   4. Evaporator Freeze Thermostat: Temperature-actuated switch that stops unit when evaporator reaches freezing temperature.
   5. Filter-dryer.
   6. High-Pressure Switch: Automatic-reset switch cycles compressor off on high refrigerant pressure.
   7. Liquid-line solenoid.
   8. Low Ambient Controller: Cycles condenser fan to permit operation down to 0 deg F.
   9. Low-Pressure Switch: Automatic-reset switch cycles compressor off on low refrigerant pressure.
   10. Thermostatic expansion valve.
   11. Time-Delay Relay: Continues operation of evaporator fan after compressor shuts off.

G. Unit Casing: Galvanized steel, finished with baked enamel; with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Mount service valves, fittings, and gage ports on exterior of casing.

2.03 CONDENSING UNITS, AIR COOLED, 6 TO 120 TONS

A. Manufacturers:
   1. Carrier Corporation; Carrier Air Conditioning Div.
   2. Lennox Industries Inc.
   3. Daikin
   4. Rheem Manufacturing Air Conditioning Div.
   5. Trane Co. (The); Worldwide Applied Systems Group.
   6. York International Corp.

7. Prior approved equal

B. Description: Factory assembled and tested, air cooled; consisting of casing, compressors, condenser coils, condenser fans and motors, and unit controls.

C. Compressor: Hermetic or semihermetic compressor designed for service with crankcase sight glass, crankcase heater, and backseating service access valves on suction and discharge ports.
   1. Capacity Control: Variable Speed Compressor .
   2. Refrigerant Charge: R-410A or R-32.

D. Condenser Coil: Seamless copper-tube, aluminum-fin coil, including subcooling circuit and backseating liquid-line service access valve. Factory pressure test coils, then dehydrate by drawing a vacuum and fill with a holding charge of nitrogen or refrigerant.

E. Condenser Fans: Propeller-type vertical discharge; either directly or belt driven. Include the following:
   1. Permanently lubricated ball-bearing motors.
   2. Separate motor for each fan.
   3. Dynamically and statically balanced fan assemblies.

F. Operating and safety controls include the following:
   1. Manual-reset, high-pressure cutout switches.
   2. Automatic-reset, low-pressure cutout switches.
   3. Low oil pressure cutout switch.
   4. Compressor-winding thermostat cutout switch.
   5. Three-leg, compressor-overload protection.
   6. Control transformer.
   7. Magnetic contactors for compressor and condenser fan motors.
   8. Timer to prevent excessive compressor cycling.

G. Accessories:
   1. Electronic programmable thermostat to control condensing unit and evaporator fan.
   2. Low Ambient Controller: Cycles condenser fan to permit operation down to 0 deg F.
   3. Gage Panel: Package with refrigerant circuit suction and discharge gages.
   4. Part-winding-start timing relay, circuit breakers, and contactors.

H. Unit Casings: Designed for outdoor installation with weather protection for components and controls and with removable panels for required access to compressors, controls, condenser fans, motors, and drives. Additional features include the following:
   1. Steel, galvanized or zinc coated, for exposed casing surfaces; treated and finished with manufacturer's standard paint coating.
   2. Perimeter base rail with forklift slots and lifting holes to facilitate rigging.
   3. Gasketed control panel door.
   4. Nonfused disconnect switch, factory mounted and wired, for single external electrical power connection.

5. Condenser coil hail guard to protect coil from physical damage.

2.04 MOTORS

A. General requirements for motors are specified in Division 22 and 23 Section "Motors."
   1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
   2. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26 Sections.

2.05 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate condensing units according to ARI 210/240.
   1. Coefficient of Performance: Equal to or greater than prescribed by ASHRAE/IESNA 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."
   2. Energy-Efficiency Ratio: Equal to or greater than prescribed by ASHRAE/IESNA 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

B. Test and inspect shell and tube condensers according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

C. Testing Requirements: Factory test sound-power-level ratings according to ARI 270.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of condensing units.

B. Examine roughing-in for refrigerant piping systems to verify actual locations of piping connections before equipment installation.

C. Examine walls, floors, and roofs for suitable conditions where condensing units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install units level and plumb, firmly anchored in locations indicated; maintain manufacturer's recommended clearances.

B. Install condensing units on concrete base. Concrete base is specified in Division 22 and 23 Section "Basic Mechanical Materials and Methods," and concrete materials and installation requirements are specified in Division 3.

C. Concrete Bases:
   1. Install dowel rods to connect concrete base to concrete slab. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of the base.
   2. For equipment supported on structural slab, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   4. Install anchor bolts to elevations required for proper attachment to supported equipment.
   5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

D. Install roof-mounting units on equipment supports specified in Division 7.

E. Vibration Isolation: Mount condensing units on rubber pads with a minimum deflection of 1/4 inch. Vibration isolation devices and installation requirements are specified in Division 22 and 23 Section "Mechanical Vibration and Seismic Controls."

F. Maintain manufacturer's recommended clearances for service and maintenance.

G. Loose Components: Install electrical components, devices, and accessories that are not factory mounted.

3.03 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect refrigerant piping to air-cooled condensing units; maintain required access to unit. Install furnished field-mounted accessories. Refrigerant piping and specialties are specified in Division 22 and 23 Section "Refrigerant Piping."

D. Ground equipment according to Division 26 Section "Grounding and Bonding."

E. Connect wiring according to Division 26 Section "Conductors and Cables."

3.04 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:
   1. Perform electrical test and visual and mechanical inspection.
   2. Leak Test: After installation, charge systems with refrigerant and oil and test for leaks. Repair leaks, replace lost refrigerant and oil, and retest until no leaks exist.
   3. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation, product capability, and compliance with requirements.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
   5. Verify proper airflow over coils.

B. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

C. Remove and replace malfunctioning condensing units and retest as specified above.

3.05 STARTUP SERVICE

A. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
   1. Inspect for physical damage to unit casing.
   2. Verify that access doors move freely and are weathertight.
   3. Clean units and inspect for construction debris.
   4. Verify that all bolts and screws are tight.
   5. Adjust vibration isolation and flexible connections.
   6. Verify that controls are connected and operational.

B. Lubricate bearings on fans.

C. Verify that fan wheel is rotating in the correct direction and is not vibrating or binding.

D. Adjust fan belts to proper alignment and tension.

E. Start unit according to manufacturer's written instructions and complete manufacturer's startup checklist.

F. Measure and record airflow over coils.

G. Verify proper operation of condenser capacity control device.

H. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

I. After startup and performance test, lubricate bearings and adjust belt tension.

3.06 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain condensing units. Refer to Division 1 Section "Closeout Procedures and Demonstration and Training."

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 23 73 39

DIRECT-FIRED H&V UNITS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes direct-fired H&V units.

1.03 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection. Prepare the following by or under the supervision of a qualified professional engineer:
   1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
   2. Mounting Details: For securing and flashing roof curb to roof structure. Indicate coordinating requirements with roof membrane system.
   3. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.
   4. Wiring Diagrams: Power, signal, and control wiring.

C. Coordination Drawings: Roof-mounted units and roof-curb mounting details drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
   1. Size and location of rooftop unit mounting rails and anchor points and methods for anchoring units to curb.
   2. Required roof penetrations for ducts, pipes, and electrical raceways, including size and location of each penetration.

D. Startup service reports.

E. Operation and Maintenance Data: For direct-fired H&V units to include in operation, and maintenance manuals.

1.04 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of direct-fired H&V units and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

1.05 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

B. Coordinate size, location, installation, and structural capacity of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

C. Coordinate size, location and installation of unit manufacturer's roof curbs and equipment supports with roof Installer.
   1. Coordinate installation of restrained vibration isolation roof-curb rails, which are specified in Division 22 and 23 Section "Mechanical Vibration and Seismic Controls."

1.06 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Filters: One set(s) for each unit.
   2. Fan Belts: One set(s) for each unit.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. ARES; Mars Air Products.
   2. Cambridge Engineering, Inc.
   3. Captive-Air Systems, Inc.
   4. CES Group; Ventrol Air Handling Systems, Inc.
   5. Greenheck.
   6. Hastings Industries; Division of Eric, Inc.
   7. Modine Mfg. Co.; Commercial HVAC&R Division.
   8. Reznor-Thomas & Betts Corporation; Mechanical Products Division.
   9. Sterling Gas; Mestek, Inc.
   10. Trane Company (The); Unitary Products Group.
   11. Weather-Rite, Inc.
   12. Prior approved equal.

2.02 PACKAGED UNITS

A. Factory-assembled, prewired, self-contained unit consisting of cabinet, supply fan, controls, filters, and direct-fired gas furnace to be installed outside and inside the building, see drawings.

2.03 CABINET

A. Cabinet: Double-wall galvanized-steel panels, formed to ensure rigidity and supported by galvanized-steel channels or structural channel supports with lifting lugs. Cabinet shall be fully weatherized for outside installation.

B. Access Panels: Piano hinged with cam-lock fasteners for furnace and fan motor assemblies on both sides of unit.

C. Internal Insulation: Fibrous-glass duct lining, comply with ASTM C 1071, Type II, applied on complete unit.
   1. Thickness: 1 inch.
   2. Insulation Adhesive: Comply with ASTM C 916, Type I.
   3. Mechanical Fasteners: Galvanized steel suitable for adhesive attachment, mechanical attachment, or welding attachment to casing without damaging liner when applied as recommended by manufacturer and without causing air leakage.

D. Finish: Heat-resistant, baked enamel.

E. Discharge: Horizontal-pattern, galvanized-steel assembly with diffusers incorporating individually adjustable vanes.

2.04 SUPPLY-AIR FAN

A. Fan Type: Centrifugal, rated according to AMCA 210; statically and dynamically balanced, galvanized steel; mounted on solid-steel shaft with heavy-duty, self-aligning, permanently lubricated ball bearings.

B. Motor: Open dripproof, variable-speed motor.

C. Drive: V-belt drive with matching fan pulley and adjustable motor sheaves and belt assembly.

D. Mounting: Fan wheel, motor, and drives shall be mounted in fan casing with restrained, spring isolators.

2.05 OUTDOOR-AIR INTAKE

A. Outdoor-Air Hood: Galvanized steel with rain baffles, bird screen, and finish to match cabinet; and sized to supply maximum 100 percent outdoor air.

2.06 AIR FILTERS

A. Comply with NFPA 90A.

B. Disposable Panel Filters: 2-inch-thick, factory-fabricated, flat-panel-type, disposable air filters with holding frames, with a minimum efficiency report value of 6 according to ASHRAE 52.2 and 90 percent average arrestance according to ASHRAE 52.1.
   1. Media: Interlaced glass or polyester fibers.
   2. Frame: Galvanized steel.

2.07 DAMPERS

A. Outdoor-Air Damper: Galvanized-steel, opposed-blade dampers with vinyl blade seals and stainless-steel jamb seals, having a maximum leakage of 10 cfm/sq. ft. of damper area, at differential pressure of 2-inch wg.

B. Fan-Discharge Dampers: Galvanized-steel, opposed-blade damper.

C. Balancing/Bypass Dampers: Galvanized-steel, opposed-blade damper.

D. Damper Operator: Direct coupled, electronic with spring return or fully modulating as required by the control sequence.

2.08 DIRECT-FIRED GAS FURNACE

A. Description: Factory assembled, piped, and wired; and complying with ANSI Z83.4, "Direct Gas-Fired Make-Up Air Heaters"; ANSI Z83.18, "Direct Gas-Fired Industrial Air Heaters"; and NFPA 54, "National Fuel Gas Code."

B. Inside Unit External Housing: Steel cabinet with integral support inserts.

C. Outside Unit External Housing: Weatherproof steel cabinet with integral support inserts.
   1. External Casing and Cabinet Finish: Baked enamel over corrosion-resistant-treated surface in color to match fan section.

D. Burners: Cast-iron burner with stainless-steel mixing plates.
   1. Control Valve: Modulating with minimum turndown ratio of 25:1.
   2. Fuel: Natural gas.
   3. Pilot: Electrically ignited by hot-surface ceramic igniter.

E. Safety Controls:
   1. Gas Manifold: Safety switches and controls to comply with ANSI standards and IRI.
   2. Purge-Period Timer: Automatically delays burner ignition and bypasses low-limit control.
   3. Airflow Proving Switch: Dual pressure switch senses correct airflow before energizing pilot and requires airflow to be maintained within minimum and maximum pressure settings across burner.
   4. Manual-Reset, High-Limit Control Device: Stops burner and closes main gas valve if high-limit temperature is exceeded.
   5. Gas Train: Redundant, automatic main gas valves, electric pilot valve, electronic-modulating temperature control valve, main and pilot gas regulators, main and pilot manual shutoff valves, main and pilot pressure taps, and high-low gas pressure switches to comply with IRI requirements.

6. Safety Lockout Switch: Locks out ignition sequence if burner fails to light after three tries. Controls are reset manually by turning the unit off and on.
7. Control Transformer: Integrally mounted 24-V ac.

2.09 CONTROLS

A. Factory-wired, fuse-protected control transformer, connection for power supply and field-wired unit to remote control panel.

B. Control Panel: Surface-mounted remote panel, with engraved plastic cover, and the following lights and switches:
   1. On-off-auto switch.
   2. Summer-winter switch. Provide custom programming for summer and winter modes at the unit controller.
   3. Supply-fan operation indicating light.
   4. Heating operation indicating light.
   5. Damper position potentiometer.
   6. Thermostat.
   7. Cooling operation indicating light.
   8. Dirty-filter indicating light operated by unit-mounted differential pressure switch.
   9. Safety-lockout indicating light.

C. Refer to Division 22 and 23 Section "HVAC Instrumentation and Controls" for control equipment and sequence of operation.

D. Control Devices:
   1. Remote Thermostat: Adjustable room thermostat with temperature readout.
   2. Remote Setback Thermostat: Adjustable room thermostat without temperature readout.
   3. Static-Pressure Transmitter: Nondirectional sensor with suitable range for expected input, and temperature compensated.
   4. Fire-Protection Thermostats: Fixed or adjustable settings to operate at not less than 75 deg F above normal maximum operating temperature.
   5. Timers: Seven-day, programming-switch timer with synchronous-timing motor and seven-day dial; continuously charged, nickel-cadmium-battery-driven, eight-hour, power-failure carryover; multiple-switch trippers; minimum of two and maximum of eight signals per day with two normally open and two normally closed output contacts.
   6. Timers: Solid-state, programmable time control with 4 separate programs; 24-hour battery carryover; individual on-off-auto switches for each program; 365-day calendar with 20 programmable holidays; choice of fail-safe operation for each program; and system fault alarm.
   7. Ionization-Type Smoke Detectors: 24-V dc, nominal; self-restoring; plug-in arrangement; integral visual-indicating light; sensitivity that can be tested and adjusted in place after installation; integral addressable module; remote controllability; responsive to both visible and invisible products of combustion; self-compensating for changes in environmental conditions.

8. Fan-Speed Controllers: Solid-state model providing field-adjustable proportional control of motor speed. Equip with filtered circuit to eliminate radio interference.

E. Fan Control: Interlock fan to start with exhaust fan(s).
   1. Program summer mode to operate at high speed and winter mode to operate at low speed. Coordinate with TAB contractor to determine the speeds that correspond to the design airflows in each condition.

F. Outdoor-Air Damper Control, 100 Percent Outdoor-Air Units: Outdoor-air damper shall open when supply fan starts, and close when fan stops.

G. Temperature Control: Operates gas valve to maintain supply-air or room temperature in heating mode.

2.10 MOTORS

A. Comply with requirements in Division 22 and 23 Section "Motors."

2.11 CAPACITIES AND CHARACTERISTICS – SEE DRAWINGS

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting installation of direct-fired H&V units.

B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.

C. Examine roof curbs and equipment supports for suitable conditions where rooftop replacement-air units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install gas-fired units according to NFPA 54, "National Fuel Gas Code."

B. Install roof curb on roof structure, according to ARI Guideline B. Install and secure direct-fired H&V units on curbs, and coordinate roof penetrations and flashing with roof construction.

C. Install suspended units from spring hangers with minimum 1-inch static deflection; refer to Division 22 and 23 Section "Mechanical Vibration and Seismic Controls."

D. Install floor-mounted units on restrained, spring isolators with minimum 1-inch static deflection; refer to Division 22 and 23 Section "Mechanical Vibration and Seismic Controls."

E. Install controls and equipment shipped by manufacturer for field installation with direct-fired H&V units.

3.03 CONNECTIONS

A. Piping Connections: Drawings indicate general arrangement of piping, fittings, and specialties. Install piping adjacent to machine to allow service and maintenance.
   1. Gas Piping: Comply with requirements in Division 22 and 23 Section "Fuel Gas Piping." Connect gas piping with shutoff valve and union and with sufficient clearance for burner removal and service. Provide AGA-approved flexible connectors.
   2. Drain: Comply with requirements in Division 22 and 23 Section "Sanitary Waste and Vent Piping" for traps and accessories on piping connections to evaporative cooling units.

B. Duct Connections: Duct installation requirements are specified in Division 22 and 23 Section "Metal Ducts." Drawings indicate the general arrangement of ducts. Connect supply ducts to direct-fired H&V units with flexible duct connectors. Flexible duct connectors are specified in Division 22 and 23 Section "Duct Accessories."

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Connect wiring according to Division 26 Section "Conductors and Cables."

3.04 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Complete installation and startup checks according to manufacturer's written instructions and perform the following:
   1. Inspect for visible damage to furnace combustion chamber.
   2. Inspect casing insulation for integrity, moisture content, and adhesion.
   3. Verify that clearances have been provided for servicing.
   4. Verify that controls are connected and operable.
   5. Verify that filters are installed.
   6. Purge gas line.
   7. Inspect and adjust vibration isolators and seismic restraints.
   8. Verify bearing lubrication.
   9. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
   10. Adjust fan belts to proper alignment and tension.
   11. Start unit according to manufacturer's written instructions.
   12. Complete startup sheets and attach copy with Contractor's startup report.
   13. Inspect and record performance of interlocks and protective devices; verify sequences.
   14. Operate unit for run-in period recommended by manufacturer.
   15. Perform the following operations for both minimum and maximum firing and adjust burner for peak efficiency:
       a. Measure gas pressure on manifold.
       b. Measure combustion-air temperature at inlet to combustion chamber.

c. Measure supply-air temperature and volume when burner is at maximum firing rate and when burner is off. Calculate useful heat to supply air.

16. Calibrate thermostats.
17. Adjust and inspect high-temperature limits.
18. Inspect dampers, if any, for proper stroke and interlock with return-air dampers.
19. Start evaporative cooler system and measure and record the following:
    a. Leaving-air, dry- and wet-bulb temperatures.
    b. Entering-air, dry- and wet-bulb temperatures.
20. Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.
21. Measure and record airflow. Plot fan volumes on fan curve.
22. Verify operation of remote panel, including pilot-operation and failure modes. Inspect the following:
    a. High-limit heat.
    b. Alarms.
23. After startup and performance testing, change filters, verify bearing lubrication, and adjust belt tension.

C. Remove and replace malfunctioning components that do not pass tests and inspections and retest as specified above.

D. Prepare written report of the results of startup services.

3.05 ADJUSTING

A. Adjust initial temperature set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.06 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain direct-fired H&V units. Refer to Division 1 Section "Closeout Procedures and Demonstration and Training."

END OF SECTION

SECTION 23 81 26

SPLIT-SYSTEM AIR-CONDITIONING UNITS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes split-system air-conditioning and heat pump units consisting of separate evaporator-fan and compressor-condenser components. Units are designed for exposed or concealed mounting, and may be connected to ducts.

1.03 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For split-system air-conditioning units to include in operation, and maintenance manuals.

F. Warranty: Special warranty specified in this Section.

1.04 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of split-system units and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Energy-Efficiency Ratio: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

D. Coefficient of Performance: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

E. Units shall be designed to operate with HCFC-free refrigerants.

1.05 COORDINATION

A. Coordinate size and location of concrete bases for units. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork are specified in Division 3 Section "Cast-in-Place Concrete."

B. Coordinate size, location, and connection details with roof curbs, equipment supports, and roof penetrations specified in Division 7 Section "Roof Accessories."

1.06 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

1.07 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Filters: One set of filters for each unit.
   2. Fan Belts: One set of belts for each unit.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Carrier Air Conditioning; Div. of Carrier Corporation.
   2. Fujitsu.
   3. Mitsubishi.
   4. LG
   5. Daikin
   6. Trane Company (The); Unitary Products Group.
   7. Prior approved equal.

2.02 WALL-MOUNTING, EVAPORATOR-FAN COMPONENTS

A. Cabinet: Enameled steel with removable panels on front and ends in color selected by Architect, and discharge drain pans with drain connection.

B. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with thermal-expansion valve.

C. Electric Coil: Helical, nickel-chrome, resistance-wire heating elements with refractory ceramic support bushings; automatic-reset thermal cutout; built-in magnetic contactors; manual-reset thermal cutout; airflow proving device; and one-time fuses in terminal box for overcurrent protection.

D. Fan: Direct drive, centrifugal fan.

E. Fan Motors: Comply with requirements in Division 22 and 23 Section "Motors."
   1. Special Motor Features: Multitapped, multispeed with internal thermal protection and permanent lubrication.

F. Filters: Permanent, cleanable.

2.03 AIR-COOLED, COMPRESSOR-CONDENSER COMPONENTS

A. Casing: Steel, finished with baked enamel in color selected by Architect, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.

B. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
   1. Compressor Type: Scroll.
   2. Two-speed compressor motor with manual-reset high-pressure switch and automatic-reset low-pressure switch.
   3. Refrigerant Charge: R-410A or R-32.

C. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with liquid subcooler.

D. Heat Pump Components: Reversing valve and low-temperature air cut-off thermostat.

E. Fan: Aluminum-propeller type, directly connected to motor.

F. Motor: Permanently lubricated, with integral thermal-overload protection.

G. Low Ambient Kit: Permits operation down to 0 deg F.

H. Mounting Base: Polyethylene.

2.04 ACCESSORIES

A. Control equipment and sequence of operation are specified in Division 22 and 23 Sections "HVAC Instrumentation and Controls" and "Sequence of Operation."

B. Thermostat: Low voltage with subbase to control compressor and evaporator fan with the following features:
   1. Compressor time delay.
   2. 24-hour time control of system stop and start.

3. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.
4. Fan-speed selection, including auto setting.

C. Automatic-reset timer to prevent rapid cycling of compressor.

D. Refrigerant Line Kits: Soft-annealed copper suction and liquid lines factory cleaned, dried, pressurized, and sealed; factory-insulated suction line with flared fittings at both ends.

E. Additional Monitoring:
1. Monitor constant and variable motor loads.
2. Monitor variable frequency drive operation.
3. Monitor economizer cycle.
4. Monitor cooling load.
5. Monitor air distribution static pressure and ventilation air volumes.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install units level and plumb.

B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

C. Install ground-mounting, compressor-condenser components on 4-inch- thick, reinforced concrete base; 4 inches larger on each side than unit. Concrete, reinforcement, and formwork are specified in Division 3 Section "Cast-in-Place Concrete." Coordinate anchor installation with concrete base.

D. Install ground-mounting, compressor-condenser components on polyethylene mounting base.

E. Install roof-mounting compressor-condenser components on equipment supports specified in Division 7 Section "Roof Accessories." Anchor units to supports with removable, cadmium-plated fasteners.

F. Install seismic restraints.

G. Install compressor-condenser components on restrained, spring isolators with a minimum static deflection of 1 inch. Refer to Division 22 and 23 Section "Mechanical Vibration Controls and Seismic Restraints."

H. Install and connect precharged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.02 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to unit to allow service and maintenance.

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Electrical Connections: Comply with requirements in Division 26 Sections for power wiring, switches, and motor controls.

3.03 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.04 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

3.05 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units. Refer to Division 1 Section "Closeout Procedures and Demonstration and Training."

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 00

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies general requirements for electrical work. Detailed requirements for specific electrical items are specified in other sections but are subject to the general requirements of this section. The electrical drawings and schedules included in this project manual are functional in nature and do not specify exact locations of equipment or equipment terminations.

B. Definitions:

1. Elementary or Schematic Diagram:
    a. A schematic (elementary) diagram shows, by means of graphic symbols, the electrical connections and functions of a specific circuit arrangement. The schematic diagram facilitates tracing the circuit and its functions without regard to the actual physical size, shape, or location of the component devices or parts.
2. One-Line Diagram:
    a. A one-line diagram shows by means of single lines and graphical symbols the course of an electrical circuit or system of circuits and the components, devices or parts used therein. Physical relationships are usually disregarded.
3. Block Diagram:
    a. A block diagram is a diagram of a system, instrument, computer, or program in which selected portions are represented by annotated boxes and interconnecting lines.
4. Wiring Diagram or Connection System:
    a. A wiring or connection diagram includes all of the devices in a system and shows their physical relationship to each other including terminals and interconnecting wiring in an assembly. This diagram shall be (a) in a form showing interconnecting wiring only by terminal designation (wireless diagram), or (b) a panel layout diagram showing the physical location of devices plus the elementary diagram.
5. Interconnection Diagram:
    a. Interconnection diagrams shall show all external connections between terminals of equipment and outside points, such as motors and auxiliary devices. References shall be shown to all connection diagrams which interface to the interconnection diagrams. Interconnection diagrams shall be of the continuous line type. Bundled wires shall be shown as a single line with the direction of entry/exit of the individual wires clearly shown. Wireless diagrams and wire lists are not acceptable.
        1) Each wire identification as actually installed shall be shown. The wire identification for each end of the same wire shall be identical. All devices and equipment shall be identified. Terminal blocks shall be shown as actually installed and identified in the equipment complete with individual terminal identification.

2) All jumpers, shielding and grounding termination details not shown on the equipment connection diagrams shall be shown on the interconnection diagrams. Wires or jumpers shown on the equipment connection diagrams shall not be shown again on the interconnection diagram. Signal and DC circuit polarities and wire pairs shall be shown. Spare wires and cables shall be shown.

6. Arrangement, Layout, Or Outline Drawings:
   a. An arrangement, layout, or outline drawing is one which shows the physical space and mounting requirements of a piece of equipment. It may also indicate ventilation requirements and space provided for connections or the location to which connections are to be made.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
NECA-1	National Electrical Contractors Association – Standard Practices for Good Workmanship in Electrical Contracting
NFPA	National Fire Protection Association
NFPA-70	National Electrical Code (NEC)
NFPA-70E	National Electrical Safety Code (NESC)
ACI 318	Building Code Requirements for Structural Concrete

B. Identification of Listed Products:
   1. List electrical equipment and materials for the purpose for which they are to be used, by an independent testing laboratory. Three such organizations are Underwriters Laboratories (UL), Canadian Standards Association (CSA), and Electrical Testing Laboratories (ETL). Independent testing laboratory shall be acceptable to the inspection authority having jurisdiction.
   2. When a product is not available with a testing laboratory listing for the purpose for which it is to serve, the product may be required by the inspection authority, to undergo inspection at the manufacturer's place of assembly. All costs and expenses incurred for such inspections shall be included in the original contract price.

C. Factory Tests:
   1. Where specified in the individual product specification section, perform factory tests at the place of fabrication and performed on completion of manufacture or assembly. Include the costs of factory tests in the contract price.

1.03 SUBMITTALS

A. Provide submittals in accordance with Section 01 33 00. Each specification will identify any additional requirements beyond those identified in 01 33 00.

1.04 PROJECT/SITE CONDITIONS

A. General: Unless otherwise specified, size and derate equipment and materials for the ambient conditions specified in Section 01 11 80, but not less than an ambient temperature of 80 degrees C at an elevation ranging from sea level to 5000 feet without exceeding the manufacturer's stated tolerances.

B. Corrosive Areas:
   1. Corrosive areas are specified in Section 01 61 45

C. Hazardous (Classified) Areas:
   1. The following areas are designated as hazardous (classified) in accordance with the NEC:

Area	Hazardous Classification
None	

D. Enclosure Material and Rating
   1. Table A specifies the electrical enclosure material and rating for the location and application.

TABLE A

Location	Electrical Enclosure Material and NEMA Rating
Indoor: Architecturally Finished Area	NEMA 1: Mild steel
Indoor: Electrical Room	NEMA 1: Mild steel
Indoor: Process Areas	NEMA 4X: Stainless Steel
Indoor: Corrosive Area	NEMA 4X: Stainless Steel
Outdoor: Corrosive Area	NEMA 4X: Stainless Steel
Outdoor: Non-Corrosive Areas	NEMA 4X: Stainless Steel
Corrosive Area (Hypochlorite)	NEMA 4X: Fiberglass
Corrosive Area (Polymer)	NEMA 4X: Stainless Steel
Hazardous Area: Class I Division 2	NEMA 4X: Stainless Steel
Hazardous Area: Class I Division 1	NEMA 7: Galvanized Malleable Iron or Aluminum

E. Support Material and Rating
   1. Table B specifies the support material for mounting and supporting equipment and rating for the location and application.

TABLE B

Location	Framing Channel	Threaded Rod, Hardware, & Fittings
Indoor, Architecturally finished Area	Steel, HDG	Steel, HDG
Indoor, Electrical Room	Steel, HDG	Steel, HDG
Indoor, Process Areas	Steel, HDG	Steel, HDG
Corrosive Area (hypochlorite area)	Fiberglass	Fiberglass
Corrosive Area (polymer area)	Stainless Steel	Stainless Steel
Indoor, Corrosive Area (general)	Stainless Steel	Stainless Steel
Outdoor, Corrosive Area (general)	Stainless Steel	Stainless Steel
Outdoor Areas, Non-corrosive	HDG	HDG

HDG = Hot Dip Galvanized Finish

PVC = PVC Coated

F. Seismic:
   1. Design and install electrical equipment, supports, and anchorage in accordance with the seismic design requirements specified in Section 01 73 24.
   2. Special Seismic Certification required for Electrical MCC's, Switchboards, Panelboards, Transformers, Generators, Control Panels, and Fire Alarm System see specification section 01 73 24 for requirements.

1.05 STORAGE OF MATERIALS AND EQUIPMENT

A. Store materials and equipment as specified in Section 01 66 00-2.05. Seal indoor designated equipment and materials with plastic wrap and store.

PART 2 PRODUCTS

2.01 EQUIPMENT AND MATERIALS

A. General:
   1. Provide equipment and materials new and free from defects. Provide all material and equipment of the same or a similar type from the same manufacturer throughout the work. Use standard production materials wherever possible.

B. Equipment Finish:
   1. Unless otherwise specified, manufacturer will paint electrical equipment as specified in Section 09 90 00.

C. Galvanizing:
   1. Where specified, provide galvanizing e in accordance with Section 05 05 13.13.

2.02 NAMEPLATES

A. Nameplates shall be made from laminated phenolic plastic.
   1. Nominal size: 3/4 inch high by 2 inches long.
   2. Black backgrounds with 3/16-inch white letters.

3. Fastened using self-tapping stainless steel screws. Nameplate adhesives will not be permitted on the outside of enclosures.
4. Abbreviations shall be submitted to the Construction Manager prior to manufacture because of space limitations.

2.03 PRODUCT DATA

A. The following information and product data specified under individual specification sections shall be provided in accordance with Section 01 33 00.
   1. Applicable operation and maintenance information on an item-by-item basis in accordance with Section 01 78 23. Provide operation and maintenance information at the time of equipment, device, or material site delivery, or at a certain stage of project completion as required by Section 01 78 23, whichever is the earlier. Reduce full-size drawings to 11 x 17 inches.
   2. Provide test results for motors and electrical systems on the forms specified in Section 26 08 00. Maintain a file of the original test. Prior to acceptance of work, provide the resulting file to the Construction Manager.
   3. Description of functional checkout procedures specified under paragraph 3.02 Pre-Functional Test Checkout provided 14 days prior to performing functional checkout tests.
   4. Record documents specified in Section 01 78 39 and paragraph 3.03.

PART 3 EXECUTION

3.01 GENERAL

A. Construction:
   1. The work under Division 26 shall be performed in accordance with these specifications.
   2. Refer to the National Electrical Contractors Association's (NECA) National Electrical Installation Standards (NEIS) for Standard Practices for Good Workmanship in Electrical Contracting (NECA-1) as a minimum baseline of quality and workmanship for installing electrical products and systems that defines what is meant by "neat and workmanlike" as required by the National Electrical Code Section 110-12. Specified requirements supersede NECA practices.
   3. Electrical layout drawings are diagrammatic, unless otherwise detailed or dimensioned. The Contractor shall coordinate the location of electrical material or equipment with the work.
   4. Major electrical openings may compromise the structural integrity of the slab and wall elements. Major electrical openings are defined as openings or penetrations greater than two times the wall thickness in any dimension, and include duct bank transitions into a building through structural elements. Major electrical openings shall be constructed according to standard details on the drawings, up to an opening dimension of three feet. For opening dimensions greater than three feet, construct walls and slabs as specifically detailed on the drawings for that case. Major electrical openings proposed by the Contractor shall be submitted to the Structural Engineer of Record for the project for review.
   5. Minor changes in location of electrical material or equipment made prior to installation shall be made at no cost to the Owner.

B. Housekeeping:
   1. Protect electrical equipment from dust, water and damage. Wipe motor control centers, switchgear, and buses free of dust and dirt, keep dry, and vacuum on the inside within 30 days of acceptance of the work.
   2. Before final acceptance, the touch up any scratches on equipment as specified in Section 09 90 00-3.03 Special Requirements.
   3. Protect electrical equipment temporarily exposed to weather, debris, liquids, or damage during construction as specified in Section 01 66 00-2.06.

C. Electrical Equipment Labeling:
   1. Provide electrical equipment with field marked signs and labeling to warn qualified persons of the potential electric arc flash hazards per NEC Article 110.16 Flash Protection.
   2. Provide electrical equipment with NFPA 70E labels installed stating the results of the Arc Flash analysis specified in Section 26 05 74 Short Circuit and Protective Device Coordination Study Report.
   3. Provide electrical distribution equipment and utilization equipment with field labels to identify the power source and the load as specified. Refer to NEC Article 110.22 for Identification of Disconnecting Means installation criteria. Specific information is required such as the equipment tag number and equipment description of both the power source and the load equipment.

D. Motor Connections
   1. Verify that the motors are purchased with the correct size motor termination boxes for the circuit content specified as shown on the power single line diagrams or submit custom fabrication drawing indicating proposed motor termination box material, size, gasket, termination kit, grounding terminal, motor lead connection method, and motor terminal box connection/support system. Verify the motor termination box location prior to raceway rough-in.

3.02 TESTING

A. Provide testing in accordance with Section 26 08 00

3.03 RECORD DOCUMENTS

A. Maintain and annotate contract documents and during construction, including the record drawings specified in Section 01 78 39 and the following additional schedules, lists, and drawings:
   1. Cable Schedule (Section 26 05 19)
   2. Raceway Schedule (Section 26 05 33)
   3. Interconnection Diagrams (Section 26 05 00)
   4. Original Submittal Drawings (Section 01 33 00)

END OF SECTION

SECTION 26 05 19

LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies stranded copper cables, conductors, and wire rated 600 volts insulation used for power; lighting, analog, digital, or pulse signals and control circuits.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section. In case of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to document shall mean the documents in effect at the time of Advertisement for bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, whether or not the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM B3	Soft or Annealed Copper Wire
ASTM B8	Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
ASTM B33	Tinned Soft or Annealed Copper Wire for Electrical Purposes
ICEA S-68-516	Ethylene-Propylene-Rubber-Insulated Wire
NEMA WC7	Cross-Linked-Thermosetting Insulated Wire and Cable for the Transmission and Distribution of Electric Energy
NFPA 70	National Electric Code (NEC)
UL 44	Rubber-Insulated Wires and Cables
UL 83	Thermoplastic-Insulated Wires and Cables

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00.
   1. Submittals specified in Section 26 05 00.
   2. Complete catalog cuts for all conductors, wire, and cable.

PART 2 PRODUCTS

2.01 GENERAL

A. Unscheduled Conductors and Cables:
   1. Where not specified on the Drawings, conductors and cables shall be sized in accordance with the National Electrical Code for the equipment served with the minimum size as specified herein. Unscheduled conductor with insulation shall be provided in accordance with the following:
      a. CABLESPEC "MEPR/CPE" multi-conductor power and control cable
      b. CABLESPEC “XHHW” for single conductors

B. Cable Specification Sheets (CABLESPEC):
   1. General requirements for conductors and cables specified in this Section are listed on CABLESPEC sheets in paragraph 3.06.

2.02 COLOR CODING

A. Control Conductors:
   1. Single-conductor control conductors shall have the following colors for the indicated voltage:

Control Conductor	120V
Power (AC)	Black
Control (AC)	Red
Neutral	White
Ground	Green
Foreign Voltage (DC)	Blue/White
Foreign Voltage (AC)	Yellow
Power (DC)	Blue
Control (DC)	Violet

B. Power Conductors:
   1. Power conductors shall have the following colors for the indicated voltage:

Power Conductor	480V	208/120V
Phase A	Brown	Black
Phase B	Orange	Red
Phase C	Yellow	Blue
Ground	Green	Green
Neutral	Gray	White

C. Cables may be black with colored 3/4-inch vinyl plastic tape applied at each cable termination and in pull boxes, handholes and manholes. Tape shall be wrapped with 25 percent overlay to provide 3 inches minimum coverage.

D. Signal Conductors:
   1. Signal cable conductors shall be color coded black and white for pairs or black, white, and red for triads. Each conductor and each group of conductors shall be numbered.

2.03 POWER AND CONTROL CONDUCTORS AND CABLE, 600 VOLT

A. Single Conductor:
   1. Provide stranded conductors for all cable or wires. Provide minimum conductor size of 12 AWG for power and lighting circuits and minimum conductor size of 14 AWG for control circuits.

B. Multiconductor Cable:
   1. Provide multiconductor power cable and multiconductor control cable where identified on the drawings. Provide multi-conductor cable designations as per the drawings Provide stranded conductors for all cable or wires.

2.04 SIGNAL CABLES

A. General:
   1. Factory cable between manufactured instrument system components shall be provided in compliance with the instrument manufacturer's recommendations.
   2. Signal cable shall be provided for instrument signal transmission. Single instrument cable (SIC) and multiple-circuit instrument cable (MIC) shall be provided in accordance with the following examples:
      a. CABLESPEC “SIC”:
         1) Cable designation:
            a) 1PR#16S shielded twisted pair (STP)
         2) Cable designation:
            a) 1TR#16S triad (STT)
      b. CABLESPEC “MIC":
         1) Cable designation example:
            a) 4PR#16S with individual shields for each of the four pair and an overall shield and jacket for the multiconductor instrument cable.

B. Communication, Paging, and Security System Cables:
   1. Voice communication, paging, and security system cables shall be specified in their respective specification sections.

2.05 SPLICING AND TERMINATING MATERIALS

A. Connectors shall be tool applied compression type of correct size and UL listed for the specific application. Connectors shall be tin-plated high conductivity copper. Wire nuts for a splice is prohibited.

B. Signal and control conductors shall be connected to terminal blocks and field devices and instruments shall be terminated with conductor terminals as specified in 2.10.

C. Connectors for wire sizes No. 8 AWG and larger shall be compression tool installed one-hole lugs up to size No. 3/0 AWG, and two-hole or four-hole lugs for size No. 4/0 and larger. Mechanical clamp, dimple, screw-type connectors are not acceptable. In-line splices and taps shall be used only by written consent of the Construction Manager.

D. Power conductor splices shall be compression type, made with a compression tool die approved for the purpose, as made by Thomas and Betts Corp., or equal. Splices shall be covered with electrical products designed for the application, insulated, and covered with a heat-shrinkable sleeve or boot, as specified elsewhere.

E. Motor connection kits shall consist of heat-shrinkable, polymeric insulating material over the connection area and high dielectric strength mastic to seal the ends against ingress of moisture and contamination. Motor connections may use the Tyco Electronics removable boot product line.

F. Motor connection kits shall accommodate a range of cable sizes for both in-line and stub-type configurations. Connection kits shall be independent of cable manufacturer's tolerances. Refer to the electric motor specification Section 43 05 21.

2.06 CORD GRIPS

A. Cord grips shall be provided where indicated on the Drawings to attach flexible cord to equipment enclosures. Cord grips shall consist of a threaded aluminum body and compression nut with a neoprene bushing and stainless steel wire mesh for strain relief. Cord grip shall provide a watertight seal at enclosure interface and sized to accommodate the flexible cord.

2.07 CONDUCTOR NUMBERING

A. Conductor Numbers:
   1. Identify conductors with numbers at both ends. Conductor tag numbers are as shown in the cable schedule.
   2. Conductors in parallel or in series between equipment have the same conductor number. Neutral conductors have the same conductor number. Wherever possible, the conductor number is the same as the equipment terminal to which it connects.
   3. Where factory-wired equipment has terminal numbers different than the conductor numbers shown on the control diagrams:
      a. Show both on the interconnection diagram
      b. Include a copy of the interconnection diagram inside of the equipment cabinet.

2.08 WIRE MARKERS

A. Identify each power and control conductor at each terminal to which it is connected. Provide identification sleeves for conductors size No. 10 AWG or smaller. Use locking tab type cable markers for conductors No. 8 AWG and larger. Provide white plastic tabs with conductor identification number permanently embossed.

B. Identify conductors in accordance with paragraph 2.07 Conductor Numbering. Adhesive strips are not acceptable.

C. Machine print the letters and numbers that identify each wire on sleeves with permanent black ink with figures 1/8 inch high. Provide yellow or white tubing for sleeves sized to fit the conductor insulation. Shrink the sleeves with hot air after installation to fit the conductor.

2.09 TERMINAL BLOCKS

A. Unless otherwise specified, terminal blocks shall be panhead strap screw type. Terminals shall be provided with integral marking strips that permanently identify with the connecting wire numbers as shown on the drawings:
   1. Terminal blocks for P-circuits (power 208-600 volts)
      a. Rated not less than the conductor current rating
      b. Rated less than 600 volts AC.
   2. Terminal blocks for C-circuits and S-circuits:
      a. Rated not less than 20 amperes
      b. Rated less than 600 volts AC.
   3. Terminals shall be tin-plated.
   4. Insulating material shall be nylon.

PART 3 EXECUTION

3.01 GENERAL

A. Conductors shall be identified at each connection terminal, in pull boxes, manholes, handholes and at splice points. The identification marking system shall comply with Section 26 05 00.

B. Pulling wire and cable into conduit or trays shall be completed without damaging or putting undue stress on the insulation or jacket. Manufacture recommended and UL Listed pulling compounds are acceptable lubricants for pulling wire and cable. Grease is not acceptable.

C. Raceway construction shall be complete, cleaned, and protected from the weather before cable is installed. Where wire or cable exits a raceway, a wire or cable support shall be provided.

D. Provide tin-plated bus bar. Scratch-brush the contact areas and tin plate the connection where flat bus bar connections are made with un-plated bar. Bolts shall be torqued to the bus manufacturer's recommendations.

3.02 600 VOLT CONDUCTOR AND CABLE

A. Conductors in panels and electrical equipment shall be bundled and laced at intervals not greater than 6 inches, spread into trees and connected to their respective terminals. Lacing shall be made up with plastic cable ties. Cable ties shall be tensioned and cut off by using a tool specifically designed for the purpose such as a Panduit GS2B. Other methods of cutting cable ties are unacceptable.

B. Conductors crossing hinges shall be bundled into groups not exceeding 10 to 15 conductors and protected using nylon spiral flexible covers to protect conductors. Provide oversized plastic panel wiring duct within panels and panelboards.

C. Slack shall be provided in junction and pull boxes, handholes and manholes. Slack shall be sufficient to allow cables or conductors to be routed along the walls. Amount of slack shall be equal to largest dimension of the enclosure. Provide dedicated electrical wireways and insulated cable holders mounted on unistrut in manholes and handholes.

D. Raceway fill limitations shall be as defined by NEC and the following:
   1. Lighting and receptacle circuits may be in the same conduit in accordance with de-rating requirements of the NEC. Lighting and receptacle circuits shall not be in conduits with power or control conductors. Signal conductors shall be in separate conduits from power and control conductors. Motor feeder circuits shall be in separate conduits including small fan circuit unless combination fan-light fixture.
   2. Power conductors derived from uninterruptible power supply systems shall not be installed in raceways with conductors of other systems. Install in separate raceways.
   3. Slices and terminations are subject to inspection by the Construction Manager prior to and after insulating.
   4. Motor terminations at 460-volt motors shall be made by bolt-connecting the lugged connectors.
   5. In-line splices and tees, where approved by the Construction Manager, shall be made with tubular compression connectors and insulated as specified for motor terminations. Splices and tees in underground handholes or pull boxes shall be insulated using Scotch-cast epoxy resin or Raychem splicing kits.
   6. Terminations at solenoid valves, 120 volt motors, and other devices furnished with pigtail leads shall be made using self-insulating tubular compression connectors within the termination box.
   7. Terminations at valve and gate motor actuators shall be made directly into the actuator where possible. Power termination shall be made in the actuator power disconnect. Control and signal cable may be routed to a termination box near the actuator on 20-ampere rated terminal strips with label identification for the control and signal conductors. Single wire control conductors and analog cable (SIC or MIC) then installed in flexible conduit to the actuator control and signal termination compartments.
   8. Install and route multi-conductor as shown on the drawings. Submit installation and routing layouts of multi -conductor cables branching out to multiple field destinations to the Engineer for pre-approval. If approved, terminate on terminals in a terminal box located adjacent to the first field device served, or in the common junction box located at the equipment as depicted on the motor feed standard detail Drawings. Make final connection to field devices with single conductors.

3.03 SIGNAL CABLE

A. Provide terminal blocks at instrument cable junctions within dedicated terminal boxes provided by the installer. Signal circuits shall be run without splices between instruments, terminal boxes, or panels.

B. Circuits shall not be made using conductors from different pairs or triads. Triads shall be used wherever 3-wire circuits are required.

C. Shields are not acceptable as a signal path, except for circuits operating at radio frequencies utilizing coaxial cables. Common ground return conductors for two or more circuits are not acceptable.

D. Unless otherwise specified, shields shall be bonded to the signal ground bus at the control panel only and isolated from ground at the field instrument or analyzer and at other locations. Shields or drain wires for spare circuits shall not be grounded at either end of the cable run. Terminals shall be provided for running signal leads and shield drain wires through junction boxes.

E. Spare circuits and the shield drain wire shall be terminated on terminal blocks at both ends of the cable run and be electrically continuous through terminal boxes.

F. Where instrument cable splicing is required, provide an instrument stand with terminal box rated for the area and environment and mounted approximately 3 feet above grade for instrument cable splices with the circuits and individual conductors provided with nameplate as specified in Section 26 05 00.

G. Cable for paging, security, voice communication, and telephone systems shall be installed and terminated in compliance with the manufacturers and the Utilities recommendations.

3.04 TESTING

A. The Contractor shall test conductors, wire, and cable in accordance with Section 26 08 00.

3.05 CABLE SPECIFICATION SHEETS (CABLESPEC)

A. General:

1. Conductor, wire, and cable types for different locations, service conditions and raceway systems are specified on individual cable specification sheets. Scheduled and unscheduled conductors, wires, and cables shall be installed in accordance with the CABLESPEC Sheets.

B. CABLESPEC Sheets:

1. The following CABLESPEC sheets are included in this section:

CABLESPEC	Volt	Product	Purpose
TCER	600	Multi-conductor power and control cable	Power and control conductors for use in cable trays and conduit raceways.
XHHW2	600	Single conductor cross-linked polyethylene power and control cable	Power and control conductors for use in conduit raceways.
VFD1	600	Shielded motor cable for VFD drives	Feeding motors fed from VFD drive for use in conduit, raceways, and Cable Tray.
VFD2	600	Shielded motor cable for VFD drives for large horsepower motors	Feeding motors fed from VFD drive for use in conduit, raceways, and Cable Tray.
INS	600	Single Pair/Triad #18 ST plus overall shield	Instrumentation, analog field devices
INSM	600	Multiple Pair/Triad #18STP plus overall shield	Instrumentation, analog field devices
NC1	300	Category 6A Ethernet, 4 pairs, U/UTP	10 Gigabit Ethernet cable unshielded
NC2	300	Category 6A Ethernet, 4 pairs, U/FTP	10 Gigabit Ethernet, shielded pairs
NC4	600	Category 6 Ethernet, 4 pairs, F/UTP	600V Gigabit Ethernet, overall foil shield, unshielded pairs
NC6		Telephone cable	Voice and Data communication cable
FOTMM	--	Fiber-optic cable – multi-mode	Data Network
FOTSM	--	Fiber-optic cable – single-mode	Data Network

CABLESPEC	TCER
Cable System Identification:	TCER
Description:	Multi conductor cross-linked polyethylene XHHW-2 power and control cable for sizes No. 14 AWG and larger. With ground. UL listed TC-ER.
Voltage:	600 volts
Conductor Material:	Bare annealed copper; stranded in accordance with ASTM B3 & B8 sizes #8 & smaller, sizes #8 & larger compact stranded per ASTM B-496
Insulation:	Cross-Linked polyethylene (XLPE) XHHW-2, 90 degree C wet or dry, in accordance with UL 1581
Assembly:	Cabled in accordance with UL 1277 and 1309. Unshielded.
Jacket:	Overall Polyvinyl Chloride(PVC) jacket
Flame Resistance:	UL 1685, IEEE 1202/FT4
Manufacturer:	Okonite X-Olene Okoseal, General Cable CVTC, or approved equal
Uses Permitted:	600V Power and Control Tray Cable and installations where TC-ER rating is permitted by the NEC.
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	MC
Cable System Identification:	MC
Description:	Multiconductor metal clad armored power and control cable, approved for tray installation and in accordance with UL 1569. Type MC-HL.
Voltage:	600 volts
Conductor Material:	Bare annealed copper; stranded in accordance with ASTM B8
Insulation:	Cross-Linked polyethylene (XLPE) XHHW-2, 90 degree C wet or dry, in accordance with UL 1581
Assembly:	Individual conductors cabled together with nonhydroscopic fillers and binding tape.
Amor	Impervious to moisture, continuous, corrugated aluminum welded over cable core. Sheath shall meet the grounding conductor requirements of NEC table 250-95
Jacket:	50 mil minimum, polyvinylchloride (PVC) in accordance with UL 1569
Flame Resistance:	IEEE 383
Manufacturer:	Okonite, C-L-X; Southwire ARMOR-X or approved equal.
Uses Permitted:	600V Power and Control Tray Cable and as depicted on the drawings
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	XHHW-2
Cable System Identification:	XHHW2
Description:	Single conductor Cross-linked polyethylene power and control cable for sizes No. 14 AWG and larger. UL listed XHHW-2.
Voltage:	600 volts
Conductor Material:	Bare annealed copper; stranded in accordance with ASTM B8
Insulation:	XHHW-2, 90 degree C wet or dry, cross-linked polyethylene in accordance with ICEA S-95-658/NEMA WC70. Insulation having integrated pre-lubrication so that that cable coefficient of friction is less than or equal to 0.17.
Flame Resistance:	UL 1685, IEEE 1202
Manufacturer:	Southwire Company SIMpull™, Encore Wire Corporation Super Slick Elite ™
Uses Permitted:	Power, control, lighting, receptacle and appliance circuits
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	VFD1
Cable System Identification:	VFD1
Description:	Shielded for VFD drives. Multi conductor cross-linked polyethylene XHHW-2 or RHW-2 power cable with ground the same size as phase conductors. UL listed TC-ER. Conductor sizes 12 AWG though 2 AWG.
Voltage:	600 volts
Conductor Material:	Tinned copper. Class D, Class K, or Class H stranded.
Insulation:	90 degree C dry or wet, crosslinked polyethylene XLPE in accordance with NEMA. UL listed XHHW-2 or RHW-2.
Shield	100% shielding with aluminum foil tape and tinned copper braid (85% coverage). Drain conductor same size as phase conductor.
Jacket:	Black jacket. PVC or Thermoplastic Elastomer. UL TC-ER listed. Minimum cable bend radius recommended by the manufacturer than or equal to 15x the cable diameter.
Flame Resistance:	UL 1685, IEEE 1202
Manufacturer:	3#12, 1#12 ground, 1#12 drain: Southwire 585344, Belden 29502, or equal 3#10, 1#10 ground, 1#10 drain: Southwire 585416, Belden 29503, or equal 3#8, 1#8 ground, 4#14 drain: Southwire 643451, Belden 29504, or equal 3#6, 1#6 ground, 4#12 drain: Southwire 643459, Belden 29505, or equal 3#4, 1#4 ground, 4#10 drain: Southwire 643467, Belden 29506, or equal 3#2, 1#2 ground, 4#8 drain: Southwire 643474, Belden 29507, or equal
Uses Permitted:	Cable tray and conduit exposed in non-classified or Class I, Division 2 per NEC 336, 392 and 501 environment.
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00.
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	VFD2
Cable System Identification:	VFD2
Description:	Shielded for VFD drives. Multi conductor cross-linked polyethylene XHHW-2 or RHW-2 power cable with three symmetrical stranded grounds. The sum of the three ground's size (circular mills) equal to or greater than the size of a phase conductor. UL listed TC-ER. Conductor sizes 1 AWG though 4/0 AWG.
Voltage:	600 volts
Conductor Material:	Tinned copper. Class B, Class D, or Class K stranded
Insulation:	90 degree C dry or wet, crosslinked polyethylene XLPE in accordance with NEMA. UL listed XHHW-2 or RHW-2.
Shield:	Two spirally applied 2 mil copper tapes with 100 percent coverage.
Jacket:	Black PVC jacket. UL TC-ER listed. Minimum cable bend radius recommended by the manufacturer than or equal to 15x the cable diameter.
Flame Resistance:	UL 1685, IEEE 1202
Manufacturer:	3#1/0, 3#4G ground: General Cable 438200, Belden 29529, or approved equal 3#2/0, 3#4G ground: General Cable 438210, Belden 29530, or approved equal
Uses Permitted:	Cable tray or conduit., exposed in non-classified or Class I, Division 2 per NEC 336, 392 and 501 environment.
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00.
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	CORD
Cable System Identification:	CORD
Description:	Portable Cord, 3-conductor with ground, extra hard usage, oil, weather and water resistant. 10 AWG and smaller, UL listed, type SOOW; larger than 10 AWG, UL listed type G/GC
Voltage:	600 volts
Conductor Material:	Type G/GC - Flexible rope lay stranded per ASTM B189 and B33. Type SOOW – Soft bare annealed copper per ASTM B-3, flexible bunch strand per ASTM B-174.
Insulation:	Insulation shall be ethylene propylene (EPR) as per ICEA S-68-516 and rated for continuous operation at 90 degrees C Dry and 75 degrees C Wet.
Jacket:	Black chlorinated polyethylene (CPE) rubber ICEA S-98-658.
Manufacturer:	Type SOOW - Paige Electric SOOW, Southwire Royal, or approved equal. Type G/GC - Paige Electric G/GC, Southwire Royal, or approved equal.
Uses Permitted:	In accordance with NEC. Design and installation for all CORD use for permanently installed equipment must be approved by Owner. For temporary construction use as approved by Owner, Construction Manager, or AHJ. Cables shall be sized by Contractor for load served.
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00. Provide cable seals where required by NEC 501.
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	INS
Cable System Identification:	INS
Description:	Single twisted, shielded pair or triad, instrumentation cable. Rated 90 degree C wet or dry. UL listed TC.
Voltage:	600 volts
Conductor Material:	Bare annealed copper; stranded in accordance with ASTM B-8
Insulation:	PVC/Nylon
Jacket:	Polyvinylchloride (PVC) per UL Standard 1277
Lay:	Twisted on a 2-inch lay
Shield:	100 percent, 1.35 mil aluminum-Polyester tape with 20 AWG 7-strand tinned copper drain wire
Flame Resistance:	UL 1685, ICEA T-29-520 and IEEE 1202.
Manufacturer:	Single Pair #18: BELDEN 1120A, Okononite Okoseal-N P-OS 264-60-3301, or equal. Single Triad #18: BELDEN 1121A, Okononite Okoseal-N P-OS 264-65-3301, or equal. Single Pair #16: BELDEN 1118A, Okononite Okoseal-N P-OS 264-60-4401, or equal. Single Triad #16 BELDEN 1119A, Okononite Okoseal-N P-OS 264-65-4401, or equal. Single Pair #14: Okononite Okoseal-N P-OS 264-60-5501, or equal. Single Triad #14: Okononite Okoseal-N P-OS 264-65-5501, or equal.
Uses Permitted:	Instrumentation cable tray, raceway
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00.
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	INSM
Cable System Identification:	INSM
Description:	Multiple twisted, shielded pairs or triads, instrumentation cable. Rated 90 degree C wet or dry. UL listed TC.
Voltage:	600 volts
Conductor Material:	Bare annealed copper; stranded in accordance with ASTM B-8
Insulation:	PVC/Nylon
Jacket:	Polyvinylchloride (PVC) per UL Standard 1277
Lay:	Twisted on a 2-inch lay
Shield:	100 percent, 1.35 mil aluminum-Polyester tape with 20 AWG 7-strand tinned copper drain wire
Flame Resistance:	UL 1685and IEEE 1202
Manufacturer:	2 pair #18: BELDEN 1048A, or equal. 4 pair #18: BELDEN 1049A, Okonite Okoseal-N SP-0S 261-60-3304, or equal. 8 pair #18: BELDEN 1050A, Okonite Okoseal-N SP-0S 261-60-3308, or equal. 12 pair #18: BELDEN 1051A, Okonite Okoseal-N SP-0S 261-60-3312, or equal. 16 pair #18: BELDEN 1052A, Okonite Okoseal-N SP-0S 261-60-3316, or equal. 20 pair #18: Okonite Okoseal-N SP-0S 261-60-3320, or equal. 24 pair #18: BELDEN 1053A, Okonite Okoseal-N SP-0S 261-60-3324, or equal. 36 pair #18: BELDEN 1054A, Okonite Okoseal-N SP-0S 261-60-3336, or equal. 50 pair #18: Okonite Okoseal-N SP-0S 261-60-3350, or equal. 4 triad #18: BELDEN 1093A, Okonite Okoseal-N SP-0S 261-65-3304, or equal. 8 triad #18: BELDEN 1094A, Okonite Okoseal-N SP-0S 261-65-3308, or equal. 12 triad #18: BELDEN 1095A, Okonite Okoseal-N SP-0S 261-65-3312, or equal. 16 triad #18: Okonite Okoseal-N SP-0S 261-65-3316, or equal. 24 triad #18: BELDEN 1096A, Okonite Okoseal-N SP-0S 261-65-3324, or equal. 36 triad #18: Okonite Okoseal-N SP-0S 261-65-3336, or equal. 2 pair #16: BELDEN 1069A, Okonite Okoseal-N SP-0S 261-60-4402, or equal. 4 pair #16: BELDEN 1070A, Okonite Okoseal-N SP-0S 261-60-4404, or equal. 8 pair #16: BELDEN 1071A, Okonite Okoseal-N SP-0S 261-60-4408, or equal. 12 pair #16: BELDEN 1072A, Okonite Okoseal-N SP-0S 261-60-4412, or equal. 16 pair #16: BELDEN 1073A, Okonite Okoseal-N SP-0S 261-60-4416, or equal. 20 pair #16: Okonite Okoseal-N SP-0S 261-60-4420, or equal. 24 pair #16: BELDEN 1074A, Okonite Okoseal-N SP-0S 261-60-4424, or equal. 36 pair #16: Okonite Okoseal-N SP-0S 261-60-4436, or equal. 50 pair #16: Okonite Okoseal-N SP-0S 261-60-4450, or equal. 4 triad #16: BELDEN 1097A, Okonite Okoseal-N SP-0S 261-65-44004, or equal. 8 triad #16: BELDEN 1098A, Okonite Okoseal-N SP-0S 261-65-4408, or equal. 12 triad #16: BELDEN 1099A, Okonite Okoseal-N SP-0S 261-65-4412, or equal. 16 triad #16: Okonite Okoseal-N SP-0S 261-65-4416, or equal. 24 triad #16: Okonite Okoseal-N SP-0S 261-65-4424, or equal. 36 triad #16: Okonite Okoseal-N SP-0S 261-65-4436, or equal.
Uses Permitted:	Instrumentation cable tray, raceway
Execution – Installation:	Install in accordance with Section 26 05 19 and 26 05 00.
Execution – Testing:	Test in accordance with Section 26 05 19, 26 05 00, and 26 08 00

CABLESPEC	NC1
Cable System Identification:	NC1
Description:	Category 6A Ethernet, IEEE 802.3 10G and PoE Ethernet, ISO/IEC Class EA. Unshielded 4 pair. UL CMP.
Voltage:	300V rms
Conductor Material:	Solid bare copper 23 AWG
Insulation:	Fluoropolymer (FEP)
Jacket:	CMP, 75 degree C minimum
Jacket Color:	Blue or white, as specified on Instrumentation Drawings
Shield:	Unshielded
Flame Resistance:	NFPA 262
Electrical Characteristics:	Maximum Insertion loss 45.3 dB at 100 meters and 500 MHz IEEE 802.3af/at/bt (PoE/PoE+) rated for applications up to 100 watts
Manufacturer:	Leviton eXtreme Cat 6A U/UTP Plenum Rated, or approved equal.
Uses Permitted:	Conduit, cable tray.
Execution – Application:	Data Network Communications – Ethernet.
Execution – Installation:	Install in accordance with this Section and associated equipment manufacturer's instruction.
Execution – Testing:	Test in accordance with this Section.

CABLESPEC	NC2
Cable System Identification:	NC2
Description:	Category 6A Ethernet, IEEE 802.3 10G and PoE Ethernet, ISO/IEC Class EA. 4 shielded pair. UL CMP.
Voltage:	300V rms
Conductor Material:	Solid bare copper 23 AWG
Insulation:	Fluoropolymer (FEP)
Jacket:	CMP, 75 degree C minimum
Jacket Color:	Blue or white, as specified on Instrumentation Drawings.
Shield:	Each pair shielded with aluminum foil. Solid tinned copper 24 AWG drain wire
Flame Resistance:	NFPA 262 CMP
Electrical Characteristics:	Maximum Insertion loss 45.3 dB at 100 meters and 500 MHz IEEE 802.3af/at/bt (PoE/PoE+) rated for applications up to 100 watts
Manufacturer:	General Cable GenSPEED 10,000 Cat 6A U/FTP Plenum Rated, or approved equal
Uses Permitted:	Conduit, cable tray.
Execution – Application:	Data Network Communications – Shielded Ethernet.
Execution – Installation:	Install in accordance with this Section and associated equipment manufacturer's instruction.
Execution – Testing:	Test in accordance with this Section.

CABLESPEC	NC3
Cable System Identification:	NC3
Description:	Category 6A Ethernet, IEEE 802.3 10G and PoE Ethernet, ISO/IEC Class EA. 4 pair with overall shield. Outside Plant (OSP) Gel-Filled.
Voltage:	300V rms
Conductor Material:	Solid bare copper 23 AWG
Insulation:	Polyolefin (PO)
Jacket:	Polyethylene
Shield:	Overall aluminum foil shield
Flame Resistance:	None
Electrical Characteristics:	Maximum Insertion loss 45.3 dB at 100 meters and 500 MHz
Manufacturer:	Belden OSP6AF or approved equal.
Uses Permitted:	Conduit.
Execution – Application:	Outdoor Data Network Communications – Ethernet.
Execution – Installation:	Install in accordance with this Section and associated equipment manufacturer's instruction.
Execution – Testing:	Test in accordance with this Section.

CABLESPEC	NC4
Cable System Identification:	NC4
Description:	Category 6 Ethernet, 1 Gigabit Ethernet, ISO/IEC Class E. 4 pair with overall shield. UL CMR.
Voltage:	600V rms
Conductor Material:	Solid bare copper 23 AWG
Insulation:	Polypropylene (PP)
Jacket:	Inner PVC Jacket (PVC), Outer PVC Jacket
Jacket Color:	Blue
Shield:	Shielded, overall aluminum-polyester tape 100 percent coverage with 24 AWG tinned copper drain wire
Flame Resistance:	UL 1666 riser
Electrical Characteristics:	Maximum Insertion loss 32.8 dB at 100 meters and 250 MHz
Manufacturer:	Belden 7953A or approved equal
Uses Permitted:	Conduit, cable tray.
Execution – Application:	Data Network Communications – Shielded Ethernet.
Execution – Installation:	Install in accordance with this Section and associated equipment manufacturer's instruction.
Execution – Testing:	Test in accordance with this Section.

CABLESPEC	NC5
Cable System Identification:	NC5
Description:	Paired – Low Capacitance, Computer Cable for EIA RS-232/485. UL TC.
Voltage:	600 volts, 75 degree C
Conductor Material:	2 pair, stranded, Tinned Copper,.18 AWG
Insulation:	Flame Retardant Polyolefin
Jacket:	PVC – Polyvinyl Chloride
Lay:	Twisted on a .75-inch lay
Shield:	Beldfoil®, Tape/Braid Layer 1: Tape, Aluminum/polyester shield with 100% coverage Layer 2: Braid, TC – Tinned Copper
Flame Resistance:	UL 1685
Manufacturer:	Belden 3074F or approved equal.
Uses Permitted:	Conduit
Execution – Installation:	Install in accordance with this Section
Execution – Testing:	Test in accordance with this Section and 26 08 00

CABLESPEC	NC6
Cable System Identification:	NC6
Description:	Telephone–Voice and Data communication cable, aluminum shield, solid annealed copper.
Code:	UL listed and NEC Type CMP
Conductor(s):	006 pair No. 24 AWG solid annealed copper 012 pair No. 24 AWG solid annealed copper 025 pair No. 24 AWG solid annealed copper 050 pair No. 24 AWG solid annealed copper 100 pair No. 24 AWG solid annealed copper
Insulation:	Thermoplastic
Jacket:	FR, low smoke Polyvinyl chloride
Shield:	Aluminum
Characteristic Impedance:	100±15Ω
Manufacturer:	General Cable or approved equal (006 pair GC##7527112) (012 pair GC##7527120) (025 pair GC##7527138) (050 pair GC##7527146) (100 pair GC##7527161)
Uses Permitted:	Conduit
Execution – Installation:	Install in accordance with this Section and with equipment vendor specifications.
Execution – Testing:	Test after installation in accordance with this Section.

CABLESPEC	FOT-MM
Cable System Identification:	FOT-MM
Description:	Multi-mode (OM3) Fiber-Optic Data Cable; indoor/outdoor, distribution loose-tube, UV stabilized, gel-free, fiber conductor: Outdoor/Indoor; Plenum Rated; Cable Tray Rated Fibers and buffer tubes shall be color coded with distinct and recognizable colors in accordance with EIA/TIA-598.
Type:	OFNP with industrial cable tray rating and NFPA 262 flame test rated Fiber Type: Multi-Mode (OM3) Standards Compliance: TIA-492AAAC (OM3) Cladding Diameter: 125 ± 1.0 µm Core Diameter: 50.0 µm Attenuation: ≤ 3.00 db/km @ 850 nm ≤ 1.00 db/km @ 1300 nm Operating Temperature Range: -40 to +70 Deg C Maximum Tensile Loading: 6-strand: 300/90 lbf (short-term/long-term) 12-strand: 300/90 lbf (short-term/long-term) Minimum Cable Bending Radius: 6-strand: 3.2”/2.1” (loaded/unloaded) 12-strand: 4.1”/2.7” (loaded/unloaded) Compression Rating: 126 lb/in or greater Cable Outer Diameter: 6-strand: 0.21” 12-strand: 0.27”
Insulation:	
Jacket:	UV stabilized, fungus and moisture resistant. Designed for indoor/outdoor installations, including cable trays. Color: Black Mark the exterior sheathing with the manufacturer's name, month and year of manufacture, and sequential meter or foot markings for easily determining the length of the cable at all points along the cable run.
Manufacturer:	Commscope LazrSPEED Indoor/Outdoor Plenum Distribution Cable, or approved equal.
Execution – Application:	Data Communications
Execution – Installation:	(1) Fiber-optic cable shall be suitable for installation in conduit runs, plenum and riser spaces, and cable trays within buildings. (2) Fiber-optic cable shall be suitable for installation between buildings in outdoor/concrete encased conduit runs which share vaults with medium voltage cable. (3) Fiber shall be terminated with LC style connectors unless otherwise shown on drawings or required by the manufacturer. (5) Fiber-optic cables shall have number of fibers as shown in the documents.
Execution – Testing:	Test in accordance with this Section.

CABLESPEC	FOT-SM
Cable System Identification:	FOT-SM
Description:	Single-Mode (OS2) Fiber-Optic Data Cable; indoor/outdoor, distribution (loose-tube), UV stabilized, gel-free, fiber conductor: Outdoor/Indoor; Plenum Rated; Cable Tray Rated Fibers and buffer tubes shall be color coded with distinct and recognizable colors in accordance with EIA/TIA-598.
Type:	OFNP with industrial cable tray rating and NFPA 262 flame test rated Fiber Type: Single-Mode (OS2) Standards Compliance: ITU-T G.652.D, ITU-T G.657.A1 Cladding Diameter: 125 ± 0.7 µm Core Diameter: 9 µm Attenuation: ≤ 0.5 db/km @ 1310 nm ≤ 0.5 db/km @ 1550 nm Operating Temperature Range: -40 to +70 Deg C Maximum Tensile Loading: 24-strand: 300/90 lbf (short-term/long-term) 48-strand: 800/240 lbf (short-term/long-term) 96-strand: 1000/300 lbf (short-term/long-term) 144-strand: 1000/300 lbf (short-term/long-term) Minimum Cable Bending Radius: 24-strand: 4.7”/3.1” (loaded/unloaded) 48-strand: 11.1”/7.4” (loaded/unloaded) 96-strand: 16.7”/11.1” (loaded/unloaded) 144-strand: 17.9”/11.9” (loaded/unloaded) Compression Rating: 126 lb/in or greater Cable Outer Diameter: 24-strand: 0.31” 48-strand: 0.74” 96-strand: 1.11” 144-strand: 1.19”
Jacket:	UV stabilized, fungus and moisture resistant. Designed for indoor/outdoor installations, including cable trays. Color: Black Mark the exterior sheathing with the manufacturer's name, month and year of manufacture, and sequential meter or foot markings for easily determining the length of the cable at all points along the cable run. Provide a telecommunication handset symbol as required by Section 350G of the National Electrical Safety Code® (NESC®), fiber count, and fiber type.
Manufacturer:	Commscope TeraSPEED Indoor/Outdoor Plenum Distribution Cable, or approved equal
Execution – Application:	Data Communications
Execution – Installation:	(1) Fiber-optic cable shall be suitable for installation in conduit runs, plenum and riser spaces, and cable trays within buildings. (2) Fiber-optic cable shall be suitable for installation between buildings in outdoor/concrete encased conduit runs which share vaults with medium voltage cable. (3) Fiber shall be terminated with LC style connectors unless otherwise shown on drawings or required by the manufacturer. (4) Fiber-optic cables shall have number of fibers as shown in the documents.
Execution – Testing:	Test in accordance with this Section

SECTION 26 05 26

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies the system for grounding electrical distribution and utilization equipment, including but not limited to cabinets, motor frames, manholes, instrumentation, metal surfaces of process/mechanical equipment that contain energized electrical components, metal structures and buildings, outdoor metal enclosures, fences and gates.

B. The Equipment Grounding Conductor shall ground or bond equipment, structures, or equipment frames to the Grounding Electrode System as defined in the National Electrical Code Article 250 and addressed herein.

C. The minimum size of the Equipment Grounding Conductors installed with the circuit conductors shall be per the National Electrical Code Table 250.122. The circuit grounding conductor size routed with a feeder or branch circuit conductors is as shown on the drawings.

1.02 REFERENCES:

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
IEEE 81	Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System
IEEE Std 81.2-1991	Guide to Measurement of Impedance and Safety Characteristics of Large, Extended or Interconnected Grounding Systems
NETA - ATS	InterNational Electrical Testing Association Inc. - Acceptance Testing Specifications
NFPA 70	National Electric Code (NEC) Article 250

1.03 SUBMITTALS:

A. The following information shall be submitted for review in accordance with Section 01 33 00:

B. Product Literature:
   1. Marked product literature for ground rods, test wells, and equipment ground plate.

PART 2 PRODUCTS

2.01 GROUND CONDUCTORS

A. The System Ground Conductor shall be soft-drawn, bare annealed copper, concentric stranded, as specified. The minimum sizes shall be as follows, where American Wire Gage (AWG) conductor sizes are not shown or specified:

1.	15 kV-5 kV transformers	2/0 or 4/0 AWG
2.	5 kV-480V transformers	2/0 or 4/0 AWG
3.	480V switchgear	2/0 or 4/0 AWG
4.	480V switchboards	2/0 or 4/0 AWG
5.	480V MCC and	2/0 or 4/0 AWG
6.	Cable tray	2/0 or 4/0 AWG
7.	Large motors 250 hp & >	2/0 or 4/0 AWG
8.	Lighting & Power panels	2 AWG
9.	Exposed metal cabinets	2 AWG
10.	Electrical equipment	2 AWG
11.	Buildings and enclosure	2 AWG
12.	Fences and gates	2 AWG
13.	Motors 25 hp to 250 hp	2 AWG
14.	Motors 1 hp to 25 hp	6 AWG

2.02 GROUND RODS

A. Ground rods shall be copper covered steel, 3/4-inch diameter and 10-feet long. Rods shall have threaded type removable caps so that extension rods of same diameter and length may be added where necessary.

2.03 COMPRESSION CONNECTORS

A. Compression connections shall be irreversible, cast copper as manufactured by Thomas and Betts, or equal.

2.04 BOLTED CONNECTORS

A. Bolted connectors shall be Burndy, O. Z. Gedney, or equal.

2.05 WELDED CONNECTORS

A. Exothermic welding products shall be Erico's Cadweld Plus system with a remotely operated battery powered electronic ignition device and moisture resistant weld metal cup for the required mold, or equal.

2.06 TEST WELLS

A. Provide concrete test well with cover and connect the ground grid extension using a removable connector.

2.07 EQUIPMENT GROUND BARS

A. Copper equipment ground bars shall be Erico Eritech EGB Series or equal, sized as required for the installation.

2.08 GROUND ELECTRODE GROUNDING BARS

A. Ground electrode grounding bars shall be 1/4-inch thick copper electro-tin plating, Erico Eritech EGBA Series CC Pattern, Burndy Type BBB or equal. Minimum length shall be 12 inches.

B. Insulators (Stand Off) material shall be halogen-free, fiberglass-reinforced thermal set unsaturated polyester molded compound with indoor rating of 600 volts.

C. Brackets shall be 1/8-inch thick, Type 304 stainless steel.

D. Fasteners shall be 3/8-inch Type 304 stainless steel.

2.09 EQUIPMENT GROUND PLATE

A. Equipment ground plate shall be two-hole copper flush mounted grounding plate, Erico Cadweld, Burndy YGF Series, or equal.

2.10 PRODUCT DATA

A. Ground resistance readings specified in Part 3 below shall be provided in accordance with Section 01 33 00.

PART 3 EXECUTION

3.01 GENERAL

A. Grounding system shall be provided in compliance with the NFPA 70 National Electrical Code (NEC). Grounding conductor shall not be used as a system neutral.

B. Embedded and buried ground connections shall be made by compression connectors utilizing diamond or hexagon dies and a hand compression tool for wire sizes 2 AWG and smaller and a hydraulic pump and compression head for wire sizes 2/0 AWG and larger. Alternate method allowed: exothermic welding using a remote igniter device.

C. Tools and dies shall be approved for this purpose; dimple compressions are not acceptable. Compression connections shall be prepared in accordance with the manufacturer's instructions. Compression-type lugs shall be used in accordance with manufacturer's recommendations. Exposed ground connections to equipment shall be made by bolted clamps unless otherwise specified. No solder material shall be used in any part of the ground circuits.

D. Embedded ground conductors and fittings shall be securely attached to concrete reinforcing steel with tie wires and prevented from displacement during concrete placement.

E. Notify the Construction Manager two hours prior to backfilling, as each part of the grounding system installed below finished grade is complete and ready for inspection. Non-compliance shall affect the payment schedule for this work.

F. Grounding conductors extended beyond concrete surfaces for equipment connection shall be extended a sufficient length to reach the final connection point without splicing. Provide grounding fittings, pads, or plates as shown in the electrical details. Minimum grounding conductor extension shall be 3-feet.

G. Grounding conductors which project from a concrete surface shall be located as close as possible to a corner of the equipment pad, protected by rigid conduit bonded to the grounding conductors, or terminated in a flush grounding plate.

H. Exposed grounding conductors shall be supported by noncorrosive metallic hardware at 4-foot intervals or less. Grounding conductors for shown and future equipment shall be terminated using an equipment grounding plate.

I. Ground conductors entering electrical enclosures shall be bonded to a single ground bus or terminal strip in the enclosure and to metallic raceways within or terminating at the enclosure. Direct ground connections to enclosure chassis or back plate are not acceptable. Prior to making ground connections or bonds, the metal surface at the point of connection shall be cleaned.

J. Lightning arresters shall be directly connected to the ground grid system using lightning industry braided copper conductors, sized as specified.

K. Metallic sheaths or shields of shielded power cable shall be terminated by a copper ground bus provided with cable connection for connection to the grounding system.

3.02 RACEWAY GROUND

A. All service, feeder and branch circuit raceways shall contain a green insulated ground conductor sized per applicable NFPA 70 National Electrical Code (NEC) tables:
   1. T250.66 - Grounding Electrode Conductor for Alternating - Current Systems or
   2. T250.122 - Minimum Size Equipment Grounding Conductors for Grounding Raceways and Equipment.

B. Metallic conduits terminating at concentric knock-outs or reducing washers shall be bonded using insulated grounding bushings. Grounding bushings shall be connected to the grounding system using conductors sized in compliance with NEC.

C. Cable trays shall have 2/0 or 4/0 bare copper ground conductor run on the outside of each tray or tray group of tiered cable tray. Conductor shall be connected to each section or fitting using an approved ground-clamp and supported at 5 foot intervals.

3.03 EQUIPMENT AND ENCLOSURE BONDING

A. Electrical distribution and utilization equipment enclosure ground bus, motor frames, manholes, metal structures and buildings, outdoor metal enclosures, fences and gates shall be bonded to the grounding system with conductor sizes as specified.

B. Connect the conductor to the metal enclosure using a UL listed connector, where the enclosure does not contain an internal ground bus

C. Non-electrical equipment with metallic enclosures, that are located outdoors and without a cover or a shade, shall be connected to the grounding system.

3.04 ISOLATED GROUNDING

A. An isolated ground system shall be installed where required by an equipment manufacturer. The isolated ground conductor shall have green insulation with a yellow stripe and shall be run in the same raceway as the power and neutral conductors. The isolated ground bus shall be kept isolated from neutral and grounding buses.

B. Where specifically directed by the Engineer and required by an equipment manufacturer, the Contractor shall provide an additional isolated ground conductor from the service or separately derived system to an isolated ground bus bar at each associated distribution point.

3.05 SERVICE AND SEPARATELY DERIVED SYSTEM BONDING

A. A neutral bonding jumper shall be installed in only one location for each service or separately derived system. The bonding jumper shall be located at the service source or the first immediate distribution point downstream from the source. The neutral and ground buses shall be kept isolated from each other accept where the bonding jumper is installed.

3.06 GROUNDING SYSTEM TESTS

A. The Contractor shall test the facility grounding system and the building grounding system to determine the ground resistance. The grounding test shall be IEEE Standard 81 using the NETA Fall-of-Potential procedure. A plot of ground resistance readings for each isolated ground rod, ground mat, or ground bus shall be submitted on 8-1/2 x 11 inch size graph paper. Point-to-point resistance measurements are not acceptable.

B. The current reference rod shall be driven at least 100 feet from the ground rod or grid under test or as recommended by IEEE Standard 81. The measurements shall be made at 10-foot intervals beginning 25 feet from the test electrode and ending 75 feet from it, in direct line between the ground rod or center of grid and the current reference electrode.

C. A grounding system that shows greater than 2 ohm resistance for the flat portion of the plotted data shall be considered inadequately grounded.

D. The Contractor shall add additional parallel connected ground rods and/or deeper driven rods until the ground resistance measurements meet the 2 ohm requirement. Additional ground rods will be paid for as extra work where the required numbers exceed that specified when authorized and approved by the Construction Manager.

E. Use of salts, water, or compounds to attain the specified ground resistance is not acceptable.

END OF SECTION

SECTION 26 05 33

RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SCOPE

A. This section covers the furnishing and installation of electrical conduits, wireways, pull boxes, manholes, handholes, cable trays, fittings and supports. Raceways shall be provided for lighting, receptacles, power, control, instrumentation, signaling and grounding systems.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:

B. Products:
   1. Manufacturer's descriptive literature for materials.
   2. Certification that Contractor has been trained to work on PVC-coated conduit systems.

C. Underground Conduit Raceway System:
   1. The Contractor shall provide detailed layout drawings or sketches for the underground conduit raceway systems. Make take-offs of the circuits and underground raceways required between electrical power and control equipment, process equipment, instrumentation, area lighting, receptacles, heat tracing, and eye-wash stations to assure all circuit are included prior to system construction.
   2. Drawings shall show plan view routing, pullboxes and manholes, consideration of other underground systems and structures, approximate system cover depths and widths, and section views showing sizes of conduits and circuits. Submit the underground conduit raceway systems drawings or sketches.

PART 2 PRODUCTS

2.01 RACEWAYS AND FITTINGS

A. General requirements for raceway materials specified in this section are listed in the RACESPECS sheets at the end of this section. The type of raceways and raceway fittings to be used for any given area and application shall conform to the requirements in this section.

2.02 BOXES, GUTTERS, TERMINAL CABINETS, MANHOLES, AND HANDHOLES

A. Materials and classifications of equipment and material is specified in Section 26 05 00

B. Pull Boxes And Wiring Gutters:
   1. Indoor boxes and enclosures larger than FD boxes shall be constructed of sheet steel and galvanized after fabrication. Outdoor boxes and enclosures shall be provided with neoprene gaskets on the hinged doors and removable covers. Box and gutter sizes, metal thickness, and grounding shall comply with the National Electrical Code. Bolt-on junction box covers 3 feet square or larger, or heavier than 25 pounds, shall have a rigid handle. Covers larger than 3 x 4 feet shall be split.

C. Terminal Cabinets:
   1. Terminal cabinets shall be provided with adjustable terminal strip mounting, back-panels for equipment mounting, print pockets in the doors, continuous door hinges, and three-point lockable latches.
   2. Classifications, ratings and enclosure material is specified in 01 61 45 and 26 05 00.

D. Manholes:
   1. Unless otherwise specified, manholes shall be precast concrete, 3000 psi strength at 28 days, with reinforcing with the manhole cover designed for H 20 bridge loading. Necking and shaft shall have 36 inch minimum clear opening.
   2. Manhole dimensions shall be as shown on the drawings and where not shown shall be sized in accordance with the NEC. Manhole cover and frame shall be Class 30B gray cast iron per ASTM A48 with machine finished flat bearing surfaces. Manhole covers shall be engraved " ELECTRICAL – LOW VOLTAGE". 2. “ELECTRICAL – MEDIUM VOLTAGE". 3. “SIGNAL/COMMUNICATIONS". " as appropriate.
   3. Manholes shall be watertight. Exterior walls of manholes shall be provided with 6 mils of waterproof membrane, Sonneborn HLM 5000 Series, or equal. Manhole walls shall be provided with boxouts with waterstops on all sides of each boxout. Waterstops shall be as specified in the Cast-in-Place Concrete section.
   4. Raceway duct entries shall be no less than 14 inches above floor and below ceiling. Raceway boxouts shall be sized to accommodate the penetrating underground duct banks. Raceways bell-ends shall be flush with the interior finished manhole wall. From each duct bank entry into the manhole, the continuous duct bank bare copper grounding conductor shall be supported and routed around the interior manhole walls and bonded together.
   5. Floor shall slope to a sump pit with dimensions shown in the manhole detail or with a minimum of 18 inch length x 18 inch width x 12 inches depth.

E. Handholes:
   1. Handholes shall be precast concrete with checker plate, galvanized, traffic covers designed for H 20 loading. Handholes shall be provided with precast solid concrete slab bottoms with sumps. Handholes shall be constructed of 3000 psi reinforced concrete. Handhole cover shall be engraved "ELECTRICAL" or "SIGNAL" as applicable.
   2. Dimensions shall be as specified on the drawings. Handhole walls shall be provided with boxouts, as specified for manholes.

F. Manhole And Handhole Cable Supports:
   1. Provide heavy-duty, non-metal cable racks for support of conductors. Racks shall be UL listed glass-reinforced nylon consisting of slotted wall brackets for support arms designed for a minimum of a 400-pound load. Each support bracket shall from the top to the bottom and the arms shall be adjustable and installed on 24-inch centers. Use ½-inch stainless steel bolts, hardware, inserts, and fasteners. Cables supports, clamps or racks shall be provided to support the cable at minimum 2-foot intervals. Concrete inserts shall be embedded on 24-inch centers in walls and ceiling.
   2. Cable Support Products:
      a. Underground Devices Incorporated Type RA arms with CR36 support brackets.
      b. Unistrut Power-Rack F20N-STA33 Stanchions with F20N-ARM14 Arms.

c. Or equal

G. Ground Bus:

1. Provide a ground bus in concrete manholes, handholes, and electrical pullboxes with dimension of 3-foot width x 3-foot length x 3-foot depth and larger. Provide a NEMA threaded 4-hole grounding plate for connecting two to four-1-hole ground connectors that enter the enclosure from two to four duct banks. From each duct bank entry into the manhole, the continuous duct bank bare copper grounding conductor shall be supported and routed around the interior manhole walls and bonded together or to a ground bus

a. Products:

1) Burndy, T&B, or equal.

2.03 RACEWAY SUPPORTS

A. Conduit Supports:

1. Framing channel with end caps and straps shall be provided to support groups of conduit. Individual conduit supports shall be one-hole pipe straps used with clamp backs and nesting backs where required
2. Conduit supports shall be one-hole clamps or oversized clamps with clamp backs and nesting backs where required .
3. Fiberglass spray sealant shall be applied to all field cuts made to fiberglass framing channel.

B. Ceiling Hangers:

1. Ceiling hangers shall be adjustable. Provide J-Type conduit support for single conduit. Straps or hangers of plumber's perforated tape are not acceptable. Unless otherwise shown, hanger rods shall meet ASTM A193 and be sized as 3/8-inch up to 2-inch conduit and shall be 1/2 inch all-thread rod over 2-inch conduit. .
2. Ceiling hangers for fiberglass framing channel shall be 1/2 inch fiberglass reinforced plastic threaded rod hangers with FRP fasteners.

C. Suspended Raceway Supports and Racks:

1. Suspended raceway supports shall consist of concrete inserts, rod hangers, and jamb nuts supporting framing channel or lay-in pipe hangers as required. Framing channel shall be a minimum of 12-gauge.
2. Hanger rods supporting fiberglass framing channel shall be 1/2 inch fiberglass reinforced plastic with FRP or nylon jamb nuts.
3. Hanger rods shall be 1/2-inch diameter all-thread rod and shall meet ASTM A193. Suspended raceway supports and racks shall be braced for seismic forces as specified in Section 26 05 00.

D. Materials:

1. Mounting and supporting material and ratings are specified in Section 26 05 00

2.04 CONCRETE ENCASED DUCT BANKS

A. Concrete used for duct banks shall be Class E and a minimum 28-day compressive strength of 2,000 psi as specified in the Cast-in-Place Concrete Section 03 30 00.

2.05 UNDERGROUND MARKING TAPE

A. Underground detectable marking tape shall be for early warning protection of digging around direct buried cables, conduits, and concrete duct banks. Tape shall be OSHA approved.

B. Marking Tape Example:
   1. tape example: Low density polyethylene plastic, nominally 6 inches wide and 4 mil thickness with metallic lined tape with red polyethylene film on top and clear polyethylene film on the bottom. Tape shall be imprinted with a warning continuously along the length similar to: "CAUTION - STOP DIGGING - BURIED ELECTRIC LINE BELOW."

C. Tape Products:
   1. Brady "Identoline"; Services and Materials "Buried Underground Tape"; Somerset (Thomas & Betts) "Protect-A-Line"; or equal.

2.06 NAMEPLATES

A. Nameplates are specified in Section 26 05 00

2.07 FIRESTOPS

A. Firestops and seals shall be Flamemastic 77, Vimasco No. 1-A, or equal, and shall be applied in accordance with manufacturer's recommendations. Products which are affected by water are not acceptable.

2.08 RACEWAY IDENTIFICATION

A. Provide raceway numbering as specified in Section 3.06.

B. Raceway number tags:
   1. Solid brass with 0.036-inch minimum thickness.
   2. Raceway number stamped in 3/16-inch minimum height characters
   3. Attached to the raceway with 316 stainless steel wire.

2.09 ELECTRICAL SEALANT

A. Electrical sealant putty shall be non-hardening, non-oxidizing, non-corrosive, non-poisonous, and non-injurious to human skin with service temperature range of 30 to 200 degrees Fahrenheit. Product shall be used to seal against the entrance of water.

2.10 HAZARDOUS AREA AND CORROSIVE AREA CONDUIT SEALS

A. Sealing compound shall be non-hardening type for corrosive areas. Seal fittings for conduit systems in hazardous atmosphere locations shall be hot-dip galvanized cast ferrous alloy or aluminum alloy. Seal fittings shall be 40-percent fill type.

B. Sealing compound shall be hard type installed in UL listed for explosion-proof sealing fittings after the conductors are installed, tested, and accepted.

C. Provide PVC-coated seal fittings used for PVC-coated conduit with 40-mil factory coating. Seal fitting and sealing compound manufacture: Appleton, Crouse-Hinds, or equal.

2.11 PULLING LINE

A. Pulling line shall be polyethylene type, mildew and rot resistant with minimum of 200-pound tensile strength and minimum 1/4-inch diameter. Install in all "future" or "spare" raceways. Manufacture: Greenlee, Ideal, or equal.

2.12 CONDUIT THREAD LUBRICANT

A. Thread lubricant shall be conductive with anti-seize and anti-corrosion properties, compatible with steel and aluminum conduit materials. Manufacture: T&B CP8 KOPR-Shield; Robroy Threadcompound; or equal.

2.13 TERMINAL BLOCKS

1. Terminal blocks are specified in Section 26 05 19.

PART 3 EXECUTION

3.01 GENERAL

A. Refer to Sections 01 61 45 and 26 05 00 for identification of hazardous and corrosive areas.

B. Table A specifies the type of raceway required for each location and application by RACESPEC sheet. Unscheduled conduit shall be galvanized, rigid steel, RACESPEC type GRS.

