Access: 18 by 10 inches.
   4. Head and Shoulders Access: 21 by 14 inches.
   5. Body Access: 25 by 14 inches.
   6. Body Plus Ladder Access: 25 by 17 inches.

J. Install the following sizes for duct-mounting, round access doors:
   1. One-Hand or Inspection Access: 8 inches in diameter.
   2. Two-Hand Access: 10 inches in diameter.
   3. Head and Hand Access: 12 inches in diameter.
   4. Head and Shoulders Access: 18 inches in diameter.
   5. Body Access: 24 inches in diameter.

K. Label access doors according to Division 22 and 23 Section "Mechanical Identification."

L. Install flexible connectors immediately adjacent to equipment in ducts associated with fans and motorized equipment supported by vibration isolators.

M. For fans developing static pressures of 5-inch wg and higher, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

N. Connect terminal units to supply ducts with maximum 12-inch lengths of flexible duct. Do not use flexible ducts to change directions.

O. Connect diffusers to low pressure ducts with maximum 60-inch lengths of flexible duct clamped or strapped in place.

P. Install duct test holes where indicated and required for testing and balancing purposes.

3.02 ADJUSTING

A. Adjust duct accessories for proper settings.

B. Adjust fire and smoke dampers for proper action.

C. Final positioning of manual-volume dampers is specified in Division 22 and 23 Section "Testing, Adjusting, and Balancing."

END OF SECTION

SECTION 23 34 23

POWER VENTILATORS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Centrifugal roof ventilators.
   2. In-line centrifugal fans.

1.03 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base fan-performance ratings on actual Project site elevations.

B. Operating Limits: Classify according to AMCA 99.

1.04 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Also include the following:
   1. Certified fan performance curves with system operating conditions indicated.
   2. Certified fan sound-power ratings.
   3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   4. Material thickness and finishes, including color charts.
   5. Dampers, including housings, linkages, and operators.
   6. Roof curbs.
   7. Fan speed controllers.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.

C. Delegated-Design Submittal: For unit hangars and supports indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

2. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

D. Coordination Drawings: Reflected ceiling plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
   1. Roof framing and support members relative to duct penetrations.
   2. Ceiling suspension assembly members.
   3. Size and location of initial access modules for acoustical tile.
   4. Ceiling-mounted items including light fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

E. Field quality-control reports.

F. Operation and Maintenance Data: For power ventilators to include in emergency, operation, and maintenance manuals.

1.05 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. AMCA Compliance: Fans shall have AMCA-Certified performance ratings and shall bear the AMCA-Certified Ratings Seal.

C. UL Standards: Power ventilators shall comply with UL 705. Power ventilators for use for restaurant kitchen exhaust shall also comply with UL 762.

1.06 COORDINATION

A. Coordinate size and location of structural-steel support members.

B. Coordinate sizes and locations of concrete bases with actual equipment provided.

C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.07 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Belts: One set(s) for each belt-driven unit.

PART 2 PRODUCTS

2.01 CENTRIFUGAL ROOF VENTILATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Acme Engineering & Manufacturing Corporation.

2. Aerovent; a division of Twin City Fan Companies, Ltd.
3. Carnes Company.
4. Greenheck Fan Corporation.
5. Loren Cook Company.
6. PennBarry.
7. Prior approved equal

B. Housing: Removable, spun-aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.
   1. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains.
   2. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

C. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

D. Belt Drives:
   1. Resiliently mounted to housing.
   2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
   3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
   4. Pulleys: Cast-iron, adjustable-pitch motor pulley.
   5. Fan and motor isolated from exhaust airstream.

E. Accessories:
   1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
   2. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted outside fan housing, factory wired through an internal aluminum conduit.
   3. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
   4. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
   5. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.

F. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch-thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.
   1. Configuration: Built-in raised cant and mounting flange.
   2. Overall Height: 18 inches.
   3. Sound Curb: Curb with sound-absorbing insulation.
   4. Pitch Mounting: Manufacture curb for roof slope.
   5. Metal Liner: Galvanized steel.

G. Capacities and Characteristics: See drawings

2.02 IN-LINE CENTRIFUGAL FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Acme Engineering & Manufacturing Corporation.
   2. Carnes Company.
   3. Greenheck Fan Corporation.
   4. Loren Cook Company.
   5. PennBarry.
   6. Prior approved equal

B. Housing: Split, spun aluminum with aluminum straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.

C. Direct-Drive Units: Motor mounted in airstream, factory wired to disconnect switch located on outside of fan housing; with wheel, inlet cone, and motor on swing-out service door.