Table A

Location	Application/Condition	RACESPEC
Indoor noncorrosive	Exposed	GRS
Indoor corrosive	Exposed	PGRS
Outdoor	Exposed	GRS
Concealed	Power circuits embedded in concrete structure or beneath slab-on-grade	PVC4
Concealed	Instrumentation, communications and data signals encased in concrete, duct bank	PVC4
Underground	Power circuits encased in concrete, duct bank	PVC4
Underground	Instrumentation, communications and data signals directly buried	PVC4
Nonhazardous	Final connection to equipment and light fixtures	LFS
Hazardous corrosive	Exposed	PGRS
Hazardous	Final connection to equipment	XPFS
Architecturally finished areas	Concealed in framed walls and ceiling spaces (lighting and receptacle circuits only)	EMT
Architecturally finished areas	Final connection to light fixtures	FLEX

3.02 CONDUIT

A. General:
   1. The conduit systems, installation, and hazardous location fittings are specified herein.

B. Indoor and Outdoor Conduit Systems:
   1. In general, Contractor shall be responsible for determining conduit routing that conforms to the specified installation requirements:
      a. Conduits for lighting and outlets:
      b. exposed
      c. Conduits for process equipment:
      d. exposed
      e. Conduit inside structures:
      f. exposed
      g. Conduit concealed inside water chambers slabs and walls
   2. Conduit installation shall conform to the requirements of the RACESPEC sheets and the following specified installation requirements:
      a. Install exposed conduit parallel or perpendicular to structural members and surfaces. Install conduit horizontally and allow minimum headroom of 7 feet.
      b. Route two or more exposed conduits in the same general routing parallel with symmetrical bends.
      c. Space exposed conduit installed on supports not more than 10 feet apart. Space multiple conduits in parallel and use framing channel.
      d. Comply with the requirements herein, where conduits are suspended from the ceiling.
      e. Secure conduit rack supports to concrete walls and ceilings with cast-in-place anchors or framing channel concrete inserts.
      f. Install conduits at least 6 inches from high temperature piping, ducts, and flues with temperatures higher than 90 degree C.
      g. Install conduits between the reinforcing steel in walls or slabs that have reinforcing in both faces.
      h. Place conduits under the reinforcement in slabs with only a single layer of reinforcing steel. Separation between conduits, conduits and reinforcement, and conduits and surfaces of concrete shall be maintained in accordance with UBC.
      i. Route conduit clear of structural openings and indicated future openings.
      j. Provide conduits with flashed and watertight seals routed through roofs or metal walls.
      k. Grout conduits into openings cut into concrete and masonry structures.
      l. Cap conduits or plug flush conduits during construction to prevent entrance of dirt, trash, and water. Cap or plug empty conduits designated as “future”, “spare”, or “empty” and include a pulling line accessible at both ends. Use anti-seize compound on cap and plug threads prior to installation.
      m. Determine concealed conduit stubup locations from the manufacturer's shop drawings. Terminate concealed conduit for future use in specified equipment.

n. Install conduit flush with structural surfaces with galvanized couplings and plugs. Caps and plugs shall match the conduit system.

o. Provide concealed portions of conduits for future equipment where the drawings indicate future equipment. Match the existing installation for duplicate equipment.

p. Terminate conduits that enter enclosures with fittings that match the NEMA rating of the enclosure.

q. Underground metallic or nonmetallic conduit that turn out of concrete, masonry or earth: Install a 90-degree elbow of PVC-coated rigid steel conduit before emergence above ground.

r. Provide O-Z Gedney "Type DX" or Crouse-Hinds "Type XD" bonded, weathertight expansion and deflection fitting for the conduit size where conduit across structural joints that allows structural movement.

C. Underground Conduit System:

1. Excavation, backfilling, and concrete work shall conform to respective sections of these specifications. Underground conduit shall conform to the following requirements:

a. Underground conduits under roadways or traffic areas that are not shown otherwise on the drawings shall be reinforced concrete encased.

b. Concrete encased conduit shall have minimum concrete thicknesses of 2 inches between conduits, 1 inch between conduit and reinforcing, and 3 inches between reinforcing and earth, unless shown otherwise in an electrical detail.

c. Concrete encasement on exposed outdoor conduit risers shall continue to 3 inches above grade, with top crowned and edges chamfered.

d. Underground conduit bend radius shall be not less than 2 feet minimum at vertical risers and shall be not less than 3 feet elsewhere.

e. Where conduit and concrete encasement are terminated underground, the conduit and reinforcing shall both extend at least 2 feet past the concrete. Conduits shall be capped and threads protected. Steel surfaces shall be given two coats of epoxy paint.

f. Underground conduits and conduit banks shall have 2 feet minimum earth cover unless otherwise shown.

g. Underground conduit banks through building walls shall be cast-in-place or installed with concrete into boxouts with waterstops on all sides of the boxout. Water-stops shall be as specified in the Cast-in-Place Concrete section. Extend the horizontal reinforcement from the duct bank into the boxout terminating with J-hook bends.

h. Conduits not encased in concrete and passing through walls with one side in contact with earth shall be sealed watertight with special rubber gasketed sleeve and joint assemblies or with sleeves and modular rubber sealing elements.

i. Thoroughly swab conduits and raceways on the inside, immediately upon completion of pouring concrete.

j. Label raceways in accordance with 2.08 and 3.05.

k. After the concrete has set and before backfilling, pull a mandrel through each conduit. The mandrel shall have a diameter equal to the nominal conduit inside diameter minus 1/2 inch and shall not be less than 4 inches long.

l. If the mandrel showed signs of protrusions on the inside of the conduit, the conduit shall be repaired or replaced.

m. Provide manufactured plastic conduit spacers anchored to prevent movement during the concrete pour. Manufacture: Carlon, PW Pipe, Underground Devices, or equal.

n. Form the concrete pour ten feet from the wall, manhole, or handhole and form to allow for future conduit entry.

o. Backfill duct banks with clean fill compacted to 90 percent in 6-inch lifts after concrete has cured. Refer to Section 03 30 00 for concrete requirements including minimum 7 days of cure time prior to backfill over duct banks.

p. Allow and provide for two offsets per conduit and raceway for each 100 linear feet to account for unexpected field conditions including for excavation and backfill limited to three feet of extra width and/or depth. Include these specified provisions in the bid price.

q. Provide PVC threaded adapter with female threads where PVC conduit is joined to steel conduit.

r. Procedure:

1) Before assembly: Double coat steel conduit with Red-Robroy, Green-Permacote, Blue-Ocal or equal product.

2) After assembly: Seal with 65-mil thick, 2-inch wide mastic sealing tape to 1/2 inch beyond threads. Procucts: 3M Scotch 2228; Plymouth 02625; or equal.

3) Cover with 20-mil corrosion protection tape applied in ½-lap layers to 2 inch beyond threads. Products: 3M Scotchwrap 51; Plymouth Plywrap 12; or equal.

s. Where reinforced concrete duct banks enter the side of a building, manhole, or handhole and the reinforcement cannot be brought into a window and be terminated, then drill the structure and embed the reinforcement in epoxy to minimum of 3-inches depth.

t. Provide PVC conduit with bell ends where duct banks terminated at walls, manholes, or handholes. Install bell ends flush with finished concrete.

u. Provide PVC conduit with bell ends where conduit rise below grade into a floor mounted electrical panel, electrical cabinet, MCC, switchboard, or switchgear.

v. Separate power conduits from signal conduit within the same ductbank by 12 inches or greater separation, as shown. Refer to the drawings or schedules for signal to be installed in metal conduits instead of PVC ducts.

w. Separate high voltage ductbanks from low voltage ductbanks, as shown.

x. Provide wireways for transition from underslab conduits rising into wall-mounted panels where the number of conduits exceed the NEC allowable panel space in the bottom of the panel. Provide conduit sleeves or fitting for panel transition. Continuous thread or all-thread is prohibited.

D. Conduit In Block Walls

1. Install multiple runs of conduit that stub-up into a block wall and connect to recessed electrical panels with adequate space for the conduit. Coordinated the electrical work with the structural work and block installers to provide a chase to install the conduit. Install conduit in the cells that do not contain structural reinforcement. Install conduits in the center of the cell to avoid affecting the structural integrity of the wall.

2. Avoid conduit and electrical boxes installation that blocks the cell from being grouted or that blocks the cell reinforcing bars from being grouted. Avoid conduit in the first cell adjacent to doors, windows, corners and wall intersections and install conduits in the center of the first available cell a minimum of 1'-0" from the edge of these openings.
3. Where solid grouting of masonry walls is specified, install conduit and electrical boxes so as to provide sufficient space for grout to flow pass the boxes and conduit in order to fully fill the space beneath and behind. Where boxes need to be held in place, secure the boxes from the face of the block wall. Do not place items behind or next to electrical boxes to hold in place.
4. Coordinate split-face, slump and scored block installation with the masonry contractor to supply smooth face block at the location of receptacles and switches so that the device covers install flush to the wall. Install translucent weather-proof sealing material under device covers on outdoor or wet area locations.

E. Conduit Seal-Off Fittings:
1. Conduits passing:
a. Between Class I, Division 1 area and Class I, Division 2 area; provide sealing fittings located at the boundary in accordance with NEC Article-500.
b. From hazardous or corrosive area into a non-hazardous or non-corrosive area.
2. Install the seal-off material in the conduit seal-off fittings after inspection.

F. Conduit And Innerduct Sealing Material:
1. Provide HYDRA-SEAL® Handi-Polyurethane-Foam or equal product to seal conduits and innerducts.
2. Sealing product required features:
a. Compatible with common cable jacket materials.
b. ASTM E-84 flame spread requirements and UL Classified.
c. Pre-pressurized, portable, one-component closed-cell foam sealing system.
d. Dries tack-free within 15 minutes and cures within 24 hours.
e. Reacts with applied moisture or with ambient humidity.
f. Remove over-spray with acetone and remove cured foam mechanically
3. Application Criteria:
a. Apply in ambient temperatures between 60 and 100 degrees Fahrenheit.
b. Apply bead onto clean surface.

G. Conduits in Concrete Construction:
1. Conduits for power, control and instrumentation may be embedded in and pass through concrete construction subject to the limitations in this paragraph. Where concrete strength or serviceability requirements prevent the direct embedment of conduit, provide adequate support, bracing, and serviceability details:
a. Do not impair significantly concrete strength by the embedment of conduits in or through structural sections.
b. Provide conduit layout to the requirements of ACI 318, Sections 3.3 – Aggregates and 6.3 – Conduits and Pipes Embedded in Concrete.
c. Treat conduits similarly to reinforcing steel for purposes of clearance. In general, code sections require conduit spacing the greater of:

d. 1.33 times the maximum concrete aggregate size, clear
    1) Three diameters center to center
    2) Alternate spacing and layout shall be as reviewed and accepted by the Engineer.

2. Conduit and raceway penetrations through walls and slabs where:
    a. one side is a conditioned or an occupied space and the other side not, or
    b. one side has liquid or groundwater contact and the other not,
    c. be detailed and constructed to prevent liquid and moisture penetration through the wall or slab section for each conduit.

3.03 MANHOLES AND HANDHOLES

A. Unless otherwise specified, manhole and handhole installation shall be as follows:
    1. Manholes, handholes, and pull boxes shall be set on a minimum of 6 inches of crushed rock on top of undisturbed or compacted earth.
    2. Manholes and handholes shall be set plumb so that water shall drain to the sump.
    3. Manhole covers shall be 36-inches in diameter and set at 2 inches above finish grade with surrounding pavement sloping away from the manhole cover.
    4. Metallic hardware inside manholes and handholes shall be bonded to the ground plate or ground bus using bolted connections, bonding jumpers and grounding bushings.

B. CABLE RACKS: Cable rack assemblies shall be installed as follows:
    1. Attach rack stanchion to manhole/handhole wall with ½-inch drop-in anchors and ½-x 3/8-inch stainless steel hex head cap screw. Stanchions shall be anchored at the top and bottom of each stanchion as well as above each cable arm.
    2. Provide cable arms to support cables on each rack along the cable run within the manhole/handhole. Provide a minimum of two racks on each wall and two spare cable arms per rack.
    3. Secure each cable or cable bundle to the cable arm with heavy duty, nylon wire ties, Richo WIT-225L or equal. Cable bundles shall be organized by circuit voltage and area served. Multiple circuits may be bundled together where the circuits are derived from the same immediate source and serve the same area. 480 volt AC circuits, No. 6 and larger, shall be individually bundled.

3.04 CABLE TRAY

A. Unless otherwise specified or shown, cable tray installation shall be as follows:
    1. Cable trays shall be supported at intervals not to exceed 5 feet.
    2. Corners shall be supported by two supports installed as close as possible to the corner, with one support on each side of the corner.
    3. Field cuts on steel cable tray shall be treated with zinc rich paint.
    4. Expansion joint splice plates shall be used to allow 1 1/2 inch free movement between adjacent trays when crossing building expansion joint.
    5. Cable tray shall have minimum clearance of 3/4 inch from concrete surfaces and minimum spacing of 12 inches from other trays. The top of the tray shall be minimum 9 inches from the ceiling.

6. Signal cable trays shall be provided with solid type covers.
7. Provide each cable tray with No. 2/0 AWG or No. 4/0 AWG minimum bare copper equipment ground conductor attached to the outside of each tray section using UL Listed bolted bronze or brass ground clamp and bond to the ground grid system.
8. Power cables shall be placed in cable trays in accordance with the NEC.
9. Cables shall be arranged in trays for minimum cross-over for entry or exit.
10. Provide cable tray barrier between power and control cables, if not in separate cable trays.
11. Provide cable tray barrier between control and instrument cable in the same cable tray.

3.05 RACEWAY NUMBERING

A. Each new and reused conduit shall be provided with a number tag at each end and in each manhole, handhole, or pull box. Cable trays shall be identified by stencils at intervals not exceeding 50 feet, at intersections, and at each end to identify power cable tray voltage, control cable tray, or instrument cable tray.

B. Raceway Numbers:
   1. Tag raceways at all terminations. Raceway numbers will comply with raceway labels assigned on the drawings. Where raceway numbers have not been assigned, assign raceway numbers in accordance with the following system:

Raceway Prefix	Type of Function
RC	Control or power - 120V or less
RH	Power above 600V
RN	Pneumatic tubing
RP	Power 208V to 600V
RS	Signal - data communication or instrumentation
RX	Spare

   2. Provide number after the prefixes . Add a letter suffix to distinguish the raceways where more than one raceway is routed to a particular piece of equipment. Example: Raceway number = P3109A where:
      a. RP = conduit contains power
      b. 50CV30051 = equipment number
      c. A = letter to distinguish raceways to same equipment

C.

3.06 RACEWAY SCHEDULE

A. General:
   1. The Raceway Schedule is included in Section 26 06 20.23.

B. Unscheduled Raceway:
   1. With the exception of lighting, communication, paging, fire alarm, security and receptacle circuits, the type and size of raceway shall be as specified on the drawings or schedules.

2. Unscheduled lighting and receptacle raceways shall be sized by the Contractor in accordance with the NEC. Minimum size shall be 3/4 inch for exposed and 1 inch for embedded raceway.
3. The number and size of communication, paging, fire alarm, and security raceways shall be as required for the particular equipment provided subject to the minimum sizes specified herein.

C. Scheduled Raceway:
1. The size and type of raceway shall be as specified on the schedules.

D. RACESPEC Sheets
1. The following RACESPECS are included in this section:
a. EMT
b. FLEX
c. GRS
d. LFS
e. PGRS
f. LFS
g. PVC4
h. PVC8
i. TRAY

3.07 RACEWAY SPECIFICATION SHEETS (RACESPEC) - EMT– EMT

A. Raceway Identification:
1. EMT

B. Description:
1. Electrical Metallic Tubing

C. Compliance:
1. ANSI and UL

D. Finish:
1. Electro-galvanized steel

E. Minimum size:
1. 3/4 inch

F. Fittings:
1. Compression type.
2. Fittings inside concrete block (CMU) walls:
a. Concrete-tight.

G. Boxes:
1. Electro-galvanized sheet steel.

2. NEMA Class 1 stamped or form-bent steel with screw covers.

3.08 RACEWAY SPECIFICATION SHEETS (RACESPEC) – FLEX

A. Raceway Identification:
   1. FLEX

B. Description:
   1. Flexible Steel Conduit

C. Application:
   1. Final connection to equipment subject to vibration or adjustment.

D. Compliance:
   1. UL 1

E. Construction:
   1. Spirally wound galvanized steel strip with successive convolutions securely interlocked.

F. Minimum Size:
   1. 1/2 inch

G. Fittings:
   1. Compression type

H. Other:
   1. FLEX shall be provided with an internal ground wire.

3.09 RACEWAY SPECIFICATION SHEETS (RACESPEC) – GRS

A. Raceway Identification:
   1. GRS

B. Description:
   1. Galvanized Rigid Steel Conduit (GRS)

C. Compliance:
   1. ANSI and UL

D. Finish:
   1. Hot-dip galvanized after fabrication, inside and outside. Smooth finished surfaces.

E. Manufacturers:
   1. Allied Tube and Conduit Corp., Wheatland Tube Co., or equal.

F. Minimum size:
   1. Unless otherwise specified, 3/4 inch for exposed, 1 inch for embedded, encased, or otherwise inaccessible.

G. Fittings:
   1. Locknuts, Rings, Hubs:
      a. Hot-dip galvanized insulated throat with bonding locknut or ring,. The hubs shall utilize a neoprene "O" ring and provide a watertight connection. O-Z Gedney, CHM-XXT, or equal
   2. Unions:
      a. Electro-galvanized ferrous alloy type Appleton UNF or UNY, Crouse-Hinds UNF or UNY, or equal. Threadless fittings are not acceptable.
   3. Conduit Bodies:
      a. Oversized conduit bodies: Ferrous alloy type with screw taps for fastening covers to match the conduit system. Gaskets shall be made of neoprene.

H. Boxes:
   1. Indoor:
      a. Type FD cast ferrous for all device boxes and for junction boxes less than 6 inches square.
   2. Outdoor:
      a. Type FD cast ferrous for all device boxes and for junction boxes less than 6 inches square.
   3. Corrosive:
      a. NEMA 4X stainless steel or nonmetallic, as specified.
   4. Hazardous:
      a. NEMA Class 7 cast ferrous.

I. Elbows:
   1. 3/4" thru 1-1/2" –- Factory fabricated or field bent.
   2. 2" thru 6" –- Factory fabricated only.

J. Conduit Bodies (Oversized):
   1. 3/4" thru 4" –- Malleable iron, hot-dip galvanized, unless otherwise noted. Neoprene gaskets for all access plates. Tapered threads for conduit entrances.
   2. 5" and 6" –- Electro-galvanized iron or cast iron box.

K. Expansion Fittings:
   1. Expansion fittings in embedded runs shall be watertight with an internal bonding jumper. The expansion material shall be neoprene allowing for 3/4-inch movement in any direction.

L. Manufacturers:
   1. Appleton, Crouse-Hinds, Hubbell, O. Z. Gedney, or equal.

M. Installation:
   1. Rigid steel conduit shall be made up tight and with conductive thread compound. Joints shall be made with standard couplings or threaded unions. Steel conduit shall be supported away from the structures using hot-dip galvanized malleable iron straps with nesting backs or framing channel.

2. Conduit entering boxes shall be terminated with a threaded hub with a grounding bushing.
3. Exposed male threads on rigid steel conduit shall be coated with zinc-rich paint.

3.10 RACEWAY SPECIFICATION SHEETS (RACESPEC) – LFS

A. Raceway Identification:
   1. LFS

B. Description:
   1. Liquidtight Flexible Steel Conduit

C. Application:
   1. Final connection to equipment subject to vibration or adjustment.

D. Compliance:
   1. UL 360

E. Construction:
   1. Spirally wound galvanized steel strip with successive convolutions securely interlocked and jacketed with liquidtight plastic cover.

F. Minimum Size:
   1. 3/4 inch

G. Fittings:
   1. Cadmium-plated malleable iron body and gland nut with cast-in lug, brass grounding ferrule threaded to engage conduit spiral.
   2. O-ring seals around the conduit and box connection and insulated throat.
   3. Provide forty-five and ninety degree fittings where applicable.
   4. Provide PVC coated flexible conduit and fittings where the conduit system is PVC coated.

H. Installation:
   1. Length of flexible liquidtight conduit shall not exceed 15 times the trade diameter of the conduit and not exceed 36 inches in length. Use conductive thread compound.

3.11 RACEWAY SPECIFICATION SHEETS (RACESPEC) –- PGRS

A. Raceway Identification:
   1. PGRS

B. Description:
   1. Rigid Steel Conduit, Corrosion-Resistant, Polyvinyl Chloride (PVC) Coated.
   2. Provide factory made and coated elbows.

C. Compliance:
   1. ANSI, ETL and UL. The PVC coated rigid galvanized steel conduit shall be stamped with the ETL Verification Mark “ETL Verified to PVC-001”.

D. Finish:
   1. PGRS shall be hot-dip galvanized rigid steel conduit as specified in Section 26 05 33- paragraph 3.03 GRS, with a PVC Coating. The PVC coating shall be gray, minimum 40 mils thick, bonded to the outside and continuous over the entire length of the conduit except at the threads, and be free of blisters, bubbles, or pinholes. Thread protectors shall be used on the exposed threads of the PVC coated conduit.
   2. A 2-mil coat of urethane enamel coating shall be bonded to the inside. Coating shall be free of pinholes. Bond strength shall exceed the tensile strength of the PVC coat.

E. Minimum Size:
   1. 3/4 inch

F. Fittings:
   1. Similarly coated to the same thickness as the conduit and provided with Type 316 stainless steel hardware. Conduit and fittings shall be manufactured by the same company Conduit and fittings shall be coated by the same company. Male threads on elbows and nipples, and female threads on fittings or conduit couplings shall be protected by application of urethane coating.

G. Covers:
   1. PVC coated covers shall have V-groove seal and stainless steel hardware.

H. Hubs:
   1. Hubs for connection of conduit to junction, device, or terminal boxes shall be threaded cast ferrous alloy.
   2. Hubs shall have the same PVC coating as the conduit and insulating grounding bushings. Hubs shall utilize a neoprene "O" ring and shall provide a watertight connection.

I. Boxes:
   1. Nonhazardous:
      a. NEMA Class 4X stainless steel or nonmetallic.
   2. Hazardous:
      a. NEMA Class 7 cast ferrous.

J. Manufacturers:
   1. PVC coated conduit that bears the ETL Verified PVC-001 label by Robroy Industries, Plasti-Bond, Perma-Cote, KorKap or equal.

K. Installation:
   1. Plastic coated conduit shall be made up tight, threaded, and installed using tools approved by the PVC-coated conduit manufacturer.
   2. Exposed conduit threads shall be covered by a plastic overlap coated and sealed per manufacturer’s recommendations.

3. Pipe wrenches and channel locks shall not be used for tightening plastic coated conduits. Damaged areas shall be patched, using manufacturer's recommended material. The area to be patched shall be built up to the full thickness of the coating. Painted fittings are not acceptable.
4. PVC coated conduit shall be supported away from the structure using PVC coated conduit wall hangers or PVC coated conduit mounting hardware.
5. Damaged work shall be replaced

L. Training:
1. Installers shall be trained and certified in the proper installation techniques provided by the PVC-coated conduit system manufacture. Proof of certification shall be provided under paragraph 1.03.

3.12 RACEWAY SPECIFICATION SHEETS (RACESPEC) – PVC4

A. Raceway Identification:
1. PVC4

B. Description:
1. Rigid Nonmetallic Conduit.

C. Application:
1. Heavy wall thickness for direct bury, concrete encasement or surface mounting where not subject to physical damage.

D. Compliance:
1. NEMA TC2, UL 651

E. Construction:
1. Schedule 40, high-impact, polyvinylchloride (PVC)

F. Minimum size:
1. 3/4 inch exposed; 1 inch embedded or encased

G. Fittings:
1. PVC solvent weld type

H. Boxes:
1. Indoor:
   a. NEMA Class 4, nonmetallic
2. Outdoor and corrosive:
   a. NEMA Class 4X, nonmetallic

I. Installation:
1. PVC conduit entering fiberglass boxes or cabinets shall be secured by threaded bushings on the interior of the box and shall be terminated with a threaded male terminal adapter having a neoprene O ring.
2. Joints shall be made with standard PVC couplings.

3. PVC conduit shall have bell ends where terminated at walls and boxes.

3.13 RACEWAY SPECIFICATION SHEETS (RACESPEC) – PVC8

A. Raceway Identification:
   1. PVC8

B. Description:
   1. Rigid Nonmetallic Conduit

C. Application:
   1. Extra heavy wall thickness for locations including direct bury under roadways where not exposed to traffic damage and surface mounted in corrosive areas.

D. Compliance:
   1. NEMA TC2, UL 651

E. Construction:
   1. Schedule 80, high-impact, polyvinylchloride (PVC)

F. Minimum Size:
   1. 3/4 inch exposed; 1 inch embedded or encased

G. Fittings:
   1. PVC solvent weld type

H. Boxes:
   1. Indoor:
      a. NEMA Class 4X, nonmetallic
   2. Outdoor and corrosive:
      a. NEMA Class 4X, nonmetallic

I. Installation:
   1. Exposed PVC conduit shall be run on supports spaced:
      a. 3 feet apart for conduits up to 1 inch.
      b. 5 feet apart for conduits 1-1/4 inches to 2 inches.
      c. 6 feet apart for conduits 2 1/2 inches and larger.
      d. PVC conduit not provided where damaged by heat.
      e. eBell ends where terminated at walls, boxes and electrical cabinets and control panels.

3.14 RACEWAY SPECIFICATION SHEETS (RACESPEC) – TRAY

A. Raceway Identification:
   1. TRAY

3.15 TRAY

A. Description:
   1. Cable Tray: Ladder type with rungs and side rails.
   2. Cable Tray Covers: No
   3. Bottom to side rail connections shall be positive mechanical joints to assure lateral and longitudinal stability.
   4. Steel:
      a. Pre-Galvanized, ASTM-A-924, indoor.
   5. Steel:
      a. Hot Dip Galvanized post fabrication, ASTM-123, outdoor.
   6. Stainless Steel:
      a. Type 304 per ASTM-A-240.
   7. Aluminum:
      a. AA-6063-T6.

B. Application:
   1. As shown on the drawings.

C. Compliance:
   1. NEMA VE-1

D. Loading and Deflection Requirements:
   1. The trays shall be designed and constructed to support a uniformly distributed load when tested as a single span, simple beam:

NEMA Load/Span Designation:

Class	Support Span Feet	Working Load (lbs/linear feet)
8A	8	50
8B	8	75
8C	8	100
12A	12	50
12B	12	75
12C	12	100
16A	16	50
16B	16	75
16C	16	100
20A	20	50
20B	20	75
20C	20	100

E. Dimensions:
   1. Width and depth shall be as specified or shown.

Width	Loading Depth (lbs/linear feet)			
(inch)	3”	4”	5”	6”
6	22	29	36	44
12	44	58	72	88
18	65	87	108	130
24	88	116	144	175
30	108	144	180	216
36	130	174	216	260

F. Finish:
   1. For steel cable tray:
   2. Hot-dip galvanized after fabrication with smooth finished surfaces.

G. Accessories:
   1. Fittings, barriers and covers shall be of the same materials, finish and construction as the straight tray products.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 36

CABLE TRAYS FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. SCOPE: This Section covers the furnishing and installation of cable trays. Cable trays shall be provided where shown on the Drawings, for lighting, receptacles, power, control, instrumentation, signaling and grounding systems. Fire alarm circuits may not be run in cable tray. For Communication systems see Section 27 05 36.

1.02 QUALITY ASSURANCE

A. REFERENCE STANDARDS:

1. This Section incorporates by reference the latest revisions of the following documents. They are part of this Section insofar as specified and modified herein. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect on the effective date of the Agreement. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

Reference	Title
NEMA VE 1-1998	Metallic Cable Tray Systems
NEMA VE 2-2000	Cable Tray Installation Guidelines
NFPA 70	National Electrical Code (NEC)
UL	Underwriters Laboratories, Inc.
IBC	International Building Code

B. SHIPMENT AND STORAGE:

1. Materials and equipment shall be stored in a manner to keep them dry and clean. Equipment and materials to be located indoors shall be stored indoors and sealed with plastic film wrap. Electrical and electronic equipment found stored or staged outdoors over night or in inclement weather shall be considered grounds for equipment rejection and shall be replaced at Contractor's expense

1.03 SUBMITTALS

A. PROCEDURES: Section 01 33 00.

B. ACTION SUBMITTAL ITEMS FOR THIS SECTION:

1. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations from Section requirements.

2. Catalog cuts of equipment, devices, and materials installed under this section. Catalog information shall include technical specifications and application information, including electrical ratings, dimensions, weight, etc. Catalog cuts shall be edited to show only the items, model numbers, and information which apply.

1.04 DESIGN OF CABLE TRAY SYSTEMS

A. GENERAL: The tray system layout may be coordinated with the piping submittals to reflect the coordination of the layout of these systems. The professional engineering services for the piping systems may provide the engineering services for cable trays structural supports called for in this Section.

B. PROCEDURES: In addition to materials and labor required to construct cable tray systems, Contractor shall provide professional engineering services ("design professional") for the design and inspection of cable tray systems work. The Contractor shall provide the final design, inspection, and certification for the tray supports and seismic restraints on this project meeting the requirements of specification section 01 73 24.

C. QUALIFICATIONS: The design of tray supports and seismic restraints shall be the product of a professional engineer retained by the Contractor and currently licensed to practice in the state of Washington. The design professional shall have not less than five years experience in the type of cable tray support, and seismic restraint design work required for this project. This requirement, however, shall not be construed as relieving the Contractor of overall responsibility for this portion of the work. Documentation demonstrating qualifications and insurance shall be submitted.

D. Coordination with Drawings and Specifications: If a particular type of support, anchor, seismic restraint, or expansion element is detailed on the Drawings, those elements shall be incorporated into the Contractor's design. Cable tray system submittals by the Contractor shall include all elements, including unscheduled trays.

E. Coordination with Cable Installation Requirements: The tray system design shall be coordinated with the cable installation means to insure that the cables can be installed without exceeding the cable manufacturer's limits for pulling tensions, sidewall pressures and minimum bending radii.

F. Usage for Unscheduled Cables:
   1. Unscheduled cables are those that are required per the specifications but are not listed in the cable schedules. See Section 26 05 19 for further description of unscheduled cables.
   2. Only multi-conductor type cables shall be used in cable trays.
   3. Any unscheduled wiring to be installed in trays must meet Section 26 05 19 requirements for cables in trays and must be submitted for review by the Owner. Review submittal shall include revised cable tray schedule and fill calculations.
   4. The Contractor shall assume that scheduled cable trays have 25 percent of their total available NEC capacity available for use for unscheduled wiring. **No tray shall be filled to more than 75 percent of its maximum allowable capacity including scheduled and unscheduled cables.**

5. The Contractor may partition trays to create space for cabling that needs to be partitioned per the NEC under the following conditions:
    a. The partitioned spaces leave at least 50 percent capacity for future cables in each partitioned space.
    b. A tray shall not have more than two partitioned spaces.
    c. The tray partitions are submitted for review and approved by the Owner.
    d. Tray transitions “over-passes” are included in the installation.
6. Contractor shall provide wider trays than those scheduled in the specified tray schedules when the desired usage for unscheduled wiring exceeds the allowable capacity for existing tray sizes in the trays schedules. Wider trays shall be submitted for review along with documentation that verifies that they do not exceed 75 percent of maximum allowable tray capacity and that the wider trays do not adversely impact the accessibility and clearance to and around trays and to other equipment or systems.
7. Contractor shall provide marked up cable and tray schedules reflecting the circuits added to the trays.
8. Lighting panel circuits for lights and receptacles can be installed in CTP trays as multi-conductor cables.
9. HVAC Division 23 controls and signals wiring can be installed in trays per the following:
    a. 24V and 120V controls wiring can be installed in the CTC trays if the control circuits are Class 1 remote control and signaling rated, and armored multi-conductor wiring is used, that meets the specified requirements of Division 26.
    b. HVAC communications wiring can be installed in the CTS trays if the circuits are Class 2 rated and armored multi-conductor cabling is used that meets the specified requirements of Section 26 05 23.
10. Unscheduled cabling for other systems shall be in accordance with the above requirements and the guidelines specified in Section 26 05 19.

PART 2 PRODUCTS

2.01 CANDIDATE MANUFACTURERS/PRODUCTS

A. Candidate manufacturers and models are listed below. To conform with specified requirements, the manufacturer’s standard product may require modification.
    1. Cooper B-Line
    2. MP Husky
    3. Cablofil
    4. Approved Equal

2.02 GENERAL

A. CABLE TRAY SECTIONS AND COMPONENTS:
    1. Cable tray systems are defined to include, but are not limited to straight sections of ladder type cable trays, bends, tees, elbows, trough drop-outs, barriers, clamps, brackets, hanger rods, splice plate connectors, expansion joint assemblies, fittings, supports and accessories.

2. Provide aluminum cable trays, of types, classes, and sizes indicated; with splice plates, bolts, nuts and washers for connecting units. Construct units with rounded edges and smooth surfaces; in compliance with applicable standards. Cable tray shall be installed according to the latest revision of NEMA VE-2.

B. TYPE OF TRAY SYSTEM:
   1. Cable Trays specified in RACESPEC category CT shall be ladder type and shall consist of two 6 inch tall longitudinal members (side rails) with transverse members (rungs) mechanically fastened to the side rails. Rungs shall be spaced 6 inches on center. Rung spacing in radiused fittings shall be industry standard 9" and measured at the center of the tray's width. Rungs shall be capable of easy removal, reinstallation, or replacement if necessary.
   2. Cable tray loading depth shall be 5 inches per NEMA VE-1.
   3. Straight sections shall be supplied in standard 10 foot (3 meters) lengths.
   4. Cable tray widths shall be 12, 24, and 36 inches as shown on drawings.
   5. Splice plates shall have 4 nuts and bolts per plate. The resistance of fixed splice connections between adjacent sections of tray shall not exceed 0.00033 ohms. Splice plates shall be furnished with straight sections and fittings.
   6. All fittings shall have a minimum radius of 12 inches.

C. CENTERRAIL TRAY SYSTEM: Cable Trays specified in RACESPEC category CTCR shall be constructed of a main single center rail with single rungs attached to the center rail as specified in RACESPEC CTCR. Refer to standard details for application and use.

PART 3 EXECUTION

3.01 INSTALLATION

A. Cable trays shall be supported at intervals not to exceed 5 feet.

B. Corners shall be supported by two supports installed as close as possible to the corner, with one support on each side of the corner.

C. All field cuts shall be treated with zinc rich paint.

D. Expansion joint splice plates shall be used to allow 1-1/2-inch free movement between adjacent trays when crossing building expansion joint.

E. Cable tray shall have minimum clearance of 3/4 inch from concrete surfaces and minimum spacing of 12 inches from other trays. The top of the tray shall be minimum 9 inches from the ceiling.

F. Each cable tray shall be grounded per 26 05 26. The ground conductor shall be attached to the outside of each tray section using UL Listed bolted bronze or brass ground clamp.

G. Cables shall be arranged in trays so as to provide minimum cross-over.

H. When required, and to provide an area free of center rails for cable transitions, contractor shall install a universal fitting. The universal fitting, B-Line U6A-xx Series, which can be used with cable ties and allows the rails to be connected so that they may be pivoted at connection points.

I. Ensure center-supported cable tray will withstand any off-balanced loading that may be created when installing cables. Follow cable tray manufacturer's recommendations on stabilizing methods.

J. Non-armored, CT rated cables shall transition from tray to conduit via listed cable tray conduit clamps, Cooper LCC Series or equal.

3.02 NUMBERING

A. Cable trays shall be identified by stencils at intervals not exceeding 50 feet, at intersections, and at each end.

3.03 TESTING

A. In addition to any testing herein, perform all testing for this product or system consistent with the requirements of Section 26 08 00, the applicable codes, and the manufacturers' current quality assurance program.

B. Test cable trays to ensure electrical continuity of bonding and grounding connections, and to demonstrate compliance with specified maximum grounding resistance. See NFPA 70B for testing and test methods.

C. Manufacturer shall provide test reports witnessed by an independent testing laboratory of the "worst case" loading conditions outlined in this specification and performed in accordance with the latest revision of NEMA VE-1; including test reports verifying rung load capacity in accordance with NEMA VE-1 Section 5.4.

3.04 CABLE TRAY SUPPORT INSPECTION

A. The Contractor shall cause the design professional retained under the provisions of this Section to inspect the installation of the cable tray supports and seismic restraints provided under this Contract. The design professional shall be at the site of the work during the installation work and shall provide the Owner with weekly reports indicating progress of the work.

B. The Owner will provide special inspection in accordance with Section 01 45 33 for certain cable tray seismic anchorage and bracing systems as shown on the Drawings.

C. Upon completion of construction, but prior to beneficial occupancy of the cable tray systems by the Owner, the design professional shall conduct a detailed final inspection and furnish the Owner with a final report certifying, without qualification, that all work has been accomplished in accordance with applicable requirements. All reports shall bear the design professional's seal and signature in accordance with the laws, rules, and regulations of the regulatory authority.

3.05 RACESPEC SHEETS

A. The following RACESPECS are included in this section:
   1. CT - Ladder Cable Tray
   2. CTCR – Low Voltage Information Technology Tray

3.05 RACEWAY SPECIFICATION SHEETS (RACESPEC)

Raceway Identification:	CT
Description:	Cable Tray
Compliance:	NEMA VE-1, 20B, 16C
Loading and deflection requirements	The tray system shall be designed and constructed to support a uniformly distributed load of 50 pounds per linear foot with a maximum deflection of 0.57 inch when tested as a single 10 foot span, simple beam. The NEMA VE-1, 20B, 16 thickness shall be maintained to ensure that the system is rigid against impact velocity (wind loading) and aerodynamic effects on the tray.
Finish:	Copper-free aluminum, Alloy 6063-T-6 (side rails, rungs and splice plates), Alloy 5052-H32 (covers and accessories except where 316 Stainless Steel is specified)
Manufacturers:	Cooper, B-Line Series 35, Burndy, Globe
Size:	5-inch minimum interior depth. 6-inch outside height. Rung spacing shall be 6-inch.
Fittings:	Splice plates, elbows, risers, tees, crosses, Y, reducer plates, blind ends, barrier strips, radiused dropouts, divider strips coated with the same finish as the cable tray. Where the cable exits the tray over the edge a cushioned conduit strap or clamp shall be used. Superstrut A-716 or U716 series, or equal. Where the cable requires vertical support in tray, a cushioned conduit strap shall be used. Superstrut A-716 series, or equal. Miscellaneous fittings and accessories shall be as provided as required. These fittings and accessories are shown in the cable tray manufacturer catalog. Fittings, when not available in aluminum, shall be 316L S.S.
Barrier	Separate the power cables, control, and signal cables where shown in the drawings. Barriers shall be manufactured with copper-free aluminum, Alloy 6063-T-6

3.05 RACEWAY SPECIFICATION SHEETS (RACESPEC)

Raceway Identification:	CT (continued)
Cover:	Where shown on drawings, provide ventilated flanged covers (B-Line 81-7-A-40-xx—xx, or equal) for all trays, use heavy duty wrap around clamps. Provide three clamps per cover. The threaded fasteners shall be treated with a resin that is specifically design to prevent the nut from working loose due to vibration, such as Loctite 242, Blue, or equal. The covers shall be overlapped at expansion joints to eliminate cover buckling. Where tray covers do not line up such as around the digester, provide field shaped flashing made out of marine-grade aluminum to cover the gap so that the cable is protected from the weather. Rivet the flashing in place.
Cable tray hold-down clamps:	316L stainless steel
Installation:	The cable tray shall be installed in accordance with the manufacture's instructions and the Cable Tray Manual as published by Cooper B-Line that is based on the latest edition of the National Electrical Code. Cable shall be fastened to the cable tray rungs every 6 feet and on both side of the turns with UV resistant plastic ties. Cables shall be supported on the vertical runs so that the weight of the cable is distributed throughout the run and not at the bend from horizontal. Appropriate cable clamps shall be used to securely fasten each cable to the cable tray. The cable shall exit the bottom of the covered tray and shall be supported an appropriate conduit fitting. Where the cable tray is installed around the perimeter of the digester, the contractor shall install short straight pieces (less than 10 foot long) of tray connected together with horizontal adjustable splice plates (B-Line Series 9A-103 or equal) to curve around the perimeter of the digester.

3.05 RACEWAY SPECIFICATION SHEETS (RACESPEC)

Raceway Identification:	CT (continued)
Grounding:	The cable tray have an equipment grounding conductor installed the entire length of the tray. The equipment grounding conductor shall be a bare #2/0 AWG copper conductor. The conductor shall be grounded to alternate sections of cable tray using a tin or zinc-plated ground clamp. The copper connection shall be coated with a joint compound such as Pentox "A" (Burndy) and Alnox (Alcoa). The tray grounding conductor shall be attached to the tray using a cable tray grounding conductor clamp. Appleton Type TCGC (or equal). Bonding jumpers shall be provided at expansion joints, discontinuities, and around adjustable splice plates.

3.05 RACEWAY SPECIFICATION SHEETS (RACESPEC)

Raceway Identification:	CTCR
Description:	Center Rail Power and Signal Cable Tray
Compliance:	NEMA VE-1, 20B, 16C
Loading and deflection requirements	The tray system shall be designed and constructed to support a uniformly distributed load of 50 pounds per linear foot with a maximum deflection of 0.57 inch when tested as a single 10 foot span, simple beam. The NEMA VE-1, 20B, 16 thickness shall be maintained to ensure that the system is rigid against impact velocity (wind loading) and aerodynamic effects on the tray.
Construction:	Cable trays shall be constructed of a center rail 1.625 x 3.250 inches with minimum section properties of Sx = 0.701 in^3 and Ix = 1.174 in^4. Rungs shall be a single continuous square tube 0.54 x 0.54 inches with radiused corners and minimum section properties of Sx = 0.019 in^3 and Ix = 0.005 in^4. Rungs shall be mechanically connected to the center rail in at least two places, symmetrical about the center rail, with ends finished to protect installers and cables.
Materials and Finish:	Aluminum: Center rails and rungs shall be extruded from Aluminum Association Alloy 6063. All fabricated parts shall be made from Aluminum Association Alloy 5052. All hardware and fasteners shall be zinc-plated steel in accordance with ASTM B633)
Manufacturers:	Cooper, B-Line Centerline Series , Data Rack; Cablofil Center Spine; Burndy; Globe.
Size:	5-inch minimum interior depth. 6-inch outside height. Rung spacing shall be 6-inch.
Fittings:	Splice plates, elbows, risers, tees, crosses, Y, reducer plates, blind ends, barrier strips, radiused dropouts, divider strips coated with the same finish as the cable tray. Where the cable exits the tray over the edge a cushioned conduit strap or clamp shall be used. Superstrut A-716 or U716 series, or equal. Where the cable requires vertical support in tray, a cushioned conduit strap shall be used. Superstrut A-716 series, or equal.

3.05 RACEWAY SPECIFICATION SHEETS (RACESPEC)

Raceway Identification:	CTCR (continued)
	Miscellaneous fittings and accessories shall be as provided as required. These fittings and accessories are shown in the cable tray manufacturer catalog. Fittings, when not available in aluminum, shall be 316L S.S.
	All splices and connectors must protect cables from the edges of the center rail and act as a barrier to prevent the center rail from transmitting hazardous gases or smoke; hardware must be installed vertically so as not to interfere with the cables in the cable fill area.

SECTION 26 05 74

ARC FLASH HAZARD ANALYSIS, SHORT CIRCUIT STUDY

AND PROTECTIVE DEVICE COORDINATION REPORT

PART 1 GENERAL

1.01 DESCRIPTION

A. General:
   1. This section specifies that the Contractor subcontract an independent full member NETA Engineering and Study Firm / Testing Firm to prepare:
      a. Electrical equipment short circuit study (SCS) all facility new and existing equipment.
      b. Existing equipment includes:
         1) Operations Building Transfer switch and MCC
         2) Clarifier Electrical Panels
      c. Protective device coordination study (PDCS) report for all equipment in the treatment building electrical distribution power system.
      d. Arc flash hazard analysis (AFHA) and labeling for the new equipment being installed.

B. The Testing Firm shall be as described in Section 26 08 00 and shall also be responsible for the electrical testing described therein.

C. Scope:
   1. The Short Circuit and Protective Device Coordination Report shall include analysis including Utility Company equipment that affect the installed equipment's short circuit ratings, protective device ratings and protective device settings.
   2. Report shall also include analysis of the equipment's short circuit ratings, protective device ratings and protective device settings affected by the installed equipment.
   3. Report shall include the results of the arc flash hazard analysis study for energized electrical equipment in accordance with the methods outlined in IEEE Standard 1584 and stated hereinafter.
   4. Work shall include the fabrication of warning labels with the arc flash hazard analysis results and the installation of the labels on the equipment in accordance with NFPA 70E Article 130.5 that includes nominal system voltage, arc flash boundary, and at least one of the following: Available incident energy and corresponding working distance or the arc flash personnel protective equipment (PPE) level but not both, the minimum arc rating of clothing, site specific level of PPE.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
IEEE 141	Recommended Practice for Electric Power Distribution for Industrial Plants
IEEE 242	Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems
NETA ATS	Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems
NFPA 70E	Standard for Electrical Safety in the Workplace
NFPA 70	National Electrical Code

1.03 SCHEDULE

A. The report shall be completed, submitted to the Construction Manager for acceptance and reworked to include the Construction Manager comments and corrections, as required. The report shall be approved by the Construction Manager prior to purchase and fabrication of electrical equipment including switchgear.

B. A copy of the Construction Manager accepted report shall be sent by the Contractor to all affected manufacturers prior to fabrication.

1.04 SUBMITTALS

A. The report specified in this Section shall be provided in accordance with Section 01 33 00.

PART 2 PRODUCTS

2.01 REPORT

A. The product shall be a certified report summarizing the short circuit and coordination study and conclusions or recommendations which may affect the integrity of the electric power distribution system. As a minimum, the report shall include the following:
   1. The equipment manufacturer's information used to prepare the study.
   2. Power Utility Company system information applicable to the project.
   3. Short circuit calculations listing short circuit levels at each bus. Provide a sketch of the bus and use both the project term and the bus-code-name to identify the bus, branches, sources, loads. Base the system on the Project One-Line diagram.
   4. Coordination study time-current curves including the instrument transformer ratios, model numbers of the protective relays, and the relay settings associated with each breaker.

5. Comparison of short circuit duties of each bus to the interrupting capacity of the equipment protecting that bus.
6. Data used as input to the report that includes cable impedances, source impedances, equipment ratings for the equipment being purchased for the project, etc.
7. Arc flash hazard calculations listing incident energy levels at each bus.
8. Copy of the Arc flash warning labels displaying information in accordance with NFPA 70e requirements.
9. Assumptions made during the study.

PART 3 EXECUTION

3.01 GENERAL

A. Provide a short circuit and coordination study on the electrical power distribution system as specified and as described in Section 6.1 of NETA ATS. The studies shall be performed in accordance with IEEE Standards 141 and 242 and shall utilize the ANSI method of short circuit analysis in accordance with ANSI C37.010.

B. The studies shall be performed using actual equipment data for both existing and new equipment. The coordination study shall use the data from the same manufacturer of protective relay devices as being provided by the switchgear manufacturer.

C. For new equipment, the Contractor shall provide copies of final reviewed equipment submittals upon request by the Study Firm.

D. For existing equipment, the Study Firm shall provide three separate one man-day trips of onsite investigation to identify loads and power distribution equipment data.

E. Any power distribution equipment outages shall be scheduled in advance and coordinated with the Owner to limit process outages as required per plant process capacities, refer to Section 01 14 19 and Section 26 05 00.

3.02 QUALIFICATIONS

A. The short circuit and coordination report shall be performed by the Study Firm/ Testing Firm as described in Section 26 08 00. The studies shall be signed by the professional electrical engineer responsible for the studies and registered to practice engineering in the state in which the project is located.

3.03 SHORT CIRCUIT STUDY

A. The Contractor shall be responsible to obtain and verify all data needed to perform the study. As a minimum, the short circuit study shall include the following:
   1. One-Line Diagram
      a. Location and function of each protective device in the system, such as relays, direct-acting trips, fuses, etc.
      b. Type designation, current rating, range or adjustment, manufacturer's style and catalog number for all protective devices.

c. Power, voltage ratings, impedance, primary and secondary connections of all transformers.
d. Type, manufacturer, and ratio of all instrument transformers energizing each relay.
e. Nameplate ratings of all motors and generators with their subtransient reactances. Transient reactances of synchronous motors and generators and synchronous reactances of all generators.
f. Sources of short circuit currents such as utility ties, generators, synchronous motors, and induction motors.
g. circuit elements such as transformers, cables, breakers, fuses, reactors, etc.
h. Emergency as well as normal switching conditions, as applicable.
i. The time-current setting of existing adjustable relays and direct-acting trips, as applicable.

B. Calculations
1. Determine the paths and situations where short circuit currents are the greatest.
2. Study shall address bolted faults and calculate the 3-phase and line-to-ground short circuits of each case.
3. Calculate the maximum and minimum fault currents.

3.04 ARC FLASH HAZARD ANALYSIS

A. The Contractor shall be responsible to obtain and verify all data needed to perform the study. The arc flash analysis study shall include the following IEEE Standard 1584 nine step analysis process:
1. Collect system and installation data.
2. Determine modes of operation.
3. Determine bolted fault current.
4. Determine arc fault current.
5. Determine protective device characteristic and arc fault duration.
6. Document system voltages and equipment class.
7. Select working distances.
8. Calculate incident energy.
9. Calculate the arc flash protection boundary.

3.05 PROTECTIVE DEVICE COORDINATION STUDY

A. As a minimum, the coordination study for the power distribution system shall include the following on 5-cycle, log-log graph paper:
1. Time-current for each protective relay or fuse showing graphically that the settings will provide protection and selectivity within industry standards. Each curve shall be identified, and the complete protective relay settings shall be specified.
2. Time-current curves for each device shall be positioned to provide for maximum selectivity to minimize system disturbances during fault clearing. Where selectivity cannot be achieved, the Construction Manager shall be notified as to the cause.
3. Time-current curves and points for cable and equipment damage.

4. Circuit interrupting device operating and interrupting times.
5. Indicate maximum fault values on the graph.
6. Sketch of bus and breaker arrangement.

3.06 IMPLEMENTING PDCS SETTINGS AND ARC FLASH SIGN INSTALLATION

A. The Study Firm/Testing Firm shall work with the Contractor to implement the protective device coordination study settings on new and existing equipment as required in Section 26 08 00, based on the Engineers accepted Protective Device Coordination Report specified herein and submit a final amended report of the Record As-Built electrical equipment protective device settings subsequent to start-up and testing.

B. The Study Firm/Testing Firm shall work with the Contractor for implementing the Arc Flash Hazard warning labels installation requirements for electrical equipment as specified in NEC Article 110.16 Arc-Flash Hazard Warning , and NFPA 70E requirements.

SECTION 26 06 20.23

ELECTRICAL CIRCUIT SCHEDULE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies the raceway schedule for conduits, wireways, and cable trays specified in Section 26 05 33.

B. Definitions:
   1. The raceway schedule contains the following information:
      a. Raceway Number:
         1) A unique number assigned to a single raceway.
      b. From and To:
         1) The equipment designations at which the raceway ends are terminated.
      c. Type:
         1) Type of raceway defined by the RACESPEC sheets and specified in Section 26 05 33.
      d. Size:
         1) Nominal trade size of raceway.
      e. Voltage:
         1) Voltage level of cables included in the raceway.
      f. Contains:
         1) List of cables routed through the referenced raceway.
      g. Reference Drawing:
         1) A plan drawing on which the raceway is shown. A single raceway may pass through area shown on other drawings than the one referenced.

PART 2 PRODUCTS – NOT USED

PART 3 EXECUTION

3.01 SCHEDULE

A. The raceway schedule consists of the following:

SECTION 26 06 20.24

ELECTRICAL CABLE SCHEDULE

PART 1 GENERAL

1.01 DESCRIPTION

A. Specifies the cable schedule for conductors and cables specified in Sections 26 05 19 and 26 05 13.

B. Schedule contains the following information:
   1. Cable number:
      a. A unique number assigned to a cable or group of conductors associated with a single piece of equipment and with the same from and to location.
   2. From and to the equipment designations in which the location cable is terminated at each end.
   3. Type of conductor and insulation defined and specified in the CABLESPEC sheets in Sections 26 05 19 and 26 05 13.
   4. Number of conductors, pairs, triads, and/or multiconductor cables.
      a. C = Conductors
      b. PR = Pair
      c. TR = Triad
   5. Cond Size:
      a. Size of each current carrying conductor in AWG or kCMIL.
   6. Grd Size:
      a. Size of the grounding conductor included in the cable.
   7. Via list of raceways through which the cable is routed between the From and To location of the utilization equipment.

1.02 CABLE NUMBERING

A. Cable numbers are prefixed for one or more of the following functions:

Cable prefix	Type of function
CC	Control and/or 120V or less power
CP	Power 208V to 600V
CS	Low level signal (less than 90V) communication or less than 30V instrumentation

B. Prefixes are followed by a three- or four-digit number. Where there is more than one cable associated with particular piece of equipment, a letter suffix may be added to distinguish the cables.
   1. Example:
      a. Cable number = CP30DS20010

2. Where:
    a. CP = power cable
3. 30 = 2 Digit area number
4. DS20010 = Equipment number
5. A = Letter to distinguish cable from other cables associated with the same equipment.

PART 2 PRODUCTS – NOT USED

PART 3 EXECUTION

3.01 CABLE SCHEDULE

A. The cable schedule consists of the following:

END OF SECTION

SALT LAKE CITY DEPT. OF PUBLIC UTILITIES
CITY CREEK TREATMENT PLAN UPGRADES
BRIC PACKAGE

Cable Schedule

SECTION 26 08 00

COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. The electrical equipment and conductors to be tested are specified herein and shown on the electrical drawings of the Contract Documents.
2. The Contractor shall retain an independent InterNational Electrical Testing Association (NETA) member Engineering and Testing Firm (Testing Firm) for specified on-site acceptance testing of the project electrical power distribution system and utilization equipment covered by this contract.
3. The Testing Firm shall be responsible for the Short Circuit and Protective Device Coordination Report as specified in Section 26 05 74. The Testing Firm shall verify the protective device settings are implemented in accordance with Section 26 05 74. The Testing Firm work includes the ARC-Fault equipment labeling work as specified in Section 26 05 74.
4. Tests performed by the Testing Firm shall be witnessed by the Owner's Representative. Provide the Construction Manager 30-day advanced notice for Testing Firm tests. Insulation tests by the Contractor typically will not be witnessed. Critical equipment witness testing may be requested by the Construction Manager.
5. The manufacturer of the electrical equipment supplied for the project shall complete their on-site factory inspection, testing, and setup prior to the Testing Firm's Acceptance Testing and subsequent Protective Device setting verification work. The power monitors shall be set up by the factory representatives and power monitor readings and settings verified by the Testing Firm. Manufacturer work is specified in the respective equipment sections.
6. The Installation Contractor shall test motors, conductors, and equipment as specified and shown. Contractor shall provide the labor, tools, material, including quality power sources required by the Testing Firm equipment, and other services necessary to provide specified tests and retesting.
7. Submit proposed electrical test procedures for tests to be performed by the Installing Contractor, other than insulation resistance testing, and proposed test procedures for tests to be performed by the Testing Firm.

1.02 QUALITY ASSURANCE

A. References

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/NETA ATS	International Electrical Testing Association (NETA) - Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems

B. Testing Firm:
   1. The Testing Firm and their proposed project team shall possess the following minimum qualifications:
      a. Testing Firm shall be an independent testing organization providing unbiased testing authority, professionally independent of the manufacturers, suppliers, and installers of equipment or systems to be evaluated.
      b. Testing Firm shall be regularly engaged in the testing of electrical equipment, devices, installations, and systems.
      c. Testing Firm shall be a “NETA Accredited Company” of the InterNational Electrical Testing Association (NETA providing testing in accordance with ANSI/NETA ATS published specifications or the pre-approved firms that use the NETA methods and published testing specifications.
      d. If firm's own published testing specifications are proposed, then submit a copy to the Engineer for acceptance and submit the qualifications of the testing staff.
      e. Testing Firm's lead technical person shall be currently certified by NETA or the National Institute for Certification in Engineering Technologies (NICET) in electrical power distribution systems testing. Submit proof of technical training and certification for performing testing work.
      f. Testing Firm's technicians shall be regularly employed, qualified testing staff.
      g. The following are pre-qualified Testing Firms:
         1) Emerson Electrical Reliability Services
         2) Power Systems Testing Co.

C. Testing Firm Qualifications:
   1. For any Testing Firm not pre-qualified, the Contractor shall receive Construction Manager approval of the proposed Testing Firm, their proposed project team, and their test procedures prior to the Pre-Test Submittals.
      a. Project Team:
         1) Identify lead technical person and testing staff and provide documentation of training and experience demonstrating compliance with the qualifications specified.

b. Testing Firm:
   1) Provide reference names and current phone numbers of the Owner, Contractor, Engineer, or Construction Manager that has knowledge of the Firm's work:
      a) Three projects for Owner completed within the past four years, or
      b) Three projects for Brown and Caldwell completed within the past four years, or
      c) Provide references for five recent projects that were completed within the last four years. Provide a description of the scope of the referenced project.

c. For Testing Firm's experience to be judged acceptable, the Contractor shall demonstrate that the proposed Testing Firm's reference projects are of similar scope and size to this project, and in performing these projects the following has been achieved:
   1) Testing Firm's work did not delay the projects or adversely impact the progress of the Contractor's work or the Owner's project.
   2) Specified requirements were achieved.
   3) Work was performed in accordance with ANSI/NETA ATS, MTS, or other Engineer accepted testing criteria.
   4) Submittals approved with two or fewer re-submittals after the initial submittal.
   5) No warranty claims related to the Testing Firm's work.

d. Provide documentation demonstrating NETA Accreditation and compliance with the qualification specified.

1.03 SUBMITTALS

A. Contractor shall submit the following information in accordance with specification Section 01 33 00:

B. Testing Firm Qualifications:
   1. For any Testing Firm not pre-qualified per paragraph 1.02 Testing Form, submit qualifications per paragraph 1.02 Testing Firm Qualifications.

C. Pre-Test Submittals:
   1. Description or samples of specified test procedures.
   2. Sample test report forms for the specified tests.
   3. Preliminary Schedule listing equipment to be tested.
   4. Notification form for the work scheduled.
   5. Pre-Functional test procedures and testing schedule.
   6. Functional test procedures and testing schedule.

Form No.	Title
26 05 00-A	Wire and Cable Resistance Test Data Form
26 05 00-B	Installed Motor Test Data Form
26 05 00-C	Dry Transformer Test Data Form
26 05 00-D	Motor Control Center Test Form

Form No.	Title
26 05 00-E	Medium Voltage Motor Starter Test Form
26 05 00-F	Medium Voltage Switchgear Test Form
26 05 00-G	Protective Relay Test Form
26 05 00-H	Low Voltage Switchgear Test Form
26 05 00-I	Medium Voltage Load Interrupter Switch Test Form
26 05 00-J	Liquid-Filled Transformer Test Form
26 05 00-K	Automatic Transfer Switch Test Form
26 05 00-L	Neutral Grounding Resistor Test
40 61 13-A	Loop Wiring and Insulation Resistance Test Data Form
40 61 13-B	Control Circuit Piping Leak Test Form
40 61 13-C	Controller Calibration Test Data Form
40 61 13-D	Panel Indicator Calibration Test Data Form
40 61 13-E	Recorder Calibration Test Data Form
40 61 13-F	Signal Trip Calibration Test Data Form
40 61 13-G	Field Switch Calibration Test Data Form
40 61 13-H	Transmitter Calibration Test Data Form
40 61 13-I	Miscellaneous Instrument Calibration Test Data Form
40 61 13-J	Individual Loop Test Data Form
40 61 13-K	Loop Commissioning Test Data Form

D. Post-Test Submittals:
   1. Completed Section 01 99 90 Test Records:
      a. Wire and Cable Resistance Test Data Form: 26 05 00-A
      b. Installed Motor Test Form: 26 05 00-B
      c. [Dry Transformer Test Data Form: 26 05 00-C]
      d. [ ]
   2. Test Reports specified in Part 3 of this Section.

PART 2 PRODUCTS

2.01 TESTING EQUIPMENT AND INSTRUMENTS

A. The test equipment, instruments and devices used for testing shall be calibrated to test equipment standards with references traceable to the National Institute of Standards and Technology.

B. The test equipment, instruments and devices shall have current calibration stickers indicating date of calibration, deviation from standard, name of calibration laboratory and technician, and date of next recalibration.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall submit a schedule for the Testing Firm work and notify the Construction Manager 30 days prior to commencement of any witnessed testing.

B. The required tests, including correction of defects where found, and subsequent retesting, shall be completed prior to energizing electrical distribution system, utilization systems, and conductors and completed prior to functional testing. The installation of the protective device, breaker, and relay settings shall be completed and verified.

3.02 INSTALLATION CONTRACTOR TESTING

A. General:
   1. Submit all completed test report forms in a 3-ring binder type notebook at the project Substantial Completion date.

B. Insulation Resistance Measurements:
   1. Tests:
      a. Insulation resistance measurements shall be made on conductors and electrical equipment that will carry current. Where not specified, the minimum acceptable values of insulation resistance shall be in accordance with the applicable NETA-ATS, ICEA, NEMA, or ANSI standards for the equipment or material being tested.
   2. The ambient temperature at which insulation resistance is measured shall be recorded on the test form. A megohmmeter shall be used for insulation resistance measurements.
   3. Refer to specification Section 01 99 90 for the test forms required to document the testing performed by the Installing Contractor.
   4. Conductor and Cable Tests:
      a. The phase-to-ground insulation resistance shall be measured for circuits 120 volts and above except lighting circuits. Measurements may be made with motors and other load equipment connected. Insulation resistance measurements shall be recorded on Form 26 05 00-A contained in Section 01 99 90, and submitted. Insulation with resistance of less than 100 megohms is not acceptable.
   5. Motor Tests:
      a. The Installed Motor Test Form, Form 26 05 00-B, contained in Section 01 99 90, shall be completed for each motor after installation and submitted. All motors shall have their insulation resistance measured before they are connected.
   6. Motors 50 HP and larger shall have their insulation resistance measured at the time of delivery and when they are connected. Insulation resistance values less than 50 megohms are not acceptable.
   7. Verify that motors are connected to rotate in the correct direction with the load disconnected. Verification may be accomplished by momentarily energizing the motor, provided the Contractor confirms that neither the motor nor the driven equipment will be damaged by reverse operation.
   8. Motor running current shall be measured on each phase with the motor operating under load. Current imbalance shall be less than 5-percent difference between phases.

C. Power Distribution Equipment:
   1. Transformers, panelboards, and other power distribution equipment shall have their insulation resistance measured phase-to-phase and phase-to-ground. Insulation resistance values less than 10 megohms are not acceptable.

D. Power Utilization Equipment:
   1. Test receptacles and power outlets using a device to verify polarity, grounding, and the correct wiring connections.

E. Signal and Data Cable Tests:
   1. Signal conductors and shield drain shall be tested for insulation resistance with the other conductors in the cable grounded. Each shield drain conductor shall be tested for continuity. Insulation resistance measurements shall be recorded on Form 40 61 13-A contained in Section 01 99 90, and submitted.
   2. Instruments used for continuity measurements shall have a resolution of 0.1 ohms and an accuracy of better than 0.1 percent of reading plus 0.3 ohms. A 500-volt or 1000-volt meg-ohmmeter shall be used for insulation resistance measurements as appropriate.

F. Pre-Functional Checkout:
   1. Prior to energizing equipment, the Contractor shall perform a pre-functional checkout of the power and the control circuit. Protective devices shall be installed and available for service and calibrated or adjusted with specified setpoints installed. Contractor selected initial setpoints shall be installed and recorded, when specified setpoints are not required from the manufacturer or the Engineer.
   2. Contractor shall submit a description of proposed test and checkout procedures conforming to the following requirements, including a schedule for conducting these procedures, not less than 30 days prior to the performance of pre-functional testing.
   3. Pre-functional checkout shall consist of energizing each control circuit and operating each control device, protective device, monitoring or alarm device, and each interlock and verify the specified action or response occurs. Coordinate testing with the requirements specified in Section 01 45 20.

G. Functional Testing:
   1. Contractor shall submit a description of proposed functional test and checkout procedures conforming to the following requirements, including a schedule for conducting these procedures, not less than 30 days prior to the performance of functional testing.
   2. Prior to functional testing, all protective devices shall be adjusted and made operative. Prior to energization of associated equipment, perform a functional checkout of all electrical and instrumentation control circuits as specified in the following and in Division 40. Checkout shall consist of energizing each control circuit and operating each control, alarm, safety device, and each interlock, in turn, to verify that the specified action occurs.
   3. Record and submit data sheets as specified. Coordinate testing with the requirements specified in Section 01 45 20.

3.03 TESTING FIRM ACCEPTANCE TESTING REQUIREMENTS

A. Acceptance Test Reports:
   1. The Contractor shall maintain a written record of all inspection and test results and, upon completion of the project, shall assemble and certify a final test report
   2. A copy of the preliminary test results shall be provided to the Construction Manager at the end of each day of testing.

3. Furnish two copies of the complete acceptance testing final report to the Construction Manager at Substantial Completion of the project.

B. Acceptance Test Documentation: The Contractor shall submit test documentation forms and a detailed description of the proposed inspection and test procedures to be performed by the Testing Firm. Testing shall not commence until the Construction Manager has approved the proposed forms and procedures.

C. The description shall identify the test equipment required for each specified test to be performed. Test report forms shall include the following information:
   1. Electrical equipment description.
   2. Electrical equipment identification number.
   3. Electrical equipment nameplate data.
   4. Electrical equipment settings.
   5. Time and date of test.
   6. Ambient conditions at time of test.
   7. Inspection checklist and results.
   8. Test results.
   9. Test equipment used with manufacture, model number, and calibration date.
   10. Remarks about test procedures, results, and suggestions.
   11. Name and signature of testing personnel.
   12. Name and signature of test witness.

D. Acceptance Testing Firm Tests:
   1. Acceptance testing procedures and test results shall be as specified in ANSI/NETA ATS. The following types of equipment and systems shall be inspected and tested by the Testing Firm. Acceptance testing work shall not be limited to equipment shown on the drawings. Refer to Division 26 specification for the electrical equipment specified.
      a. Refer to the electrical drawings for location and identification of the electrical distribution system equipment, utilization equipment, and electrical conductors, included but not limited to:
         1) Switchgear and Switchboard Assemblies.
         2) Transformers Dry-Type Air-Cooled.
         3) Transformers Liquid Filled.
         4) Cables Low-Voltage 600 Volt Maximum.
         5) Circuit Breakers Low-Voltage, 100A frame and larger.
         6) Protective Relays.
         7) Instrument Transformers.
         8) Metering, include non-utility power metering equipment.
         9) Grounding Systems include installed grounding systems and existing grounding systems that are being utilized.
         10) Ground Fault Protection Systems.
         11) Motors.
         12) Motor Starters Low-Voltage.

13) Motor Control Centers Low-Voltage.
14) Adjustable Speed Drive Systems and harmonic testing per Section 26 29 23-3.02.
15) Surge Protection Devices, include lightning arresters, surge capacitors, and TVSS.
16) Engine Generators.
17) Automatic Transfer Switches (ATS).
18) Manual Transfer Switched (MTS).

3.04 ACCEPTANCE TEST VALUES

A. Minimum acceptable test values shall be as specified in ANSI/NETA ATS. Where acceptance test values are not specified, the equipment manufacturer's recommended test values shall be used. Where acceptance test values are not specified and the equipment manufacturers recommended test values are not available, request acceptance test values from the Construction Manager.

3.05 ACCEPTANCE TEST FINAL REPORT

A. Test report shall be assembled as described in ANSI/NETA ATS. Test results shall be organized by electrical distribution system equipment, project utilization equipment, and electrical conductors with individual tab dividers with labels to identify each group of items and cross-referenced to the Contract Documents. The equipment description, equipment number, and equipment tag number shall be used as shown on the drawings or listed in specifications.

B. Final Test Reports that are illogically assembled, labeled, and organized shall be returned for rework at no cost to the Owner and resubmitted in an acceptable format.

C. Deficiencies and non-compliant test results found during acceptance testing shall be identified in the test report and cover letter. The Testing Firm shall certify in the final test report that all deficiencies and non-compliant test results listed have been "corrected" and shall include a description of the resolution for each problem listed.

3.06 PROTECTIVE DEVICE FIELD SETTINGS

A. The Testing Firm shall verify, and certify in the acceptance test final report, that the protective device coordination study settings for new and existing equipment based on the Short Circuit and Protective Device Coordination Report specified in Section 26 05 74 have been implemented and recorded on the Testing Firm's Data Sheets.

3.07 ARC FLASH STUDY RESULTS

A. The Testing Firm shall provide and install labels on the project electrical equipment for personnel protective clothing requirements as specified in Section 26 05 74.

END OF SECTION

SECTION 26 09 13

ELECTRICAL POWER MONITORING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies power monitors and associated instrument transformers, test switches, fuses and accessories for electrical distribution equipment assemblies.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
IEEE C37.20.1	Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
IEEE 519	Recommended Practice and Requirements for Harmonic Control in Electric Power Systems
IEC 61850	Power Utility Automation
IEEE C57.13	Standard Requirements for Instrument Transformers
IEC 61557-12	Electrical safety in low voltage distribution systems up to 1000V a.c. and 1500V d.c. – Equipment for testing, measuring, or monitoring of protective measures – Part 12: Power metering and monitoring devices (PMD)."
ANSI C12.20	Electricity Meters – 0.1, 0.2 and 0.5 Accuracy Classes
IEC 62053-22	Electricity Metering Equipment – Static Meters for Active Energy

1.03 SUBMITTALS

The following information shall be provided in accordance with Section 01 33 00:

1. Catalog and technical data including outline dimensions and weights.
2. Elementary connection and interconnection diagrams..

PART 2 PRODUCTS

2.01 INSTRUMENT TRANSFORMERS

A. General:
   1. Instrument transformers shall be molded dry-type in accordance with ANSI C57.13. Transformer volt-ampere rating shall be suitable for carrying the specified load without overheating or exceeding the permissible accuracy for the transformer.

B. Potential Transformers:
   1. Potential transformers shall have an ANSI accuracy class of 0.3. They shall be equipped with current limiting fuses.

C. Current Transformers:
   1. Current transformers shall be furnished with the specified ratios. The accuracies shall conform to IEEE C37.20.1.

2.02 POWER AND POWER QUALITY METERS

A. Provide Power Meters, Power Quality Meters, or Advanced Power Quality Meters as shown on the drawings and as described herein.

B. Provide a separate metering compartment with front hinged door as needed. Include associated instrument transformers. Mount monitoring device on the compartment door to allow operator access to meter menu and display. No wiring above 120 V maximum, shall be extended to the unit at the door.

C. Provide current transformers (CT) for each meter as required. Current transformers shall be wired to shorting-type terminal blocks before connecting to any other device. Current transformers shall be suitable for carrying the rated current at the specified thermal rating factor without overheating or exceeding the permissible accuracy at load level currents.

D. Potential transformers (PT) including primary and secondary fuses with disconnecting means shall be provided for metering as shown on the drawings.

   1. Potential transformers shall have an ANSI accuracy class of 0.3 with a burden determined by the manufacturer.
   2. Unless otherwise specified, potential transformers wired 480-120 V shall consist of three (3) PTs with secondary connected in WYE (120 V phase to neutral).
   3. Potential transformer volt-ampere rating shall be suitable for carrying the specified load without overheating or exceeding the permissible accuracy for the transformer.

E. Setup for system requirements shall be from power meter display and shall include: CT rating, PT rating, and system type. Ratios shall be programmable; DIP switches or other fixed ratios shall not be acceptable.

F. Include voltage and current test block and plug.

2.03 POWER METERS

A. Provide one of the following specified product and manufacturer : PowerLogic PM 5000 Series by Schneider Electric, Electro Industries Shark 200 Series, or Eaton Power Xpert 1000 Series.

B. The metering device used to monitor circuits for purposes of network management, energy cost management, energy allocation, and operational efficiency shall provide the following minimum features:

1. Connections and form factor - direct connect to circuits up to 600 VAC, eliminating the need for voltage (potential) transformers; 5 A nominal current inputs. Removable connectors for voltage inputs, control power, communications, inputs and outputs; easily mountable in the pre-made cutout without tools; form factor will be ¼ DIN with 92 X 92 cut-out and 96 x 96 panel mount integrated display.
2. Supported monitoring parameters—full range of 3-phase voltage, measure each phase and neutral current using 4 current inputs, power and energy measurements, power factor, frequency, total harmonic distortion (THD), individual power harmonics (up to 63rd order).
3. Accuracy shall comply with ANSI C12.20 class 0.2 and IEC 62053-22 class 0.2S for revenue meters.
4. Support 4 digital inputs for Demand Synch Pulse, Time Synch Input, and Conditional Energy Control; have 2 digital outputs that operate either by user command sent over communication link, or in response to a user defined alarm or event.
5. Communications - serial RS-485 Modbus, Ethernet Modbus TCP, Ethernet BACnet IP (BTL listed), and EtherNet IP; provide 2 Ethernet ports to allow wiring from meter to meter as a daisy-chain; be capable of serving data over the Ethernet network accessible through a standard web browser; the monitor shall contain default pages from the factory.
6. Onboard data logging capabilities - to log data, alarms and events; logged information shall include data logs, minimum/maximum log files of selected parameter values, and alarm logs for each user defined alarm or event log; support the following on-board nonvolatile memory—14 parameters every 15 minutes for 90 days.
7. Alarming capabilities - support 29 set-point driven alarms, 4 digital alarms, 4 unary alarms, 10 Boolean alarms and 5 custom alarms; user definable alarm events; set-point driven alarms shall be available for voltage/current parameters, input status, and end of interval status; shall send emails and/or text messages containing alarm condition indication via Simple Mail Transfer Protocol [SMTP]; Shall have the capability to manage and monitor devices on the IP network via Simple Network Management Protocol [SNMP]; Indication of an alarm condition shall be delivered by SNMP Traps.
8. Firmware-upgradeable to enhance functionality through the Ethernet or serial communication connection and shall allow upgrades of individual meters or groups.
9. Integrated gateway functionality, enabling the capability to connect via Ethernet to downstream, serially connected devices.
10. Designed accordingly to eco-design complying with ISO 14062, especially MCCB materials shall be halogen free type; designed for easy disassembly and recycling at end of life, and comply with environmental directives ROHS and WEEE.

11. The meter shall provide 4 digital inputs configurable for input metering with on-board pulse weight calculation and conversion to standard units for external water, air, gas, electrical or steam (WAGES) meters.

2.04 NAMEPLATES

A. Nameplates shall be provided in accordance with Section 26 05 00.

2.05 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Operation and maintenance items as specified in Section 01 78 23.
   2. Manufacturer's product data with features and dimensions of devices.
   3. Burden, accuracy class, and ratio data for instrument transformers.

PART 3 EXECUTION

3.01 INSTALLATION

A. Accessories and devices shall be installed per the electrical distribution equipment manufacturer's instructions.

B. Functional testing, commissioning, and first parameter adjusting shall be carried out by a factory trained manufacturer’s representative field service engineer. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment. Report to the Engineer any discrepancies or issues with the installation.

END OF SECTION

SECTION 26 09 16

ELECTRICAL CONTROLS AND RELAYS

PART 1 GENERAL

1.01 DESCRIPTION

A. The vendor, manufacturer, and custom control panels shall provide enclosures, selector switches, pushbuttons, indicators, terminal strips, surge devices, nameplates, testing procedures, wiring method, wiring color coding, wire labeling, separation between power, controls, and instruments, hardwired logic relays or PLC logic products as specified herein and in Section 40 67 00.

B. This section specifies electrical control and monitoring devices:
   1. Pushbuttons
   2. Selector Switches
   3. Indicating Lights
   4. Control Station Enclosures
   5. Horns
   6. Beacons
   7. Thermostats
   8. Elapsed Time indicators

C. This section specifies Control Relays:
   1. Load-Switching
   2. Logic Level Switching
   3. Timers
   4. Time Switch
   5. Alternators

D. This section specifies power devices:
   1. Overcurrent Protection:
      a. Circuit breakers
      b. Power Fuses
      c. Control Fuses
   2. Current transformers and transducers

E. This section specifies terminal strips, blocks, and devices.

F. This section specifies specialty contactors:
   1. Intrusion Switches
   2. Override Key Switches

G. Request clarification where conflicts occur with this section and other sections in Divisions 23, 26, 40, 43, and 46.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid or on the effective date of the Agreement if there were no Bids.

C. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

D. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
NEMA 250	Enclosures for Electrical Equipment (1000 volts maximum)
NEMA ICS-1	General Standards For Industrial Controls and Systems
NEMA ICS-2	Industrial Control Devices, Controllers, and Assemblies

1.03 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00 and Section 40 67 00:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
    a. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
    b. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
    c. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
2. Arrangement drawings of the panel enclosure indicating the front door and panel equipment arrangement and dimensions, and enclosure type.

3. Nameplate legend with engraving and sizes.
4. Internal layout drawings showing all components.
5. List of materials and components with the layout drawings.
6. Elementary / schematic diagrams.
7. Internal wiring connection diagrams.
8. External wiring interconnection diagrams including interlocks.
9. Power and control single line diagrams, where motor controllers are included.
10. Manufacturer's catalog data for all material provided under this section shall be assembled in a folder with each page clearly marked with the item model number and reference number to the specification.
11. Operation and maintenance data as specified in Section 01 78 23 including approved submittal manufacturer's catalog data, as-built drawings, and instructions for all configurable or programmable components.

PART 2 PRODUCTS

2.01 CONTROL DEVICES

A. Pushbuttons:
   1. Pushbuttons shall be flush head, heavy-duty, with NEMA rating to match enclosure type. Operators shall be green for start function, red for stop functions, and black for all other functions. The escutcheon legend shall be as specified on the drawings.
      a. UL Listed.
      b. Dielectric Strength: 1300 Volts for one minute for Logic Reed contacts, 2200 Volts for one minute for other contacts.
      c. 30.5mm mounting hole.
      d. Temperature operating range -10 degree C. to +55 degree C.
      e. Momentary contact type.
      f. When switching circuits are monitored by programmable controllers or other solid state circuits, furnish hermetically-sealed, logic-reed type contacts rated not less than 0.15 amperes at 150 Vac and 0.06 amperes at 30 Vdc.
      g. When switching circuits are not monitored by programmable controllers or other solid state circuits, furnish contacts with NEMA Utilization Category rating A600 rated not less than 10 amperes continuous and 6 amperes break at 120 Vac.
   2. Manufacturer: Allen-Bradley 800T/800H series or equal.

B. Selector Switches:
   1. Selector switches shall be heavy-duty with NEMA rating to match enclosure type. Selector switches shall have maintained position contacts. Switches shall be provided with contact blocks and number of positions as required performing the specified or indicated operations.
   2. The escutcheon legend shall be as specified on the drawings. Provide:
      a. UL Listed.
      b. Dielectric Strength: 1300 Volts for one minute for Logic Reed contacts, 2200 Volts for one minute for other contacts.
      c. 30.5mm mounting hole.

d. Temperature operating range -10 degree C. to +55 degree C.
e. Standard knob operator (not lever type nor wing lever type).
f. Number of positions and contact configuration as shown on Drawings.
g. When switching circuits are monitored by programmable controllers or other solid state circuits, furnish hermetically-sealed, logic-reed type contacts rated not less than 0.15 amperes at 150 Vac and 0.06 amperes at 30 Vdc.
h. When switching circuits are not monitored by programmable controllers or other solid state circuits, furnish contacts with NEMA Utilization Category rating A600 rated not less than 10 amperes continuous and 6 amperes break at 120 Vac.

3. Manufacturer: Allen-Bradley 800T/800H series or equal.

C. Indicating Lights:
1. Red, amber, green, and blue indicating lights shall be heavy-duty full voltage 120Vac or 24Vdc push-to-test LED type with NEMA rating to match enclosure type for installation in a 30.5mm hole. Furnish with 28 chip high visibility LED. The escutcheon and lens color shall be as shown on Drawings or scheduled.
2. White indicating lights shall be as above, incandescent type lamp.
3. Manufacturer:
a. Allen-Bradley 800H-QRTH10 series or equal for 120Vac applications with colors other than white.
b. Allen-Bradley 800HQRTH24 series or equal for 24Vdc applications with colors other than white.
c. Allen-Bradley 800H-QRT10 series or equal for 120Vac applications with white.
d. Allen-Bradley 800H-QRT24 series or equal for 24Vdc applications with white.
4. Indicating Light Lens Color:

Lens Color	Typical Function	Example
Green	Danger, running, open	Equipment operating, motor running, valve open, power voltage applied, cycle in automatic
Amber	Fault condition, attention	Equipment failure, status abnormal
Red	Off, closed, ready	End of cycle; unit or head returned; motors stopped; motion stopped; contactors open, valve closed
White or Clear	Normal condition	Normal pressure of air, water, lubrication, control power on, status okay
Blue	Advisory	Control mode not in automatic

D. Control Station Enclosures:
1. Enclosures locations and ratings:
a. Indoors – conditioned space: NEMA 12.
b. Outdoors, process and Corrosive areas: NEMA 4X
c. NEC 500 Hazardous Areas: NEMA-7.

E. Horns:
1. The horn shall be a surface mount 120-volt AC enclosed buzzer and shall be Federal Signal Model 350WB (NEMA 4X); Model 31X (NEMA 7) or equal.

2. Each horn located standalone shall include a 6 x 10 inch Red with white letter lamacoid nameplate with the specific warning such as the following:
    a. DANGER GAS.
    b. VENTILATION SYSTEM FAILURE.
    c. As needed for each application.

F. Beacons:
1. The alarm beacon shall be a 75-watt sealed-beam lamp with motor driven rotating reflector; Beacon shall be for 120-volt AC service and shall be Federal Signal Model 191XL or equal.
2. Each beacon located standalone shall include a 6 x 10 inch Red with white letter lamacoid nameplate with the specific warning such as the following:
    a. DANGER GAS.
    b. VENTILATION SYSTEM FAILURE.
    c. As needed for each application.

G. Thermostats:
1. Thermostats shall be line voltage type with motor current rated contact and 70-degree to 140-degree Fahrenheit setpoint range.
    a. Manufacturer: Honeywell T631A-1022 or equal.

H. Elapsed Time Indicators:
1. Elapsed time indicators shall be panel mounted, non-resettable, 5.5-digit, hour indicator, rated 120Vac, 60-Hertz.
    a. Manufacturer: Trumeter 722-series or equal.

2.02 CONTROL RELAYS

A. Load-Switching Control Relays:
1. Control relays used for switching loads such as solenoids, actuators, contactors, motor starter coils, remote interlocking, etc. shall be heavy-duty machine tool type.
2. Contacts shall be 4-pole and be field interchangeable to either normally-open or normally- closed. Relay shall be capable of accepting a 4-pole adder.
3. AC relays shall have NEMA A600 contact ratings and electrical clearances for 600 volts. DC relays shall have NEMA P300 contact ratings and electrical clearances for 250 volts.
4. Manufacturer:
    a. Allen Bradley Bulletin-700.
    b. Square D Class 8501.
    c. or equal.

B. Logic Level Switching Control Relays:
1. Control relays for signal circuits shall have a minimum of three SPDT, gold-flashed, fine silver contacts rated 10-ampere resistive at 120V AC or 28Vdc.
2. Control relays shall be plug-in type with heavy-duty, barrier-protected screw terminal sockets and clear polycarbonate dust cover with clip fastener.

3. AC models shall have neon lamp indicator wired in parallel with coil. DC models shall have LED lamp indicator wired in parallel with coil.
4. Manufacturer: Potter Brumfield series KUP; IDEC Series RH; or equal.

C. Timers:
1. Multi-function, micro-controller based, socket mounted timing relay.
2. Single functions:
   a. Delay on Make.
   b. Delay on Break.
   c. Recycle (on time first, equal recycle delays).
   d. Single shot.
   e. Interval.
   f. Trailing edge single shot.
   g. Inverted single shot.
   h. Inverted delay on break.
   i. Accumulative delay on make.
   j. Re-triggerable single shot.
3. Dual functions:
   a. Delay on make/delay on break.
   b. Delay on make/recycle (on time first, equal recycle delays.)
   c. Delay on make/interval.
   d. Delay on make/single shot.
   e. Interval/recycle (on time first, equal recycle delays).
   f. Delay on break/recycle (on time first, equal recycle delays).
   g. Single shot/recycle (on time first, equal recycle delays).
   h. Recycle – both times adjustable (on time first).
   i. Recycle – both times adjustable (off time first).
   j. Interval/delay on make.
   k. Accumulative delay on make/interval.
4. Time delay range, switch selectable:
   a. Single function 0.1 second to 1,705 hours in 8 ranges.
   b. Dual function 0.1 second to 3,100 minutes in 8 ranges.
   c. Setting accuracy +/- 1 percent or 50 milliseconds, whichever is greater.
   d. Repeat accuracy +/- 0.1 percent or 16 milliseconds, whichever is greater.
5. Output:
   a. Two Form-C electromechanical isolated contacts rated 10-amperes resistive at 240Vac.
   b. Rated 1/3-horsepower at 120 or 240Vac.
   c. Double-pole double-throw: DPDT.
   d. Mechanical life: 10,000,000 operations.
6. Electrical life: 1,000,000 operations at full load.
   a. Mounting: Magnal Plug 11-pin socket.

7. Environment: -20 to +65 degree C.
8. Manufacturer:
    a. ABB / SSAC's multifunction type TRDU time delay relay with dip-switch function setting with 12Vdc, 24Vac, 120Vac, 240Vac inputs as required or indicated or equal.

D. Time Switch:
1. Provide an electronic time switch with full-year control in a NEMA 1 enclosure. The switch shall incorporate a non-volatile memory that maintains programmed switching times for the life of the time switch and provide a factory installed field replaceable lithium or alkaline battery for time keeping and calendar information for a minimum of 8 years. Furnish with one single-pole, double-throw output switch rated 20-ampere at 240Vac. Furnish with manual override control.
2. Manufacturer:
    a. Intermatic Model ET2815CP.
    b. or equal.

E. Alternating Relay:
1. Alternate assignment between "Duty" and "Stand-by" at the end of each run cycle.
2. Double-pole, double-throw output relay rated for 7-amps inductive at 120-volts AC. Isolation not less than 1,500-volt RMS input to output. Life of 1,000,000 operations at full electrical load.
3. Switch to select alteration or continuous operation of either load.
4. Mount in Magnal 11-pin socket.
5. Operating temperature range of -20 to +60-degree C.
6. Manufacturer:
    a. ABB-SSAC type ARP series.
    b. or Engineer accepted substitute.

2.03 POWER DEVICES OVERCURRENT PROTECTION

A. Overcurrent Protection:
1. CIRCUIT BREAKERS: Circuit breakers shall be thermal magnetic, molded case type with the ampere rating as specified. Unless otherwise specified or indicated, circuit breaker interrupting rating shall be 18,000 amperes symmetrical.
2. POWER FUSES: Provide Class R fuses and fuse holders where required for proper protection of equipment. Fuse clips shall be Class R rejection type and sized for UL Class R, one-time, time-delay fuses. Fuse assembly shall have a minimum short circuit capacity of 100,000 amps symmetrical. Provide fuses as shown and one set of spare fuses with each switch.
3. CONTROL FUSES: Fuses for 120 Vac circuits shall have a minimum of 12,000-amperes interrupting capacity and blown fuse indicators. Fuses for 24 Vdc circuits shall be fast acting glass tube type rated 1/8 or 1/10 amp for 4-20 mA loops. Fuses for 24 Vdc circuits shall be 1/2 amp for the power supply to individual instruments. Fuse holders shall be tip-out or draw-out type.

B. Current Transformers And Transducers:
   1. Provide monitoring current transformers with 600Vac insulation and primary ampere rating as indicated with 5-ampere output.
   2. Provide AC current transducer for any one of the phase conductors of the power circuit to be installed through onboard toroid. Provide a loop-powered transducer with input rated from 0 to 50 ampere with 4-20madc analog output scaled for the primary current of the current transformer. Provide zero and span adjustments.
   3. Provide a DIN rail or back plate mounted AC current transducer that is a loop-powered transducer with input rated from 0 to 5-ampere and with 4-20madc analog output scaled for the primary current of the current transformer.
   4. Manufacturer:
      a. ABB AC current transducer DCSA Series Loop Powered and mounting accessories, or equal.
      b. ABB AC current transducer TCSA Series Loop Powered and mounting accessories, or equal.

2.04 TERMINAL STRIPS, BLOCKS, AND DEVICES

A. Power Wiring: Provide back plate mounted terminal strips rated at 600 Vac.

B. Control Wiring: Provide a DIN rail with spring powered contact rated at 300 Vac 24 ampere with pluggable terminals.

C. Terminal identification standard to the product provided.

D. Manufacturer:
   1. Standard: Allen Bradley or equal.
   2. Standard: DIN rail: Phoenix Contact or Weidmuller Z-Series.

2.05 SPECIALTY CONTACTORS

A. Intrusion Device:
   1. The intrusion switch shall be wide-gap industrial grade magnetic door switch with maximum gap 2.5 inches between the sensing elements. The magnet element shall be mounted on the moving part of the door. The sensor switch shall close when the door is closed. The sensor switch shall open when the door is opened. Provide with appropriate mounting bracket for the entrance doors.
   2. Manufacturer:
      a. George Risk Industries Series 4400.
      b. or equal.

B. Override Key Switch:
   1. The override key switches shall be access control type with mortise cylinder and 24 Vdc single pole double threw (SPDT) maintained contacts.

C. Manufacturer:
   1. Schlage 650 Series Keyswitches.
   2. or equal.

2.06 NAMEPLATES

A. Nameplates for all control stations, relays, timers, and motor contactors shall be provided in accordance with the requirements of Section 26 05 00-2.04.

PART 3 EXECUTION

3.01 INSTALLATION

A. Control stations shall be mounted 48 inches above the floor, ground, or slab to center of device.

B. Devices shall be tested in accordance with Section 26 05 00 and Section 26 08 00.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 21 16

LOW-VOLTAGE UNDERGROUND ELECTRICAL SERVICE ENTRANCE

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies outdoor rated, 480Vac, four-wire, Service Entrance Section (SES) with Rocky Mountain Power power utility metering equipment and main disconnecting means as shown on the drawings.

B. The SES shall consist of the following:
   1. Enclosure Section-1:
      a. Power utility metering compartment that meets the EUSERC standards in an outdoor NEMA-3R, non-walk-in enclosure.
   2. Enclosure Section-2:
      a. Includes the fixed insulated-case power circuit breaker with solid state trip "Main" circuit breaker
      b. Ground fault interrupting system initially set to the maximum setting
      c. Transient voltage surge suppresser (TVSS)

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/IEEE	Definitions and Requirements for 600 Volt Air Switches, Insulators, and Bus Supports
ANSI C37.46	Specifications for Power Fuses and Fused Disconnecting
ANSI C37.47	Specifications for Distribution Fuse Disconnecting Switches, Fuse Supports, and Current-Limiting Fuses
NEMA PB 2	Deadfront Distribution Switchboards

Reference	Title
UL 489	Underwriters Laboratory – Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures
UL 891	Underwriters Laboratory - Deadfront Switchboards
UL 943	Underwriters Laboratory – Ground-Fault Circuit-Interrupters
UL 977	Underwriters Laboratory – Fused Power-Circuit Devices
UL 1066	Underwriters Laboratory – Low Voltage AC and DC Breakers used in Enclosures

B. Factory Tests:
   1. Switchboards shall be tested for operation at the specified voltage and current ratings after assembly. The main circuits shall be given a dielectric test of 2200 volts for 1 minute between live parts and ground, and between opposite polarities. The wiring and control circuits shall be given a dielectric test of 1500 volts for 1 minute between live parts and ground.
   2. Instrument transformers shall have ratio and phase angle tests made in conformance with ANSI C57.13.

1.03 SUBMITTALS

A. The following information shall be submitted in accordance with Section 01 33 00.
   1. Electrical single line, schematic diagrams, and conductor connection diagram.
   2. Layout drawings indicating arrangement, dimensions, cable entries, and weights.
   3. Manufacturer's product and catalog data indicating equipment specifications and features including interrupting, withstand, and continuous current ratings of all relevant equipment and components. Catalog data shall be edited or “arrowhead” to indicate only the models and options to be provided as part of this specification.
   4. Manufacturer’s procedure for ground-fault performance test.

B. The SES submittal information shall also be submitted to Power Utility Metering Department for their approval.

C. After Power Utility approval, submit one approved copy with Utility comments to the Engineer.

1.04 PROJECT / SITE CONDITIONS

A. The equipment shall be designed and manufactured to meet the specified requirements of Sections 01 11 80 and 01 73 24 for environmental and seismic conditions.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers include:
   1. Eaton Cutler-Hammer
   2. General Electric Co.
   3. ABB
   4. Siemens
   5. or equal

2.02 SERVICE ENTRANCE SECTION

A. General:
   1. Coordinate with Power Utility for the correct meter socket, test devices, potential transformers, current transformers, and other items installed in the metering section. Refer to Power Utility Electric Service Requirements, latest edition.
   2. Equipment and materials shall be new and free from defects.
   3. Continuous Current Ratings: As shownat 600Vac.

B. Power Disconnect – Fused Switch Device Type:
   1. The high-pressure contact-switch shall provide a stored energy operating mechanism, Class-L fuse coordination for 200,000-ampere root mean squared (rms) interruption and isolation, and self-powered ground-fault protection with time and current field adjustments.

C. The following components shall be provided:
   1. Emergency switch-open button that triggers the stored energy operating mechanism with positive "On-Off" indication and with an entrance door - power disconnect switch safety interlock.
   2. Blown Fuse-Protection: Provide single-phase protection when only one fuse is blown.
   3. Test Buttons:
      a. No-trip Ground Fault Test Button: Permits ground fault test without tripping the SES switch.
      b. Test Button: Simulates ground-fault occurrence and trips the SES switch.
      c. Provide an external 120Vac control power source for test function.

D. Power Disconnect - Circuit Breaker Type:
   1. The circuit breaker with adjustable solid-state trip with sizes as indicated. The circuit breaker settings shall be confirmed with a protective device coordination study provided by others.
      a. General:
         1) Circuit breakers shall be stored energy type mechanism to provide quick-make, quick-break, trip-free operation:
            a) Insulated case UL listed 100 percent continuous current capacity.
            b) Ground fault protection shall be provided as specified or indicated.
      b. Circuit breakers shall provide manual switching operation by means of a low-torque handle or pushbutton on the front of the unit. Automatic operation during overload and short circuit conditions shall be provided by solid state or thermal magnetic tripping devices located in the circuit breaker frame as specified on the drawings.
      c. Circuit breakers shall be front accessible, stationary, individually mounted, and shall have short circuit capabilities equal to or greater than the system in which they are installed. Unless otherwise noted, circuit breakers shall have a minimum interrupting current of [65,000] amperes symmetrical RMS at 480 Vac.
      d. Static Tripping Devices:
         1) Solid state static tripping devices shall consist of current sensors, logic assembly, magnetic latch release, and required interconnecting wiring. Tripping devices shall be automatic and self-contained within the breaker frame and shall not require any external relaying or power supplies.
      e. Tripping functions shall be field adjustable and contain the following tripping characteristics:
         1) Overload tripping:
            a) Adjustable ampere setting
            b) Adjustable long-time delay
         2) Short circuit tripping:
            a) Adjustable short-time pickup
            b) Adjustable short-time delay
            c) Adjustable instantaneous pickup
         3) Ground fault tripping:
            a) Adjustable ground fault pickup
            b) Adjustable ground fault delay
   2. Power Bus:
      a. The bus shall be insulated tin-plated copper bus bar. Unless otherwise specified, buses shall be braced to withstand short circuit stresses up to 65,000 RMS amperes.
   3. Enclosure:
      a. The enclosure shall be designed for outdoor installation. Each of the enclosure sections shall have a full-length flanged front door.
      b. The structure supporting current carrying parts shall be flame retardant non-tracking glass polyester or porcelain.

4. Safety Interlocking:
    a. The inner door shall be hinged and interlocked with the main circuit breaker or fused switch so that the power disconnecting device opens before internal access is possible and the door must be closed before the power disconnecting device may be closed.
5. Lightning Arrestor and Surge Capacitor:
    a. Provide a lightning arrestor and surge capacitor for 480Vac service entrance sections cabinets:
        1) Silicon Oxide Varistor (SOV)
        2) Energy Rating: 3000 joules per pole.
        3) Time Rating: 5 nanoseconds.
        4) Resistors: Prohibited.
        5) Manufacture and Models:
            a) Delta LA-603 for 3-phase, 3-wire or equal.
            b) Delta LA-603 for 3-phase, 4-wire or equal.
            c) Delta CA-603 for 3-phase, 3 or 4-wire rated at 650 Vac, or equal.
6. TVSS Surge Device:
    a. Refer to Section 26 43 13 for additional TVSS requirements. Provide a transient voltage surge suppressor (TVSS) rated at:
        1) 480Y/277 Vac
        2) 150,000 ampere per phase with 5-nanosecond response time
        3) Five-year manufacturer warrantee with UL Label.
        4) Features:
            a) Fault monitoring.
            b) Trouble monitoring.
            c) Strike counter.
        5) Manufacturer: ABB, Eaton/Cutler Hammer, GE, Square D, Transtector-Facility Protector, or equal product.
7. Grounding:
    a. A common ground bus shall extend the entire length of the assembly with ground lugs furnished at each end where multiple enclosures are attached together. A ground lug, sized for a 4/0 bare copper ground wire, shall be bolted to the interior of the enclosure.
8. Neutral:
    a. A neutral bus shall extend the entire length of the assembly with lugs furnished at each end where multiple cabinet enclosures are attached together.
9. Finish:
    a. The finish shall comply with in accordance with Section 26 05 00.
10. Nameplates:
    a. In addition to the manufacturer's identification, an external nameplate shall be provided with equipment number and name as shown.

b. Each section compartment shall be provided with nameplates indicating utility meter, main breaker circuit name with equipment number and description of load, pull sections, TVSS, and any additional designations describing the compartment function or usage.

c. Provide nameplates per Section 26 05 00. Provide nameplates for power sources indicating the power loads and nameplates for power loads that indicate the power sources, in accordance with these specifications and the NEC.

11. Wiring:

a. Internal switchboard wiring shall consist of single conductor SIS 90 degree C copper wire and UL listed for panel wiring. The wire shall be sized to suit load requirements. Minimum size shall be No. 14 AWG.

2.03 ARC FLASH MITIGATION METHODS

A. The following mitigation method requirements shall apply to all power distribution and utilization equipment supplied for any products supplied on the project and applies to all equipment divisions in the Contract Documents. Refer to the NFPA-70 (NEC), and NFPA-70E (NESC) for equipment labeling requirements.

B. Equipment Labels:

1. Equipment labels shall be installed on the outside of the electrical equipment enclosure, cabinet, and panels to avoid opening the equipment to access the manufacture's data or the equipment ratings.

C. Power and Control Equipment Separation:

1. Provide separation between power equipment within an enclosure, cabinet, or panel by the uses of barriers, separate access doors, or by other means.
2. Provide separation barriers between main breaker feeders coming into equipment and other termination points or bussing on the load side of the main breaker.

D. Automatic Shutters:

1. Provide automatic shutters, where possible, to close the access to the power bus when a power device is not engaged.

2.04 PRODUCT DATA

A. The following product data shall be provided in accordance with Section 01 33 00:

1. Applicable operation and maintenance information shall be provided in the product submittal, including:
   a. As-built drawings.
   b. Final, complete, reviewed submittal information.
   c. Manufacturer's Circuit Breaker instructions.
   d. Manufacturer's TVSS instructions.
2. Results of factory tests conducted in accordance with paragraph 1.02 Factory Tests.
3. Results of field tests conducted in accordance with paragraph 3.04.
4. Ground-fault protection performance test.

PART 3 EXECUTION

3.01 INSTALLATION AND INSPECTION

A. Coordinate the SES conduit installation with the power utility and request their inspection of the work prior to covering up the work.

3.02 PROTECTIVE DEVICE SETTING COORDINATION

A. Refer to Section 26 05 74 for Short Circuit and Protective Device Coordination Studies and Section 26 08 00 for device setting implementation requirements and Arc Flash labeling requirements.

3.03 PROTECTIVE DEVICE SETTINGS

A. The power utility metering instrument transformer ratios shall be confirmed with the power utility metering department.

B. The protective devices shown on the drawings are preliminary and are subject to confirmation with the coordination study in Section 26 05 74.

C. The ground fault protective device and the fuses or tripping devices shall be adjusted to the settings specified in the protective device coordination study in Section 26 05 74 prior to energizing the SES.

3.04 FIELD TESTING

A. The SES equipment shall be tested in accordance with Section 26 08 00. Verify the ground fault setting and trip functions. Perform ground-fault protection performance test per Manufacturer instructions. Provide written successful test results.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 22 00

LOW-VOLTAGE TRANSFORMERS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies dry-type transformers with primary winding rated 600 volts and less used for power distribution, lighting and control purposes as specified or shown.

B. This section specifies mini-power centers that include the primary transformer protection, transformer, secondary protection and a circuit breaker panel in one package.

C. This section specifies K-Rated transformer with electro-magnetic shielding.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/IEEE C57.12.01	General Requirements for Dry-Type Distribution and Power Transformers
ANSI/UL 506	Specialty Transformers
DOE	10 CFR Part 431 Efficiency Standards
NEMA ST20	Dry-Type Transformers for General Application

1.03 RATINGS AND STANDARDS

A. Transformers rated:
   1. 10 kVA and smaller shall be single phase or as indicated.
   2. 15 kVA and greater shall be 3 phase or as indicated.
   3. Voltage, frequency, number of phases and kVA as indicated.
   4. Conform to ANSI/IEEE C57.12.01, DOE 10 CFR Part 431 Efficiency Standards, NEMA ST20, and ANSI/ UL 506.

1.04 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's data.
   2. Dimension and rating data.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers include:
   1. ABB
   2. Eaton Cutler-Hammer
   3. Siemens
   4. Square D
   5. or equal.

Ambient Temperature	+ Winding Temperature Rise	+ Hot Spot	= Temperature Class
40-d C	80-d C	30-d C	150-d C
40-d C	115-d C	30-d C	185-d C
40-d C	150-d C	30-d C	220-d C

2.02 INSULATION

A. Transformers temperature rise based on 40-degree C ambient temperature:
   1. 15 kVA and above: Not exceed [80] [115] [150] degree C temperature rise.
   2. below 15 kVA: Not exceed [80] [115] degree C temperature rise.

2.03 COILS

A. Transformer coils:
   1. Copper
   2. 15 kVA and above:
      a. Impregnated with varnish.
   3. 10 kVA and below:
      a. Encapsulated.

2.04 WINDING CONFIGURATION

A. Transformers shall have electrically isolated primary and secondary windings. Primary and secondary winding configurations shall be as specified or shown. Provisions shall be made to permit separate grounding of the neutral conductor and the enclosure. Single-phase transformers shall be the four winding type.

2.05 TRANSFORMER TAPS

A. Transformers 15 kVA and above shall be provided with two 2-1/2 percent full capacity taps above normal voltage and four 2-1/2 percent full capacity taps below rated voltage on the primary winding.

2.06 TERMINAL COMPARTMENTS

A. Terminal compartments shall be sized to permit termination of cables specified. Terminal connections shall be made in the bottom third of the enclosure. The terminals shall be copper and sized for the cable specified.

2.07 ENCLOSURES

A. Transformers enclosures:
   1. 15 kVA and smaller:
      a. Weatherproof, nonventilated enclosures.
   2. Indoor over 15 kVA:
      a. Dripproof, ventilated enclosures.
   3. Outdoor:
      a. Weatherproof enclosures.

2.08 MOUNTING

A. Transformers 25 kVA and below shall be suitable for wall mounting and include mounting brackets and hardware. Transformers over 25 kVA shall be floor mounting type.

B. See specification 01 73 24 for seismic requirements.

2.09 NAMEPLATES

A. Nameplates shall be provided in accordance with the requirements of Section 26 05 00-2.04.

2.10 SOUND LEVELS

The sound levels shall not exceed the following values:

kVA	dB
0 - 9	40
10 - 50	45
51 - 150	50
151 - 300	55
301 – 500	60
501 – 700	62
701 - 1000	64

2.11 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's verification that the unit has been built and tested in accordance with the specified ANSI standards.
   2. Manufacturer's verification of the sound levels, if different from the specified NEMA ST20 standards.
   3. Applicable operation and maintenance information as specified in Section 01 78 23.
   4. Manufacturer's product literature.

PART 3 EXECUTION

3.01 GENERAL

A. Bond transformer enclosures and neutrals together and connect to the ground grid.

3.02 INSTALLATION

A. Install transformers on walls or floors at locations shown on the Drawings. Install floor mounted transformers on raised concrete bases. Provide sufficient access and working space for ready and safe operation and maintenance.

B. Mount transformers so that vibrations are not transmitted to the structural parts of the building or to other equipment. Make connections to transformers with flexible conduit.

C. Adjust tap settings to provide proper voltage at panelboards.

D. Ground transformer in conformance with the National Electrical Code.

3.03 TESTING

A. Transformers shall be tested in accordance with Section 26 08 00.

END OF SECTION

SECTION 26 23 00

LOW-VOLTAGE SWITCHGEAR

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies switchgear rated 600 volts, 3 phase, 60 Hertz for power distribution with drawout circuit breakers and associated electrical metering. Switchgear features include:
   1. Automatic Transfer Controller (ATC) PLC
   2. Uninterruptible Power Supply
   3. Power Monitors

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 73 24 Structural Design and Anchorage Requirements for Nonstructural Components and Nonbuilding Structures
   2. Section 26 05 00 Common Work Results for Electrical
   3. Section 26 05 74 Arc Flash Analysis Shot Circuit Study
   4. Section 26 08 00 Commissioning of Electrical Systems
   5. Section 26 43 13 Surge Protective Devices for Low-Voltage Electrical Power Circuits

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.04 CODES AND STANDARDS

A. Work shall conform to or exceed the applicable requirements of the National Electric Code (NEC); provided, that where a local code or ordinance is in conflict with the NEC, the provisions of said local code or ordinance shall take precedence.

B. LV Switchgear shall be Underwriters Laboratory listed to UL 1558.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Pre-installation Meetings:
   1. Conduct (1) one 2-hour workshop with the Owner and Engineer, answer questions, solicit feedback,and present the following:
      a. Draft HMI Screen Graphics.
      b. Draft Automatic-Transfer-Controller (ATC) Sequence of Operation.
      c. Draft Hard-wire interlock construction.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section, and those listed below with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.

3. Check-marks (✓) shall denote full compliance with a paragraph as a whole. Deviations shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. A copy of the drawings (one line diagrams, wiring diagrams, and network diagrams) with a check mark to indicate compliance with the drawing a whole. If deviations from the drawing are indicated, and therefore requested by the Contractor, each deviation shall be circled and denoted by a number, referenced to a detailed written explanation of the reasons for requesting the deviation.
5. Catalog cuts of equipment, devices, and materials in Part 2 Products.
    a. Manufacturer's data indicating momentary, interrupting, and continuous current ratings of all relevant equipment, components, and devices.
    b. Manufacturer's catalog data indicating materials and features of construction and information on control features and components.
    c. Protective device data: Characteristic curves and instructions for coordination and settings of protective relays.
6. Outline and Arrangement Drawings completely dimensioned, shall show:
    a. Plan view, front view, other elevation views, if pertinent
    b. Equipment arrangement
    c. Required clearances for opening doors and for removing breakers
    d. Location and size of all conduit entrance provisions for user's power and control connections
    e. Bus configuration and dimensions
    f. User's interface wiring terminal blocks locations and details
    g. Grounding connections
    h. Weight of equipment by vertical section of switchgear
    i. Location, size, and loads on hold-down bolts, details of embedded channels and detail seismic bracing and anchoring
7. Seismic design drawings, calculations, and data as specified in Section 01 73 24.
8. Diagrams:
    a. Single-line Diagrams with ANSI device function numbers used throughout shall show:
        1) Circuit breakers
        2) Instrument transformers
        3) Relays
        4) Meters
        5) Switches, test switches, and shorting type terminal blocks

b. Elementary Diagrams
    1) An elementary diagram shall be furnished for the electrically operated breaker control scheme.
    2) The elementary diagram shall show all related control devices and device contacts, each of which shall be labeled with its proper ANSI device function number.
    3) Three-line diagrams of potential and current secondary circuits showing device terminal numbers and internal diagrams.
    4) All diagrams shall be computer generated.
c. Detailed Connection (Wiring) Diagram shall show:
    1) Approximate physical location of all items in the section.
    2) All wiring in the section.
    3) All interconnecting wiring between the sections.
    4) Identification of all terminals, terminal blocks, and wires.
    5) Spare auxiliary contacts and relay contacts wired to terminal blocks for future use.
d. Schematic diagrams of control and alarm circuits. Schematics shall be computer generated. Schematic diagrams shall show part numbers for all devices.
e. Network drawings.

9. A complete bill of material separated into each subassembly and showing manufacturer's part number, quantity and description of each part. If another manufacturer makes the part, the description shall indicate the other manufacturer and their part number.
10. ATC Functionality:
    a. A complete description of system operating sequences.
    b. Written overview of the switchgear PLC control logic explaining the sub-routine program including control, monitoring, alarming and interlock functions.
    c. Annotated PLC application program logic code, with a written control description that describes the application program code in non-technical terms using clear sentence structure that includes sequence of events, interlocks, and action on fault conditions. Hard copy and electronic copy shall be provided in native program and PDF.
11. SCADA:
    a. Switchgear configuration parameters available to be read/written by the Owner's SCADA system, with register address, bit assignment, and setting value (range of value). Vendor shall indicate which, if any, parameters the switchgear requires from the Owner's SCADA for automated operation of the switchgear.
    b. Interconnection Diagrams for SCADA interface shall show:
        1) All wiring from the breaker controls to terminal strips located within an accessible section of the Switchgear section for monitoring of:
            a) Breaker 86 Tripped Status to SCADA (From Protective Relays)
            b) Breaker Closed Status to SCADA
            c) Utility Status (Bus A) to SCADA
            d) Utility Status (Bus B) to SCADA
            e) Breaker Racked In/Out Status to SCADA

12. Full color operator interface terminal (OIT) submittal shall be provided including the following:
    a. OIT application program graphics/code which achieves the functions specified. Hard copy and electronic copy shall be provided in native program and PDF.
    b. Updated control description detailing the PLC control program as it relates to the OIT graphics in terms of operator control set points, status, and indications.
13. Test Plans:
    a. Factory Test Plan
    b. Field Test Plan
14. All diagrams, schematics, interconnections, layouts and details submitted shall be on 11-inch by 17-inch reproducible bond, as well as in Autodesk MEP 2012 and pdf file formats with details clearly legible. Supplier shall submit both bond and drawing data files.

B. Informational Submittals:
    1. Procedures: Section 01 33 00.
    2. Arrangement and layout drawings of the switchgear enclosures depicting equipment and bus arrangement and dimensions including areas of permissible cable entries. A list of material and components shall accompany the layout drawings.
    3. Catalog data and instruction manuals on all electrical devices and components mounted on or within the switchgear.
    4. Results of factory tests as specified in this Section and Section 26 08 00.
    5. Supplier's certification and calculations that the equipment meets the seismic requirements of Section 26 05 00 and Section 01 73 24.
    6. Loading and unloading procedures.
    7. Installation instructions covering all the equipment furnished including all circuit breakers, protective relays, metering, etc.
    8. Warranty information.

C. Closeout Submittals:
    1. Procedures: Section 01 78 23.
    2. Results of field tests and field breaker setting tests as specified in this Section and Section 26 08 00.
    3. Operations and Maintenance Manuals (including Warranty) in accordance with Section 01 78 23.
    4. Information verifying that the current and potential transformers configuration is per the power monitor manufacturer’s requirements for the power monitors as specified within this Section.
    5. Information required to verify that the differential current transformers meet the performance requirements specified in this Section.
    6. Spare parts:
        a. Procedures: Section 01 33 00.
        b. Complete recommended spare parts list, including parts location diagrams or drawings.
        c. List of priced spare parts that Supplier recommends should be on hand during switchgear start-up and the first year's operation.

1.07 QUALITY ASSURANCE

A. Qualifications:
   1. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.
   2. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.
   3. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.
   4. Provide Seismic tested equipment as follows:
      a. The equipment and major components shall be suitable for and certified by actual seismic testing to meet all applicable seismic requirements of the latest International Building Code (IBC).
      b. The Project Structural Engineer will provide site specific ground motion criteria for use by the manufacturer to establish SDS values required.
      c. The IP rating of the equipment shall be 1.5
      d. The Structural Engineer for the Site will evaluate the SDS values published on the Manufacturer's or OSHPD website to ascertain that they are "equal to" or "greater than" those required for the Project Site.
      e. The following minimum mounting and installation guidelines shall be met, unless specifically modified by the above referenced standards.
         1) The Contractor shall provide equipment anchorage details, coordinated with the equipment mounting provision, prepared and stamped by a licensed civil engineer in the state. Mounting recommendations shall be provided by the manufacturer based upon the above criteria to verify the seismic design of the equipment.
         2) The equipment manufacturer shall certify that the equipment can withstand, that is, function following the seismic event, including both vertical and lateral required response spectra as specified in above codes.
         3) The equipment manufacturer shall document the requirements necessary for proper seismic mounting of the equipment. Seismic qualification shall be considered achieved when the capability of the equipment, meets or exceeds the specified response spectra.

B. Factory Tests:
   1. Factory Testing shall be performed by the Supplier prior to delivery in order to verify the accuracy and performance of the systems as specified. Factory Testing need not be witnessed by the City Representative, unless a special Witness Testing paragraph is included in this Section. However, the Supplier shall certify and provide copies of the tests and guarantee the equipment's performance as specified in this Section. All certifications of Factory Testing shall be submitted and approved by the City Representative, prior to shipping equipment.

2. Factory Testing shall include at the minimum all standard tests recommended by the Supplier and the following:
    a. Operation at the specified voltage and current ratings. The main circuits shall be given a dielectric test of 2200 Volts for 1 minute between live parts and ground, and between opposite polarities. The wiring and control circuits shall be given a dielectric test of 1500 Volts for 1 minute between live parts and ground.
    b. Instrument transformers shall have ratio and phase angle tests made in conformance with ANSI C57.13. Three copies of test results shall be submitted.
    c. Automatic Transfer Controller (ATC) and Human Machine Interface (HMI) functionality.

C. Contractor (Equipment Supplier, as applicable) shall provide a 2 year warranty.

1.08 DELIVERY, STORAGE AND HANDLING

A. Procedures: Section 01 66 00.

B. Loading and unloading per manufacturer's instructions.

1.09 WARRANTY

A. The manufacturer shall warrant that products supplied are free from defects in material or workmanship and shall repair or replace defective products for a period of 24 months provided that the manufacture performs functional testing, commissioning and first parameter adjusting of equipment. The warranty period shall begin after the Owner utilizes the equipment or partial/substantial completion has been attained - whichever comes first. The start of this period shall not exceed 18 months from equipment energization or shipment date of equipment. This warranty shall be in addition to any provided by the Contractor. The warranty shall exclude normal wear and tear under normal usage and any damage caused by abuse, modification, or improper maintenance by entities other than the manufacturer or its approved representative.

B. Additional Owner Rights: The warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Engineer believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers include:
    1. Eaton
    2. ABB

3. Schneider Electric
4. or approved equal

2.02 EQUIPMENT

A. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

B. Enclosure:
   1. Switchgear shall be factory assembled and metal enclosed. Each unit shall consist of a stationary structure assembly and one or more air circuit breaker units, disconnecting devices, and other specified equipment. Each unit shall be provided with a breaker hoist for removing the breaker for maintenance. The breaker hoist shall be mounted on the top of the structure.
   2. Main Breakers shall be installed in end of line up vertical sections. No other feeder breakers shall be installed within the main breaker vertical sections.

C. Stationary Structure:
   1. Stationary structure shall be a self-contained steel unit housing one or more individual breakers or instrument compartments and a rear compartment for buses and outgoing cable connections.
   2. Structure shall be provided with removable steel plates on the top and sides, and each breaker compartment shall be equipped with primary and secondary contacts, rails, and stationary levering mechanism.
   3. Structures shall be provided with horizontal and vertical barriers to separate different voltage classes, buses and cables:
      a. Separate different voltage classes.
      b. Separate bus compartments from cable compartments.
      c. Separate cable compartments between vertical sections.
   4. Structure shall be provided with a rear hinged cover for each cable compartment and a front hinged door for each breaker and metering compartment.
   5. Minimum depth: 72”
   6. Maximum depth: 84”

D. Finish:
   1. Electrical equipment shall be treated with zinc phosphate, bonderized or otherwise given a rust-preventive treatment. Equipment shall be primed, coated with enamel, and baked. Minimum dry film thickness shall be 3 mils.
   2. Color: Exterior color of electrical equipment shall be ANSI 49 or ANSI 61 light gray. Interior shall be painted white.

2.03 BUS BARS

A. General:
   1. Buses shall be tin-plated copper and shall be insulated where accessible to maintenance personnel.

B. Main Bus:
   1. Main horizontal bus shall extend through all sections of the switchgear with vertical connections to circuit breakers in each section.
   2. Main bus shall have a continuous rating at least equal to the main circuit breaker and shall be braced to withstand stresses resulting from the maximum short-circuit current available. Minimum bracing shall be 65,000 amperes symmetrical (SCCR).
   3. Buses shall be mounted on heavy-duty glass polyester supports, and main bus joints shall be tin-plated and bolted using a minimum of two bolts.
   4. Shipping splits and provisions for future bus extensions shall have silver-plated bolted connections.

C. Ground Bus:
   1. A ground bus having a momentary rating at least equal to the highest momentary rating of any circuit breaker in the assembly shall extend the length of the bottom of the switchgear. Each end of the ground bus shall be provided with clamp type terminals for No. 4/0 bare copper ground wire.

2.04 CIRCUIT BREAKERS

A. General:
   1. Breaker element shall consist of a three-pole electrically operated with solid state overcurrent trip device, arc quenchers, manual stored energy closing mechanism, mechanical pushbutton trip and position indicator.
   2. Breakers shall have a minimum interrupting current of 65,000 amperes symmetrical RMS at 480 Vac. Breaker element shall be suitable for mounting on the drawout mechanism in the circuit breaker compartment. Electrically operated circuit breakers shall be capable of operating on 80 to 120 Vac control power.
   3. Provide a breaker test circuit appliance and device.

B. Disconnecting Devices and Drawout Mechanism:
   1. Disconnecting devices shall be the self-aligning type with the disconnecting fingers mounted on the breaker. The drawout mechanism shall rigidly hold the circuit breaker in the fully connected, test, and fully disconnected positions. Interlocks shall be provided to prevent moving the circuit breaker from the fully connected, test, or fully disconnected positions unless the breaker is open. Interlocks shall also prevent closing the breaker between any of these positions.
   2. The drawout mechanism shall be designed so that the breaker can be racked to any position without opening the door. A hasp on the breaker escutcheon shall be provided that can receive three padlocks when the breaker is in the open position.

C. Auxiliary Switches:
   1. Breakers shall be equipped with four (4) normally open and four (4) normally closed auxiliary switches or eight (8) Form-C contacts rated 10 amperes, 120 volts, and wired to terminal blocks.

D. Solid State Tripping Devices:
   1. Solid state tripping devices shall consist of current sensors logic assembly, magnetic latch release, and required interconnecting wiring. Tripping devices shall be automatic and self-contained within the breaker frame, and shall not require any external relaying or power supplies.
   2. Tripping device shall be provided with manually resettable fault indicators. As a minimum, fault indicators shall provide indication of tripping caused by overload, short circuit or ground fault.
   3. Tripping functions shall be field adjustable and shall provide, as specified, the following tripping characteristics:
      a. Overload Tripping:
         1) Adjustable ampere setting
         2) Adjustable long-time delay
      b. Short Circuit Tripping:
         1) Adjustable short-time pick-up
         2) Adjustable short-time delay
         3) Adjustable instantaneous pick-up
      c. Ground Fault Tripping:
         1) Adjustable ground fault pick-up
         2) Adjustable ground fault delay
   4. The trip units shall utilize ARMS (Arcflash Reduction Maintenance System), Energy Reduction Maintenance Setting (ERMS) or equal. ARMS / ERMS shall be provided in a system that shall reduce the trip unit Instantaneous pickup value when activated. ARMS / ERMS device shall not compromise breaker phase protection even when enabled. Once ARMS /ERMS unit is disabled, the recalibration of trip unit phase protection shall not be required. Activation and deactivation of ARMS / ERMS setting shall be accomplished without opening the circuit breaker door and exposing operators to energized parts. ARMS / ERMS shall provide a clearing time of 0.04 seconds, adjustable with a minimum of five settings ranging from 2.5X to 10X of the sensor value.
      a. ARMS / ERMS shall be enabled via a switch on the trip unit. It shall also provide confirmation of protection via a Blue LED.
      b. ARMS / ERMS shall be provided with remote “enable/disable” control
      c. ARMS / ERMS shall be provided with a switchgear panel mounted enable padlockable selector switch and indication via Blue LED pilot light.

2.05 PANEL INSTRUMENT AND ACCESSORIES

A. Panel instrument and accessories shall be provided as the manufactures standard offerings for panel instrument and accessories that are rated for metering services and that include potential and current transformers with the standard associated protective and testing devices.

2.06 PROTECTIVE RELAYING

A. Protective relaying shall be as specified. The tripping devices and instrument transformer ratios specified are preliminary and are subject to confirmation with the protective devices coordination study in Section 26 05 74.

2.07 EQUIPMENT IDENTIFICATION

A. Nameplates:
   1. In addition to the manufacturer's identification, switchgear shall be provided with phenolic nameplates showing switchgear, main breaker, and feeder breaker designations as specified. Nameplates shall comply with Section 26 05 00.

B. Conductor Markers:
   1. Conductor markers shall comply with Section 26 05 00.

2.08 WIRING

A. Conductors:
   1. Internal switchgear wiring shall consist of single conductor SIS 90 degree C copper wire and UL listed for panel wiring. The wire shall be sized to suit load requirements with the minimum size of No. 14 AWG.

B. Terminal Blocks:
   1. Terminal blocks shall comply with Section 26 05 00.

C. Cable Connectors:
   1. Cable connectors for outgoing power cables shall be suitable for use with aluminum or copper conductors. They shall be UL listed as a compression connector and shall be sized for the specified conductor.
   2. Conical washers shall be used for each connection.

2.09 ARC FLASH MITIGATION METHODS

A. The following mitigation method requirements shall apply to all power distribution and utilization equipment supplied for any products supplied on the project and applies to all equipment divisions in the Contract Documents. Refer to the NFPA-70 (NEC), and NFPA-70E (NESC) for equipment labeling requirements.

B. Equipment Labels:
   1. Equipment labels shall be installed on the outside of the electrical equipment enclosure, cabinet, and panels to avoid opening the equipment to access the manufacture’s data or the equipment ratings.

C. Hinged Doors:
   1. Power distribution equipment shall have hinged rear doors where back access is shown.

D. Remote Racking Devices:
   1. Power distribution equipment shall have remote racking devices for Operators to insert or remove rack-mounted breakers, rack-mounted devices, or auxiliary equipment drawers into the associated equipment location.

E. Insulated Power Bus and Insulated Cable Boots:
   1. Provide insulated power bus in power distribution equipment where accessible to installers or maintenance workers.
   2. Provide cable boots for power conductor connections to insulate the exposed power conductor connections.

F. Power and Control Equipment Separation:
   1. Provide separation between power equipment within an enclosure, cabinet, or panel by the uses of barriers, separate access doors, or by other means.
   2. Provide separation barriers between main breaker feeders coming into equipment and other termination points or bussing on the load side of the main breaker.

G. Automatic Shutters:
   1. Provide automatic shutters, where possible, to close the access to the power bus when a power device is not engaged.

2.10 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Arrangement and layout drawings of the switchgear enclosures depicting equipment and bus arrangement and dimensions including areas of permissible cable entries. A list of material and components shall accompany the layout drawings.
   2. Catalog data and instruction manuals on all electrical devices and components mounted on or within the switchgear.
   3. Results of factory tests and field breaker setting tests as specified in paragraphs 1.02 Factory Tests and 3.02.
   4. Operation and maintenance information as specified in Section 01 78 23.
   5. Manufacturer's product information.
   6. Manufacturer's certification and calculations that the equipment meets the seismic requirements of Section 01 73 24-1.03.

2.11 POWER QUALITY METERS

A. Provide power monitors for each bus.
   1. Capable of monitoring and recording the following information:
      a. Instantaneous values:
         1) Current: A, B, and C phase.
         2) Voltage: Phase-to-phase and phase-to-neutral.
         3) Watts, VARs, VA.
         4) Power factor (Apparent and Displacement)
         5) Frequency.

6) THD:
a) Voltage – up to 50th harmonic.
b) Current – up to 50th harmonic.

b. Minimum and Maximum Values:
1) Volts (L-L), Volts (L-N), Current (L, N, G), Watts, VARs, VA, power factor (Apparent and Displacement.)

2. Accuracy:
a. Revenue accuracy per ANSI C12.16 (0.5 percent) and C12.20 (0.5 percent).

3. Event Logging:
a. Automatic trigger setting per ITIC standard
b. Sequence of event logging with time/data

4. Display:
a. Door-mounted LCD

5. Power Supply: 120VAC

6. Communications:
a. Ethernet/IP

7. Onboard memory:
a. 4GB minimum.

8. Time synchronization:
a. Network time protocol (NTP)

9. Manufacturers:
a. Eaton PXM6000
b. Schneider ION7550
c. Or equal

2.12 SURGE PROTECTIVE DEVICES

A. Provide metal oxide varistor (MOV) surge protective devices (SPD) on each switchgear bus.

B. Modular parallel surge protective device (SPD) shall have use metal oxide varistors. A surge suppression path shall be provided for each mode, line to neutral, line to ground, and neutral to ground. Each surge suppression mode shall be individually fused and use circuitry with thermal cutouts to isolate the SPD and ensure shutdown in the event of the MOV damage during sustained overvoltages.

C. Features: SPD shall include the following:
1. High-energy parallel design for IEEE C62.41 and C62.45 category C
2. Duty cycle tested (ANSI C 62.41 C3, 10 kA 20 kV) minimum 5000 impulses.
3. EMI/RFI filtering up to -50 dB (100 kHz to 100 MHz)
4. Form C dry contacts
5. UL 1449
6. 5-year warranty

D. Surge Capacity: 250 kA minimum surge capacity per phase.

E. Unit Mounting: SPD shall be mounted in a 22-inch tall SWGR unit. The unit shall include:
   1. Molded case circuit breaker
   2. Plexiglass cover over the circuit breaker and SPD
   3. Disconnect
   4. Display on the door with the following:
      a. LCD screen with surge count
      b. Surge count reset button.
      c. LED for each phase indicating protection is functional.
      d. LED for each phase indicating replacement is required.
      e. Alarm with silence button

2.13 AUTOMATIC TRANSFER CONTROL

A. Provide an automatic transfer control system that operates the utility main breaker, the generator main breaker, and the tie breaker to ensure power is provided to the feeder breakers whenever the utiliy source is available.

   1. The normal configuration for these breakers will be with the utility main breaker closed, the generator main breaker open, and tie breaker open for service from the incoming utility power source.

   2. In the event of the loss of the incoming source, and after 30 seconds (programmable from 2 to 120 seconds), the main breaker on the lost source shall automatically open, a call to run command shall be sent to the generator, the generator main breaker shall close, and the tie breakers shall close.
   3. Provide a enable/disable function selector switch function that allows disabling of the transfer function with indication in all user interface screens that the transfer function is not enabled

B. The restoration sequence when power is restored on the lost source shall be open transition. The generator shall open and the main breaker on the restored source shall close. Initiation of the restoration sequence shall be automatic or manual selectable via the HMI interface to the automatic transfer controller.

C. The utility main breaker, the generator main breaker, and tie circuit breakers shall be interlocked to positively prevent all three (3) breakers from all being closed at any time. This shall be done via positive electrical interlocking. The interlocking shall be redundant with two (2) means of electrical interlocking: hard-wired interlocking and programmed logical interlocking in the automatic transfer controller.

D. The controls for this transfer scheme shall be provided with the switchgear and shall be powered from either incoming power source such that the controls are fully functional regardless of which incoming power source is available.

E. Adjustable time delays shall be included for timing functions for delay on initial transfer on power loss and for the delay on automatic restoration to a restored source.

F. Provide status monitoring for the following conditions:
   1. Power loss on Source 1 (Bus A).
   2. Power loss on Source 2 (Bus B).
   3. Indication that the breakers have transferred to the generator power source.
   4. Indication that transfer back to the restored power source will occur in X seconds.
   5. Indication that transfer back to the restored power source has been initiated.
   6. Indication that transfer back to the restored power source has been completed.
   7. Provide all line and load side potential transformers to monitor voltage as required for implementation of this scheme or include interface to the power monitors specified for this switchgear.
   8. Arc flash reduction selector switch engaged (Bus A).
   9. Arc flash reduction selector switch engaged (Bus B)

G. Power loss sensing shall include single phasing, and undervoltage and overvoltage conditions.

2.14 CONTROL POWER

A. Provide all control power required for the operation of the switchgear. Control power shall be internally derived from the power buses.

B. Separate and independent power supplies shall be provided for the A side and B side of the switchgear and the associated circuit breakers and control functions. Common control power required for common functions such as automatic transfer controls and the tie breaker shall be provided via control power sources capable of drawing power from either of the A side or B side power sources should one or the other not be available. Should the control power source malfunction, the protective trip functionality of the circuit breakers shall be available whenever the breaker is powered from the line side.

C. Provide local and HMI status indicating lights that control power is available for all control power sources (utility and generator).

2.15 UNINTERRUPTIBLE POWER SYSTEM (UPS)

A. Provide a switchgear mounted 120VAC UPS system for power of the automatic transfer controller PLC, power monitor communications to SCADA and local display.

B. UPS system shall be specifically for use within the switchgear. Provide dedicated space/compartment within switchgear for UPS and batteries.

C. UPS system shall provide communications to plant SCADA system and provide the following remote monitoring capabilities:
   1. Two methods of communication shall be supported.
      a. Form "C" relay contacts. Each status item shall have its own dedicated relay contact.
      b. Modbus TCP/IP.

2. Provide remote status for:
    a. Input Fail / On battery
    b. UPS On-Line
    c. Low Battery
    d. Load on Bypass

2.16 ACCESSORIES

A. Provide a traveling type circuit breaker lifter, rail-mounted on top of switchgear.

B. A remote racking and operation device shall be provided for operation of the circuit breakers from a distance. No modification of breaker, cell or door shall be necessary to use the device. Opening and closing electrically and manually operated devices shall be possible.

C. Test Set.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install switchgear in accordance with the manufacturer's requirements and recommendations and the submitted and approved anchorage design.

3.02 PROTECTIVE DEVICE SETTINGS

A. The protective devices shall be adjusted to the settings specified in the protective device coordination study in Section 26 05 74 prior to energizing the switchgear.

3.03 FIELD TESTS

A. Each switchgear breaker shall be tested in accordance with Section 26 08 00.

END OF SECTION

SECTION 26 24 16

PANELBOARDS

PART 1 GENERAL

1.01 DESCRIPTION

A. Three phase, four wire 208Y/120 or 480Y/277 volt, dead front, circuit breaker type panelboard with current rating of 600-amperes or less.

B. Single phase, three wire 120/240 volt, dead front, circuit breaker type panelboards with current rating of 400-amperes or less.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
IEEE	Institute of Electrical and Electronic Engineers
NEMA	National Electrical Manufacturing Association
NFPA 70	National Electrical Code (NEC)
UL 50	Cabinets and Boxes
UL 67	Underwriters Laboratories, Electric Panelboards
UL 489	Molded-Case Circuit Breakers and Circuit Breaker Enclosures
UL 1449	Surge Suppression Devices

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers include:
   1. Eaton / Cutler-Hammer:
      a. PRL1a and PRL3a
   2. General Electric:
      a. AQ and AD
   3. Siemens:
      a. S1, SE, and S3
   4. Square D:
      a. NQOD and NF
   5. or equal

2.02 ARRANGEMENT AND CONSTRUCTION

A. The front of the panel shall have concealed trim clamps and hinges. The locks shall be flush with cylinder tumbler-type with spring loaded door pulls. The fronts shall not be removable with doors in the locked position. Panelboard locks shall be keyed alike.

B. Gutter space shall be provided on all sides of the breaker assembly to neatly connect and arrange incoming wiring.

C. Panelboard shall be composed of individually mounted circuit breakers designed to be removable without disturbing other breakers.

D. A directory holder with clear plastic plate and metal frame shall be mounted on the inside of the door.

2.03 BUS

A. Bus shall be tin-plated copper and shall have current ratings as shown on the panelboard schedules, sized in accordance with UL 67. Ratings shall be determined by temperature rise test.

B. The minimum bus size shall be 100 amperes. Panel fault withstand rating shall be not less than the interrupting rating of the smallest circuit breaker in the panel. Series rating is prohibited.

C. Panelboards shall be provided with a separate ground bus and, where specified, with a full capacity neutral bus. The neutral bus shall be mounted on insulated stand-offs.

2.04 CIRCUIT BREAKERS

A. Circuit breakers shall be molded-case type provided for the current ratings and pole configurations specified on the panelboard schedule. Circuit breakers shall be bolt-on type. Circuit breakers shall be listed in accordance with UL 489 for the service specified. Load terminals of circuit breakers shall be solderless connectors.

B. Circuit breakers rated 120/208 volt and 120/240 volt alternating current shall have a minimum interrupting current rating of 18,000 amperes symmetrical at 240 volt AC.

C. Circuit breakers rated 277/480 volt alternating current shall have a minimum interrupting current rating of 25,000 amperes symmetrical at 480 volt or as specified on the panelboard schedule.

D. Provide circuit breakers with special features such as ground fault interrupting (GFI), heating air conditioning and refrigeration (HACR) rating, or locking capability as shown on the Drawings or Schedules.

2.05 FINISH

A. Panelboard cabinet shall be fabricated from hot-dip galvanized steel in accordance with UL 50. Panelboard fronts shall have a gray, baked enamel finish.

2.06 NAMEPLATES

A. Nameplates shall be provided in accordance with the requirements of Section 26 05 00.

2.07 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's certification that bus bracing is capable of withstanding the specified short circuit condition.
   2. Operation and maintenance information as specified in Section 01 78 23.
   3. Quantity and rating of circuit breakers provided with each panelboard.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall type in the circuit description on the circuit directory as shown on the final record drawings or panelboard schedule.

B. Provide “Circuit Directory and Circuit Identification” in accordance with NEC 408.4. Each circuit shall be of sufficient detail to allow each circuit to be distinguished from other circuits. Circuit identification shall include load location and provide equipment or instrument Tag Number and Tag Description, where shown on the drawings.

3.02 TESTING

A. Panelboards shall be tested for proper operation and function.

3.03 SCHEDULE

A. Panelboards schedules as shown on the drawings.

END OF SECTION

SECTION 26 24 19

MOTOR-CONTROL CENTERS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies freestanding, factory assembled 600 (480) volt Motor Control Centers (MCC) with digital power monitors to display the voltage and current load parameters.

B. Equipment List:
   1. MCCs specified herein shall be furnished by a single manufacturer.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/NEMA ICS 1	Industrial Control Systems: General Requirements
ANSI/NEMA ICS 18	Motor Control Centers
NFPA 79	Electrical Standards for Industrial Machinery
UL 845	Motor Control Centers

B. Codes And Standards:
   1. Motor Control Centers and all components shall be Underwriters Laboratory listed to UL 845 and shall conform to NEMA ICS-1 and ICS-18 standards.

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Elementary connection and interconnection diagrams as required in paragraph 2.07, in accordance with NFPA 79 and/or NEMA ICS 18 Part 1 standards.

2. List of starters and feeder tap compartments indicating the size and type of circuit protection.
3. Interrupting, withstand, and continuous current rating of:
    a. Bus bars
    b. Feeder tap units
    c. Starter units
    d. Main incoming units
4. Nameplate schedule.
5. Dimensioned drawings showing conduit access locations.
6. Front view elevation with starter and component schedule.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Motor Control Centers shall be as manufactured by Allen Bradley, Square D, or equal.

2.02 SERVICE

A. Motor control centers shall be rated 480 volts, 60 Hertz, 3 phase, 3 wire (no neutral bus) as specified or indicated, suitable for operation at the specified voltages and short circuit capacities.

2.03 STRUCTURE AND CONSTRUCTION

A. Structure:
    1. Motor control centers shall be made of No. 14 gage steel minimum and, unless otherwise shown, each section shall be 90 inches high by 20 inches wide by 20 inches deep. The individual unit compartments shall be a minimum of 12 inches high.
    2. Each section shall have 72 inches for stacking starter units into the sections. Size NEMA 1 through 3 FVR and FVNR starter units shall be provided with an additional 6 inches of vertical space.
    3. The compartments shall have pan-type doors with a minimum of two quarter-turn hold-down latches; and neoprene gaskets.
    4. A full height vertical wireway, 4 inch wide minimum, but not less than 30 square inches in cross section, shall be provided for each vertical motor control center section. The wireway shall contain full height removable doors. Horizontal wireways shall be provided top and bottom, extending the length of motor control centers.
    5. Bottom channel sills shall be mounted front and rear of the vertical sections extending the full length of the motor control center lineup. A removable lifting angle shall be mounted on top and shall extend the width of the motor control center lineup.

B. Construction:
   1. Motor control centers located indoors shall have NEMA 1, gasketed enclosures.
   2. Starter units, size 4 and smaller, and feeder tap units less than 225 amperes shall be drawout plug-in construction with hardened, tin-plated copper free-floating stabs, steel spring backups. The door shall have interference tabs which prevent door closure if unit is improperly installed.
   3. Units shall be latched in the position to assure proper bus contact. The unit disconnect device shall be interlocked to prevent removal or reinsertion of a unit when the disconnect is in the "ON" or "TRIPPED" positions.
   4. Fusible switch or circuit breaker disconnect operators shall be capable of accommodating three padlocks for locking in the "OPEN" position.
   5. Hardware for mounting future starter and feeder tap units shall be provided at compartments specified as "FUTURE."

C. Seismic Bracing:
   1. Motor control centers and related equipment shall conform to the seismic anchorage and bracing requirements of Section 01 73 23. As an additional minimum requirement, the Motor Control Centers shall be braced for the requirements of Section 01 73 23.

2.04 FINISH AND COLOR

A. The finish and color shall be in accordance with Section 26 05 00.

2.05 BUS

A. General:
   1. Bus shall be tin-plated copper with bolted connections between vertical and horizontal bus bars. Access for tightening these connections shall be from the front, without the need for tools on the rear of the connection. Insulated horizontal and vertical bus barriers shall be provided. Barriers shall be fabricated from high-strength, glass-filled polyester resin.
   2. The bus shall be braced to withstand a fault current of 65,000 amperes, RMS, symmetrical.

B. Horizontal Bus:
   1. Unless otherwise specified or shown, the main horizontal bus shall be rated a minimum 1600 amperes continuous.

C. Vertical Bus:
   1. Unless otherwise specified or shown, the vertical bus shall be insulated and rated a minimum 300 amperes continuous.

D. Neutral Bus:
   1. The neutral bus shall be provided and have the same rating as the main horizontal bus, where specified or shown.

E. Ground Bus:
   1. A 1/4-inch by 2-inch ground bus shall be provided the full length of the motor control center. Ground bus shall be located at the bottom of the motor control center. Provide a lug to terminate a bare 4/0 AWG copper ground conductors at each end of the ground bus.

2.06 WIRING

A. General:
   1. Motor control centers shall be provided with NEMA ICS 18 Class II, Type B wiring. All starter units shall have terminal blocks for control wiring. Terminal blocks shall be provided for power wiring for starters size 2 and smaller.
   2. Motor control centers shall be provided with all necessary interconnecting wiring and interlocking. When a MCC control section is specified on the drawings or schedules, wire directly to the relays or programmable controller's input/output modules as part of the interconnecting wiring.
   3. Provide elementary and connection diagrams for each starter unit and an interconnection diagram for the entire motor control center.

B. Power Wire:
   1. Power wire shall be copper 90 degrees C insulated, sized to suit load; minimum power wire size shall be No. 12 AWG copper stranded.

C. Control Wire:
   1. Control wire shall be No. 16 AWG stranded copper wire, rated 90 degrees C machine tool wiring (MTW) and UL listed for panel wiring.

D. Terminations and Cable Connections:
   1. Terminals:
      a. Control wiring shall be lugged with ring-tongue or locking spade crimp type terminals made from electrolytic copper, tin-plated.
   2. Cable Connectors:
      a. Cable connectors for use with stranded copper wire, sizes No. 8 AWG to 1000 kCmil shall be UL listed. Dished conical washers shall be used for each bolted connection. Connectors shall be reusable and shall be rated for use with copper conductors. Incoming line and outgoing feeder compartments shall be provided with crimp type lugs, 3M Company, Burndy Company, or equal.

E. Conductor Markers:
   1. Each power and control conductor shall be identified at each terminal to which it is connected. Conductors size No. 10 AWG or smaller shall have identification sleeves. Conductors No. 8 AWG and larger shall use cable markers of the locking tab type. Tabs shall be white plastic with conductor identification number permanently embossed.
   2. Adhesive strips are not acceptable.
   3. The letters and numbers that identify each wire shall be machine printed on sleeves with permanent black ink with figures 1/8 inch high. Sleeves shall be yellow or white tubing and sized to fit the conductor insulation. Shrink the sleeves with hot air after installation to fit the conductor.

2.07 MAIN AND FEEDER CIRCUIT PROTECTION

A. General:
   1. Main and feeder tap units shall consist of fused disconnect switches or circuit breakers, as specified or shown. Series ratings for overcurrent devices to meet specified short circuit withstand ratings is prohibited.

B. Circuit Breakers (Thermal Magnetic):
   1. Thermal-magnetic circuit breakers shall be molded case equipped with toggle type handle, quick-make, quick-break over center switching mechanism that is trip-free so that breaker cannot be held closed against short circuits and abnormal currents. The tripped position shall be clearly indicated by breaker handle maintaining a position between "ON" and "OFF." All poles shall open, close, and trip simultaneously. Minimum short circuit capacity shall be 65,000amperes symmetrical.

C. Circuit Breakers (Magnetic Only):
   1. Magnetic circuit breakers shall be molded-case equipped with toggle type handle, quick-make, quick-break over center switching mechanism that is trip-free so that breaker cannot be held closed against short circuits and abnormal currents. The tripped position shall be clearly indicated by breaker handle maintaining a position between "ON" and "OFF." All poles shall open, close, and trip simultaneously. Minimum short circuit capacity shall be 65,000 amperes symmetrical.

2.08 MOTOR STARTER UNITS

A. General:
   1. Motor starter units shall be combination type with contactor and fused disconnect switch, thermal magnetic circuit breaker, or motor circuit protector, and solid-state overload unit as indicated on the drawings or specified in the MCC schedule. The starter units shall have a minimum combination UL listing of 65,000 amperes RMS symmetrical or as indicated or specified in the schedule.

B. Motor Circuit Protectors:
   1. The molded case motor circuit protector (MCP) shall operate on the magnetic principle with a current sensing coil in each of the three poles to provide an instantaneous trip for short circuit protection. The trip setting shall be adjustable from 700 to 1300 percent of the motor full load amperes from the front of the MCP. The motor circuit protector shall be set at its lowest position at the factory.

C. Control Transformers:
   1. Each control transformer shall be rated 480/240-120V, single phase, 2-wires, 60 Hertz. The transformer shall be sized for the load it feeds but shall not be less than the minimum ratings as follows:

NEMA starter size	Minimum transformer volt-ampere rating
1	100
2	150
3	200
4	300

2. Each control transformer shall be provided with time-delay, slow-blow secondary fuse rated to interrupt 10,000 amperes short circuit at 250 volts AC. Two primary fuses rated to interrupt 200,000 amperes at 600 volts shall be provided on all starters.
3. Fuse holder for secondary fuse shall be drawout indicating type and mounted on the door of the compartment. Fuse holders for primary fuses shall be fuse clips with full barriers between fuses.

D. Contactors:
1. Unless otherwise specified or shown, contactors shall be full voltage, 3-pole, 600 volt AC, NEMA Size-1 minimum. Contacts shall be double break, silver-cadmium oxide, and weld resistant. Contacts shall be isolated to prevent arcing. Coils and magnets shall be capable of being removed or replaced without special tools. IEC contactors are prohibited.
2. Reversing, multispeed, and reduced voltage starters shall have additional contactors, overload relays, and auxiliary relays as required, and shall have mechanically interlocked contactor coils to prevent simultaneous engagement.

E. Transient Voltage Surge Suppressor:
1. Provide metal oxide varistor (MOV) surge protective device (SPD) integral within each motor control center that indicates the status and condition of the SPD, tested per NEMA LS-1, rated IEEE C3 Combined Wave of 20kV and 10kA with 200kAIC internal fusing and listed / labeled per UL 1449. Minimum surge rating: 160kA per phase.
2. Provide a factory selected transient surge suppressor rated for each motor starter and power contactor encapsulated in a small module and mounted directly to the starter or contactor coil.

F. Auxiliary Contacts:
1. Contactors shall be equipped with auxiliary contacts, rated 10 amperes at 120 volts AC. Refer to drawings for actual quantities required. As a minimum, each contactor shall be equipped with two normally open and two normally closed electrically isolated auxiliary contacts with the used and auxiliary contacts wired out to terminal blocks.

G. Overload Relay:
1. The solid-state overload relay shall protect the power wiring and motor from excessive overcurrents. The relay shall be ambient compensated and have adjustment from 90 to 110 percent of the normal rating.
2. The sensing element shall be adjustable Class 20 tripping time of 20-seconds at 600-percent of current setting. The faster overload trip Class 10 (10-seconds at 600-percent of current setting) and the longer overload trip Class 30 (30-seconds at 600-percent of current setting) shall be field set by the installer during the driven equipment startup with the overload settings that are required by the type of motor driven load.

H. Terminal Blocks:
1. Terminal blocks shall be screw type rated 600 volts; 20 amperes for control wiring and 30 amperes power wiring with starters Size 3 and larger shall terminate the power leads directly to the contactor.

2. The number of terminal blocks shall be specified on the drawings. Terminal blocks shall be provided with integral marking strips and shall be permanently marked with the conductor number as specified on the drawings. Internal wiring shall be connected on one side of the terminal block; outgoing conductors shall be connected to the other side.

2.09 MISCELLANEOUS

A. General:
   1. Control devices such as pushbuttons, selector switches, indicating lights and overload reset pushbuttons shall be mounted on the unit compartment door.
   2. The control devices shall comply with the requirements of Section 26 09 16.

B. Elapsed Time Indicator:
   1. Where shown or specified, the elapsed time indicator shall be as specified in Section 26 09 16. The indicator shall be mounted on the unit compartment door.

C. Nameplates:
   1. Nameplates shall be provided in accordance with the requirements of Section 26 05 00. Nameplates shall be provided for all cubicles and compartments and identify the load per NEC. A Nameplate shall be provided identifying the motor control center. Provide equipment tag numbers and descriptions as shown on the drawings.

2.10 SPACE HEATERS AND THERMOSTATS

A. Motor control centers located outdoors or in a corrosion rated area shall be provided with space heaters and thermostats to maintain the interior temperature at more than 45 degrees F. Space heaters and thermostats shall be rated 120 volts AC. Space heater shall be powered from a control power transformer.

2.11 DRY-TYPE TRANSFORMERS

A. Dry-type energy efficient power transformers shall meet the requirements of Section 26 22 00. The size and voltage shall be as specified.

2.12 ADJUSTABLE FREQUENCY DRIVES

A. AFDs mounted in motor control centers shall be flush mounted and shall meet the following requirements.
   1. AFD, ASD, VFD, VSD are interchangeable terms.
   2. Provide variable or constant torque PWM type drives for motors as indicated on the Drawings. MCC mounted AFD's shall not be applied for motors exceeding 60 horsepower. Include circuit breaker disconnecting means, 3-percent line reactors and cooling fans as required to dissipate the heat into the room.
   3. Provide a motor terminator to trim the reflected-wave voltage spike from reflected waves from the motor where indicated on the Drawings.
   4. Provide ratings as indicated.
   5. Provide microprocessor Operator Interface Station (OIS) on the AFD door.
   6. EMI/RFI shielding as required for products and wiring.

7. Provide current limiting fuses for short circuit protection.
8. Provide factory technician for setup, startup services, and training.
9. Data communication: None.
10. Provide four Form C relays with 5-ampere contacts for interlocks.
11. Provide four programmable relay outputs for on-off status, alarm, “Remote” mode.
12. Provide isolated 4-20madc analog input for speed control.
13. Provide isolated 4-20madc analog output for speed indication.
14. Provide a harmonics filter for the MCC bus. Meet IEEE-519 for voltage and current harmonics with Point-of-Common-Coupling at the MCC bus.

2.13 REDUCED VOLTAGE SOLID STATE STARTERS (RVSS)

A. RVSS mounted in motor control centers shall be flush mounted and shall meet the following requirements.
   1. Provide ratings as indicated and circuit breaker.
   2. Provide full-voltage operating contactor. Provide cooling fan and filter, as required.
   3. Provide EMI/RFI shielding as required for products and wiring.
   4. Provide current limiting fuses for short circuit protection, as required.
   5. Provide factory technician for setup, startup services, and training.
   6. Data communication: None.
   7. Provide [one] [two] [three][four] Form-C relays with 5-ampere contacts for interlocks.
   8. Provide selectable kick start and adjustable ramp up and ramp down speeds.
   9. Provide overload protection with selectable classes of 10, 15, 20, and 30 with three-phase current sensing, initially set for 20 and field adjusted as required for the application by the Factory Engineer.
   10. Provide the following selectable protection:
      a. Under-load
      b. Under-voltage
      c. Over-load
      d. Over-voltage
      e. Voltage Unbalance
      f. Excessive Starts Per Hour
      g. Phase Reversal
      h. Stall and Jam
   11. Provide microprocessor Operator Interface Station (OIS) on the SSS door and display as a minimum:
      a. Three-phase current
      b. Three-phase voltage
      c. Power in kW
      d. Power usage in kWh
      e. Power factor
      f. Elapsed time

12. Provide programmable relay outputs for:
    a. Fault alarm
    b. On-Off status
    c. Auto mode or Remote mode status
    d. Ready status
    e. Full-Speed-Bypass status

2.14 SPARE PARTS

A. One set consisting of the following spare parts shall be provided:
    1. 1--set each fuse size and type
    2. 10--indicating light bulbs

2.15 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
    1. Manufacturer's certification that the following items are capable of interrupting and/or withstanding the specified short circuit condition:
        a. Bus bar bracing
        b. Feeder tap units
        c. Starter units
    2. Operation and maintenance information as specified in Section 01 78 23.
    3. Dimensions and weights.
    4. Installation instructions.
    5. Manufacturer's product data.
    6. Manufacturer's certification and calculations confirming that the equipment complies with the seismic anchorage and bracing requirements of Section 01 73 23 and paragraph 2.03 Seismic Bracing.

PART 3 EXECUTION

3.01 GENERAL

A. The motor control centers shall be erected in accordance with the recommendations of the manufacturer and with the details specified herein.

B. Field wiring shall meet the requirements of Section 26 05 19-3.02.] Cables larger than No. 6 AWG which hang from their vertical connections shall be supported within 2 feet of the connection.

C. The solid-state overload relay settings shall be implemented by the Contractor with the settings selected based on the actual full load amperes of the motor connected to the starter and the requirements of the motor driven equipment. Refer to the manufacturer’s literature for setting the overload relays. Refer to the overload relay paragraph 2.09 Overload Relay for the setting options that available in the overload relay.

D. The motor circuit protectors shall be adjusted by the Contractor to the lowest setting not causing false tripping.

E. Install motor control centers level and plumb on 3-1/2-inch concrete housekeeping pads per the manufacturer's installation instruction.]

F. [Seismic anchorage shall be per Section 01 73 23.

3.02 FIELD TESTS

A. Motor control centers shall be tested in accordance with Section 26 08 00.

END OF SECTION

SECTION 26 27 26

WIRING DEVICES

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section specifies wiring devices consisting of receptacles, plugs, switches and appurtenances.

1.02 REFERENCES

A. This Section contains references to the following documents. They are a part of this Section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this Section as if referenced directly. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
NEMA 250	Enclosures for Electrical Equipment (1000 volts maximum)
NEMA WD-1	General Requirements for Wiring Devices
NFPA 70	National Electrical Code (NEC)

PART 2 PRODUCTS

2.01 GENERAL

A. Wiring devices shall be UL approved for the current and voltage specified and shall comply with NEMA WD-1. Devices shall contain provisions for back wiring and side wiring with captive binding screws.

B. Provide devices colored to conform to manufacturer's or industry standard for special use such as orange for isolated ground receptacles, blue for surge suppression receptacles, and red for emergency power receptacles. Unless shown otherwise on the Drawings or Schedules, normal use devices shall be brown, except those located in finished areas shall be ivory.

2.02 RECEPTACLES AND PLUGS

A. General:
   1. Receptacles shall be grounding type.

B. 120V Receptacles:
   1. Indoor, Clean Areas:
      a. Unless shown otherwise on the Drawings or Schedules, receptacles shall be duplex 20 amp, NEMA 5-20R, and shall accept NEMA 5-15P and 5-20P plugs. Where the manufacturer of cord connected equipment requires and isolated ground, a receptacle with isolated ground shall be provided.
         1) Manufactures: Hubbell 5362, 5362-AI or equal.
         2) Isolated ground receptacle manufactures: Hubbell IG-5362, Arrow-Hart IG5362, or equal.
   2. Outdoor, Process or Corrosive Areas:
      a. Receptacle shall be duplex, 20 ampere, NEMA 5-20R, and shall accept NEMA 5-15P and 5-20P plugs. Receptacle and plug shall be corrosion resistant, marine duty with yellow polycarbonate weatherproof lift covers that maintain weatherproofing during receptacle use.
         1) Manufacturers: Hubbell 53CM62/53CM21, 15W33W/O BOX, or equal.

C. 250V Receptacles:
   1. Receptacles shall be duplex 15 amp, NEMA 6-15R, and shall accept NEMA 6-15P plug caps. Receptacles shall be Hubbell 5662, Arrow Hart 5662, or equal. Plug caps shall be Hubbell 5666-C, Arrow-Hart 6866, or equal.

D. Plug Caps:
   1. Male plug caps for 120 volt and 250 volt receptacles shall be of the cord grip armored type with heavy phenolic housing, of the same manufacture as the receptacle. Plug caps shall be rated 15 amps. One plug cap shall be provided for every four receptacles furnished, with a minimum of two plug caps being provided. Plug caps shall be delivered to the Construction Manager.

E. Three Phase Receptacles and Plugs:
   1. Receptacles shall be suitable for 480 volt, 3-phase, 4-wire service, with ampere ratings as specified. Receptacles and plugs shall be designed so that the grounding pole is permanently connected to the housing. The grounding pole shall make contact before the line poles are engaged when the plug is connected to the receptacle housing. The plug sleeve shall also make contact with the receptacle housing before the line and load poles make contact. Receptacles shall be provided complete with cast back box, angle adapter, gaskets, and a gasketed screw-type, weathertight cap with chain fastener. Each receptacle shall be provided with one plug.
   2. Manufactures:
      a. Crouse-Hinds "Arktite," Appleton "Powertite," or equal.

F. Receptacles for Hazardous Areas:
   1. Receptacles for use in hazardous areas shall be rated in accordance with NEC for the area in which they are to be located and shall be factory sealed. Receptacles shall be designed so the plug must be inserted and turned before load is energized. Receptacles shall be provided with mounting box, sealing chamber, and compatible plug. Voltage and current ratings shall be as 120 Vac, 20-ampere.
   2. Manufactures:
      a. Appleton "U-Line," Crouse-Hinds "Ark-Gard 2," or equal.

2.03 SWITCHES

A. General Purpose (Indoor, Clean Areas):
   1. General purpose switches shall be quiet AC type, specification grade, back and side wired, and shall be provided in accordance with rated capacities as required or as indicated on Drawings or Schedules. Switches shall match receptacles in color.
   2. Manufactures:
      a. General Electric, Hubbell, or Construction Manager accepted substitute , as follows:

	15A, 120-277V		20A, 120-277V	
	G.E. Co.	Hubbell	G.E. Co.	Hubbell
Single:	PS 15AC1	HBL1201	PS 20AC1	HBL1221
Three-way:z	PS 15AC3	HBL1203	PS 20AC3	HBL1223
Four-way:	PS 15AC4	HBL1204	PS 20AC4	HBL1224
SPST momentary:	# 7842	--	--	--
Three position center off momentary:	# 1250	HBL1556	--	HBL1557

B. Switches for Outdoor and Corrosive Areas:
   1. Switches shall be 20-ampere with weatherproof/ corrosion resistant neoprene plate. Switches shall be mounted in "FS" type copper-free aluminum or PVC mounting boxes.
   2. Manufactures:
      a. Hubbell or Arrow-Hart as follows:

	Hubbell with 17CM50 plate	Arrow-Hart with 2881 plate
Single pole	1281	2991
Double pole	1282	2992
3-way	1283	2993
4-way	1284	2994

2.04 DEVICE PLATES

A. Device plates shall be provided with switches. In non-corrosive indoor areas, receptacle device plates shall be made of sheet steel, zinc electroplated with chrome finish as manufactured by Crouse-Hinds, Appleton, or equal.

B. Device plates in corrosive or outdoor areas shall be corrosion-resistant/marine-duty type. Device plates for explosion-proof equipment shall be factory provided with the equipment.

C. Device plates shall be provided with engraved laminated phenolic nameplates with 1/8-inch white characters on black background.

D. Nameplates for switches shall identify panel and circuit number and area served. Nameplates for receptacles shall identify circuit and voltage if other than 120 volts, single phase.

2.05 PLUG STRIPS

A. Plug strips shall be manufactured of sheet steel with the receptacles mounted on the front cover. The front cover shall be removable.

B. Plug strips for office and laboratory areas shall have single 3 wire, 20 ampere grounding type receptacles mounted along the strip on a single circuit.

C. Plug strips for work benches in shop and laboratory areas shall have 3 wire, 20 ampere grounding type duplex receptacles mounted along the strip on the circuits specified. Sufficient space shall be provided behind the receptacles for ten No. 12 AWG conductors in accordance with the NEC space rules.
   1. Manufacture of plug strips:
      a. Plugmold, or equal.

2.06 PRODUCT DATA

A. In accordance with Section 01 33 00, the Contractor shall provide catalog cuts for all materials provided under this section.

PART 3 EXECUTION

3.01 INSTALLATION

A. Boxes shall be independently supported by galvanized brackets, expansion bolts, toggle bolts, or machine or wood screws as appropriate. Wooden plugs inserted in masonry or concrete shall not be used as a base to secure boxes, nor shall welding or brazing be used for attachment.

B. Receptacles and switches installed in sheet steel boxes shall be flush mounted. Flush mounted receptacles shall be located 18 inches above the floor unless otherwise indicated. Switch boxes shall be mounted 48 inches above the floor. Receptacles installed in cast device boxes shall be located 48 inches above the floor.

C. Wiring devices shall be tested for correct connections.

END OF SECTION

SECTION 26 28 16.16

ENCLOSED SWITCHES

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies:
   1. 3-Pole Enclosed Disconnect Switches: Straight-Blade
   2. 3-Pole Enclosed Disconnect Switches: Rotary
   3. Single Phase Enclosed Disconnect Switches

B. Request clarification where conflicts occur with this section and other sections in Divisions 23, 26, 40, 43, and 46.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid or on the effective date of the Agreement if there were no Bids.

C. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

D. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
NEMA FU-1	Low Voltage Cartridge Fuses
NEMA KS-1	Enclosed and Miscellaneous Distribution Equipment Switches (600 V Max.)
UL 98	Enclosed and Dead-Front Switches
UL 250	Enclosures for Electrical Equipment

1.03 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
      a. Check marks shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
      b. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
      c. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Nameplate legend with engraving and sizes.
   3. Manufacturer's catalog data for all material provided under this section shall be assembled in a folder with each page clearly marked with the item model number and reference number to the specification.
   4. Operation and maintenance data as specified in Section 01 78 23 including approved submittal manufacturer’s catalog data, as-built drawings, and instructions for all configurable or programmable components.

PART 2 PRODUCTS

2.01 3-POLE ENCLOSED SWITCH ASSEMBLIES: STRAIGHT-BLADE

A. Manufacturers:
   1. ABB TH Series
   2. Eaton DH Series
   3. Schneider Electric H Series
   4. Or equal

B. Standards:
   1. UL 98 listed
   2. NEMA KS-1 compliant

C. Features:
   1. Enclosure:
      a. Dead-front design with hinged door
      b. Environmental Ratings:
         1) Indoor enclosures: UL Type 12
         2) Outdoor or corrosive areas: UL Type 4X 316 stainless steel
         3) Hazardous classified areas: UL type suitable for the class, division, and group of the hazardous classified area into which the switch will be installed.
      c. Finish Color: ANSI 61 gray
   2. Switch Mechanism:
      a. Ratings:
         1) Voltage: 600VAC
         2) Amps: As indicated on the Drawings
         3) Poles: 3
      b. Quick-make, quick-break type
      c. Straight-blade switch with vertical up/down handle.
      d. Line terminal shields
   3. Fuses:
      a. Where a disconnect switch is indicated as fused on the Drawings, provide Class R current-limiting fuses, conforming to NEMA FU-1, rated minimum 100kAIC.
   4. Interlocks:
      a. Preventing door from being opened when the switch is in the "ON" position. With defeat mechanism on switch exterior.
   5. Padlocking Provisions:
      a. Suitable to install padlock with 3/8" shank to lock the switch in the OFF position.
      b. Suitable to install padlock with 3/8" shank to lock the hinged door in the CLOSED position.
   6. Equipment Ground Lug:
      a. With terminations for incoming and outoing equipment ground cables.
      b. Bonded to switch enclosure.
   7. [Auxilary Contact(s):
      a. Where indicated on the Drawings (Control Schematics), provide auxiliary contacts in the Disconnect switch with a break-before-break configuration where the auxiliary contact opens before the main power contacts open.]

2.02 3-POLE ENCLOSED SWITCH ASSEMBLIES: ROTARY

A. Manufacturers:
   1. Eaton ER Series
   2. Leviton LDS Series
   3. Hubbell HBLDS3 Series
   4. Mennekes DS Series
   5. Or equal

B. Standards:
   1. UL 98 listed
   2. NEMA KS-1 compliant

C. Features:
   1. Enclosure:
      a. Dead-front design with cover secured by 4 stainless steel screws
      b. Environmental Ratings:
         1) Indoor enclosures: UL Type 12
         2) Outdoor or corrosive areas: UL Type 4X 316 stainless steel
         3) Hazardous classified areas: UL type suitable for the class, division, and group of the hazardous classified area into which the switch will be installed.
      c. Finish Color: ANSI 61 gray
   2. Switch Mechanism:
      a. Ratings:
         1) Voltage: 600VAC
         2) Amps: As indicated on the Drawings
         3) Poles: 3
      b. Quick-make, quick-break type
      c. Rotary type with 90 degree travel operating handle
   3. Fuses:
      a. Where a disconnect switch is indicated as fused on the Drawings, provide Class J current-limiting fuses, conforming to NEMA FU-1, rated minimum 100kAIC.
   4. Interlocks:
      a. Preventing door from being opened when the switch is in the “ON” position.
   5. Padlocking Provisions:
      a. Suitable to install padlock with 3/8” shank to lock the switch in the OFF position.
   6. Equipment Ground Lug:
      a. With terminations for incoming and outoing equipment ground cables.

2.03 SINGLE-PHASE ENCLOSED SWITCH ASSEMBLIES

A. Manufacturers:
   1. Non-Classified Locations:
      a. Bryant 30102D
      b. Greenheck N1TS4
      c. Hubbell HBL13 Series
      d. Or equal
   2. Hazardous Classified Locations:
      a. Appleton EDS series
      b. Or Equal

B. Features:
   1. Enclosure:
      a. Environmental Ratings:
         1) Indoor enclosures: UL Type 3 or 12
         2) Outdoor or corrosive areas: UL Type 4X 316 stainless steel
         3) Hazardous classified areas: UL type suitable for the class, division, and group of the hazardous classified area into which the switch will be installed.
      b. Finish Color: ANSI 61 gray
   2. Switch Mechanism:
      a. Ratings:
         1) Voltage: 240VAC
         2) Amps: 30A minimum
         3) Poles: 1 or 2
      b. Quick-make, quick-break type
      c. Toggle switch or rotary type
      d. Switch disconnecting motor circuits:
         1) Motor rated for the horsepower of the connected load
   3. Non-fused
   4. Interlocks:
      a. Preventing door from being opened when the switch is in the “ON” position.
   5. Padlocking Provisions:
      a. Suitable to install padlock with 3/8” shank to lock the switch in the OFF position.

2.04 NAMEPLATES

A. Provide nameplates for all enclosed switches in accordance with the requirements of Section 26 05 00-2.04.

2.05 ACCESSORIES:

A. Provide the following:
   1. One fuse puller for each class of fuse installed up to 200A.

2.06 SPARE PARTS

A. Provide the following:
   1. One set (3) spare fuses for each type and amp rating provided.

PART 3 EXECUTION

3.01 APPLICATION

A. Provide rotary type disconnects switches for valve actuators and HVAC equipment only

3.02 INSTALLATION

A. Install switch assemblies 60 inches above the floor, ground, or slab to center of operating handle.

B. Install fuses for fusible switches.

C. Install nameplates with the equipment tag number, equipment description, and power source as indicated on the drawings. Labeling requirement shall be met by the electrical contractor regardless of which trade has provided and/or installed the disconnect switch.

D. Provide adhesive tag on inside door of each fused switch indicating NEMA fuse class and size installed.

E. Perform acceptance testing of enclosed switches in accordance with Section 26 08 00.

END OF SECTION

SECTION 26 29 13

ENCLOSED CONTROLLERS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies individual motor starters and motor controllers installed in enclosures other than motor control centers. Refer to drawings for product, device, and circuit requirements.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid or on the effective date of the Agreement if there were no Bids.

C. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

D. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
NEMA ICS 1	General Standards For Industrial Control and Systems
NEMA 250	Enclosures for Electrical Equipment (1000-Volt Maximum)

1.03 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:
   1. Verification of fault withstand ratings, as applicable, and interrupting ratings
   2. The bill-of-material, schematic diagram, and wiring diagrams

PART 2 PRODUCTS

2.01 ENCLOSURE

A. The door to the motor starter enclosure shall be interlocked with an externally operated disconnect handle. Disconnect handle shall be arranged to indicate disconnect position. The disconnect operator handle shall have provisions to accept up to three 3/8-inch shackle padlocks to lock the disconnect in the open position.

B. Enclosures shall be:
   1. NEMA 12 for indoor areas.
   2. NEMA 3R for outdoor areas.
   3. NEMA 4X [stainless steel, or non-metallic in chlorine storage areas]
   4. NEMA 7 cast metal for hazardous areas.

2.02 MOTOR BRANCH CIRCUIT PROTECTION

A. General:
   1. Motor branch circuit protection shall be provided by fused disconnect switches or molded case motor circuit protectors as specified or as indicated.

B. Fused Disconnect Switches:
   1. Fused disconnect switches shall be provided with visible knife blades, shielded line terminals and quick-make, quick-break switch operator. Fuse clips shall be Class R rejection type and sized for UL Class RK, one-time, time-delay fuses. Fuse assembly shall have a minimum short circuit capacity of 50,000 amps symmetrical.

C. Molded Case Motor Circuit Protectors:
   1. The motor circuit protector (MCP) type molded case circuit breaker shall only be used as a part of a combination motor starter.
   2. The MCP shall operate on the magnetic principle with a current sensing coil in each of the three poles to provide an instantaneous trip for short circuit protection. The trip setting shall be adjustable over a range of 700 to 1300 percent of the full load current of the motor served and shall be adjustable from the front of the breaker.
   3. The MCP circuit breaker shall be rated to interrupt [42,000] ampere symmetrical when used in conjunction with an individual motor starter.

2.03 MOTOR STARTERS

A. The basic full voltage, non-reversing motor starter (FVNR) shall consist of a 3 pole, 600 volt AC contactor, transient surge suppressor, and solid-state overload relay, NEMA Size-1 minimum. Reversing (FVR) and multispeed (2S2W) starters shall have additional contactors, overload relays and auxiliary relays as required for the specified functions.

B. The contactors shall comply with NEMA ICS and NEMA rated for the horsepower as specified.

C. Overload relays shall be adjustable solid-state with protection for each of the poles. An overload condition shall cause the overload relay to latch in the open position. Reset shall be accomplished with a reset button located on the unit door exterior. Trip setting shall be adjustable from 85 to 115 percent of rating. Provide [1] [2] Form C 2-ampere auxiliary contact for remote monitoring of the overload alarm condition.

2.04 SOLID STATE STARTERS

A. The solid state reduced voltage motor starter shall consist of a self-contained unit for the control of 3-pole, 460-volt, 60-Hertz electric motors. The starter shall use solid-state components to limit current during motor starting and stopping. The starter shall include built-in bypass contacts operating closed when the motor is running at speed.

B. Controls shall permit selection among soft-start with selectable kickstart, current limiting with starting that is programmable 50 to 600 percent of full load current and field set as required. Full voltage start with ramp time less than 0.25 second, dual ramp start, or a start profile designed to reduce fluid surges when starting pumps. Controls shall permit field selection among ramp to stop, coast to stop, or stop profile designed for use with pumps.

C. Provide an alphanumeric, backlit LCD display. Example: four-line 16-character, for controller set-up, diagnostics, status and monitoring. Provide a keypad for parameter adjustment.

D. Provide motor overload protection with selectable trip classes of 10, 15, 20 and 30 utilizing three-phase current sensing, initially field set at 20 and field adjusted as required for the application by the Factory Engineer.

E. Provide a minimum of four 2-ampere, 240 Vac rated auxiliary contacts for customer use. Configure output contacts for:
   1. “Auto-Mode” status, “Ready” status, “Full-speed-Bypass” status, and “Fault” alarm. Provide for remote start command. Provide for remote stop command.

F. Provide the following monitoring functions indicated through the LCD display:
   1. Three-phase current
   2. Three-phase voltage
   3. Power in kW
   4. Power usage in kWh
   5. Power factor
   6. Elapsed time.

G. Provided as standard:
   1. Pre-start line fault alarm
   2. Running line fault advising power loss
   3. Shorted or missing load connection
   4. Pre-start power loss with phase indication
   5. Over-temperature
   6. Fault alarm with phase problem indication.

H. Provide the following defeatable protection as standard:
   1. Under-load
   2. Under-voltage
   3. Over-load
   4. Over-voltage

5. Voltage Unbalance
6. Excessive Starts Per Hour
7. Phase Reversal
8. Stall
9. Jam.

I. When fault conditions are detected, the controller shall inhibit starting or shut down. Fault diagnostics shall be indicated in descriptive text on the LCD display. The exclusive use of fault codes is unacceptable. Provide an auxiliary contact that is programmable for fault indication.

J. Manufacture and model:
1. ABB
2. Allen-Bradley Bulletin 150 SMC Flex
3. GE
4. Eaton - Cutler Hammer
5. Siemens
6. Square D
7. or equal

2.05 TERMINAL BLOCKS

A. Terminal blocks shall be heavy duty, rated at 20 amperes, 600 volts, and shall contain integral marking strips.

B. Terminal blocks shall be provided for external control connections. Spare terminals shall be provided as specified. Terminals shall be permanently identified with the numbers specified.

2.06 CONTROL DEVICES

A. Combination starters shall be provided with door-mounted control devices as shown on the diagrams. Control devices shall be as specified in Section 26 09 16.

2.07 SURGE PROTECTION DEVICE

A. Surge protection devices shall be provided in each starter. Suppressors shall be encapsulated, three component, solid-state circuit, in a module suitable for mounting directly to the starter coil. Additional space for suppressors shall not be required. Suppressors shall be rated 120 volts AC/DC.

2.08 CONTROL CIRCUIT TRANSFORMERS

A. Each combination motor control unit shall be provided with a control circuit transformer rated for 480 x 240-120V, single phase, 60 Hertz. Unless otherwise specified, transformers shall have a minimum volt-ampere rating as follows:

Starter	CPT Minimum Volt-Ampere Rating
Size 1	100
Size 2	150
Size 3	200
Size 4	300

B. The transformer size shall be increased if the devices applied will cause a control transformer overload or secondary terminal voltage to drop to or below 95 percent of rated secondary control voltage when rated primary voltage is applied. Each control transformer shall be mounted within the enclosure along with its associated circuit breaker and starter.

2.09 CONTROL CIRCUIT FUSING

A. Two primary fuses, rated to interrupt 200,000 amperes at 600 volts, shall be provided on all motor starters.

B. Each control circuit transformer shall be provided with one control circuit secondary fuse. The secondary fuse shall have an interrupting rating of 10,000 amperes at 250 volts. The secondary fuse shall be sized at 125 percent of full load current. Fuses shall have time delay characteristics as required to prevent false tripping due to coil in-rush currents.

C. Fuse holders shall be lamp indicating type for blown fuse indication and shall contain neon lamp, clear transparent knob, and solder terminals.

2.10 WIRING

A. Conductors shall be 90-degree C switchboard type. Conductors shall be identified with tag numbers as specified in Section 26 05 00.

2.11 MANUAL STARTERS

A. Manual starters shall comprise a horsepower rated quick-make, quick-break, toggle mechanism together with overloads in all phase conductors.

2.12 ARC FLASH MITIGATION METHODS

A. The following arc flash and mitigation method requirements shall apply. Refer to specification section 26 05 74, NFPA-70 (NEC) for arc mitigation requirements, and NFPA-70E (Standard for Electrical Safety in the Workplace) for equipment labeling requirements.

B. Equipment Labels:
   1. Equipment labels shall be installed on the outside of the electrical equipment enclosure, cabinet, and panels to avoid opening the equipment to access the manufacture's data or the equipment ratings.

C. Hinged Doors:
   1. Power distribution equipment shall have hinged rear doors where back access is shown.

D. [Remote Racking Devices:
   1. Power distribution equipment shall have remote racking devices for Operators to insert or remove rack-mounted breakers, rack-mounted devices, or auxiliary equipment drawers into the associated equipment location. [Provide one remote racking device for each IPA provided.]]

E. Insulated Power Bus and Insulated Cable Boots:
   1. Provide insulated power bus in power distribution equipment where accessible to installers or maintenance workers.
   2. Provide cable boots for power conductor connections to insulate the exposed power conductor connections.

F. [View Windows for Monitoring:
   1. Provide protected view windows into cabinets that allow infra-red analyzers, monitors, or cameras to monitor hot temperature for unusual heat generated by deteriorating connections. The view windows shall have a method to move the window protector and hold-in-place during the monitoring operation.]

G. [Power and Control Equipment Separation-for purpose of arc flash rating:
   1. Provide separation between power equipment and controls within an enclosure, cabinet, or panel by the uses of barriers, separate access doors, or by other means.
   2. Provide separation barriers between main breaker feeders coming into equipment and other termination points or bussing on the load side of the main breaker.]

H. [Automatic Shutters:
   1. Provide automatic shutters, where possible, to close the access to the power bus when a power device is not engaged.]

2.13 NAMEPLATES

A. Nameplates shall be provided in accordance with the requirements of 26 05 00.

2.14 SPARE PARTS

A. The following spare parts shall be provided:

2.15 PRODUCT DATA

A. The following product data shall be provided in accordance with Section 01 33 00:
   1. Operating and maintenance as specified in Section 01 78 23.

2. Manufacturer's catalog data for all material provided under this section. The catalog data shall be assembled in a folder with each page clearly marked with the item and reference number to the specification.
3. MCP and solid-state overload rating selection data.
4. Product calibration and setup information.
5. A copy of the electrical diagrams in a plastic folder in the units.

PART 3 EXECUTION

3.01 DEVICE CALIBRATION AND TESTING

A. The Contractor shall size the overload relay heater elements or adjust the solid-state overload device to the actual nameplate full load amperes of the motor connected to the starter.

B. The Contractor shall adjust motor circuit protector to the lowest setting not causing false tripping.

C. The Contractor shall record the settings on each motor controller and record the settings as part of the Record As-Built drawing submittal.

3.02 MOUNTING HEIGHT

A. The Contractor shall mount local motor starters at 48 inches above the floor.

3.03 TESTING

A. Local motor starters and circuits shall be tested in accordance with Section 26 08 00.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 29 23

VARIABLE FREQUENCY MOTOR CONTROLLERS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies 480 Vac rated adjustable frequency drive motor controller systems using insulated gate bipolar transistors (IGBT) for pulse width modulation technology (PWM).
2. The AFDs specified in this section shall be the product of a single vendor and mounted in the specified cabinet enclosure.
3. The terms AFD (adjustable frequency drive), ASD (adjustable speed drive), VFD (variable frequency drive), and VSD (variable speed drive) are interchangeable for the purposes of this specification.
4. Refer to the drawings for control and monitoring requirements including special interlocking requirements. Refer to the Control Section 40 61 96 for the control description for the AFD system.

B. System Requirements:

1. The AFD system shall convert 460 volt, 60-Hertz nominal input to a suitable voltage and frequency to cause a premium efficient, inverter duty, squirrel-cage induction motor to run at a speed proportional to an external input analog 4 to 20 ma dc or digital input command as specified for the required AFD speed range.
2. The AFD system shall include rectifier units, inverter units, control circuitry, protective equipment, input line reactors and output load reactors and other filters and accessories as necessary to provide the specified functions to meet voltage and current harmonics at the specified point of common connection and to mitigate the motor reflected voltage wave. Unless otherwise specified, the point of common connection for AFDs shall be the 480 distribution bus (motor control center, distribution panel, etc.) immediately upstream of the AFD.
3. The AFD system torque requirement shall match the pump torque requirement. Verify the pump type and select variable torque (VT) or constant torque (CT) as specified in the AFD Schedule. Select 6-Pulse units for small pump motors and 18-Pulse units for large pump motors.

C. AFD Schedule:

Equipment Name & Tag Number	Drive Number	Drive Horse Power	Drive Speed Range	Driven Equipment Specification	AFD Type	AFD Enclosure & Mounting	Distance (ft) from AFD to Driven Equipment Motor
71-P-00010	71-VFD-00010	100	900-1800	43 23 62	18P	NEMA-1 Gasketed, Floor Mount	75
71-P-00020	71-VFD-00020	100	900-1800	43 23 62	18P	NEMA-1 Gasketed, Floor Mount	75
71-P-00030	71-VFD-00030	100	900-1800	43 23 62	18P	NEMA-1 Gasketed, Floor Mount	75

D. Environmental Conditions:
   1. Ambient conditions are specified in Section 01 11 80.

E. Seismic:
   1. Freestanding AFDs shall be braced per Section 01 73 23.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
IEEE 519	IEEE Recommended Practices and Requirements for Harmonic Control in Electrical Power System
NEMA 250	Enclosures for Electrical Equipment (1000 Volts Maximum)
NEMA ICS 2	Industrial Control and Systems: Controllers, Contactors, and Overload Relays Rated 600 Volts
NEMA ICS 6	Industrial Control and Systems: Enclosures
NEMA ICS 7	Industrial Control and Systems: Adjustable-Speed Drives
NEMA ICS 7.1	Safety Standards for Construction and Guide for Selection, Installation, and Operation of Adjustable-Speed Drive Systems
NFPA 70	National Electrical Code (NEC)
UL Standard 508	Industrial Control Equipment

B. Industry Standards:
   1. The AFD shall be UL 508 listed and shall conform to the requirements specified in NEMA ICS 2, 6, 7 and 7.1.

C. Unit Responsibility:
   1. The Contractor shall assign unit responsibility for the adjustable frequency drives in this section as specified in Section 43 05 11-1.02 Unit Responsibility. The Contractor shall submit letters of certification with the shop drawings from the AFD manufacturer, the motor manufacturer, and the driven equipment manufacturer stating that they have reviewed each application and that the combination will satisfy the application duties required, for the actual motor sizes required, regardless of deviations from the scheduled "nominal horsepower."