D. Belt-Driven Units: Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing.

E. Fan Wheels: Aluminum, airfoil blades welded to aluminum hub.

F. Accessories:
   1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
   2. Volume-Control Damper: Manually operated with quadrant lock, located in fan outlet.
   3. Companion Flanges: For inlet and outlet duct connections.
   4. Fan Guards: 1/2- by 1-inch mesh of galvanized steel in removable frame. Provide guard for inlet or outlet for units not connected to ductwork.
   5. Motor and Drive Cover (Belt Guard): Epoxy-coated steel.

G. Capacities and Characteristics: See drawings

2.03 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 22 and 23 Section "Common Motor Requirements for HVAC Equipment."
   1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
   2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 26 Sections.

B. Enclosure Type: Totally enclosed, fan cooled.

2.04 SOURCE QUALITY CONTROL

A. Certify sound-power level ratings according to AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Certify fan performance ratings, including flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating." Label fans with the AMCA-Certified Ratings Seal.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install power ventilators level and plumb.

B. Support units using restrained elastomeric mounts having a static deflection of 1 inch. Vibration- and seismic-control devices are specified in Division 22 and 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."

1. Secure vibration and seismic controls to concrete bases using anchor bolts cast in concrete base.

C. Install floor-mounted units on concrete bases designed to withstand, without damage to equipment, the seismic force required by code. Concrete, reinforcement, and formwork requirements are specified in Division 3 Section "Cast-in-Place Concrete."

D. Secure roof-mounted fans to roof curbs with cadmium-plated hardware. See Division 7 Section "Roof Accessories" for installation of roof curbs.

E. Ceiling Units: Suspend units from structure; use steel wire or metal straps.

F. Support suspended units from structure using threaded steel rods and elastomeric hangers having a static deflection of 1 inch. Vibration-control devices are specified in Division 22 and 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."

G. Install units with clearances for service and maintenance.

H. Label units according to requirements specified in Division 22 and 23 Section "Identification for HVAC Piping and Equipment."

3.02 CONNECTIONS

A. Duct installation and connection requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Division 22 and 23 Section "Duct Accessories."

B. Install ducts adjacent to power ventilators to allow service and maintenance.

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Connect wiring according to Division 26 Section "Conductors and Cables."

3.03 FIELD QUALITY CONTROL

A. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
   3. Verify that cleaning and adjusting are complete.
   4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
   5. Adjust belt tension.
   6. Adjust damper linkages for proper damper operation.
   7. Verify lubrication for bearings and other moving parts.
   8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
   9. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
   10. Shut unit down and reconnect automatic temperature-control operators.
   11. Remove and replace malfunctioning units and retest as specified above.

C. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Prepare test and inspection reports.

3.04 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Comply with requirements in Division 22 and 23 Section "Testing, Adjusting, and Balancing" for testing, adjusting, and balancing procedures.

D. Replace fan and motor pulleys as required to achieve design airflow.

E. Lubricate bearings.

END OF SECTION

SECTION 23 37 13

DIFFUSERS, REGISTERS, AND GRILLES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes ceiling- and wall-mounted diffusers, registers, and grilles.

B. Related Sections include the following:
   1. Division 23 Section "Duct Accessories" for fire and smoke dampers and volume-control dampers not integral to diffusers, registers, and grilles.

1.03 SUBMITTALS

A. Product Data: For each product indicated, include the following:
   1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
   2. Diffuser, Register, and Grille Schedule: Indicate Drawing designation, room location, quantity, model number, size, and accessories furnished.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Products: Subject to compliance with requirements, provide one of the products specified.

2.02 GRILLES AND REGISTERS

A. Adjustable Bar Side Wall Supply Grille:
   1. Products:
      a. Carnes; RVEA.
      b. Krueger; 5815.
      c. METALAIRE, Inc., Metal Industries Inc.; 422.
      d. Price Industries; LBMR.
      e. Titus; 1707.
      f. Tuttle & Bailey; VF5.
      g. Or equal by:
         1) A-J Manufacturing Co., Inc.
         2) Anemostat; a Mestek Company.