1.03 PRODUCT HANDLING

A. AFD units shall be shipped in air-cushion vans to ensure against shipping damage and packed in suitable protective containers. The units shall be inspected upon receipt for damage.

1.04 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
   2. Catalog and technical data including outline dimensions, shipping section dimensions, weight, and foundation requirements for all assemblies.
   3. Schematic diagrams and wiring connection diagram showing functions and identification of terminals.
   4. Voltage and current Total Harmonic Distortion (THD) calculations with line reactors or filter design to mitigate harmonics to meet IEEE-519, if applicable.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer’s products, nor shall it be construed that named manufacturers’ standard equipment or products will comply with the requirements of this Section. AFDs shall be installed in the custom enclosures as specified and Candidate manufacturers include:
   1. ABB ACQ-580
   2. Toshiba Series:
      a. W7 18-Pulse for centrifugal fan and pump motors
      b. G7 18-Pulse for slow speed and high-torque motors
   3. Cutler-Hammer SV9000
   4. General Electric AF-300
   5. Siemens Model 6SE32
   6. Square D Altivar Series

7. Siemens-Robicon
8. Allen Bradley
9. Or equal

2.02 ENCLOSURES

A. Provide AFD in NEMA enclosures with fan cooling and conformal coating protection on circuit boards for corrosive atmosphere protection.
   1. General:
      a. Provide enclosures with AFDs and custom control as required for the project and as indicated on the drawings. Each drive shall be designed for stand-alone operation and multiple drives shall not utilize shared components. Review the project site location, elevation, temperature, humidity, plant atmosphere, and load current-torque requirements to size the AFD and its associated enclosure with requirements specified herein and the control and monitoring devices and interlocks as indicated.
      b. Enclosures shall be designed for indoor service. Each AFD system shall be mounted in a NEMA 250 internally force ventilated enclosure with UL approved Class 1 filters on ventilation openings. Enclosures shall be fabricated from 12-gage minimum thickness sheet steel with an interior frame or formed to provide a rigid structure.
      c. Provide enclosure size to allow entry of power source and motor load cables as indicated on the drawings. Submit drawing of the source and load power cable location within the enclosure and indicated barriers from control and instrument wiring.
      d. Door width shall not exceed 30 inches and shall be hung on removable-pin hinges, with three-point latch hardware, and handle latch for 3/8-inch-shackle padlock.
   2. Finish and Coatings:
      a. AFD systems enclosures shall be finished with corrosion protection coatings inside and outside for hydrogen sulfide atmospheres. The electrical and electronic assemblies shall have conformal coatings.

2.03 AFD ASSEMBLIES

A. General:
   1. AFDs shall include the following assemblies:
      a. Power disconnect using a thermal magnetic circuit breaker or fused disconnect sized for the specific application by the manufacturer.
      b. Line input harmonic filter, as required, for harmonic mitigation.
      c. A load reactor for dV/dT mitigation or motor terminator units for addressing dv/dt effects at the motor
      d. Rectifier, direct current bus filter, and inverter.
      e. Control circuitry interface with Operator Interface Unit
      f. Output protection including phase overload

B. AFD Features:
   1. Provided with the following features:
      a. Fused control circuit transformer and microprocessor for system logic sequencing functions. Provide fuses with blown fuse indicator lamps.
      b. Accept 4 to 20 mAdc] [digital command input speed reference signal.
      c. A 4 to 20 mAdc output signal proportional to inverter output frequency for the speed range specified.
      d. Adjustable minimum/maximum frequency limits:
         1) Minimum frequency shall be adjustable from 6 to 40 Hertz.
         2) Maximum frequency shall be adjustable from 48 to 90 Hertz.
      e. Adjustable and independent timed linear acceleration and deceleration functions, adjustable from 6 to 20 seconds.
      f. Current limiting.
      g. Automatic restart.
      h. Control Wiring:
         1) 600 volt stranded copper
         2) 90 degrees C color-coded insulation
         3) No. 16 AWG
      i. Wiring Identification and Termination:
         1) Crimp type wire lugs with sleeve type markers at each termination point and numbered terminal blocks for external connections.
      j. Electrically isolated discrete output contacts for ready, running, remote mode status and trouble alarm.
      k. Conformal coated terminal blocks for control and signal wires entering and leaving the controller.
      l. Control Power:
         1) Provide a 120 Vac, triple fused, control power transformer for cooling fans and external control circuits when required. Control circuits shall be isolated from power circuits by distance and by insulated barriers.
      m. Provide 120 Vac or 24 Vdc as required for Operator Interface Unit.

C. Functional Requirements:
   1. Supply Power:
      a. Operate continuously with supply power of 480 volts plus or minus 10 percent, 60 Hertz plus or minus 3 percent and remain on line and operate without damage to the AFD or connected load during a supply power under-voltage variation to the drive up to 85% of its nominal value for 30 milliseconds at full load.
   2. Load:
      a. Capable of driving the specified maximum motor load continuously and under the following conditions:
         1) Deliver 110 percent of the specified load for up to 60 seconds in variable torque applications.
         2) Deliver 150 percent of the specified load for up to 60 seconds in constant torque applications.

3. Efficiency:
    a. Not less than 95 percent at 60 Hertz output driving the specified maximum load at rated torque and speed at 40 degrees C ambient based on measured input power versus output power with all specified components in the system.
4. Frequency and Voltage Regulation:
    a. Output frequency regulated to within 0.6 Hertz of the signal/output frequency relationship. Output voltage regulated to within 1.0 percent to produce minimum motor heating at any operating frequency within the specified range.
5. Frequency Range:
    a. AFD shall be capable of continuous operation with the specified load at any frequency between 6 and 60 Hertz unless noted otherwise.
6. Space and AFD Access:
    a. Enclosure size shall not exceed the size allotments specified on the drawings nor shall any portion of the AFD system exceed a height of 90 inches.
    b. Front accessible only and shall not require rear access.
    c. Mount against the wall without any clearance for ventilation or other purposes.
    d. Submit AFD in the enclosure drawing with the detail of front door and the internal arrangement, including the feeder and motor cables, and the control cables, and the instrument cable location and terminations.
7. Ambient Noise:
    a. Free field noise generated shall not exceed 85 dBA at 3 feet out from any point on the AFD enclosure under any normal operating condition.
8. Motor Coordination:
    a. AFDs shall be configured as required to maintain output voltage peaks at the connected motor windings from reaching levels damaging to the motor insulation. Provide protection integral to the AFD or as protective hardware to be installed at the motors.
        1) Where motor terminator units are provided, they shall be rated for the environment in which they are located. Motor terminator units shall be:
            a) Allen Bradley 1204 Motor Terminator for AFD with the maximum carrier frequency of 6 kilohertz,
            b) Cutler Hammer Reflected Wave Trap (RWT) with the maximum carrier frequency of 12 kilohertz,
            c) Or Equal product

D. Protection and Annunciation:
1. Overcurrent Protection:
    a. Electronic current limit at 150 percent of motor nameplate current and provide motor running overcurrent protection in compliance with NFPA 70.
2. Short Circuit Protection:
    a. Protected against load faults: bolted faults, phase to phase or phase to ground shall not damage the unit. Fault protection based on a power source short circuit capacity of 65,000 amperes RMS symmetrical at the AFD power input terminals with impedance or current limiting device provided.
3. Line Voltage:
    a. Protected against high and low line voltage on one or more phases.

4. Internal Faults:
    a. Internal fault monitoring system to detect malfunctions to protect from transient and sustained faults and to limit damage that may be caused.
5. Motor Over Temperature:
    a. Interface to motor over temperature device 2-ampere output contact to shut down and alarm if the motor becomes overheated.
6. Fault Alarm:
    a. Indicates the cause of any shutdown visible on the AFD keypad/display without opening the AFD enclosure. As a minimum, the following faults shall be alarmed:
        1) Motor over-temperature
        2) Motor overcurrent
        3) Incoming power line over/under/unbalanced-voltage
        4) AFD over-temperature
        5) AFD over-voltage
        6) AFD control failure
7. Safety Features:
    a. The AFD shall include:
        1) Padlock main disconnect handle in the “Off” position.
        2) Mechanical interlock to prevent opening enclosure door with disconnect in the “On” position while the unit door is open.
        3) Auxiliary contact on main disconnect to isolate 120Vac control power when fed from external source.
        4) Barriers and warning signs on terminals that are energized with the power disconnect “OFF”.
        5) Separation and insulated barriers between the power and control and instrument products.
        6) External emergency stop input
8. Reverse Direction Protection:
    a. Provide protection from inadvertent operation in reverse where reverse rotation can damage the driven equipment.
9. Critical Speed Bypass:
    a. Provide capability to program speed bypass for minimum two critical speed points.
10. Transient Voltage Protection:
    a. Provide solid state transient voltage protection to meet or exceed ANSI C37.90.

2.04 CONTROL AND MONITORING DEVICES

A. Front door mounted on the AFD enclosure between 36 inches and 72 inches above the floor for each unit:
    1. Digital Operator keypad/display.
    2. Local-Off-Remote door mounted selector switch.
    3. Manual speed control: OIU function

4. Internal terminal strips for remote monitoring:
    a. Run status
    b. Trouble / Fail alarm
    c. Auto Mode status
    d. Additional devices as indicated on the drawings.

B. Operator Interface Unit:
1. Digital keypad/display for monitoring and controlling the drive and to input drive parameter settings with a backlit LCD or equally visible display with a minimum of 16 characters per line.
2. Digital keypad for numerical settings in English engineering units and a guide to parameter settings. Setup operations and adjustments stored in non-volatile EEPROM memory transferable to new and spare boards. Settings shall be protected from unauthorized tampering, revision, or adjustment by a personal lockout code.
3. The digital keypad to provide programming of the drive and include:
    a. Up and Down Arrow Keys:
        1) Increase or decrease output frequency or data values.
    b. Monitor Key:
        1) Selection of control mode.
    c. Run and Stop Keys:
        1) Starting and stopping in the manual mode.
    d. Fault Clear / Enter Keys:
        1) Reset fault conditions and enter change
    e. Program Key:
        1) Enter the program mode and adjust parameters.
    f. Remote / Local Location Keys:
        1) Operation location and local speed control.
    g. Auto / Manual Mode Keys:
        1) Program mode.
    h. Number Keys:
        1) 0 through 9 keys to access specific parameters.
    i. Keypad Digital Illustrations:
        1) English and display the last 5 faults.
    j. Frequency / Motor Speed Indication:
        1) Calibrated in Hertz and RPM.
    k. Run Status Indication.
    l. Ready Status Indication.
    m. Fault Alarm Indication.

C. Control and Monitoring Communication
1. None or:
    a. Additional analog I/O as required for the project
    b. Additional discrete I/O as required for the project

c. Thermistor inputs
d. EtherNet Communication Card]

2.05 KEYPAD FUNCTIONS AND OPERATION

A. Adjustment of the following parameters through the OIU digital keypad:
   1. Current limit and torque boost.
   2. Maximum voltage level.
   3. Minimum/Maximum speed, Volts/Hertz, Upper and Lower limit.
   4. Adjustable acceleration rate and deceleration rate.
   5. Electronic thermal overload setting.
   6. Coast, controlled ramp or DC injection selectable modes of stopping.
   7. PID setpoint and time-function selection.
   8. Critical frequency avoidance:
      a. Three set points selectable from 0 to maximum frequency with set points adjustable from 0-30 Hertz.

2.06 ARC FLASH MITIGATION METHODS

A. The following arc flash and mitigation method requirements shall apply. Refer to specification section 26 05 74, NFPA-70 (NEC) for arc mitigation requirements, and NFPA-70E (Standard for Electrical Safety in the Workplace) for equipment labeling requirements.

B. Equipment Labels:
   1. Equipment labels shall be installed on the outside of the electrical equipment enclosure, cabinet, and panels to avoid opening the equipment to access the manufacture's data or the equipment ratings.

2.07 NAMEPLATES

A. Nameplates shall be provided in accordance with the requirements of Section 26 05 00. Nameplates shall be provided for all drive enclosures. Provide equipment tag numbers and descriptions as shown on the drawings.

2.08 SPARE PARTS

A. The following spare parts shall be supplied with each type or frame size AFD:
   1. Three sets of all replaceable fuses.

2.09 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Operation and maintenance information as specified in Section 01 78 23, including:
      a. Final reviewed submittal.
      b. As-built drive configuration settings.
   2. Installation certification Section 43 05 11-Form A as specified in paragraph 3.01.
   3. Training certification Section 43 05 11-Form B as specified in paragraph 3.03.

PART 3 EXECUTION

3.01 FIELD INSTALLATION

A. Each adjustable speed controller shall be installed and tested by the Contractor with the assistance of factory-trained pump manufacturer engineer/technician and AFD engineer/technician in accordance with the manufacturer's specifications and Section 26 29 23, and witnessed by the Construction Manager.

B. Manufacturers' factory representatives shall provide field testing for devices including the setup of the Operator Interface Unit and the setup of the data communication devices, where used. Upon satisfactory completion of the testing, the Contractor shall submit two certified copies of the test report to the Construction Manager.

C. Component failure during testing will require repeating any test associated with the failure or modified components to demonstrate proper operation.

D. The installation shall be certified on Form 43 05 11-A specified in Section 01 99 90.
   1. Adjust drive and perform "start-up" tests as recommended by manufacturer. Set parameters and carrier frequency for existing motors to avoid insulation damage.
   2. Establish proper direction of rotation for the motor controlled by the drive. Verify that the AFD is precluded from operating in a direction that can damage the driven equipment. Change motor or AFD power lead connection and not the AFD direction, where rotation is incorrect.
   3. Verify that the drive will operate properly both in the "manual speed control mode" and in the "remote or automatic mode" from a remote speed signal input.
   4. Set the maximum "locked rotor" current drawn during start-up recommended by the manufacturer and approved by the Construction Manager.
   5. Set the minimum and maximum speeds and the acceleration and deceleration "ramps" recommended by the Construction Manager.
   6. Verify the motor high temperature switch contacts are wired into the AFD 120 Vac control circuit and will trip on high winding temperature. Test or simulated the alarm and trip feature at the motor for high temperature and for high vibration, where used.
   7. Operate the drive at 100 percent speed for one hour and monitor output current. The output current shall remain below the full load current listed on the motor nameplate.
   8. Check for excessive heating of the drive and motor. Report any discrepancies to the Construction Manager.

3.02 HARMONIC TESTING

A. The Testing Firm specified in Section 26 08 00 shall perform a harmonics acceptant test with all AFD motor controllers operating to verify compliance with IEEE-519 of less than 5 percent voltage THD and 12 percent current THD at the defined point of common connection when running from Power Utility power source with a BMI-Dranetz or equal harmonic test set that provides a hard-copy record of the test results.

B. The test shall also be run with power sourced from the standby generator where such a power source is being used at the project site. THD shall be limited to a maximum level of 8 percent voltage THD on standby generator operation.

C. Submit the test performance to the Construction Manager per latest version NETA ATS Acceptance Testing Specifications. Refer to the electrical testing specification Section 26 08 00.

3.03 TRAINING

A. Two hours of onsite AFD operation and maintenance training shall be provided for the Owner's Operation and Maintenance Staff.

B. Manufacturers' factory representative shall conduct the training, upon acceptance of a resume submitted by the trainer.

C. Training shall be certified on Form 43 05 11-B specified in Section 01 99 90.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 32 13.13

DIESEL ENGINE DRIVEN GENERATOR SETS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This Section specifies the requirements for providing, factory testing, and on-site acceptance testing of complete and operable standby diesel engine driven generating system (GenSet). This section covers outdoor diesel engine generator sets with outdoor metal enclosures used only for providing power during a loss of utility power. Equipment provided under this section is not suitable for peak shaving, or any other unrestricted long-term operaton that would have to meet Tier 4 emission standards. This section also inlcudes [,belly tank fuel storage container,] and the devices and equipment required for the system operation. [A separate fuel storage container for the GenSet fuel supply is specified in Section [26 32 13.15].]
2. Refer to the Section 26 36 23 that specifies the Automatic Transfer Switches (ATS) supply, custom features, factory tests by the generator manufacturer and the GenSet supplier, and shipping the ATS to the project site for installation. The ATS will not be installed within the GenSet enclosure.

B. The generator shall have two main breakers with kirk-key interlock with connections for:

1. One set of standby feeders to the ATS.
2. One set of portable load bank lead connections.

C. The generation system shall include the following:

1. Digital control, monitoring, and display system
2. Cooling system
3. Belly tank
4. Exhaust silencer: Mounted inside the enclosure.
5. Noise dampening mounting system.
6. Sound attenuated outdoor enclosure accessories.
7. Accessories: Including batteries, battery charger, block heater with 120/240 Vac 100-ampere panel for lights, power outlets, battery charger, and block heater.
8. Control system testing
9. [Temporary Test Load Bank] [Permanently Installed Load Bank]
10. Testing with load bank

D. Operating Requirements:

1. The electric power generating system shall have ratings as indicated with 0.80 power factor, 480 volts, WYE connected generator, three-phase, three-wire, 60-Hertz, 1800 rpm and rated for Standby operation per NEC Article-700, Article -701 or Article-702.

E. Generator Set Schedule:

Tag No.	Description / Location	Enclosure	Rating
GEN-2500	Operations Building Diesel Fueled Generator	Indoor	1000-kW, 3-Phase, 3-Wire

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI C57.13	Requirements for Instrument Transformers
IEC 34-5	Rotating Electrical Machines - Part 5: Degrees of Protection by Enclosures for Rotating Machinery
IEC 60529	Degrees of protection provided by enclosures (IP Code)
ISO	International Organization for Standardization
NEMA MG1	Motors and Generators
NEMA MG2	Safety Standard for Construction and Guide for Selection, Installation, and Use of Electric Motors and Generators
NEMA SG31	Low Voltage Power Circuit Breakers
NEMA SG51	Power Switchgear Assemblies
NFPA 37	Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines
NFPA 70	National Electrical Code (NEC)
NFPA 110	Standard for Emergency and Standby Power Systems
OSHA	Occupational Safety and Health Act
SAE J 1349	Society of Automotive Engineers Engine Power Test Code
UL	Underwriters Laboratories Inc.

B. Unit Responsibility:
   1. The Contractor shall assign unit responsibility, as specified in Section 43 05 11, to the manufacturer of the GenSet provided under this section. This manufacturer is the unit responsibility manufacturer and has unit responsibility, as specified in Section 43 05 11, for both the GenSet equipment assembly specified in this section and for the automatic transfer switch specified in Section [26 36 23]. A completed, signed, and notarized Certificate of Unit Responsibility (Section 01 99 90-Form 43 05 11-C) shall be provided.

C. Design Requirements:
   1. Engine:
      a. Rating:
         1) Engine brake horsepower shall be sufficient to deliver full rated GenSet kW/kVA when operated at rated rpm and equipped with all engine-mounted parasitic and external loads such as radiator fans, fuel pumps, and cooling water pumps.
      b. Fuel:
         1) Diesel engines shall be able to deliver rated power when operating on ultra low-sulfur No. 2 diesel fuel.
      c. Fuel Consumption:
         1) Diesel fuel rates shall be based on fuel having a low heating value (LHV) of 42,780 kJ/kg (18,390 Btu/lb) when used at 29°C (85°F) and weighing 838.9 g/l (7.001 lb. / U.S. gal).
   2. Generator:
      a. Motor starting:
         1) Solid-state-starters, variable speed controllers, or auto-transformer reduced voltage starting with the typical RVAT start would be on the 65% tap, as indicated.
      b. Generator Performance:
         1) Voltage dip for motor starting shall not exceed 25% for any individual load step.
   3. GENSET Start time and load acceptance: Engines shall start, achieve rated voltage and frequency, and be capable of accepting load within 10 seconds.
   4. Outdoor Enclosure:
      a. GenSet enclosure shall be designed to resist the loads prescribed by the Governing Building Code including: Dead, Live, Wind, Seismic, Rain, Snow, and Ice.
      b. GenSet enclosure shall also be designed to support any superimposed loads imparted from system components mounted to it, including those identified in Section **Error! Reference source not found.**
      c. In no case shall the enclosure be designed to resist loads less than the minimum loading conditions listed below:
         1) Roof live load: 50 psf
         2) Floor live load (when equipped): 200 psf
         3) Wind Load design speed: 100 mph

D. Noise Requirements and Control:

Sound pressure level when operating fully loaded shall not be greater than [ ] dBA at the nearest fenceline.

E. Manufacturer's Qualifications and Warranty:

1. The complete power generation system shall be the product of one manufacturer who has been regularly engaged in the production of complete generating systems for at least twenty-five years.
2. The supplier shall be the engine-generating system manufacturer's authorized local representative that shall provide installation assistance, start-up services, and Owner's staff training. The supplier shall have 24-hour service availability with factory-trained technicians qualified to perform trouble-shooting, repairs on the system, and warranty and post warranty -compliance services.
3. Preventive maintenance to be performed by:The GenSet supplier shall provide the following warranty that includes battery warranty:
    a. Two year parts and labor with travel time included.

F. Manufacturer Factory Testing:

1. Functional Tests:
    a. Functional testing of the complete power generation system final assembly shall be performed at the GenSet manufacturer's factory to assure proper system operation.
2. GenSet shall be load tested after the assembly is installed into the enclosure and operate continuously without stoppage for a period of 8 hours.
3. GenSet shall operate for one hour at ½, ¾, and full load, at 0.8 power factor or greater. Restart the test, if stopped for any reason.
4. Prototype Test:
    a. The GenSet manufacturer shall certify that engine, generator, and controls have been tested as complete systems in accordance with NFPA 110 of representative engineering models (not on equipment sold).
5. Sound Test:
    a. Provide a GenSet factory test for sound pressure level measured in accordance with IEEE Standard 85, Test Procedure for Airborne Sound Measurement on rotating electrical machines or propose acceptable alternate to free field sound test. Refer to paragraph 1.02 for sound test criteria.

G. Shipment, Handling, and Storage:

1. The equipment shall be protected during shipment, handling, and storage per Section 01 66 00.

1.03 ENVIRONMENTAL CONDITIONS

A. General:

1. The GenSet manufacturer shall verify that the diesel engine is correctly sized and is capable of driving the generator with all accessories in place and operating, at the generator's kW rating after derating for the range of temperatures expected in service and the project site altitude, per NEMA MG1.

B. Seismic:
   1. Equipment and supports shall be braced per Section 01 73 23.

C. Site Conditions:
   1. The site conditions are:
      a. 40 degrees C maximum ambient
      b. 5335 feet altitude per Section 01 11 80

1.04 SUBMITTALS

A. The following submittals shall be provided in accordance with the requirements of Section 01 33 00.
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
      a. Section 26 36 23 Automatic Transfer Switches
   2. A check mark (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration
   3. Completed Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
   4. Manufacturer and manufacturer's type designation.
   5. Manufacturer's catalog and/or other data confirming conformance to specific design, material and equipment requirements including:
      a. Engine:
         1) Type, aspiration, compression ratio, and combustion cycle
         2) Bore, stroke, displacement, and number of cylinders
         3) Rotational speed, RPM
         4) Engine lubricating oil capacity
         5) Engine coolant capacity without radiator
         6) Engine coolant capacity with radiator
         7) Coolant pump external resistance (maximum)
         8) Coolant pump flow at maximum external resistance
         9) Exhaust back-pressure (maximum allowable pressure)

10) Combustion air inlet flow rate
11) Exhaust gas, flow rate, stack temperature
12) Exhaust system back pressure (maximum)
13) Heat rejection to:
    a) coolant
    b) aftercooler
    c) lube oil
    d) exhaust
    e) atmosphere
14) Fuel Consumption:
    a) 50% load
    b) 75% load
    c) 100% load
15) Fuel supply system shall be external outdoor tank.

b. Generator:
    1) Model
    2) Frame
    3) Voltage
    4) kW
    5) Power Factor
    6) Frequency
    7) Insulation class
    8) Number of leads
    9) Weight, total
    10) Weight, rotor
c. Efficiency At rated voltage:
    1) Efficiency at 0.8 power factor for 50% load.
    2) Efficiency at 0.8 power factor for 75% load.
    3) Efficiency at 0.8 power factor for 100% load.
d. Radiator:
    1) Model
    2) Type
    3) Heat Rejection:
    4) BTU/Hour
    5) Fan drive ratio
    6) Coolant capacity, radiator
    7) Coolant capacity, radiator and engine
e. GenSet with enclosure Dimensions:
    1) Dimensions:
    2) Length, width, height
    3) Weight:
    4) Dry and wet

5) Vibration isolators

f. Power Rating:

g. Nominal full capacity standby kW at 0.8 power factor and corresponding kVA rating

6. Exterior paint color chip for enclosure per paragraph 2.07 Interior Lighting and Outlets.
7. Structural design calculations for the Structural Steel Frame supporting the generator, radiator and engine, stamped and signed by a Prefessional Engineer licensed and registered to practice in UT.
8. Drawings:
   a. General dimensions drawings showing overall GenSet measurements, mounting location, and interconnection points for load leads, fuel, exhaust, cooling and drain lines.
   b. General dimension drawings for fuel supply and storage system including interconnection points, fuel and drain lines, and level and leak detection equipment, terminal-boxes and panels.
9. Wiring diagrams, schematics and control panel outline drawings published by the manufacturer in Joint Industrial Council (JIC) format for controls and switchgear showing interconnected points and logic diagrams for use by contractor and owner.
10. Product Data
    a. Certified factory test results.
    b. Operation and maintenance information as specified in Section 40 61 21. In addition the following:
       1) Operating instructions with description and illustration of engine and generator controls and monitors.
       2) Manuals that illustrate and list assemblies, subassemblies and components, except the standard fastening hardware.
       3) Preventative maintenance instructions for daily, weekly, monthly, biannual, and annual maintenance requirements. Include a lubrication chart for all components.
       4) Routine test procedures for electronic and electrical circuits including the generator.
       5) Troubleshooting chart covering the complete GenSet with a description of trouble, probable cause, and suggested remedy.
       6) Recommended spare parts list showing consumables anticipated during routine maintenance and test.
       7) Wiring diagrams and schematics showing function of electrical components.
       8) Complete final submittals including Record As-Built drawings.
       9) Manuals and books described above shall be contained in rigid plastic pouches.
       10) Training certification Section 43 05 11-Form B specified in paragraph 3.03.
       11) Field test reports as specified.
       12) Warranty verification statements published by manufacturer.
       13) Location and description of supplier's parts and service facility including parts inventory and number of qualified GenSet service personnel.

c. Installation requirements showing clearances required for maintenance purposes: Access to main breaker, oil fill line, fuel fill line, etc.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Engineer believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section.

The candidate manufacturers include the following:

Equipment / Manufacturer / Supplier	Engine-Generator	Control Panel
[Manufacturer / Supplier 1	Caterpillar / Caterpillar	CAT EMCPIT]
[Manufacturer / Supplier 2	Cummins / Onan	Onan Power Command Amp Sentry Protection]

2.02 ENGINE EQUIPMENT

A. General:
1. The engine shall be a single stationary, liquid cooled, 1800 rpm, four-cycle design, direct injection engine with forged steel crankshaft and connecting rods. Systems with dual engine-generators will not be permitted.
2. The engine cylinder block shall be cast iron with replaceable wet liners with four valves per cylinder. Provide 6, 12, or 16 cylinders engine with turbocharger and after-cool, as required by the GenSet manufacturer.
3. The GenSet engine shall not be manufactured with any Class I ozone depleting substances (ODS) as defined by Federal Register Vol. 57 No. 86.
4. The GenSet shall be pre-certified EPA Tier-2 emission requirements and in comppliance with the local Air Pollution Control District (APCD) regulations, whichever is the more stringent. Certified test reports shall be furnished for APCD acceptance.

B. Structural Steel Frame:
1. The generator, radiator, and engine shall be securely mounted on a heavy welded steel frame structure frame that is stiffened and cross-braced to provide a rigid mounting base.

C. Engine Equipment:
1. The engine shall be equipped with manufacturers standard air filters, pressure gauges, lubricating oil cooler, filters, and pressure gauge, water pump and temperature gauge, service hour meter, flywheel, and flywheel housing when applicable.
2. Lube Oil Filter: Provide a lube oil filter, equipped with a spring-loaded bypass valve to ensure oil circulation if filters are clogged. Provide an oil drip pan for mounting underneath the engine. Provide an oil drain extension.

D. Engine Fuel System:
   1. Fuel Strainer and Filter:
      a. Provide fuel strainer and filter between engine fuel pump and engine. Provide indicating pressure gauges on both upstream and downstream side of strainer and filter.
   2. Fuel Lines:
      a. Flexible braided stainless steel fuel lines between engine and fuel supply shall be provided to isolate vibration.
   3. Fuel System Maintenance:
      a. The fuel transfer pump, injection pumps, rack and pinion assembly, and timing mechanism shall be maintenance and adjustment free for the life of the equipment. The fuel filter shall not require changing more frequently than once per year or every 250 hours. Provide a fuel filter with spill containment and catch pan for about three gallons of fuel.

E. Governor:
   1. General:
      a. The engine governor shall control engine speed and transient load response. The governor shall be selected, installed, and tested by the GenSet manufacturer.
   2. Speed Control:
      a. The engine governor shall be an electronic speed-control actuator. Speed droop shall be 0 (isochronous) from no load to full rated load.
   3. Frequency Regulation:
      a. The steady state frequency regulation shall be within 0.25%. Speed shall be sensed by a magnetic pickup off the engine flywheel ring gear.
   4. Remote Speed Control:
      a. A provision for remote speed adjustment shall be provided.
   5. Actuator:
      a. The forward acting actuator shall move to the minimum fuel position in the event of a DC power loss.

F. Cooling System:
   1. General:
      a. The engine jacket water cooling system shall be a closed circuit design with provision for filling, expansion, and de-aeration.
         1) The cooling pump shall be driven by the engine. Auxiliary coolant pumps required for heat exchangers or separate circuit after-cooling shall be engine driven.
         2) The cooling system shall tolerate at least 172 kPa (25 psi) static head. Coolant temperature shall be internally regulated to disconnect external cooling systems until operating temperature is achieved.
   2. Engine Mounted Radiator:
      a. Heat rejected to the engine jacket water shall be discharged to the atmosphere through a close-coupled radiator.

3. Coolant:
    a. The unit shall have an antifreeze / coolant mixture. The radiator shall cool the jacket water while the engine is operating at full site capability and 0.123 kPa (0.50 inch water column) external air restrictions.
        1) Additional restriction affecting airflow shall not limit the radiator's capability to adequately cool at maximum site temperature. Provide air flow to meet ambient conditions at specified ratings at 100% rated connected load.
4. Fan and Belt Guarding:
    a. The fan, fan drive, and fan belts shall be covered with 14 gauge punched steel mesh guarding for personnel protection. The guarding shall conform to IEC 34-5, ISO and OSHA standards.
5. Radiator Fan:
    a. The radiator-cooling fan shall be a propeller type driven from the engine with the air drawn from the engine side and exhausted through the radiator core.
6. Inlet Air System:
    a. The engine air cleaner shall be engine mounted with maintenance access. The maximum restriction to the combustion air inlet shall not exceed engine manufacturer requirements where external ducting provided.

G. Exhaust System:
1. General:
    a. The engine exhaust system shall discharge combustion gases safely and without leakage with minimum restriction. The critical sound silencer shall be designed for minimum restriction without excessive back-pressure.
        1) Engine exhaust piping shall be Schedule 40 carbon steel with long radius 90 degree bends. Piping shall be installed with 9 inch minimum clearance from combustible material or incorporate appropriate insulation and shielding, as appropriate for personnel safety. Provide a stainless steel flexible connection between the engine and exhaust piping.
        2) Exhaust piping shall be supported and anchored to prevent weight or thermal growth being transferred to the engine. Flexible expansion fittings provided to accommodate thermal growth. Support dampers and spring isolators provided to isolate vibration.
        3) Long runs of exhaust piping shall be pitched away from the engine and water traps installed at the lowest point. Provide a 1-inch diameter capped sample port for emissions testing. Provide ports 90-degrees apart on a straight section of exhaust piping.
        4) Exhaust stacks shall be extended to avoid fumes and odors inside enclosure and installed to minimize noise.

2. Silencer-Critical:
    a. Exhaust Silencer: The exhaust silencer shall be a critical-grade type exhaust silencer. Exhaust noise shall be limited to 75 dBA as measured at 10 feet in a free field environment. Silencer shall be Maxim, Nelson, or equal. Silencer shall have mounting/seismic restraint lugs, and shall have a one-inch condensate drain connection. A 2-1/2-quart, low pressure, manual drip trap (Varec Figure No. 246, Groth Model 8460, or equal) shall be provided loose for installation by the Contractor. The silencer shall be fabricated of heavy-gauge steel in all-welded construction with inspection ports and drain fittings in each chamber. Exhaust system (pipe, fittings, and silencer) shall be coated in accordance with Coating System H-1 (Section 09900). Once painted, exhaust system shall be insulated in accordance with Section 15250.

H. Flexible couplings for jacket water, lube oil, fuel and exhaust piping shall be provided. Water, oil and fuel connectors shall be single braided, stainless steel, 150 psig working pressure. Fuel connectors shall bear the Underwriters Laboratories label. The exhaust connector shall be unbraided, stainless steel, suitable for temperatures up to 1300 degrees F. All connectors shall be selected for a design of not less than 10,000,000 full displacement cycles. Flexible metal hose shall be by Flexonics, Hyspan, or equal

2.03 GENERATOR SYSTEM

A. Generator:
1. The generator shall be synchronous, four pole, revolving field, pre-lubricated bearing, air cooled by a direct drive centrifugal blower fan, and directly coupled to the engine with flexible drive discs.
2. The armature shall have skewed laminations of insulated electrical grade steel, two-thirds pitch windings. The rotor shall have amortissuer damper windings of layer-wound, mechanically-wedged winding construction. The rotor shall be dynamically balanced.
3. Insulation system components shall meet NEMA MG1 temperature limits for a Class H insulation system. Actual temperature rise measured by resistance method shall not exceed 125 degrees Celsius to provide additional allowance for internal hot spots.
4. The generator insulation systems shall be suitably impregnated for operation in severe environments for resistance to sand and other air-born contaminants.

B. Exciter:
1. A permanent magnet generator (PMG) shall provide excitation power to the automatic voltage regulator for immunity from voltage distortion caused by non-linear loads on the generator.
2. The PMG shall sustain field excitation power for optimum motor starting and shall sustain short circuit current for selective operation and coordination of system overcurrent devices.
3. The PMG exciter insulation systems shall be suitably impregnated for operation in severe environments for resistance to sand and other air-born contaminants.

C. Voltage regulator:
   1. The automatic voltage regulator shall be temperature compensated, digitally controlled pulse width modulated solid-state design, and include over-voltage and over-current protection functions.
   2. Over-voltage protection shall sense generator output voltage, In the event of regulator failure or loss of reference, the regulator shall shut down its output on a sustained over-voltage of one-second duration.
   3. Over-excitation protection shall sense regulator output and shut down its output if overload exceeds ten seconds duration. Both over-voltage and over-excitation protection shall be latched, requiring the generator to be stopped for reset.
   4. Generator output voltage shall be maintained within 1% of rated value for any load variation between no load and full load and drift no more than within 0.5% of rated value at constant temperature.

D. Circuit Breaker:
   1. The generator mounted circuit breaker shall be mounted and connected in a guarded drip proof freestanding enclosure meeting, NEMA 3R requirements and provided with adequate space for customer power cable lug connections. Cable lugs by supplier, refer to the electrical drawings for circuit conductor sizes and numbers.
   2. Provide the following:
      a. Molded case circuit breaker rated for 100% current, 3-pole, single-throw, stationary-mounted with manual operating handle, overload and short circuit trips, complete with cable lugs.
      b. Circuit breaker shall be UL labeled and rated for 600-volt circuits and provided with a solid state over-current trip device.
      c. Circuit breakers rated shall have ground-fault protection and ground-fault indication.
      d. A circuit breaker with a 24 Vdc shunt-trip unit wired to terminal board.
      e. Three current transformers with 5-ampere secondary windings for the ammeter display, as needed.
      f. National Electrical Code required working access space around the Circuit Breaker enclosure.

2.04 ENGINE-GENERATOR SYSTEMS

A. Engine Starting System:
   1. The engine starting system shall include 24 Vdc starting motor(s), starter relay, and automatic reset circuit breaker to protect against butt engagement.
   2. Required cables furnished and sized for power feeder circuit requirements and capable of starting the specified engine within 10 seconds at the elevation and ambient environmental conditions specified herein.

B. Water Jacket Heater:
   1. Jacket water heater(s) shall be provided to maintain coolant temperature of 32°C (90°F) while the engine not running. Heaters shall accept 208 Vac single phase power and include thermostatic controls.

C. Batteries:
   1. Batteries for GenSet starting and control shall be selected and supplied by the GenSet manufacturer. Battery warranty shall be the responsibility of the GenSet manufacturer. Batteries shall be protected from engine fuel leaks.
   2. Batteries shall be maintenance free SLI lead acid type with through-partition connectors and mounted near the starting motor. Batteries shall be mounted on a corrosion resistant or coated steel battery rack close to the starting motor as practical and allow personnel access for inspection and maintenance.
   3. Starting batteries shall be rated 24 Vdc with ampere-hour and ampacity sizing to provide a minimum of 210-ampere-hour 1,250 cranking amperes that includes the sizing requirements to allow for engine oil viscosity, ambient starting temperature, project elevation, and accessories.

D. Alternator:
   1. An engine-mounted belt-driven battery charging alternator shall be installed with an automatic voltage regulator. Alternator and regulator suitable for the application with a rating of 24 Vdc output with 45-amperes minimum.

E. Battery Charger:
   1. A dual rate 10-ampere battery charger shall be provided that shall accept 120 Vac single phase input to provide 24 Vdc output.
   2. The battery charger shall be fused on the AC input and DC output, and incorporate current limiting circuitry to avoid the need for a crank disconnect relay. The charger shall be rated for operation at plus 50°C ambient. Charger voltage regulator shall be temperature compensated.
   3. The battery charger shall be provided with the following: corrosion resistant enclosure, on/off switch, dc ammeter, dc voltmeter, ac input and dc output circuit breakers or fuses, floating voltage equalization, equalizing timer, and relays with form c contacts for remote annunciation of loss of AC power, low battery voltage, and high battery voltage.
   4. A voltage power switch shall be mounted on the face of the charger and shielded from accidental switching. The charger shall include an AC ammeter and voltmeter, a failure malfunction alarm switch, and be housed in an enclosure suitable for mounting inside the outdoor enclosure.
   5. The batteries, battery rack, and battery charger shall be located inside a separate vented enclosure inside the engine-generator enclosure. The battery rack frame shall be constructed of corrosion resistant material.

2.05 CONTROLS

A. Engine-Generator Control Panel:
   1. The control panel shall be designed and built by the engine-generator manufacturer and mounted near the generator with vibration dampening mounting devices.
   2. Provide a 100 percent solid state microprocessor based control circuitry, sealed dust tight, watertight modular components, and digital instrumentation. Provide NEMA 12 enclosure ratings. Comply with NEMA 250 standards for enclosure protection. Label the control panel with ISO symbols.

3. Display critical parameters such as operating hours, engine RPM, battery DC volts, oil pressure, jacket water temperature, including the specified engine and electrical parameters.

B. Engine monitoring Devices:
   1. Engine monitoring signals provided by engine mounted lubricating oil pressure and coolant temperature transducers shall communicated over a serial data link through a Data Sending Unit (DSU) to the control panel receiving module. The safety logic shall shut the engine down if the serial data link is lost.

C. Control Functions:
   1. Provide control panel front mounted devices such as generator voltage control device, ammeter/voltmeter phase selector switch, control selector switches, and pushbuttons. Provide control and monitor devices identified and labeled with ISO symbols.
   2. Provide start-stop logic for cycle cranking and cool down operation and red-mushroom head emergency-stop maintained pushbutton.

D. Control Wiring:
   1. GenSet control wiring:
      a. Number 16 AWG stranded wire and control panel ground wire
      b. Number 12 AWG with green and yellow striped insulation rated. Conductors shall be rated 90°C 600 Vac insulation with UL or CSA listing.
      c. Provide wire identification on the conductor 6-inches from the terminal and protect wire from sharp bends and metal edges.
      d. Provide four sets of Form C dry contacts rated at 2 amps for remote customer alarming.

E. Alarm and Shutdown Conditions:
   1. Indicate the following alarm and shutdown conditions and provide a RESET device to clear fault:
      a. Low oil pressure: pre-alarm
      b. High engine temperature: pre-alarm
      c. Low engine temperature: pre-alarm
      d. Low fuel: pre-alarm
      e. Low battery DC voltage: pre-alarm
      f. Generator output circuit breaker (trip or off): alarm
      g. Generator overload: alarm
      h. Low oil pressure: shutdown
      i. High engine temperature: shutdown
      j. Low coolant level: shutdown
      k. Over-crank: shutdown
      l. Over-speed: shutdown
      m. Over-voltage: shutdown
      n. Under-voltage: shutdown
      o. Under-frequency: shutdown

p. High battery voltage alarm
q. Low battery voltage alarm
r. Normal battery voltage indication
s. Battery charger malfunction alarm
t. Spare (2): alarm and shutdown

F. Metering:
1. Provide digital metering with 0.5% accuracy. Provide true RMS indication that includes the total harmonic voltage and current content:
a. Voltmeter
b. Ammeter
c. Frequency meter
d. Phase select switch
e. Non-resettable running time

G. Alarm Module:
1. Provide integral digital alarm annunciator for indication and audible alarm per NFPA Standard 110 on the engine-generator control panel. Provide lamp test switches, alarm horn silence-button, and first-out alarm detection.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
1. The GenSet shall be installed and connected in accordance with manufacturer's recommendations and the installation shall be certified on Form 43 05 11-A as specified in Section 01 99 90.
2. Verify the equipment pad is sized for the GenSet size per submittal information, level, with ground pad installed.

B. Signs:
1. Provide NEMA MG1-22.61 GenSet nameplate. Provide laminated equipment, device, and panel nameplates per specification Section 26 05 00.
2. Provide one sign in accordance with NEC [700.7] [701.7] [702.7] for Contractor installation on the Service Entrance Equipment. Sign shall conform to NEC 110.21(B), and shall describe the type and location of the generator.

C. Conduit Transitions at Slab:
1. Connection from underground conduits to GenSet equipment shall transition via PVC coated flexible steel conduits. Loose or open cabling will not be permitted.

D. Protection Post Barriers:
1. Provide a minimum 4-inch diameter concrete filled 36-inch high posts around the GenSet. Post shall be removable with locking pin device to keep in place. Provide post at each corner within 3-feet from the enclosure and with 3-feet between posts.

3.02 FIELD INSPECTION AND TESTING

A. Pre-Delivery Inspection:
   1. Provide a pre-delivery inspection performed by the system manufacturers' local dealer at the dealer's facility to insure no damage occurred in transit. Verify GenSet components, controls, and electrical equipment is included as specified herein. Verify the NEC work access to electrical power equipment and control equipment is provided as specified.

B. Pre-Delivery Supplier Facility Testing:
   1. Prior to delivery of the GenSet to the project site, test the GenSet to verify it is free of defects, starts automatically, and carry full load. Test shall be performed at the facility of the system manufacturer's authorized supplier.
   2. The testing shall be done on dry type, resistive load banks capable of precise incremental loading. Salt water brine tanks or load banks requiring water as a source of cooling will not be allowed.
   3. Provide separate test grade instrumentation to monitor the GenSet using the load bank. The GenSet monitoring instruments shall be read and compared to the amperage and voltage on each phase. Both readings shall be recorded and compared in the test report.

C. Pre-Delivery Testing Procedure:
   1. Provide a pre-delivery test and operation that includes the ATS setup, test, and operation performed by factory trained technicians with test equipment, facilities, and consumables provided by the supplier.
   2. [Owner Representative] [Construction Manager] shall be scheduled to witness all tests. The test shall be performed on the complete fabricated GenSet within sound attenuated enclosure.
      a. Check electrical, exhaust, fuel and water connections for proper size, continuity and tightness of fittings.
      b. Check fluids for appropriate levels and jacket water heater operation.
      c. Correct defects during the test at no additional cost to the Owner prior to shipment to the job site.
      d. Connect a 100 percent rated resistance load bank equivalent to the nameplate rating at unity power factor.
      e. The GenSet shall be run for 1.5 hours during first initial run for proper engine break-in, (0.5-hour no-load, 0.5-hour at 50 percent rated load, 0.5-hour at 75 percent load) then 100 percent for 2 hours, or similar manufacturer recommended test operation sequence.
      f. The test period shall extend until oil and water temperatures have stabilized for a period not less than 30 minutes.
      g. Maintain test records at fifteen minute intervals to record water temperature, fuel pressure, oil pressure, ambient air temperature, voltage, amperage, frequency, kilowatts and power factor.
      h. Test safety devices using methods recommended by the manufacturer.
      i. Test results shall be documented and submitted for approval.
      j. Setup the control system to allow engine to cool before shutdown.

D. On Site Post-Installation Testing:
   1. Following installation, the following tests shall be performed by the system manufacturer's qualified representative in the presence of the Owner's representative.
   2. Pre-start Checks:
      a. oil level
      b. water level
      c. day tank fuel level
      d. battery connection and charge condition
      e. engine to control interconnects
      f. GenSet intake/exhaust obstructions
      g. engine room ventilation obstructions
      h. removal of all packing materials

E. Field Tests:
   1. The GenSet field test shall be performed by factory trained technicians at the project site with test equipment, facilities, and consumables including fuel and lubricants provided by the supplier. Provide a full tank of diesel fuel when the testing is completed and the GenSet is available for operation.
   2. Owner’s representatives shall witness the field tests. Contractor shall provide to the Construction Manager written notice of the date field testing will commence a minimum of two weeks prior to that date.
   3. The following field tests shall be conducted:
      a. Check electrical exhaust, fuel and water connections for proper size, continuity and tightness of fittings.
      b. Check fluids for appropriate levels and jacket water heater operation.
      c. Start-up engine and make initial start-up check of operational equipment.
      d. Upon completion of initial start-up and system checkout, schedule the witnessed field test to demonstrate load carrying capability, stability, voltage and frequency.
      e. Operate the GenSet for l-hour for proper engine break-in and record water temperature, fuel pressure, oil pressure, ambient air temperature, voltage, amperage, frequency, kilowatts, and power factor.
      f. Operate a minimum of 4-hours under full load with consumables necessary for testing furnished by the bidder.
      g. Return to normal power source and test the ATS transfer from normal power to standby power and the ATS monitoring functions by simulating the loss of normal power source.
      h. Test the ATS initiated "GenSet Start" condition with the load bank.
      i. Run the generator for test duration; monitor the oil and water temperatures and record readings every fifteen minutes.
      j. Test the GenSet safety devices using methods recommended by the manufacturer.
      k. Setup the unloaded run at the conclusion of the test and the retransfer to normal power to allow engine to cool before engine shutdown.
      l. Notify the Owner’s representative of problems and the mitigation plan.

m. Submit the formal Test Results Report for approval.

3.03 TRAINING

A. The Contractor shall contract with the GenSet manufacturer to provide 8-hours of training for each of the subjects below. Arrange and schedule the training with the Owner.

B. Training shall include the requirements of Section 01 79 00 and the following:
   1. Operations and Maintenance for the Diesel Engine and Fuel System.
   2. Operations and Maintenance for the AC Generator.
   3. Operations and Maintenance for the Control Panels, Battery System, and Enclosure Systems
   4. Operational information for the specific equipment provided.
      a. Operation of the equipment in automatic and manual modes.
   5. Troubleshooting.
   6. Routine maintenance.

C. Training shall be certified on Form 43 05 11-B as specified in Section 01 99 90.

END OF SECTION

SECTION 26 41 13

LIGHTNING PROTECTION FOR STRUCTURES

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. Contractor shall provide the lightning protection system design by a qualified Lightning Protection System (LPS) firm registered to design lightning protection systems.
   2. Contractor shall furnish and install a complete lightning protection system for the following facilities and structures:
      a. Treatment Building
   3. Contractor shall test and certify that the lightning protection system design, installation, and testing comply with the lightning protection industry standards as applied to the project facilities and structures.
   4. Contractor shall provide the LPS firm with the plant or facilities drawings that indicate the equipment, buildings, structures, and HVAC equipment as the basis for their design work.
   5. Contractor shall submit the design drawing to the Design Review Agency for approval and to the Engineer for reference.

B. Coordination:
   1. Lightning Protection Systems design shall be arranged in accordance with the class of structure to be protected.
   2. Coordinate arrangement and connections with roof system proposed for use and roof mounted equipment. Refer to the structural and architectural drawings provided by the Contractor.

C. Related Sections:
   1. Contractor shall coordinate the requirements of the Work in this Section along with the requirements of the sections listed:
      a. Section 26 05 00 – Common Work Results for Electrical
      b. Section 26 05 26 – Grounding and Bonding for Electrical Systems.

1.02 QUALITY ASSURANCE

A. Quality Control:
   1. Lightning protection system materials shall be the standard product of a manufacturer regularly engaged in the production of lightning protection systems.
   2. Materials shall comply in weight, size, and composition for the class of structure to be protected.
   3. Lightning protection systems shall be installed under the direct supervision of a Lighting Protection System Certified Master Installer.

B. Certification Requirements:
   1. Provide and submit Master Installer Certified forms for the following:
      a. Form LP1-175A - Jobsite Witness of Grounding Connections.
      b. Form LP1-175B - Post-Installation Inspection.
      c. UL Master Label C.

C. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 SUBMITTALS

A. Shop Drawings:
   1. The following submittals shall be provided in accordance with Section 01 33 00
      a. Manufacturers technical information for materials proposed for use.
      b. Complete scaled drawings identifying the system arrangement and equipment connections for each building.

c. Drawings shall include equipment connection details, down-lead details, routing of system conductors, and locations of air terminals.

B. Master Label Certificates:
   1. Submit certificates for LP1 Code Compliance together with UL Master Label C certificates.

PART 2 PRODUCTS

2.01 MATERIALS

A. Materials:
   1. General:
      a. System materials shall be copper and high copper-content bronze castings.
         1) Fittings, except cable holders, shall be heavy-duty type made from bronze castings.
         2) Terminal rods, bolts, screws, and related type hardware shall be copper clad steel or brass to prevent galvanic corrosion.
   2. Components:
      a. The system shall consist of the necessary equipment as required to provide a complete and coordinated system. Cable and air terminals used shall bear the UL Label. The components shall consist of, but not limited to, the following:
         1) Cables.
         2) Air terminals.
         3) Mounting bases.
         4) Fittings.
         5) Couplings.
         6) Connectors.
         7) Fasteners.
         8) Conduit.
         9) Pitch pads and weatherproof seals.

2.02 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate firms are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section.

B. The candidate detailed design, product manufacturer, and installation firm shall be one of the following or accepted equal:
   1. Thompson Lightning Protection Inc.
   2. AC Lightning Security.

C. Early Streamer Emission (ESE) is prohibited product system.

PART 3 EXECUTION

3.01 INSTALLATION

A. Verify field measurements as indicated on the drawings and as specified elsewhere herein.

B. Conceal system conductors where practical and main down-leads and roof risers shall be concealed within the building walls or columns.

C. Allow six foot minimum clearances as required by the NEC from:
   1. Lightning rod conductors to non-current-carrying metal parts of electrical equipment unless they are bonded to the rods;
   2. Lightning conductors to open conductors of communications systems;
   3. Lightning protection grounding electrodes to electrodes of other grounding systems.

D. Do not use lightning protection rods and electrodes in place of the grounding electrodes for electrical equipment.

E. Run leads in 1-inch Schedule-80 PVC plastic conduit.

F. Terminate upper end above floor ceiling, utilize through-roof connectors for cable roof penetrations. Conduit terminations at lower end to be 6-inch above finished ground level, to pinpoint locations during future inspections.

G. Bond metallic objects and systems at roof level.

H. Primary bonds using appropriate fittings and full-size conductor:
   1. Roof intake and exhaust fans, HVAC units, ductwork, piping, ladders, skylights, stacks, vents, etc.
   2. Down-leads to steel column or major framing member at every down-lead position.

I. Secondary bond using secondary cable and fittings:
   1. Metal bodies of inductance located within six feet of a conductor
   2. Equipment with primary bond.

J. Connect to structure ground grid system using exothermic welds.

K. Insure installation of air terminals to withstand wind force equivalent to 100 miles per hour with a gust factor of 1.3 without structural damage and without damage to the integrity of the lightning protection system.

L. Interconnect the Lightning Protection System to the building grounding grid at one location. Suggest the design indicate the interconnection be on opposite side of the building's service entrance location.

END OF SECTION

SECTION 26 41 23

LIGHTNING PROTECTION SURGE ARRESTERS AND SUPPRESSORS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies surge arresters used for the protection of electrical power equipment against surges caused by lightning or switching.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI C62.1	Surge Arresters for AC Power Circuits
NEMA LA 1	Surge Arresters

B. Design Test Data and Factory Tests:
   1. The manufacturer shall provide copies of design test data on the arresters provided showing that the arresters are in compliance with ANSI C62.1

C. The following tests shall be made on each arrester in conformance with ANSI C62.1:
   1. Power-frequency spark-over
   2. Radio influence voltage
   3. Sealing

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The surge arresters shall be valve-type designed to protect electrical power distribution equipment against overvoltages due to surges from lightning or switching. The arresters shall comply with ANSI C62.1 and NEMA LA 1.

B. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers for surge arresters suppliers include ABB, Eaton/Cutler Hammer, General Electric, Siemens, Square D, or equal.

2.02 CLASSIFICATION OF ARRESTERS

A. General:
   1. Surge arresters are classified according to prescribed ANSI test requirements.

B. Station Class:
   1. Where specified, station class arresters shall be provided on electrical distribution power equipment rated above 10,000 KVA unless otherwise specified.

C. Intermediate Class:
   1. Where specified, intermediate class arresters shall be provided on electrical power distribution equipment rated 10,000 KVA and below unless otherwise specified.

D. Distribution Class:
   1. Where specified, distribution class arresters shall be provided on electrical power distribution equipment.

2.03 RATING

A. The surge arresters shall be rated for the voltage class specified.

2.04 MOUNTING

A. The manufacturer shall provide the necessary mounting hardware.

2.05 NAMEPLATES

A. Nameplates shall be provided in accordance with the requirements of Section 26 05 00.

2.06 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Certified design test data and individual test data for arresters as specified in paragraph 1.02 Design Test Data and Factory Tests.
   2. Operation and maintenance information items as specified in Section 01 78 23.

PART 3 EXECUTION

3.01 INSTALLATION

A. Unless otherwise specified, the surge arresters shall be mounted next to the equipment terminals. The terminations shall be torqued as recommended by the manufacturer.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 42 00

CATHODIC PROTECTION

PART 1 GENERAL

1.01 WORK OF THIS SECTION

A. The CONTRACTOR shall install a cathodic protection system for the City Creek WTP yard piping, 24-inch and 36-inch welded steel pipe (WSP) with a dielectric polyethylene tape system. The cathodic protection system shall protect all associated pipes, joints, valves, fittings, etc., and includes electrical continuity (joint bonding), electrical isolation (insulating flanges), sacrificial (magnesium) prepackaged anodes, and cathodic protection testing facilities, in accordance with the Contract Documents.

B. The CONTRACTOR shall be responsible for review of the installation procedures under this and other Sections and for coordinating the installation of the corrosion control system, as required by the Contract Documents, and this specification.

1.02 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. The publications listed below form a part of this specification to the extent referenced and are referred to within the text by the basic designation only.

B. Commercial Standards

1. American Society for Testing and Materials (ASTM)
    a. ASTM B3: Specification for Soft or Annealed Copper Wire
    b. ASTM B80: Specification for Magnesium-Alloy Sand Castings
    c. ASTM B843: Specification for Magnesium Alloy Anodes for Cathodic Protection
    d. ASTM D149: Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies
    e. ASTM D257: Test Methods for DC Resistance or Conductance of Insulating Materials
    f. ASTM F436: Standard Specification for Hardened Steel Washers
    g. ASTM G97: Laboratory Evaluation of Magnesium Sacrificial Anode Test Specimens for Underground Applications
2. American Water Works Association (AWWA)
    a. AWWA C217 Petrolatum and Petroleum Wax Tape Coatings for the Exterior of Connections and Fittings for Steel Water Pipeline.
3. NACE International (NACE)
    a. SP0169: Control of External Corrosion on Underground or Submerged Metallic Piping Systems
    b. SP0286: Electrical Isolation of Cathodically Protected Pipelines
    c. TM0497: Measurement Techniques Related to Criteria for Cathodic Protection on Underground or Submerged Metallic Piping Systems
4. National Fire Protection Association (NFPA)
    a. NFPA 70: National Electrical Code

5. NSF International (NSF)
    a. NSF 61: Drinking Water System Components – Health Effects

1.03 SUBMITTALS

A. Catalog cuts of all materials to be installed shall be submitted for approval.

B. Qualifications of the CONTRACTOR's Corrosion Engineer and Corrosion Technician, as outlined in the Quality Assurance Section 1.04, shall be submitted for approval.

C. Manufacturer's information for each item listed below shall be submitted for approval. (Include sufficient information to show that the materials meet the requirements provided herein, including references to specific sections and details shown on the Drawings.)
    1. Prepackaged Magnesium Anodes
    2. Flush-Mounted Cathodic Protection Test Stations
    3. Reference Electrodes
    4. Pipe Lead and Joint Bond Wire
    5. Thermite Weld Equipment and Materials
    6. Thermite Weld Coating
    7. Insulating Flange Components
    8. Coating for Buried Insulating Pipe Flanges
    9. Insulating Blankets
    10. Electrical Tape
    11. Cable Warning Tape

D. The following reports shall be submitted for approval:
    1. ASTM G97 current capacity test results.
    2. Insulating Flange/Joint Inspection Report.
    3. Electrical Isolation Testing Between Pipe and Steel Reinforcement Report.
    4. Baseline (Native) Potential Survey Report.
    5. A letter report documenting all testing performed during system installation and activation. The letter report shall include a description of the test methods, all data, analysis of the data, and conclusions about the cathodic protection system's effectiveness.

1.04 QUALITY ASSURANCE

A. The criteria used to indicate adequate corrosion protection of the metallic water pipeline shall be as listed in NACE Standard SP0169.

B. The installation of the cathodic protection system's electrical components shall conform to the National Electrical Code NFPA 70, applicable federal, state, and local codes, and the recommendations of NACE Standard SP0169.

C. The criteria used to indicate adequate electrical isolation of the metallic water pipeline from structures not intended to be cathodically protected shall in accordance with NACE Standard SP0286.

D. Provide all materials, equipment, labor, and supervision necessary for the completion of all installations and testing.

E. Services of Corrosion Engineer: The Owner will obtain the services of a Corrosion Engineer to inspect, activate, adjust, and evaluate the effectiveness of the cathodic protection system. The Corrosion Engineer is herein defined as a registered Professional Engineer with certification or licensing that includes education and experience in cathodic protection of buried or submerged metal structures, or a person accredited or certified by NACE at the level of Corrosion Specialist or Cathodic Protection Specialist (i.e., NACE CP Level 4). Such a person shall have not less than five years' experience inspecting pipeline cathodic protection systems.

F. Services of Cathodic Protection Technician: The Owner will obtain the services of a Cathodic Protection Technician to inspect, activate, adjust, and evaluate the effectiveness of the cathodic protection system. The Cathodic Protection Technician is herein defined as a person accredited or certified by NACE as a Cathodic Protection Technician (NACE CP Level 2). Such a person shall have not less than five years' experience inspecting pipeline cathodic protection systems.

G. Maintain record drawings for the cathodic protection system throughout the installation of the equipment. Properly identify all items of equipment and material. Show the exact locations of all anodes, buried wires, cathodic protection test boxes, and insulating pipe flanges using dimensional ties to existing structures or survey monuments. Record all changes by using a red pen or red pencil on full-size drawings.

PART 2 - PRODUCTS

2.01 GENERAL

A. Provide cathodic protection system materials and equipment that are new, undamaged, and in the original packaging marked with the manufacturer's name or trademark. The materials and equipment shall be of the manufacturer's latest standard design and shall be fully compatible to provide a complete and functional cathodic protection system.

2.02 PREPACKAGED MAGNESIUM ANODES

A. Each high-potential magnesium anode shall have a nominal weight of 17 pounds, excluding backfill in accordance with ASTM B80 or B843. The anode shall be 25.75 inches long by 3.50 inches wide by 3.75 inches high.

B. Composition of the anode shall be as follows (per ASTM B843):

Component	Composition by Weight %
Aluminum	0.01 max
Manganese	0.50 to 1.30
Silicon	0.05 max
Copper	0.02 max
Nickel	0.001 max
Iron	0.03 max
Other Metallic Impurities (ea.)	0.05 max
Others (total)	0.30 max

Component	Composition by Weight %
Magnesium	Remainder

C. The 17-pound anodes shall be packaged in permeable fabric that is 25.75 inches in length by 3.50 by 3.75 inches in diameter.

D. The fabric for each 17-pound anode shall contain a minimum of 30 pounds of backfill. The backfill material shall have the following composition:
   1. Hydrated Gypsum: 75%
   2. Bentonite: 20%
   3. Sodium Sulfate: 5%

E. The anode and backfill shall be prepackaged into a single unit, as described in Section 2.02 A thru D. A minimum of 25 feet of AWG No. 8 stranded copper wire with HMWPE insulation (black) shall be attached to the anode. The wire shall be sufficient length to reach the termination point without splices. Wire-to-anode attachment shall be by silver solder and sealed to prevent any moisture penetration. The anode system shall be as manufactured by BK Corrosion or approved equal.

F. The anode's current capacity, as measured using the ASTM G97 standard test procedure, shall be minimum 480 amp-hours per pound. If anodes are of the cast type, the anode foundry or the anode retail supplier shall have a quality control program that includes random ASTM G97 testing. ASTM G97 current capacity tests shall be performed on randomly selected anodes at a minimum rate of 1 for every 2,500 anodes cast. Submit the ASTM G97 current capacity test results for the testing date that is closest to the production date of the anodes supplied for this project. All cast high-potential magnesium anodes shall bear a stamp with its foundry heat number for traceability.

2.03 CATHODIC PROTECTION TEST STATIONS

A. Flush-Mounted Test Stations
   1. The flush-mounted test station shall consist of a nonconductive terminal board mounted in a locking cast iron lid and collar (suitable for placement in heavy traffic areas) and a plastic shaft.
   2. The test box shall pass U.S. DOT H-20 roadway load test. The cast iron of the lid and collar shall meet or exceed ASTM A48 Class 25 specification. The test box lid shall be made of cast iron and painted yellow. The lid shall feature a cast-in pentagonal bolt to lock into the cast iron cover.
   3. The cast iron collar shall be at least 5-inches in diameter, 2.75 inches high with lugs cast inside to accept the locking lid and to accept a 1-inch cast iron repaving adapter with original lid.
   4. The plastic shaft shall be made of ABS (acrylonitrile butadiene styrene), 18 inches long, with a flared bottom—to resist sinking in soil and provide protection against wire damage. The plastic shaft shall have a minimum 3.25-inch inner diameter. The plastic shaft shall be riveted to the cast iron collar.
   5. The test block shall be made of nonconductive PVC (polyvinyl chloride) plastic or phenol-formaldehyde resin.
   6. The test station shall be set in a 24-inch by 24-inch by 6-inch-thick concrete slab.

7. Where the test station is used for sacrificial anodes, the anodes shall be connected through a 0.01-ohm shunt.
8. The test station shall be permanently labeled with the purpose, type, stationing, and pipeline.
9. The terminal board shall contain a minimum of five terminals—using 0.25-inch by 20-thread brass or stainless-steel machine screws and nuts. The terminal board shall fit into the lid using hangers cast inside the lid.
10. The flush-mounted test station shall be manufactured by CP Test Services, Cott Manufacturing, Inc., or approved equal.

B. Test Station Concrete
1. Install level on a compacted gravel base. Install a 24-inch long, 2-inch diameter PVC vertical test port in the bottom of the test box. Place a slip-on PVC cap on the test port. Use flexible conduit to protect cable insulation where it enters the test box.
2. In unpaved areas, provide a square reinforced concrete pad that is 24 inches by 24 inches, and 6 inches thick. Reinforcement shall be #4 bars, at 12 inches on center each way, in the center of the pad. Edges shall be provided with a 3/4-inch chamfer. To channel water away from the test station slope the concrete 2 percent from center.
3. In paved areas, provide a square reinforced concrete pad that is 24 inches by 24 inches, and 12 inches thick. Reinforcement shall be #4 bars, at 12 inches on center each way, in the center of the pad. To channel water away from the test station slope the concrete 2 percent from center.

C. Compression Wire Terminals
1. Test station terminal lugs shall be non-insulating, one-hole ring type, compression terminal lugs for a 0.25-inch bolt size. Compression terminals shall be specially manufactured for terminating copper cables at test stations. The terminals shall be copper or tin-coated copper, as manufactured by Burndy Corporation or approved equal.
2. Compression connectors shall be specially manufactured for terminating the copper cables at the test stations. The connectors shall be copper and shall be manufactured by Burndy Corporation or approved equal.

D. Current-Measuring Shunt
1. Test station shunts shall be constructed to fit the terminal posts for the specified test station or junction box. The resistance shall be 0.01 ohm with a current capacity of 8 amperes. The shunt shall be Model "Yellow", as manufactured by Cott Manufacturing Company or approved equal.

2.04 REFERENCE ELECTRODES

A. The reference electrode shall be a permanent copper/copper sulfate reference electrode (CSE) designed for a minimum 20-year life. The electrode shall have a 2-inch diameter by 12.75-inch-long Schedule 80 PVC body. Lead wire shall be of sufficient length to reach the test station terminals without splicing. The lead wire shall be attached to the electrode core with the manufacturer's standard connection. The connection shall be stronger than the wire. No splicing of the reference electrode lead wire shall be permitted under any circumstances. The reference electrode shall be Model “Stelth 7 Rocket”, as manufactured by Borin Manufacturing Company or approved equal.

2.05 PIPE LEAD AND JOINT BOND WIRE

A. All wiring shall be stranded copper wire of the AWG wire size and insulation color shown on the Drawings in accordance with ASTM B3, excluding wire provided with the magnesium anodes and reference electrodes.

B. Wire for bonded joints shall be single conductor, stranded copper with high molecular weight polyethylene (HMWPE) insulation (black). Wire size shall be AWG No. 2 for piping larger than 36-inch diameter, AWG No. 4 for 16-inch through 36-inch diameter piping, and AWG No. 6 for smaller than 16-inch diameter piping and all associated pipe fittings. A minimum of two bonding wires per joint shall be installed.

C. Pipeline test wires shall be single conductor, AWG No. 8 stranded copper wire with 600-volt HMWPE insulation, with colors as shown on the Drawings.

D. No wire splices shall be allowed unless prior written approval is given by the Corrosion Engineer.

2.06 THERMITE WELD EQUIPMENT AND MATERIALS

A. Thermite weld molds and charges shall be suitable for the sizes and types of materials and shapes encountered. Adapter sleeves shall be utilized for all thermite welds.

B. Typical size of the exothermic weld charge is 15 grams. The manufacturer shall be consulted for the proper charge size and material to be welded.

C. All welding materials and equipment shall be the product of a single manufacturer.

D. All exothermic welds shall have one wire per weld, with a minimum of 6-inches between welds.

2.07 COATING FOR THERMITE WELDS

A. Thermite welds to steel piping shall be coated with a prefabricated assembly, specifically designed for covering cathodic protection wire connections to piping and fittings. There shall be one weld per prefabricated assembly. The prefabricated assembly shall consist of the following components:

1. Top plastic sheet formed with an igloo-shaped dome and entry tunnel for the lead wire;
2. A special elastomeric compound in the plastic dome, firm enough to resist flow at normally encountered application and operating temperatures, but soft enough to mold itself around and completely cover the irregular welded profile;
3. A double row of parallel, flexible, serrations on each side of the dome to assist with conforming around small-diameter pipe; and
4. A base of black, unbacked, elastomeric tape with exceptional adhesive properties for bonding firmly to a surface, when used with the appropriate primer.

B. Caps shall be Model Handy Cap, as manufactured by Royston Laboratories Division or approved equal. The appropriate primer, as required by the elastomeric cap manufacturer, shall be used. Primer for the Royston Handy-Cap shall be Model Roybond 747 Primer, as manufactured by Royston.

2.08 INSULATING FLANGE COMPONENTS

A. For purposes of this specification, the terms “Pipe Flange Insulating Kit”, “Insulated Flange”, “Insulated Joint”, and “Dielectric Flange” are used synonymously. “Isolation” may be substituted for “insulation”.

B. Pipe flange insulating kit materials shall be designated by the manufacturer as suitable for service at the operating temperatures and pressures for the pipeline.

C. Flange insulating kits shall consist of: a one-piece, full-face, insulating gasket; an insulating sleeve for each bolt; insulating washers; and steel washers. For nominal pipe diameters up to, and including, 36 inches, provide one insulating washer and one steel washer on each side of the flange for each flange bolt. For nominal pipe diameters greater than 36 inches, the insulating washers shall be installed sandwiched between a pair of matching steel washers on each side of the flange for each flange bolt.

D. Insulating Gasket: Insulating gasket retainers shall be full-face, Type E, NEMA G-10 glass, reinforced epoxy retainers with an ethylene propylene diene monomer (EPDM) rubber rectangular cross section O-ring seal. Minimum total gasket thickness shall be at least 1/8 inch. The gasket shall have the same outside diameter as the pipe flange. At valve-to-pipe connections where the inside diameters are not equal, the gasket’s inside diameter shall be equal to the smaller of the two inside diameters. Dielectric strength shall be at least 550 volts per mil in accordance with ASTM D149, and compressive strength shall be not less than 50,000 psi. The manufacturer’s name and date of manufacture shall be marked on both sides of the gasket with a minimum of 2-inch tall block letters using a durable marking ink or paint. The gasket shall be installed within six months of its manufacture date. Do not store insulated flange gaskets under direct sunlight nor at temperatures exceeding 110 degrees Fahrenheit. Use PSI Linebacker insulating gasket or approved equal.

E. Insulating Sleeves: Provide full-length, one-piece, NEMA G-10 glass-reinforced epoxy insulating flange bolt sleeves. Dielectric strength shall be at least 400 volts per mil, in accordance with ASTM D257. The length of the insulating sleeves shall provide an air gap between the end of the insulating sleeve and the inside surface of the stud bolt nut with a tolerance of 1/32 inch minimum and 1/8 inch maximum. Insulating sleeve length must be adjusted for the actual thickness of the steel washers and insulating washers, in accordance with ASTM F436. The bolt holes on the opposing flanges shall be aligned so as not to pinch the insulating sleeve, which would result in electrical shorting of the two flanges.

F. Insulating Washers: Insulating washers shall be NEMA G-10 glass-reinforced epoxy with a minimum thickness of 1/8 inch. Dielectric strength shall not be less than 550 volts per mil, and compressive strength shall not be less than 50,000 psi. The insulating washer’s inside diameter shall be sized to fit over the insulating sleeve’s outside diameter.

G. Steel Washers: Provide hardened steel washers that conform to ASTM F436 for insulated flanges greater than 36 inches in nominal diameter. Double steel washers—four steel washers per flange bolt—are required for insulated flanges greater than 36 inches in nominal diameter. The inside and outside diameters of the steel washers shall match those of the insulating washers. The steel washers must be able to freely rotate around the insulating sleeve. Attention must be paid to the fit between the steel washers and the insulating sleeve in order to avoid the washers twisting and cracking the sleeves when the flange bolts are torqued.

H. Provide four extra insulating sleeves and eight extra insulating washers for each insulating flange upon successful inspection of the insulating flange by the OWNER's ENGINEER.

2.09 EXTERNAL COATING SYSTEM FOR INSULATING FLANGES

A. Insulating flanges shall receive an exterior wax tape wrapping in the field. The coating applicator must apply the coating by and following all manufacturer's application specifications for the coating system and per the guidance in AWWA 217. All components of the coating system shall be manufactured by a single supplier to assure compatibility of individual components. The coating system shall be manufactured by Trenton Corporation or approved equal.

B. Materials:
   1. Primer: A blend of microcrystalline wax, plasticizer, and corrosion inhibitors, which has a paste-like consistency and is designed to displace moisture, penetrate rust and wet the surface, ensuring adhesion of the tape. The primer shall be Trenton Wax-Tape Primer or approved equal.
   2. Filler Putty: A cold-applied, anti-corrosive, moldable filler material used to even the contours of irregular fittings and surfaces. Filler putty shall be used at all irregular surfaces to provide a smooth surface for the application of the inner-wrap and outer-wrap, and shall have the following properties:
      a. Specific Gravity: 1.15
      b. Density: 24 cu. in. per lb.
      c. The filler putty shall be Trenton Fill-Putty or approved equal.
   3. Inner-Wrap: The inner-wrap shall be a non-woven, non-stitch-bonded, synthetic fabric saturated with a blend of microcrystalline wax, plasticizer, and corrosion inhibitor (no clay fillers). The inner-wrap shall have the following properties:
      a. Thickness: 70 to 90 mils
      b. Dielectric strength: 170 volts/mil
      c. The inner-wrap shall be Trenton #1 Wax-Tape or approved equal.
   4. Outer-Wrap: A white, resin-coated, woven fiberglass fabric. The outer-wrap shall have the following properties:
      a. Thickness: 0.005 inch
      b. Tensile strength (per 1-inch width): 85 lb. minimum
      c. Tape width: 6 inches
      d. The outer-wrap shall be Trenton Glas-Wrap or approved equal.

2.10 INSULATING BLANKETS

A. Where stray currents or contact with unprotected metallic structures are anticipated installation of an insulating blanket may be required between the two interfering structures. The insulating blanket shall be a minimum 1/8-inch neoprene or butyl rubber. The blanket shall be installed midway between the two structures. The blanket shall be square or rectangular with sides 36 inches greater than the diameter of the larger structure.

2.11 ELECTRICAL TAPE

A. Electrical tape shall be a conformable, water-tight sealant having a dielectric strength of at least 15 kV for a 1/8-inch-thick layer.

B. Tape shall be Scotch 88 Vinyl Tape and Scotch C130 Rubber Tape or approved equal.

2.12 CABLE WARNING TAPE

A. Cable warning tape shall be polyethylene material, minimum 6 inches wide, red or yellow in color, and labeled "CAUTION - CATHODIC PROTECTION".

B. Tape shall be Terra Tape, as manufactured by Reef Industries or approved equal.

PART 3 EXECUTION

3.01 GENERAL

A. The Drawings are diagrammatic. The exact locations and routing of anodes, test stations, cables and conduits shall be governed by structural conditions and any physical interference. The final placement of the anodes and test stations shall be at the locations approved by the OWNER's ENGINEER and shall be marked on the record drawings. Where above-grade test stations are specified, OWNER's ENGINEER may approve or request a "flush-to-grade" test station configuration, in accordance with the Drawings.

B. All materials, workmanship and installation shall conform with all requirements of the legally constituted authority having jurisdiction. These authorities include, but are not limited to, the Federal, State, County, or City codes and regulations.

C. Unless otherwise indicated, install all materials in accordance with the manufacturers' recommendations and safety procedures, and as shown on the Drawings.

D. Where requirements of this section conflict with the manufacturer's recommendations, the manufacturer's recommendations shall take precedence.

E. All materials and equipment to be used in construction shall be stored in such a manner as to be protected from detrimental effects from the elements. If appropriate storage is not available, stack materials and equipment well above ground level and protect from the elements as needed.

3.02 THERMITE WELDING

A. All thermite welds shall be made as shown on the Drawings and in accordance with the manufacturer's recommendations using the proper combination of equipment for the material and wire size being welded.

B. Ensure that the area where the attachment is to be made is absolutely dry. Remove mill coating, dirt, grime and grease from the pipe or fitting surface at the weld location by wire brushing or by the use of suitable safety solvents. At the weld location, use a mechanical grinder to clean a 2.5-inch square area of the pipe or fitting surface to a bright shiny surface, free of all serious pits and flaws.

C. Prepare the wire for welding by ensuring the cable is absolutely dry. The cable shall be free of dirt, grease and other foreign products. Cut the cable in such a way as to avoid flattening or forcing out of round. To prevent deformation of the cable, cut the cable with cable cutters. Remove the insulation in a manner that will avoid damage to strands. Install adapter sleeves for all bonds and test wires prior to welding; either prefabricated factory sleeved joint bonds or bond wire with formed sleeves made in the field are acceptable. Hold the cable at an approximate 30-degree angle to the pipe surface when welding.

D. When the weld has cooled, remove the weld slag and test the weldment for strength by striking with a sharp, shearing blow using a 2-pound hammer, while pulling firmly on the wire. Remove unsound welds and make new welds at least 2 inches away. Thoroughly clean mold and mold covers after completion of each weld to assure that no slag will penetrate into the next weld.

E. After soundness of the weld has been verified, thoroughly clean with a stiff wire brush and apply primer over the entire weld area where the elastomeric cap will be placed. The elastomeric cap shall extend on all four sides beyond the cleaned area. Push the dome of the prefabricated cap, containing elastomeric material, firmly into weld area. Lift the wire away from the pipe and apply the elastomeric material completely around and underneath the wire. Push the wire back down on the pipe. Follow all manufacturer's instructions for installing prefabricated caps.

3.03 BONDED JOINTS

A. All non-welded pipe joints—including those on pipe, fittings, valves and branch connections intended to be cathodically protected, and except those specified to be insulated—shall be bonded as shown on the Drawings. All bond cables shall be thermite-welded to the pipe or fitting, as described in 3.02 above.

B. A minimum of two bonding wires per joint shall be installed.

3.04 PREPACKAGED MAGNESIUM ANODES

A. Prepackaged high-potential magnesium anodes shall be installed where indicated on the civil Drawings or in accordance with the Cathodic Protection Schedule. Each anode shall be placed a minimum of 18-inches from the pipeline. Provide a minimum of 10 feet of separation between anodes that are grouped and electrically connected together in a single termination point. Provide a minimum anode spacing of 5 feet from other pipelines. Prior to installation, remove all shipping covers from the anode. (Note: The prepackaging fabric for magnesium anodes shall not be removed.) Install the anodes in existing soils—free from rocks, roots, organic material, trash or other debris—and backfill with a minimum of 6 inches of native soil. Do not install the anodes in sand, rock or gravel backfill. After placement, but prior to backfilling, pre-soak the anodes with 5 gallons of water.

B. Each anode shall be lowered, using a sling or rope, into the hole/excavation site and placed vertically at the bottom of the hole. The anodes shall not be transported, lifted, or lowered into the excavation using the anode lead wires. Care shall be taken to ensure that the anode lead wire insulation is not damaged. Anodes with damaged lead wires or insulation shall be removed from the project and replaced.

C. Anode lead wire shall be long enough to reach the junction box or test station without splicing. Care shall be taken not to damage the lead wire throughout the installation and testing process.

D. Prior to connecting the anodes to the structure wires, the open circuit potential of each anode shall be measured. A voltage of –1.70 volts, or more negative, shall be obtained. If –1.70 volts are not obtained, further investigation shall be conducted to determine why the –1.70 volts have not been obtained. If required, replace the anode.

E. At anode test stations, anode lead wires shall be buried a minimum of 2 feet below grade. Handle wire with care. Route the anode wires to the junction box or test station, without splices, in a manner to prevent damage to the wires.

F. The metal portion of the anodes shall not contact the protected pipeline, except through the anode leads at termination points.

G. Where multiple anodes are installed, the anodes shall be installed with half on the left side and half on the right side of the pipeline. As looking upstream, the right-side anode leads shall be orange color coded and the left-side anode leads shall be black color coded.

H. All anode wires shall terminate at a or junction box or test station for testing and monitoring.

3.05 DIRECTLY CONNECTED ANODES

A. All galvanic anodes shall be connected to the pipeline through a junction box or test station. Direct connection of anodes to the pipeline shall not be permitted.

3.06 TEST STATIONS

A. The CONTRACTOR shall have responsibility for determining the correct test station type to install, based on the location, structural obstructions, roads, anodes, insulating flanges, etc. Test stations shall be installed so as to avoid being damaged or obstructing the normal operation of any equipment.

B. Install test stations at the locations indicated on the civil Drawings or in accordance with the Cathodic Protection Schedule. Test stations shall be located directly over the pipeline, except in areas that would place the test station in a roadway. If the Drawings or Cathodic Protection Schedule indicate a placement location that lands in a roadway, then locate the test station at the closest point, just off the edge of the road. If installing an offset from the pipeline, refer to the offset test station detail on the Drawings. Flush-mounted test stations can be installed in the roadway as an alternate method. All test stations shall be properly labeled to indicate that they are for cathodic protection.

C. Attach test wires to the pipeline as indicated, using the proper thermite welding equipment and charges specified for the wire size and respective pipe material. Follow all procedures as outlined in Section 3.02 above.

D. All test station wires shall be routed a minimum of 2 feet below finished grade. Maintain sufficient slack in the test wires so that the wires can extend a minimum of 18 inches beyond the test station. Connect the test wires to the test station terminal block with one-hole compression terminal lugs for a 0.25-inch bolt size. Install a shunt and a copper shorting strap to connect the anode leads to the pipe lead where indicated on the Drawings.

E. The test station wires shall be protected from damage where they enter the conduit below the concrete pad.

F. The test stations shall be set in poured concrete (2 feet on each side and 6 inches thick) and reinforced with #4 rebar.

G. Where offset test stations are utilized in roadways, the test wires shall be routed under the roadway to the test station through PVC electrical conduit.

3.07 TRENCHING AND BACKFILL FOR CATHODIC PROTECTION SYSTEMS

A. Complete excavations and trenching, regardless of the type, nature, or condition of materials encountered, as required to accomplish specified construction to lines and grades shown.

B. Take care to avoid damage to existing structures and utilities during excavating and trenching process. Contractor may modify location, as approved by the ENGINEER, to minimize possible damage to existing structures. Trenches shall be of uniform depth and width, level, smooth, and free of sharp objects.

C. Slope, shore, or brace excavations and trenches, in accordance with OSHA regulations, as necessary, to prevent caving during excavation in unstable material, and to protect adjacent structures, property, workers, and the public.

D. Install horizontal runs of PVC electrical conduit in trenches at a depth of 36 inches. Install plastic warning tape in a continuous manner at 12 inches above all horizontal runs.

E. Securely attach identification tags to all wires with nylon fasteners prior to backfilling operations.

F. Backfill trench with excavated backfill materials, if suitable. Suitable backfill shall be free of angular rock, debris, roots, turf, or other deleterious materials.

G. Do not use backfill material of frozen or consolidated debris. Leave the trench with the excess backfill material neatly mounded at not more than 4 inches above the existing ground level for the entire width of the trench.

3.08 REFERENCE ELECTRODES

A. Install reference electrodes at the test stations, as indicated on the Cathodic Protection Schedule. The reference electrodes shall be installed between 12 inches to 18 inches from the pipe and at an approximate depth of 6 inches below pipe invert. Native trench material shall be used to backfill the reference electrodes for a minimum of 6 inches. Prior to installation, remove the plastic shipping cover from the reference electrode. The cloth bag containing the special backfill shall remain intact. Where one anode is installed the reference electrode shall be installed on the side of the pipeline opposite that of the anodes. Where multiple anodes are installed the reference electrode shall be placed a minimum of 10 feet from the closest anode

3.09 CLEARANCE TO OTHER STRUCTURES

A. Natural clearance of 18 inches between the pipeline and other structures shall be maintained where possible. If 18 inches of clearance cannot be maintained, then an insulating blanket shall be installed between the two structures.

3.10 INSULATING FLANGES

A. Insulating flanges shall be installed where shown on the Drawings. The CONTRACTOR shall carefully align and install the insulating components according to the insulator manufacturer's instructions. Before backfilling, the CONTRACTOR shall test each insulator for electrical isolation. If the flanges are not properly isolated, the CONTRACTOR shall, at their expense, repair or replace all defective components. The CONTRACTOR shall test the repaired insulating flange assembly. This process will continue until testing reveals that the flanges are properly isolated. Install test stations at all insulating flanges and insulating couplings as shown on the Drawings.

B. When the insulating flange kits are installed on an open-end flange, care shall be taken not to introduce any foreign material that could contaminate the interior surfaces for potable water in accordance with NSF 61.

3.11 COATING OF INSULATING FLANGES

A. The insulating flanges, including all isolation components, shall be tested for proper electrical isolation prior to applying the coating. The insulator shall be coated as described below.
   1. Clean the surface of the flange and all of its components by power tool cleaning, in accordance with the coating manufacturer's recommendations. If any part of the insulating flange kit is damaged while cleaning the metal components of the flange the damage part shall be replaced.
   2. Apply a uniform coat of the primer to the external surfaces of the insulator and all of its components, including bolts, nuts, etc. The primer shall extend a minimum of 12 inches on each side of the insulator.
   3. Apply filler mastic to all irregular surfaces of the insulator to ensure a smooth profile for application of the inner-wrap.
   4. Apply inner-wrap to the insulator and its components in a spiral fashion with a 50% minimum overlap. The inner-wrap shall extend a minimum of 12 inches on each side of the insulator.
   5. Apply outer-wrap to the insulator and its components in a spiral fashion with a 1-inch minimum overlap. The outer-wrap shall be applied with sufficient tension to provide continuous adhesion of the outer-wrap tape.

3.12 REINFORCED CONCRETE STRUCTURES

A. Under no circumstances shall metallic pipe be in contact with reinforcing steel.

B. Position reinforcing steel used in the construction of support blocks, anchor blocks, and any and all other concrete structures so that they are not in contact with the piping. Maintain a minimum clearance of 2 inches between the piping and all reinforcement steel or other metallic components. Under no circumstances shall metallic pipe be in contact with reinforcing steel, in accordance with NACE SP0286. If sufficient clearance cannot be provided, then an insulating blanket may be required between the pipe and reinforcing steel.

C. When penetrating a reinforced concrete slab (wall or floor), install a linked rubber seal between the pipe and the concrete slab sleeve. Install the linked rubber seal, in accordance with the manufacturer's requirements, to form direct contact to the concrete and to seal the area of the pipe penetration from water intrusion.

3.13 ISOLATION AND CONTINUITY TESTING

A. INSULATING FLANGES
   1. Test each insulated pipe flange in the presence of the Corrosion Engineer for effective electrical isolation of the two mating pipe flanges. Effectiveness of the insulated pipe flange shall be tested prior to backfilling in accordance with NACE SP0286, Section 8.2.7, using an insulation checker (e.g., M.C. Miller Gas Electronics Model 601, Tinker & Rasor RF-IT or approved equal).

B. CASINGS
   1. Test for electrical isolation between any metallic pipeline and metallic casing in accordance with NACE SP0286.

2. Prior to and upon completion of backfilling operations, test the electrical isolation between the pipeline and all casings the pipe passes through to ensure the casing is not electrically shorted to the pipeline. If the casing is found to be electrically shorted, or electrolytically coupled to the pipeline, the CONTRACTOR shall correct the deficiency at the CONTRACTOR's expense.

C. JOINT BONDING
   1. After installation, test all joint bonds to ensure the intended structures are electrically continuous.
   2. Where the pipeline is installed utilizing horizontal directional drilling (HDD), or any method other than open trench, the pipe section shall be tested for electrical continuity prior to connecting to the upstream and downstream pipe sections.
   3. The CONTRACTOR is responsible for the electrical continuity of pipe where the bonding is performed.

3.14 STRAY CURRENT MITIGATION

A. The CONTRACTOR's Corrosion Engineer and Cathodic Protection Technician shall conduct AC/DC stray current evaluations over the entire alignment.

B. A report shall be submitted detailing whether stray currents were found.

C. When AC/DC stray currents are either located or anticipated during construction, one or more of the following mitigation methods shall be employed:
   1. Installing strategically placed sacrificial anodes;
   2. Installing test wires for draining current through electrical bonds;
   3. Installing dielectric mats between the two pipelines;
   4. Increasing the distance between the two pipelines;
   5. Applying a high-quality, bonded coating to both pipelines;
   6. Utilizing nonmetallic pipeline material for the short section at the crossing;
   7. Installing metallic pipelines in nonmetallic casings.
   8. Modifying the design of the pipe to minimize susceptibility to stray currents; and
   9. Installing zinc grounding cells or solid-state devices.

D. The CONTRACTOR's Corrosion Engineer and Cathodic Protection Technician shall conduct a follow up stray current evaluation between 6 months and one year from construction completion.

3.15 CATHODIC PROTECTION SYSTEM ACTIVATION

A. The CONTRACTOR's Corrosion Engineer and Cathodic Protection Technician shall inspect, activate, and adjust the cathodic protection system in accordance with NACE TM0497. The Cathodic Protection Technician shall work under the direct supervision of a Corrosion Engineer, as defined by this specification.

B. The Corrosion Engineer shall evaluate whether there are any stray currents affecting the water pipeline. If stray currents are present and affecting the water pipeline, and if there is the possibility that the current can cause detrimental corrosion, then the cathodic protection system's performance shall be evaluated.

C. Do not proceed with the cathodic protection system activation until the reports for the following have all been submitted and accepted as complete by the OWNER's ENGINEER: Insulated Flange/Joint Inspection Report; Electrical Isolation Testing Between Pipe and Steel Reinforcement Report; and Baseline (Native) Potential Survey Report. Provide a minimum of five days' advance notice to the OWNER's ENGINEER before the cathodic protection activation will be performed to allow for coordination and observance of these tests.

D. Before beginning each day of testing, calibrate portable copper/copper sulfate reference electrodes with respect to a master reference copper/copper sulfate reference electrode.

E. Measure and record native pipe-to-soil potentials (i.e., baseline pipe-to-soil potentials) at all cathodic protection test stations prior to activating the cathodic protection system. Measure native potentials on both sides of all insulating flanges, at the dielectric unions and at all test station wires. Measure the native potentials of electrically grounded equipment inside all vaults and structures along the pipeline. Where two wires are attached to the same pipeline, measure and record the native potentials for both wires. If the potential measurements for the same pipeline differ by more than 5 millivolts, investigate the cause. All test measurements shall be in accordance with NACE TM497.

F. At test stations constructed with buried copper/copper sulfate reference electrodes (i.e., stationary reference electrodes), measure and record native potentials of the pipeline using both the stationary reference electrode and a portable copper/copper sulfate reference electrode before the cathodic protection system is activated.

G. Measure the potentials of all galvanic anodes before they are connected to the pipe. Verify that the open-circuit potential of each high-potential magnesium anode is more electro-negative than –1,700 millivolts. While making these measurements, place the copper/copper sulfate reference electrode in the soil directly over the anode hole. If an electro-negative potential -1,700 millivolts cannot be obtained a minimum of 24 hours shall be allowed before obtaining these measurements.

H. Activate the cathodic protection system by connecting all of the anode wires to the terminals inside each test station.

I. Measure and record "On" potentials at the same locations where native potentials were previously measured.

J. Measure and record the initial current of each anode groundbed using a portable digital meter. Measure and record the individual anode current outputs. Next, bond the anode lead wires to the pipe lead wires and measure the "On" potentials.

K. Resurvey the cathodic protection system at least two weeks after the initial energization to allow for the development of the cathodic polarization process.

L. Use the most recent current output of each anode groundbed to calculate the anode replacement dates, assuming continued uniform current outputs and the appropriate anode alloy consumption rate. Assume an 85% utilization rate for all anode ingots.

M. Furnish all test results, including all potential readings, anode groundbed current readings, insulating flange test data, dates, and times. Reference all data to the pipeline name and station number from which it was taken/observed. Submit all data, along with a letter report, to the OWNER's ENGINEER. The letter report shall include a description of the test methods, analysis of the data, and conclusions about the cathodic protection system's effectiveness. Submit all data in a spreadsheet format compatible with Microsoft Excel. Submit data in both hard copy and electronic format.

N. Prior to substantial completion, the OWNER's ENGINEER shall perform post-installation testing of all cathodic protection components. The repair or replacement of any defective or improperly installed components shall be the sole responsibility of the CONTRACTOR. Any and all repairs or replacement of defective or improperly installed cathodic protection components shall be performed by the CONTRACTOR and at no additional cost to the OWNER.

3.16 ACCEPTANCE CRITERIA FOR WSP

A. The operation of the cathodic protection system shall be tested to ensure that all portions of the pipeline are provided a full level of corrosion protection. Additional required tests are as follows:
   1. Open-circuit potentials of the anodes as indicated herein.
   2. Electrical isolation of all structures not intended to be cathodically protected, to include, but not be limited to, reinforcing steel, pipe piers, pipe saddle supports, electronic sensors, electrically operated valves, etc.
   3. Electrical continuity of the pipeline along the entire alignment.
   4. Electrical continuity of all test wires from the pipe to the termination end of the wire.

B. The criteria used to evaluate the protection levels shall be as listed in NACE SP0169.

C. Workmanship furnished by the CONTRACTOR shall be guaranteed for two years.

SECTION 26 43 13

SURGE PROTECTIVE DEVICES FOR LOW-VOLTAGE ELECTRICAL POWER CIRCUITS

PART 1 GENERAL

1.01 DESCRIPTION

A. Surge Protective Devices (SPD) replaces the Transient Voltage Surge Suppressors (TVSS) based on the National Electrical Code requirements.

B. Scope:
   1. Provide SPD with electrical characteristics and ratings for service entrance equipment, switchgear, switchboards, motor control centers, and panelboards specified in the Division 26 electrical distribution equipment specification sections or indicated on the Drawings. Provide SPD with the same voltage, phase, 3 or 4 wire system as the host electrical equipment.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids).
   3. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.
   4. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 RELATED SPECIFICATIONS

A. Section 26 23 00 – Low-Voltage Switchgear

B. Section 26 24 16 – Panelboards

C. Section 26 21 16 – Low-Voltage Underground Electrical Service Entrance

D. Section 26 24 19 – Motor Control Centers

1.04 SUBMITTALS

A. The following information shall be submitted to the Engineer:
   1. Submittals and transmittal procedures for submittals are defined in Section 01 33 00. Submittals should be required for the following conditions:
      a. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks shall denote full compliance with a paragraph as a whole.
      b. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
      c. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
      d. Provide verification that the SPD complies with the required ANSI/UL 1449 listing by Underwriters Laboratories (UL) or other Nationally Recognized Testing Laboratory (NRTL).
      e. Compliance: File number verified on UL's website or other NRTL's website, with the following information:
         1) Model number
         2) SPD Type
         3) System voltage, phases
         4) Protection modes
         5) Voltage Protection Rating (VPR)
         6) Nominal Discharge Current (In).
      f. Drawings showing unit dimensions, weights, installation instruction details, and wiring configuration for sidemount SPD mounted external to electrical assembly.

1.05 PRODUCT DATA

A. The following information shall be submitted:
   1. Final Record as-built drawings and information.

1.06 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. The manufacturer shall be ISO 9001 or ISO 9002 certified for the equipment specified herein.

C. The manufacturer shall have produced similar electrical equipment for a minimum period of five years.

1.07 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions.

B. One copy of manufacturer's instructions shall be included with the equipment at time of shipment.

1.08 OPERATION AND MAINTENANCE MANUALS

A. Operation and maintenance manuals shall be provided with each SPD shipped.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The listing of manufacturers does not imply acceptance of products that do not meet the specified ratings, features, and functions. Manufacturers listed shall meet the specifications in their entirety.

B. Products in compliance with the specification and manufactured by others not named will be considered if pre-approved by the Engineer ten days prior to bid date.
   1. ABB
   2. Eaton Cutler-Hammer
   3. General Electric
   4. Siemens
   5. Accepted equal

2.02 SURGE PROTECTIVE DEVICES

A. Electrical Requirements:
   1. Refer to drawings for operating voltage and unit configuration.
   2. Maximum Continuous Operating Voltage (MCOV):
      a. Not be less than 125% of the nominal system operating voltage.

3. SPD suppression system include thermally protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and other distribution levels.
4. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may lead to system upset or create environmental hazards.
5. SPD shall protect all modes of the electrical system being utilized. The required protection modes are indicated by bullets in the following table:

	Protection modes			
Configuration	L-N	L-G	L-L	N-G
Wye	●	●	●	●
Delta	N/A	●	●	N/A
Single Split Phase	●	●	●	●
High Leg Delta	●	●	●	●

6. Nominal Discharge Current (In):
   a. SPDs applied to the distribution system shall have a 20kA In rating that include Types 1 and 2 or operating voltage. SPD's with "In" that is less than 20kA, shall be rejected.
7. Voltage Protection Rating (VPR): The maximum VPR for the device shall not exceed the following:

Modes	208Y/120	480Y/277	600Y/347
L-N; L-G; N-G	700	1200	1500
L-L	1200	2000	3000

B. Surge Protective Device Design:
   1. SPD's containing replaceable modules, replaceable fuses, replaceable batteries, requiring maintenance, or requiring diagnostic test kit shall not be accepted.
   2. Balanced Suppression Platform:
      a. The surge current shall be equally distributed to MOV components for equal stressing with equal impedance paths to each matched MOV.
   3. Electrical Noise Filter:
      a. EMI/RFI noise rejection filter for noise attenuation of line noise of 50 dB from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method.
   4. Internal Connections:
      a. Plug-in component modules or printed circuit boards shall not be used as surge current conductors. Components shall be soldered, hardwired with connections utilizing low impedance conductors.

5. Monitoring Diagnostics:
    a. SPD monitoring:
        1) Status:
            a) Green/red solid-state indicator light for status of the protection on each phase.
                (1) For wye configured units, provide indicator lights for status of protection elements and circuitry in the L-N and L-G modes and in the N-G mode.
                (2) For delta configured units, provide indicator lights status of protection elements and circuitry in the L-G and L-L modes.
                (3) The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode.
                (4) Status indicators indicate the protection on each phase or mode. If power is removed from any one phase, the indicator lights shall indicate the status of the protection on other phases and protection modes.
            b) Remote Alarm:
                (1) Provide Form C dry contacts (one NO and one NC) for remote annunciation. Both contacts change state under fault condition.
            c) Audible Alarm and Silence Button:
                (1) Audible alarm activates upon fault conditions. Alarm silence button silences the audible alarm.
            d) Surge Counter:
                (1) LCD display indicates number of surges and trigger each time a surge event with a peak current magnitude of a minimum of 50 ± 20A occurs. A reset pushbutton allows the surge counter to be zeroed and contains a mechanism to prevent accidental resetting of the counter.
        2) Overcurrent Protection:
            a) The unit shall contain thermally protected MOVs shall disconnect the MOV(s) from the system during a thermal runaway condition.
        3) Design:
            a) SPD's components and diagnostics shall be contained within one discrete assembly.
        4) Safety Requirements:
            a) SPD shall minimize potential arc flash hazards by containing no user serviceable / replaceable parts.
            b) SPD's designed to interface with the electrical assembly via conductors shall require no user contact with the inside of the unit and required conductors be factory installed.
            c) Sidemount SPD's shall be factory sealed in order to prevent access to the inside of the unit with factory installed phase, neutral, ground and remote alarm contacts shall have conductors protruding outside of the enclosure for field wiring.

2.03 SYSTEM APPLICATION

A. Minimum surge current capacity:

Minimum surge current capacity based on ANSI / IEEE C62.41 location category

Category	Application	Per Phase	Per Mode
C	Service Entrance Locations, Switchboards, Switchgear, MCC, Main Entrance	240kA	120kA
	High Exposure Roof Top Locations and Distribution Panelboards	160 kA	80 kA
A	Branch Locations: Panelboards, MCCs, Busway	120 kA	60 kA

B. SPD's installed on the line side of the service entrance disconnect:
   1. Type 1.

C. SPD's installed on the load side of the service entrance disconnect:
   1. Type 1 or 2.

D. Panelboard Requirements:
   1. Where SPDs area required for panelboards, provide SPDs tested for application within ANSI/IEEE C62.41 Category B environments.
   2. SPD shall not limit the use of through-feed lugs, sub-feed lugs, and sub-feed breaker options.
   3. SPD's installed following the load side of the main breaker and in main lug only panelboards installed following the incoming main lugs.
   4. SPD interfaced to the panelboard via a direct bus bar connection. Or SPD connected to a 30A circuit breaker for disconnecting purposes may be installed using short lengths of conductors integrally to the SPD and located directly adjacent to the 30A circuit breaker.
   5. SPD shall be mounted within the panelboard by the manufacturer.
   6. SPD shall be of the same manufacturer as the panelboard.
   7. Panelboard including the SPD shall be UL67 listed.

E. Switchgear, Switchboard, MCC and Busway Requirements:
   1. Where SPDs are required for switchgear, switchboard, MCCs, or busways, provide SPDs tested within ANSI/IEEE C62.41 Category C environments for service entrance locations
   2. SPD shall be of the same manufacturer as the switchgear, switchboard, MCC, and busway.
   3. SPD shall be factory installed inside the switchgear, switchboard, MCC, and/or bus plug at the assembly point by the original equipment manufacturer.
   4. Locate SPD on the load side of the main disconnect device, close to the phase conductors and the ground/neutral bar.
   5. SPD connected through a disconnect (30A circuit breaker) located in immediate proximity to SPD. Connection shall be made via bus, conductors, or other connections originating in the SPD shall be as short as possible per the factory specifications.
   6. Monitoring and diagnostic features shall be visible on the front of equipment.

F. Sidemount Mounting (SPD mounted external to electrical assembly):
   1. Lead length between the breaker and suppressor shall be short as possible.

2.04 ENCLOSURES

A. Where SPDs are mounted outside of electrical distribution equipment, provide SPDs in a dedicated enclosure of type in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems.

PART 3 EXECUTION

3.01 GENERAL

A. Host equipment Manufacturer's representative shall visit the site, verify installation and testing, and verify that the SPD equipment and SPD installation meets intent of the Contract Documents and manufacturer's warranties and that the guarantees are in effect.

3.02 INSTALLATION

A. Install according to manufacturers recommendations.

B. Lead lengths shall not exceed manufactures recommendation.

C. Electrical equipment manufacturer shall authorize and perform bus taps connections, as necessary.

3.03 WARRANTY

A. The manufacturer shall provide a ten year warranty from the date of shipment against any SPD part failure when installed in compliance with manufacturer's written instructions and applicable national or local code.

END OF SECTION

SECTION 26 51 19

LED INTERIOR LIGHTING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies light emitting diode (LED) indoor lighting fixtures, features and installation. Exterior LED lighting is specified in Section 26 56 19 LED Exterior Lighting.

B. Terminology used in this Section conforms to the following definitions: Nomenclature and Definitions for Illuminating Engineering Lighting terminology as defined in Illuminating Engineering Society IES RP-16-17.

1.02 QUALITY ASSURANCE

A. REFERENCE STANDARDS:

1. This Section incorporates by reference the latest revisions of the following documents as part of this Section insofar as specified and modified herein. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.
2. References to documents shall are in effect on the effective date of the Agreement. If referenced documents have been discontinued by the issuing organization, references to those documents shall be the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document, before it was discontinued.

Reference	Title
NFPA 70	National Electrical Code (NEC)

B. SPECIAL WARRANTY: Provide a Special Warranty for LED lightings that shall include the following:

1. The written 5-year on-site replacement includes parts, material, fixture finish and workmanship. Provide on-site fixture replacement includes transportation, removal, and installation of new products.
2. The fixture finish shall include failure or substantial deterioration such as blistering, cracking, peeling, chalking, or fading.
3. The replacement material warranty shall include defective or non-starting LED source assemblies and on power supply units.
4. The replacement warranty shall include lighting fixtures producing inadequately maintained illuminance levels at the end of the warranty period, as prorated from levels expected at end of useful life.
5. The warranty period shall begin on the date of Substantial Completion.
6. The Contractor shall provide the Owner with appropriate signed 5-year warranty certificates.
7. The Owner shall receive these certificates prior to final payment.

1.03 SUBMITTALS

A. PROCEDURES: Section 01 33 00 – Submittal Procedures.

B. ACTION SUBMITTAL ITEMS FOR THIS SECTION:

1. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations from Section requirements.
2. Manufacturer's descriptive catalog literature for all lighting fixtures and accessories being installed under this section. Catalog information describing fixture make, materials, and dimensions.
3. Information shall include manufacturer, wattage, voltage, mounting configuration, and lamp type. Catalog cuts shall be edited to show only the items, model numbers, and information which apply.
4. Submit applicable data as specified in Section 01 78 23 – Operation and Maintenance Data.
5. Lighting fixture model numbers are provided on the drawings in the lighting fixture schedule. The manufacturer's catalog numbers listed are examples of the basic model or series.
6. Referenced catalog numbers may not include voltage, mounting style, modifications, and other special features that are specified. The Contractor, supplier, and manufacturer shall provide the specified requirements.
7. The Contractor may propose an alternate luminaire for approval; however, sufficient information shall be provided as a part of the submittal for the Engineer and the Owner to review and compare the listed luminaire and the proposed alternate.
    a. The Contractor and lighting supplier shall provide a photometric, energy usage (efficiency), approvals/listings and materials comparison between the two fixtures.
    b. If an alternate lighting fixture layout is required, the Contractor and lighting fixture supplier shall provide all illuminance calculations as part of the submittal to verify minimum illuminance levels are met by the proposed revisions.
    c. Proposed alternates shall be shown to be equivalent or superior to the fixture listed. It shall be the Contractor’s responsibility to provide sufficient information to the Engineer and the Owner to verify and approve alternates.

PART 2 PRODUCTS

2.01 GENERAL

A. Lighting materials, including fixtures, accessories, and hardware, shall conform to the requirements specified on the Lighting Fixture Schedule on the project drawings.

B. Lighting fixtures shall be provided where shown on the drawings. The drawing’s light fixture placement is diagrammatical. The fixture layout shall be coordinated with the various trades to provide access to the fixture and to avoid installed equipment interference.

2.02 LIGHTING CONTROLS

A. Per Section 26 09 16 – Electrical Controls and Relays - that includes control switches, selector switches, relays, lighting contactors and other devices.

B. The project drawings indicate the operation and control methods and the circuits for the lighting systems.

2.03 LED LIGHTING

A. LED lighting shall be a functioning unit with all components including light source, lamps, power supply, control interface and components required for operation and shall be assembled by the lighting manufacturer or supplier.

B. Lighting fixtures shall be UL or ETL listed and labeled. Lighting testing shall be per IESNA LM-79 and LM-80 procedures.

C. Lighting fixtures shall comply with ANSI chromaticity standard for classifications of color temperature. Refer to the specified LED lamp color and color temperature or the manufacturer's literature.

D. LED drivers shall have reversed polarity protection, open circuit protection and require no minimum load. Drivers shall operate at a minimum 80 percent efficiency and have a class A noise rating.

E. Where LED systems are specified to be dimmable, the LED system shall be capable of full and continuous dimming.

PART 3 EXECUTION

3.01 GENERAL

A. The location and type of light fixtures and control are shown on the drawings.

B. Lighting circuit raceways and conductors shall be sized by the contractor, where the circuits are not shown on the drawings.

C. Raceways and wire shall be provided from the fixtures and switches to the lighting panel in accordance with the NEC.

D. Raceways shall be provided in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems.

E. Circuit wire shall be provided in accordance with Section 26 05 19 – Low Voltage Power Conductors.

F. Fixtures labeled to require conductors with a temperature rating exceeding 75 degrees C shall be spliced to circuit conductors in a separately mounted junction box. Fixture shall be connected to junction box using flexible conduit with a temperature rating equal to that of the fixture.

G. Labels and marks, except the UL label, shall be removed from exposed parts of the fixtures. Fixtures shall be cleaned when the project is ready for acceptance.

H. Where recessed fixtures are required, the fixture shall be provided with mounting hardware for the ceiling system specified.

I. A concealed latch and hinge mechanism shall be provided for access to the lamps and ballasts and for removal and replacement of the diffuser without removing the fixture from ceiling panels.

J. Fixtures recessed in concrete shall have protective coating of bituminous paint.
   1. Fixtures shall be aligned and directed to illuminate an area as specified.
   2. Fixtures shall be directly and rigidly mounted on their supporting structures.
   3. Conduit system shall not be used to support fixtures.
   4. Where brackets or supports for lighting fixtures are welded to steel members, the welded area shall be treated with rust-resistant primer and finish paint.

K. Tighten electrical connectors and terminals according to manufacture's published torque-tightening values or use torque values specified in UL 486A and UL 486B.

L. Verify normal operation of each fixture.

M. Interrupt the power supply to demonstrate emergency lighting operation to battery power source or alternate power source. Retransfer to normal power supply.

N. Replace damaged fixtures.

3.02 LIGHTING FIXTURE SPECIFICATIONS

A. GENERAL: Lighting fixtures, including their related accessories, options, and hardware are specified on the drawings.

B. LIGHTING FIXTURE IDENTIFIER: Each lighting fixture type shown on the drawings may be identified with a unique acronym of two to four digits, as indicated below:
   1. FAMILY MEMBERS: Family members share the same primary physical characteristics, appearance, construction or function. The first digit as follows:
      a. A = Area light
      b. B = Bare lamp holder or strip light
      c. C = Corrosion-resistant
      d. D = Downlight
      e. E = Emergency
      f. F = Floodlight
      g. G = Grid mounted troffer
      h. H = Hazardous location
      i. I = Industrial
      j. L = Louver lens
      k. M = High/Low Bay
      l. N = Sign

m. O = Pool, or fountain, underwater
n. P = Patterned plastic lens
o. R = Roadway/parking lot
p. S = Suspended (architecturally finished areas)
q. T = Track-mounted
r. U = Under-cabinet
s. V = Vapor tight
t. W = Wraparound lens
u. X = Exit sign

2. LAMP SOURCES: The second digit of the fixture type indicates the lamp source from which the light is produced: L = Light Emitting Diode (LED)
3. OPTIONAL VARIANT: The third digit of the fixture type indicates variant of the same lighting type noted numerically.
4. Last Digit: Modifier to provide fixture information, as needed.

LED INTERIOR LIGHTING LIGHTSPEC

3.03 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	MF1
Fixture description:	High Bay LED Industrial pendant, high performance.
Construction:	Housing: Cast aluminum, integral heat sink. Sealed optic. Finish Color: Black
Electrical:	Input voltage: 277V, 254W Lamps: High performance 35,000 Lumen LED array, 3500K
Mounting :	Pendant.
Special Features:	Distribution: Wide. Control: 0-10V dimmable, motion sensor, Photocell, Wireless
Acceptable products:	Holophane LED High Bay Phuzion Series or equal.

3.04 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	MF1E
Fixture description:	High Bay LED Industrial pendant, high performance with emergency backup.
Construction:	Housing: Cast aluminum, integral heat sink. Sealed optic. Finish Color: Black
Electrical:	Input voltage: 277V, 254W Lamps: High performance 35,000 Lumen LED array, 3,500K
Mounting :	Pendant.
Special Features:	Distribution: Wide.
Acceptable products:	Holophane LED High Bay Phuzion Series or equal.

3.05 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	SF1
Fixture description:	Industrial Type LED, pendant industrial.
Construction:	Housing: 10 inch wide luminaire, 20-gauge steel, access plate on back of channel Finish: White.
Electrical:	Input voltage: 120V, 29W Lamps :48" LED, 4000 lumens, 3500°K, 80 CRI
Mounting:	Pendant, cable, chain.
Special :	Distribution: Spread downlight Molded UV-stabilized polycarbonate or acrylic diffuser, mounted with stainless steel cam latches.
Acceptable products:	Lithonia MSL LED Low Bay or equal.

3.06 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	SF1E
Fixture description:	Industrial Type LED, pendant industrial with emergency battery pack.
Construction:	Housing: 10 inch wide luminaire, 20-gauge steel, access plate on back of channel Finish: White.
Electrical:	Input voltage: 120V, 29W Lamps :48" LED, 4000 lumens, 3500°K, 80 CRI
Mounting:	Pendant, cable, chain.
Special :	Distribution: Spread downlight Molded UV-stabilized polycarbonate or acrylic diffuser, mounted with stainless steel cam latches.
Acceptable products:	Lithonia MSL LED Low Bay or equal.

3.07 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	X1
Fixture description:	LED exit sign with right arrow, red lettering, damp locations.
Construction:	Housing: ABS thermoplastic Finish Color: White Faceplate: Green lettering on black stencil.
Electrical:	Input voltage: Universal 120-277V Lamps: LED Battery: Nickel cadmium battery, 90 minutes minimum
Mounting:	Universal, top, end or back mounted.
Special features:	Meets UL924, NFPA 101
Acceptable products:	Dual Lite EVE Series or equal.

3.08 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	X2
Fixture description:	LED exit sign, no arrow, red lettering, damp locations.
Construction:	Housing: ABS thermoplastic Finish Color: White Faceplate: Green lettering on black stencil.
Electrical:	Input voltage: Universal 120-277V Lamps: LED Battery: Nickel cadmium battery, 90 minutes minimum
Mounting:	Universal, top, end or back mounted.
Special features:	Meets UL924, NFPA 101
Acceptable products:	Dual Lite EVE Series or equal.

3.09 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	X3
Fixture description:	LED exit sign with left arrow, red lettering, damp locations.
Construction:	Housing: ABS thermoplastic Finish Color: White Faceplate: Green lettering on black stencil.
Electrical:	Input voltage: Universal 120-277V Lamps: LED Battery: Nickel cadmium battery, 90 minutes minimum
Mounting:	Universal, top, end or back mounted.
Special features:	Meets UL924, NFPA 101
Acceptable products:	Dual Lite EVE Series or equal.

SECTION 26 56 19

LED EXTERIOR LIGHTING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies light emitting diode (LED) exterior lighting fixtures features and installation. Interior LED lighting is specified in Section 26 51 19 LED Interior Lighting.

B. Terminology used in this Section conforms to the following definitions: Nomenclature and Definitions for Illuminating Engineering Lighting terminology as defined in Illuminating Engineering Society IES RP-16-17.

1.02 QUALITY ASSURANCE

A. REFERENCE STANDARDS:

1. This Section incorporates by reference the latest revisions of the following documents as part of this Section insofar as specified and modified herein. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.
2. References to documents shall are in effect on the effective date of the Agreement. If referenced documents have been discontinued by the issuing organization, references to those documents shall be the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document, before it was discontinued.

Reference	Title
NFPA 70	National Electrical Code (NEC)

B. SPECIAL WARRANTY: Provide a Special Warranty for LED lighting that shall include the following:

1. The written 5-year on-site replacement includes parts, material, fixture finish and workmanship. Provide on-site fixture replacement includes transportation, removal, and installation of new products.
2. The fixture finish shall include failure or substantial deterioration such as blistering, cracking, peeling, chalking, or fading.
3. The replacement material warranty shall include defective or non-starting LED source assemblies and on power supply units.
4. The replacement warranty shall include lighting fixtures producing inadequately maintained illuminance levels at the end of the warranty period, as prorated from levels expected at end of useful life.
5. The warranty period shall begin on the date of Substantial Completion.
6. The Contractor shall provide the Owner with appropriate signed 5-year warranty certificates.
7. The Owner shall receive these certificates prior to final payment.

1.03 SUBMITTALS

A. PROCEDURES: Section 01 33 00 – Submittal Procedures.

B. ACTION SUBMITTAL ITEMS FOR THIS SECTION:

1. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations from Section requirements.
2. Manufacturer's descriptive catalog literature for all lighting fixtures and accessories being installed under this section. Catalog information describing fixture make, materials, and dimensions.
3. Information shall include manufacturer, wattage, voltage, mounting configuration, and lamp type. Catalog cuts shall be edited to show only the items, model numbers, and information which apply.
4. Submit applicable data as specified in Section 01 78 23 – Operation and Maintenance Data.
5. Lighting fixture model numbers are provided on the drawings in the lighting fixture schedule. The manufacturer's catalog numbers listed are examples of the basic model or series.
6. Referenced catalog numbers may not include voltage, mounting style, modifications, and other special features that are specified. The Contractor, supplier, and manufacturer shall provide the specified requirements.
7. The Contractor may propose an alternate fixture for approval; however, sufficient information shall be provided as a part of the submittal for the Engineer and the Owner to review and compare the listed luminaire and the proposed alternate.
    a. The Contractor and lighting supplier shall provide a photometric, energy usage (efficiency), approvals/listings and materials comparison between the two fixtures.
    b. If an alternate lighting fixture layout is required, the Contractor and lighting fixture supplier shall provide all illuminance calculations as part of the submittal to verify minimum illuminance levels are met by the proposed revisions.
    c. Proposed alternates shall be shown to be equivalent or superior to the fixture listed. It shall be the Contractor’s responsibility to provide sufficient information to the Engineer and the Owner to verify and approve alternates.

PART 2 PRODUCTS

2.01 GENERAL

A. Lighting materials, including fixtures, accessories, and hardware, shall conform to the requirements specified on the Lighting Fixture Schedule on the project drawings.

B. Lighting fixtures shall be provided where shown on the drawings. The drawing’s light fixture placement is diagrammatical. The fixture layout shall be coordinated with the various trades to provide access to the fixture and to avoid installed equipment interference.

2.02 EXTERIOR LIGHTING POLES

A. Provide lighting poles with pole cap, hand holes, ground lug, and the necessary fixture mounting hardware.

B. TYPE:
   1. Site/Area poles as shown on the contract drawings:
      a. Shape: round, square, tapered, straight
      b. Material: Steel, concrete, aluminum, wood
      c. Finish: galvanized, powder coated
      d. Height: 6', 10', 15', 20', 30' examples
      e. Options: tall pole breakaway, selector switch such as HOA where Auto mode may be a photo cell, and GFI receptacle may also be required on a pole where shown.
   2. Stanchion poles:
      a. In Class I, Div. 1 areas provide pole as detailed and specified on the drawings.
      b. In Class I, Div. 2 and unclassified areas provide a telescoping light pole. Pole shall meet the sub-sequent requirements.
      c. Construction:
         1) Telescoping; factory sealed and pre-wired
         2) Adjustable 360 deg. pole rotation
         3) Adjustable height
         4) Spring assist for controlled lowering and assist to raise
      d. Height: As shown; adjustable raised height
      e. Certifications:
         1) UL 1598
         2) CSA C22.2 No. 250.0-08
         3) Suitable for use in Class I, Division 2 and Class I, Zone 2 areas
      f. Wind Rating: AASHTO standard; 310 mph aluminum; 230 mph stainless steel
      g. Vibration: IEC 60068-2-6
      h. Material: Aluminum T6061 or Stainless Steel 316 grade, as specified
      i. Hardware: Xylan 1400 coated for corrosion protection
      j. Cable:
         1) 12/3 AWG UL/CSA Listed
         2) 600V, -40 deg C to 105 deg C
         3) Sun and oil resistant
         4) ROHS II Reach
         5) Internal conduit for cable protection
      k. System shall be factory assembled and wired
      l. Coordinate with fixture mounting requirements
      m. Poles shall not to be handrail mounted
      n. Pole shall be Eaton/Crouse Hinds V-Spring system or approved equal.

o. Model V65BA –A; top hat and fitting mounts shall be provided as required for fixtures;
p. Provide optional “J” bolts as required for wind requirements in the area.

2.03 SITE JUNCTION BOXES

A. Provide a minimum of one junction box for the distribution of outdoor lighting circuits within ten feet of building and as required. Boxes shall be precast concrete, set flush with the ground. Size shall be approximately 10 x 16 x 12 inches deep.

B. Lid shall be cast iron with permanent inscription: "LIGHTING". Boxes shall be Brooks Products, Oldcastle Precast, Forni Corporation, Utility Vault Company, Christy Concrete Products, or equal.

C. Examples: Jensen Precast Pull Boxes 10” x 17”, Oldcastle, Brooks Products, Christy, J&R, Caltrans. HT = High Traffic Pull Box.

D. Circuit’s raceways and conductors shall be terminated and spliced, respectively at new junction box. Provide watertight U.L. Listed splices for the circuits.

2.04 PHOTOELECTRIC CELL UNITS

A. Photoelectric cell units shall in a plug receptacle assembly.

B. The plug receptacle assembly shall be three-prong polarized locking type.

C. Assembly shall be suitable for outdoor mounting.

2.05 LIGHTING CONTROLS

A. Per Section 26 09 16 – Electrical Controls and Relays - that includes control switches, selector switches, relays, lighting contactors and other devices.

B. The project drawings indicate the operation and control methods and the circuits for the lighting systems.

2.06 LED LIGHTING

A. LED lighting shall be a functioning unit with all components including light source, lamps, power supply, control interface and components required for operation and shall be assembled by the lighting manufacturer or supplier.

B. Lighting fixtures shall be UL or ETL listed and labeled. Lighting testing shall be per IESNA LM-79 AND LM-80 procedures.

C. Lighting fixtures shall comply with ANSI chromaticity standard for classifications of color temperature. Refer to the specified LED lamp color and color temperature or the manufacturer’s literature.

D. LED drivers shall have reversed polarity protection, open circuit protection and require no minimum load. Drivers shall operate at a minimum 80 percent efficiency and have a class A noise rating.

PART 3 EXECUTION

3.01 GENERAL

A. The location and type of light fixtures and control are shown on the drawings.

B. Lighting circuit raceways and conductors shall be sized by the contractor, where the circuits are not shown on the drawings.

C. Raceways and wire shall be provided from the fixtures and switches to the lighting panel in accordance with the NEC.

D. Raceways shall be provided in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems.

E. Circuit wire shall be provided in accordance with Section 26 05 19 – Low Voltage Power Conductors.

F. Fixtures labeled to require conductors with a temperature rating exceeding 75 degrees C shall be spliced to circuit conductors in a separately mounted junction box. Fixture shall be connected to junction box using flexible conduit with a temperature rating equal to that of the fixture.

G. Photoelectric cells, where specified, shall be oriented toward the north.

H. Labels and marks, except the UL label, shall be removed from exposed parts of the fixtures. Fixtures shall be cleaned when the project is ready for acceptance.

I. A concealed latch and hinge mechanism shall be provided for access to the lamps and ballasts and for removal and replacement of the diffuser without removing the fixture.

J. Fixtures recessed in concrete shall have protective coating of bituminous paint.
   1. Fixtures shall be aligned and directed to illuminate an area as specified.
   2. Fixtures shall be directly and rigidly mounted on their supporting structures.
   3. Conduit system shall not be used to support fixtures.
   4. Where brackets or supports for lighting fixtures are welded to steel members, the welded area shall be treated with rust-resistant primer and finish paint.

K. Underground and outdoor wire splices shall be in accordance with Section 26 05 19.

L. Tighten electrical connectors and terminals according to manufacture's published torque-tightening values or use torque values specified in UL 486A and UL 486B.

M. Verify normal operation of each fixture.

N. Interrupt the power supply to demonstrate emergency lighting operation to battery power source or alternate power source. Retransfer to normal power supply.

O. Replace damaged fixtures.

3.02 LIGHTING FIXTURE SPECIFICATIONS

A. GENERAL: Lighting fixtures, including their related accessories, options, and hardware are specified on the drawings.

B. LIGHTING FIXTURE IDENTIFIER: Each lighting fixture type shown on the drawings may be identified with a unique acronym of two to four digits, as indicated below:

1. FAMILY MEMBERS: Family members share the same primary physical characteristics, appearance, construction or function. The first digit as follows:
    a. A = Area light
    b. B = Bare lamp holder or strip light
    c. C = Corrosion-resistant
    d. D = Downlight
    e. E = Emergency
    f. F = Floodlight
    g. G = Grid mounted troffer
    h. H = Hazardous location
    i. I = Industrial
    j. L = Louver lens
    k. M = High/Low Bay
    l. N = Sign
    m. O = Pool, or fountain, underwater
    n. P = Patterned plastic lens
    o. R = Roadway/parking lot
    p. S = Suspended (architecturally finished areas)
    q. T = Track-mounted
    r. U = Under-cabinet
    s. V = Vapor tight
    t. W = Wraparound lens
    u. X = Exit sign
2. LAMP SOURCES: The second digit of the fixture type indicates the lamp source from which the light is produced: L = Light Emitting Diode (LED)
3. OPTIONAL VARIANT: The third digit of the fixture type indicates variant of the same luminaire type noted numerically.
4. Last Digit: Modifier to provide fixture information, as needed.

LED EXTERIOR LIGHTING LIGHTSPEC

3.03 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	AF1
Fixture description:	LED trapezoidal wedge mini sconce
Construction:	Housing: Die-cast aluminum, with black finish
Lighting:	Distribution: Type IV throw Alt. Source: Emergency battery back-up with surface adapter.
Electrical:	Input voltage: 120VAC Lamps: 39W LED array, 4,000°K
Mounting:	Wall
Special features:	Surge protector, 0-10VDC dimming
Acceptable products:	Signify Gardco 111L, or equal.

3.04 LIGHTING FIXTURE SPECIFICATION SHEET–LIGHTSPEC

Identifier:	A1
Fixture description:	LED outdoor light pole area luminaire, wet locations
Construction:	Housing: die cast aluminum, NEMA 4X (IP66) construction
Electrical:	Input voltage: Universal 120-277VAC. Lamps: 305W LED array, 3000°K, 43,000 Lumens
Mounting:	Adjustable knuckle mount option, yoke mount option
Special features:	Distribution: general area diffused by prismatic globe. Prismatic glass globe with guard.
Acceptable products:	Holophane Predator Medium LED or equal.

END OF SECTION

SECTION 28 10 00

ACCESS CONTROL AND MONITORING

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies the final design, provision, supervision, and installation of a complete, operable, programmed, and tested intrusion and access control system by a qualified firm specializing in access control and monitoring system (ACAMS) installation. Work includes the design and installation of cable and raceway systems to support the ACAMS monitoring, control, and alarm devices. The ACAMS qualified firm shall assume unit responsibility for all aspects of the ACAMS.

B. The provided system shall be fully new system installed at the City Creek Water Treatment Plant (CCWTP). Contractor shall coordinate all system components with the Officer-in-Charge to confirm compatibility and integration.

1.02 QUALITY ASSURANCE

A. Reference Standards:
   1. This Section incorporates, by reference, the latest revisions of the following documents. They are part of this Section insofar as specified and modified herein. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect on the effective date of the Agreement. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.
      a. NFPA 70 National Electrical Code (NEC)
      b. UL 464 Audible Signaling Appliances
      c. UL 294 ALVY: Access Control Systems Unit
      d. UL 681 Standard for Installation of Burglar Alarm Systems
      e. UL 683 Intrusion Detection Units
   3. This Section references other sections with associated work specified therein:
      a. Sections in Div. 26 specify raceways, conductors, and device requirements.

B. Listed Products:
   1. Equipment and components shall be Underwriters Laboratory (UL) listed for the purpose per Div. 26 specifications, or UL recognized.

C. Unit Responsibility:
   1. The Contractor, in conjunction and coordination with the security Contractor specified in this Section, shall integrate all new video cameras into the existing video management system.

D. Contractor Requirements:
   1. The security Contractors are pre-qualified by CCWTP to perform the work specified in this section without the need to provide Evidence of Experience. CCWTP shall provide a list of said Contractors.
   2. The security Contractor shall be a licensed security contractor with a minimum of five (5) years experience installing and servicing systems of similar scope and complexity. The Contractor shall provide three (3) current references from clients with systems of similar scope and complexity which became operational in the past three (3) years. The technicians shall have a minimum of three (3) continuous years of technical experience in electronic security systems.

1.03 ENVIRONMENTAL CONDITIONS

A. Equipment provided under this section shall be suitable for operation under ambient conditions described in Section 26 05 00.

1.04 SUBMITTALS

A. General:
   1. Submittals and transmittal procedures for submittals are defined in Section 01 33 00. Submit in accordance with the procedures set forth in the General Conditions of the Contract Documents and Section 01 33 00 that include drawings, information and technical data for equipment and as required in Section 26 05 00.

B. Action Submittals:
   1. Package 1:
      a. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
         1) Section 01 79 00 – Demonstration and Training
         2) Section 01 78 23 – Operating and Maintenance Data
         3) Section 26 05 00 – Common Work Results for Electrical
         4) A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
         5) The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
         6) Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

b. A copy of the contract document instrumentation network diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.

c. A copy of the contract document electrical plan drawings, sections, and details showing sensor installation locations and details. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.

d. Contractor or security sub-Contractor experience and resumes for the personnel installing the cameras and integrating them into the Owner's existing video management system. Include factory training certifications.

2. Package 2:

a. Marked product literature of all cameras, mounting hardware, cable junction boxes, and accessories to be provided.

b. Installation drawings for only the camera equipment and mounting accessories to be provided. Drawings shall include:

1) Floor plan drawing(s) and riser diagram(s) showing intended installation locations of cameras along with mounting hardware, brackets, poles/stanchions, base plates, cable junction boxes, and other necessary appurtenances for a complete installation.

2) Complete interconnection diagram(s) of all cameras with their associated junction boxes, including wiring, terminations, and details of interconnection to data transmission media and data communication network.

3) Details of surge protection device installation.

c. Coordination drawings:

1) Floor plans, elevations, and details indicating all floor, wall, and ceiling penetrations.

d. List of miscellaneous items, cables, spare parts, that will be provided.

C. Closeout Submittals:

1. BRIC Package:

a. Final reviewed submittal, including revised as-built submittal drawings.

b. Manufacturer's operation and maintenance information, edited for this project, as specified in Section 01 78 23.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND ACCCEPTABLE PRODUCTS

A. All access control equipment and devices shall be compatible with the new ACAMS server.

B. Latest versions of Mercury Security LP1502 series Intelligent Controllers (or approved equal).

C. Latest versions of Mercury Security MR52 2-door interface module, or approved equal.

D. Latest versions of HID RP40, or approved equal.

E. ACAMS supplier shall have sufficient products available and shall have an available service organization for seven-days-a-week technical support for throughout the ACAMS warranty.

2.02 SYSTEM DESCRIPTION

A. The Contract Drawings are diagrammatic in nature and are subject to change due to requirements of the favorably reviewed ACAMS submittal and actual field conditions. ACAMS control panels are located on the plan drawings. The Contractor shall design and install the system cable and raceway system to connect the ACAMS devices to the ACAMS control panels and to interconnect the system panels.

B. The System shall be a microprocessor-based network system with the ACAMS control panel assemblies and connected devices designed and manufactured by the same company and tested for a fully functioning system.

C. Equipment, materials, accessories, devices shall be provided by a single manufacturer where possible. Equipment provided by different manufacturers shall be recognized as system compatible by both manufacturers, and “Listed” as such by Underwriters Laboratories (UL).

D. System shall allow authorized service personnel using a program/service tool or laptop computer to change the configuration of the ACAMS control panels to meet changes in building layout or environment. System changes by the manufacturer’s representative, including hardware additions or deletions, shall be documented, and Record As-built drawings shall be submitted upon completion.

2.03 ACCESS CONTROL SYSTEM COMPONENTS

A. The ACAMS for the plant shall be compatible and integrated with a new access control server. Where specified on the Contract Drawings, each building shall have one or more Mercury Security LP1502 series (or higher model) Intelligent Controllers that is networked to the ACAMS and shall coordinate the access control for the card reader devices installed at the building. These networked controllers shall be installed in an enclosure with appropriate power supplies. The networked controllers shall be extended by appropriate Mercury Security MR52 2-door interface modules located in enclosures near the door(s) assigned to the module. A backup battery system shall be provided for each control panel housing networked controllers. Remote devices including card reader devices, electrified door locks or electric door strikes, and door switches shall be interconnected to the door interface modules and/or networked controllers as required to provide an integrated, fully-functional ACAMS. Contractor to relay wiring information to CVWRF such as input, output, card reader connection locations on the control boards.

B. MAIN CONTROLLER:

1. The networked controller shall be Ethernet-enabled and provided with a built-in feature-set whose capabilities include Access Control, Intrusion Detection, and Card Reader monitoring.

2. The networked controller shall include the following features and capabilities:
    a. Support for 240,000 identities (cardholders)
    b. Support for 32 access levels per cardholder
    c. 50,000 transaction buffer
    d. Management for up to 64 doors
    e. One 10/100 Mbps ethernet port
    f. RS-485 (2-wire) port for networking of door interface modules
    g. Power requirements: 12 - 24 VDC, 500 mA
    h. Fully configurable via Genetec Security Center 5.7 web browser interface
    i. Open Supervised Device Protocol (OSDP) compliant
    j. 4 form C relay outputs rated 5A @ 30 VDC
    k. 8 general purpose programmable inputs
    l. UL 294 recognized
    m. Anti-pass back support with nested area, hard, soft, or timed forgiveness
3. Manufacturer/model: Mercury Security LP1502 series Intelligent Controller (or higher), or approved equal.

C. DOOR INTERFACE MODULE:
1. The door interface module shall provide an interface for the card reader, door contact, and electric strike/lock control.
2. The door interface module shall include the following features and capabilities:
    a. RS-485 (2-wire) communication with networked controller.
    b. Power requirements: 12 - 24 VDC, 550 mA maximum
    c. 6 relay form C relay outputs rated 5A @ 28 VDC
3. Manufacturer/model: Mercury Security MR52 2-door interface module, or approved equal.

D. REQUEST-TO-EXIT SENSOR: (NOT USED)

E. CARD READER:
1. The card reader shall provide access request to the system from individual points of physical entry via smart card technology.
2. Card readers shall be provided with the following features and functions:
    a. Compatible with CVWRF existing access security cards.
    b. Compatible with both industry standard 125 kHz proximity detection and 13.56 MHz contactless technologies, including MIFARE DESFIre EVI.
    c. Dual-state LED (red, green) visual indication and audio feedback representing the status and activity information.
    d. Optical tamper configured to alarm when mounting plate is removed.
    e. Housing material: UL94 polycarbonate, black
    f. Power: 5 - 16 VDC
    g. EAL5+ Certified Secure Element Hardware that provides tamper-proof protection of keys/cryptographic operations.
    h. Lifetime warranty against defective materials and workmanship.

i. Mounting on standard single gang electrical box, suitable for wall mounting.
j. Output interface compatible with Wiegand (500 feet maximum length with 24 AWG and 300 feet with 24 AWG), Clock & Data, and RS-485 (maximum bus length of 4000 feet).

3. Manufacturer/model: HID RP40, or approved equal.

F. ELECTRIFIED DOOR LOCK:
1. The electrified door lock shall be coordinated with new and existing door types and door interface modules provided to ensure compatibility.
2. The electrified door lock power requirements shall be compatible with the ACAMS.
3. The electrified door shall be configured to be fail-safe in the event of power failure or equipment failure.
4. Door strike shall have fully sealed electronics, tamper proof, and weather proof.
5. Door strike shall have dual voltage options: 12VDC or 24VDC.
6. Manufacturer/model:
a. Securitron Magnalock M32/62/82B Series
b. Vista V2M1200/1290 Series Maglock
c. Or approved equal

G. ELECTRIC DOOR STRIKE:
1. Electrified door strike shall be compatible with the door latch hardware and listed by the door hardware manufacturer as being compatible. The door strike operating power requirements shall be compatible with the ACAMS.
2. Door strike shall have dual voltage options: 12VDC or 24VDC.
3. The electric door strike shall be configurable to be fail safe in the event of power failure or equipment failure.
a. Manufacturer/model: HES 9500/1500C /4500C Series
b. Or approved equal

H. DOOR CONTACT:
1. Door contacts shall be manufactured for installation in the door jam and incorporate non-powered (dry) switches with leads to connect to the monitoring equipment.
2. Door contacts shall be compatible with the ACAMS to provide door open/closed status.
3. Door contacts shall have lifetime warranty from manufacturer.
4. Manufacturer/model:
a. GRI 184-12
b. GRI 270-36
c. Or approved equal

I. POWER SUPPLY AND CHARGER, ENCLOSURES, AND BATTERY BACKUP
1. Power supply shall be an integrated package consisting of a power-limited supply and a battery charger to maintain and charge the backup batteries.
2. The power supply and enclosure selected for a specific location shall be as indicated on the submitted shop drawings and sized appropriately for the ACAMS component loads.

3. Door interface module control panels: The power supply and enclosure shall include the following features:
    a. Supply that converts 120VAC to 12VDC or 24VDC power-limited output. Output voltage shall be switch-selectable. Minimum output rating shall be 4A at 12VDC and 3A at 24VDC. Outputs shall be filtered and electronically regulated to limit output voltage ripple to 100mV maximum.
    b. Steel enclosure with locking door, NEMA rated based on area type as specified in Section 25 05 00. Enclosure shall have space for installing a minimum of two door interface modules. The panels shall be wall mounted with enclosure containing power supplies with advanced power management features. The enclosure and power supply shall be certified for operating in an environment of -10° to +55° C (14° to 131° F) with 10 to 90% RHNC. The enclosure minimum size shall be 16" H x 12" W x 4.5" D.
    c. Incoming power (120VAC) switch.
    d. LED indicators for input and output status. (ON/OFF)
    e. Relay contact (Form C) output to indicate AC power fail.
    f. Relay contact (Form C) output to indicate Low Battery.
    g. Automatic switchover to back up battery power when AC power fails.
    h. Low battery disconnect.
    i. Thermal overload protection.
    j. Output side short circuit protection.
    k. Tamper switch.
    l. Manufacturer: Mercury Security dual-voltage integrated power supplies for Mercury Security door interface modules, or approved equal.
4. Main controller control panel: The enclosure and power supply provided for each networked controller control panel shall include the following features:
    a. Supply that converts 120VAC to 12VDC or 24VDC power-limited output. Output voltage shall be switch-selectable. Minimum output rating shall be 6A at 12VDC and at 24VDC. Outputs shall be filtered and electronically regulated to limit output voltage ripple to 100mV maximum.
    b. Power limited distribution panel.
    c. Steel enclosure with locking door, NEMA rated based on area type as specified in Section 25 05 00. Enclosure shall have space for installing a minimum of two networked controllers. The panels shall be wall mounted with enclosure containing power supplies with advanced power management features. The enclosure and power supply shall be certified for operating in an environment of -10° to +55°C (14° to 131°F) with 10 to 90% RHNC. Enclosure minimum size shall be 42"H x 36" W x 8" D.
    d. Incoming power (120VAC) switch.
    e. LED indicators for input and output status. (ON/OFF)
    f. Relay contact (Form C) output to indicate AC power fail.
    g. Relay contact (Form C) output to indicate Low Battery.
    h. Automatic switchover to backup battery power when AC power fails.
    i. Low battery disconnect.
    j. Thermal overload protection.
    k. Output side short circuit protection.

l. Tamper switch.

m. Manufacturer: Mercury Security dual-voltage integrated power supplies for Mercury Security LP1502 series Intelligent Controllers, or approved equal.

5. Where installation allows, networked controller(s) and door interface modules may be combined in one or more control panels for space savings, each control panel housing networked controller(s) and door interface modules shall be provided with a power supply, charger, and battery backup system compatible with the ACAMS components as specified above.

6. Battery Backup: The battery backup package shall be compatible with the power supply and charger package included in the networked controller control panel and door interface module control panel enclosures. The battery backup shall include the following features:

   a. Rechargeable Sealed Lead Acid (SLA) type, using Absorbent Glass Matt (AGM) technology.

   b. Protective enclosure rated for the surrounding environment, NEMA rated based on area type as specified in Section 26 05 00.

   c. Built-in terminals for conductors to charger and load.

   d. Rated 12 volts with minimum capacity 20-hour rate of 7.2 Ah and 15-minute rate of 3.5 Ah.

   e. Operating temperature range during charge: -4°F to 122°F.

J. SIGNAL AND COMMUNICATION CABLE:

1. Copper signal and communication cables shall be as required by the ACAMS component manufacturer and as specified in Section 26 05 19.

2. Ethernet cables:

   a. Indoor: Category 6 (CAT6) shielded plenum/non-plenum terminated to CAT6 patch panel.

   b. Outdoor: CAT6 shielded waterproof and UV rated terminated to CAT6 patch panel.

K. SOFTWARE

1. Provide all necessary software packages and licenses required for a complete and functional system.

2.04 NAMEPLATES

A. In addition to the manufacturer's identification, ACAMS control panels shall be provided with phenolic nameplates showing the equipment tag number and description specified in subsection 1.01 of this Section. Nameplates shall be back engraved type and shall comply with Section 26 05 00.

2.05 SPARE PARTS

A. The following spare parts shall be provided:

1. One of each type of networked controller provided.

2. One of each type of door interface module provided.

3. One door card reader.

2.06 WIRE AND CABLE

A. Low voltage wire and cable shall be provided and installed as required per Division 26 requirements.

B. Wire and cable shall be selected, sized, and used as appropriate for the device application in accordance with the device manufacturer's specifications, voltage and load, and distance of the wire/cable run.

C. Wire and cable runs shall be "home run".

D. Mid-run splices shall not be permitted.

E. Provide surge arrestor kits as recommended by the manufacturer and as required by the NEC.

PART 3 EXECUTION

3.01 INSTALLATION

A. Coordinate with Sections 26, 27, and 28 (if a sub-Contractor to Division 28) Contractors and the Owner to provide and install and make fully operational all components required for a fully functional system.

B. All equipment locations shall be coordinated with other trades. Coordinate Work with other trades to verify exact routing of all cable and conduit before installation.

C. Provide easy, safe, and code-mandated clearances at equipment enclosures, and other equipment requiring maintenance and operation.

D. Install the equipment in accordance with the Contract Documents, all applicable codes and standards, and the Manufacturer's written instructions. The installed system shall meet all applicable equipment and performance requirements.

E. Installation, programming, and testing of ACAMS shall be performed by an authorized and factory-trained supplier.

F. Devices and equipment shall be installed in accordance with the requirements of the Construction Documents and the manufacturer's recommendations. Refer to contract drawings that represent facility and building plans and the Officer-in-Charge approved diagrams and materials. Electrical devices, wiring, conduits, etc. shall meet the various electrical area classification, Division 26 specification requirements, and the National Electrical Code Article 500 hazardous classification area requirements as shown in the Contract Drawings.

G. Only access control circuits shall be in access control conduits and raceways. Wiring splices shall not be permitted, except at device connections. Wiring shall be checked and tested to ensure that there are no grounds, opens, or shorts. Transposing or changing color coding on wiring is unacceptable.

3.02 TESTING

A. The following testing is in addition to Section 26 08 00 requirements.

B. Perform the following additional tests at a minimum:
   1. Visually inspect installation and correct cabling or connectors if the following conditions exist:
      a. Mechanically damaged cable
      b. Too small bending radii
      c. Disregard of minimum spacing
      d. Defective connectors
      e. Missing labels on cables
      f. Wiring pinouts do not meet terminated equipment requirements
   2. Copper transmission media cable:
      a. No short circuit between the wires
      b. No wire breaks
      c. No pair has been separated
      d. Cable length is less than 100 m
      e. Near-end and far-end cross talk
      f. Permissible attenuation values
   3. Performance testing shall be conducted to measure the following characteristics at a minimum: video transfer speed, storage and retrieval, and local refresh rate on Owner workstations.
   4. Performance testing shall include verifications of acceptable image clarity and ability to control camera zoom functions.
   5. Contractor shall coordinate testing of the video management system with the Owner's Representative, which will require Owner assistance to access the network. Contractor shall confirm that all cameras provided under this Section can be monitored over the network, both directly and via the video management system. Contractor shall also confirm that recorded data for all cameras hosted by the video management system and/or NVR can be accessed over the network from the laptop. The Owner's Representative shall retain the right to witness this testing and shall be provided with a minimum of five (5) days notice prior to the test.

3.03 MANUFACTURER'S SERVICE

A. Training:
   1. Provide a Manufacturer's representative or certified technician skilled in equipment use at the Site for the following activities. Specified durations do not include travel time to or from the Site.
      a. Provide minimum 6 hours training session for up to 6 Owner staff members that includes configuration, operation, troubleshooting, and warranty coverage for cameras provided under this Section.

B. MANUFACTURER SUPERVISION AND INSPECTION: The Contractor shall have the manufacturer of the ACAMS equipment provide the services of a qualified and factory-trained technical representative to supervise and instruct the Contractor in installation procedures. The representative shall supervise and inspect the ACAMS during installation and supervise the performance of testing and commissioning activities.

C. IN-PROGRESS INSPECTIONS:
   1. Inspection shall be performed at the conclusion of cable pulling, prior to closing of ceilings or walls. Inspect the method of cable routing, support and the fire-stop used at wall, floor, or ceiling penetrations.
   2. Inspection shall be performed at completion of Ethernet cable termination to validate cables are terminated in accordance with TIA/EIA specifications, with minimum bend radius adhered to, and verify that cable ends are dressed neatly and orderly.

D. FINAL INSPECTION: Final inspection of the ACAMS shall validate that the system cables were installed, and installation meets the NEC stated workmanship requirements.

3.04 PROGRAMMING

A. Request ACAMS parameter review by CCWTP a minimum of three weeks prior to the programming of the system parameters.

3.05 DOCUMENTATION

A. Update the ACAMS record as-built documentation to show additions and changes to the system during installation and to document the settings of installed equipment.

B. Provide information for all devices installed: device name, device type, IP address, serial number, MAC address, manufacturer, manufacturer's part number, description of part, warranty, expiration date of warranty, credential information (User ID, Password) and license keys as applicable. (Format: one (1) hard copy and Microsoft Excel electronic file).

3.06 SYSTEM TESTING

A. PRELIMINARY OPERATIONAL TESTING:
   1. Conduct operational tests of each equipment item or each equipment system for not less than 24 hours without interruption.
   2. Furnish personnel, power, and necessary facilities for conducting the test operations. System components shall operate satisfactorily, under continuous full load for the duration of the test period. If any part of a unit shows evidence of unsatisfactory or improper operation during the test period, correction or repairs shall be made and the full operational test, as specified above, shall be repeated after all parts operate satisfactorily.

B. FINAL OPERATIONAL TESTING:
   1. CCWTP will test the system for seven days by operating either under actual or simulated conditions before ACAMS final acceptance. Defects of material or workmanship that appear during this test period shall be corrected and the final test performed before final acceptance.

2. Completion of the installation; in-progress and final inspections; receipt of the test and record as-built documentation; and successful performance of the system for a two-week period, after the seven-day test, shall constitute acceptance of the system.

3.07 SYSTEM PERFORMANCE

A. CCWTP shall activate the ACAMS components to validate operation of the ACAMS.

B. Equipment manufacturer factory-trained representative shall provide a minimum of 16 man-hours on-site time for assisting the CCWTP with configuration of ACAMS components and software.

3.08 TRAINING

A. CONFIGURATION AND OPERATION: Equipment manufacturer factory-trained representative shall conduct configuration, monitoring, and operational training conforming to the requirements of Div. 01. A minimum of 8 man-hours on-site including training materials and expenses shall be provided for four CCWTP personnel.

END OF SECTION

SECTION 28 23 00

VIDEO MANAGEMENT SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies requirements for the video management system which includes video cameras, network video recorders (NVRs), and video camera software. Video camera software shall be installed on new, dedicated or existing workstations, as required, by CCWTP. Section 26 05 19 specifies requirements for data communication cables and their installation. Division 27 Sections specify terminations and testing, respectively, for data communication cables

B. Cameras shall be located as specified on the Drawings. The NVR, video camera/security software, and servers associated with the CCWTP's video management system shall be new. Contractor shall confirm the new video management system vendor and version with CCWTP prior to beginning work.

C. Integration of new cameras into the video management system shall be provided by CCWTP's Subcontractor. The Contractor shall be responsible for providing the supporting infrastructure for the video system. CCWTP will rovide configuration of network switches, patching of fiber-optic and cables at network cabinets and racks, and host IP address assignments for the cameras. The Contractor shall request host IP address, subnet mask, and default gateway information from CCWTP via a Request for Information (RFI). The Contractor shall coordinate the integration, testing, and configuration work for the cameras with CCWTP to minimize outages and disruptions to plant processes.

1.02 QUALITY ASSURANCE

A. Reference Standards:
   1. Network
      a. IEEE
         1) 802.3 Ethernet Standards
         2) 802.1x – Port-based authentication
   2. Video
      a. ISO / IEC 14496 –10, MPEG-4 Part 10 (ITU H.264)
      b. ISO / IEC 10918 – JPEG
      c. ONVIF – Profile S and Profile G
   3. Emissions
      a. FCC-47 CFR Part 15, Class A
      b. CE, Class A
      c. ICES-003, Class A
   4. Environmental
      a. ANSI / IEC 60529 – Degrees of Protection Provided by Enclosures – IP66
      b. IK10 (20J) Impact Resistance / IEC62262

c. National Electrical Manufacturers Association, NEMA 250-2003, 4X Enclosure Definition

B. Unit Responsibility:
   1. The Contractor or security Subcontractor specified in this Section shall integrate all new video cameras into the video management system.

C. Contractor Requirements:
   1. CCWTP may provide a pre-qualified security Subcontractor to perform the work specified in this section without the need to provide Evidence of Experience.
   2. The Contractor or security Subcontractor shall be a licensed security contractor with a minimum of five (5) years experience installing and servicing systems of similar scope and complexity. The Contractor shall provide three (3) current references from clients with systems of similar scope and complexity which became operational in the past three (3) years. The technicians shall have a minimum of three (3) continuous years of technical experience in electronic security systems.

1.03 ENVIRONMENTAL CONDITIONS

A. Equipment provided under this section shall be suitable for operation under ambient conditions described in Section 26 05 00.

1.04 SUBMITTALS

A. General:
   1. Submittals and transmittal procedures for submittals are defined in Section 01 33 00. Submit in accordance with the procedures set forth in the General Conditions of the Contract Documents and Section 01 33 00 that include drawings, information and technical data for equipment and as required in Section 26 05 00.

B. Action Submittals:
   1. Package 1:
      a. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
         1) Section 01 79 00 – Demonstration and Training
         2) Section 01 78 23 – Operating and Maintenance Data
         3) Section 26 05 00 – Common Work Results for Electrical
         4) A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
         5) The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.

6) Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

b. A copy of the contract document instrumentation network diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.

c. A copy of the contract document electrical plan drawings, sections, and details showing sensor installation locations and details. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.

d. Contractor or security sub-Contractor experience and resumes for the personnel installing the cameras and integrating them into the Owner's existing video management system. Include factory training certifications.

2. Package 2:

a. Marked product literature of all cameras, mounting hardware, cable junction boxes, and accessories to be provided.

b. Installation drawings for only the camera equipment and mounting accessories to be provided. Drawings shall include:

1) Floor plan drawing(s) and riser diagram(s) showing intended installation locations of cameras along with mounting hardware, brackets, poles/stanchions, base plates, cable junction boxes, and other necessary appurtenances for a complete installation.

2) Complete interconnection diagram(s) of all cameras with their associated junction boxes, including wiring, terminations, and details of interconnection to data transmission media and data communication network.

3) Details of surge protection device installation.

c. Coordination drawings:

1) Floor plans, elevations, and details indicating all floor, wall, and ceiling penetrations.

d. List of miscellaneous items, cables, spare parts, that will be provided.

C. Closeout Submittals:

1. Package 3:

a. Final reviewed submittal, including revised as-built submittal drawings.

b. Manufacturer's operation and maintenance information, edited for this project, as specified in Section 01 78 23.

PART 2 PRODUCTS

2.01 GENERAL

A. Video surveillance cameras and equipment shall comply with the following requirements:
   1. All cameras shall be IP camera technology and shall connect to shielded twisted pair (STP) patch panels in network cabinets and racks for final connection to the data communication system network switch by CCWTP, as indicated in the specifications and Drawings.
   2. All cameras shall be capable of being powered by Power over Ethernet (PoE) technology. PoE power for cameras shall originate from the data communication system network switch.
   3. All cameras shall use CAT6A, Class E_A cable for signal transport as specified in Section 26 05 19. Camera video signals and power shall be via the same cable. Cameras that require greater power than can be provided by the standard IEEE 802.3bt PoE provided by the data communication system network switch, shall be powered by centralized wall-mounted high power PoE power injectors or centralized wall mounted CCTV power supplies where possible.
   4. All video related equipment requiring building power shall be connected to building UPS circuits. The Contractor shall be responsible for coordinating the electrical load requirements of the equipment provided in this Section in the UPS load calculations submitted under Division 26.
   5. Cameras located outdoors shall be provided with surge protectors.
   6. All equipment shall be installed in accordance with this specification and the manufacturers recommendations. Provide and install any and all equipment necessary to provide a complete and operating system, and meet the full intent of this design and other specifications within these Contract Documents. Any equipment such as consumables, terminators, or any other materials or equipment needed to install this system shall be considered ancillary and be provided as a part of this project.

2.02 INDOOR CAMERA

A. Video
   1. Camera shall be capable of 2 simultaneous streams, each of which may have the following properties:
      a. Compression type:
         1) H.264 (high, main, or base profiles) available in stream 1 and stream 2
         2) MJPEG, available in stream 2
      b. Bit rate:
         1) 0.5 to 8 Mbps
      c. Frame rate:
         1) Variable from 1 to 60 frames per second
      d. Resolution:
         1) 2.01M (Full HD): 1920x1080
         2) 0.92M (HD): 1280x720
      e. 130 dB Wide Dynamic Range (WDR)

f. Zoom
    1) Digital: 12X
    2) Optical: 30X

2. Storage and Recording
    a. Camera shall have onboard SD card storage
        1) Card type: SDXC
        2) Capacity: up to 2 TB
    b. Local SD storage shall have the ability to be backed up to alternate media without removal of the SD card from the camera
    c. Local recording on the SD card shall commence upon loss of network connectivity, based on a pre-programmed schedule.
    d. Video shall be recorded continuously in the case of network outage.
    e. Alarm recording: Camera shall capture selectable 1, 5, or 10 second video clips on camera sabotage, motion detection, or alarm input.
    f. Video recording and storage shall support ONVIF profile G.
3. Camera Optics
    a. Sensor Type:
        1) 1/2.8 Sony Exmor CMOS
    b. Lens:
        1) 4.7 – 94 mm variable, F1.6 – F4.7 focal length, with remote auto-focus
        2) Horizontal angle of view:
            a) 63.7 degrees wide and 2.3 degrees tele
        3) Focus settings:
            a) Auto focus: Automatically focuses during operation.
            b) Sure focus: Camera auto focuses when pan, tilt, and zoom operations are complete or if the IR cut filter changes state.
            c) Focus trace: Enables camera to use a focus trace curve when zooming based on the distance to ground-level targets in the scene.
    c. Day and night settings
        1) Minimum illumination
            a) Color mode: 0.20 lux (33 ms, F1.6), 0.025 lux (250 ms, F1.6)
            b) Color mode (low light): 0.03 lux (33 ms, F1.6), 0.008 lux (250 ms, F1.6)
            c) Black & white mode: 0.06 lux (33 ms, F1.6), 0.008 lux (250 ms, F1.6)
            d) Black & White mode (low light): 0.004 lux (33 ms, F1.6), 0.001 lux (250 ms, F1.6)

B. Camera Movement
1. Variable speed: 0.1 to 80 degrees per second
2. Preset accuracy: ±0.1 degrees
3. Pan movement: 360 degrees continuous pan rotation
4. Vertical tilt: +1 to -90 degrees
5. Maximum pan speed: Up to 450 degrees per second
6. Maximum tilt speed: Up to 450 degrees per second

7. Manual Pan/Tilt Speeds
    a. Pan: 0.1 to 80 degrees per second manual operation
    b. Tilt: 0.1 to 45 degrees per second manual operation
8. Preset Speeds
    a. Pan: 450 degrees per second
    b. Tilt: 450 degrees per second

C. Network
1. Ethernet: 100 BASE-TX with RJ-45 connector
2. Supported protocols:
    a. Transmission Control Protocol (TCP), Internet Protocol (IP) v4 and v6, User Datagram Protocol (UDP)
    b. Configuration: Dynamic Host Configuration Protocol (DHCP)
    c. Web services: Hypertext Transfer Protocol (HTTP), Secure HTTP (HTTPS)
    d. Network services: Domain Name System (DNS), Network Time Protocol (NTP), Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP) v2c/v3, Universal Plug and Play (UPnP)
    e. Media: Real-Time Transport Protocol (RTP), Real-Time Streaming Protocol (RTSP)
    f. Multicast: Internet Group Management Protocol (IGMP)
    g. Notifications: File Transfer Protocol (FTP), Simple Mail Transfer Protocol (SMTP)
    h. Remote Access: Secure Shell (SSH)
    i. Security: Secure Sockets Layer (SSL), IEEE 802.1x (EAP-MD5, EAP-TLS, EAP-TTLS, EAP-PEAP and EAP-FAST)
    j. Quality of Service: IEEE 802.1p Layer 3 Differentiated Services Code Point (DSCP)
3. Security
    a. Camera shall support IP address filtering whereby users can enter a list of allowed or blocked IP addresses for viewing video and configuring camera settings
    b. Camera shall provide three levels of user access with password protection.
    c. User authentication shall be available through a Lightweight Directory Access Protocol (LDAP) server.

D. Mechanical and Environmental
1. Housing material
    a. Back Box: Aluminum
    b. Dome Drive: Aluminum, thermo plastic
    c. Lower Dome: Nylon
    d. Dome: Clear
2. Conduit attachments
    a. Pendant mounted: 1.5 inch NPT
    b. In-ceiling: 3/4 inch NPT

3. Temperature
    a. Non-environmental
        1) In-Ceiling: 32 to 122 degrees F
        2) Pendant: 23 t 122 degrees F
    b. Environmental
        1) In-Ceiling and Pendant: -4 to 140 degrees F
4. Operating Humidity
    a. Non-environmental:
        1) 10 to 90 percent, RH noncondensing
    b. Environmental:
        1) 10 to 100 percent, RH condensing

E. Electrical
1. Input Power:
    a. PoE (802.3at)
        1) 18W consumption, Environmental models (with heater off, blower on)
        2) 15W consumption, Non-Environmental models (with heater and blower off)
    b. PoE (802.3bt)
        1) 60W consumption, Environmental models (with heater and blower on)
        2) 15W consumption, Non-Environmental (with heater and blower off)
2. Ports: Ethernet RJ-45 connector

F. Software
1. Camera Software
    a. Camera shall have built in web server which supports browser-based configuration
    b. Camera web server shall allow access to camera information and all primary software functions
    c. Camera shall offer video viewer and configuration
2. Camera Analytics
    a. Analytics shall be pre-loaded in the camera.
    b. Camera shall have the ability to detect motion within user defined areas of the video image.
    c. Number of simultaneous running analytic behaviors: 3
    d. Configurable behaviors:
        1) Abandoned Object - Detection of objects placed in a defined zone and triggers an alarm if the object remains in the zone longer than the user-defined time allows.
        2) Adaptive Motion - Detection and tracking of objects that enter a scene and triggering of an alarm when the objects enter a user-defined zone
        3) Auto Tracker - Detection and tracking of movement in the camera's field of view, with automatic pan and tilt to follow the moving object until the object stops or disappears from the monitored area

4) Camera Sabotage - Detection of contrast changes in the field of view, suitable to detect lens obstruction or unauthorized repositioning of the camera
5) Directional Motion - Detection of person or object moving in a specified direction
6) Loitering Detection – Identification of people or vehicles remaining in a defined zone longer than a user-defined time
7) Object Counting - Counting the number of objects that enter a defined zone or cross a tripwire
8) Object Removal – Detection of object is removed from a defined zone
9) Stopped Vehicle – Detection of vehicles stopped near a sensitive area longer than a user-defined time

G. Certifications and Ratings
1. CE, Class A
2. FCC, Class A
3. UL listed
4. NEMA Type 4X

H. Manufacturer:
1. Pelco Spectra Enhanced Series IP PTZ Dome, Model S6230-EGL1.
2. Or approved equal.

2.03 OUTDOOR CAMERA

A. Video
1. Camera shall be capable of 2 simultaneous streams, each of which may have the following properties:
a. Compression type:
1) H.264 (high, main, or base profiles) available in stream 1 and stream 2
2) MJPEG, available in stream 2
b. Bit rate:
1) 0.5 to 8 Mbps
c. Frame rate:
1) Variable from 1 to 60 frames per second
d. Resolution:
1) 2.01M (Full HD): 1920x1080
2) 0.92M (HD): 1280x720
e. 130 dB Wide Dynamic Range (WDR)
f. Zoom:
1) Digital: 12X
2) Optical: 30X

2. Storage and Recording
    a. Camera shall have onboard SD card storage:
        1) Card type: SDXC
        2) Capacity: up to 2 TB
    b. Local SD storage shall have the ability to be backed up to alternate media without removal of the SD card from the camera
    c. Local recording on the SD card shall commence upon loss of network connectivity, based on a pre-programmed schedule.
    d. Video shall be recorded continuously in the case of network outage.
    e. Alarm recording: Camera shall capture selectable 1, 5, or 10 second video clips on camera sabotage, motion detection, or alarm input.
    f. Video recording and storage shall support ONVIF profile G.
3. Camera Optics
    a. Sensor Type:
        1) 1/2.8 Sony Exmor CMOS
    b. Lens:
        1) 4.7 – 94 mm variable, F1.6 – F4.7 focal length, with remote auto-focus
        2) Horizontal angle of view
            a) 63.7 degrees wide and 2.3 degrees tele
        3) Focus settings
            a) Auto focus: Automatically focuses during operation.
            b) Sure focus: Camera auto focuses when pan, tilt, and zoom operations are complete or if the IR cut filter changes state.
            c) Focus trace: Enables camera to use a focus trace curve when zooming based on the distance to ground-level targets in the scene.
    c. Day and night settings:
        1) Minimum illumination
            a) Color mode: 0.03 lux (33 ms, F1.6), 0.008 lux (250 ms, F1.6)
            b) Black & white mode: 0.004 lux (33 ms, F1.6), 0.001 lux (250 ms, F1.6)

B. Camera Movement
1. Variable speed: 0.1 to 140 degrees per second
2. Preset accuracy: ±0.1 degrees
3. Pan movement: 360 degrees continuous pan rotation
4. Vertical tilt: unobstructed +40 to -90 degrees
5. Manual Pan/Tilt Speeds
    a. Pan: 0.1 to 80 degrees per second
    b. Tilt: 0.1 to 40 degrees per second
6. Preset Speeds: 140 degrees per second, both pan and tilt

C. Network
   1. Ethernet: 100 BASE-TX with RJ-45 connector
   2. Supported protocols:
      a. Transmission Control Protocol (TCP), Internet Protocol (IP) v4 and v6, User Datagram Protocol (UDP)
      b. Configuration: Dynamic Host Configuration Protocol (DHCP)
      c. Web services: Hypertext Transfer Protocol (HTTP), Secure HTTP (HTTPS)
      d. Network services: Domain Name System (DNS), Network Time Protocol (NTP), Internet Control Message Protocol (ICMP), Simple Network Management Protocol (SNMP) v2c/v3, Universal Plug and Play (UPnP)
      e. Media: Real-Time Transport Protocol (RTP), Real-Time Streaming Protocol (RTSP)
      f. Multicast: Internet Group Management Protocol (IGMP)
      g. Notifications: File Transfer Protocol (FTP), Simple Mail Transfer Protocol (SMTP)
      h. Remote Access: Secure Shell (SSH)
      i. Security: Secure Sockets Layer (SSL), IEEE 802.1x (EAP-MD5, EAP-TLS, EAP-TTLS, EAP-PEAP and EAP-FAST)
      j. Quality of Service: IEEE 802.1p Layer 3 Differentiated Services Code Point (DSCP)
      k. NTCIP 1205
   3. Security
      a. Camera shall support IP address filtering whereby users can enter a list of allowed or blocked IP addresses for viewing video and configuring camera settings
      b. Camera shall provide three levels of user access with password protection.
      c. User authentication shall be available through a Lightweight Directory Access Protocol (LDAP) server.

D. Mechanical and Environmental
   1. Housing material :
      a. Die-cast, extruded and sheet aluminum; stainless steel hardware.
      b. Pressurized integrated optics cartridge.
   2. Finish:
      a. Gray polyester powder coat
   3. Temperature
      a. -50 to 140 degrees F
   4. Operating Humidity
      a. Standard with pressurized integrated optics cartridge (IOC): 10 to 100% RH condensing
   5. Camera shall be provided with integrated window wiper with configurable delay and shut-off.

E. Electrical
   1. Input Power:
      a. PoE (802.3bt)
         1) 72W consumption, with heaters

2. Connectors:
    a. Ethernet: RJ-45 connector, 2 SFPs
    b. Aux: 20-pin terminal block

F. Software
    1. Camera Software
        a. Camera shall have built in web server which supports browser-based configuration
        b. Camera web server shall allow access to camera information and all primary software functions

            Camera shall offer video viewer and configuration
    2. Camera Analytics
        a. Analytics shall be pre-loaded in the camera.
        b. Camera shall have the ability to detect motion within user defined areas of the video image.
        c. Number of simultaneous running analytic behaviors: 3
        d. Configurable behaviors:
            1) Abandoned Object - Detection of objects placed in a defined zone and triggers an alarm if the object remains in the zone longer than the user-defined time allows.
            2) Adaptive Motion - Detection and tracking of objects that enter a scene and triggering of an alarm when the objects enter a user-defined zone
            3) Auto Tracker - Detection and tracking of movement in the camera's field of view, with automatic pan and tilt to follow the moving object until the object stops or disappears from the monitored area
            4) Camera Sabotage - Detection of contrast changes in the field of view, suitable to detect lens obstruction or unauthorized repositioning of the camera
            5) Directional Motion - Detection of person or object moving in a specified direction
            6) Loitering Detection – Identification of people or vehicles remaining in a defined zone longer than a user-defined time
            7) Object Counting - Counting the number of objects that enter a defined zone or cross a tripwire
            8) Object Removal – Detection of object is removed from a defined zone
            9) Stopped Vehicle – Detection of vehicles stopped near a sensitive area longer than a user-defined time

G. Certifications and Ratings
    1. CE, Class A
    2. FCC, Class A
    3. UL listed
    4. NEMA Type 4X

H. Manufacturer:
   1. Pelco Esprit Enhanced Series IP Positioning System, Model ES6230-12P.
   2. Or approved equal.

2.04 WIRE AND CABLE

A. Low voltage wire and cable shall be provided and installed as required per Division 26 requirements.

B. Wire and cable shall be selected, sized, and used as appropriate for the device application in accordance with the device manufacturer's specifications, voltage and load, and distance of the wire/cable run.

C. Wire and cable runs shall be "home run".

D. Mid-run splices shall not be permitted.

E. Provide surge arrestor kits as recommended by the camera manufacturer and as required by the NEC.

2.05 MOUNTING HARDWARE AND CABLE JUNCTION BOX

A. Wherever possible use mounting hardware from the camera manufacturer. Mount cameras at locations shown on Drawings.

B. Where manufacturer cable is provided, provide a cable junction box or water-proof connector with each outdoor camera to transition from manufacturer provided cable to Division 26 cable within an enclosure rated for the installation environment, as specified in Section 26 05 00.

2.06 SPARE PARTS

A. Provide the following spare parts for the project:
   1. One spare indoor camera.
   2. One spare outdoor camera.
   3. One spare PoE power injector of each type provided, if required.
   4. Package of 10 window wiper replacement blades (if used).
   5. One spare surge arrestor of each type provided.

PART 3 EXECUTION

3.01 INSTALLATION

A. Coordinate with Sections 26, 27, and 28 (if a Subcontractor to Division 28) Contractors and the Owner to provide and install and make fully operational all components required for a fully functional system.

B. All equipment locations shall be coordinated with other trades. Coordinate Work with other trades to verify exact routing of all cable and conduit before installation.

C. Provide easy, safe, and code-mandated clearances at equipment enclosures, and other equipment requiring maintenance and operation.

D. Install the equipment in accordance with the Contract Documents, all applicable codes and standards, and the Manufacturer's written instructions. The installed system shall meet all applicable equipment and performance requirements.

3.02 TESTING

A. The following testing is in addition to Section 26 08 00 requirements.

B. Perform the following additional tests at a minimum:
   1. Visually inspect installation and correct cabling or connectors if the following conditions exist:
      a. Mechanically damaged cable
      b. Too small bending radii
      c. Disregard of minimum spacing
      d. Defective connectors
      e. Missing labels on cables
      f. Wiring pinouts do not meet terminated equipment requirements
   2. Copper transmission media cable:
      a. No short circuit between the wires
      b. No wire breaks
      c. No pair has been separated
      d. Cable length is less than 100 m
      e. Near-end and far-end cross talk
      f. Permissible attenuation values
   3. Performance testing shall be conducted to measure the following characteristics at a minimum: video transfer speed, storage and retrieval, and local refresh rate on Owner workstations.
   4. Performance testing shall include verifications of acceptable image clarity and ability to control camera zoom functions.
   5. Contractor shall coordinate testing of the video management system with CCWTP's Representative, which will require CCWTP assistance to access the network. Contractor shall confirm that all cameras provided under this Section can be monitored over the network, both directly and via the video management system. Contractor shall also confirm that recorded data for all cameras hosted by the video management system and/or NVR can be accessed over the network from the laptop. CCWTP's Representative shall retain the right to witness this testing and shall be provided with a minimum of five (5) days notice prior to the test.

3.03 MANUFACTURER'S SERVICE

A. Training:

1. Provide a Manufacturer's representative or certified technician skilled in equipment use at the Site for the following activities. Specified durations do not include travel time to or from the Site.
    a. Provide minimum 6 hours training session for up to 6 Owner staff members that includes configuration, operation, troubleshooting, and warranty coverage for cameras provided under this Section.

END OF SECTION

SECTION 28 46 00

FIRE DETECTION AND ALARM - ADDESSABLE

PART 1 GENERAL

1.01 SUMMARY

A. Design, obtain all required permits for, furnish, install, test, and commission new addressable fire detection and alarm system(s) for the following structure(s):
   1. [Structure #1]

B. [Design, furnish, install, test, and commission a central fire alarm system monitoring panel to allow the Owner to monitor the activity of each individual structure's fire alarm panel from a central location. The central fire alarm monitoring panel shall be located at the [Admin Building].

C. Equipment List:
   1. Equipment numbers are as follows:

Item	Equipment No.	Location
Fire Alarm Control Panel	[FACP-####]	[Location]
Fire Alarm Control Panel	[FACP-####]	[Location]
Fire Alarm Control Panel	[FACP-####]	[Location]

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 26 05 33 – Raceways and Boxes for Electrical Systems
   2. [Section 21 10 00 – Water-Based Fire Suppression Systems]

1.03 REFERENCES

Reference	Title
[IFC][CFC][XXX]	[International Fire Code] [California Fire Code][Specific State Fire Code]

UL 521	Heat Detectors for Fire Protective Signaling Systems
UL 864	Control Units for Fire Protective Signaling Systems
UL 1424	Cables for Power-Limited Fire Alarm Circuits

Reference	Title
UL 1638	Visible Signaling Device for Fire Alarm and Signaling Systems

1.04 SUBMITTALS

A. Per Section 01 33 00

B. Product Data:
   1. Cutsheets for the following system components:
      a. Fire alarm control panels
      b. Manual pull stations
      c. Smoke detectors
      d. Duct smoke detectors
      e. Heat detectors
      f. Water flow indicating switches
      g. Valve tamper switches
      h. Audible notification appliances
      i. Visible notification appliances
      j. Fire alarm cable

C. Shop Drawings:
   1. System input/output matrix
   2. System riser diagram
      a. Show cable and raceway requirements.
      b. Show device addresses.
   3. Plan drawings
      a. Show visual notification appliance candela ratings.
   4. Installation and Mounting Details
   5. Calculations:
      a. Battery Sizing
      b. Voltage Drop

D. Operations and Maintenance (O&M) Manuals:
   1. Per Section 01 78 23.

1.05 QUALITY ASSURANCE

A. Regulatory Approvals:
   1. All system components shall be listed or approved by the following agencies:
      a. Underwriters Laboratories (UL)
      b. Factory Mutual (FM)

B. Certification and verification approval that the proposed equipment is acceptable to the local fire department and its component parts are as listed and are approved by the Fire Marshall.

1.06 DELIVERY, STORAGE AND HANDLING

A. Per Section 01 66 00

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section:
   1. Edwards
   2. Fike
   3. Honeywell
   4. Siemens

2.02 PERFORMANCE/DESIGN CRITERIA

A. Signaling Line Circuits (SLC):
   1. Class: B

B. Notification Appliance Circuits (NAC):
   1. Class: B

C. Communications to Central Station:
   1. Primary: [IP Network][Analog Telephone Line]
   2. Backup: [Cellular Modem]

D. Input/Output Matrix:
   1. Develop an input/output matrix as required to comply with the requirements of the authority having jurisdiction (AHJ), providing the following basic functionality as a minimum:

Input/Output Matrix

	Activate Notification	Indicate Alarm at FACP	Indicate Trouble at [illegible]	Indicate Supervisory at	Send Alarm Signal to	Send Trouble Signal to	Send Supervisory	Send Alarm Signal to	Send Trouble Signal to	Send Supervisory	Shut Down Associated						
Manual Pull Station	X	X			X			X									
Smoke Detector	X	X			X			X									
Duct Smoke Detector	X	X			X			X			X						
Water Flow Switch	X	X			X			X									
Valve Tamper Switch	X			X			X			X							
SLC Wiring Problem			X			X			X								
NAC Wiring Problem			X			X			X								

2.03 COMPONENTS

A. Fire Alarm Control Panel (FACP):
   1. Standard: UL 864 compliant
   2. Type: Addressable
   3. Power Supply: 120VAC with minimum 24 hour battery backup.
   4. Interfaces:
      a. Relay output contacts for remote monitoring of the following signals by SCADA/DCS:
         1) Alarm activated
         2) Supervisory Condition
         3) Trouble Condition
      b. [Modbus TCP Network Communication Port]

B. Manual Pull Stations:
   1. Standard: UL 38 compliant
   2. Action: Double
   3. Color: Red

C. Smoke Detectors:
   1. Standard: UL 268 compliant
   2. Type: Photoelectric

D. Duct Smoke Detectors:
   1. Standard: UL 268A compliant
   2. Type: Photoelectric
   3. Interfaces:
      a. Relay contact output for hard-wired shutdown of associated air handling equipment.
      b. Addressable port for interface to FACP.

E. Heat Detectors:
   1. Standard: UL 521 compliant

F. Water Flow Indicating Switch:
   1. Standard: UL 346 compliant
   2. Enclosure: NEMA 4

G. Valve Tamper Switch
   1. Standard: UL compliant.
   2. Enclosure: NEMA 4

H. Audible Notification Appliances:
   1. Standard: UL 464 compliant
   2. Type: Horn

3. Housing Color: Red

I. Visible Notification Appliances:
   1. Standard: UL 1638 compliant
   2. Type: Strobe
   3. Housing Color: Red

J. Fire Alarm Cable
   1. Standards:
      a. UL 1424 compliant
      b. NEC Type FPLP
   2. Jacket Color: Red

PART 3 EXECUTION

3.01 INSTALLATION

A. Perform all work in accordance with NECA 305 - Standard for Fire Alarm Systems Job Practices.

B. Install all fire alarm wiring in conduit in accordance with Section 26 05 33 – Raceways and Boxes for Electrical Systems. The use of plenum or riser rated cable outside of conduit is not acceptable.

3.02 FIELD QUALITY CONTROL

A. Provide the services of a NICET Certified Fire Alarm Technology Technician (level 2 or higher) to perform system startup.

3.03 SYSTEM START UP

A. System Testing:
   1. Perform in accordance with NFPA 72 - National Fire Alarm and Signaling Code.
   2. Address any deficiencies identified during system testing, including any requirements of the authority having jurisdiction (AHJ), and re-test all modified portions of the system.
   3. Submit final certified test reports to the Owner.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 09 00

GEOTECHNICAL INSTRUMENTATION AND MONITORING

PART 1 GENERAL

1.01 DESCRIPTION

A. This Section specifies the requirements for providing, installing, and monitoring of ground movements around excavations and shoring work, as well as movements of existing improvements, utilities, and roadways, before, during and after excavation and shoring operations.

B. Work shall be performed by a State of Utah Professional Licensed Surveyor, by such methods, instruments, tools, and other materials necessary to perform the Work to the required accuracies.

C. Conduct preconstruction surveys to depict existing interior and exterior conditions of buildings, utilities, underground structures and structural improvements, streets, sidewalks, and the like, within the area of influence of the work site. Monitor these conditions as construction progresses and continue records of damage or influence if necessary.

1. Existing buildings, utilities, and other related structural improvements and properties located in the area of influence of the work site are subject to possible damage as a result of heavy construction activities, including but not limited to excavation.
2. Survey and identify conditions existing in and around the properties anticipated to be potentially affected by the construction operations.

1.02 REQUIREMENTS

A. Minimum instrumentation and monitoring requirements are presented herein. Conduct additional instrumentation and monitoring as necessary to comply with the Approved Integrated Excavation Plan and to control the work and ensure the safety of the work.

B. The CONTRACTOR shall obtain applicable encroachment permits and traffic control permits to perform the work.

C. Remove or abandon in place all instrumentation in accordance with applicable laws, regulations and guidelines and restore the ground at the completion of the project. As a minimum, instrumentation shall be demolished within five feet of the ground surface.

1.03 DEFINITIONS

A. SETTLEMENT MONITORING POINTS (SMP) – Each Settlement Monitoring Point shall be attached to the structure being monitored.

B. VIBRATION MONITORING POINTS (VMP) – Locations where a seismograph will be set up. VMP should be located a minimum of four (4) feet from existing structures to reduce reflected vibrations.

C. INCLINOMETER – Sealed casing installed outside of the excavation to monitor horizontal displacement related to the excavation or failure of the excavation.

D. CRACK MONITORS. Avongard Tell tale or approved equal.

1.04 REFERENCES

A. This Section includes references to the standards as specified in the Contract Documents. They are a part of this Section as specified and modified. In case of conflict between the requirements of this Section and those of the listed documents, the requirements affording the greatest protection to the OWNER shall apply, as determined by the CONSTRUCTION MANAGER.

1.05 SUBMITTALS

A. Submittals in accordance with the General Conditions and Section 01 33 00.

B. Permits. List permits, third party approvals, and approval contract submittals required to perform the work.

C. Submit proposed Preconstruction Survey Plan for Engineer's review.

D. Submit product data on manufactured survey markers for SMP.

E. Submit product data on vibration monitors, inclinometer casing, and inclinometer probes to be used including accuracies. Include calibration dates of vibration monitors and inclinometer probes.

F. Description of methods and materials for installing and protecting the instruments.

G. Proposed location of inclinometer casings with respect to proposed excavation in general accordance with the plans.

H. Materials and mixture proportions for cement-bentonite grout for installing and backfilling inclinometer casings.

I. For all instrumentation installed in borings, submit proposed schedule for installing instruments, detailed step by step procedures for installation, including post installation acceptance test, together with a sample installation record sheet. The installation procedures shall include:
   1. Specifications for proposed grout mixtures, including commercial names, proportions of admixtures and water, mixing sequence, mixing methods and duration, pumping methods and tremie pipe type, size and quantity.
   2. Drill casing or auger type and size.
   3. Method for overcoming buoyancy of instrumentation components during grouting.
   4. Method of sealing joints in pipes and casing to prevent ingress of grout.

J. Prior to commencement of activities submit the following:
   1. Submit a copy of the monitoring report form for approval. The results shall be presented in a graphical format showing successive readings and total cumulative vertical movement (i.e., settlement or heave), total cumulative horizontal movement, maximum vibration, and total cumulative rotation per day.
   2. Submit initial readings.

3. Submit a schedule and outline of procedures and timing for the performance of monitoring.
4. Submit final readings

K. Read inclinometers a minimum of 3 times per week during excavation, once per week for one month after excavation is complete, and once per month until backfill is complete.

L. During activity, submit a daily monitoring report to the CONSTRUCTION MANAGER on the approved form. Submit SMP, vibration monitor, and inclinometer reports to the CONSTRUCTION MANAGER within 12 hours after the readings are taken. If readings exceed Action Trigger Levels, immediately notify CONSTRUCTION MANAGER and submit monitoring data within 2 hours after readings are taken.

M. Submit a mitigation plan and actions to be taken if SMP, vibration monitor, or inclinometer readings exceeds Action Trigger Levels.

Stop the Work and implement the mitigation plan in the event that SMP, vibration monitor, or inclinometer Maximum Allowable Reading are exceeded.

N. Submit close-out report on the approved form.

1.06 QUALITY ASSURANCE

A. A Professional Land Surveyor registered in the State of Utah shall supervise and direct all survey activities related to monitoring and the establishment of horizontal and vertical control.

B. Survey for location and elevation shall be performed by individuals with a minimum of 3 years surveying experience performing the type of survey required.

C. Surveys are to be performed to a minimum horizontal accuracy of 0.02 feet (1/4 inch) and minimum vertical accuracy of 0.01 foot (1/8 inch).

D. Seismographs shall have a recording accuracy as outlined in Specification 31 41 01 Vibration Control.

E. The inclinometer equipment shall be capable of providing a system accuracy of ±0.01 inch per reading.

PART 2 EQUIPMENT, PRODUCTS, AND MATERIALS

2.01 PRODUCTS

A. NOT USED

2.02 MONITORING REPORTS

A. Monitoring shall be provided on an approved report form. The report form will clearly indicate the following information:
1. SMP, VMP, and inclinometer identification number and marker type, and calibration date.