3) Dayus Register & Grille.
4) Hart & Cooley, Inc.; Hart & Cooley Div.
5) Nailor Industries of Texas Inc.

2. Material: Aluminum.
3. Finish: Baked enamel, white.
4. Face Blade Arrangement: Adjustable horizontal spaced 1/4 inch apart.
5. Frame: 1 inch wide.

B. Fixed Face Ceiling Return, Exhaust, or Transfer Air Grille:
1. Products:
a. Carnes; RSLA.
b. Krueger; S85H.
c. Price Industries; 535.
d. Titus; 355RL.
e. Tuttle & Bailey; T70D.
f. Or equal by:
1) A-J Manufacturing Co., Inc.
2) Anemostat; a Mestek Company.
3) Dayus Register & Grille.
4) Hart & Cooley, Inc.; Hart & Cooley Div.
5) Nailor Industries of Texas Inc.
2. Material: Steel.
3. Finish: Baked enamel, white.
4. Face Arrangement: 1/2 inch horizontal blade spacing.
5. Frame: 1-1/4 inches wide.

C. Low Sidewall Return Grilles
1. Finish – Standard white baked enamel.
2. Zero degree deflection.
3. Approved Manufacturers And Models
a. Carnes - RSHA
b. J & J - S-590
c. Krueger - S480H
d. Metalaire - HD-RH
e. Price - 90-L
f. Titus - 30RL or 30 SL
g. Tuttle & Bailey - T110 or equal by
h. Agitair
i. Anemostat
j. Barber Colman
k. Environmental Air Products
l. Air Control Products
m. Nailor

2.03 CEILING DIFFUSER OUTLETS

A. Round Ceiling Diffuser Duct Mounted Exposed:
   1. Manufacturers:
      a. Price RCD or equal by:
         1) Anemostat; a Mestek Company.
         2) Carnes.
         3) Hart & Cooley, Inc.; Hart & Cooley Div.
         4) METALAIRE, Inc.; Metal Industries Inc.
         5) Nailor Industries of Texas Inc.
         6) Titus.
         7) Tuttle & Bailey.
         8) Prior approved equal.
   2. Material: Heavy gauge spun steel.
   3. Finish: Baked enamel, color selected by Architect.
   4. Face Style: Three cone.
   5. Pattern: Two position horizontal.

B. Rectangular and Square Ceiling Diffusers:
   1. Products:
      a. Carnes.
      b. Krueger.
      c. METALAIRE, Inc., Metal Industries Inc.
      d. Price Industries; SPD or equal by.
      e. Titus.
      f. Tuttle & Bailey.
      g. A-J Manufacturing Co., Inc.
      h. Anemostat; a Mestek Company.
      i. Hart & Cooley, Inc.; Hart & Cooley Div.
      j. Nailor Industries of Texas Inc.
      k. Prior approved equal.
   2. Material: Steel.
   3. Finish: Baked enamel, white.

2.04 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine areas where diffusers, registers, and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install diffusers, registers, and grilles level and plumb.

B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practicable. For units installed in lay-in ceiling panels, provide lay-in ceiling module. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.03 ADJUSTING

A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION

SECTION 23 37 14

LOUVERS AND VENTS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Fixed, extruded-aluminum louvers.

1.03 DEFINITIONS

A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.

B. Horizontal Louver: Louver with horizontal blades; i.e., the axes of the blades are horizontal.

C. Vertical Louver: Louver with vertical blades; i.e., the axes of the blades are vertical.

D. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

E. Storm-Resistant Louver: Louver that provides specified wind-driven rain performance, as determined by testing according to AMCA 500-L.

1.04 PERFORMANCE REQUIREMENTS

A. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

1.05 SUBMITTALS

A. Product Data: For each type of product indicated.
   1. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.

B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.
   1. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.
   2. Show mullion profiles and locations.

3. Wiring Diagrams: For power, signal, and control wiring for motorized adjustable louvers.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Samples for Verification: For each type of metal finish required.

E. Product Test Reports: Based on evaluation of comprehensive tests performed according to AMCA 500-L by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver and showing compliance with performance requirements specified.

1.06 QUALITY ASSURANCE

A. Source Limitations: Obtain louvers and vents from single source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

B. Welding: Qualify procedures and personnel according to the following:
1. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
2. AWS D1.3, "Structural Welding Code - Sheet Steel."
3. AWS D1.6, "Structural Welding Code - Stainless Steel."

C. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

D. UL and NEMA Compliance: Provide motors and related components for motor-operated louvers that are listed and labeled by UL and comply with applicable NEMA standards.

1.07 PROJECT CONDITIONS

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

PART 2 PRODUCTS

2.01 MATERIALS

A. Aluminum Extrusions: ASTM B 221, Alloy 6063-T5, T-52, or T6.

B. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

C. Aluminum Castings: ASTM B 26/B 26M, Alloy 319.

D. Fasteners: Use types and sizes to suit unit installation conditions.
1. Use hex-head or Phillips pan-head screws for exposed fasteners unless otherwise indicated.
2. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.
3. For fastening galvanized steel, use hot-dip-galvanized steel or 300 series stainless-steel fasteners.

4. For fastening stainless steel, use 300 series stainless-steel fasteners.
5. For color-finished louvers, use fasteners with heads that match color of louvers.

E. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.

F. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.02 FABRICATION, GENERAL

A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Include supports, anchorages, and accessories required for complete assembly.

C. Provide subsills made of same material as louvers or extended sills for recessed louvers.

2.03 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Horizontal, Nondrainable-Blade Louver:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Ruskin Company; Tomkins PLC. Model ELF811 or equa by.
   b. Airolite Company, LLC (The).
   c. American Warming and Ventilating, Inc.; a Mestek company.
   d. Arrow United Industries; a division of Mestek, Inc.
   e. Carnes Company, Inc.
   f. Cesco Products; a division of Mestek, Inc.
   g. Greenheck Fan Corporation.
   h. NCA Manufacturing, Inc.
   i. Pottrof
   j. United Enertec
   k. Prior approved equal.
2. Fabrication: Continuous blade style.
   a. Frame:
      1) Frame Depth: 4 inches (102mm).
      2) Material: Extruded aluminum, Alloy 6063-T5.
      3) Wall Thickness: 0.125 inch (3.2mm), nominal.
   b. Blades:
      1) Style: Horizontal “K”.
      2) Material: Formed aluminum, Alloy 6063-T5.
      3) Wall Thickness: 0.125 inch (3.2 mm), nominal.

4) Angle: 45 degrees.
5) Centers: 4-1/2 inches (114 mm), nominal.
6) Continuous Blade Style – Design incorporates visible mullions or frames at the perimeter of the louver only. Rear-mounted hidden blade supports are utilized at section joints and at intermediate locations as needed. Louver blade sightlines are not interrupted at section joints or blade support locations. The rear-mounted blade support depth varies depending on louver height and the design windload.
7)

c. Assembly:
1) Factory assembled louver components. Mechanically fastened construction.

B. Performance Data:
1. Performance Ratings:
a. Based on testing 48 inch by 48 inch (1219 mm by 1219 mm) size unit in accordance with AMCA 500.
2. Free Area: 44 percent, nominal.
3. Maximum Recommended Air Flow through Free Area: 707 feet per minute (214 m/min).
4. Air Flow: 5027 cubic feet per minute (142 cu. m/min).
5. Maximum Pressure Drop (Intake): .06 inches w.g. (14.9 Pa).
6. Water Penetration: Maximum of 0.01 ounces per square foot (3.1 g/sm) of free area at an air flow of 707 feet per minute (214 m/min) free area velocity when tested for 15 minutes.

C. Design Load: Incorporate structural supports required to withstand wind load of:
1. 20 lb/sf (0.96 kPa).
2. Per Code.
3. Louvers shall be factory engineered to withstand the specified seismic loads.
a. Minimum design loads shall be calculated to comply with ASCE – 7, or local requirements of Authority Having Jurisdiction.

2.04 ACCESSORIES

A. Aluminum Insulated Blank-Off Panels: 1 inch (25 mm), aluminum skin, insulated core, factory installed with removable screws and neoprene gaskets.

B. Hinged Frame: Continuous piano hinge attached to angle subframe.

C. Hinged Frame: Continuous piano hinge attached to channel subframe.

D. Bird Screen:
1. Aluminum: Aluminum, 3/4 inch by 0.051 inch (19 mm by 1.3 mm), expanded, flattened.
2. Aluminum: Aluminum, 5/8 inch by 0.040 inch (16 mm by 1 mm), expanded, flattened.