2. Station and offset along the pipe alignment.
3. Initial elevation and horizontal coordinates.
4. Elevation and horizontal coordinates from subsequent readings.
5. Direction of movement.
6. Date and time of readings.
7. Names of the individuals who performed the monitoring.
8. Bench mark and horizontal control point data including identification, location, elevation and horizontal coordinates.
9. Inclinometer readings shall be shown graphically with a maximum horizontal axis of 1 inch. Each report shall include a cumulative displacement plot for the A and B axis.
10. Inclinometer reports shall include the maximum displacement of the casing reported to 0.01 inch (not inclusive of readings above or near the ground surface).

B. The approved report for shall be used for initial, all daily and close-out submittals.

2.03 INSTRUMENT SCHEDULE

A. Provide SMP, VMP, and inclinometers as shown on the drawings.

PART 3 EXECUTION

3.01 QUALITY CONTROL

A. Instrument Installation. Install all instruments within 3 ft of the horizontal location shown on the Contract Drawings or as approved or directed by the ENGINEER.

B. Should actual field conditions prevent installation of instruments at the location and elevations shown on the Contract Drawings or specified herein, obtain prior acceptance from the ENGINEER for new instrument location and elevation.

3.02 SAFETY REQUIREMENTS

A. Methods of installing the instrumentation shall be such as to ensure the safety of the work, project participants, the public, third parties, and adjacent property, whether public or private.

3.03 INSTALLATION

A. Begin immediately upon Notice to Proceed and submit applicable portions of this survey report and data to the Engineer for compliance review prior to the start of construction activities.

B. Survey all structures within the construction area. Submit any Contractor recommended deviations from this area, if any.

C. Install six (6) crack monitors, at the approximate locations of the SMP and as directed by the ENGINEER, permanently affixed to structure.

D. SMP, Inclinometers, and VMP shall be located as shown on the Contract Drawings.

E. Each inclinometer shall be outside the excavation. Inclinometer locations should be in an appropriate location shown in the IEP to detect a potential failure and in a location approved by the ENGINEER.

F. Inclinometers shall be installed to a tip depth a minimum of 30 feet below the deepest excavation or 15 feet deeper than proposed shoring, whichever is deeper.

3.04 INSTALLATION AND INITIAL READINGS

A. A minimum of fourteen (14) days prior to activity, install all SMP, crack monitors, and inclinometer casings unless otherwise approved by the Engineer. Survey the SMP for the horizontal and vertical location. Submit the results to the CONSTRUCTION MANAGER.

B. A minimum of seven (7) days prior to activity, survey the location of each SMP. Submit the results to the CONSTRUCTION MANAGER.

C. A minimum of one (1) days prior to activity, survey the location of each SMP. Submit the readings to the CONSTRUCTION MANAGER.

D. A minimum of seven (7) days prior to activity, and at least 24 hours after casing installation obtain baseline readings for the inclinometer casing. Take two (2) or more baseline readings and establish the best possible baseline reading. Submit report with graphical representation of checksums of chosen baseline reading to the CONSTRUCTION MANAGER.

3.05 MONITORING

A. Monitor all SMP, VMP, crack monitors, and inclinometers to the accuracy and the frequency specified. Frequency:

1. As a minimum, the CONTRACTOR shall follow the following schedule:

Table 1: Frequency

Instrument Type	During Dewatering	During Installation/Removal of the Shoring	During Excavation	During Construction	Post Construction – 3 months after end of construction
SMP	Once (1) per day	Once (1) per day	Once (1) per day	Once (1) per day	Weekly
VMP	NA	Continuously	NA	Once (1) per day during backfill compaction	NA
Inclinometer*	NA	NA	Three (3x) per week	Once (1) per week after excavation	NA
Crack monitor	Once (1) per day	Once (1) per day	Once (1) per day	Once (1) per week after excavation	NA

**see section 1.05 J*

2. The CONTRACTOR shall perform additional monitoring as necessary to control construction and to ensure the safety of the work.

B. Notify CONSTRUCTION MANAGER within 2 hours of taking readings if action limits are exceeded. The action and maximum limits for ground distortions are provided in Table 2.

SECTION 31 10 00

SITE CLEARING

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope: This section specifies site preparation which consists of clearing, grubbing and demolition.

B. Existing Conditions: The Contractor shall determine the actual condition of the site as it affects this portion of work. The Contractor shall locate and preserve utilities that are to remain in service.

C. Protection: Site preparation shall not damage structures, landscaping or vegetation adjacent to the site. The Contractor shall repair, or replace any damaged property. Contractor is responsible for developoing and managing a Storm Water Pollution Pervention Plan with detail Erosion and Sediment Control Plans.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 CLEARING AND GRUBBING

A. Unless otherwise specified, the Contractor shall remove obstructions such as brush, trees, logs, stumps, roots, heavy sod, vegetation, rock, stones larger than 6 inches in any dimension, broken or old concrete and pavement, debris, and structures where the completion of the work require their removal.

B. Material that is removed and is not to be incorporated in the work shall be disposed of off the site.

C. Contractor Stagging and Laydown Areas – provide surface stabilization after clearing and grubbing.

3.02 DEMOLITION AND REMOVAL

A. Structures: Demolition and removal of structures consist of removal of abandoned superstructures, foundation walls, footings, slabs and any other structures. Excavations caused by existing foundations shall be cleared of waste, debris and loose soil, and refilled as specified.

B. Pavement: When portions of asphalt pavements and concrete pads are to be removed and later construction is to be connected, edges shall be saw cut, on a neat line at right angles to the curb face.

3.03 UTILITY INTERFERENCE

A. Where existing utilities interfere with the prosecution of the work, the Contractor shall relocate them in accordance with the General Conditions of the Contract Documents.

B. Before starting, the Contractor shall arrange for disconnection of all utility services that are to be removed or which interfere with Work with the Owner and the respective utility company.

END OF SECTION

SECTION 31 21 33

TRENCHING, BACKFILLING, AND COMPACTING FOR UTILITIES

PART 1 GENERAL

1.01 SUMMARY

A. Section specifies excavation, trenching, backfilling and compaction for underground utilities and appurtenances.

B. The CONTRACTOR shall provide all labor, materials, equipment, supervision, and testing necessary to construct the improvements.

C. Excavating, trenching, bedding and backfill shall be performed as specified herein and in accordance with the requirements of the Agency with jurisdiction over the rights-of-way in which the Work is performed. In the case of conflict between the Agency's requirements and these specifications, the requirements affording the greatest protection to the OWNER shall apply, as determined by the CONSTRUCTION MANAGER.

D. Work must be performed in accordance with OSHA and all local, state and federal requirements.

E. Stockpile excavated trench materials offsite, not in roadway.

1.02 REFERENCES

A. Referenced Standards: This Section incorporates by reference the latest revision of the following documents. These references are a part of this Section as specified and modified. In case of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.

1. ASTM International (ASTM):
    a. C33, Standard Specification for Concrete Aggregates.
    b. D1557, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3).
    c. D2487, Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System).
    d. D4253, Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
    e. D4254, Standard Test Methods for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density.
    f. D6938, Standard Test Methods for In-Place Density and Water Content of Soil and Soil Aggregate by Nuclear Method (Shallow Method).

1.03 QUALIFICATIONS:

A. Hire an independent certified soils laboratory to conduct source materials testing and compaction testing.

1.04 SUBMITTALS

A. Procedures: Section 01 33 00 Submittal Procedures.

B. Product technical data per Section 31 23 00, Excavation and Fill.

C. Contractor's Safety Plan for personnel.

D. Contractor-obtained permits.

E. Qualifications: Name(s) and qualifications of trenching and excavation Competent Person(s). To qualify as a Competent Person, he or she shall have completed the equivalent of 10-hour Utah OSHA (UOSH) Construction Safety Training within the last five (5) years.

F. The following information shall be provided prior to beginning Work:
   1. Excavation sheeting, shoring, and bracing system design in accordance with Section 31 41 00.
   2. Qualification information of excavation support system designer (Professional Engineer registered in the State of Utah) in accordance with Section 31 41 00.

G. Submit report from a testing laboratory verifying that material conforms to the specified gradations or characteristics for pipe zone and trench backfill material including sand, rock for foundation stabilization, and water. Include laboratory moisture-density relations of soils in accordance with ASTM D1557.

H. Submit method of compaction in pipe zone including removal sequence of shoring where used.

I. Submit mix designs for controlled low strength material (CLSM, aka flowable fill). Comply with CLSM cold weather placement as specified herein.

J. Submit excavation plans for worker protection and dewatering plans in accordance with Section 31 23 19.

1.05 SITE CONDITIONS

A. Plan for and provide work zone traffic control where required to meet Salt Lake City agency requirements.

B. Avoid overloading or surcharge a sufficient distance back from edge of excavation to prevent slides or caving.

C. Maintain and trim excavated materials in such manner to be as little inconvenience as possible to public and adjoining property owners.

D. Provide full access to public and private premises to prevent interruption of travel.

E. Protect and maintain benchmarks, monuments or other established points and reference points and if disturbed or destroyed, replace items to full satisfaction of the Owner and controlling agency.

F. Verify location of existing underground utilities and comply with the rules of the Blue Stakes of Utah 811.

1.06 TESTING FOR COMPACTION

A. Test for compaction as described in Section 31 23 00.

B. Where compaction tests indicate a failure to meet the specified compaction, the Contractor shall take additional tests every 10 feet in each direction until the extent of the failing area is identified. Rework the entire failed area until the specified compaction has been achieved.

1.07 DEFINITIONS

A. PAVEMENT ZONE

1. The pavement zone includes the asphalt concrete and aggregate base pavement section placed over the street zone.

B. ROAD ZONE OR STREET ZONE

1. The road zone (street zone) is the top 12 inches of the trench immediately below the pavement zone in paved areas.

C. TRENCH ZONE

1. The trench zone includes the portion of the trench from the top of the pipe zone to the bottom of the street zone in paved areas or to the existing surface in unpaved areas or 6 inches below existing or finished grade where topsoil is required, unless noted otherwise.

D. PIPE ZONE

1. Unless noted otherwise, the pipe zone shall include the full width of trench from the bottom of the pipe base or bedding to a horizontal level above the top of the pipe, as specified below. Where multiple pipes or conduits are placed in the same trench, the pipe zone shall extend from the bottom of the lowest pipes to a horizontal level above the top of the highest or topmost pipe. Thickness of pipe zone above the highest top of pipe shall be as follows unless otherwise shown on Drawings or otherwise described in the Specifications for the particular type of pipe installed. For electric ducts and duct banks, trench wall clearances and pipe zone dimensions are shown on Drawings.

Pipe Diameter	Thickness of Pipe Zone Above Top of Pipe
6 inches or smaller	6 inches
8 inches and larger	12 inches

E. PIPE BASE OR BEDDING

1. The pipe base or bedding shall be defined as a layer of material immediately below the bottom of the pipe or conduit and extending across the full trench width in which the pipe is bedded. Thickness of pipe base shall be as follows unless otherwise shown on Drawings or otherwise described in the specifications for the particular type of pipe installed.

Pipe Diameter	Thickness of Pipe Base Below Bottom of Pipe
12 inches and smaller	4 inches
14 inches and larger	6 inches

PART 2 PRODUCTS

2.01 MATERIAL

A. Per Section 31 23 00, Excavation and Fill.

B. Marking tape and tracer wire:
   1. Fiber Optic Conduit Marking Tape: As provided by fiber optic conduit supplier.
   2. Marking Tape (Nondetectable):
      a. Inert polyethylene, impervious to known alkalis, acids, chemical reagents, and solvents likely to be encountered in soil.
      b. Thickness: Minimum 4 mils.
      c. Width:(2) 6 inches for 24" larger pipe or (1) 6 inch for smaller pipe
      d. Color: Blue (for water) and Orange for Cathodic Protection test wires, green for storm and sanitary sewer, red for electrical wires, and yellow for gas.
      e. Lettering: Minimum 1-inch high, permanent black lettering imprint continuously over entire length.
         1) Text shall be:
            a) "High Pressure Waterline Buried Below" for water
            b) CP Test Wires" for cathodic protection wire.
            c) ""Buried Electrical Line Below" for electric wires.
            d) "Caution: Buried Gas Line" for gas.
            e) ""Buried Sewer Line Below" for sewer lines.
         2) Provide over other utilities exposed if utility owner requires.
         3) Install over all buried utilities.
      f. Manufacturers and Products:
         1) Reef Industries; Terra Tape.
         2) Allen; Markline.
   3. Tracer Wire:
      a. 12-gauge, copper, stranded UF, black 600V tracing wire.

PART 3 EXECUTION

3.01 GENERAL

A. Excavate and dispose of all materials of whatever nature encountered, including all obstructions that would interfere with the proper execution and completion of the Work. The removal of these materials shall conform to the lines and grades indicated or ordered.

B. Shoring system designer shall certify in writing that the excavation support systems are constructed per the applicable stamped, dated, and signed excavation support system of the designer including any modifications by Contractor during construction.

3.02 PROTECTION

A. Protect existing surface and subsurface features on-site and adjacent to site. Provide barricades, coverings, or other types of protection necessary to prevent damage to existing items indicated to remain in place.

B. Protect existing utilities from damage or disturbance. Immediately notify utility whose facilities have been damage or disturbed. At utility owner's option, repair damaged utility or compensate utility owner for completed repairs.

C. Perform trenching and excavating operations in such a manner to protect personnel and the public from the dangers associated with trenching and excavation.

3.03 EXCAVATION

A. Follow applicable health and safety OSHA standards and requirements.

B. Remove rock, soil, organics, pavement, debris, trash, hard pan, loose shale, loose stone, and other obstructions as required to complete the Work or as directed by the Construction Manager.

C. Dewatering shall be in accordance with Section 31 23 19, Dewatering.
   1. Provide and maintain means and devices to remove and dispose of all water entering the trench excavation during the time the trench is being prepared for the pipe laying, during the laying of the pipe, and until the backfill at the pipe zone has been completed. Maintain groundwater 1 foot below the bottom of trench excavations and at an adequate lateral distance away from the trench slopes so as to have negligible effects on stability. Locate dewatering facilities such as deep wells and well points a minimum distance of one trench depth away from the trench.
   2. Open pumping from sumps shall not result in boils, softening of the ground, or loss of fines. These provisions shall apply 24 hours a day whenever pumping is performed. Dispose of the water in a manner to prevent damage to adjacent property and in accordance with regulatory agency requirements. Do not drain trench water through the pipeline under construction. Do not allow groundwater to rise around the pipe until jointing (welds and coatings) are complete.

D. Trench Excavation:
   1. Excavation is unclassified. Perform all excavation regardless of type, groundwater or other conditions per Section 31 23 00. Excavate the trench to the lines and grades shown on Drawings with allowance for pipe thickness, sheeting and shoring if used, and for pipe base or special bedding. If the trench is excavated beyond (horizontally or vertically) that required on Drawings and Specifications, refill any part of the over-excavated trench at no additional cost to the Owner with the same material required in the plans and specs, or foundation stabilization material, where required by the Construction Manager.
   2. Excavate trenches by open cut method to depth shown on Drawings and necessary to accommodate work.

a. Verify location of utilities and protect as necessary.
b. Support existing utility where proposed work crosses at a lower elevation.
c. Stabilize excavation to prevent undermining of existing utility.

3. Open trench limits:
   a. Limit length of open trench to no more than shown on the Drawings or specified.
   b. Reduce limits of open trench as weather conditions or groundwater infiltration dictate.
   c. At Owner's discretion, any excavation, trench, or portion of a trench which is opened and remains idle, shall be backfilled, if directed by the Construction Manager.
      1) If backfilled at Construction Manager's direction, trench or excavation may not be reopened until Construction Manager is satisfied that work associated with the trench or excavation will be performed immediately.
   d. Trenches left open must be protected from traffic and to prevent public access.
      1) Within unpaved areas limit the length of open trench to 500 feet in advance of pipe laying or the amount of pipe installed in one working day. Complete backfilling not more than 500 feet in the rear of pipe laying.
      2) Open trenches allowed within a traveled way (vehicular or pedestrian) or within 25 feet of a traveled way or occupied structure that is not barricaded off from the public traveled way using UDOT-approved jersey barriers shall be fully backfilled at the end of each day or covered with steel plates or other acceptable covers capable of supporting AASHTO HS-20 traffic loads. Maximum length of trench that may be covered with steel plates shall not exceed 200 feet.
4. Observe following trenching criteria:
   a. Trench size:
      1) Excavate width to provide adequate working room given the work area restrictions.
      2) Refer to drawings for trench maximum width dimensions. Comply with 29CFR Part 1926 Subpart P, Excavations. Trench width at the top of the trench will be limited to the width of the shoring for the excavation and should not undercut adjacent structures and footing. In such case, width of trench shall be such that there is at least 2 feet between the top edge of the trench and the structure or footing.
      3) Cut trench walls vertically from bottom of trench to minimum 1 foot above top of pipe.
      4) Keep trenches free of surface water runoff and groundwater seepage to a minimum 12 inches below the bottom of the trench, as required by Section 31 23 19, Dewatering.
5. Sloping, sheeting, shoring, and bracing of trenches:
   a. Trenches shall have sloping, sheeting, shoring, and bracing conforming with 29CFR1926, Subpart P - Excavations, OSHA requirements, and General Conditions.
   b. Provide shoring protection in accordance with Section 31 41 00 Sheeting, Shoring, and Bracing.

1) Shoring/bracing shall be designed and maintained so that soil does not migrate from behind the structural system creating voids. Shoring/bracing systems shall be removed such that compacted backfill is not disturbed.
2) Address ground settlement and utility shearing/settlement during installation and removal of shoring. If shoring methods are damaging utilities or services, change shoring methods or provide alternate construction methods so utilities and services are in acceptable and functional condition during and after construction.

6. Trench excavation in backfill and embankment areas:
   a. Conduct trenching in fill areas after primary settlement is achieved and rough grading completed.
   b. Where top of pipe is above existing grade, place and compact fills to 12 inches above top of pipe before excavating trench. Fills above top of pipe may be placed after pipe installation.
   c. Excavate trench in the compacted backfill or embankment. Place pipe base material, install pipe or conduit, and backfill with pipe zone material. Compact backfill above the pipe zone to the same relative compaction as the adjacent embankment as specified in Section 31 23 00, Earthwork.
7. Location of excavated material:
   a. See Drawings for designated stockpile areas.
   b. During trench excavation, place the excavated material only within the working area or within the construction and permanent easements and stockpile areas shown on Drawings unless letters of authorization from landowners (and land owner signed release forms at the end of the Project) are submitted to the Construction Manager authorizing work outside construction limits.
   c. Locate stockpiles for excavated trench materials outside of street rights of way. Do not obstruct any roadways or streets. Conform to federal, state, and local codes governing the safe loading of trenches with excavated material.
   d. Excavated topsoil shall be removed and stored separately. Unless otherwise noted, replace topsoil in the top 6 inches of the trench zone.
   e. Trench spoil piles shall be located at least 5 feet from the tops of the slopes of trenches. Cranes and other equipment shall not be operated on the same side of the trench as the spoil piles.
   f. Where natural cross-slopes exceed 15 degrees, trench spoil shall not be located uphill of the excavation unless stability is assessed through analysis by a registered professional engineer and authorized by the Construction Manager.
   g. Dispose of excess excavated native trench materials per Section 31 23 00.

3.04 PREPARATION OF FOUNDATION FOR PIPE LAYING

A. Regular Trench Excavation:
   1. Excavate minimum of 6 inches below bottom exterior surface of the pipe.
   2. Remove soft, loose, or previously disturbed or otherwise unsuitable material or soil from the bottom of the trench.
   3. Install pipe bedding material.
   4. Form welder access holes in trench bottom (if required).
   5. Support pipe.

B. Over-Excavation and Subgrade Stabilization:
   1. Observe the following requirements when unstable trench bottom materials are encountered.
      a. Notify Construction Manager when unstable materials are encountered.
      b. Remove unstable trench bottom.
      c. Backfill to the grade of the bottom of the pipe bedding with flowable fill material and compact.
   2. Any over-excavation carried below the grade ordered or indicated or if caused by Contractor's operations or failure to dewater or maintain a dry trench, shall be performed by the Contractor at no additional cost to the Owner.
   3. Over excavation, if field-initiated by Construction Manager, shall include the removal of all material that exists directly beneath the pipeline to a width 24 inches (minimum) greater than the pipe outside diameter and to the depth required.
      a. Backfill the trench to subgrade of pipe base with rock refill material for foundation stabilization. Place the foundation stabilization material over the full width of the trench and compact in layers not exceeding 8 inches deep to the required grade. Compact each layer with a track-hoe roller head to the satisfaction of the Construction Manager. Rock refill used by the Contractor for his/her convenience will not receive any additional payment.
      b. Where over excavation and rock refill are not required on Drawings, foundation stabilization work shall be executed only by change order when unacceptably soft (as determined by the Construction manager) subgrade materials are encountered in the trench. In such areas, after the required excavation has been completed, the Construction Manager will inspect the exposed subgrade to determine the need for any additional excavation. It is the intent that additional excavation be conducted in all areas within the influence of the pipeline where unacceptable materials exist at the exposed subgrade.

3.05 INSTALLING BURIED PIPING

A. Store, handle, and install pipe per the detailed piping specifications for the particular type of pipe, and per the following:
   1. Handle pipe in such a manner as to avoid damage to the pipe. Do not drop or dump pipe into trenches under any circumstances.
   2. Inspect each pipe and fitting before lowering the buried pipe or fitting into the trench. Inspect the interior and exterior protective coatings. Patch damaged areas in the field with material recommended by the protective coating manufacturer. Clean ends of pipe thoroughly. Remove foreign matter and dirt from inside of pipe and keep clean during and after installation.

B. Grade trench bottom to line and grade allowing for pipe thickness and bedding. Remove hard spots that would prevent a uniform bedding thickness. Place specified bedding thickness over full trench width. Grade and compact the top of bedding before pipelaying to provide firm, continuous, uniform support along full pipe length, and compact to the relative compaction specified. Before laying each section of the pipe, check the grade with a straightedge and correct any irregularities.
   1. Where CLSM backfill is used, provide sandbags to support the pipeline before CLSM placement.

C. Excavate bell hole at each joint to permit proper assembly and inspection of entire joint. Fill areas excavated for joints with CLSM.

D. Line and Grade: As shown on the Drawings.

E. After pipe has been bedded, place pipe zone material simultaneously on both sides of the pipe, in maximum 8-inch lifts, keeping the level of backfill the same on each side. Carefully place the material around the pipe so that the pipe barrel is completely supported and that no voids or uncompacted areas are left beneath the pipe. Use particular care in placing material on the underside of the pipe to prevent lateral movement during subsequent backfilling.

F. Compact each lift to the relative compaction specified herein. Compact trench backfill to the specified relative compaction. Compact by using mechanical compaction, or hand tamping.
   1. Compact material placed within 12 inches of the outer surface of the pipe by hand operated tampers or other equipment that will not damage the pipe.
   2. Do not use any axle-driven or tractor-drawn compaction equipment within 5 feet of building walls, foundations, and other structures.

G. Push the backfill material carefully onto the backfill previously placed in the pipe zone. Do not permit free fall of the material until at least 2 feet of cover is provided over the top of the pipe. Do not drop sharp, heavy pieces of material directly onto the pipe or the tamped material around the pipe. Do not operate heavy equipment over the pipe until at least 3 feet of backfill has been placed and compacted over the pipe.

H. When the pipelaying is not in progress, including the noon hours, close the open ends of pipe. Do not allow trench water, animals, or foreign material to enter the pipe.

I. Remove and dispose of all water entering the trench during the process of pipelaying. Keep the trench dry until the pipelaying and jointing are completed.

J. To avoid jarring pipe off grade, after setting (surveying) pipe to grade, do not MOVE shoring until after joint welding, coating and initial CLSM pipe zone set. After initial set, lift shoring panels to fill all shoring voids with CLSM and bring up backfill uniformly on both side of the pipe.

3.06 BACKFILLING METHODS

A. Do not backfill until tests to be performed on pipe show system is in full compliance with specifications.

B. Backfill shall be placed after all water is removed from the excavation, and the trench sidewalls and bottom have been dried to a moisture content suitable for compaction.

C. Lift trench shields and trench boxes during placement of backfill. Ensure that each lift of backfill material makes full contact with earth trench sides prior to compacting the lift of backfill.

D. Pipe Zone:

1. The CONTRACTOR shall not proceed with bedding placement or pipe installation in excavated areas until the subgrade has been inspected.
2. Bedding material shall be placed in the bottom of the trench, leveled and compacted over the full width of the trench. Grade the top of the bedding ahead of the pipe laying to provide a firm, uniform support along the full length of pipe.
3. Backfill material shall be carefully placed and compacted around the pipe to ensure the pipe barrel is completely supported and that no voids or uncompacted areas are left beneath the pipe or below the haunches. Fill material shall be placed simultaneously on both sides of the pipe, keeping the level of backfill the same on each side.
4. Backfill around and over pipe shall be compacted using light hand operated, vibratory compactors and rollers. The use of a jetting and backhoe mounted compaction wheel is prohibited within the pipe zone above the top of the pipe. Care shall be exercised in placing material to prevent movement of the pipe during backfilling and to prevent gouging, denting or crushing of pipe or laterals.
5. Contractor shall be responsible for properly protecting pipe and appurtenances during backfill operations utilizing flowable backfill and providing measures as approved by the Construction Manager to prevent flotation.
6. Avoid displacing pipe joints and appurtenances or causing any horizontal or vertical misalignment, separation, or distortion.
7. Comply with pipe manufacturer's recommendations regarding backfilling and compaction.

E. Trench Zone and Final Backfill:
1. After the Pipe Zone material has been placed, compacted, inspected and accepted by the Construction Manager, backfill in the Trench Zone may proceed.
2. Care shall be exercised in the moving or removal of trench supports to prevent the caving or collapse of the excavation face. Voids between the native material, bedding and backfill must be filled and compacted to the satisfaction of the Construction Manager, UDOT, or Agency with jurisdiction of the right-of-way.
3. Place backfill in lift thicknesses capable of being compacted to density specified, but in no case exceeding 18-inch loose thickness.
4. Comply with pipe manufacturer's recommendations regarding backfilling and compaction.
5. Avoid displacing pipe joints and appurtenances or causing any horizontal or vertical misalignment, separation, or distortion.
6. Backfill to finished grade as shown on the Drawings and as follows:
    a. In paved areas, backfill shall be placed in accordance with requirements for pavement restoration.
    b. In unpaved or landscaped area, place topsoil as necessary to maintain the surface of the backfilled trench level with the adjacent ground surface.

F. Water flushing for consolidation is not permitted unless allowed in writing from Construction Manager.

G. If a moveable trench shield is used during excavation, pipe installation, and backfill operations, the shield shall be moved by lifting the shield free of the trench bottom or as backfill material is being placed and compacted and then moving the shield horizontally.

Do not drag trench shields along the trench causing damage or displacement to the trench sidewalls, the pipe, or the bedding and backfill.

H. Cold weather limitations in placing fill and backfill
   1. Unless allowed in the authorized Cold Weather Construction Plan, earth fills and backfills requiring 95 percent or higher relative compaction shall not be placed when either atmospheric temperature, or the temperature of the existing ground or the fill being placed, are below 35 degrees Fahrenheit unless both the existing ground and the fill being placed are both non-frost susceptible materials.
   2. Earth fills and backfills requiring 90 percent or lower relative compaction may be placed when temperatures are below 35 degrees Fahrenheit if the required compaction is achieved. If the required compaction is not achieved, the work shall be removed and re-compacted.
   3. Do not place any fill or backfill materials which require 95 percent, or higher, relative compaction if the excavation or subgrade contains frozen moisture (snow, ice, sleet, etc.), frozen earthen materials, or earthen materials which have been deposited in the excavation due to freezing, thawing, precipitation, or other inappropriate means.
   4. Do not place fill materials which contain frozen moisture (snow, ice, sleet, etc.) except as allowed in the paragraphs above.
   5. Work performed outside the required temperature limitations is subject to rejection, removal and replacement.

I. Remove and replace any trenching and backfilling material which does not meet the Specifications, at the Contractor's expense.

3.07 COMPACTION REQUIREMENTS

A. Unless otherwise shown on Drawings or otherwise described in the Specifications for the particular type of pipe installed, relative compaction in pipe trenches shall be as follows (relative compaction values are per ASTM D1557 and per Section 31 23 00):
   1. Pipe Bedding (except CLSM): 90 percent relative compaction.
   2. Pipe Zone (except CLSM): 90 percent relative compaction.
   3. Backfill in Trench Zone not Beneath Paving: 95 percent relative compaction.
   4. Backfill in Trench Zone and Street Zone in Paved Areas: 95 percent relative compaction.
   5. Backfill in Pavement Zone under Asphalt: 95 percent relative compaction.
   6. Rock Refill for Contractor Over-excavation and for Foundation Stabilization: With a track-hoe roller head to the satisfaction of the Construction Manager.
   7. Topsoil Replaced: Match density of adjacent topsoil.
   8. Beneath Vaults, Manholes, and Other Structures: 95 percent relative compaction.
   9. All backfill placed soil for compaction shall be between 2 percent below and 2 percent above optimum moisture content unless noted otherwise.

3.08 PLACEMENT OF CLSM

A. The aggregate, cement, and water shall be proportioned either by weight or by volume. The water content shall be sufficient to produce a fluid, workable mix that will flow and

can be pumped without segregation of the aggregate while being placed. Prepare CLSM in accordance with ASTM C94.

B. Provide batching equipment to obtain the proper weights of soil, cement, water, and admixtures. All measuring devices should be sensitive to a 2 percent variation above or below the actual weights required. Volumetric batching may be used, provided the same accuracy required for weight batching is maintained.

C. Design and operate the mixers used for mixing the CLSM so that the CLSM as discharged from the mixer is uniform in composition and consistency throughout each batch.

D. Place the CLSM such that it flows easily into all open spaces and voids between the pipe and the excavated trench. In some cases, such as trenches on a slope, a stiffer mix may be required to prevent it from flowing down the trench. In this case, use vibration to be sure that the CLSM completely fills all open spaces and voids.

E. Lay the pipe on the sandbags and place the CLSM bedding as shown on Drawings. Bedding shall be placed under pipe from one side and vibrated, as necessary, so that it flows under the pipe until it appears on the other side. CLSM shall then be added to both sides of the pipe and vibrated until it completely fills the space between the pipe and the excavated trench bottom. This operation shall follow as closely behind pipe laying operations as possible. Place CLSM in a way as to prevent uplift or buckling of the pipe.

F. Place CLSM into trench so it immediately fills voids left when shoring is removed. Do not place and compact pipe zone or trench zone backfill around the pipe until the CLSM has reached the initial set.

G. CLSM protection in freezing temperatures:
   1. If the ambient temperature is 40 degrees F or less, comply with the cold weather backfill and CLSM placement and curing requirements in Section 31 23 00, Earthwork.
   2. Whenever freezing temperatures are imminent, maintain the CLSM at a temperature of not less than 50 degrees F for 7 days after placement. The temperature of the mix shall be 50 degrees F or greater at the time of placement. The temperature shall be monitored by placing a thermometer in the CLSM immediately after sampling at the placement site. When freezing weather appears imminent, make ready at the placement site materials which may be required for protection of CLSM. Placement of CLSM shall be delayed until adequate provisions for protection against weather are made. No CLSM bedding shall be placed in pipe trenches when the trench bottom or walls are frozen or contain frozen material. Backfill placed as cover over the CLSM is prohibited from containing any frozen material.

3.09 INSTALLING MARKING TAPE AND TRACER WIRE

A. Install marking tape where shown in the trench details on Drawings. Secure marking tape to prevent movement during backfill. Marking tape is required over fiber optic ducts, water pipes, and cathodic test wires.

B. Tracer wire is required over all fiber optic, I&C, and electric ducts, and all pipelines except welded steel pipelines larger than 30-inches in diameter. Install atop the marking tape a

tracer wire and secure to prevent movement during backfill. Bring tracer wire to the surface every half mile in a testing/junction box.

C. Terminate tracer wire on a post mounted (or flush mounted) terminal. If the tracer wire terminals are acceptably labeled with securely attached bright yellow plastic tags, Construction Manager may allow them to be terminated on a cathodic test station post or in a pull box.

3.10 FIELD QUALITY ASSURANCE

A. Materials Testing:

1. The Owner shall perform and be responsible for all sampling and testing of materials as required for quality assurance/control of the Work. The Contractor shall pay for all costs associated with the day-to-day quality assurance/control to maintain all material within specified or approved limits. The Contractor shall retain a registered geotechnical engineer, independent from the Contractor, and a testing laboratory, whose qualifications are each acceptable to the Construction Manager by submittal, to perform all compliance testing described below. The Construction Manager may have an independent testing laboratory perform additional tests at no cost to the Contractor, however the Contractor shall provide materials for testing at no additional cost to the Owner.
2. Perform particle size analysis of soils and aggregates in accordance with ASTM C 136 Sieve Analysis of Fine and Coarse Aggregate and ASTM C 117 Materials Finer than No. 200 Sieve in Mineral Aggregate by Washing.
3. Determine sand equivalent in accordance with ASTM D 2419. Unified Soil Classification System: References to soil classification types and standards shall have the meanings and definitions indicated in ASTM D 2487. The Contractor shall be bound by all applicable provisions of ASTM D 2487 in the interpretation of soil classifications.
4. Where soil material is required to be compacted to a percentage of maximum dry density, the maximum dry density at optimum moisture content will be determined in accordance with ASTM D 1557. In the field, determine the density of soil in place by the sand cone method, ASTM D 1556 or by nuclear methods, ASTM D 6938 and D 3017.
5. Apply rock correction factors as applicable. In case the test of the fill or backfill shows non-compliance with the required density, perform remedies as may be required to insure compliance. Subsequent testing to show compliance shall be by a testing laboratory selected by the Construction Manager and paid for by the Contractor.
6. Compaction tests shall be performed for each lift or layer. If nuclear methods are used for in-place density determination, verify the accuracy with one sand cone test, and one maximum laboratory dry density test, for every 2 weeks nuclear tests are used if the backfill material is processed fill or visually consistent. The Construction Manager shall be the sole judge of visual consistency. More sand cone and dry density tests will be required if the backfill material is visually variable. The minimum depth for the sand cone test hole shall be 8 inches. The minimum size shall be 8 inches and size 16/30 or 10/20 silica sand shall be used.
7. Determine laboratory moisture-density relations of soils by ASTM D 1557. If nuclear methods are used for in-place density determination, the compaction test results for maximum dry density and optimum water content shall be adjusted in accordance

with ASTM D 4718. This will be required for determination of percent relative compaction and moisture variation from optimum.

8. Determine the relative density of cohesion-less soils by ASTM D 4253 and D 4254. Sample backfill materials by ASTM D 75. "Relative Compaction" is the ratio, expressed as a percentage, of the in-place dry density to the laboratory maximum dry density.

B. Testing Frequency:

1. After an acceptable compaction procedure is established, compaction tests shall be taken at 300-foot intervals along the trench and at vertical intervals for every other lift at random locations and not necessarily vertical in line. A minimum of two tests will be required for each production day in the trench. Tests shall also be taken near structures, manholes, etc., and where designated by the Construction Manager. Embankment and fill areas shall have at least one compaction test performed each production day and no fewer than one test for each 1,000 cubic yards. Copies of all test reports shall be submitted to the Construction Manager by the next working day.
2. Location for compaction tests shall be prepared and submitted to the Construction Manager for approval prior to testing.
3. Compaction and other tests may be taken by the Construction Manager at intervals along the trench as described above to verify compliance with these requirements. Accommodate the Construction Manager in conducting these tests. Provide access and exploratory excavation as required to collect samples or conduct tests. Allot sufficient time during construction for the performance of any such compaction testing.
4. Compaction shall be deemed to comply with the specifications when no compaction test falls below the specified relative compaction. Pay the costs of any retesting of work not conforming to the specifications. Should the compaction methods used fail to achieve the required degree of compaction, revise compaction method to achieve the required compaction.
5. If a lift fails to meet the specified compaction requirements, remove and replace the backfill at proper density or bring the density up to specified level by other means acceptable to the Construction Manager. Pay for all subsequent tests required to confirm and verify that the reconstructed backfill has been brought up to specified density. Frequency of confirmation tests for remedial work shall be double that amount specified for initial confirmation tests.

C. Costs associated with necessary corrective work resulting from failed tests or inspections shall be paid by Contractor. Should any originally scheduled quality assurance test or inspection fail to meet requirements of the Contract Documents, the Contractor shall be responsible for the cost of retesting or re-inspection of Work including inspector’s and tester’s time and trips.

D. Should any compaction density test or subgrade inspection fail to meet requirements, perform corrective work as necessary to bring the material into conformance with the requirement of the Contract Documents.

END OF SECTION

SECTION 31 23 00

EXCAVATION AND FILL

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies earthwork which consists of but not limited to the following:
      a. Excavation
      b. Filling/backfilling
      c. Pipe bedding
      d. Flowable fill
      e. Aggregate basecourses
      f. Grading
      g. Disposal of excess material.

B. Definitions:
   1. Compaction: The degree of compaction is specified as percent compaction. Maximum or relative densities refer to dry soil densities obtainable at optimum moisture content.
   2. Excavation Slope: Excavation slope shall be defined as an inclined surface formed by removing material from below existing grade.
   3. Embankment Slope: Embankment slope shall be defined as an inclined surface formed by placement of material above existing grade.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, whether or not the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM C136	Standard Method for Sieve Analysis of Fine and Coarse Aggregates
ASTM D1556	Test Method for Density of Soil in Place by the Sand-Cone Method
ASTM D1557	Test Methods for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-lb (4.5-kg) Rammer and 18-in. (457-mm) Drop
ASTM D3017	Test Method for Moisture Content of Soil and Soil- Aggregate in Place by Nuclear Methods (Shallow Depth)
2017 APWA	Manual of Standard Specifications and Plans

B. Tests:
   1. The Construction Manager will take samples and perform moisture content, gradation, compaction, and density tests during placement of backfill materials to check compliance with these specifications. The Contractor shall remove surface material at locations designated by the Construction Manager and provide such assistance as necessary for sampling and testing. The Construction Manager may direct the Contractor to construct inspection trenches in compacted or consolidated backfill to determine that the Contractor has complied with these specifications. Payment for inspection trenches shall be as specified in the General Conditions of the Contract Documents_.
   2. Tests will be made by the Construction Manager in accordance with the following:

Test	Standard Procedure
Moisture content	ASTM D3017
Gradation	ASTM C136
Density in-place	ASTM D1556
Moisture-density relationships	ASTM D1557

1.03 SUBMITTALS

A. Procedures: Section 01 33 00, Submittal Procedures.

B. Samples of fill materials to be used shall be submitted 2 weeks in advance of use.

C. Submit a description and location of proposed sources of imported material.

D. Submit samples of all materials proposed to be used in the Work to demonstrate material conformance with these Specifications. Samples shall consist of 0.5 cubic feet of each type of material.

E. Test for conformance and submit certification and test records of all materials showing that they meet the applicable requirements. Obtain favorable review of test and certification submittals prior to commencing placement of the materials for the Work.

F. Product technical data including:
   1. Acknowledgement that products submitted meet requirements of standards referenced.
   2. Certified test results: Including, but not limited to gradation analysis, moisture density relationships, and in-place density test result reports on all materials tested.

3. Provide excavation support system submittal information in accordance with the following:
    a. Methods and sequencing of trench excavations.
    b. Proposed locations of stockpiled excavation and backfill material.
    c. Number, types, and sizes of equipment proposed to perform excavations.

1.04 SITE CONDITIONS

A. Avoid overloading excavation walls. Keep equipment and surcharge a sufficient distance back from edge of excavation to prevent slides or caving.

B. Maintain and trim excavated materials in such manner to be as little inconvenience as possible to public and plant operations.

C. Protect and maintain benchmarks, monuments or other established points and reference points and if disturbed or destroyed, replace items to full satisfaction of Owner and controlling agency.

D. Verify location of existing underground utilities and comply with the rules of the Blue Stakes of Utah 811. Contractor shall provide a potholing plan to the Engineer.

E. Rock removal shall be performed in accordance with 2017 APWA Section 31 23 17, if applicable. Rock removal shall be limited to non-explosive methods. Rock removal shall be coordinated with the approval of the Engineer.

PART 2 PRODUCTS

2.01 FILL MATERIALS

A. Type A: Sand
    1. Type A material shall be a clean gravel-sand mixture free from organic matter and shall conform to the following gradation:

U.S. standard sieve size	Percent by weight passing
3/4 inch	100
3/8 inch	70-100
No. 4	55-100
No. 10	35-95
No. 20	20-80
No. 40	0-55
No. 100	0-2

B. Type B: 3” Minus
    1. Type B material shall be a select granular material free from organic matter and of such size and gradation that the specified compaction can be readily attained. Material shall conform to the following gradation:

U.S. standard sieve size	Percent by weight passing
3 inch	100
No. 4	35-100
No. 30	20-100

2. The coefficient of uniformity shall be 3 or greater.
3. The material may be an imported quarry waste, clean natural sand or gravel, select trench excavation or a mixture thereof.

C. Type C: Native
1. Type C material shall be unclassified material which is free from peat, wood, roots, bark, debris, garbage, rubbish or other extraneous material. The maximum size of stone shall not exceed 6 inches. If the material excavated from the site meets these requirements, it may be classified as Type C.

D. Type D: Pea Gravel
1. Type D material shall be granular material commonly known as pea gravel and shall conform to the following gradation:

U.S. standard sieve size	Percent by weight passing
1/4 inch	100
No. 8	0-5

E. Type E: 1-1/2" Drain Rock
1. Type E material shall be crushed rock commonly known as drain rock and shall conform to the following gradation:

U.S. standard sieve size	Percent by weight passing
1-1/2 inch	100
3/4 inch	30-75
1/2 inch	15-55
1/4 inch	0-5

2. Type E material shall be composed of hard, durable, sound pieces having a specific gravity of not less than 2.65

F. Type F: Road Base and/or ¾" Minus
1. Type F material shall be crushed rock and shall conform to the following gradation:

U.S. standard sieve size	Percent by weight passing
1-1/2 inch	87-100
3/4 inch	45-90
No. 4	20-50
No. 30	6-29
No. 200	0-12

2. Type F material shall be composed of hard, durable, sound pieces having a specific gravity of not less than 2.65.

G. Type G: Pervious Backfill

1. Type G material shall be pervious backfill. Pervious backfill material shall conform to the following gradation:

U.S. standard sieve size	Percent by weight passing
3/8 inch	100
1/4-inch	50-100
1/8-inch	0-10
No. 200	0-2

H. Type H: 6" Riprap

1. Type H material shall be 6-inch riprap. Riprap shall be graded rock having a range of individual rock weights as follows:

Weight of stone	Percent smaller by weight
10 pounds	100
5 pounds	80-100
2 pounds	45-80
1 pound	15-45
1/2 pound	5-15
Below 1/2 pound	0-5

2. Specific gravity shall be between 2.5 and 2.82.

I. Type I: 12" Riprap

1. Type I material shall be 12-inch riprap. Riprap shall be graded rock having a range of individual rock weights as follows:

Weight of stone	Percent smaller by weight
160 pounds	100
100 pounds	80-100
50 pounds	45-80
20 pounds	15-45
5 pounds	5-15
1 pound	0-5

2. Specific gravity shall be between 2.5 and 2.82.

J. Type J:

1. Type J material shall be unclassified material and may be obtained from excavation on site. The material may contain extraneous material such as demolition waste, unsuitable material excavated from beneath structures, and clearing and grubbing debris up to 50 percent by volume. Extraneous material shall be thoroughly mixed and the maximum size of organic particles shall be 6 inches.

K. Type K: CLSM

1. Type K material shall be flowable fill (Controlled Low Strength Material, or CLSM)
2. CLSM shall consist of a mixture of Portland cement, aggregate, fly ash, water, and admixtures conforming to the following:

a. Portland Cement: ASTM C 150, Type II.
b. Aggregate: Concrete sand, or processed material from the excavations meeting the requirements of sand as herein specified. Aggregate size shall be maximum 3/8 inch and meet the requirements of ASTM C 33 for fine aggregate. The soluble sulfate content shall not exceed 0.3 percent by dry weight.
c. Water: Potable quality.
d. Fly Ash: Class F per ASTM C 618.
e. The minus 200 sieve fraction shall be non-plastic.

3. CLSM shall be flowable, non-segregating, self–consolidating and non-shrink
4. The unconfined compressive strength at 28 days shall be a minimum of 50 and a maximum of 150 psi per ASTM D 4832. For bidding, assume 100 pounds of cement and 100 pounds of fly ash per cubic yard of CLSM.
5. Sample CLSM at least once a day, four cylinders each time. Perform two cylinder breaks per four-cylinder sample at 7 days, the same as for concrete. Do not move cylinders for 72 hours after making.
6. The temperature of the CLSM discharged into the trench shall be below 70 degrees and above 45 degrees Fahrenheit.
7. The aggregate, cement, and water shall be proportioned either by weight or volume. The water content shall be sufficient to produce a fluid, workable mix that will flow and can be pumped without segregation of the aggregate while being placed. Prepare CLSM in accordance with ASTM C 94.
8. Water content shall match trial batch content. Do not add water after batching.

2.02 WATER FOR COMPACTION:

A. Water shall be free of organic materials, a pH of 7.0 to 9.0, a max chloride concentration of 200 mg/L, and a max sulfate concentration of 500 mg/L. Provide all work needed to transport water for earthwork including piping, valves, pumps and trucks, to convey water to the point of use.

PART 3 EXECUTION

3.01 GENERAL

A. Control of Water:
1. Construction dewatering for excavations shall be in accordance with the requirements of Section 31 23 19.
2. Maintain berms, sandbags, or other devices deemed appropriate by Engineer to divert or control surface runoff.
3. In no case shall runoff or construction water be allowed to enter the Creek.

3.02 SITE EXCAVATION

A. Overexcavation:
1. Where the undisturbed condition of natural soils is inadequate for support of the planned construction, the Construction Manager will direct the Contractor to overexcavate to adequate supporting soils. The excavated space shall be filled to the

specified elevation with backfill. The quantity and placement of such material will be paid for as extra work.

B. Surplus Material:
   1. Unless otherwise specified by the Owner, surplus excavated material shall be disposed of off site in accordance with applicable ordinances and environmental requirements.
   2. Material shall not be stockpiled to a depth greater than 5 feet above finished grade within 25 feet of any excavation or structure except for those areas designated to be preconsolidated. For these areas, the depth of stockpiled material shall be as specified. The Contractor shall maintain stability of the soil adjacent to any excavation.

C. Borrow Material:

   If the quantity of acceptable material from excavation is not sufficient to construct the work, the quantity of material needed to complete the work shall consist of imported borrow conforming to specified requirements.

D. Hauling:
   1. When hauling is done over highways or city streets, the loads shall be trimmed and the vehicle shelf areas shall be cleaned after each loading. The loads shall be watered after trimming to eliminate dust.

E. Haul Roads:
   1. The Contractor shall construct haul roads required to transport materials on site. Alignment of haul roads shall be selected to avoid interference with plant operations. Haul roads shall be removed after completion of embankment construction.

F. Finish Grading:
   1. Finished surfaces shall be smooth, compacted, and free from irregularities. The degree of finish shall be that normally obtainable with a blade-grader.
   2. Finished grade shall be as specified by the contours plus or minus 0.10 foot except where a local change in elevation is required to match sidewalks, curbs, manholes and catch basins, or to ensure proper drainage. Allowance for topsoil and grass cover, or subbase and pavement thickness shall be made so that the specified thickness of topsoil or pavement section can be applied to attain the finished grade.
   3. When the work is an intermediate stage of completion, the lines and grades shall be as specified plus or minus 0.5 foot to provide adequate drainage.
   4. Protection of Finish Grade:
      a. During construction, shape and drain excavations.
      b. Maintain ditches and drains to provide drainage at all times.
      c. Protect graded areas against action of elements prior to acceptance of work.
      d. Reestablish grade where settlement or erosion occurs.

G. Control Of Erosion:
   1. The Contractor shall maintain earthwork surfaces true and smooth and protected from erosion. Where erosion occurs, the Contractor shall provide fill or shall excavate

as necessary to return earthwork surfaces to the grade and finish specified. Surfaces shall be maintained to divert runoff away from the Creek.

3.03 PROTECTION

1. Protect existing surface and subsurface features on-site and adjacent to site. Provide barricades, coverings, or other types of protection necessary to prevent damage to existing items indicated to remain in place.
2. Protect existing utilities from damage or disturbance. Immediately notify utility whose facilities have been damage or disturbed. At the utility owner's option, repair damaged utilities or compensate utility owner for completing the repairs.

3.04 CLASSIFICATION OF FILL

A. Fill material shall be placed in horizontal layers and compacted with power-operated tampers, rollers, idlers, or vibratory equipment. Material type, maximum layer depth, relative compaction, and general application are specified in Table A. Unless otherwise specified, fill classes shall be used where specified in Table A under general application.

Table A, Fill Classifications

Fill class	Material type	Maximum uncompressed layer depth, inches	Minimum relative compaction, percent	General application
A1	A	8	95	Bedding for pipe, initial pipeline backfill; slabs on grade (other than specified for Class E1)
A2	A	48	95	Initial and subsequent pipeline backfill when ponded or jetted
B1	B	8	95	Structure and subsequent pipeline backfill
B2	B	8	90	Site fill
C1	C	8	90-95	Subsequent pipeline backfill; compaction as specified
C2	C	8	90	Site fill, embankments and dikes
D1	D	-	95	Bedding for tanks and pipe, initial and subsequent tank and pipeline backfill
E1	E	8	-	Site Laydown and road widening areas, Trench Foundation, Fill under slabs for structures and tank slabs with pressure relief valves. Drainage Swales and Ditches
F1	F	12	95	Structure backfill, pipeline bedding, initial and subsequent pipeline backfill
G1	G	8	95	Bedding for plastic pipe, initial and subsequent pipeline backfill
H1	H	-	-	Embankment slope face, channel slope face
I1	I	-	-	Embankment slope face, channel slope face
J1	J	8	90	Excess fill
K1	K	-	-	Substitute fill for unsuitable soils or areas where there is less than 12" of clearance between utilities.

3.05 A. EARTHWORK FOR STRUCTURES

A. Structure Excavation:

1. The bottom shall not be more than 0.15 foot above or below the lines and grades specified. If the elevation of structure excavation is not specified, the excavation shall be not more than 0.15 foot above or below the elevation specified for fill material below the structure. Slopes shall vary no more than 0.5 foot from specified grade unless the excavation is in rock where the maximum variation shall be 2 feet.
2. Should the excavation be carried below the lines and grades specified on the drawings or should the bottom of the excavation be disturbed because of the Contractor's operations and require overexcavation and backfill, the Contractor shall refill such excavated space to the proper elevation in accordance with the procedure specified for backfill. The cost of such work shall be borne by the Contractor.
3. Unless otherwise specified, excavations shall extend a sufficient distance from walls and footings to allow for placing and removal of forms, installation of services, and for inspection, except where concrete is specified to be placed directly against excavated surfaces.

B. Foundation Treatment:

1. Rock foundations for concrete or masonry footings shall be excavated to sound material. The rock shall be roughly leveled or cut to steps and shall be roughened. Seams in the rock shall be grouted under pressure as directed by the Construction Manager and paid for as extra work.
2. When footings are to be supported on piles, excavations shall be completed to the bottom of the footings before any piles are drilled or driven therein. When swell or subsidence results from driving piles, the Contractor shall excavate, or backfill the footing area to the grade of the bottom of the footing with suitable material as specified. If material under footings is such that it would mix into the concrete during footing placement or would not support the weight of the fluid concrete, the Contractor shall replace the material with suitable material, install soffit forms or otherwise provide a suitable platform on which to cast the footing as directed by the Construction Manager. This shall be paid for as extra work.
3. Whenever any structure excavation is substantially completed to grade, the Contractor shall notify the Construction Manager who will make an inspection of the subgrade. Subgrade treatment shall not commence until subgrade has been approved by the Construction Manager.
4. No concrete or masonry shall be placed until the foundation contact has been inspected by the Construction Manager. The Contractor shall, if directed by the Construction Manager, dig test pits and make test borings and foundation bearing tests. If the material tested is undisturbed soil, the cost thereof will be paid for as extra work. If the material tested is backfill material, the cost thereof will be paid as specified in the General Conditions of the Contract Documents.

C. Subgrade Treatment:

1. One foot of Type E material shall be placed above all native materials. A layer of geotextile fabric (Mirafi 270 or equal) shall be placed between the native material and the Type E material.
2. A layer of geotextile fabric (Mirafi 270 or equal) shall be placed between other materials that could migrate into the Type E material.

3. Whenever any structure excavation is substantially completed to grade, the Contractor shall notify the Construction Manager who will make an inspection of the subgrade. Subgrade treatment shall not commence until subgrade has been approved by the Construction Manager.
4. No concrete or masonry shall be placed until the foundation contact has been inspected by the Construction Manager. The Contractor shall, if directed by the Construction Manager, dig test pits and make test borings and foundation bearing tests. If the material tested is undisturbed soil, the cost thereof will be paid for as extra work. If the material tested is backfill material, the cost thereof will be paid as specified in the General Conditions of the Contract Documents.

D. Structure Backfill:
1. Unless otherwise specified, structure backfill shall be Class B1.
2. After completion of construction below the elevation of the final grade, and prior to backfilling, forms shall be removed and the excavation shall be cleaned of debris.
3. Structure backfill shall not be placed until the subgrade portions of the structure have been inspected by the Construction Manager. No backfill material shall be deposited against concrete structures until the concrete has developed a strength of not less than 75 percent of the minimum 28-day compressive strength.
4. Do not operate earthmoving equipment within 5 feet of any concrete structure. Structural backfill shall not be placed until the concrete has developed to at least 75 percent of the minimum 28-day compressive strength, and in all cases not less than 24 hours after the last pour.
5. Place structural backfill material around structures, channels, vaults, manholes, and other structures to the lines and grades shown or specified. If hand compaction equipment is used, limit loose lift depths to 6-inches or less.
6. Place and compact fill or backfill adjacent to concrete structures using hand-operated tampers, roller wheels, or other equipment that shall not damage structure
7. Compact each lift as hereinafter specified. Stop structural backfill at least 6 inches below finished grade in areas where topsoil is to be replaced.
8. Backfill material shall be placed in uniform layers and shall be brought up uniformly on all sides of the structure.
9. Compaction of structure backfill shall not be performed by ponding and jetting.
10. Unless otherwise specified, backfill around and above pipelines within the excavation line of any structure shall be the same as that specified for structures.

3.06 EARTHWORK FOR PIPELINES AND CONDUITS

A. Earthwork for Pipelines and Conduits shall be performed in accordance with Section 31 21 33 Trenching, Backfilling, and Compacting for Utilities.

B. Materials:
1. Trench Foundation:
a. Flowable fill (CLSM) where shown on the drawings..
b. Fill Class F1 unless otherwise specified.
2. Pipe Bedding and Pipe Zone:
a. Provide concrete encasement for all piping and conduits located below structures as indicated in the Drawings.

b. Flowable fill (CLSM) where shown on the drawings. Use flowable fill to backfill the space above the excavated subgrade and the bottom of pipe zone. Also use flowable fill to backfill the pipe zone of piping where vertical separation between other piping is less than 12 inches.
c. General Piping: Fill Class A1
d. Plastic piping less than 2-inches in diameter and direct buried electrical or control conduits: Fill Class G1
e. Perimeter drain pipe: Drain sand.

3. Trench Zone:
   a. Flowable fill (CLSM) where shown on the drawings.
   b. Beneath AC paved roads and road shoulders: Fill Class F1
   c. Other Locations: Native material excavated from the project trenches which is free from organic matter, nested cobbles 3-inches or larger, or other deleterious matter and meeting the requirements for earth fill as specified.
      1) If Contractor cannot achieve the required trench zone compaction with the native material excavated from the project trenches, then Contractor shall use an imported material, or another material acceptable to the Construction Manager.
4. Final Backfill:
   a. Beneath AC paved roads and road shoulders: Fill Class F1
   b. Other Locations: Six (6) inches of topsoil

3.07 PLACING AND COMPACTING FILL

A. Remove form materials and trash from excavation before placing fill material. Remove uncompacted fill, loose and disturbed soils until firm soils or formational material are exposed. Removed materials may be used as compacted fill if they meet specifications.

B. Under earth fills, scarify the exposed surface to a depth of 6 inches, moisture condition to within 2 percent of optimum moisture content, and compact to at least 95 percent relative compaction.

C. Obtain Construction Manager inspection and authorization to begin backfill on the exposed surface before starting placement of fill.

D. Add water to the backfill material or dry the material, as necessary, to obtain a moisture content within 2 percent of optimum. Obtain a uniform moisture content throughout the material of each layer being compacted.

E. If the backfill material is saturated from groundwater, rains or any other source, remove and replace the unsatisfactory material with suitable material compacted to the specified density. No additional payment will be made for removal and replacement of unsatisfactory material.

F. Where earth fills are to be constructed on slopes steeper than 5:1, excavate an equipment width keyway beneath the toe at the base of the fill. The keyway will have a minimum width of 10 feet and slope at least 2 percent into the slope. Continue benching into competent material as the fill progresses up slope. All benching shall be inspected and authorized by the Construction Manager before fill placement begins.

G. Place all fills in 6- to 8-inch lifts, brought to within 2 percent of optimum moisture content, and compacted to 90 percent relative compaction (except as specified under "Trench Backfill and Compaction". Do not place rocks larger than 6 inches in maximum dimension in the fills.

H. Provide special attention to compaction along the top and outer edge of the earth fill slopes during construction. Backroll fill slopes after each fill lift is completed. Perform additional rolling and trimming as may be required at the finish of the slope construction to correct local surficial slumping

3.08 SUBGRADE FOR PAVEMENT

A. The prepared subgrade shall be scarified to a depth of at least 12 inches and recompacted to at least 95 percent of the maximum density based on ASTM D 1557.

B. Contractor shall use Class F1 unless specified in the drawings.

3.09 SITE FILL

A. Unless otherwise specified, site fill shall be Class C2 fill. If the existing slope in an area to be filled is greater than 5:1, the Contractor shall bench the area prior to filling.

3.10 GROUTING RIPRAP

A. When riprap is properly positioned, stones shall be flushed with water to remove fines sweep. After Contractor shall sweep sand or fine gravel into the interstices to fill to within four (4) inches of the outer surface of the riprap.

B. Fill the remaining volume of the interstices flush with a well-mixed grout. Grout shall be applied in two courses using baffles and diverting equipment. The first course shall completely penetrate the stone voids and shall be applied with the aid of poles or rods to loosen the tight pockets of stone. The second course shall be applied as soon as the first course has jelled. The second course shall be broomed uphill during application, and the entire surface shall be rebroomed to eliminate runs and fill voids.

C. Keep grout wet by sprinkling or covering with wet material for at least three (3) days. Protect grout from stream water or any other disturbance during this cure period.

D. Do no place grout in freezing weather.

E. After grouting is complete, no load shall be permitted on the grouted surface for 24 hours. The grouted surface shall be protected from damage until curing is complete.

3.11 COLD WEATHER LIMITATIONS IN PLACING FILL AND BACKFILL

A. Unless allowed in the authorized Cold Weather Construction Plan, earth fills and backfills shall not be placed when either atmospheric temperature, or the temperature of the existing ground or the fill being placed, are below 35 degrees Fahrenheit unless both the existing ground and the fill being placed are both non-frost susceptible materials.

B. Do not place any fill or backfill materials on subgrade which contains frozen moisture (snow, ice, sleet, etc.), frozen earthen materials, or earthen materials which have been

deposited in the excavation due to freezing, thawing, precipitation, or other inappropriate means.

C. Do not place fill materials which contain frozen moisture (snow, ice, sleet, etc.).

D. Work performed outside the required temperature limitations is subject to rejection, removal and replacement.

3.12 STOCKPILE LIMITATIONS AND DISPOSAL OF EXCAVATED MATERIAL

A. Confine stockpiles to the areas designated in the Contract Drawings.

B. Prevent dust from damaging homes, businesses, public and private facilities, crops, cultivated fields, and other improvements, or causing a nuisance to persons. Perform dust control for the duration of the project.

C. Legally dispose of all excavated materials unsuitable for backfill, and other unused excavated materials. Excavated materials suitable for backfill may temporarily be stored at the site so-as not to interfere with public traffic or concurrent work or to mix with other stockpiled material.

D. Notify the Construction Manager immediately if contaminated soils are found on the project.

E. Provide adequate facilities for drainage of water from stockpiled excavated material and adequate facilities for handling of storm drainage from storage and other areas. Do not allow runoff water to enter the Creek.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 31 23 19

DEWATERING

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies the requirements for the installation, maintenance, operation, and removal of dewatering systems, and all Work necessary to control, handle, satisfactorily treat, if required, and dispose of groundwater and surface water, and all other water including construction-generated water that may be encountered, as required for performance of the Work.

B. Dewatering of trenches and other excavations will not be measured and paid for separately but will be considered as incidental to performance of the Work.

1.02 DEFINITIONS

A. Construction-Generated Wastewater: Groundwater, surface water, precipitation, water generated from maintenance or cleaning of equipment, and all other water collected in dewatering systems associated with the Work.

1.03 REFERENCES

A. Referenced Standards: This Section incorporates by reference the latest revision of the following documents. These references are a part of this Section as specified and modified. In case of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.

1. Environmental Protection Agency (EPA):
   a. 40 *Code of Federal Regulations* (CFR) 136 - Guidelines Establishing Test Procedures for the Analysis of Pollutants
   b. 40 CFR 261 - Identification and Listing of Hazardous Waste
   c. 40 CFR 403 - General Pretreatment Regulations for Existing and New Sources of Pollution
2. Utah Administrative Code and Utah Department of Environmental Quality, Division of Water Quality
3. Utah Department of Environmental Quality Best Management Practices

1.04 QUALIFICATIONS:

A. Sumping systems within the trench may be designed by the Contractor or the Contractor's dewatering system designer.

B. For external dewatering systems such as wellpoints or extraction wells, the system(s) designer shall be a Registered Geologist, Certified Engineering Geologist, or professional engineer registered in the State of Utah, having a minimum of five (5) years of dewatering experience similar in type and scope. The exception is for an experienced, professional hydrogeologist with at least ten (10) years' experience designing similar

external dewatering systems. The designer shall have experience dewatering systems similar in type and scope.

1.05 SUBMITTALS

A. Procedures: Section 01 33 00, Submittal Procedures.

B. Groundwater Control Plan (GWCP) to include:

1. Submit the plan to the Construction Manager at least 15 working days before beginning work.
2. The plan shall include a narrative of the type of dewatering system or systems proposed with a discussion of how the system may be modified or augmented in order to handle more flow or increase drawdown of the water table. Show the pump types and sizes selected, header surface piping layout, primary and backup power systems, details of discharge piping if crossing roads including methods of protecting the pipe and traffic and other related information.
3. The plan shall show the proposed route of the discharge pipeline compatible with the Contractor's work plan, and the discharge point. The proposed route shall be approved by the Owner.
4. The plan shall also contain a narrative description of the installation sequence and methods as well as operation and maintenance procedures and observation of groundwater levels.
5. The plan shall also include a narrative description that describes the procedure and timing of decommissioning the dewatering system including final abandonment of groundwater control wells and groundwater observation wells.
6. Include drawings and complete design analytical methods for the external and internal trench systems, including system equipment and installation and abandonment (with identified licensed well driller) and observation well typical materials such as screens, riser pipe, filters/and sand packs, and installation.
7. The plan shall also include details on collected water treatment facilities as needed and methods to dispose of the collected water.

C. Product Data:

1. Manufacturer's catalogs for proposed equipment detailing the basis of operation, operating and maintenance instructions and manuals, product descriptions, and ratings in terms of size and capacity.
2. Manufacturer catalogs for proposed materials, and supplies identifying their type, description, and properties.
3. Calibration documentation for flow meters.

D. Contractor shall be responsible to identify and secure permits required. Contractor shall obtain and submit a groundwater discharge permit from Utah Division of Environmental Quality (UDEQ) prior to any groundwater discharge.

1. CONTRACTOR is responsible for obtaining said permit from the UDEQ and performing any sampling and laboratory analyses required as part of permit compliance.
2. Submit all correspondence and permits with the Utah Department of Environmental Quality regarding dewatering operations, including but not limited to the authorization to drill, well driller's license, and completion report.

E. Dewatering system designer qualifications. Include a list of past groundwater control projects during the past five (5) years showing date of work, location, project name and Owner, and type of groundwater control system(s) used.

F. Drilling logs and well diagrams:

1. Submit drilling logs that include the following:
   a. Drilling method(s).
   b. Location numbering.
   c. Surface elevation.
   d. Drilling conditions.
   e. Soil descriptions.
   f. Groundwater conditions.
   g. Borehole depth.
2. Provide descriptions of filter pack material to be used in pumped groundwater control wells and groundwater observation wells that include manufacturer's or supplier's statement that material is free of clay, silt, dirt, organic or other foreign matter.

G. Groundwater control and groundwater observation well decommissioning documentation.

H. Evidence of State of Utah license for well driller responsible for installation and abandonment of wells, well points, and observation wells.

1.06 SITE CONDITIONS

A. Methods of dewatering will be determined by the Contractor.

B. Locate dewatering facilities where they shall not interfere with utilities and construction work to be performed by others.

C. Modify dewatering procedures which cause, or threaten to cause, damage to new or existing facilities, so as to prevent further damage. Control the rate of dewatering to avoid all objectionable settlement and subsidence.

D. Where critical structures or facilities exist immediately adjacent to areas of proposed dewatering, reference points shall be established and observed at daily intervals by a Professional Land Surveyor of the State of Utah to detect settlement that may develop.

1. Conduct dewatering operation in a manner that will protect adjacent structures and facilities.
2. Repair damage to adjacent structures and restore facilities at no expense to OWNER.
3. Submit initial and weekly test results.

E. Comply with all applicable requirements and provisions of local, federal and/or state laws or regulations. Obtain authorization, as required, prior to discharge of groundwater, and comply with the sampling, testing, monitoring, and reporting requirements specified therein.

1.07 DESIGN CRITERIA

A. General:

1. Design surface drainage to intercept and divert away from the Work site and in accordance with Section 31 23 00, Earthwork.
2. Design facilities to adequately collect, handle, and treat flows, and to discharge water of the minimum quality required by local, State, and Federal regulations and applicable permits.
3. Dewatering activities shall be in compliance with the requirements of the Utah Administrative Code and Utah Department of Environmental Quality, Division of Water Quality.
4. Handle and dispose of water in such manner as shall not damage property or create nuisance or safety concerns.
5. Dispose of water from site at such rates that do not exceed capacity of the receiving systems.

B. Other Discharge Requirements:

1. Do not discharge waters exhibiting visible oil, grease, trash and/or other hazardous substances.
2. Prevent odors, vectors, and other nuisances of waste origin beyond Work limits.

PART 2 PRODUCTS

2.01 MATERIALS

A. Furnish and maintain all materials, tools, equipment, facilities, and services as required for providing the necessary dewatering Work and facilities.

PART 3 EXECUTION

3.01 DEWATERING

A. Dewatering systems shall be installed to collect, treat, and dispose of all surface water, perched water, water migrating along existing buried utilities, and groundwater that enters excavations, trenches, or other parts of the Work.

B. Contractor shall assume complete responsibility for prevention of damage to the existing facilities from potential settlement caused by the dewatering operation. The Contractor shall assume full responsibility for mitigation of these damages at no additional costs to the Owner.

C. All excavations shall be kept free from water and all construction shall be in the dry.

1. It should be presumed that the presence of groundwater will require dewatering operations. A well point system or other acceptable dewatering method may be required in certain locations. Furnish, install, maintain, and operate all necessary pumping and other equipment for dewatering all excavations. At all times have on the project sufficient pumping equipment for immediate use, including standby pumps for use in case other pumps become inoperable.

2. Provide a sufficient number of pumps so as to hold the groundwater level at an elevation of not less than 1 foot below the lowest elevation of the trench, excavation, material to be placed.
3. Dewatering operations shall start and continue sufficiently in advance of the excavation to ensure that all water in the soil above and to the side of the excavation is free of water and that the hydrostatic pore pressure has been relieved.
4. Dispose of water in such a manner as to cause no injury or nuisance to public or private property or be a menace to the public health.
5. The dewatering operation shall be continuous, so that the excavated areas shall be kept free from water during construction, while concrete is setting and achieves full strength, and until backfill has been placed to a sufficient height to anchor the Work against possible flotation.
6. Continue dewatering during backfilling operations such that the groundwater is at least 1 foot below the level of the compaction effort at all times. No compaction of saturated materials will be allowed.
7. Dewatering devices must be adequately filtered to prevent the removal of fines from the soil.
8. The Contractor shall be responsible for any damage to the foundations or any other parts of existing structures or of the new Work caused by failure of any part of the Contractor's protective works. After temporary protective works are no longer needed for dewatering purposes, they shall be removed by the Contractor.
9. If pumping is required on a 24-hour basis, requiring engine drives, then engines shall be equipped in a manner to keep noise to a minimum and below the noise level requirements of applicable permits.
10. Prevent disposal of sediments from the soils to adjacent lands or waterways by employing whatever methods are necessary, including settling basins. Refer to 01 57 23 Temporary Storm Water Pollution Control.

D. Promptly remove and dispose of all excess water entering the trench from the time the trench is being prepared for the pipe laying and until the backfill at the pipe zone has been completed. Dispose of the water in an approved manner without damage to adjacent property.

E. Control groundwater to prevent softening of the bottom of excavations or formation of "quick" conditions or "boils." Design and operate dewatering systems to prevent migration or removal of the natural soils and so that the groundwater level outside the excavation is not reduced to the extent that would damage or endanger adjacent structures or property.

F. When dewatering near a river, lake, or stream, conform to the requirements of applicable permits. When the presence of water or other conditions in the excavated area would be detrimental to the purpose of the Work, obtain approval of the Construction Manager for the temporary measures required to correct or care for the condition.

G. If water or other conditions encountered require permanent correction or care not anticipated by the Contract and not due to the Contractor's neglect or method of operation, immediately notify the Construction Manager.

H. At all times have on hand sufficient pumping equipment and machinery in good working condition for all ordinary emergencies, including power outages. Have available at all times competent workmen for operation of the pumping equipment. Control surface runoff to prevent entry or collection of water in excavations. Keep all excavations free of water when concrete is being deposited or during placement of backfill.

I. Release ground water to its static level in such a manner as to maintain the undisturbed state of natural foundation soils. Prevent disturbance of compacted backfill and flotation or movement of structures, water mains, sewers, and other utilities.

3.02 DISCHARGE OF CONSTRUCTION GENERATED WASTEWATER

A. Manage discharge of construction-generated wastewater into a public sewer, public sump, or body of surface water as required by Construction Manager and/or permitting agency/agencies. Plans shall cover all Work necessary to design, permit, provide, operate, maintain, monitor, restore and remove all machinery, appliances and equipment required to perform this Work.

B. Discharge Permit

1. Apply for and obtain a wastewater Discharge Permit(s) from the regulating agencies before discharging any wastewater into a public sewer, public sump, or body of surface water. Do not begin discharge until the appropriate permitting agency/agencies has reviewed the Discharge Permit application and has issued written authorization to proceed including any specific conditions that apply. All applications shall include a copy of the proposed GWCP and, if applicable, a copy of the project environmental site assessment.
2. The approved Discharge Permit may restrict discharge of wastewater to a quantity containing less than a specified maximum daily load for a distinct set of parameters such as Total Dissolved Solids (TDS) or Total Suspended Solids (TSS). Any specified daily load limits will apply to the project as a whole and not to individual discharge location(s) unless otherwise specified. Limits specified by the Discharge Permit will be determined based on likely site pollutants and/or pollutants of concern for the receiving system. Design, operate, and maintain a containment and discharge system to control the flow rate, solids, or other pollutants in accordance with limitations specified by the applicable Discharge Permit.

C. Groundwater Control Plan Modifications

1. Upon discovery or receipt of notice that any discharge exceeds GWCP limitations, immediately stop all discharge, modify the process described in the GWCP and submit a GWCP modification proposal for review.
2. If breakdown, accident, acts of nature, or any other condition cause the release of any pollutant, excessive solids load or wastewater volume, take the following actions:
   a. Immediately take action to stop, contain, and correct the problem.
   b. Immediately notify the Construction Manager.
   c. Within five (5) calendar days after such a noncompliance event, submit a detailed written report describing the breakdown, the actual quantity of resultant wastewater discharged, the corrective action taken, the steps taken to prevent

recurrence, proposed GWCP modifications, if necessary, and any other pertinent information.

d. Implement all approved corrective measures and retest the discharge system before restarting any operations. The Construction Manager will observe all retesting and review the system for use. If necessary, modify discharge operations during unusually severe weather conditions or as directed.

D. Design and Construction

1. Design and select materials and equipment for implementing the GWCP in a manner that will yield compliance with the Discharge Permit. Incorporate equipment and/or procedures to record total daily discharges.
2. Install properly sized totalizing flow meters on all pumps to accurately log the total daily discharge volume. Do not install flow meters closer than four feet from any bend in the pump discharge line.
3. As an alternative, record the total number and volume of all storage tanks filled throughout a workday. Calculate average flow rate by recording the time, in minutes, to empty each tank after it has been filled and the contents have been sampled. Make sure there is adequate number of storage facilities on site to assure that none of the wastewater is directly discharged without being held for sampling.
4. Install and maintain fittings for sampling purposes in all of the discharge line(s). Locate fittings downstream of storage facilities but upstream from the approved disposal locations(s). Fittings shall be fully accessible and provide the Construction Manager opportunity to safely obtain one-liter samples of wastewater. Detail sampling locations in the GWCP.

E. Operation

1. Give one (1) working days notice before initiating discharge operations. Record daily total amount of wastewater discharged at all location(s). Submit a weekly report to the Construction Manager summarizing discharge rates and volumes at each location(s) for the previous seven calendar days.
2. From time to time, the Construction Manager will collect and analyze representative samples from all discharge location(s). Samples will be taken downstream from any storage or treatment facility. Sampling will continue throughout wastewater discharge. Samples will frequently be taken on random occasions and frequency will change without notice.
3. Provide the previous day total discharge at each sample location(s). The Construction Manager will report sample analyses to the Contractor within 72 hours after sample results are available. During this' time, do not modify the discharge method or its operation without approval.
4. Retain all records relating to the Discharge Permit for a minimum of three (3) years after Acceptance and Final Payment. Extend this retention throughout the course of any unresolved litigation pertaining to the discharge of pollutants, or when a regulatory authority (e.g., DEQ or EPA) requests this information.
5. Pretreat all wastewater containing solids or pollutant concentrations exceeding, the specified maximum Daily Load limit(s). Dispose of all wastewater in such manner as to prevent injury to public or private property or nuisance or menace to the public. Control the entry or collection of surface runoff to prevent contamination of discharged wastewater. Pipe all wastewater from the site to the approved discharge

point(s). Do not convey any wastewater in open ditches or trenches. Protect all pipe outlets to avoid damage at the discharge location.

F. Enforcement

1. The Discharge Permittee will be solely responsible for any civil penalties that may be assessed for any violation of the Discharge Permit or Discharge Authorization conditions.

3.03 SYSTEM PROTECTION

A. Take all reasonable and necessary precautions to provide continuous and successful system operation.

B. Clearly mark and protect all pumped groundwater control wells, header pipes, discharge lines, observation wells, and other system components to prevent damage from vehicles or equipment.

3.04 SYSTEM DECOMMISSIONING AND REMOVAL

A. The Contractor shall employ Utah State licensed well drillers for the abandonment of wellpoints, wells, observation wells and other dewatering facilities in accordance with applicable regulations. Contractor is responsible for the abandonment of all new installations done by the Contractor.

B. The Contractor shall not abandon or remove any wellpoints, wells, observation wells, piezometers, or other dewatering and groundwater control systems without prior written authorization of the Construction Manager, and shall provide Construction Manager minimum 24-hour notice prior to abandonment.

C. The Contractor shall submit written documentation of abandonment of all wellpoints, wells, observation wells, piezometers, or other similar penetrations below the ground surface including unique identification number, location coordinates, date and time of abandonment, the names of the Contractor's personnel performing the abandonment and the Construction Manager observing the abandonment.

D. Cost of abandonment shall be considered incidental to the Work or included in contractual unit prices as appropriate.

E. Continue dewatering during backfilling operations to meet requirements above and including no compaction of saturated materials above the trench foundation material or granular fill under structures.

F. Dispose of all surface water runoff and water removed by the dewatering system in an environmentally sound and legal manner that will not endanger health, property, or any portion of the Work. The discharge locations shall be identified in the Contractor's GWCP submittal.

G. Install groundwater monitoring wells as necessary.

H. Shut off dewatering system at a slow rate to prevent a quick upsurge of water that might weaken the subgrade.

END OF SECTION

SECTION 31 26 20

FILTER FABRIC

GENERAL

1.01 SUMMARY

A. Section includes: Nonwoven filter fabric.

PART 1

1.02 REFERENCES

A. ASTM International (ASTM):
   1. D 4491 - Standard Test Method for Water Permeability of Geotextiles by Permittivity.
   2. D 4632 - Standard Test Method for Grab Breaking Load and Elongation of Geotextiles.
   3. D 5261 - Standard Test Method for Measuring Mass per Unit Area of Geotextiles.

1.03 DEFINITIONS

A. Filter fabric: Nonwoven geotextile fabric manufactured from polypropylene fibers.

1.04 SUBMITTALS

A. Product data.

B. Samples.

C. Quality control submittals:
   1. Certificates of Compliance.
   2. Manufacturer's Instructions.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Storage and protection:
   1. Furnish filter fabric in protective covers capable of protecting the fabric from ultraviolet rays, abrasion, and water.

1.06 PROJECT CONDITIONS

PART 2

A. Take field measurements to determine the lengths and dimensions of the surfaces to receive the fabric.

PRODUCTS

A. Specified on design drawings

EXECUTION

3.01 EXAMINATION

A. Verification of conditions: Verify that conditions are satisfactory for the installation of filter fabric.

PART 3

3.02 PREPARATION

A. Surface preparation:

During grading operations, take care not to disturb the subgrade.

1. This may require use of lightweight dozers for low strength soils such as saturated, cohesionless, or low cohesion soils.

B. Prior to placement of fabric: Prepare surface to smooth condition free of debris, depressions, or obstructions that may damage the fabric.

3.03 INSTALLATION

A. Follow manufacturer's installation instructions and as complimented herein.

B. Place the filter fabric smoothly without folds or wrinkles.

C. Use special care when placing the filter in contact with the soil so that no void spaces occur between the filter and the prepared surface.

D. Overlap the parallel rolls and ends of rolls a minimum of 24 inches and not less than manufacturer's instructions.

E. Do not drag filter fabric across subgrade.

F. Make overlaps at ends of rolls in the direction of the aggregate placement with the previous roll on top.

G. Use lightweight dozers if necessary. Do not allow equipment directly on filter fabric.

H. Do not leave fabric uncovered for more than 5 days.

I. Use 18 inch long piins to secure the fabric during installation.

3.04 FIELD QUALITY CONTROL

A. Inspection:
   1. Before covering, the condition of the fabric will be observed by the CONSTRUCTION MANAGER to determine that no holes or rips exist in the fabric.
   2. Repair all holes and rips by placing a new layer of fabric extending beyond the defect in all directions a distance equal to the minimum overlap required for adjacent rolls.

END OF SECTION

SECTION 31 32 36

SOIL NAIL RETAINING WALLS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. Permanent soil nail retaining walls, including design.
2. Monitoring and control of deformations of the soil nail wall, surrounding ground, utilities, and other facilities existing at the time of construction.
3. Verification and proof tests including load schedules, acceptance criteria, frequency of tests, and testing equipment.

B. Design Requirements:

1. Design the soil nail walls according to guidance provided in FHWA GEC 7.
    a. Provide a minimum design life of 75 years for soil nail walls and all components. Include supporting data and calculations in the design submittal.
    b. Provide corrosion protection as shown for SBSNs.
    c. Provide sacrificial steel corrosion protection according to FHWA GEC 7 for HBSNs.
    d. Do not use HBSNs in aggressive soils.
    e. Use a soil nail length of at least 10 ft.
    f. Design soil nail walls to withstand seismic ground shaking.
2. Provide a structural facing thickness of at least 10 inches excluding architectural relief.
    a. Provide reinforcement in the structural facing consisting of at least No. 4 bars at 12-inch spacing in both directions.
        1) Supplement this minimum reinforcing with additional bars or with wire mesh as required by the design and construction methods.
3. Extend facing at the toe of the wall to at least 2 ft below the finished grade at front face of wall at all points.
4. Provide expansion joints and contraction joints at appropriate intervals for the wall design, according to FHWA GEC 7.
5. Locate the top row of nails within 2 ft of the top of the wall.
6. Arrange soil nails so that the distance between the lowest row of soil nails and the facing at the toe of the wall is less than two thirds of the vertical nail spacing.
7. Consider the locations of existing utilities or obstructions in the area of construction.
8. Provide backwall drainage through weep holes or to toe drain as designed by Contractor in addition to drainage features shown on Contract Documents.
    a. Transmit backwall drainage between every column of soil nails down the wall through geocomposite strip drains.
    b. Provide a weep hole for each geocomposite strip drain.
    c. Provide a positive connection from each strip drain to a toe drain (where used), using a compatible drain connection grate and pipe.
9. Include provisions to prevent water flow over the top surface of the walls.

10. Show the quantity and locations of verification tests to be performed, accounting for subsurface conditions and variability, wall geometry, and project phasing.
    a. Require the greater of at least two verification tests per wall or one verification test per every 200 feet of wall.
    b. Size verification test nails so that the maximum test load does not exceed 90 percent of the minimum yield strength for Grade 75 through 80 bars and 80 percent of the minimum ultimate tensile strength for Grade 150 bars.

1.02 REFERENCES

FHWA Geotechnical Engineering Circular No. 7	Soil Nail Walls Reference Manual, Report No. FHWA-NHI-14-007, February 2015 (FHWA GEC7)
OSHA	OSHA Safety Regulations (29 CFR, Part 1926, Subpart P Excavations)

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of the effective date of the Agreement. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 DEFINITIONS

A. Bird's Beak: The space above the bottom elevation of the inclined drill hole opening at the face of the wall after grout placement.

B. Hollow Bar Soil Nail (HBSN): Hollow core and self-drilling bar advanced into the soil by drilling with a sacrificial bit as grout is injected through the bar.

C. Solid Bar Soil Nail (SBSN): Solid threaded bar installed into a drilled hole and grouted from the beginning at the bottom of the hole using a grout tube or tremie pipe.

1.04 SUBMITTALS

A. Soil Nail Contractor Qualifications for review. Include at least the following:

1. Company name.
2. List of planned subcontractors for design and construction.
3. List of the following personnel and their experience with at least three permanently anchored or nailed structures in the last three years:
    a. Drill operators.
    b. On-site supervisors assigned to the project.
4. Do not substitute for these personnel without authorization.

B. Wall Designer Qualifications for review when Contractor provides wall design. Include at least the following:

1. Wall Designer name and professional engineer licensing information.
2. Company name.
3. Do not substitute for the wall designer without authorization.

C. Soil Nail Retaining Wall Drawings for review. Include at least the following:

1. Plans, profiles, cross-sections, quantities, and details for each retaining wall.
    a. Subsurface exploration locations noted with station and offsets with respect to the wall alignment.

1) Provide soil data sheets for each subsurface exploration.

b. Top of wall detail.
   1) Aesthetically pleasing
   2) Adequately supports fence, drainage, or other requirements as shown.

c. Production soil nail details showing at least the following:
   1) Bar sizes and grades
   2) Corrosion protection
   3) Centralizers
   4) Nail head assemblies.

d. Verification test nail locations

e. Test nail details (verification and proof) including nail size, bonded/unbonded lengths, reaction frames and supports, jacks, load cells, and gauges.

f. Provisions for facilities directly behind the wall face, such as shoring elements, foundation elements, utilities, piping, and guardrail posts.

g. Surface and subsurface drainage details.

h. Architectural treatment details for wall facing elements and concrete color as shown.

i. Expansion/contraction joint locations and details.

2. Include supporting calculations sufficient to demonstrate that the soil nail walls are designed according to the required criteria.

3. Provide the seal of a Professional Engineer (PE) licensed in the State of Utah on the drawings and calculations.

D. Construction Plan for review. Include at least the following:

1. Wall construction start date and proposed detailed wall construction sequence and phasing plan.

2. Proposed methods to contain grout, shotcrete, and void-filling materials within the project area and Right-of-Way.

3. Proposed drilling methods, equipment, and drill hole diameters.

4. Proposed methods of soil nail installation.

5. Procedures for placing nail grout, grout quality control plan, and equipment.

6. Proposed methods for controlling seepage and unstable drill holes.

7. Monitoring and instrumentation plan. Include at least the following:
   a. Measures to verify wall and slope stability during construction.
   b. Details for measuring the movement of the excavated face and the wall during stability testing and construction.
   c. Methods, frequencies, and locations of measurement points for monitoring displacements of the wall facing, surrounding ground, utilities, and other existing facilities.

E. Equipment calibration data for information:

1. Calibration data for testing equipment including load cells, test jacks, pressure gages, and grout pumps.
   a. Include calibration date, device identification number, and calibration results, certified with an accuracy of at least 2 percent of the applied certification.

F. Manufacturer's product data sheets and installation instructions for furnished materials, for information, such as the following:

1. Soil nail bars
    a. Include ultimate strength and yield strength.
    b. Include corrosion protection, such as epoxy coating or encapsulation.
2. Bar couplers
3. Geocomposite strip drains.
4. Centralizers
5. Drain connection grates.

G. Nail grout mix design for approval, including:

1. Compressive strength test results, according to ASTM C 109, supplied by a qualified independent testing lab and verifying specified 3 day and 28-day minimum grout compressive strengths.
2. Include specific gravity test results of the fresh grout used for compression testing for neat cement grout.

H. Shotcrete mix design for approval, including:

1. Compressive strength test results, according to ASTM C 1604, supplied by a qualified independent testing lab and verifying specified 3 day and 28-day minimum compressive strengths.

I. Soil Nail Test Results for information within 48 hours of the test.

1. Include results from failed and passing soil nails.
2. Include at least the following:
    a. Project name, location, and type (verification or proof) of test.
        1) Include times and dates of drilling, installation, grouting, and testing.
    b. Name of person(s) performing testing.
    c. Hydraulic jack calibration information.
    d. Soil nail bar bonded and unbonded lengths, as well as any additional bar length used for testing.
    e. Soil nail bar type, diameter, cross-sectional area, and grade of steel.
    f. Drill method, hole length, and diameter.
    g. Maximum test load.
    h. Ultimate load capacity of soil nail bar.
    i. Soil to grout bond strength.
    j. Tabulated individual and average displacements for each dial gage at each specified loading increment and observation period.

J. Soil Nail Retaining Wall As-Built Drawings for information within 30 days after completion of the work.

1. Provide the locations and lengths of the nails for each wall. Include Northings, Eastings, elevation, azimuth, and inclination (to the nearest 0.1 inch and 0.5 degrees), Include survey datum.
2. Provide revised design calculations signed and sealed by a PE licensed in the State of Utah for design changes made during the construction of the wall.

1.05 AESTHETICS TEST PANELS

A. Construct a 3 ft high by 10 ft long test panel on-site for final shotcrete facings with sculpted or formed aesthetic treatments.
   1. Receive authorization before beginning production work.
   2. Use the same sculpting or forming methods, procedures, form liner, texture configuration, expansion joint, concrete mixture, and color/stain application proposed for the production work.
   3. Furnish one test panel for each type of wall finish.

1.06 QUALITY CONTROL

A. Soil Nail Grout
   1. Test each batch of grout for specific gravity using a mud balance according to the procedure in ASTM D 4380.

1.07 DELIVERY, STORAGE AND HANDLING

A. Deliver, store and handle materials in a manner that will prevent contamination, segregation, corrosion, and damage.
   1. Store and protect all bars such that corrosion protective coatings, bar surfaces, and threads are undamaged.
   2. Geocomposite strip drain
      a. Store/stockpile in a manner which protects the material from mud, dirt, dust, debris, and shotcrete rebound.
      b. Do not remove the protective wrapping until immediately before material is installed.
      c. Avoid exposure to ultraviolet light.

PART 2 PRODUCTS

2.01 SOIL NAILS

A. Soil Nail Tendon.
   1. Provide fully threaded solid or hollow bars as shown, continuous or with couplers, threaded to allow proper attachment of bearing plate, washer, and nut.
   2. Solid Bar Soil Nails (SBSNs)
      a. Use solid threaded bar according to one of the following:
         1) ASTM A 706 Grade 75 or 80
         2) ASTM A 722 Grade 150.
      b. Verify that bar meets the minimum capacity required at the threaded section if threads are cut into the bar.
   3. Hollow Bar Soil Nails (HBSNs), unless excluded as shown.
      a. ASTM A 519 Grade 75 or better, size as shown.
      b. Fully-threaded hollow-steel tubing that serves as drilling steel, grout transfer medium, and reinforcing element of the soil nail.

c. Uniform elongation without necking (Agt) greater than or equal to 5 percent.
d. Minimum Charpy impact resistance of 30 ft-lb at -4 degrees F (40 J at -20 degrees C) according to ASTM A 370.
e. Provide bar couplers with seals or similar mechanisms to verify minimum grout loss and a means of transferring percussive drilling forces, if required.
f. Select drill bits based on subsurface data and minimum grout column requirements, with at least two ports for grout exit.

4. Bar Couplers
   a. Develop the full nominal tensile capacity of the soil nail bar as certified by the manufacturer.
5. Corrosion protection
   a. SBSNs
      1) Bar encapsulation. Use one of the following sheathings:
         a) Corrugated high-density polyethylene (HDPE) tube having a minimum wall thickness of 60 mils and conforming to ASTM F 2648.
         b) Corrugated PVC tube having a minimum wall thickness of 40 mils.
      2) Bar coating. Use one of the following:
         a) Use epoxy-coated bars according to ASTM A 775 with between 0.008- and 0.012-inch coating thickness. Omit bend test requirements.
         b) Use galvanized bars according to ASTM A 767 with minimum coating thickness of 3.4 mil.

B. Centralizers
1. SBSNs.
   a. Use centralizers manufactured from Schedule 20 or 40 PVC pipe securely attached to the soil nail bar with coated wire.
   b. Size to position the soil nail bar within 1.0 inch of the center of the drill hole.
2. HBSNs.
   a. Centralizers are not required for HBSN.

C. Nail Head Assemblies
1. Bearing Plate Assembly
   a. Bearing Plate
      1) ASTM A36, Grade 36. Refer to Section 05120.
   b. Shear Connectors
      1) Headed studs or anchor bolts.
   c. Fabrication
      1) Refer to AASHTO/AWS D1.5.
   d. Galvanize after fabrication according to ASTM A 767.
2. Nuts and Washers
   a. ASTM A 563, hexagonal.
   b. Fit with beveled washers or spherical seats to provide uniform bearing.
   c. Galvanize according to ASTM A 767.

D. Soil Nail Grout

1. Use a neat cement or sand/cement mixture.
    a. Use either Type II Portland Cement meeting ASTM C 150 or Type IL cement meeting ASTM C 595.
    b. Use admixtures as appropriate to control bleed, improve flowability, reduce water content, and/or retard set, as specified in the authorized submittals.
        1) Use only admixtures that are compatible with the grout and mixed according to the manufacturer's recommendations.
        2) Do not use accelerators.
2. Meet 3-day minimum compressive strength of at least 2,000 psi according to ASTM C 109
3. Meet 28-day minimum compressive strength of at least 4,000 psi according to ASTM C 109
4. Meet specific gravity between 1.80 and 1.90.

2.02 FACING

A. Shotcrete
    1. Use a wet mix shotcrete.
        a. Use either Type II Portland Cement meeting ASTM C 150 or Type IL cement meeting ASTM C 595.
        b. Meet air content range of 8% to 10% at the pump.
        c. Meet 28-day minimum compressive strength of at least 4,000 psi.
        d. Use a curing compound that complies with ASTM C 309 Type 1-D or Type 2, Class A
    2. Owner will perform the following testing.
        a. Air Content per AASHTO T 152 with a frequency of 1 per load prior to placement.
        b. 28-day Compressive Strength per ASTM C 1604 with a frequency of 1 set per 50 cubic yards using production test panels.

B. Concrete
    1. Class 4000 (Underground application). Refer to Section 03 30 04.

C. Reinforcing Steel and Welded Wire Reinforcement
    1. Coated. Refer to Section 03 20 00.

2.03 GEOCOMPOSITE STRIP DRAIN

A. Use a strip drain consisting of a drainage core and an attached or encapsulating filtration geotextile meeting the following:
    1. At least 85 percent by mass of polypropylenes, polyester, polyamine, polyvinyl chloride, polyolefin, or polystyrene.
    2. Compressive strength of at least 40 psi when tested according to ASTM D 1621, Procedure A.
    3. Flow rate of at least 0.1 gallons per second per foot of strip width under a gradient of 1.0 tested according to ASTM D 4716.
    4. Provide in rolls wrapped with a protective covering and labeled to identify the production run.

2.04 TOE DRAIN

A. Perforated Pipe

1. ASTM D 1785 Schedule 40 PVC solid and perforated wall; cell classification 12454-B or 12454-C, wall thickness SDR 35, with solvent or elastomeric joints

B. Fittings

1. ASTM D 3034, cell classification 12454-B or 12454-C, wall thickness SDR-35, with solvent or elastomeric joints.

C. Type E: 1-1/2" Drain Rock

1. Refer to Section 31 23 00.

D. Drainage Geotextile

1. Refer to Section 31 05 19.

2.05 EXPANSION JOINT MATERIALS

A. Preformed Joint Filler

1. Refer to Section 32 13 73

B. Backer Rod

1. Refer to Section 32 13 73

C. Joint Sealant

1. Refer to Section 32 13 73

2.06 EQUIPMENT

A. Soil Nail Grouting

1. Use a high-shear colloidal mixer with separate holding tank and water and cement dosing system to verify continuous grouting independent from mixing.
2. Capable of grout pump flow rate of at least 15 gpm for bars less than 2-inch diameter and 45 gpm for bars 2 inch or greater in diameter.
3. Capable of grout pump pressure of at least 250 psi in sands/gravels and 1,500 psi in clays/silts.

B. Soil Nail Testing

1. Provide testing equipment including dial gages, dial gage support, jack and pressure gage, load cell, and a reaction frame as shown.
   a. Use a pressure gage with a maximum graduation of 50 psi and use calibrated load cell for load steps.
   b. Support dial gages on a frame that is independent from the jacking and the wall.
   c. Measure nail head movement with at least 2 dial gages capable of measuring to 0.001 inch.
2. Use testing equipment that has been calibrated by an independent testing lab within 90 days of the submittal date.
   a. Calibrate jack and pressure gage as a single unit.

PART 3 EXECUTION

3.01 GENERAL

A. Follow the authorized soil nail retaining wall drawings.

B. Perform additional exploration and testing when appropriate to complete final design.

3.02 EXCAVATION

A. Refer to Section 31 23 00.

B. Establish the ground contour above the wall to its final configuration and slope as shown before beginning excavation of the soil for the first row of soil nails.

C. Excavate from top down in staged horizontal lifts.

1. Limit the excavation to no more than 3 ft below the elevation at which the soil nails will be installed for the current lift.
2. Place reinforced initial shotcrete facing before the vertical cut becomes unstable, but no more than 24 hours after excavation.
    a. Place reinforcement with at least 2 inch of shotcrete cover between the soil or the strip drain, and the reinforcement.
3. Do not excavate a lift until the soil nail installation and reinforced initial shotcrete placement for the preceding lift is completed.

D. Excavated face.

1. Remove loose materials, mud, rebound, and other foreign matter that could prevent or reduce shotcrete bond before placing shotcrete.
2. Accuracy
    a. Sufficient to allow placement of the required shotcrete thickness shown.
        1) Additional shotcrete thickness due to overexcavation or irregularities in the excavated face is at no additional cost to the Owner.
    b. Sufficient to prevent damage to overlying shotcrete sections by undermining or other causes.

E. Monitor the wall and slope stability during construction.

1. Suspend soil nail wall construction if an excavation becomes unstable.
    a. Temporarily stabilize the excavation by immediately placing an earth berm against the unstable excavation face.
    b. Notify the Engineer immediately.

3.03 SOIL NAIL INSTALLATION

A. Drilling

1. Use core drilling, rotary drilling, percussion drilling, auger drilling, or driven casing.
    a. Use a method that prevents loss of ground above the drilled hole that may be detrimental to the soil nails or existing structures.
    b. Use a method that is suited to the ground conditions.

c. Use cased drilling methods or other suitable means to support the sides of the drill holes if needed.
    1) Remove casing unless Engineer permits it to remain.

2. Drilled hole tolerances.
    a. Inclination
        1) Within ±3 degrees of planned angle at the bearing plate
    b. Location
        1) Within ±0.5 ft of the planned location at the face of the excavated surface (point of entry).
    c. Horizontal Splaying
        1) Splay drill holes up to 10 degrees horizontally from plan orientation to avoid obstructions such as piles, drainage features, utilities, etc.
        2) Note location of splayed nails and reason for splay on as-built drawings.
3. Adjust drill hole and soil nail length as necessary to develop the load capacity and satisfy acceptance criteria for the required design load if required by testing.

B. Tendon Insertion

1. Inspect bar coating or encapsulation on soil nail bars before insertion into the drill hole.
    a. Replace soil nail bars exhibiting abrasions, cuts, welds, weld spatter, corrosion, or pitting.
    b. Replace or repair soil nail bars exhibiting damage to bar coating or to encapsulation.
2. Space centralizers no greater than 10 ft apart and no more than 1.5 ft from the end of each nail.
    a. Use centralizers that allow tremie pipe insertion to the bottom of the hole, and free flow of grout up the hole.
    b. Attach to the bar in front of the couplings for HBSNs.
3. Insert soil nail tendon into the drilled hole without difficulty.
    a. Remove the tendon and clean or redrill the drill hole to permit insertion if the tendon cannot be completely inserted.
    b. Do not drive or force partially inserted bars into the hole.
4. Notify the Engineer and the Wall Designer immediately if soil nails cannot be installed as shown.

C. Grouting

1. Grout the drill hole after installation of the soil nail bar and within 2 hours of completing drilling.
2. Inject grout at the lowest point of each drill hole through a hollow bar soil nail, grout tube, casing, hollow-stem auger, or drill rods.
3. Place the outlet end of the grout delivery tube below the surface of the grout as the conduit is withdrawn to prevent the creation of voids.
4. Fill the drill hole in one continuous operation. Do not allow cold joints in the grout column except at the top of the test-bond length of proof-tested production nails.
5. Consider hollow bar soil nails to be completed when the final grout returns to the excavated face, signaling that drilling spoils have been removed.

6. Provide at least 1 inch of grout cover between the soil nail bar and the surrounding soil for SBSN.
7. Fill bird's beaks with additional grout after placing a temporary cover in front of the drill hole. Alternatively, fill bird's beaks with shotcrete.
    a. Position shotcrete nozzle into the mouth of the drill-hole to completely fill the void where shotcrete is used to backfill bird's beaks.
8. Do not add water to grout conforming to the mix design to improve workability.

D. Nail Head Assembly

1. Attach a bearing plate, washers, and nut to each nail head as shown.
2. Provide uniform contact between the plate and the shotcrete.
    a. Seat the bearing plate uniformly on the shotcrete while the facing is still plastic and before its initial set. Hand-wrench tighten the nut.
    b. Set the bearing plate in a bed of grout if needed. Re-tighten the nut by hand with a wrench after the grout has set for 24 hours.

3.04 SHOTCRETE PLACEMENT

A. Prepare shotcrete application surface by:

1. Removing loose material, mud, rebound, and other foreign matter.
2. Clear any vegetation or organic material from the surface.
3. Remove curing compound on previously placed shotcrete surfaces by sandblasting.
4. Install depth gages on 4 ft centers longitudinally and vertically to indicate the thickness of shotcrete layers.
5. Dampen natural excavated surfaces immediately before shooting.

B. Place shotcrete in one or more layers.

1. Apply shotcrete within discharge time limit indicated in the approved mix design.
2. Make the surface of each shotcrete layer uniform and free of sags, drips, or runs.
3. Limit the layer thickness to 3 inches per application with no sloughing or sagging.
4. Remove laitance, loose material, and rebound.
    a. Promptly remove rebound from work area.
5. Do not apply shotcrete during adverse weather including rain, snow, and high winds without adequate protection.
    a. Cease placement operations when the ambient temperature drops below 50 degrees F.
6. Form construction joints by cutting plastic shotcrete and taper construction joints at an approximately 45-degree angle from the receiving surface.
7. Apply curing compound to shotcrete surfaces are exposed in their final condition.
8. Construct test panels for compressive strength testing using wood forms at least 3.5 inch thick by 2 feet by 2 feet in size.
    a. Do not include reinforcing steel bars in the test panels.
    b. Cure test panels in similar conditions to what is anticipated in the field and until test specimens are sampled.

3.05 SOIL NAIL TESTING

A. General

1. Conduct soil nail testing after the Wall Designer approves the calibration reports.
2. Perform soil nail testing after the nail grout and shotcrete facing have cured for at least 72 hours and have attained their specified 3-day compressive strength.
3. Do not apply loads greater than the following:
   a. Grade 75 or 80 bars: 90 percent of the minimum yield strength of the soil nail bar
   b. Grade 150 bars: 80 percent of the minimum ultimate tensile strength of the soil nail bar
4. Use verification and proof test nails having an unbonded length of at least 3 ft.
   a. Clean out the hollow bar unbonded length after bar installation.
   b. Do not place a PVC pipe bond breaker without cleanout as a substitute for providing the required unbonded length.
   c. Measure and verify void for unbonded length before testing.
5. Provide verification test and proof test nails having a bonded length of at least 10 ft. Shorter bonded lengths are appropriate for proof tests on production nails less than 13 feet in length.
6. Immediately report failed verification and proof nail test results to the Engineer and the Wall Designer, with the soil nail location, bonded and unbonded lengths, maximum load held, and the failure load.

B. Verification Testing

1. Perform verification tests on sacrificial nails at the locations shown.
   a. Perform additional verification testing as determined by the Engineer.
   b. Test nails of the same design and constructed with the same methods to be used on production nails.
2. Test sacrificial nails before installation of production soil nails to verify that the design nail pullout resistance is representative of the Contractor's drilling and installation methods in the site soils.
3. Notify the Engineer of changes to drilling methods, installation methods, or equipment during installation of production nails.
   a. Test additional sacrificial nails to address these changes as determined by the Engineer at no additional cost to the Owner.
4. Test soil nails with a known bonded length and a measured unbonded length.
5. Select a bonded length, L_{BVT}, as follows:
   a. Calculate L_{VBTmax}

$$L_{BVTmax} = (C_{RT} \times A_t \times f_s) / (r_{po}) \qquad \text{EQ1}$$

where:

C_{RT} = reduction coefficient; 0.9 for Grade 75 or 80 bar or 0.8 for Grade 150 bar

A_t = cross-sectional area of the test soil nail bar

r_{po} = nominal load transfer rate (kips/ft)
= $\pi \times q_u \times D_{dh} / 12$
q_u = bond strength (ksf)
D_{dh} = drill hole diameter (inch)
f_s = nominal resistance of the test tendon, f_y or f_u (ksi)

in which:

f_y = nominal yield resistance of the test tendon (ksi) for Grade 75 or 80 bar
f_u = minimum ultimate tensile strength of the test tendon (ksi) for Grade 150 bar

b. If $L_{VBTmax} > 10$ ft, $10 \text{ ft} \leq LVBT \leq L_{VBTmax}$
c. If $L_{VBTmax} < 10$ ft, LVBT = 10 ft, increase the test tendon size until $L_{VBTmax} \geq 10$ ft.
d. Use q_u as shown.
e. Calculate the maximum load during the verification test, defined as the Verification Test Load (VTL), as follows:

$$VTL = L_{BVT} \times r_{po} \text{ (kips/ft)} \qquad EQ2$$

where:

L_{BVT} = verification test nail bonded length (ft)

6. Perform verification test by incrementally loading the verification test nail to pullout or maximum test load (VTL) according to Table 1.

Table 1

Verification Test Schedule	
Load	Observation Period (minutes)[3]
AL[1]	Apply AL And set dial gauge to "zero"
0.13 VTL[2]	10 (record soil nail head movement at 1, 2, 5, 10)
0.25 VTL	10 (record soil nail head movement at 1, 2, 5, 10)
0.38 VTL	10 (record soil nail head movement at 1, 2, 5, 10)
0.50 VTL	10 (record soil nail head movement at 1, 2, 5, 10)
0.63 VTL	10 (record soil nail head movement at 1, 2, 5, 10)
0.75 VTL (Creep Test)	60 (record soil nail head movement at 1, 2, 5, 6, 10, 20, 30, 50 ,60)
0.88 VTL	10 (record movement at 10)
1.00 VTL	10 (record movement at 10)
AL	Reduce to AL And record permanent set

Tables Notes:

[1] Alignment Load (AL) ≤ 0.025 VTL (kips)

[2] Verification Test Load (VTL) = L_{BVT} x r_{po} (kips/ft)

[3] Measure soil nail head movement after each load increment has been achieved and at each indicated time step

7. Maintain the load during the creep test to within 2 percent of the intended load by using a load cell.
8. Re-pump jack as needed to maintain load during hold times.
9. Reduce loading to the AL and record the permanent set after applying VTL or other maximum test load.
10. Perform stepped unloading where determined or authorized by the Wall Designer.
    a. Perform between one and seven intermediate steps in stepped unloading.
    b. Hold each load step until the gage readings are stable.

C. Proof Testing

1. Perform proof testing on production soil nails.
    a. Test at least 5 percent of production soil nails.
    b. Test no fewer than one production nail per row on each soil nail wall.
        1) Distribute the locations of proof tests evenly across the vertical and horizontal extent of the wall face.
    c. Test the number of nails in each row sufficient to account for variability of soil and installation technique.
    d. Proof test at least 10 percent of production soil nails, with at least two proof tests per row on each soil nail wall where HBSNs are used without centralizers.
2. The Engineer will determine locations and number of proof tests before completing grout placement.
3. Perform proof tests on soil nails with a known bonded length and a measured temporary unbonded length.
4. Select a bonded length (LBPT) for the proof tests such that LBPT is 10 ft or L_{BPTmax}, whichever is smaller.
5. Select L_{BPTmax}

$$L_{BPTmax} = (C_{RT} \times A_t \times f_s) / (r_{po} \times 0.75) \quad \text{EQ3}$$

6. Allow for bond lengths less than 10 ft for production proof nails shorter than 13 ft.
7. Do not proof test fully grouted nails.
8. Calculate the maximum load for proof tests, defined as the Proof Test Load (PTL), as follows:

$$PTL = L_{BPT} \times r_{po} \text{ (kips/ft)} \times 0.75 \quad \text{EQ4}$$

9. Conduct proof tests by incrementally loading the proof test nail according to the test loading schedule in Table 2.

Table 2

Proof Test Schedule	
Load	Observation Period (minutes)[1]
AL[2]	1
0.17 PTL[3]	Record movement when it stabilizes
0.33 PTL	Record movement when it stabilizes
0.50 PTL	Record movement when it stabilizes
0.67 PTL	Record movement when it stabilizes
0.83 PTL	Record movement when it stabilizes
1.0 PTL (Creep Test)[4]	10 (record soil nail head movement at 1, 2, 5, 6, 10 minutes)
AL	1

Tables Notes:

Re-zero dial gages after the alignment load is applied.

Re-pump jack as needed to maintain load within 5 percent of the intended load during hold times.

[1] If the soils reinforced with nails are relatively susceptible to deformation or creep, hold each load increment for 10 minutes and record soil nail movement at 1, 2, 5, 6, and 10 minutes.

[2] Alignment load ≤ 0.025 PTL

[3] Proof Test Load (PTL) = L_{BPT} x r_{po} (kips/ft) x 0.75

[4] If soil nail movement measured between 1 and 10 minutes exceeds 0.04 inch, maintain PTL for 50 more minutes and record movements at 20, 30, 50, and 60 minutes. Record permanent soil movement.

3.06 SOIL NAIL LOAD TEST ACCEPTANCE CRITERIA

A. A verification-tested or proof-tested soil nail is acceptable if all of the following are met:

1. The soil nail resists the creep test load with less than 0.04 inch of movement between the 1 minute and 10-minute readings.
2. The soil nail resists the creep test load with less than 0.08 inch of movement between the 6 minute and 60-minute readings if the creep test load is maintained for 60 minutes.
3. The creep rate is linear or decreasing throughout the creep test observation period.
4. The total soil nail movement (ΔTL) measured at the maximum test load (VTL or PTL) exceeds 80 percent of the theoretical elastic elongation of the temporary unbonded length of the test nail, as calculated using Equation 5 (EQ5).

$$\Delta TL > 0.8 \times \text{Maximum Test Load} \times L_{UB} / (E \times A_t) \qquad \text{EQ5}$$

where:

ΔTL = Total soil nail movement measured at the maximum test load (PTL or VTL)

L_{UB} = Test nail unbonded length

E = Young's Modulus of steel (29,000 ksi)

5. Pullout does not occur before achieving the maximum test load (VTL or PTL).

a. Pullout is defined as the load at which attempts to further increase the test load increment results in continued test nail movement.

B. Verification-tested Nail Failure

1. Modify the design or the installation procedures or both.
2. Install replacement sacrificial nails for verification testing.

C. Proof-tested Nail Failure

1. The production nail will be rejected.
2. The Engineer may determine that additional proof testing is required to delineate the area of unsatisfactory production nails.
3. Evaluate and modify the design and construction procedures as applicable.

3.07 WALL DRAINAGE

A. Install and secure wall drainage elements.

1. Wall drainage elements include geocomposite strip drains, PVC connection pipes, soil nail wall toe drains, and weep holes.
2. Construct wall drainage to provide continuous and unrestricted flow to discharge water collected behind the wall face.
3. Install wall drainage elements before shotcreting with the exception of toe drains in front of the wall face.

B. Geocomposite strip drains.

1. Center between each column of soil nails, as shown.
2. Provide a minimum strip width of 12 inches.
3. Secure in continuous contact with the excavated face, and with the geotextile side against the excavated face.
4. Prevent shotcrete contamination of the geotextile against the excavated face.

C. Toe drains

1. Install at the bottom of the wall, according to the authorized soil nail retaining wall drawings.
2. Encase the free-draining granular backfill and pipe with drainage geotextile that conforms to the dimensions of the excavated trench.

3.08 FACING JOINTS

A. Construct expansion and contraction joints through the final shotcrete layer as shown.

3.09 CONSTRUCTION TOLERANCES

A. Refer to Table 3.

Table 3

Construction Tolerances	
Item	Tolerance

Cross-sectional location for reinforcing steel, welded wire reinforcement, and shear connectors.	3/8 inch
Location of headed studs on bearing plate	¼ inch
Reinforcing steel lap	1 inch
Planeness of finish surface, gap under 10-ft straight edge, if troweled or screeded	9/16 inch
Planeness of finish surface, gap under 10-ft straight edge, if left as shot	1 1/8 inch
Nail head bearing plate deviation from parallel to wall face	10 degrees

END OF SECTION

SECTION 31 41 00

SHEETING, SHORING AND BRACING

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies requirements for sheeting, shoring, and bracing of trenches and excavations greater than 5 feet in depth.

B. Design Requirements:
   1. The Contractor shall design sheeting, shoring, and bracing in accordance with OSHA regulations and appropriate design standards.
   2. Horizontal strutting below the barrel of a pipe and the use of pipe as support are not acceptable.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
APWA	Standard Specifications for Municipal Public Works Construction, Prepared by Utah State Chapter of the American Public Works Association
OSHA	OSHA Safety Regulations (29 CFR, Part 1926, Subpart P Excavations)

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 SUBMITTALS

A. Submittals in accordance with General Conditions, Section 01 33 00 and Section 01 57 29, Integrated Excavation Plan.

B. Submit a Sheeting, Shoring, and Bracing Plan including: design calculations, shop drawings, and detail drawings that demonstrate conformity with OSHA regulations and suitability for design loads and installation methodology. The Design Plan shall be stamped and signed by a Registered Professional Engineer of the State of Utah.

C. Submit shop drawings showing dimensions, elevation, and structural details for each utilized excavation support system. Include on the drawings any required construction sequence, loading, testing, monitoring, and re-bracing/removal requirements. The design shall be stamped and signed by a Registered Professional Engineer of the State of Utah.

1.04 DESIGN REQUIREMENTS

A. Design excavation support systems to withstand earth pressures, hydrostatic pressures, bottom heave, equipment loads, applicable traffic and construction loads, and other surcharge loads to allow safe construction without movement or settlement of the ground and to prevent damage to or movement of adjacent structures, streets, and utilities. Design each member or support element with appropriate safety factors.
   1. Geotechnical data has been prepared for this project per the Supplementary Conditions.

B. Acceptable excavation support methods include the use of trench boxes, suitable moving support systems, steel sheet pilings, soldier piles and lagging, secant pile structures, structural steel wales and struts, liner plates, tieback anchors, and timber. If soldier piles are used, insert in predrilled holes. Horizontal strutting below the barrel of a pipe and the use of pipe as support are not acceptable.
   1. Due to the nature of the existing soils and proximity of adjacent infrastructure no vibratory or impact-type installation or removal methods are permitted. All sheets shall be inserted by hydraulic pushing, or other previously approved methods. Any resulting damage to existing structures from installation or removal procedures shall be the responsibility of the CONTRACTOR.
   2. Provide construction stage loadings for a staged removal of the support system that conforms to the pipe, structure placement, and indicated backfill.
   3. Compaction of foundation, bedding, haunching, and backfill shall extend to the undisturbed trench wall during staged removal of the support system.

1.05 QUALITY ASSURANCE

A. Provide surveys to monitor movements of critical facilities in accordance with the requirements of Section 31 09 00.

B. Excavation support systems shall be designed by a professional engineer registered in the State of Utah who has a minimum of 5 years of experience in the design of retaining structures.

PART 2 PRODUCTS

A. Slide rail shoring may be required to protect existing buildings and utilities. Acceptable slide rail shoring suppliers include the following, or equal:
   1. GME (Griswold Machine and Engineering)
   2. Pro-Tec Equipment, Inc
   3. Efficiency Production, Inc..
   4. SHB, Double Slide Rail, Series 750.

B. Structural Steel: ASTM A36 or better, unless otherwise approved.

PART 3 EXECUTION

3.01 GENERAL

A. Provide, place, and maintain supports, shoring, and sheeting as may be required for sides of excavations. Slope or otherwise support excavations in a safe manner in accordance with applicable regulatory safety requirements.

B. The construction of sheeting, shoring, and bracing shall not disturb the state of soil adjacent to the trench and below the excavation bottom.

C. Trench sheeting below the top of a pipe shall be left in place.

D. All shoring shall be removed.

E. Provide, place, and maintain supports, shoring, and sheeting as may be required for sides of excavations. Support excavations in a safe manner in accordance with applicable regulatory safety requirements.

F. All welding will conform to the applicable provisions of ANSI/AWS D1.1.

3.02 SEQUENCE

A. Excavation shall not be started until the design for support has been accepted by the Owner.

3.03 TRENCHES

A. For trench excavation exceeding 5 feet in depth, provide adequate safety system meeting requirements of applicable local construction safety orders, and OSHA requirements.

B. At any time Contractor's personnel are not present within the immediate vicinity of the Work, open excavations shall be plated, barricaded, or fenced, as necessary, to protect the public and worker safety.

3.04 REMOVAL OF SUPPORT SYSTEM

A. Excavation support shall not be removed until support can be removed without damage to existing facilities, completed Work, or adjacent property.

B. Any void left by shoring system or voids created by the removal of the shoring system shall be filled with controlled low strength material (CLSM) or cement grout, as approved by the Construction Manager.

END OF SECTION

SECTION 31 41 01

VIBRATION CONTROL

PART 1 GENERAL

1.01 SCOPE

A. This Section specifies procedures for monitoring and controlling vibrations adjacent to the project site that arise from installation of sheet piling, pile driving, soil compaction and other vibration-producing activities. The CONTRACTOR shall provide all necessary labor, equipment, materials, and services.

1.02 SUBMITTALS

A. Submittals in accordance with the General Conditions, Section 01 33 00 and Section 01 57 29, Integrated Excavation plan.

B. Seismograph Location Plan for review that includes proposed monitoring locations and existing structures and utilities that are to be protected. Vibration monitoring points (VMP) should be located at least four (4) feet from existing structures to reduce reflected vibrations.

1. A minimum of four VMP shall be provided by the Vibration Monitoring Specialist.

C. Calibration data and machine documentation for each seismograph used on the project.

1.03 QUALITY CONTROL

A. CONTRACTOR shall pay the costs for any re-testing or additional testing of Work not conforming to the Specifications. CONTRACTOR shall bring Work into compliance before Work will be accepted by CONSTRUCTION MANAGER.

1.04 DEFINITIONS

A. Vibration Monitoring Specialist: An individual experienced in vibration monitoring techniques for similar civil and geotechnical works, the preparation of vibration monitoring plans, instrumentation, and interpretation and use of vibration records. The Vibration Monitoring Specialist will possess all required federal, state and local licenses and/or permits. The Vibration Monitoring Specialist will be responsible for supervision of all field vibration monitoring operations and personnel and have a minimum 10 years of vibration monitoring experience.

PART 2 MATERIALS (NOT USED)

PART 3 EXECUTION

3.01 PREPARATION

A. Control and monitor vibrations when engaging in construction-related activity near objects, structures or utilities which may be susceptible to damage from ground vibrations.

3.02 EQUIPMENT

A. Use approved seismographs located, at a minimum and as approved by the ENGINEER, between the vibration source and the closest susceptible object(s), structure(s) or utility(ies).

B. Use seismographs capable of recording particle velocity for three (3) mutually perpendicular components of vibration.

C. Furnish records of seismograph characteristics and factory calibration to the ENGINEER prior to commencing vibration producing activity.

D. Provide vibration monitoring equipment capable of detecting velocities of 0.01 in/s or less that has been calibrated within the last year.

E. Use seismographs with response characteristics in the range generally found for the specific construction related activity being monitored.

3.03 MONITORING

A. Do not allow ground motions, in each component, to exceed the safe limits prescribed in paragraph E.

B. Use appropriate care in all vibration inducing operations. Repair, at no expense to the OWNER, any damage to neighboring structures or utilities caused by construction related vibrations.

C. Monitor every vibration-inducing activity for which ground motions may exceed 0.09 in/sec. at any structure or utility, using calibrated seismographs containing internal calibration and triaxial orthogonal transducers with a flat frequency response from 2 to 200 hz. Furnish real-time, permanent time histories of the vibration measurements in terms of particle velocity. Make vibration monitoring records available to the ENGINEER no later than 48 hours after measurements are taken.

D. Place transducers in locations approved by the ENGINEER. The ENGINEER may direct that different features be monitored.

E. Vibration limits are based on instrumentation with a flat frequency response from 2 to 200 hertz. Do not exceed the following maximum ground motions:
   1. 0.2 in/sec for steady state vibrations (vibrations generated by construction traffic, vibrating rollers, etc.).
   2. 0.1 in/sec for steady state vibrations at the existing utilities and buildings (vibrations generated by construction traffic, vibrating rollers, etc.).

END OF SECTION

C. As directed by the CONSTRUCTION MANAGER or when maximum allowable movement limits are exceeded per Table 2, immediately take additional readings to verify SMP, VMP, crack monitors, or inclinometer stability. Notify CONSTRUCTION MANAGER and submit readings.

D. Corrective Action Trigger Levels:

Table 2: Maximum Allowable Readings

Movement	Action Trigger Level	Maximum Allowable Movement
Movement	Action Trigger Level	Maximum Allowable Movement
SMP (vertical)	0.031 ft (0.375 in)	0.063 ft (0.75 in)
SMP (horizontal)	0.031 ft (0.375 in)	0.063 ft (0.75 in)
SMP (Differential)[A]		3/16“ (0.1875 in) over 15 ft
VMP[B]	0.5 in/sec	1.0 in/sec
Inclinometer	0.1 inch per days	1 inch
Crack Monitor	0.0052 ft (0.0625in)	0.0078 ft (0.09375 in)

A – Differential settlement measured on Buildings and Structures between SMPs (Vertical and Horizontal)

B - See Section 31 41 01 Vibration Control 3.03E

E. At any time during the Work, additional monitoring shall be performed if measurements fail to meet required accuracies, measurements detect significant, anomalous, or sudden changes in elevation or horizontal location and/or when action limits and maximum allowable movements are exceeded. Such additional monitoring will be performed at no additional cost to the OWNER.

F. Evaluate existing damage to properties in the area of influence of the construction project that might be affected by the construction activities.

3.06 PROTECTION, MAINTENANCE AND REPLACEMENT

A. Maintain access to SMP, VMP, crack monitors, and inclinometers throughout the duration of monitoring and performance of the Work.

B. Replace damaged or missing SMP, VMP, crack monitors and inclinometers immediately and notify the CONSTRUCTION MANAGER.

3.07 CLOSE-OUT READINGS

A. Upon completion of the Work, including backfill, grouting, and surface restoration, perform a minimum of two sets of monitoring readings of all SMP, crack monitors and inclinometers. Final Readings shall be performed seven (7) days and three (3) months after completion of the Work Submit the readings to the CONSTRUCTION MANAGER.

END OF SECTION

SECTION 32 12 16

ASPHALT PAVING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies paving consisting of aggregate base, asphaltic concrete, and associated materials.

1.02 DEFINITIONS

A. Bituminous prime coat: Consist of application of hot bituminous material on previously prepared base course.

PART 2 QUALITY ASSURANCE

2.01 REFERENCES

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM D 2041	Standard Test Method for Theoretical Maximum Specific Gravity and Density of Bituminous Paving Mixtures.
ASTM D 4318	Standard Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.

B. Testing:
   1. Testing will be conducted by the Construction Manager to determine compliance with the specified degree of compaction and moisture content.

2.02 SUBMITTALS

A. Proposed mix design and gradation of materials.

B. Quality control submittals:
   1. Certificate of Compliance.

2.03 DELIVERY, STORAGE, AND HANDLING

A. Asphalt concrete delivery:
   1. Transport the mixture from the mixing plant to the point of use in vehicles having tight bodies previously cleaned of all foreign materials.
   2. Treat bodies as necessary to prevent material from sticking to the bodies.
   3. Cover each load with canvas or other suitable material of sufficient size and thickness to protect the asphalt mixture from the weather.
   4. Transfer the mixture directly from the transport vehicle to the paving machine. Dumping asphalt on the ground and “shuttling” it to the paver will not be allowed.

PART 3 PRODUCTS

3.01 MATERIALS

A. Prime coat: Use bituminous material for prime coat conforming to requirements for MC 70 and apply at temperature of 105 to 175 degrees Fahrenheit at rate of 0.3 to

B. 0.6 gallons per square yard by use of bituminous distributor.

C. Sand: Acceptable to the ENGINEER.

D. Tack coat: Grade CSS-1h asphalt emulsion in accordance with ASTM D 977.

E. Asphalt concrete materials:
   1. Asphalt cement: Conform to requirements for asphalt cement, PG 64-28 AASHTO MP1.
   2. Mineral aggregate:
      a. Consist of coarse aggregate of crushed stone or gravel composed of hard, durable particles, sand, and filler as follows:
         1) Coarse aggregate: Portion of material retained on Number 8 sieve.
         2) Fine aggregate: That portion passing Number 8 sieve.

b. Provide composite material that is uniformly graded from coarse to fine and that complies with requirements of one of following gradings when tested in accordance with ASTM C 136.

c. Asphalt concrete: As indicated on the Drawings, 2 course mix for asphalt concrete having an overall thickness of 2 1/2 inches or more if not indicated. If less than 2 1/2 inches asphalt concrete, use single course mix.

Two Course Mix				Single Course Mix	
Seal, 2 inch Thick Minimum		Base, 2 inch Thick Minimum		1-1/2 inch Thick Minimum	
Sieve Size	Percent Passing	Sieve Size	Percent Passing	Sieve Size	Percent Passing
1/2"	100	1-1/4"	100	3/4"	100
3/8"	95 - 100	1"	87 - 100	1/2"	75 - 95
No. 4	60 - 80	3/4"	75 - 100	3/8"	65 - 85
No. 8	35 - 55	3/8"	55 - 80	No. 4	50 - 65
No. 30	15 - 30	No. 4	40 - 70	No. 8	35 - 50
No. 100	5 - 15	No. 8	30 - 50	No. 30	15 - 30
No. 200	3 - 7	No. 30	15 - 30	No. 100	5 - 15
		No. 100	5 - 15	No. 200	3 - 7
		No. 200	3 - 5		

3. Coarse aggregate:
   a. Consist of at least 70 percent by weight of each size aggregate and consist of particles, which have at least 1 rough, angular surface produced by crushing:
      1) Have percentage of wear of not more than 50 at 500 revolutions, in accordance with ASTM C 131.
   b. Aggregate plasticity index: Not more than 2 in accordance with ASTM D 4318.
   c. Sand may be added to crusher or pit run product to supply any deficiency in 8-mesh size, and filler may be added to supply any deficiency in 200-mesh material. If aggregate contains an excess of sand, wasting will be required.
   d. Filler:
      1) Use finely powdered limestones, portland cement, or other artificially or naturally powdered mineral dust, acceptable to the ENGINEER.
      2) Weigh filler and add separately to each batch at time of proportioning.
      3) Use filler that is free from deleterious matter of any kind.
      4) Fineness that meet the following requirements:
         a) Passing 50 mesh sieve: 100 percent.
         b) Passing 200 mesh sieve: At least 75 percent.
      5) Determine amount of material passing the Number 200 sieve in accordance with ASTM C 117.

e. Provide composite aggregate that is free from vegetable matter, lumps or balls of clay, adherent films of clay, or other matter which would prevent thorough coating of asphalt cement.

f. Materials derived from processing demolished, or removed asphalt concrete, are limited to 15%. RAP shall meet the same gradation requirements as the mineral aggregate.

F. Fog sealing: Asphalt emulsion, Grade CSS-1h.

G. Seal Coat: Maxwell products or equal.

H. Slurry Seal: UDOT Spec 02789.

3.02 EQUIPMENT

A. Bituminous distributor: Designed and equipped so as to distribute bituminous material uniformly at even heat on variable widths of surface at readily determined and controlled rate with pressure range of 25 to 75 pounds per square inch.

B. Liquid asphalt distributor:
   1. Designed and operated to distribute asphaltic material in uniform spray without atomization.
   2. Equipped with bitumeter having dial registering feet of travel per minute.
      a. Locate dial so that it is visible to truck driver so that he can maintain constant speed required for application at specified rate.
   3. Equip pump with tachometer having dial registering gallons per minute passing through nozzles.
      a. Locate dial so that it is readily visible to operator.
   4. Provide means for accurately indicating temperature of asphaltic material in distributor at all times.
      a. Locate thermometer well so that it is not in contact with, or close to, heating tube.
   5. Have spray bar having normal width of application of not less than 12 feet and capable of providing for application of lesser width when necessary.
   6. Provided with hose and spray nozzle attachment for applying asphaltic material to patches and areas inaccessible to spray bar.
   7. Equipped with heating attachments and capable of circulating asphaltic material through spray bar during entire heating process.

C. Asphalt concrete mixing plants:
   1. Equipment:
      a. Use screen and storage bins at plant of sufficient capacity to furnish the necessary amount of all aggregates, when operating at the maximum capacity of the plant, with no periods of undue waiting for material.
         1) Use bins consisting of at least 2 compartments, so proportioned as to insure adequate storage of appropriate fractions of the aggregate.
         2) Provide each compartment with an overflow pipe of such size and at such location as to prevent any backing up of material into other compartments.

b. Dryer:
    1) Designed to heat and dry the aggregate to Specification requirements and to agitate it continuously during the heating.
    2) Capable of preparing aggregates at a rate equal to the full-rated capacity of the plant.
c. Dust collector:
    1) So constructed as to waste or return uniformly to the hot elevator all or any part of the material collected.
d. Mixer:
    1) Adequate capacity, with twin shafts.
e. Thermometers:
    1) Furnished for determining the temperature of the mix.
f. Weighting and measuring equipment:
    1) Weighing or volumetric measuring equipment of sufficient capacity.
    2) Devices to permit easy readjustment of any working part needing readjustment, so that the equipment will function properly and accurately.
    3) Attach scales for weighing to the bucket.
    4) Test and seal all weighing equipment by a representative of the Inspector of Weights and Measures having jurisdiction, as often as the ENGINEER may deem necessary to insure accuracy.
g. Tanks for storage of bituminous material:
    1) Capable of heating the material under effective and positive control at all times to temperatures within the range stipulated.

2. Asphalt concrete plant operation:
    a. Mineral aggregate:
        1) Dry and heat mineral and then screen into at least 2 fractions and conveyed into separate compartments ready for proportioning and mixing.
        2) When combined with asphalt cement:
    b. Aggregate:
        1) Contain not more than 2 percent moisture by weight.
        2) Be at a temperature within the range of that specified for the asphalt cement but not more than 25 degrees Fahrenheit above the temperature of the asphalt cement.
    c. Combine dry aggregate in the plant in the proportionate amounts of each fraction of aggregate required to meet the specified grading.
        1) Introduce the asphalt cement into the mixer in the amount and at the temperature for the particular material being used.
        2) Continue mixing for at least 30 seconds, and for such longer period as may be necessary to coat all the particles.
    d. When a continuous mixer is used, determine the mixing time by weight method using the following formula:
        1) Mixing time in seconds = Pugmill dead capacity in pounds.
        2) Pugmill output in pounds per second.

D. Asphalt concrete placing equipment:
   1. Use equipment for placing, spreading, shaping, and finishing asphalt concrete consisting of a self-contained power machine operating in such manner that no supplemental spreading, shaping, or finishing is required to provide surface which complies with requirements for smoothness contained in this Section.
      a. In areas inaccessible to the machine, hand spreading may be permitted.
   2. Furnish 1 self-propelled, pneumatic-tired roller, and one 8 ton (minimum), smooth-wheel tandem roller.
      a. When spreading is in excess of 100 tons per hour, furnish 1 additional roller of either type for each additional 100 tons, or fraction thereof, spread per hour.

3.03 MIXES

A. Asphalt cement:
   1. Do not mix at temperatures lower than 275 degrees Fahrenheit nor higher than 325 degrees Fahrenheit.
   2. Amount of asphalt cement, by weight, to be added to aggregate shall be at least 5.4 percent of weight of mixture.
   3. Voids filled with asphalt (VFA), %: 70 - 80
   4. Voids in mineral aggregate (VMA), %:
      a. 13.5% - 14.5% for 3/4-inch
      b. 14.5% - 15.5% for 1/2-inch
   5. Dust proportion range: 0.6 - 1.40
   6. Air voids, %: 3.5 - 4.5

B. Asphalt concrete:
   1. Before being delivered to the site, mix aggregate with asphalt cement at central mixing plant.
   2. Use mixing plants that are in good working order with no excessively worn parts and so equipped that:
      a. Temperatures of aggregates leaving dryer, of asphalt cement entering mixer, and of mix leaving mixer can be readily determined and positively controlled within Specification limits at all times.
      b. Weights of different sizes of aggregates and of asphalt cement as set by the ENGINEER can be consistently introduced into mixer.
      c. Asphalt cement can be uniformly distributed throughout mixture with aggregate completely coated.
      d. Mixing time can be positively controlled to minimum specified.
      e. Bin samples of aggregate can be readily obtained.
      f. Provide means of calibrating weighing devices.

PART 4 EXECUTION

4.01 PREPARATION

A. Protection
   1. Prime coated surfaces:
      a. Maintain surfaces until succeeding layer of pavement has been placed.
      b. During this interval, protect primed surfaces against damage and repair any broken spots.
      c. Protect all structures from being spattered or marred by overspray or applicator.

B. Surface preparation:
   1. Prime coat:
      a. Where portions of base course prepared for immediate treatment are excessively dry, sprinkle such portions lightly with water immediately in advance of prime coat application.
      b. Immediately following preparation of base course, apply bituminous material by means of bituminous distributor at the temperature previously specified.
      c. Apply priming material in manner that results in uniform distribution being obtained at all points of surface to be primed.
      d. Following the application of prime material, allow the surface to dry for a period of not less than 48 hours without being disturbed, or for such additional period of time as may be necessary to obtain penetration into the base course and drying out or evaporation of the volatiles from prime material.
      e. Spread sufficient sand on areas which show an excess of bituminous material to effectively blot up and cure the excess.
   2. Base courses:
      a. Thoroughly clean base and apply prime coat before placing asphalt concrete.
      b. Thoroughly clean any existing base, surfacing, or pavement prior to placing plant-mixed surfacing.
      c. Where existing pavement is being widened or extended cut to straight vertical face and treat with asphalt paint binder prior to paving operations.
      d. When asphalt concrete is to be applied over existing pavement and local irregularities in existing surface would result in course of more than specified thickness, bring surface of existing pavement to uniform contour by patching with asphalt concrete thoroughly tamped or rolled until it conforms with surrounding surface, and then apply tack coat.

4.02 APPLICATION

A. Tack Coat:
   1. At existing asphalt to be paved over and at all vertical faces of concrete or asphalt: Apply tack coat at minimum rate of 0.10 gallons per square yard.
   2. Clean the surface of all materials that prevent the tack coat from bonding to the existing surface such as mud, dirt, leaves, etc.
   3. Protect all structures from being spattered or marred by overspray or applicator.

B. Placing and compacting asphalt concrete:
   1. Placing and compacting asphalt mixture: Progress in sections generally not more than 250 linear feet in length.
   2. Spreading of mixture:
      a. Spread, shape, and finish by specified equipment.
      b. Spread each successive strip adjacent to previously spread strip.
      c. Do not compact minimum 6-inch width of each strip adjacent to new strip until after new strip has been placed.
      d. Spread as nearly continuous as possible.
      e. Laying against vertical surfaces such as gutters: Roughen and clean face of vertical surfaces as required for proper bonding and then paint with light coating of asphalt cement or emulsified asphalt.
      f. At terminations of new surface courses: Feather asphalt mixture into existing surface over such distance as may be required to produce smooth riding transition.
      g. Base course and single course construction: Joined by vertical butt joints, finished and rolled to smooth surface.
      h. Rolling:
         1) Perform initial or "breakdown" rolling with tandem power roller and follow spreading operation when mixture has reached temperature where it does not "pick up" on rolls.
         2) Keep rolls properly moistened but do not use surplus of water.
         3) Follow initial rolling with pneumatic roller when mixture is in proper condition and when rolling does not cause undue displacement, cracking, or shoving.
         4) Begin rolling at sides and progress gradually to center, lapping each preceding track until entire surface has been rolled.
         5) Terminate alternate trips of roller in stops at least three feet distant from any preceding stop.
         6) At any place not accessible to roller, thoroughly compact mixture with tampers and finish, if necessary, with hot iron to provide uniform layer over entire width being paved.
   3. Offset longitudinal joints 6 to 12 inches in succeeding courses.
      a. Tack the longitudinal edge before placing the adjacent pass if the previous pass has cooled below 175 degrees F.
   4. Provide finish surface having uniform texture and sealed surface.

C. Slurry sealing:
   1. Slurry seal asphalt pavement after compaction with slurry sealing material applied at rate of 18-22 lbs. per square yard at following locations:
      a. All asphalt pavement.

D. Full-depth asphalt pavement:
   1. CONTRACTOR's option:
      a. Not permitted to use one system in one location and another system elsewhere.

b. Install either asphalt and aggregate base material or full-depth asphalt pavement in areas where paving is indicated on the Drawings or specified to be 2 inches of asphalt concrete over aggregate base course.

c. If option is selected to install full-depth asphalt pavement, prepare subgrade as previously specified in this Section.

d. Substitute asphalt concrete for aggregate base at ratio of 1 inch of asphalt concrete to 2-1/2 inches of aggregate base material. Use full-depth asphalt pavement not less than 4 inches in thickness after compaction.

e. Place asphalt concrete in courses of not more than 4 inches.

f. Use compaction equipment in accordance with following course thicknesses:

1) 1 to 2 inch thickness: Minimum 8 ton roller.

2) 2 to 3 inch thickness: Minimum 10 ton roller.

3) 3 to 4 inch thickness: Minimum 12 ton roller.

2. Pneumatic rollers used for initial or secondary rolling: Use 12 to 15 tons with tires capable of 90 pounds per square inch inflation pressure.

3. Asphalt concrete for full-depth asphalt pavement:

a. Asphalt concrete as previously specified in this Section

b. Apply bituminous prime coats where full-depth asphalt pavement is installed.

c. CONTRACTOR's option: If CONTRACTOR elects to use full-depth asphalt pavement, at road shoulders reduce aggregate base course to minimum aggregate thickness of 4 inches.

4. Except for asphalt thickness, aggregate base course thickness and prime coating, full-depth asphalt pavement comply with requirements of this Section.

4.03 FIELD QUALITY CONTROL

A. Placement:

1. Place the mixture on the roads, pavements, or walks at a temperature not less than 225 degrees Fahrenheit.

B. Tests:

1. Provide sampling and control testing for the asphalt concrete.

a. The type and size of the samples: Suitable to determine conformance with stability, density, thickness, compaction, and other specified requirements.

b. Use an approved power saw or core drill for cutting samples.

c. Furnish all tools, labor, and materials for cutting samples, testing, and replacing the pavement where samples were removed.

d. Take a minimum 1 sample per 200 tons of asphalt concrete placed.

C. Inspection:

1. Asphalt concrete:

a. Test with a 10-foot straightedge laid on the surface parallel with the centerline of the road: Variation of the surface from the testing edge of the straightedge not to exceed 1/4 inch.

END OF SECTION

SECTION 32 31 13

CHAIN LINK FENCES AND GATES

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies galvanized chain link fence comprising fences, gates, and appurtenances.

B. Related Sections:
   1. Section 32 31 15 Hydraulic Vertical Pivot Gate System
   2. Division 3: Concrete support slab.
   3. Division 26: Electrical connections.

1.02 QUALITY ASSURANCE

A. Factory Testing:
   1. Wire fabric and barbed wire shall be tested for zinc coating weight by the method specified in ASTM A90. Ferrous metal, except the fabric, shall be tested for zinc coating uniformity by the method specified in ASTM A239; zinc coating shall withstand six 1-minute dips.

B. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A90	Weight of Coating on Zinc-Coated (Galvanized) Iron or Steel Articles
ASTM A53	Pipe, Steel, Black and Hot-Dipped Zinc-Coated, Welded and Seamless
ASTM A121	Zinc-Coated (Galvanized) Steel Barbed Wire
ASTM A123	Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
ASTM A153	Zinc Coating (Hot Dip) on Iron and Steel Hardware
ASTM A239	Locating the Thinnest Spot in a Zinc (Galvanized) Coating on Iron or Steel Articles by the Preece Test (Copper Sulfate Dip)

Reference	Title
ASTM B221	Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.
ASTM F1184	Industrial & Commercial Horizontal Slide Gates
ASTM A392	Zinc-Coated Steel Chain-Link Fence Fabric

1.03 SUBMITTALS

A. Shop Drawings: Detailed information and specifications for materials, finishes, gate operators, gate elevations, and dimensions. Show location of gate systems in relationship with adjacent fencing and paving, details of installation, hardware locations, and accessories. Provide drawings or templates for installation of anchor bolts in support slab.

B. Wiring Diagrams: Furnish manufacturer's wiring diagrams for gate operator.

C. Product Data: Furnish manufacturer's literature, operator manual, and parts manual for gate and operator and each manufactured accessory to be provided for project.

D. Samples: Approximately 6 inches square, or 6 inches long of posts, rails, braces, fabric, wire, ties, and fittings.

E. Quality Control Submittals:
   1. Manufacturer's recommended installation instructions.
   2. Evidence of Supplier and installer qualifications.
   3. Furnish manufacturer's certification indicating system provided complies with specified requirements.

PART 2 PRODUCTS

2.01 MATERIALS

A. General: Provide steel fence materials commercial grade with black powder-coated steel. All materials to match style, finish, and color of each fence component with that of other fence components.

B. VERTICAL LIFT GATE
   1. See 32 31 15 Hydraulic Vertical Pivot Gate System.
   2. Vertical Pivot Gate System: Ideal Mfg., Inc. /TILT-A-WAY Model HYJ

2.02 CHAIN LINK FENCE FABRIC

A. PVC-coated galvanized fabric conforming to ASTM F668, Class 1 or 29. PVC coating only applies where it is specifically indicated on the Drawings.
   1. Color: Black.
   2. Manufacturers and Products:
      a. Colorbond Corp., Raritan, NJ; Colorbond II.
      b. Cyclone Fence, United States Steel, Chicago, IL; Cyclone Color Fence System.

B. Height: 72 inches, unless otherwise shown.

C. Wire Gauge: No. 9.

D. Pattern: 2-inch diamond-mesh.

E. Diamond Count: Manufacturer's standard and consistent for fabric furnished of same height.

F. Loops of Knuckled Selvages: Closed or nearly closed with space not exceeding diameter of wire.

G. Wires of Twisted Selvages:
   1. Twisted in a closed helix three full turns.
   2. Cut at an angle to provide sharp barbs that extend minimum 1/4-inch beyond twist.

H. Privacy Slats, if called for on Drawings:
   1. HDPE or PVC Top Lock slats sized for No. 9 gauge 2-inch mesh, approximately 1 3/32-inches wide.
   2. Length to match the fabric height minus 2 inches.
   3. Color selected by OWNER.

2.03 FENCE POSTS

A. General:
   1. Strength and Stiffness Requirements: ASTM F669, Heavy Industrial Fence, except as modified in this section.
   2. Steel Pipe: ASTM F1083.
   3. Roll-Formed Steel Shapes: Roll-formed from ASTM A570, Grade 45, steel.
   4. Protective Coatings:
      a. Zinc Coating: ASTM F1234, Type A external and internal coating.
   5. Color Coating: ASTM F1043, minimum 10 mils thickness over zinc coating to match color of chain link fabric.

B. Line Posts:
   1. Steel Pipe:
      a. Outside Diameter: 2.375-inch.
      b. Weight: 3.65 pounds per foot.
   2. Roll-Formed Steel C Shape:
      a. Outside Dimensions: 2.25-inch by 1.625-inch.
      b. Weight: 2.70 pounds per foot.
   3. Steel H-Section:
      a. Outside Dimensions: 2.25-inch by 1.70-inch.
      b. Weight: 3.26 pounds per foot.

C. End, Corner, Angle, and Pull Posts:
   1. Steel Pipe:
      a. Outside Diameter: 2.875-inch.
      b. Weight: 5.79 pounds per foot.

D. Posts for Removable Fence Panels: As specified for end, corner, angle, and pull posts.

2.04 TOP RAILS AND BRACE RAILS

A. Galvanized steel pipe or roll-formed steel C shapes, color-coated.

B. Protective Coatings: As specified for posts.

C. Color Coating: ASTM F1043, minimum 10 mils thickness over zinc coating to match color of chain link fabric.

D. Strength and Stiffness Requirements: ASTM F669, Top Rail, Heavy or Light Industrial Fence.

E. Steel Pipe:
   1. ASTM F1083.
   2. Outside Diameter: 1.625-inch.
   3. Weight: 2.27 pounds per foot.

F. Roll-Formed Steel C Shapes:
   1. Roll formed from ASTM A570, Grade 45.
   2. Outside Dimensions: 1.625-inch by 1.25-inch.
   3. Weight: 1.40 pounds per foot.

2.05 FENCE FITTINGS

A. General: In conformance with ASTM F626, except as modified by this article.

B. Post and Line Caps: Designed to accommodate passage of top rail through cap, where top rail required.

C. Tension and Brace Bands: No exceptions to ASTM F626.

D. Tension Bars:
   1. One-piece.
   2. Equal in length to full height of fabric.

E. Truss Rod Assembly: 3/8-inch diameter.

F. Barb Arms: 45-degree arms for supporting three strands of barbed wire.

2.06 TENSION WIRE

A. Zinc-coated steel marcelled tension wire conforming to ASTM A824, Type II, Class 2.

2.07 TRUSS RODS AND MISCELLANEOUS FITTINGS:

1. Truss rods shall be fabricated of 3/8-inch diameter steel rods and shall have turnbuckles or similar means of adjustment. Extension arms for barbed wire shall be steel or malleable iron. Gate hinges, drop bar locking devices, caps, gate stops and miscellaneous bolts, bands, and other appurtenances shall be consistent in quality and strength to the rest of the fence. Fittings used shall be hot-dip galvanized iron or steel with a minimum coating of at least 2.0 ounces of zinc per square foot of surface in accordance with ASTM A123 or A153, whichever is applicable.

2.08 CONCRETE:

1. Concrete for post foundations shall be as specified Type C-1 in Section 03 30 00.

2.09 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's product information designating specific materials provided.
   2. Results of the factory testing specified in paragraph 1.02 Factory Testing.
   3. The layout of the chain link fence as it is to be provided illustrating fence height, post sizes, bracing configurations, and accessories.

PART 3 EXECUTION

3.01 GENERAL

A. Install chain link fences and gates in accordance with ASTM F567, except as modified in this section, and in accordance with fence manufacturer's recommendations, as approved by ENGINEER. Erect fencing in straight lines between angle points.

B. Provide all necessary hardware for a complete fence and gate installation.

3.02 FENCE

A. Line posts shall be equally spaced between corners, end posts, and gate posts at a spacing not exceeding 10 feet. The base top shall be at least 1 inch above grade and sloped for drainage. Posts shall be set vertical, shall be accurately aligned, and shall have their tops level or at a constant slope between changes in grade. Tubular posts shall be fitted with extension arms for barbed wire, post top to permit passage of top rail or rainproof malleable iron caps as applicable.

B. Corner, end, and gate posts shall be braced to the nearest line post. Corner and end posts shall be diagonally braced. Bracing for gate posts shall be horizontal braces with truss rods. Line posts shall be braced horizontally and trussed in both directions with truss rods at 1000-foot minimum intervals. Top rails, where specified, shall be in lengths not less than 18 feet and shall be fitted with couplings for connecting lengths into continuous runs. Couplings shall be not less than 6 inches long and allow for expansion and contraction of the rail.

C. Chain link fabric shall be taut and shall be attached to posts, rails, and wires with galvanized fabric bands or tie wires at a maximum spacing of 12 inches on posts and 18 inches on the rails and tension wires. Stretcher bars shall be provided at ends of fabric. The bottom tension wire shall be stretched tight and shall be located 2 inches maximum above finished grade and on a straight grade between posts by excavating the high points of ground, and in no case shall depressions be filled.

D. Unless otherwise specified, three strands of barbed wire attached to extension arms shall be provided along the fence top. Extension arms shall overhang the outside of the fence at a 45-degree angle. The topmost strand of barbed wire shall be 12 inches above the top of the fabric.

E. Provide a continuous brace rail set 1 ft below top rail. All fence panels to include

3.03 GATES

A. See Manufactuers Instructions and Section 32 31 15 Hydraulic Vertical Pivot Gate System

B. Gate frames shall be fabricated with welded joints or rigid connectors. The fabric shall be the same as that used for the fence and shall be rigidly attached to the frames. Frames shall be suitably braced and trussed. Gates shall be equipped with suitable offset hinges to permit a 180-degree swing and a drop bar locking device with provision for padlocking. A stop to hold the gate open and a center rest with catch shall be provided. Unless otherwise specified, three strands of barbed wire shall be provided on top of chain link gates.

3.04 FIELD QUALITY CONTROL

A. Installer Qualifications: Firm approved by manufacturer or with minimum five years successful experience completing vertical pivot gate installation similar to that required.

B. Pre-installation Conference: Conduct meeting at site prior to commencing work related to vertical pivot gate operator system installation.
   1. Require attendance of parties directly affecting vertical pivot gate operator installation.
   2. Review site conditions, procedures, and coordination required with related work.

C. Field Measurements: Verify dimensions and component layout by field measurements prior to beginning installation.

D. Gate Tests: Prior to acceptance of installed gates and gate operator systems, demonstrate proper operation of gates under each possible open and close condition specified.

E. Provide manufacturer's standard limited warranty for gate operator system and system components against failure resulting from normal use based on manufacturer's literature.
   1. Failure shall be defined as any defect in manufacturing which prevents gate from operating as intended.
   2. Warranty Period: Three years.

END OF SECTION

THIS PAGE IS INTENTIONALLY LEFT BLANK

32 31 15

HYDRAULIC VERTICAL PIVOT GATE SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes: Provide vertical pivot gate system including gates and special Tilt-A-Way hydraulic operator, with accessories as required for complete operational installation. Tilt-A-Way vertical pivot gate systems are UL 325, and CSA C22.2#247 listed.

B. Related Sections:
   1. Section 32 31 13: Chain link fences and gates.
   2. Division 3: Concrete support slab.
   3. Division 26: Electrical connections.

1.02 SYSTEM DESCRIPTION

A. Performance Requirements:
   1. Safety Devices: Provide manufacturer's standard safety devices including the following features.
      a. Provide pressure relief valve to avoid crushing obstruction encountered in either direction of travel.
      b. Provide shut off power device if balance system fails.
   2. Power Failure: Provide manual bypass system, which allows barrier to be opened and to be closed in event of power failure.
   3. Operation: Design system to allow for a minimum of 2900 open and close operations per day.

B. Gate Height: Total height 7-ft. 6 ft line post with 1ft extension for 3 lines of barbed wire. Match Barrier Style Patriot.
   1. [Note: Gate widths from 25 feet wide or up to 50 feet total width for two vertical pivot gate operators are possible with aluminum barriers, up to 40 feet total width for steel barriers, with no center posts, overhead supports, tracks, or special framing required.]

C. Gate Width: Provide widths as indicated on drawings. Provide 2 vertical pivot gates operators for greater than 25 ft wide entrance.

1.03 SUBMITTALS

A. Product Data: Furnish manufacturer's literature for gate and operator and each manufactured accessory required for Project.
   1. Wiring Diagrams: Furnish manufacturer's wiring diagrams for gate operator.
   2. Maintenance Data: Furnish manufacturer's operators and parts manual.

B. Shop Drawings: Show location of vertical pivot gates system in relationship with adjacent fencing and paving, details of installation, hardware locations, and accessories.
   1. Templates: Provide drawings or templates for installation of anchor bolts in support slab.

C. Certificates: Furnish manufacturer's certification indicating system provided complies with specified requirements.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: Firm approved by manufacturer or with minimum five years successful experience completing vertical pivot gate installation similar to that required.

B. Pre-installation Conference: Conduct meeting at site prior to commencing work related to vertical pivot gate system installation.
   1. Require attendance of parties directly affecting vertical pivot gate installation.
   2. Review site conditions, procedures, and coordination required with related work.

1.05 PROJECT CONDITIONS

A. Field Measurements: Verify dimensions and component layout by field measurements prior to beginning installation.

1.06 WARRANTY

A. Provide manufacturer's standard limited warranty for system and system components against failure resulting from normal use based on manufacturer's literature.
   1. Failure shall be defined as any defect in manufacturing, which prevents the gate from operating as intended.

B. Warranty Period: Three years.

PART 2 PRODUCTS

2.01 MANUFACTURER

A. Ideal Manufacturing, Inc., 2011 Harnish Blvd., Billings, MT 59101.

Telephone 800-523-3888 or 406-656-4360; Fax 406-656-4363.

Web address: www.tilt-a-way.com; E-mail: info@tilt-a-way.com

2.02 MANUFACTURED UNIT

A. Vertical Pivot Gate System: Ideal Mfg., Inc. /TILT-A-WAY Model HYJG.

2.03 COMPONENTS

A. Hydraulic Power Unit: 1 HP TEFC motor, 1725 RPM, 220 VAC Single Phase Spencer Hydraulic power unit capable of delivering 4 GPM at 385 PSI, with external adjustment relief valve and 4-way solenoid operated 3-position manual override valve.
   1. Hydraulic pump, motor, and reservoir will all be as one unit with fluid thermometer and fluid level sight gauge.
   2. The hydraulic system will be designed to keep the gate locked in the closed position, keeping any person from lifting the gate open when it is in the closed position.
   3. Pedestal Frame: Welded construction with removable outer skin of cross break corrosion resistant painted gray .063 aluminum plate panels.
   4. Inspection Door Hardware: Stainless steel continuous hinges and heavy-duty lockable pull down catches to hold inspection door shut.
   5. Power: [208 / 230 VAC Single Phase] 3 Wire.
      a. The total gate system requires 20-amp service, with no more than 3% drop in voltage, while gate is in operation. Note: If your installation requires 110 volts AC run a neutral wire (208 / 230 VAC Single Phase 4 Wire). (FOR WIRE SIZE: CONSULT LOCAL ELECTRICAL CODE.)

B. Hydraulic System: 3000-psi hydraulic cylinder.
   1. Cylinder: 2-1/2" by 38" stroke hydraulic cylinder with 1-3/8" diameter rod, limit switches and cushioned slow down on each end of travel, and adjustable stops with lock down in any position.
   2. Hydraulic Fluid: Manufacturer's standard, factory checked, filled, and tested.

C. Balance System: System designed to allow barrier to be hand raised and to be hand lowered with 12 to 15 pounds of pressure, consisting of manufacturer's standard cables, sheaves, sealed cam yoke roller bearings, and tension springs pulled in a straight line.
   1. Safety Control Switch: Provide built-in safety control switch capable of stopping barrier in any position should balance system fail.
   2. Testing: Factory test and adjust balance system to ensure gate may be manually raised and lowered with specified pressure.
   3. Signage: Signage to be added to the gate barrier must be declared at the time of order so the manufacturer can add the signs on the barrier, to ensure Ideal Mfg. balances the operator correctly at the time of manufacturing.

D. Electrical System: Oversized rain tight enclosure housing electrical components except limit switches, safety switches, and motor.
   1. Wire: Oil and gasoline resistant.
   2. Overload Protection: Allen Bradley type overload protection relay to protect motor.
   3. Reversing Controller: Provide as required to operate motor and solenoid valves.
   4. Overrun Delay Timers: Integral to board capable of shutting down system in case motor runs longer than 30 seconds.
   5. Limit Switches: Adjustable snap action style limit switches capable of stopping barrier at each end of travel.
   6. Logic Board: Programmable logic board with manufacturer's full range of available functions.

7. All gates are equipped with a dry contactor to accommodate all types of access equipment.
    a. [Note: Coordinate selection of following options with manufacturer.]
8. Options:
    a. Cold Weather Package: (required in areas where the temperature drops to less than 35° F).
    b. Stanchion: (this is for the free end of the gate).
    c. Radio Controls: Provide standard open-close-stop commercial transmitters/receivers systems.
    d. Loop Detectors: Provide detector system (except loop) to allow free exit/safety, safety, or close gate operation; system to be factory wired inside electrical box and tested.
    e. Reversing Edge: Provide manufacturers standard reversing edge system.
    f. Synchronizing Box: Master slave system for paired gate system (required only when 2 gates operate in conjunction with each other).
    g. Gate Status Lights: Provide light stacks indicating gate status: such as green light indicates barrier is open; red light indicates barrier is closed; and amber flashing indicates barrier is moving.
    h. Locks: Magnetic lock secures gate in closed position.
    i. Photo Eye: Used as a form of safety.
    j. S.O.S.: Siren Operated Sensor (emergency access system)
    k. Stainless steel fasteners.
    l. Heater for Electrical Box: Provide heater, including full box insulation to protect system for conditions to -70° F.
    m. Ice Scrapers: (for cable sheaves).
    n. Weather Guard Package.
        1) *[Note: Coordinate selection of systems with vertical pivot gate system manufacturer.]*
    o. Access Control Systems:
        1) Key switches.
        2) Keypads.
        3) Card readers.
        4) Intercom stations.
        5) Proximity card readers.
        6) Phone access systems.
        7) Fire access systems.
        8) Pedestals.
        9) Closed circuit television.
        10) Infrared detectors.

E. Barrier System (Gates): Design to resist twist and to resist sway.
   1. Type: Manufacturer's standard aluminum barrier (up to 25 foot wide opening per gate leaf), nominal 3.125" by 2.875" diamond 6063-T5 alloy aluminum screen fabric (amplimesh) welded both sides completely, with sway bracing. Leading member of an aluminum barrier 4" schedule 40 round tube, sway braces- 1 ¼ x 1 ¼ x 1/8 square tube uprights- 2 x 2 x .188 square tube. Sway braces bolted to barrier. Barriers with sway braces are designed to withstand 100 MPH wind load, or optional 150 MHP sway bracing.
   2. Type: Custom barrier as indicated on Drawings, with sway bracing.
   3. Options: Provide stanchion to contain free end for severe crash applications; match barrier.

F. Accessories: Provide as required for complete operational installation.
   1. Child Guards: Provide child and small animal guard on secured side of operator.

2.04 FINISHES

A. Finish: Factory prime with DTM epoxy and paint with Gensis acrylic urethane topcoat to resist corrosion.
   1. Color: [As selected from manufacturer's standard colors.] [Custom color as indicated on Finish Schedule.]
   2. The manufacturer's standard color is Sherwin Williams Gray.
   3. Specify color of gate if different from manufacturer's standard color.
   4. If a color (other than standard gray) is ordered the operator panels will be made with 16 gauge aluminum.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions: Verify concrete support slab complies with requirements and verify anchors and conduits are properly installed
   1. Ensure alignment with adjacent construction, fencing, and paving, coordinate with adjacent construction.

3.02 INSTALLATION

A. Comply with manufacturer's recommendations and installation instructions.
   1. Install vertical pivot gate system to provide rigid and secure installation as indicated, straight and true to lines and levels indicated, for free, effortless operation.
   2. Install components square and level, accurately fitted and free from distortion and free from defects.

B. Advise Owner regarding programmable features and controls and preset controls according to Owner requirements.
   1. Instruct Owner personnel in proper operation, maintenance, and reprogramming of system.

3.03 PROTECTION

A. Protect vertical pivot gate system from damage during remainder of construction operations; replace components damaged by subsequent construction operations.

B. Touch-up scratched and damaged surfaces using same primer and finish system applied in shop.

END OF SECTION

SECTION 32 80 00

LANDSCAPE IRRIGATION SYSTEM

PART 1 GENERAL

1.01 THE REQUIREMENT

A. The CONTRACTOR shall construct an automatic irrigation system, complete and operable, in accordance with the requirements of the Contract Documents.

B. Said irrigation system shall include but not be limited to all pipes, fittings, irrigation drip emitters, valves, pump assemblies, automatic control valves, controller, valve boxes, drain valves, quick coupler valves, operating wrenches, riser assemblies, direct burial wires, electrical connections, filter, wiring and other appurtenances, piping, connections, testing, cleaning-up, maintenance and adjustments necessary for a complete operating system, ready for immediate use upon completion. Minor items necessary for proper construction and functional operation of this system, not specifically described in the Contract Documents, shall be included as a part of the work of this Section.

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Codes: All codes, as referenced herein, are as specified in Division 01.

B. Commercial Standards:

ASTM B 3	Specification for Soft or Annealed Copper Wire
ASTM D2564	Specification for Solvent Cements for Poly (VinylChloride) (PVC) Plastic Pipe and Fittings
AWWA C 500	Gate Valves for Water and Sewerage Systems

1.03 CONTRACTOR SUBMITTALS

A. Manufacturer's literature, samples (where requested by the Owner) and installation instructions shall be submitted in accordance with Division 01 Section “Contractor Submittals."

B. Record drawings, showing actual locations of all valves, pipes (lines), heads, dimensions, controllers, control lines, and electrical wires shall be submitted prior to final inspection. Diagrammatic location of irrigation system components is not acceptable when submitting record drawings – actual location of irrigation system equipment is required for locating in the field.

1. Actual routing of mainline with dimensions from fixed points.
2. Actual routing of control wiring with dimensions from fixed points.
3. Location of wire splices (must be placed in valve box and only use splices in approved locations)
4. Actual routing of lateral lines and head locations
5. Actual location of valve boxes with notes on type of valve used at each location.
6. Actual location of sleeves with dimensions from fixed points.
7. Actual location of stubbed mainlines or lateral lines (if applicable)

8. Provide legend of symbols/notes used on record drawings.
9. Any other notes as necessary to enable the owner to understand and locate irrigation system equipment in the field upon completion of the project.

C. Controller literature, specifications, installation wiring diagram, and circuit breaker information shall be submitted to the OWNER for review prior to ordering.

D. Equipment for Operation: The CONTRACTOR shall provide the following equipment, in addition to what is indicated on the Drawings.
1. Two keys for locking automatic controller door.
2. One Gate valve key.
3. Two keys for locking valve boxes.
4. 2 Valve Keys for Quick Coupler – coordinate with Owner.
5. One Valve Key for Manual Drain Valve.

E. A reduced copy of the irrigation plan shall be laminated and mounted in the controller.

1.04 QUALITY ASSURANCE

A. In addition to other inspections, as provided by the OWNER, the CONTRACTOR shall give at least 72 hours' notice to the OWNER for scheduling the following special inspections:
1. Layout of the system
2. Inspection of trenches, backfilling, and equipment.
3. Pressure tests
4. Coverage adjustment
5. Automatic operation

B. The CONTRACTOR shall notify the OWNER at least 72 hours prior to performing the tests. All tests shall be performed in the presence of the owner's representative. Test requirements shall be as follows:
1. After assembly and installation, all water pipes, fittings, automatic equipment, and appurtenances shall be tested at a hydrostatic pressure of 150 psi at the lowest point of the system for not less than 60 minutes.
2. The first test shall be made in such a manner that all valves in the new water pipe irrigation lines will be tested for watertight closure. Valves may be tested in groups or singly while subjected to 150 psi water pressure for a period of not less than 60 minutes.
3. The second test shall be made by forcing all air from the pipes with water and capping or plugging pipe risers. After the pipe risers have been plugged or capped, all line valves shall be fully opened, and the pipelines subjected to the full static water pressure for a period of not less than 120 minutes. Pressure pipelines 150 PSI).
4. The third test required that lateral lines be tested at 100 psi for 120 minutes.
5. The fourth test requires that all pressure lines be tested at 120 psi for 24 hours.
6. Water lines and valves which show evidence of leakage or fail to be watertight shall be repaired or replaced. After all repairs or replacements have been made, the above-required tests shall be performed again.

7. When the irrigation system is completed, the CONTRACTOR, in the presence of the OWNER, shall test coverage of water afforded the lawn and planting areas. The CONTRACTOR shall furnish all material and perform all the work required to correct any inadequacies of coverage disclosed. The CONTRACTOR shall inform the OWNER of any deviation from the Drawings required due to wind, planting, soil, or site conditions that bear on proper coverage.
8. Upon completion of each phase of the work, the CONTRACTOR shall check and adjust each irrigation head to meet the site requirements and the requirements of the Contract Documents.
9. (Testing as noted in 1 through 5 is at the owner's option, and generally will not be required unless verification of the contractor's workmanship and quality is required.)

C. Certifications: All General laborers or workers on the Project shall be previously trained and familiar with sprinkler installation and have a minimum of one year's experience. Those workers performing tasks related to PVC pipe and electrical components shall have certificates designated below:
   1. Certified Irrigation Contractor
   2. All workers engaged in handling, assembling, and gluing of PVC pipe shall carry on Project site a Certificate of Training from the IPS factory representative authorizing said worker to prime and glue PVC pipe.
   3. All Workers engaged in the installation of irrigation pipe, which is assembled using joint restraint fittings, shall carry on project site; a Certificate of Training from authorized representative of Ductile Iron Fitting Manufacturer, (HARCO, Leemco, or approved equal) indicating:
      a. Contractor firm has been adequately trained in installation of joint restraints to replace thrust blocking.
      b. Authorizing said worker to install Ductile Iron fittings, joint restraints, isolation line valves, manifold isolation valves.
   4. Documents verifying Certified Irrigation Contractor, PVC Pipe Certification, Electrical Component Certification, and Joint Restraint Systems shall be provided to Owner's Representative at least 30 days in advance of any irrigation installation on project site.

1.05 INSTRUCTION

A. The CONTRACTOR shall, upon completion of the maintenance period of the irrigation instruct the OWNER and the OWNER'S personnel as to the proper operation and maintenance of the system.

1.06 EXISTING UTILITIES AND CONDITIONS

A. Prior to cutting into the soil, the CONTRACTOR shall locate all cables, conduits, sewers, septic tanks, and other such underground utilities, and shall take proper precautions not to damage or disturb such improvements. If a conflict exists between such obstacles and the proposed work, the CONTRACTOR shall promptly notify the OWNER.

B. The CONTRACTOR shall be responsible for coordinating its work with the operation of existing utilities and new utilities on the Project. The CONTRACTOR shall notify the OWNER or its representative when utilities which are in operation require shut-off.

C. Due to the scale of Drawings, it is not possible to indicate all offset, fittings, etc., which may be required. The CONTRACTOR shall carefully investigate the structural and finished conditions affecting all its work, and plan its work, accordingly, furnishing such fittings, etc., as may be required to meet such conditions. The Contract Documents are generally diagrammatic and indicative of the work to be installed. The work shall be installed in the most direct and workmanlike manner, so that conflicts between irrigation systems, planting, structures, piping, etc. will be avoided.

D. The CONTRACTOR shall verify the water pressure available at the site before installation of the system to make sure there is adequate pressure (design pressure 30 to 40 psi) to properly operate irrigation heads and valves and shall also provide pressure reducing valves if required before commencement of any work. Minor additions and adjustments of heads, piping, and circuits shall be made at no additional cost to OWNER where it is necessary to make the irrigation system operate properly.

1.07 STORAGE OF MATERIALS

A. The CONTRACTOR shall be responsible for storage of materials and for damage to the WORK covered by these Contract Documents before final acceptance of its work. The CONTRACTOR shall securely cover openings into the system, and shall cover all apparatus, equipment, and appliances both before and after being set in place to prevent obstruction in the pipes and the breakage, misuse, or disfigurement of said apparatus, equipment, or appliances.

1.08 SCHEDULING AND COORDINATION

A. The CONTRACTOR shall be responsible for deciding for the coordination of its construction operations with those of all others on the job. The CONTRACTOR shall permit others engaged in work to accomplish their portion of the WORK without undue interference or delay.

B. The CONTRACTOR shall be responsible for the scheduling and coordination of the electrical and water connections and the installation of the piping and equipment in a manner that will affect the earliest completion of the WORK in conformance with the construction progress schedules.

C. If electrical service is not already in place, the Contractor will be required to make all necessary arrangements with the power utility company including, but not limited to, paying fees, making power connections, providing poles, weatherhead and meter, etc., as specified on the plans. All permits, fees, and compliance with electrical company requirements shall be the Contractor's responsibility.

1.09 GUARANTEE/WARRANTY OF THE IRRIGATION SYSTEM

A. The CONTRACTOR shall guarantee the complete irrigation system to be free from leaks or breakage due to defective material or workmanship for a period of one year from the date of acceptance of the complete work by the OWNER. Damage due to sabotage and/or vandalism is specifically excepted from this guarantee.

B. Other items of the required guarantee shall be as specified in the Division 32 Section “Landscape Planting”.

C. The CONTRACTOR shall repair any settling of backfilling trenches occurring during a one-year period after final acceptance without expense to the OWNER including complete restoration of all damaged planting, paving, or other improvements of any kind.

D. The CONTRACTOR shall provide winterization of the irrigation system during the one-year guarantee period.

E. When defective material or workmanship is discovered which will require repair or replacement, all such repair work or replacement work shall be done by the CONTRACTOR at its own expense within 24 hours after written notification is given to the CONTRACTOR by the OWNER of such required repairs. However, if the CONTRACTOR fails to comply with the requirements of the above guarantee within the 24 hours after notification is given, the OWNER shall proceed to have the repairs made by others at the CONTRACTOR'S expense.

PART 2 PRODUCTS

2.01 GENERAL

A. Brand names specified for materials are supplied for the purpose of describing the type, size, quality, and performance of materials in the Irrigation Schedule. The CONTRACTOR may propose other manufacturers and models, as substitutions for those other than indicated in the Irrigation Schedule, if the materials are of equal quality and performance to the OWNER for review in accordance with Division 01 Section "Contractor Submittals." Any proposed irrigation equipment submitted by the contractor for approval as proposed substitution shall hydraulically match the originally specified equipment in the Drawings (i.e., flow rate, precipitation rate, friction loss, etc.)

B. The CONTRACTOR shall furnish, at no additional charge, all samples necessary for testing as outlined in the Specifications or, when requested, certified evidence of off-site testing.

C. Equipment compatibility: automatic controller and automatic (remote) control valves shall be products of the same manufacturing company.

D. The electrical point of connection for the irrigation system automatic controller shall be 120-volt electrical supply or as per manufacturer’s recommendations.

2.02 PLASTIC PIPE AND FITTINGS

A. Pipe shall be continuously and permanently marked with the following information: manufacturer's name, nominal pipe size, PVC type, pressure rating, and extrusion date.

B. All plastic pipes for lateral lines shall be PVC (polyvinyl chloride) SDR 21, Schedule 40, NSF approved.

C. Materials for pressure main lines shall be PVC (polyvinyl chloride) SDR 21, Schedule 40, NSF approved, or galvanized steel pipe.

D. Pipe and Fittings Table:

Size	Mainline Piping	Mainline Fittings	Lateral Piping	Lateral Fittings
1"	SCH 40	SCH 40	SCH 40	SCH 40
1-1/4"	SCH 40	SCH 40	SCH 40	SCH 40
1-1/2"	SCH 40	SCH 40	SCH 40	SCH 40
2"	SCH 40	SCH 80	SCH 40	SCH 80
2-1/2"	SCH 40	SCH 80	SCH 40	SCH 80
3"	SCH 40	SCH 80	SCH 40	SCH 80

E. Ductile iron fitting shall be grade 65-45-12 in accordance with ASTM A-536. Fitting shall be deep bell push-on joints with gaskets meeting ASTM F-477. Fittings shall be Harco Deep Bell or approved equal. Transition gaskets are not allowed.
   1. All Ductile Iron fittings shall include Joint Restraints at each fitting.
   2. All Ductile Iron fittings shall come from a manufacturer offering a 10-year warranty on products and replacement labor costs. Prior to install, Contractor shall provide OAR documentation from the manufacturer shall provide documentation stating the above warranty information, including the labor reimbursement hourly rate.
   3. All Ductile Iron fittings and joint restraints shall have a fusion bonded epoxy coating on interior and exterior of the product surface, average of 10-12mm thickness. Epoxy coating shall conform to the requirements of CSA Z245.20-20 and NSF 61 for water services. Tar/bitumen coating will not be approved.
   4. All bolts used in fittings to be stainless steel.

F. Swing joint ells and nipples shall be Schedule 80 PVC or galvanized as noted on Drawings.

G. Control wiring conduit
   1. rigid non-metallic schedule 40 PVC
   2. UL listed: meets requirements of UL 651.

2.03 VALVES

A. Gate valves shall be as indicated on the Drawings.

B. Master valves shall be as indicated on the Drawings.

C. Isolation valves for valve manifolds shall be as indicated on the Drawings.

D. Remote Control Valves shall be as indicated on the Drawings.
   1. Each group of remote-control valves shall be housed in a poly plastic valve box with locking lid and gravel base.

E. Quick-coupling valves shall be as indicated on the Drawings.

F. Manual drain valves shall be as indicated on the Drawings.

2.04 AUTOMATIC CONTROLLER

A. Shall be as indicated on drawings.

2.05 DRIP EMITTERS

A. Drip Emitters shall be the model and type indicated on the Drawings.

2.06 BACKFLOW PREVENTER

A. Backflow Preventer shall be the model and type indicated on the Drawings.

2.07 FLOW SENSOR

A. Flow Sensor shall be the model and type indicated on the Drawings.

2.08 CONTROL WIRING

A. All splices shall be made with wire connectors, such as manufactured by 3M DBY or approved equal.

B. Electric Control Wire shall be Polyethylene (PE) UF DIRECT BURIAL type. The wire which is routed from the Electric Remote-Control valve to the controller shall be #14 AWG.

C. Use PE-39 shielded communication cable for flow sensor and master valves.

2.09 PVC SOLVENT CEMENT AND PRIMERS

A. Solvent Cement shall be NSF approved and shall meet the requirements of ASTM D 2564.

B. The Primer shall be NSF approved and shall be Weld-On, P-70 Industrial Polychemical Service or approved equal.

2.10 VALVE AND CONTROLLER BOXES

A. Boxes for valves shall be heavy duty plastic Rain Bird, Carson-Brooks, complete with locking lids, or approved equal.

B. Boxes and lids shall be tan color in shrub beds and green turf areas.

PART 3 EXECUTION

3.01 GENERAL

A. Installation of the irrigation system shall be performed after the finish grading, but prior to landscaping.

B. All valves, fittings, drip emitters, and piping shall be installed as indicated on the Drawings and all connections made to permit the irrigation system to function properly through its entire length.

C. All materials and equipment shall be installed in strict accordance with the manufacturer's written instructions and recommendations and all local and state codes, laws, ordinances, and regulations.

D. Before proceeding with the installation of any section or unit of the irrigation system, the CONTRACTOR shall check and verify the correlation between ground measurements and Drawings and shall advise the OWNER of any discrepancies.

E. The total number of irrigation drip emitters and circuits and size of pipes shall be not less than shown unless otherwise approved. The stated maximum spacing for each type of irrigation drip emitters shall not be exceeded.

3.02 EXCAVATION

A. Trenches shall be dug as wide and as deep as necessary to properly install the irrigation pipe.

B. Pipe trenches shall be straight, or "snaked" slightly allowing for expansion and contraction of PVC pipe.

C. Subsoil shall be kept separate from topsoil, where possible.

D. Minimum cover depth shall be as follows:
   1. Supply pressure lines from water source to control valves: 18 inches unless otherwise indicated on the Drawings.
   2. Lateral lines from control valves to irrigation drip emitters; 8 and 16 inches unless otherwise indicated on the Drawings. Lateral lines under paving, roadways, and driveways shall have 18 inches of cover and located in Schedule 40 PVC sleeves
   3. Trenches for control wire only shall be 18 inches deep unless otherwise indicated on the Drawings. Control wires under concrete walks and slabs, paving, roadways, and driveways shall be installed in Schedule 40 PVC sleeves.

E. A trench of sufficient width shall be provided to allow for proper tamping around pipe.

3.03 PIPING-GENERAL

A. Piping shall be laid out and installed in accordance with manufacturer's printed recommendations and industry standards. Substantial support shall be provided at all points, and pipes shall be snaked slightly allowing for expansion and contraction.

B. Minimum 1-inch vertical clearance shall be between lines crossing at angles greater than 45 degrees.

C. Minimum 3 inches horizontal and vertical clearances shall be between all other lines.

D. All swing or swivel joints shall provide a leak-resistant joint with freedom of movement.

E. Teflon thread sealant 3/4-inch wide (tape or liquid) or approved equal shall be used at all threaded joints.

F. Galvanized steel pipes shall have clean standard threads of standard lengths. Joints shall be made up with pipe compound applied to male threads only and not more than 2 threads shall show at the joints when connected.

G. Pipe sleeves shall be provided under all paving and where necessary for passage under finish surface material, future replacement, and for protection of PVC piping and control wire.

3.04 PLASTIC PIPE

A. The pipe shall be guaranteed by the manufacturer to be suitable for operation under the conditions of this installation and shall be guaranteed free from defects in workmanship and quality.

B. The pipe shall be connected by O-ring type or by solvent-weld joints as outlined below. Joints shall be made in strict accordance with the manufacturer's printed recommendation.

C. The plastic pipe sections shall be placed accurately to line and grade in the prepared trenches. The inside of all pipes shall be clean and free from foreign matter and shall be end-reamed to remove burrs and provide full inside diameter of the nine end.

D. Pipe assembly shall have a firm, uniform bearing for the entire length of each pipeline to prevent uneven settlement. All adjustments to grade shall be made by scraping away or filling in with clean earth backfill material, well compacted under the body of the pipe. Wedging of pipe will not be permitted. The inside of all pipes shall be clean and free from foreign materials before joints are assembled.

E. Sealant tape shall be used on all threaded joints.

F. All pipeline open ends upon which the WORK has been stopped shall be closed at the end of each day's construction work with a suitable temporary plug to prevent entrance of any foreign materials into the assembled pipeline.

G. Pressure pipe shall be defined as all piping lying "upstream" from remote control valves and quick-coupling lines.

H. Joint Restraint System
   1. All ductile iron pipe fittings and mainline gate valves shall be restrained by the joint restraint system. Fittings shall require a ‘fitting to pipe restraint’ and mainline gate valves shall require a ‘valve to pipe’ restraint. When required by manufacturer, gasket bell ends of pipe shall require a ‘pipe to pipe’ restraint.
   2. Concrete thrust blocks shall not be used.
   3. Joint restraints are needed on pipe sized 3” and larger, wherever the main pipeline:
      a. Changes any direction at tees, angles, and crosses vertical and horizontal.
      b. Changes size at reducers.
      c. Stops at a dead-end.
      d. Valves at which thrust develops when closed.

4. The size and type of joint restraint system depends on a number of factors, including pressure, pipe size, kind of soil, and type of fitting. Refer to detail table, as well as manufacturer's recommendations for proper sizing and types.

I. All pipes, lines, and risers shall be flushed thoroughly with water before installation of any drip emitters. All debris and rocks found at that time shall be removed from the area as soon as possible.

J. The areas noted on the details table shall be measured in a place perpendicular to the longitudinal axis of the pipe or to the longitudinal axis of the thrust developed. The thrust block bearing area shall be against undisturbed around.

K. Compression fitting (compression by compression slip joint PVC) shall be provided on mainline at 250 on center for expansion and contraction of mainline on straight runs on solvent welded pipe.

3.05 VALVES

A. Piping systems shall be supplied with valves at all points as indicated on the Drawings or specified herein so arranged to give complete regulating control throughout. Automatic control valves and gate valves shall be as detailed in the Contract Documents or as otherwise directed by the OWNER.

B. Valves shall be the full size of the line in which they are installed, unless otherwise indicated on the Drawings.

C. Remote control valves shall be adjusted so the most remote irrigation drip emitters operate at the pressure recommended by the drip emitter manufacturer. Remote control valves shall be adjusted so a uniform distribution of water is applied by the irrigation drip emitters to the planting areas for each individual valve system. A union fitting shall be provided on the discharge side of the control valve. They shall be wired to operate in the order as shown. They shall be capable of being operated manually entirely independent of the controller.

D. Isolation shall be installed as indicated on the Drawings.

E. Manual Drain valves shall be installed where indicated on the Drawings.

F. Quick-coupling valves shall be provided, located, and installed as indicated on the Drawings.

3.06 VALVE BOXES

A. All valve assemblies shall be installed as indicated on the Drawings.

B. Install all Valve Boxes no closer than three feet from sidewalks, curbs, and all hard surfaced areas. Where three feet clearance from hardscape is not possible, locate the valve box as far as practical from areas of vehicle traffic. Do not install Valve Boxes at the low point of the landscaping.

C. Limit the number of valves per valve box. The maximum number allowed in each box is:

Valve Box Size	Electric Valve Size and Quantity
Standard Valve Box	One Valve per Box
Jumbo Valve Box	One 2" Valve, or Two 1-1/2" Valves, or Two 1" Valves
Little Giant	Two 2" Valve, or Three 1-1/2" Valves, or Three 1" Valves
Giant	Three 2" Valve, or Four 1-1/2" Valves, or Four 1" Valves

3.07 IRRIGATION DRIP EMITTERS

A. All irrigation drip emitters shall be installed as detailed in the Drawings.

B. The irrigation system shall be thoroughly flushed remove all possible foreign material prior to installation of the irrigation heads.

C. The CONTRACTOR shall protect against re-entry of contaminated water into risers or piping. After flushing, the CONTRACTOR shall immediately install irrigation drip emitters.

3.08 CONTROLLER

A. The CONTRACTOR shall connect to the controller as indicated on the Drawings.

B. Controller location is essentially diagrammatic, and field verify exact location with Owner's Representative.

C. Adjustment of the controller shall be such that each control valve in the circuit will remain open for a readily adjustable period of 5 or less minutes to 60 minutes. Readily made field adjustments shall include a provision whereby any number of days in a week can be skipped and whereby one or more positions on the controller may be skipped. When any or all of the above adjustments have been made, the controller shall continue to operate automatically as set until further adjustments are made. Provision shall be made for conveniently resetting the start of the irrigation cycle at any time and for advancing from one position to any other position at will.