3. Aluminum: Aluminum, 1/2 inch mesh by 0.063 inch (13 mm mesh by 1.6 mm), intercrimp.
4. Steel: Galvanized steel, 1/2 inch mesh by 19 gage (13 mm mesh by 1.1 mm), intercrimp.
5. Frame: Removable, rewireable.

2.05 FINISHES

A. Kynar:
1. Coating shall conform to AAMA 2605. Apply coating following cleaning and pretreatment. Cleaning: AA-C12C42R1X.
2. Standard 2-coat.
3. Pearledize 70 (2-coat mica).

B. 50 percent Floropolymer-Based Painted Finishes:
1. Coating shall conform to AAMA 2604, sections 4.2 and 4.3. Apply coating following cleaning and pretreatment. Cleaning: AA-C12C42R1X.
2. Baked Enamel.
3. Pearledize 50 (2-coat mica).

C. Color for Kynar Finish:
1. Color: Custom. Refer to Drawings.

D. Anodized Finishes:
1. Class 2 Clear Anodized.
a. Comply with Aluminum Association AA-C22A41. Clear anodized finish 215-R1.
b. Apply finish following chemical etching and pretreatment.
c. Minimum Thickness: 0.7 mils (0.018 mm), 60 minute anodizing process.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.03 INSTALLATION

A. Locate and place louvers and vents level, plumb, and at indicated alignment with adjacent work.

B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

F. Protect unpainted galvanized and nonferrous-metal surfaces that will be in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

G. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Division 7 Section "Joint Sealants" for sealants applied during louver installation.

3.04 ADJUSTING AND CLEANING

A. Test operation of adjustable louvers and adjust as needed to produce fully functioning units that comply with requirements.

B. Clean exposed surfaces of louvers and vents that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

C. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

D. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.

1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

SECTION 23 54 00

FURNACES

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes the following:
   1. Gas-fired, condensing furnaces and accessories complete with controls.
   2. Air filters.

1.03 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each of the following:
   1. Furnace.
   2. Air filter.
   3. Refrigeration components.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Wiring Diagrams: Power, signal, and control wiring.

C. Operation and Maintenance Data: For each furnace to include in operation, and maintenance manuals for each of the following:
   1. Furnace and accessories complete with controls.
   2. Refrigeration components.

D. Warranty: Special warranty specified in this Section.

1.04 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

1.05 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

1.06 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace the following components of furnaces that fail in materials or workmanship within specified warranty period:
   1. Warranty Period, Commencing on Date of Substantial Completion:
      a. Furnace Heat Exchanger: 10 years.
      b. Integrated Ignition and Blower Control Circuit Board: Five years.
      c. Draft-Inducer Motor: Five years.
      d. Refrigeration Compressors: 10 years.
      e. Evaporator and Condenser Coils: Five years.

1.07 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Disposable Air Filters: Furnish two complete sets.

PART 2 PRODUCTS

2.01 GAS-FIRED FURNACES, CONDENSING

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Carrier MVB or equal by.
   2. Trane.
   3. York.
   4. Daikin
   5. Lennox
   6. Prior approved equal.

B. General Requirements for Gas-Fired, Condensing Furnaces: Factory assembled, piped, wired, and tested; complying with ANSI Z21.47/CSA 2.3, "Gas-Fired Central Furnaces," and with NFPA 54.

C. Cabinet: Steel.
   1. Cabinet interior around heat exchanger shall be factory-installed insulation.
   2. Lift-out panels shall expose burners and all other items requiring access for maintenance.
   3. Factory paint external cabinets in manufacturer's standard color.

D. Fan: Centrifugal, factory balanced, resilient mounted, direct drive, variable speed.
   1. Special Motor Features: Variable speed, premium efficiency, as defined in Division 22 and 23 Section "Motors," and with internal thermal protection and permanent lubrication.
   2. Special Motor Features: Multitapped, multispeed with internal thermal protection and permanent lubrication.
   3. Special Motor Features: Electronically controlled motor (ECM) controlled by integrated furnace/blower control.

E. Type of Gas: Natural.

F. AFUE: 90 percent.

G. Heat Exchanger:
   1. Primary: Aluminized steel.

H. Burner:
   1. Gas Valve: 100 percent safety two-stage main gas valve, main shutoff valve, pressure regulator, safety pilot with electronic flame sensor, limit control, transformer, and combination ignition/fan timer control board.
   2. Ignition: Electric pilot ignition, with hot-surface igniter or electric spark ignition.

I. Controls:
   1. Provide with 7 day programmable thermostat with auto change over to control, each furnace and associated condensing unit and cooling coil.

J. Gas-Burner Safety Controls:
   1. Electronic Flame Sensor: Prevents gas valve from opening until pilot flame is proven; stops gas flow on ignition failure.
   2. Flame Rollout Switch: Installed on burner box; prevents burner operation.
   3. Limit Control: Fixed stop at maximum permissible setting; de-energizes burner on excessive bonnet temperature; automatic reset.

K. Combustion-Air Inducer: Centrifugal fan with thermally protected motor and sleeve bearings prepurges heat exchanger and vents combustion products; pressure switch prevents furnace operation if combustion-air inlet or flue outlet is blocked.

L. Furnace Controls: Solid-state board integrates ignition, heat, cooling, and fan speeds; adjustable fan-on and fan-off timing; terminals for connection to accessories.

M. Accessories:
   1. Combination Combustion-Air Intake and Vent: PVC plastic fitting to combine combustion-air inlet and vent through outside wall or roof.
   2. Plastic Vent Materials.
      a. CPVC Plastic, Schedule 40 Pipe: ASTM F 441/F 441M.
         1) CPVC Plastic, Schedule 40 Fittings: ASTM F 438, socket type.
         2) CPVC Solvent Cement: ASTM F 493.

b. PVC Plastic, Schedule 40 Pipe: ASTM D 1785.
   1) PVC Plastic, Schedule 40 Fittings: ASTM D 2466, socket type.
   2) PVC Solvent Cement: ASTM D 2564.

N. Capacities and Characteristics: See drawings.

2.02 AIR FILTERS

A. Disposable Filters: 1-inch- thick, disposable, fiberglass type in sheet metal frame.

2.03 REFRIGERATION COMPONENTS

A. Refrigerant Coil: Copper tubes mechanically expanded into aluminum fins. Comply with ARI 210/240, "Unitary Air-Conditioning and Air-Source Heat Pump Equipment." Match size with furnace. Include condensate drain pan with accessible drain outlet.
   1. Refrigerant Coil Enclosure: Steel, matching furnace and evaporator coil, with access panel and flanges for integral mounting at or on furnace cabinet and galvanized sheet metal drain pan coated with black asphaltic base paint.

B. Refrigerant Piping: Comply with requirements in Division 23 Section "Refrigerant Piping."

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine factory-installed insulation before furnace installation. Reject units that are wet, moisture damaged, or mold damaged.

C. Examine roughing-in for refrigerant piping systems to verify actual locations of piping connections before equipment installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install gas-fired furnaces and associated fuel and vent features and systems according to NFPA 54.

B. Suspended Units: Suspend from structure using threaded rods, spring hangers, and building attachments. Secure rods to unit hanger attachments. Adjust hangers so unit is level and plumb.
   1. Install seismic restraints to limit movement of furnace by resisting code-required seismic acceleration.

C. Base-Mounted Units: Secure units to substrate. Provide optional bottom closure base if required by installation conditions.
   1. Anchor furnace to substrate to resist code-required seismic acceleration.

D. Controls: Install thermostats and humidistats at mounting height of 60 inches above floor.

E. Wiring Method: Install control wiring in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Conceal control wiring except in unfinished spaces.

3.03 CONNECTIONS

A. Gas piping installation requirements are specified in Division 22 Section "Fuel Gas Piping." Drawings indicate general arrangement of piping, fittings, and specialties. Connect gas piping with union or flange and appliance connector valve.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Vent Connection, Noncondensing, Gas-Fired Furnaces: Connect Type B vents to furnace vent connection and extend outdoors. Type B vents and their installation requirements are specified in Division 23 Section "Breechings, Chimneys, and Stacks."

D. Vent and Outside-Air Connection, Condensing, Gas-Fired Furnaces: Connect plastic piping vent material to furnace connections and extend outdoors. Terminate vent outdoors with a cap and in an arrangement that will protect against entry of birds, insects, and dirt.
   1. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
   2. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
   3. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
      a. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
      b. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
      c. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
   4. Slope pipe vent back to furnace or to outside terminal.

E. Connect ducts to furnace with flexible connector. Comply with requirements in Division 22 and 23 Section "Duct Accessories."

F. Connect refrigerant piping to refrigerant coil in furnace and to air-cooled, compressor-condenser unit.
   1. Flared Joints: Use ASME B16.26 fitting and flared ends, following procedures in CDA's "Copper Tube Handbook."
   2. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
   3. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

G. Comply with requirements in Division 22 and 23 Section "Refrigerant Piping" for installation and joint construction of refrigerant piping.

3.04 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Perform electrical test and visual and mechanical inspection.
   2. Leak Test: After installation, charge systems with refrigerant and oil and test for leaks. Repair leaks, replace lost refrigerant and oil, and retest until no leaks exist.
   3. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation, product capability, and compliance with requirements.
   4. Verify that fan wheel is rotating in the correct direction and is not vibrating or binding.
   5. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

3.05 STARTUP SERVICE

A. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
   1. Inspect for physical damage to unit casings.
   2. Verify that access doors move freely and are weathertight.
   3. Clean units and inspect for construction debris.
   4. Verify that all bolts and screws are tight.
   5. Adjust vibration isolation and flexible connections.
   6. Verify that controls are connected and operational.

B. Adjust fan belts to proper alignment and tension.

C. Start unit according to manufacturer's written instructions and complete manufacturer's operational checklist.

D. Measure and record airflows.

E. Verify proper operation of capacity control device.

F. After startup and performance test, lubricate bearings.

3.06 ADJUSTING

A. Adjust initial temperature and humidity set points.

B. Set controls, burner, and other adjustments for optimum heating performance and efficiency. Adjust heat-distribution features, including shutters, dampers, and relays, to provide optimum heating performance and system efficiency.

3.07 CLEANING

A. After completing installation, clean furnaces internally according to manufacturer's written instructions.

B. Install new filters in each furnace within 14 days after Substantial Completion.

3.08 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain condensing units. Refer to Division 1 Section "Demonstration and Training."

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 52 16

CONDENSING UNITS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes air-cooled condensing units.

1.03 SUBMITTALS

A. Product Data: For each condensing unit, include rated capacities, operating characteristics, furnished specialties, and accessories. Include equipment dimensions, weights and structural loads, required clearances, method of field assembly, components, and location and size of each field connection.

B. Manufacturer Seismic Qualification Certification: Submit certification that condensing units, accessories, and components will withstand seismic forces defined in Division 22 and 23 Section "Mechanical Vibration and Seismic Controls." Include the following:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For condensing units to include in operation, and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.04 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of condensing units and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Fabricate and label refrigeration system according to ASHRAE 15, "Safety Code for Mechanical Refrigeration."
   1. Units shall be designed to operate with HCFC-free refrigerants.

D. ASME Compliance: Fabricate and label water-cooled condensing units to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

1.05 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

C. Coordinate location of piping and electrical rough-ins.

1.06 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of condensing units that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Compressor failure.
      b. Condenser coil leak.
   2. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 CONDENSING UNITS, AIR COOLED, 1 TO 5 TONS

A. Manufacturers:
   1. Carrier Corporation; Carrier Air Conditioning Div.
   2. Lennox Industries Inc.
   3. Daikin
   4. Rheem Manufacturing Air Conditioning Div.
   5. Trane Co. (The); Worldwide Applied Systems Group.
   6. York International Corp.
   7. Prior approved equal

B. Description: Factory assembled and tested, consisting of compressor, condenser coil, fan, motors, refrigerant reservoir, and operating controls.

C. Compressor: Scroll, hermetically sealed, with rubber vibration isolators.
   1. Motor: Single speed, and includes thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
   2. Two-Speed Compressor: Include manual-reset, high-pressure switch and automatic-reset, low-pressure switch.
   3. Accumulator: Suction tube.
   4. Refrigerant Charge: R-410A.

D. Condenser Coil: Seamless copper-tube, aluminum-fin coil; circuited for integral liquid subcooler, with removable drain pan and brass service valves with service ports.

E. Condenser Fan: Direct-drive, aluminum propeller fan; with permanently lubricated, totally enclosed fan motor with thermal-overload protection and ball bearings.

F. Accessories:
   1. Crankcase heater.
   2. Cycle Protector: Automatic-reset timer to prevent rapid compressor cycling.
   3. Electronic programmable thermostat to control condensing unit and evaporator fan.