D. Timing, sequence, and period will be supplied to the CONTRACTOR by the OWNER. At this time, the CONTRACTOR shall adjust the controller for normal operation.

3.09 FLOW SENSOR AND MASTER VAVLE

A. Wire flow sensor and master valve directly to controller using PE-39 shielded communication cable.

B. Maintain manufacture recommended distances up and downstream of flow sensor.

3.10 WIRING AND ELECTRICAL WORK

A. All electrical equipment and wiring shall comply with local and state codes and shall be installed by those skilled and licensed in the trade. Unless the governing codes specify otherwise, low voltage control wire may be installed by the CONTRACTOR when code allows.

B. All 110-volt wire shall be installed in conduit and taken from appropriate sources as indicated on the Drawings. CONTRACTOR shall coordinate manufacturer and installer.

C. The CONTRACTOR shall provide low voltage, 24-volt direct burial wires. Wire size shall be as shown but shall be not less than No. 14. Where sizes are not shown, they shall be sized per wire manufacturer's sizing charts and specifications.

D. The CONTRACTOR shall provide all wiring, conduits, sleeves, and connection for the low voltage electrical system between controller and valves, and where else shown and necessary for a complete and operable irrigation system.

E. All splices shall be moisture proof using specified electrical connectors.

F. An expansion curl should be provided within 3 ft of each wire connection and at pull box locations. Provide three feet of extra wire in each valve box.

G. All conduits and sleeves necessary for running wires under concrete, walks, and paving shall be furnished and installed before said concrete, walks, and paving work is installed.

H. Wire shall be continuous without splices except at control valves and shall be routed in main line trench whenever possible.

I. Install 2 extra wires (blue) to the last valve box in each run.

J. Wiring color:
   1. Common: white
   2. Valve: red
   3. Spare: blue

3.11 PIPE TRENCH BACKFILL

A. After pipe and wires have been installed and approved by the Owner’s inspection, the trenches shall be backfilled. The backfill operation must provide a firm continuous support for the pipe.

B. Backfill material shall be free of rocks and other materials that may damage the piping.

C. Bottom of trenches shall be smooth and free of sharp rocks and other object that may damage pipe.

D. The initial backfill shall be accomplished by carefully tamping selected material (from material excavated from the trench) under the pipe and between the pipe and the trench.

E. The pipes shall be filled with water and pressurized during backfilling operations, if necessary, to prevent drainage to piping.

F. The backfill shall be carefully installed around and over the pipe to approximately 10 inches of the ground surface, then water shall be allowed to flow in the trench. After this puddling operation has been completed and allowed to stand for 24 hours, the balance of the materials shall be placed in the trench to the sub-grade line (leaving room for topsoil) Rocks and other materials found in the backfill shall be removed. The backfill shall be compacted carefully and thoroughly.

G. Couplings and fittings shall be left exposed until leakage tests have been completed.

H. Topsoil shall be installed prior to planting.

I. Install detectable warning tape as indicated on the Drawings.

3.12 TESTING AND ADJUSTMENTS

A. The OWNER shall be notified by the CONTRACTOR prior to performing hydrostatic tests on the irrigation system in place. This test shall be done by the CONTRACTOR in the presence of the OWNER. The test results will be acceptable to the OWNER when no leakage or loss of pressure is evident during the test period. Defects shall be detected and repaired prior to retesting.

B. The irrigation drip emitters shall be adjusted and balanced for optimum and uniform coverage without excessive fogging and overthrow on walks, paving, and structures. The height and elevations of risers and irrigation heads shall be adjusted.

C. Following adjusting and balancing of the irrigation heads, an operating test of the entire system shall be performed by the CONTRACTOR in the presence of the OWNER at normal operating pressures. The test will be considered as acceptable if the system operates in a satisfactory manner providing uniform coverage of irrigated areas for a one-week period of automatic operation with no leaks.

3.13 RECORD DRAWINGS

A. Record Drawings shall be furnished to the OWNER at the time of the irrigation system inspection and before acceptance of the operating system by the OWNER.

3.14 ACCEPTANCE AND OPERATION BY OWNER

A. Upon substantial completion of the work and acceptance by the Owner, the OWNER will issue a date of substantial completion letter to the contractor. Contractor shall be responsible for the training of the owner’s maintenance staff in the operation of the system (provide minimum 48 hours written notice in advance of test). The Contractor shall furnish, in addition to the Record Drawings and operational manuals, copies of all available specification sheets and catalog sheets to the Owner's personnel responsible for the operation of the irrigation system. The Contractor shall guarantee all parts and labor for a minimum period of one (1) year from date of substantial completion.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SEEDING

32 92 19

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies the methodology and sequencing for establishing the seed mixes prescribed in the design.

B. Dormant seeding: the optimal time to “dormant seed” prescribed native grasses and forbs is when soil temperatures are consistently below 55 degrees Fahrenheit, but above freezing so that seed can work into the soil, approximately September 15 to October 15 in the project region. Seeding when snow is on the ground should be avoided because it reduces seed-to-soil contact and exposes the seed to predation. During this period, the prescribed native cool season species will establish; however, warm season grasses and forbs will germinate in the spring when soil temperatures rise. Dormant seeding enables cold stratification of the seed and allows the seed the earliest germination possible going into the live seeding period.

C. Live or spring seeding: “Live seeding” takes place when soil temperatures are consistently above 55 degrees Fahrenheit, and seed can actively germinate without the risk of a hard freeze. In the project region, live seeding is recommended between April 15 and May 30. Planting after late May is not recommended because the establishment period is a minimum of 120 days after germination. Arid and/or drought conditions in the summer months may prevent seeds from becoming established. Supplemental irrigation is recommended for Live seeding.

D. Disturbed areas outside the permanent seeding dates specified must be stabilized with a temporary seed mix until the permanent stabilization mix can be applied. Permanent seeding mixes shall be implemented in this area during the earliest appropriate seeding window. The Contractor shall apply temporary cover crop to all disturbed areas within 14 days of disturbance.

E. Weather forecasts should be monitored as supplemental watering may be necessary during prolonged dry periods. The seeding sequence should begin within 48 hours after soil preparation to capitalize on existing soil moisture prior to surficial drying. Site stabilization techniques should be used in this 48-hour period. All disturbed areas shall be stabilized no later than 14 calendar days from the date of disturbance in accordance with the standard for permanent construction area plantings.

1.02 MATERIAL

A. SEED
   1. The seed mix – see Section 2.4
   2. Supply seed on a pure live seed basis.

3. Obtain seed from lots that have been tested by a state-certified seed testing laboratory such as Association of Seed Analyst or Society of Commercial Seed Technologists.
    a. Seed germination tests older than 18 months for grass seed and 9 months for shrub or tree seed are not acceptable.
4. Do not use wet, moldy, or otherwise damaged seed.
5. Seed substitutions:
    a. Contact the major seed brokers in the state to verify that the seed is unavailable before requesting a seed substitution.
    b. Obtain approval for a seed substitution.

B. WATER
1. Source: Picinic Site 12 and 13 potable water pump or as designated by SLCDPU.
2. Free of dirt, silt, and other detrimental matter.

1.03 DELIVERY, STORAGE AND HANDLING

A. Deliver materials and products in ultraviolet- and weather-resistant factory-labeled packages. Store and handle in strict compliance with manufacturer's instructions and recommendations. Protect from damage, weather, excessive temperatures, and construction operations.

1.04 MAINTENANCE

A. During plant establishment, supplemental irrigation will be required during the first growing season for herbaceous seed mixes.

B. The maintenance work required shall include, but not be limited to, the following:
1. Appropriate watering of seed.
2. Weed treatment and weed removal.
3. Filling and re-compaction of eroded areas, along with any required reseeding and/or replanting.

C. During the first growing season, problem weeds should be hand pulled or spot sprayed with approved herbicides.

D. During the second growing season, problem weeds should be hand pulled or spot sprayed with an approved herbicide.

E. Minimal work shall be required during the winter months, but it is expected that the City and Contractor shall mutually determine when the Contractor shall return for continued maintenance of the site.

F. The contractor shall be responsible for removing the temporary irrigation system after 2 growing seasons.

1.05 WARRANTY

A. Contractor shall guarantee a minimum of 60% native aerial herbaceous coverage after a period of 2 growing seasons from time of execution. Herbaceous coverage may be assessed on an average cover by segmented cells, fields, or blocks. Any individual area greater than 200 square feet with less than 60% aerial herbaceous coverage shall be reseeded as part of the coverage warranty.

B. Noxious and invasive weed species may not be present or established in the restoration area. If weed species are identified during the monitoring and maintenance period, they should be treated and managed according to the City's Invasive Plant Management Plan.

C. The Contractor shall be responsible for additional maintenance or re-seeding efforts if the success criteria is not met after 2 years of monitoring and maintenance.

1.06 SUBMITTALS

A. The Contractor shall submit a letter of certification from the manufacturer that the product meets or exceeds all physical property, endurance, performance, and packaging requirements.

B. The Contractor shall provide written certification that the seed conforms to Utah seed law and is in compliance with Utah State Department of Agriculture regulations.

PART 2 EXECUTION

2.01 PREPARATION

A. Remove the gravel material using grading equipment or shovels, taking care not to disturb the geotextile fabric underneath.

B. Roll up or fold the geotextile fabric in manageable sections, starting from one edge of the installation area and working towards the opposite edge.

C. Store the removed geotextile fabric and gravel material in designated areas for disposal or reuse as appropriate.

D. Install the temporary irrigation system according to the specifications and the design plan sheet.

E. If pertinent, topsoil should be replaced or generated from on-site earthwork. The importation of topsoil should be a last resort and only used as an amendment for "localized" spots that lack the characteristics of a soil seed bed. The topsoil depth should be a minimum of 4 inches spread across the disturbance area.

F. Treat the disturbed area for weeds using herbicide and/or mechanical removal methods. If using herbicide treatment, the chemical compound should be approved by SLCDPU prior to use and be completed a minimum of 2 months in advance of seeding. The application should be in accordance with the product label and instructions.

G. Immediately prior to seeding, use a disk or harrow to run across the land, effectively breaking up the compacted soil surface to facilitate seed germination. Ensure that the equipment is properly sized and adjusted to achieve the desired depth of soil disturbance.

H. Operate the disk or harrow at an appropriate speed to effectively loosen the soil without causing excessive disruption or compaction of the soil structure. The soil should be scarified to maximum depth of 3 inches. Apply seed within 24 hours after seed bed preparation.

2.02 APPLICATION

A. Ensure all components of the disc or drill seeder are clean, lubricated, and in good working condition. Check for any damage or wear on discs, openers, and closing wheels, and replace if necessary.

B. Calibrate the seeder according to the seed type and desired planting rate. Appropriate seed rates for the prescribed seed mix are specified on the design plan sheet.

C. Adjust the depth control mechanism to the desired planting depth based on soil conditions and seed type. The seeds should be sown into the soil 1/8–inch to ¼–inch depth maximum.

D. Fill the seed hopper with the prescribed seed mix and amount of seed. Make sure the seed hopper is clean and remove any debris or foreign materials before loading the seed.

E. Adjust the seeder settings to control the depth at which the seed will be planted and the spacing between seeds. Refer to the equipment manual for specific instructions on how to adjust these settings.

F. Install the seeder according to the manufacturer's instructions. Make sure the seed disk is securely attached and aligned with the seed metering mechanism.

G. Drive across the field at a consistent speed. As the seed disk rotates, seeds are picked up from the seed hopper and deposited into furrows created by the seed opener discs or tubes. Continue planting until the entire disturbance area is seeded, making sure to overlap the seed rows slightly to ensure complete coverage.

H. Water the area immediately after seeding. Monitor soil moisture levels and adjust watering practices accordingly. Avoid waterlogging the seed. Saturating the soil may cause seeds to float or be displaced, leading to uneven seed distribution and poor germination. This is especially problematic in soils with poor drainage.

2.03 IRRIGATION

A. Provide temporary irrigation to establish the seeds. Contractor to obtain a licensed contractor and designer to develop the temporary irrigation system.

2.04 SEEDING MIX INSTRUCTIONS

A. Below table

Seeding Mix Instructions Table

CITY CREEK RESTORATION SEED MIX (3 ACRES)																			
BOTANICAL NAME	COMMON NAME	GROWTH HABIT	INDICATOR (WMVC)	BLOOM PERIOD			POLLINATOR VALUE			WILDLIFE (BROWSE)			SHADE TOLERANCE			APPLICATION RATE (PLS)	SEEDING DATES
				EARLY	MID	LATE	BEES	BUTTERFLIES	OTHER	LOW	MED	HIGH	LOW	MED	HIGH

CLEOME SERRULATA	ROCKY MOUNTAIN BEEPLANT	HERBACEOUS	FACU														
FESTUCA IDAHOENSIS	IDAHO FESCUE	HERBACEOUS	FACU														
HELIOMERIS MULTIFLORA	SHOWY GOLDENEYE	HERBACEOUS	UPL														
LOMATIUM DISSECTUM	FERNLEAF BISCUITROOT	HERBACEOUS	FAC														
PASCOPYRON SMITHII	WESTERN WHEATGRASS	HERBACEOUS	UPL														
PSEUDOROEGNERIA SPICATA	BLUEBUNCH WHEATGRASS	HERBACEOUS	UPL														
POA SECUNDA	SANDBERG BLUEGRASS	HERBACEOUS	FACU														

SEEDING SPECIFICATIONS

Dormant seeding: the optimal time to “dormant seed” prescribed native grasses and forbs is when soil temperatures are consistently below 55 degrees Fahrenheit, but above freezing so that seed can work into the soil, approximately September 15 to October 15 in the project region. Seeding when snow is on the ground should be avoided because it reduces seed-to-soil contact and exposes the seed to predation. During this period, the prescribed native cool season species will establish; however, warm season grasses and forbs will germinate in the spring when soil temperatures rise. Dormant seeding enables cold stratification of the seed and allows the seed the earliest germination possible going into the live seeding period.

Live or spring seeding: “Live seeding” takes place when soil temperatures are consistently above 55 degrees Fahrenheit, and seed can actively germinate without the risk of a hard freeze. In the project region, live seeding is recommended between April 15 and May 30. Planting after late May is not recommended because the establishment period is a minimum of 120 days after germination. Arid and/or drought conditions in the summer months may prevent seeds from becoming established. Supplemental irrigation is recommended for Live seeding.

Disturbed areas outside the permanent seeding dates specified must be stabilized with a temporary seed mix until the permanent stabilization mix can be applied. Permanent seeding mixes shall be implemented in this area during the earliest appropriate seeding window. The Contractor shall apply temporary cover crop to all disturbed areas within 14 days of disturbance.

Weather forecasts should be monitored as supplemental watering may be necessary during prolonged dry periods. The seeding sequence should begin within 48 hours after soil preparation to capitalize on existing soil moisture prior to surficial drying. Site stabilization techniques should be used in this 48-hour period. All disturbed areas shall be stabilized no later than 14 calendar days from the date of disturbance in accordance with the standard for permanent construction area plantings.

SITE PREPARATION

Remove the gravel material using grading equipment or shovels, taking care not to disturb the geotextile fabric underneath.

Roll up or fold the geotextile fabric in manageable sections, starting from one edge of the installation area and working towards the opposite edge.

Store the removed geotextile fabric and gravel material in designated areas for disposal or reuse as appropriate.

Install the temporary irrigation system according to the specifications and the design plan sheet.

If pertinent, topsoil should be replaced or generated from on-site earthwork. The importation of topsoil should be a last resort and only used as an amendment for “localized” spots that lack the characteristics of a soil seed bed. The topsoil depth should be a minimum of 4 inches spread across the disturbance area.

Treat the disturbed area for weeds using herbicide and/or mechanical removal methods. If using herbicide treatment, the chemical compound should be approved by SLCDPU prior to use and be completed a minimum of 2 months in advance of seeding. The application should be in accordance with the product label and instructions.

Immediately prior to seeding, use a disk or harrow to run across the land, effectively breaking up the compacted soil surface to facilitate seed germination. Ensure that the equipment is properly sized and adjusted to achieve the desired depth of soil disturbance.

Operate the disk or harrow at an appropriate speed to effectively loosen the soil without causing excessive disruption or compaction of the soil structure. The soil should be scarified to maximum depth of 3 inches. Apply seed within 24 hours after seed bed preparation.

SEED APPLICATION

Ensure all components of the disc or drill seeder are clean, lubricated, and in good working condition. Check for any damage or wear on discs, openers, and closing wheels, and replace if necessary.

Calibrate the seeder according to the seed type and desired planting rate. Appropriate seed rates for the prescribed seed mix are specified on the design plan sheet.

Adjust the depth control mechanism to the desired planting depth based on soil conditions and seed type. The seeds should be sown into the soil 1/8–inch to ¼–inch depth maximum.

Fill the seed hopper with the prescribed seed mix and amount of seed. Make sure the seed hopper is clean and remove any debris or foreign materials before loading the seed.

Adjust the seeder settings to control the depth at which the seed will be planted and the spacing between seeds. Refer to the equipment manual for specific instructions on how to adjust these settings.

Install the seeder according to the manufacturer's instructions. Make sure the seed disk is securely attached and aligned with the seed metering mechanism.

Drive across the field at a consistent speed. As the seed disk rotates, seeds are picked up from the seed hopper and deposited into furrows created by the seed opener discs or tubes. Continue planting until the entire disturbance area is seeded, making sure to overlap the seed rows slightly to ensure complete coverage.

Water the area immediately after seeding. Monitor soil moisture levels and adjust watering practices accordingly. Avoid waterlogging the seed. Saturating the soil may cause seeds to float or be displaced, leading to uneven seed distribution and poor germination. This is especially problematic in soils with poor drainage.

IRRIGATION

Obtain licensed contractor and designer to provide temporary irrigation for the establishment periord.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 32 93 10

LANDSCAPE PLANTING

PART 1 GENERAL

1.01 GENERAL REQUIREMENTS

A. Before submitting a Bid, each Contractor shall carefully examine the Contract Documents; shall visit the site of the Work; shall fully inform themselves as to all existing conditions and limitations; and shall include in the Bid the cost of all items required by the Contract Documents. If the Contractor observes that portions of the Contract Documents are at variance with applicable laws, building codes, rules, regulations, or contain obvious erroneous or uncoordinated information, notify the Project Manager in writing of unsatisfactory conditions. Do not proceed until conditions have been corrected.

B. Landscaping Work shall be suspended at any time when it may be subject to damage by climatic conditions. However, no substantial work suspension may be made without permission of the Project Manager.

C. Visit the site and become familiar with all existing conditions and the extent of work being performed by other contractors on the site.

D. The work covered by this section of the specifications consists in furnishing all plant material, labor, materials, and equipment; and, in performing all operations in connection with the installation of landscaping in strict accordance with this section of the specifications and the applicable drawings.

1.02 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.03 SUMMARY

A. This Section includes the following:
   1. Trees
   2. Shrubs
   3. Mulch
   4. Topsoil
   5. Landscape Accent Boulder
   6.

B. The Section cross references the following sections:
   1. Division 1 Section "Definitions and Standards"
   2. Division 1 Section "Submittals"
   3. Division 1 Section "Closeout Procedures"
   4. Division 32 Section "Landscape Irrigation Systems"

1.04 DEFINITIONS

A. Balled and Burlaped Stock: Exterior plants dug with firm, natural balls of earth in which they are grown, with ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of tree or shrub required; wrapped, tied, rigidly supported, and drum laced as recommended by ANSI Z60.1.

B. Balled and Potted Stock: Exterior plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1 for type and size of exterior plant required.

C. Container-Grown Stock: Healthy, vigorous, well-rooted exterior plants grown in a container with well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for kind, type, and size of exterior plant required.

D. Fabric Bag-Grown Stock: Healthy, vigorous, well-rooted exterior plants established and grown in-ground in a porous fabric bag with well-established root system reaching sides of fabric bag. Fabric bag size is not less than diameter, depth, and volume required by ANSI Z60.1 for type and size of exterior plant.

E. Finish Grade: Elevation of finished surface of mulch.

F. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

G. Planting Soil: Native or imported topsoil, manufactured topsoil, or surface soil modified to become topsoil; mixed with soil amendments.

H. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing planting soil.

1.05 SUBMITTALS

A. At least 30 days prior to ordering materials, the Contractor shall submit to the Landscape Architect representative samples, certifications, manufacturer's literature, and certified test results for all materials as specified below. No materials shall be ordered or delivered until the required submittals have been reviewed and stamped approved by the Landscape Architect. Delivered materials shall match the approved samples.

B. Approval shall not constitute final acceptance. The Landscape Architect reserves the right to reject, on or after delivery, any material that does not meet these Specifications.

C. Product Data: For each type of product indicated.
   1. Topsoil Borrow
   2. Organic Compost
   3. Fertilizer
   4. Mulches

D. Samples for Verification: For each of the following:
   1. 1-lb. sample of bark mulch, identifying source, including name and telephone number of suppliers, and analysis testing results based on Handout “B”.
   2. Sample topsoil borrow and soil analysis testing results based on Handout “B”.
   3. Sample of organic compost and sieve analysis.
   4. Peat Moss.

E. Product Certificates: For each type of manufactured product, signed by product manufacturer, and complying with the following:
   1. Manufacturer's certified analysis for standard products.
   2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.

F. Qualification Data: For landscape installer.

G. Planting Schedule: Indicating anticipated planting dates for exterior plants.

H. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of exterior plants during a calendar year. Submit before expiration of required maintenance periods.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulted in the successful establishment of exterior plants.
   1. Installer's Field Supervision: Installer shall maintain an experienced full-time supervisor on Project site when exterior planting is in progress.
   2. Qualification of Arborist: All work of pruning shall be performed by an arborist certified by the International Society of Arboriculture.
   3. All work shall be performed in accordance with the best standards of practice relating to the trade and under the continuous supervision of a competent foreman capable of interpreting the Drawing and Specifications.

B. The following standards apply to the work for topsoil borrow:
   1. AOAC: Association of Official Agricultural Chemists.
   2. ASA: Methods of Soils Analysis, American Society of Agronomy, Soil Science Society of America, Inc., Madison Wisconsin, latest edition.
   3. American Society for Testing and Materials (ASTM).
   4. All applicable local codes and regulations.
   5. Soil-Testing Laboratory Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.
   6. Topsoil Analysis: Furnish a soil analysis for each planting soil mix specified in this section by a qualified soil-testing laboratory stating percentages of organic matter; gradation of sand, silt, and clay content; cation exchange capacity; sodium absorption ratio; deleterious material; pH; and mineral and plant-nutrient content of topsoil.

7. Report suitability of topsoil for lawn growth. The state recommended quantities of nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory topsoil.

C. Provide quality, size, genus, species, and variety of exterior plants indicated, complying with applicable requirements in ANSI Z60.1, "American Standard for Nursery Stock."

D. Tree and Shrub Measurements: Measure according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches above ground for trees up to 4-inch caliper size, and 12 inches above ground for larger sizes. Measure the main body of tree or shrub for height and spread; do not measure branches or roots tip-to-tip.

E. Observation:
   1. Landscape Architect shall observe trees and shrubs at place of growth and at site before planting for compliance with requirements for genus, species, variety, size, and quality. Landscape Architect retains right to observe trees and shrubs further for size and condition of balls and root systems, insects, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from Project site. Cost of replacements shall be borne by the Contractor.

F. Owner observation: All planting areas shall be inspected by the Owner's Representative prior to placing topsoil and amendments. All trees shall be inspected by the Owner's Representative prior to planting.

G. Selection: Contractor shall locate plant material sources and ensure plants are shipped in a timely fashion for installation. Landscape Architect shall inspect and tag plants at place of growth prior to delivery to site. Contractor to incur costs for Landscape Architect to inspect and tag plants at place of growth prior to delivery to site.
   1. At least one month prior to the expected planting date, the Contractor shall request that the Landscape Architect provide a representative to select and tag nursery stock to be planted under this Section. Contractor shall pay for the transportation, subsistence, and overnight accommodations, for the Landscape Architect's representative during the period required to select and tag the plant material.
   2. The contractor shall be responsible for certifying the availability of quality plants in specified sizes from his/her sources of supply prior to requesting that the Landscape Architect make plant source inspections. In the event that plants at the inspection location are found to be unavailable or of insufficient size, and quality, the Contractor shall be liable to reimburse the Owner for all costs of the Landscape Architect's hourly services incurred during unproductive inspection trips.
   3. Unless specifically designated otherwise, a representative of the Contractor shall accompany the Landscape Architect on plant material selection field trips.
   4. All trees for the project shall be individually tagged for approval with the Landscape Architect's seals, and no trees shall be accepted for delivery to the site without such seals.
   5. All plants procured for this project are to be tagged by the supplier nursery with the identification labels consistent with the specified plant names and project drawing identifiers if drawing symbol identifiers are used.

6. Unauthorized substitutions will not be accepted. If proof is submitted that specific plants or plant sizes are unobtainable, written substitution requests will be considered for the nearest equivalent plant or size. All substitution requests must be made in writing.

H. Pre-installation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.07 DELIVERY, STORAGE, AND HANDLING

A. Notify Landscape Architect 3 working days prior to the proposed arrival of plant material on site.

B. Plant materials shall be examined by Landscape Architect at time of delivery on site. This inspection does not constitute final acceptance of plants. All plants will be inspected again at time of final inspection and once again at the end of the warranty period. Any plant found to be unacceptable at any of these inspections shall be immediately removed and replaced.

C. Do not prune trees and shrubs before delivery, except as approved by Landscape Architect. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of exterior plants during delivery. Do not drop exterior plants during delivery.

D. Handle planting stock by root ball.

E. Deliver exterior plants after preparations for planting have been completed and install immediately. If planting is delayed more than six hours after delivery, set plants in shade, protect from weather and mechanical damage, and keep roots moist.
   1. Set nursery stock on ground and cover roots with mulch.
   2. Do not remove container-grown stock from containers before time of planting.
   3. Water root systems of exterior plants stored on-site as often as necessary to maintain root systems in a moist condition.

1.08 COORDINATION

A. Planting Restrictions: Plant during the following period. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion. March 15 to October 31.

B. Weather Limitations: Planting shall not take place when the ground is frozen.

C. Coordination with Lawns: Plant trees and shrubs after finish grades are established and before planting lawns, unless otherwise acceptable to Landscape Architect.

1.09 WARRANTY

A. All plants will be inspected at the time of final inspection for conformance to specified planting procedures, and for general appearance and vitality. Any plant not approved by the Project Manager will be rejected and replaced immediately.

B. The Contractor shall water the plantings, maintain the irrigation system, and maintain all plants at the work site until the Owner accepts the Work at the Final Inspection or Substantial Completion Inspection, whichever occurs first.

C. A Substantial Completion Certificate will only be issued for the "landscape and irrigation projects," in their entirety. Substantial Completion will not be portioned to designated areas of a project.

D. Special Warranty: The contractor shall be required to guarantee all work and plant material for a minimum of one year after the date of substantial completion. The contractor will be required to accompany the Owner's Representative on an onsite inspection just prior to the conclusion of the guarantee period. Any plant not alive, in poor health, or in poor condition at the end of the guarantee period will be replaced immediately. All replaced plants shall be guaranteed and maintained according to the specifications for another four growing months.

E. Remove dead exterior plants immediately. Replace immediately unless required to plant in the succeeding planting season.

F. Replace exterior plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.

PART 2 PRODUCTS

2.01 TREE AND SHRUB MATERIAL

A. General: Furnish nursery-grown trees and shrubs complying with ANSI Z60.1, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

B. Grade: Provide trees and shrubs of sizes and grades complying with ANSI Z60.1 for type of trees and shrubs required.

C. Size and Planting Condition: As indicated on Drawings.

D. Label each tree and shrub with securely attached waterproof tag bearing legible designation of botanical and common name. Remove tags after substantial completion.

2.02 SHADE AND FLOWERING TREES

A. Shade Trees: Single-stem trees with straight trunk, well-balanced crown, and intact leader, of height and caliper indicated, complying with ANSI Z60.1 for type of trees required.

B. Small Ornamental Trees: Branched or pruned naturally according to species and type, with relationship of caliper, height, and branching according to ANSI Z60.1; stem form as indicated on Drawings.

C. Multistem Trees: Branched or pruned naturally according to species and type, with relationship of caliper, height, and branching according to ANSI Z60.1; stem form as indicated on Drawings.

2.03 DECIDUOUS SHRUBS

A. Form and Size: Deciduous shrubs with not less than the minimum number of canes required by and measured according to ANSI Z60.1 for type, shape, and height of shrub.

2.04 CONIFEROUS EVERGREENS

A. Form and Size: Normal-quality, well-balanced, coniferous evergreens, of type, height, spread, and shape required, complying with ANSI Z60.1.

2.05 BROADLEAF EVERGREENS

A. Form and Size: Normal-quality, well-balanced, broadleaf evergreens, of type, height, spread, and shape required, complying with ANSI Z60.1.

2.06 GROUND COVER PLANTS

A. Ground Cover: Provide ground cover of species indicated, established, and well rooted in pots or similar containers, and complying with ANSI Z60.1.

2.07 PLANTS

A. Perennials: Provide healthy, field-grown plants from a commercial nursery, of container size, species and variety shown or listed.

B. Fast-Growing Vines: Provide vines of container size and species indicated complying with requirements in ANSI Z60.1.

C. Bulbs: Provide large, firm bulbs of type and variety listed.

D. Pre-purchase or contract grow
   1. Perennials: Pre-purchase or contract grow healthy, field-grown plants from a commercial nursery, of container size, species and variety shown or listed.
   2. Ornamental Grasses: Pre-purchase or contract grow healthy, field-grown plants from a commercial nursery, of container size, species and variety shown or listed.

2.08 TOPSOIL BORROW

A. Refer to Section 32 93 00 Handout “B” for “Topsoil Quality Guidelines”, “Coarse Fragment Guidelines”, and “Nutrient Guidelines” for standards. Topsoil borrow shall meet all specifications for either “Ideal” or “Acceptable” categories. Topsoil that falls within the “Not-Acceptable” range shall not be used.

B. Fertilizer and additives shall be determined by the Topsoil Analysis and based on Section 32 93 00 Handout “B” for “Topsoil Quality Guidelines”, “Coarse Fragment Guidelines”, and “Nutrient Guidelines” for standards.

C. Topsoil shall consist of natural sandy loam and be of uniform quality, free from subsoil, hard clods, stiff clay, hard-pan, sod, partially disintegrated debris, or any other undesirable material. Soil shall be free of plants, roots, or seeds that would be toxic or harmful to growth. Topsoil shall be obtained from naturally drained areas and shall contain at least 4 percent organic material as determined by loss upon ignition of a moisture free sample that has been dried in accordance with current methods of the Association of Official Agricultural Chemists. Ph range shall be 5.5 to 8.2 inclusive. Subsoil will not be accepted as topsoil.

D. The Contractor shall furnish a certified report of an analytical chemist approved by the Project Manager showing the analysis of the topsoil proposed for use. Furnish a sample of the proposed topsoil to the Project Manager prior to delivery of topsoil on site.

E. No topsoil borrow shall be delivered to the site until topsoil borrow test results and recommendations have been reviewed and approved by the Landscape Architect. Such approval shall not constitute final acceptance. The Landscape Architect shall reject any material delivered to the site, which, after on-site, post-delivery testing, does not meet these specifications.

2.09 INORGANIC SOIL AMENDMENTS

A. Sulfur: Type and rate as recommended in soil reports from a qualified soil-testing agency

B. Sand: Clean, washed, natural or manufactured, free of toxic materials.

2.10 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter. The contractor shall contact the project manager for the appropriate compost to use. Refer to Section 32 93 00 Handout “B” for “Compost Quality Guidelines for Landscaping” for standards. Compost shall meet all specifications for either “Ideal” or “Acceptable” categories. Compost that falls within the “Not-Acceptable” range shall not be used.

B. Compost shall not exceed 0.5 percent inert contaminants and be free of substances toxic to plantings:

Toxic Elements	Maximum Concentration (mg/kg dry weight)
Arsenic	41
Cadmium	39
Copper	1500
Lead	300
Mercury	17
Molybdenum	75
Nickel	420
Selenium	36
Zinc	2800

C. Peat: Coir dust, reed peat, sedge peat, moss peat (fine shreds only), reed muck or sedge muck must all comply with Q-P166e, class B coarseness. pH range of 3.4 to 4.8.

2.11 PLANTING ACCESSORIES

A. Selective Herbicides: EPA registered and approved, of type recommended by manufacturer for application.

2.12 FERTILIZER

A. Bonemeal: Commercial, steamed, granulated; a minimum of 2 percent nitrogen and 14 percent phosphoric acid.

B. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid, in amounts recommended in soil reports from a qualified soil-testing agency.

C. Commercial Fertilizer: Commercial-grade complete fertilizer, O-F-241C, type 1, grade 16-16-8, level B with guaranteed chemical analysis of contents marked on the containers.

D. Animal fertilizer shall not be used.

2.13 MULCHES

A. Rock Mulch – 1" to 3" diameter – tan in color – fractured.

B. Rock Mulch – 4" to 6" diameter – tan in color – fractured.

2.14 WEED BARRIER FABRIC

A. Weed barrier fabric shall be one of the following: "Dewitt@ Weed Barrier Pro 5, Typar #3301, “Polyspun” XL, or approved equal.

2.15 LANDSCAPE ACCENT BOULDER

A. 36” to 48” diameter and tan boulders – provide photos for approval.

PART 3 EXECUTION

3.01 OVERALL EXAMINATION

A. Landscape Contractor must examine the site conditions under which the work is to be performed and notify the Project Manager in writing of unsatisfactory conditions. Do not proceed until conditions have been corrected.

B. Examine areas to receive exterior plants for compliance with requirements and conditions affecting installation and performance.

C. Proceed with installation only after unsatisfactory conditions have been corrected and contract operations have been completed to a point where the areas will not be disturbed.

D. All planting areas to be inspected by the Owner’s Representative prior to adding topsoil and amendments.

E. Before any planting operation begins, all plants must be inspected and approved by the Project Manager. All rejected plants will be removed from the site and replaced with approved plants. This inspection does not waive any guarantee to be furnished by the Contractor.

F. The Landscape Contractor must coordinate with all other trades working on site to best facilitate progress on the job.

3.02 OVERALL PREPARATION

A. Locate all underground utilities prior to digging. Do not place plants on or near utility lines. Obtain a digging permit and have the permit at the site.

B. Protect structures, utilities, sidewalks, pavements, and other facilities, and lawns and existing exterior plants from damage caused by planting operations.

C. Provide erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

D. The Landscape Contractor is responsible for finish grade elevations in landscaped areas which include topsoil shrub and turf areas, refer to Drawings for depths. Apply mulch as indicated on the Drawings in shrub beds and at base of trees. Do not bury small plants with bark mulch.

3.03 TREE, SHRUB, GROUNDCOVERS, AND PLANT BED ESTABLISHMENT

A. Review the exact locations of all trees and shrubs with the Project Manager for approval prior to the digging of any holes. Refer to the drawings for the sizes and preparation of tree and shrub holes. Prepare all holes according to the details on the drawings.

B. To avoid a soil water interface problem, excavated soil material from planting holes is to be inspected by the Project Manager to determine if such soil should be used as backfill material. If it is determined that the excavated material is not of good quality, then it should be modified to an acceptable texture, organic content and PH.

C. Prior to the installing of any plant material in the prepared hole, the Project Manager must approve the size, width, and depth of the hole.

D. Sub grades:
   1. The surface shall be free of all materials larger than 1/2" in diameter. Remove stones larger than 1/2 inch in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
   2. Scarify and pulverize the subgrade to a depth of not less than 4 inches.
   3. Mix layered soils. First place a 2–3-inch layer of the new soil, mix thoroughly with the existing soil and spread planting soil mix over loosened subgrade to depth indicated on Drawings.
   4. Scarification shall be completed in all areas that are to receive plant materials whether it is to be trees, ground cover, or shrubs.

E. Finish Grading:
   1. Finish grades shall be smooth, even and on a uniform plane with loose, uniformly fine texture. The finish grade shall not vary more than one half inch (1/2") in ten feet (10') from the required line, and grade set forth in the Drawings.
   2. Adjustments of finish grades shall be made at direction of Landscape Architect as required. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit fine grading to areas that can be planted in the immediate future.
   3. Finish grade (top of rock and bark mulch) shrub bed areas shall be 1 1/2 inches below finish grades of adjacent pavement.

F. Restore planting beds if eroded or otherwise disturbed after finish grading and before planting.

3.04 TREE AND SHRUB PLANTING OPERATION

A. Before planting, locate all underground utilities prior to digging. Do not place plants on or near utility lines. Obtain a digging permit first (3.01 B of this section) and have the permit at the site.

B. The planting hole should be the same depth as the root ball, and three times the diameter of the root ball. See Section 32 93 10 "Soil Preparation and Fine Grading" for Handout "A", Steps for Planting a Tree.

C. Trees and shrubs must be placed on undisturbed soil at the bottom of the planting hole.

D. The tree hole depth shall be determined so that the tree may be set slightly high of finish grade, 1" to 2" above the base of the trunk flare, using the top of the root ball as a guide.

E. EXCEPT IN RARE CASES TREES SHOULD NOT BE STAKED.

F. Set tree on soil and remove ALL burlap, wire baskets, twine, wrappings, etc. before beginning any backfilling operations. Do not fold and leave in hole.

G. Hand water all plant material in pot and when planted.

H. All tree holes shall be backfilled in 12-inch lifts and settled with water to minimize any settling of the tree.

I. Upon completion of backfilling operation, thoroughly water the tree to completely settle the soil and fill any voids that may have occurred. Use a watering hose, not the area irrigation system. If additional prepared topsoil mixture needs to be added, it should be a coarser mix as required to establish finish grade as indicated on drawings.

J. The amount of pruning shall be limited to the minimum necessary to remove dead or injured twigs and branches. All cuts, scars and bruises shall be properly treated according to the direction of the Project Manager. Proper pruning techniques shall be used. Do NOT leave stubs and do NOT cut the leader branch. Improper pruning shall be cause for rejection of the plant material.

K. Prepare a watering circle of 2' diameter around the trunk. For conifers, extend the watering well to the drip line of the tree canopy. Place 4" of mulch around the planted trees.

3.05 TREE, SHRUB, GROUNDCOVERS, AND PLANT MAINTENANCE

A. Trees, Shrubs, Groundcovers, and Plants: The Contractor is responsible to maintain all planted materials in a healthy and growing condition for a period of any four (4) consecutive growing months (growing months to be defined as April, May, June, July, August and September). This maintenance is to include weeding, cultivating, fertilizing, monitoring water schedules, controlling insects and diseases, re-guying and staking, and all other operations of care necessary for the promotion of root growth and plant life so that all plants are in a condition satisfactory to the Owner's Representative at the end of the guarantee period. The Contractor shall be held responsible for the failure to monitor watering operations and shall replace any and all plant material that is lost due to the improper application of water.

B. The Contractor shall instruct and inform the owner as to the watering and feeding requirements for each portion of the project.

3.06 PLANTING BED MULCHING

A. Upon completion of all planting operations, The Contractor is to remove all undesirable material from the surface of the planting beds, including all rocks over the size of 1/2 inch diameter; re-establish all watering basins and install the specified mulch as indicated on the Drawings. Mulch shall be placed in the planting areas as shown, spread carefully and evenly. Do not bury small plants with mulch.

3.07 CLEANUP AND PROTECTION

A. During exterior planting, keep adjacent paving and construction clean and work area in an orderly condition. The Contractor shall keep the site free from accumulation of waste material.

B. Protect exterior plants from damage due to landscape operations, operations by other contractors and trades, and others. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged exterior planting.

C. At the time of completion, all areas must be swept or washed clean, and all rubbish removed to the satisfaction of the Project Manager.

3.08 DISPOSAL

A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of them off Owner's property.

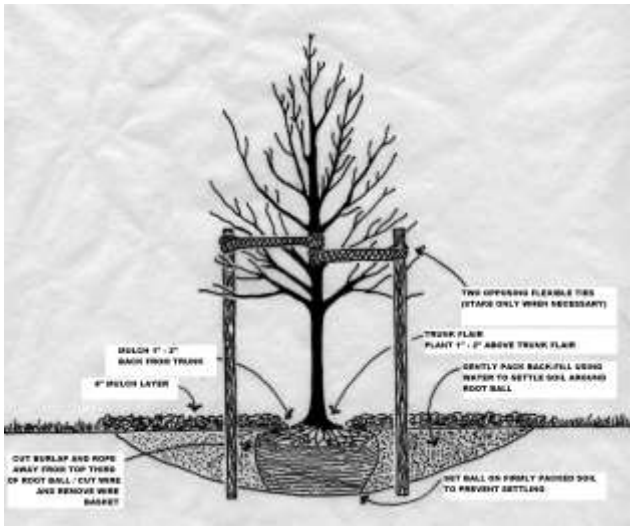
3.09 AS-BUILT DRAWINGS

A. The Contractor is required to keep a record of all departures from the working drawings that occur during construction. These shall be kept on a clean set of prints and all modifications should be noted in a clear, concise manner. The AS-BUILT DRAWINGS maintained by the Contractor shall be furnished to the Project Manager at or before the time of the Systems Inspection / Substantial Completion Inspection. The Substantial Completion Certificate Date will not be issued until the Project Manager receives the as-built record.

HANDOUT “A”

STEPS FOR PLANTING A TREE

Developed by the International Society of Arboriculture (ISA)



A. Dig a shallow, broad planting hole.

A. Make the hole wide, as much as three times the diameter of the root ball, but only as deep as the root ball.

B. Identify the trunk flare.

C. The trunk flare is where the roots spread at the base of the tree. This point should be partially visible after the tree has been planted (see diagram). If the trunk flare is not partially visible, remove some soil from the top of the root ball. Find the trunk flare to determine how deep the hole needs to be for proper planting.

D. Place the tree at the proper height.

E. Before placing the tree in the hole, check to see that the hole has been dug to the proper depth, and not more. It is better to plant the tree a little high, 1" to 2" above the base of the trunk flare, than to plant it at or below the original growing level. This will allow for some settling (see diagram). Always lift the tree by the root ball, and never by the trunk to avoid damage when setting the tree in the hole.

F. Straighten the tree in the hole.

G. Before backfilling, ask an assistant to view the tree from several directions to confirm the tree is straight.

H. Fill the hole gently but firmly.

I. Fill the hole about 1/3 full and gently but firmly pack the soil around the base of the root ball. Then, if the tree is balled and burlapped (or contained in a wire basket), cut and remove the rope, string, wire, and or wire basket from around the trunk and top 1/3 of the root ball (see diagram). Use care not to damage the trunk or roots in the process.

J. Fill the remainder of the hole, firmly packing the soil to eliminate air pockets that may cause roots to dry out. To avoid this problem, add the soil a few inches at a time and settle with water. Continue this process until the hole is filled and the tree is firmly planted. Do not apply fertilizer at time of planting unless approved by the Grounds Department.

K. Stake the tree, if necessary.

L. Except in rare cases trees should not be staked. However, protective staking may be required on sites where lawn mower damage, vandalism, or windy conditions are concerns. If staking is necessary for support, two stakes used in conjunction with a wide flexible tie material will hold the tree upright, provide flexibility, and minimize injury to the trunk (see diagram).

M. Mulch the base of the tree.

N. Apply a four inch layer. Do not cover the actual trunk of the tree. A mulch free area, one to two inches wide at the base of the tree is sufficient to avoid moist bark conditions and prevent decay.

O. Follow-up care. Keep the soil moist, but not soaked.

SECTION 33 01 30.50

BYPASS PIPING AND PUMPING

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope: This section describes the existing conditions for temporary bypass piping and pumping during construction.

B. Requirements:

1. Contractor shall provide labor, materials, and supervision to temporarily bypass flow around the Contractor's work in accordance with the specific needs construction. All references to the bypass piping, pumping and/or bypass pumping system include, but are not limited to, all pumps, piping, valves and other equipment needed to move the intended flow from one location to another.
2. The actual design of the bypass arrangement and alignment shall be prepared by the Contractor, and shall be submitted to the Engineer to determine conformance to project objectives. Means and methods of accomplishing the bypassing shall be the responsibility of the Contractor.
3. Designated yard piping shall remain in service at all times throughout the duration of the project. Contractor shall be responsible for diverting flow through the use of bypass pumping or flow diversions with prior written approval by the Engineer.
4. Service to laterals shall be disrupted for a period of no more than 8 hours. Laterals within residential areas shall only be out of service between the hours of 8:00 am to 5:00 pm, Monday through Friday. Laterals within business areas shall be addressed on a case by case basis. If Contractor feels that it is necessary to disrupt lateral services for a period longer than 8 hours, Contractor shall provide alternate means of service without disrupting use of the service by the owner/resident.
5. The bypass pumping system shall be designed to normally maintain the water flow below the top of the pipe, without surcharging.
6. The Contractor shall have the complete bypassing system in place and successfully pressure tested at 1.5 times the maximum operating pressure of the system before bypassing any water.
7. The Contractor shall notify the Engineer 48 hours prior to shutting down or bypassing the pipeline.
8. The bypassed flow shall be continuously monitored.
9. Contractor is responsible for immediate and proper cleanup should any spill occur, regardless of amount.

C. Experience: Contractor shall utilize staff and/or a subcontractor that has been directly responsible for completion of a project that required the bypass pumping of flows in excess of 4.4 mgd.

1.02 SUBMITTALS

A. The Contractor shall submit, in accordance with Section 01 33 00, drawings and complete design data showing methods and equipment he proposes to utilize in bypassing for approval by the Engineer. The submittal shall include the following information:
   1. Drawings indicating the scheme and location of temporary plugs and bypass discharge lines. The drawings shall also show the method and location for discharging the bypass lines.
   2. Capacities of pumps, prime movers, and standby equipment.
   3. Design calculations proving adequacy of the system and selected equipment.
   4. Standby power source.
   5. Staffing plan.
   6. Show suction and discharge points with elevations & stationing on the design plans.
   7. Provide pump performance curves.
   8. Submit calculations to verify suction lift of pumps has not been exceeded.
   9. Contractor shall submit proposed noise control and exhaust control plans for pumping equipment.
   10. Contractor shall submit bypass piping inspection plan.

B. The actual design of the bypass arrangement shall be prepared by the Contractor or Subcontractor performing the work, and shall be submitted to the Engineer to determine conformance to project objectives. The Contractor shall be responsible for any Subcontractors design (if used) on this Project. Means and methods of accomplishing the bypassing shall be the responsibility of the Contractor.

C. Approval of submitted plans for connection and temporary rerouting shall in no way relieve the Contractor of their responsibility for the protection of, downstream drainage systems and water tributaries against spill. Any litigation, claims, fines, etc. associated with any spill shall be the responsibility of the Contractor.

1.03 JOB CONDITIONS

A. Available Flow Data:
   1. Available flow data for yard piping to be bypassed at the project site is located in Section 01 12 16 Work Sequence and Restrictions.

B. Protection:
   1. In areas where flows are bypassed, all bypass flows shall be discharged as approved by the Engineer. No bypassing to the ground surface, receiving waters, storm drains, or bypassing which results in soil or groundwater contamination or any potential health hazards shall be permitted.

C. Scheduling:
   1. The bypassing system shall not be shut down between shifts, on holidays or weekends, or during work stoppages without written permission from the Engineer. The bypass system will have an attendant around the clock whose only duty is to maintain the bypass pumping system until the bypassing of that specific pipeline is no longer required.

PART 2 PRODUCTS

2.01 PUMPING SYSTEMS

A. Two different bypass pumping system criteria have been identified for this project. These criteria are identified below. Projects that are in environmentally sensitive areas or that have a high sewage flows will require one or more of these criteria as specified herein.

B. Criterion 1 - Bypass Pumping System with flows equal to or less than 2.5 MGD
   1. Contractor shall maintain on site, the following minimum requirements for all bypass pumping systems:
      a. Sufficient equipment and materials to ensure continuous and successful operation of the bypass systems. The COMPLETE bypass system, including all piping, shall be continuously monitored by Contractor personnel.
      b. A system of pumps and piping operating on site to maintain a minimum 50% over capacity of the anticipated maximum flow (as determined by the Contractor). In addition, the Contractor shall have a standby pump, equal in capacity to the largest pump in the system, piped, plumbed and ready for operation. Standby pumps shall be fueled and operational at all times.
      c. The Contractor shall maintain on site a sufficient number of valves, tees, elbows, connections, tools, sewer plugs, piping, hoses and other parts of system hardware to ensure immediate repair or modification of any part of the system as necessary.

C. Criterion 2 - Bypass Pumping System with flows greater than 2.5 MGD
   1. In addition to the requirements identified under Criterion 1, Contractor shall design construct, operate and maintain the bypass system specified herein:
      a. All bypass piping shall be fused HDPE piping.
      b. The bypass piping system shall include multiple pipelines to convey 150% of the maximum anticipated flow (as determined by the Contractor). A minimum of one additional (spare) pipeline will be constructed and plumbed for immediate operation that is equal in diameter to the largest pipe size in use for the bypass setup. All other requirements shall be the same as identified under Criterion 1 of these specifications.

PART 3 EXECUTION

3.01 INSPECTION

A. The Contractor shall inspect the entire bypass pumping and piping system for leaks for spills on a daily basis. The Contractor shall also create an inspection log and shall enter the time of the inspections and the condition of the piping and the name of the inspector into the log for review by the Engineer.

3.02 DAMAGES

A. The Contractor shall repair, without cost to the owner, any damage that may result from his negligence, inadequate or improper installation, maintenance and operation of bypassing system, including mechanical or electrical failures.

END OF SECTION

SECTION 33 05 01

PROTECTION OF EXISTING UTILITIES

PART 1 GENERAL

1.01 REQUIREMENTS

A. This Section specifies the requirements to identify and locate (potholing) existing subsurface utilities and requirements for protection of existing utilities and improvements.

B. Electrical, telephone, fiber optic, gas, water, and sewer locations are approximations only. Dimensions and configurations shown are compiled from various sources and are not field verified. Neither the accuracy nor the completeness of information shown is guaranteed. CONTRACTOR shall verify utility locations, dimensions, and configuration prior to start of construction.

C. Existing condition of utilities is neither known nor implied. Maintain the present day functional purpose of all existing utilities regardless of the discovered state of repair and condition, unless shown to be abandoned or removed.

1.02 RELATED SECTIONS:

A. Section 02 41 00 Demolition

1.03 REFERENCES

A. This Section includes references to the following standards. They are a part of this Section as specified and modified. In case of conflict between the requirements of this Section and those of the listed documents, the requirements affording the greatest protection to the OWNER shall apply as determined by the CONSTRUCTION MANGER.

Reference	Title
APWA	Standard Specifications for Municipal Public Works Construction, Prepared by Utah State Chapter of the American Public Works Association
ASCE 38-02	ASCE Standard Guideline for the Collection and Depiction of Existing Subsurface Utility Data

1.04 DEFINITIONS:

A. Definitions used in this specification are as defined in ASCE 38-02 and as follows: Utility support systems are defined as the support systems provided to secure and suspend utilities in place and in complete working order during the performance of the WORK and for extended periods as specified.

B. Maintenance is defined as monitoring and maintaining the functional purposes of all utilities and support systems affecting the WORK.

1.05 SUBMITTALS

A. Submittals in accordance with the General Conditions and Section 01 33 00.

B. Prepare and submit a Utility Protection Plan for underground utilities affected by the Work. Plan shall include but not limited to:
   1. Description of utility to be protected
   2. Potholing data showing the relationship of the proposed work to the existing utility, size, horizontal and vertical position, material and service.
   3. Work to be completed in the proximity of the utility
   4. Proposed method to protect including:
      a. Shop drawing, the method of excavation, shoring, dimensions of trench or pit, zone of influence, offset distances from critical utilities, deflections, strain/stress on facilities, and soil-bearing loads;
      b. Structural details and calculations of temporary support systems and proposed sequence of construction;
      c. Materials list and specifications of the materials proposed for the support systems.
      d. If utility can not be protected provide method to bypass and maintain service.
   5. Proposed method to verify utility is undamaged

PART 2 PRODUCTS

2.01 REPLACEMENT IN KIND

A. Except as indicated below or as specifically authorized by the CONSTRUCTION MANAGER, reconstruct utilities with new materials of the same size, type, and quality as that removed or damaged.

B. Alternatively, contractor may construct the final configuration of the replacement pipeline and provide temporary by-pass piping and pumping for testing and commissioning. At all times the existing process pipelines must be operational and maintained until final completion of the new treatment building is operational.

2.02 PARALLEL AND PERPENDICULAR UTILITY PROTECTION

A. The pipeline alignments have numerous parallel and perpendicular utilities in close proximity which may or may not lie within the CONTRACTOR'S excavation/trench zone required to complete portions of the Work. The cost of exploratory excavations, protecting, supporting, or removal and reconstruction of these facilities will be at the expense of the CONTRACTOR and included in the bid item to which the Work is appurtenant.

2.03 SUPPORT SYSTEMS

A. Support systems used are capable of maintaining the utilities in service, undamaged for the duration of the Work.

B. Plastic Foam if used, shall be polyethylene, foam cushioning material.

PART 3 EXECUTION

3.01 GENERAL

A. Replace in kind existing infrastructure, such as curbs and gutters, barricades, traffic islands, signalization, fences, signs, etc., that are cut, removed, damaged, or otherwise disturbed by the construction.

B. Replace in kind manhole/structure components removed for bypassing or construct replacement infrastructure.

C. Before beginning pipeline excavation, determine the true location and depth of utilities and service connections which may be affected by or affect the Work. Determine the type, material, and condition of these utilities. To provide sufficient lead time to resolve unforeseen conflicts, order materials and take appropriate measures to ensure that there is no delay in Work

1. If a conflict exists between drawings and field information, notify CONSTRUCTION MANAGER immediately.

3.02 PROCEDURES

A. Protection in Place: Protect utilities in place, unless abandoned, and maintain the utility in service, unless otherwise specified on the plans or in the Specifications.

B. Remove and Reconstruct: Where so indicated on the plans or as required by the CONSTRUCTION MANAGER, remove the utility and after passage, reconstruct it with new materials. Provide temporary service for the disconnected utilities or as directed by the utility owner.

3.03 INSTALLATION

A. Perform excavation around the utilities and installation of the support systems without damage to utilities. Maintain the utility systems during the period of the WORK. Upon completion of the WORK, the utility systems are in a condition equal to or better than the preconstruction condition and operate as prior to construction.

B. Provide access to utilities for the purpose of operating and verifying the condition of their respective facilities.

C. Notify affected utility and CONSTRUCTION MANAGER of any damage to facilities immediately. Subsequent to repair, condition of the facility is equal to or better than condition of the facility prior to damage.

D. Notify affected utility and CONSTRUCTION MANAGER in the event that the existing state of repair of the utility is deemed unsafe or otherwise precludes proper support.

E. Modification to Utility Support Systems: Notify CONSTRUCTION MANAGER if the condition or location of the facility to be supported in place will require a modification to the support system as initially proposed or installed. Coordinate the revised support system through the CONSTRUCTION MANAGER.

F. Arrange and facilitate a meeting at the site with the CONSTRUCTION MANAGER and respective utility representatives for the utilities to be affected by the WORK at least 7 days prior to WORK in the vicinity of the specific utility unless otherwise specified. Be prepared to discuss the proposed utility protection measures as described in the Utility Protection Plan. Incorporate modifications to the plan resulting from the site meeting into the plan and resubmit to the CONSTRUCTION MANAGER at least five days prior to commencing the WORK in the vicinity of the specific utility.

G. Gas Facilities, Telephone, Electrical, and Fiber Optic Facilities: Protect and support in place.

3.04 BACKFILL AND COMPACTION

A. Utilities Protection in Place: After completing the Work and during trench zone backfill, backfill and compact under and around the utility so that no voids are left. Backfill around utilities shall be as shown and specified in the CONTRACT DOCUMENTS.

3.05 SERVICE LATERALS AND CONNECTIONS

A. Service laterals and connections to the various utilities (water, sewer, gas, CATV, telephone, etc) in the vicinity of the Work are not all shown on the plans. Information shown is based on best available data.

B. The CONTRACTOR shall conduct advanced potholing to confirm existing utility location, size, depth and condition to adequately define and protect existing utilities when their presence cannot be inferred from the presence of other visible facilities, such as markers, valves, buildings, meter and junction boxes, on or adjacent to the site of the Work.

C. If the CONTRACTOR discovers utility facilities not identified in the Contract Documents or in a position different from that shown in the Contract Drawings, immediately notify in writing the CONSTRUCTION MANAGER about the utility facility.

3.06 UTILITY INTERFERENCE

A. Where existing utilities interfere with the prosecution of the Work, the CONTRACTOR, shall relocate them in accordance with the requirements of the utility owner. Relocation shall only be completed after written approval by the utility owner and/or CONSTRUCTION MANAGER is provided.

B. When it is necessary to remove, relocate, protect, or temporarily maintain a service connection, the CONTRACTOR shall bear all expenses incidental to the Work on the utility or damage thereto. The work on the utility shall be done in a manner satisfactory to the utility owner; it being understood that the owner of the utility has the option of doing such work with his own forces or permitting the work to be done by the CONTRACTOR.

END OF SECTION

SECTION 33 05 25

EXCAVATION SUPPORT SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies requirements for sheeting, shoring, and bracing of trenches greater than five (5) feet in depth. The CONTRACTOR shall provide all labor, equipment, materials, and services necessary.

B. The CONTRACTOR shall design sheeting, shoring, and bracing in accordance with OSHA safety regulations (29 CFR, Part 1926, Subpart P, Excavations) for sloping the sides of excavations, using shoring and bracing, and for using other safety features.

1.02 REFERENCES

A. This Section includes references to the following standards. They are a part of this Section as specified and modified. In case of conflict between the requirements of this Section and those of the listed documents, the requirements affording the greatest protection to the OWNER shall apply, as determined by the CONSTRUCTION MANAGER.

Reference	Title
APWA	Standard Specifications for Municipal Public Works Construction, Prepared by Utah State Chapter of the American Public Works Association, latest edition.
MUTCD	Manual on Uniform Traffic Control Devices, United States Department of Transportation, Federal Highway Administration (latest edition)
OSHA	OSHA Safety Regulations (29 CFR, Part 1926, Subpart P. Excavations)
UDOT	Utah Department of Transportation (UDOT) 2017 Standard Specification and Drawings for Road and Bridge Construction

1.03 SUBMITTALS

A. Submittals in accordance with the General Conditions and Section 01 33 00.

B. Submit design calculations, shop drawings, and detail drawings that demonstrate conformity with OSHA regulations and suitability for design loads and installation methodology. The design shall be stamped and signed by a Registered Professional Engineer of the State of Utah.

C. Submit shop drawings showing dimensions, elevation, and structural details for each utilized excavation support system. Include on the drawings any required construction sequence, loading, testing, monitoring, and re-bracing/removal requirements. The design shall be stamped and signed by a Registered Professional Engineer of the State of Utah.

D. Submit excavation plans for worker protection in pipe trenches and other excavations. Submittal of excavation plans shall be for records only. Other than to verify that slide rail shoring is being used, submittals will not be reviewed by the Construction Manager as they are the sole responsibility of the Contractor and the Registered Engineer who signs and seals said plans.

E. Informational Submittals:
   1. Trench excavation plan addressing following topics:.
      a. Details of shoring, bracing, sloping, or other provisions for worker protection from hazards of caving ground.
      b. Design assumptions and calculations.
      c. Methods and sequencing of installing excavation support.
      d. Proposed locations of stockpiled excavated material.
      e. Minimum lateral distance from the crest of slopes for vehicles and stockpiled excavated materials.
      f. Anticipated difficulties and proposed resolutions.
   2. Movement measurement and data and reduced results indicating movement trends.
   3. The excavation support plan and the trench excavation plan shall be sealed by a professional engineer licensed in the State of Utah.
   4. Stamped Calculations

F. Action Submittals: Name and qualifications of the Professional Engineer(s) registered in the State of Utah responsible for trench excavation support design.

1.04 DESIGN REQUIREMENTS

A. Design excavation support systems to withstand earth pressures, hydrostatic pressures, bottom heave, equipment loads, applicable traffic and construction loads, and other surcharge loads to allow safe construction without movement or settlement of the ground and to prevent damage to or movement of adjacent structures, streets, and utilities. Design each member or support element with appropriate safety factors.

B. Acceptable excavation support methods include the use of trench boxes, suitable moving support systems, steel sheet pilings, soldier piles and lagging, jet grouted structures, secant pile structures, structural steel wales and struts, liner plates, and timber. If soldier piles are used, insert in predrilled holes. Horizontal strutting below the barrel of a pipe and the use of pipe as support are not acceptable.

C. Provide construction stage loadings for a staged removal of the support system that conforms to the pipe, structure placement, and indicated backfill.

D. Compaction of foundation, bedding, haunching, and backfill shall extend to the undisturbed trench wall during staged removal of the support system.

1.05 QUALITY ASSURANCE

A. Provide surveys to monitor movements of critical facilities.

B. Trench excavation support systems shall be designed by a professional engineer registered in the State of Utah who has a minimum of 5 years of experience in the design of retaining structures.

PART 2 PRODUCTS

A. Slide rail shoring may be required to protect existing buildings and utilities. Acceptable slide rail shoring suppliers include the following, or equal:
   1. GME (Griswold Machine and Engineering)
   2. Pro-Tec Equipment, Inc
   3. Efficiency Production, Inc..
   4. SHB, Double Slide Rail, Series 750.

B. Structural Steel: ASTM A36 or better, unless otherwise approved.

PART 3 EXECUTION

3.01 GENERAL

A. Design, provide, and maintain shoring, sheeting, and bracing as necessary to support the sides of excavations and to prevent detrimental settlement and lateral movement of existing facilities, adjacent property, and completed the Work.

B. Before beginning construction, install, and survey monitoring points as required, adequately protect existing structures, utilities, trees, shrubs, and other existing facilities. The repair of or compensation for damage to existing facilities will be at no cost to the Owner.

C. All welding will conform to the applicable provisions of ANSI/AWS D1.1.

D. Provide, place, and maintain supports, shoring, and sheeting as may be required for sides of excavations. Support excavations in a safe manner in accordance with applicable regulatory safety requirements.

E. The construction of sheeting, shoring, and bracing shall not disturb the state of soil adjacent to the trench and below the excavation bottom.

3.02 SEQUENCE

A. Trench excavation shall not be started until the design for trench support has been accepted by the CONSTRUCTION MANAGER.

3.03 TRENCHES

A. For trench excavation exceeding 5 feet in depth, provide adequate safety system meeting requirements of applicable local construction safety orders, and OSHA requirements.

B. At any time Contractor's personnel are not present within the immediate vicinity of the Work, open excavations shall be plated, barricaded, or fenced, as necessary, to protect the public and worker safety.

3.04 REMOVAL OF SUPPORT SYSTEM

A. Excavation support shall not be removed until support can be removed without damage to existing facilities, completed Work, or adjacent property.

B. As a minimum, excavation support shall be removed between the existing adjacent surface grade and 5 feet below the adjacent surface grade. As-built Drawings will be prepared showing location of temporary shoring and bracing that remains in place.

C. Excavation support shall be removed in a manner that will maintain support as excavation is backfilled and will not leave voids in backfill. Removal of the support system shall be performed in a manner that will not disturb the pipeline, the compacted backfill, or adjacent construction or facilities.

D. Any void left by shoring system or voids created by the removal of the shoring system will be filled with controlled low strength material (CLSM) or cement grout, as approved by the Construction Manager, to provide soil support between backfill zone and the native soil.

E. Sheet piling removal shall be performed in a manner that will not result in “vibro consolidation” of sandy or granular material below the excavation that could lead to settlement of the pipeline or other works of construction.

F. The support system removed from the excavation shall remain the property of the Contractor and shall be removed from the Site.

END OF SECTION

SECTION 33 05 31

PVC C900 PIPE

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies gasketed, solid wall polyvinyl chloride (PVC) pressure and gravity pipe, fittings, joints and service connections where specified.
   1. Construction of Plant Drains, Storm lines, Recycled Water, Potable, and Sewer shall adhere to the State of Utah Criteria for the Separation from Drinking water.

B. Provide all necessary labor, materials, equipment, and services to provide a complete, in-place PVC pipeline and to accurately locate in the field service laterals.

C. Pipe diameters specified represent nominal inside pipe diameter, unless otherwise specified. [Cast iron pipe sizes CIOD]

1.02 RELATED SECTIONS

A. Section 31 21 33 Trenching, Backfilling, and Compacting for Utilities

1.03 QUALITY ASSURANCE

A. REFERENCE: This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

PVC Pipe Association (UNI-BELL)	The Handbook of PVC Pipe Design and Installation by the Uni-Bell PVC Pipe Association. (latest edition)
PVC Pipe Association (UNI-BELL)	UNI-B-13 - Recommended Standard Performance Specification for Joint Restraint Devices for Use with Polyvinyl Chloride Pipe.

C. SHOP INSPECTION

1. The Owner’s Representative may inspect materials production and witness testing of pipes, fittings, elbows, and special pieces at the manufacturer's plant.
   a. Provide two weeks written advance notice of where and when production will commence and provide free and unlimited access to all portions of manufacturer's plant that are necessary to verify compliance with this specification. This inspection shall not replace the pipe manufacturer's own quality control procedures.

D. SHOP TESTING

1. Unless otherwise specified, all materials used in the manufacture of the pipe shall be tested in accordance with the requirements of the applicable referenced standards. Perform said material tests at no additional cost to the OWNER. The Owner’s Representative shall have the right to witness all testing.
   a. For pressure applications, each length of pipe must be hydrotested at twice the rating and a short-term pressure test must be conducted once per production run.

E. SUPPLIERS

1. Like items of pipe, joints and fittings shall be the end products of one manufacturer and shall be manufactured within 18-month period prior to installation. Pipe shall be date coded by manufacturer and the manufacturer's code provided on the pipe and delivery manifests.

F. Manufacturer Certifications:
   1. AWWA C900
   2. Factory Mutual (FM) 1612 Approved
   3. NSF Standard 14 and NSF Standard 61 listings for Potable Water Application
   4. Certification under NSF/ANSI 327 Annex G "lead-free"
   5. Underwriters Laboratories Inc. Standard 1285 mark of acceptance

1.04 SUBMITTALS

A. Procedures: Section 01 33 00, SUBMITTAL PROCEDURES.

B. Action Submittals
   1. A copy of this specification section, with addendum updates included, and referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the CONTRACTOR, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The ENGINEER shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the CONTRACTOR with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

C. Informational Submittals
   1. Manufacturer’s shop drawings and catalog data with sufficient detail to show compliance with specified requirements. Shop drawings shall illustrate pipe lengths, wall thickness, pipe class, and dimension ratios (DR).
   2. Details of fittings, pipe joints, joint gasket (size and shape), service connections, saddles, their locations, and related appurtenances with locations and complete service connection detail.
   3. Pipe-to-pipe/appurtenance connection details with Manufacturer’s product data, material properties with applicable ASTM references and technical installation requirements.

D. Construction Submittals
   1. Prior to delivery of the pipe from each manufacturing lot or run:
      a. Provide an affidavit of compliance with AWWA C900 and this specification.
      b. Submit certified laboratory testing results for provided pipe.

E. Construction Submittals
   1. Cut sheets showing stationing, invert elevations, ground elevations, and cuts every [25 feet] or at connection points to manhole and structures. Surveying shall be performed under the supervision of and certified by a licensed Professional Land Surveyor of the State of [state].

F. Close out Submittals
   1. Per Section 01 78 39, PROJECT RECORD DOCUMENTS

1.05 DELIVERY, STORAGE AND HANDLING

A. Pipe shall be packaged, handled and stored in accordance with AWWA M23 and the manufacturer's recommendations. PVC pipe that has been gouged, scratched, or otherwise damaged shall be subject to rejection at the discretion of the Owner's Representative. Rejected pipe shall be removed from the site and replaced at no additional cost to the Owner.

B. Pipe shall be protected from UV radiation by covering with opaque tarpaulins until immediately prior to installation. Remove from Site all PVC pipe showing signs of physical damage or ultraviolet exposure, as determined by [Owner's Representative].

C. Inspect each pipe prior to installation. The pipe shall be free of cracks, crazing, holes, delamination, foreign inclusions, air bubbles, blisters, or other deleterious defects. Remove rejected, damaged or defective materials from Site.

D. Keep pipe and gaskets free of dirt, foreign matter, and exposure to heat, sunlight, ozone, oil, and grease. PVC pipe that has been contaminated in any way with petroleum products (on the inside or outside of the pipe) shall not be used.

1.06 WARRANTY

A. Provide Manufacturer warranty

PART 2 PRODUCTS

2.01 MATERIALS

A. Provide pipe and fittings manufactured from virgin PVC compound meeting or exceeding cell classification of 12454 as defined by ASTM D1784 and a hydrostatic design basis rating of 4000 psi for water at 73.4 Deg F.

B. Additives and fillers, including stabilizers, antioxidants, lubricants, colorants, etc., shall not exceed 10 parts by weight per 100 of PVC resin in the compound.

C. Color per
   1. Potable Water: Blue
   2. Sewer Water : Olive Green
   3. Recycled Water: Purple
   4. Drain/Storm Water: White

2.02 PVC PRESSURE PIPE

A. Meet or exceed the minimum DR and pressure rating as specified and meeting the requirements of AWWA C900.

B. Provide pipe in accordance with AWWA C900 with a minimum [Pressure class, dimension ratio, Cast Iron Outside Diameter (CIOD)]

C. Provide standard nominal laying lengths, 10- or 20-ft unless otherwise specified or required to achieve the pipe alignment geometry. Pipe and fittings must be circular and concentric with the pipe barrel cut off on a plane at right angle to longitudinal axis of pipe.

D. Markings: Meet the minimum requirements of AWWA C900. Minimum pipe markings shall be as follows:
   1. Manufacturer's Name or Trademark and production record
   2. Nominal pipe size
   3. ASTM Standard
   4. Cell Classification
   5. Seal of testing agency that verified the suitability of the pipe. (marked "NSF-PW-G")
   6. ["CAUTION: "NON-POTABLE" OR "RAW WATER" – DO NOT DRINK."]
   7. Homemark on the spigot end to indicate proper penetration when the joint is made.

E. Accepted pipe manufacturers:
   1. Diamond Plastics Corporation
   2. North American Pipe Co (NAPCO)
   3. JM Manufacturing Co., Inc.
   4. IPEX, Blue Brute,
   5. or equal]

2.03 DESIGN CRITERIA

A. Obtain the following information from the drawings:
   1. Elevation of the pipe invert and of the completed ground.
   2. Alignment of the pipeline.
   3. Nominal diameter.
   4. Outside Diameter Control [CIOD]
   5. Pipe Dimension Ratio
   6. Maximum allowable deflection

2.04 PVC JOINTS

A. Bell and Spigot Joints
   1. Provide integral bell joint meeting the requirements of ASTM D3139 with an elastomeric seal meeting the specification defined in ASTM F477. Ends must have the same or greater thickness as of the pipe barrel.
   2. Gaskets shall be factory-assembled and securely bonded in place to prevent displacement. [Gaskets shall be lock-in style]
   3. Lubricants shall be non-toxic, food grade and biodegradable as recommended by the manufacturer.

B. Restrained Joints

1. Provide restrained joints on all pressure pipelines via restrained push-on or restrained mechanical joint per AWWA C111 except where flanged joints are required to connect to fittings, valves, and other equipment as specified. Joint restraint shall be installed in accordance with the manufacturer's instructions.

C. Gaskets

1. Provide [SBR],[EPDM] gaskets conforming to ASTM F477: Elastomeric Seals (Gaskets) for Joining Plastic Pipe.

2.05 FITTINGS

A. PVC Fitting shall be one-piece injection molded or fabricated from PVC compounds meeting ASTM D1784 with an equal or greater pressure rating that the pipe to which the fitting is connected.

B. Fabricated fittings shall conform to AWWA C900 PVC pipe. Segments bonded together may be over-wrapped with fibreglass-reinforced polyester. The pressure class must meet or exceed the pipe.

C. Accepted fittings manufacturers:

1. GPK Products, Inc.
2. North American Pipe Co (NAPCO)
3. JM Manufacturing Co., Inc.
4. IPEX, Blue Brute,
5. Multifittings, Ltd./Ipex, Inc.]

D. DIP Fittings

1. Provide ductile-iron fittings in accordance with AWWA C110 or C1553 with a minimum rated working pressure equal or greater that the PVC pressure pipe.
2. The fittings shall match the bell size and diameter control of the provided PVC pipe including the gasket-ring retaining groove.

2.06 COUPLINGS

A. Couplings shall meet the requirements of AWWA C900 as applicable, and have a minimum rated working pressure equal or greater that the PVC pressure pipe. Deflection at the coupling shall not exceed 50% of the manufacturer's written maximum recommendation unless otherwise specified.

B. Flange Adapters

1. Provide flange adapter specifically designed for PVC Pressure pipe when connecting PVC pressure pipe to flanged fittings or flanged valves

C. Transition and Sleeve Type Couplings

1. Provide transition and sleeve-type couplings specifically designed for use with PVC pressure pipe. Devices must be restrained to prevent axial separation of connected plain end pipe or dissimilar materials.

D. Bolts and nuts for mechanical joints, or flanged ends will be of a high strength corrosion resistant low-alloy steel and shall conform to AWWA C111. Flange bolts and nuts for above ground installation shall conform to Appendix A of AWWA C115. Flange bolts and nuts for below ground installation shall be 316 stainless steel. All fittings shall be fusion bonded epoxy lined and coated and lined unless stainless steel is used.]

PART 3 EXECUTION

3.01 GENERAL

A. Make connections to different pipe materials by means of flanges, specified adapters or transition fittings. Where sleeve type couplings are used, both shall be uniformly torqued in accordance with pipe manufacturer's recommendation. Foreign material shall be removed from the pipe interior prior to assembly. Do not change the type or class of pipeline material between manhole sections.

3.02 COMPLIANCE TESTING

A. Conduct tests required in ASTM D3034, ASTM D2412, D32124, and F477.

3.03 INSTALLATION

A. Install PVC pressure pipe in accordance with ASTM D2774, AWWA M23, AWWA C605, and the manufacturer's recommendations. In the case of conflict, the stricter requirement as determined by the Owner's Representative shall apply.

B. Provide survey cut sheets with invert elevations, ground elevations, and cuts every 25 feet and lateral locations. Cut sheets shall be provided by a surveyor working under the supervision of a registered professional surveyor in the state of Utah.

C. Minimum bedding thickness shall be 6-inches unless otherwise specified.

D. Lay pipe without break, upgrade from structure to structure, with the socket ends of the pipe upgrade.

E. Do not use the pipe as a drain for removing water from the trench.

F. After joint assembly, bring the bedding material up to pipe spring line, taking care to uniformly support the pipe. Bedding material shall be imported, placed and compacted per Section 31 20 00 EARTHWORK.

G. Backfill remainder of trench per Section 31 23 00 EARTHWORK.
   1. Do not use hydro hammers to compact bedding or backfill.
   2. Do not use flooding and jetting to compact bedding or backfill.

H. Place a 2 foot PVC joint of the same inside diameter as the adjoining pipe at the inlet and outlet to each manhole or structure. Use one of the following methods:

3.04 LINE AND GRADE

A. Pipe shall not deviate more than 1 inch from line or 1/4 inch from grade. Measure for grade at the pipe invert.
   1. Corrections or changes in line or grade may not be made by pipe bending.
   2. When installed, established line shall not result in high points or bellies in the reach.

B. PVC pressure pipe shall be deflected at the joints only. The maximum allowable joint deflection shall be limited to and shall not exceed 50% of the manufacturer's recommendation or 1 degree, Whichever is less.

3.05 TESTING

A. Testing of plastic piping shall be as specified in Section 40 05 01.

END OF SECTION

SECTION 33 05 33.13

CORRUGATED-WALL, SMOOTH INTERIOR HDPE GRAVITY PIPE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes high-density polyethylene (HDPE) pipe for stormwater and other surface water drainage, with or without end treatments such as headwalls or flared end sections.
   1. Double-wall, smooth interior polyethylene pipe manufactured for all drainage applications, including storm sewers, culverts, stormwater storage and water quality management.
   2. Related joints and accessories.

1.02 RELATED SECTIONS:

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 31 23 00: Excavation and Fill
   2. Section 31 21 33: Trenching, Backfilling, and Compacting for Buried Piping

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
AASHTO M 252	Specification for Corrugated Polyethylene Pipe, 75- to 255-mm (3- to 10-inch) Diameter
AASHTO M 294	Specification for Corrugated Polyethylene Pipe, 305- to 915-mm (12- to 36-inch) Diameter
ASTM D2321	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications
ASTM D3350	Standard Specification for Polyethylene Plastics Pipe and Fittings Materials
ASTM F477	Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe
ASTM F2306	Standard Specification for 300 mm to 1500 mm [12 in. to 60 in.] Annular Corrugated Profile-Wall Polyethylene (PE) Pipe and Fittings for Non-Pressure Gravity-Flow Storm Sewer and Subsurface Drainage Applications

1.04 SUBMITTALS

A. Product Data: Submit data on pipe, fittings, and accessories.

PART 2 PRODUCTS

2.01 MATERIALS

A. Plastic Storm Drain Pipe:

1. Polyethylene Storm Pipe: AASHTO M252 or M294, or ASTM F2306, with a smooth interior and annular exterior corrugations. Manning's "n" for use in design shall be 0.012.
    a. Joints: Pipe shall be joined using a bell and spigot joint meeting the requirements of AASHTO M252, AASHTO M294,or ASTM F2306.
    b. The joint shall be soil-tight and gaskets for diameters 12- through 60-inch, shall meet the requirements of ASTM F477. For diameters 4- through 10-inch, the joint shall be soil-tight using an engaging dimple connection.
    c. Gaskets shall be installed by the pipe manufacturer and covered with a removable, protective wrap to ensure the gasket is free from debris. A joint lubricant available from the manufacturer shall be used on the gasket and bell during assembly.

B. Fittings:

1. Fittings shall conform to AASHTO M252, AASHTO M294, or ASTM F2306. Bell and spigot connections shall utilize a welded bell and valley or saddle gasket meeting the soil-tight joint performance requirements of AASHTO M252, AASHTO M294, or ASTM F2306.

C. Materials Properties:

1. Material for pipe and fitting production shall be high density polyethylene conforming with the minimum requirements of cell classification 424420C for 4- through 10-inch diameters, and 435400C for 12- through 60-inch diameters, as defined and described in the latest version of ASTM D3350, except that carbon black content should not exceed 4 percent.
2. The 12- through 60-inch pipe material shall comply with the notched constant ligament-stress (NCLS) test as specified in Sections 9.5 and 5.1 of AASHTO M294 and ASTM F2306, respectively.

D. Bedding and Cover Materials:

1. Bedding: Class A material as defined in Section 31 23 00.
2. Backfill: As specified in Section 31 21 33.

PART 3 EXECUTION

3.01 PREPARATION

A. Verify existing conditions before starting Work. Notify ENGINEER when existing conditions DO NOT match Drawings.

B. Verify trench cut or excavation base is ready to receive Work and excavations, dimensions, and elevations are as shown on the Drawings.

C. Remove large stones or other hard matter that could damage piping or impede consistent backfilling or compaction.

3.02 INSTALLATION

1. Excavation and Bedding:
   a. Excavate trench in accordance with Section 31 23 00 and place bedding material in accordance with Section 31 21 33.
   b. Maintain optimum moisture content of bedding material to attain required compaction density.
2. Pipe:
   a. Installation shall be in accordance with ASTM D2321 and pipe manufacturer recommended installation guidelines.
   b. Minimum cover in trafficked areas for 4- through 48-inch diameters shall be one foot. and for 60-inch diameter the minimum cover shall be 2-feet.
   c. Lift or roll pipe into position. Do not drop or drag pipe over prepared bedding.
   d. Shore pipe to required position; retain in place until after compaction of adjacent fills.
   e. Ensure pipe remains in correct position and to required slope.
   f. Place and compact bedding and fill as described in Section 31 21 33 and Section 31 23 00.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 01

PIPING SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies the general requirements for design, selection, and supply of pipe materials, fittings, appurtenances, expansion control, supports, and seismic restraints for process, mechanical, plumbing, utility, odor control ducts, and HVAC piping systems. Installation, inspection, and testing are also specified in this Section.

B. Use the general requirements specified in this section with the more specific requirements listed in the Piping System Schedules (Section 40 05 02.00 through 40 05 02.99) and other referenced sections. Except where referenced specification sections specify alternate provisions, the requirements of this Section apply to all piping systems listed in Section 40 05 02.

C. Provide professional engineering services for a piping system design engineer (hereinafter and in all related and referenced sections the "Design Professional") for the design and inspection of piping systems work. For the scope of the work, defined herein as the “Design Professional’s Scope of Responsibility,” the Design Professional provides the design, final inspection, and certification for the piping supports, seismic restraints, and expansion control as specified in this Section and referenced sections.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 61 45 – Area Exposure Designations
   3. Section 01 66 00 – Product Storage and Handling Requirements
   4. Section 01 73 24 – Design Requirements for Non-Structural Components and Non-Building Structures
   5. Section 03 30 00 – Cast-in-Place Concrete
   6. Section 31 23 00 – Excavation and Fill
   7. Section 40 05 02 – Piping System Schedules
   8. Section 40 05 06 – Specialty Couplings and Adapters for Process Piping
   9. Section 40 05 07 – Hangers and Supports for Process Piping
   10. Section 40 05 07.13 – Seismic Restraints for Piping
   11. Section 40 05 07.16 – Expansion Control for Piping
   12. Section 40 05 45 – Piping System Identification
   13. Section 40 42 00 – Insulation for Exposed Piping and Equipment

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.

Reference	Title

CAN/CGA B149.6	Code for Digester Gas and Landfill Gas Installations
EJMA	Expansion Joint Manufacturer's Association
UPC	Uniform Plumbing Code

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Maximum pressure: The greatest continual pressure at which the piping system is designed to operate.
   2. Test pressure: The hydrostatic, air, or gas pressure used to determine system compliance.
   3. Take down coupling: Pipe couplings that facilitate disassembly of piping systems without damage or demolition of piping system components.
   4. Embedded/Encased piping: Piping enveloped in reinforced concrete, typically under structures and under roadways, where specified on the drawings.
   5. Exposed: All area exposures specified in Section 01 61 45 other than buried, submerged, or encased/embedded.

B. Piping System Identification
   1. Process, mechanical, plumbing, utility, odor control, and HVAC piping system piping is identified by a two component alpha-numeric code, (Line Label) as follows:
      a. The first component of the code indicates the nominal line size.
      b. The second component of the code identifies the process Service or fluid being conveyed in the Piping System.
   2. Process Service identifiers for pipelines are specified on the drawings. The Process Service is defined for each Process Service Identifier in Section 40 05 02.

3. Detailed specifications for each Process Service are scheduled in Section 40 05 02.00 through 40 05 02.99.
4. Mark and label Piping Systems as specified in Section 40 05 45.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
1. Refer to Section 40 05 45 for process piping identification requirements.
2. Pipe Sleeves: Coordinate placement of sleeves and penetrations in cast-in-place concrete with raceway, duct, and pipe penetrations prior to concrete placement. Coordinate placement of sleeves and wall penetration prior to construction of masonry building elements.
3. Coordination required with the design of piping supports (hangers, guides, anchors, structural attachments, etc.), expansion joints, and expansion control and seismic restraints. Refer to sections 40 05 06.23, 40 05 07, 40 05 07.13, and 40 05 07.16.
4. Refer to paragraph 1.09 Piping System Design for additional coordination requirements.

1.06 SUBMITTALS

A. Action Submittals:
1. Procedures: Section 01 33 00.
2. Qualifications of the Design Professional charged with inspection and certification of pipe hangers and supports and related scope of work; provide educational background, proof of registration, and proof of insurance and previous experience in performing this type of work. No further submittals under this or any related section will be considered until the Design Professional's qualifications have been reviewed and accepted by the Construction Manager.
3. A copy of this specification section, along with Sections 01 73 24, 40 05 06.23, 40 05 07, 40 05 07.13 and 40 05 07.16, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. For each piping system (refer to Piping System Schedules in Section 40 05 02.00 through 40 05 02.99), submit document listing pipe, fittings, linings, coatings, valves, flexible connectors, expansion joints, couplings, bolts, gaskets, restraints, and other items provided for each applicable pipe size and category.

5. Welding: Prior to commencing any welding of steel or stainless steel pipe, supports, and/or structural attachments, provide a written description of welding techniques, including, but not limited to, materials, methods, and quality control. Identify differences in shop and field techniques. Indicate in the submittal that the welding technique has been reviewed for each piping service and certify that the technique is acceptable for the intended service condition (piping service defined in Section 40 05 02 and area exposure designation specified in Section 01 61 45). Written procedures to be stamped and sealed by a Professional Engineer registered in the State of Utah and qualified for welding design.

B. Informational Submittals:
   1. Procedures: Section 01 33 00
   2. Pre-Construction Data:
      a. Design drawings and calculations for pipe supports, anchorage, seismic restraints, and expansion control systems as specified in Sections 40 05 07, 40 05 06.23, 40 05 07.13, and 40 05 07.16. Drawings and calculations sealed and submitted by the Design Professional specified in this Section. The Design Professional shall affirm that loads on structures are within any stipulated load limits that may be noted on the contract documents.
      b. Submit piping layout drawings for all piping systems, including raceway, duct and other specified systems support. Indicate assembly details, location and placement of field welds, unions and flanges, fittings, valves, flushing connections, drains, sample taps, cathodic protection, seismic restraint system, expansion joints, guides, anchors, hangers, supports, and the provisions for thrust restraint, as well as any other pertinent details and appurtenances for all piping, including wall and floor penetrations, where applicable, in that area. Indicate location and clearances from structures and other utilities (ductwork, conduit, electrical tray, etc.). Include details of connections to new and existing equipment, piping and structures. Submit original layouts by the Contractor; photocopies of Contract Drawings are not acceptable. Identify the invert elevation of buried pipe at changes in slope, pipe crossings, and connections to structures on piping layout drawings in addition to providing coordinates for locating changes in horizontal alignment of buried pipe.
      c. Product Samples: Where specified or when directed by the Construction Manager, provide mill test results or product samples.
      d. Prior to the commencement of welding, submit current and complete documentation of the welder's qualifications.
      e. Safety plans for pneumatic pressure testing.
   3. Post-Construction Data: Inspection reports, authored, sealed, and signed by the Design Professional retained under the provisions of this Section submitted to the Construction Manager. The Design Professional's final report shall be submitted to the Construction Manager before beneficial occupancy by the Owner.

1.07 QUALITY ASSURANCE

1. Review the drawings prior to installation of piping, conduit services, and fixtures. Identify any conflicts and cooperate with the Construction Manager to determine the adjustments necessary to resolve conflicts.
2. Confirm the routing of each section of pipeline with other services prior to commencement of installation. Advise the Construction Manager of any conflicts with existing services or services yet to be installed. Where necessary, amend the routing of pipework to avoid conflict and confirm with the Construction Manager.
3. Refer to paragraph 1.09 Piping System Design for additional quality assurance requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Requirements:
   1. Deliver pipe, fittings, and specials to site using loading methods which do not damage pipe or linings, or coatings.
   2. Piping materials delivered to site will be clearly marked to indicate size, type, class/schedule and coatings.
   3. Until ready for incorporation in the work, store on site as recommended by the piping materials manufacturer to prevent damage, undue stresses, or weathering.
   4. Store materials at least 8 inches above ground. Provide sufficient supports to prevent undue bending.
   5. Protect non-UV light inhibited plastic from sunlight.
   6. Maintain refrigerant piping factory seals until ready for incorporation into the Work.
   7. Cover openings in piping, and temporarily seal to protect from contamination.
   8. Protect materials and equipment from damage due to environmental conditions. Use protective cover, and protect from surface water by elevating above floor or surrounding grade.
   9. Protect unfinished work at end of each workday from damage, contamination and moisture by use of plugs, caps or covers.
   10. Protect piping and valves from damage pending performance of system tests.
   11. Use proper implements, tools, and facilities for the proper protection of the pipe. Exercise care in the installation so as to avoid damage to pipe, linings, and coatings.
   12. Inspect each pipe and fitting prior to installation. Do not install damaged pipe or pipe with damaged protective coatings or linings.
   13. Prevent entry of foreign matter during handling, assembling, and installation. Use compressed air, wire brush, solvent and other acceptable means to remove all foreign matter from inside of pipe prior to installation. Remove residual scale, dirt and other foreign matter from interior of piping before final connections are made.

1.09 PIPING SYSTEM DESIGN

A. Design Professional:
   1. Provide professional engineering services ("Design Professional") for the design and inspection of piping systems work. The Design Professional must have not less than ten years' experience in the type of piping support, seismic restraint, and expansion control design work required for this project.
   2. The Design Profession shall be a professional engineer currently licensed to practice in the State of Utah.
   3. The Design Professional must obtain and maintain professional liability insurance in the amount of $1,000,000 aggregate, to be in effect for the duration of this project plus one year.
   4. The requirements for the Design Professional shall not be construed as relieving the Contractor of overall responsibility for this portion of the work.

B. Piping System Design and Inspection:
   1. The Design Professional shall provide the design, inspection, and certification for piping supports (hangers, guides, anchors, structural attachments, etc.), expansion control and seismic restraints as specified in this Section and referenced Sections.
   2. The work of the Design Professional is complementary to the design elements specified in the Contract Documents and intended to provide complete piping system designs. The Design Professional's inspection responsibilities also complement inspections by the Construction Manager. The division of responsibility for work is shown in the following table:

Piping System Element (Specification)	Design Professional's Responsibility	Construction Manager's Responsibility
Pipe material and thickness, test pressures and other properties (Section 40 05 02.00 through 40 05 02.99)	(NA)	All piping
Contractor layout drawings (Section 40 05 01)	All piping	(NA)
Support design (Section 40 05 07 and Section 01 73 23, and related sections)	All piping, except as indicated for Construction Manager's Responsibility	Pipe supports specified on the drawings
Seismic bracing (Sections 40 05 07.13 and Section 01 73 23, and related sections)	All piping, except as indicated for Construction Manager's Responsibility	Seismic bracing specified on the drawings
Expansion and Control Design (Section 40 05 07.16 and related sections)	All piping, except as indicated for Construction Manager's Responsibility	Expansion Control provisions specified on the drawings
Inspection – General. For design and specification conformance (Section 40 05 01 and related sections)	All piping	(NA)

   3. Acceptable types of supports, guides, saddles, expansion joints, flexible couplings, hangers and structure attachments for general piping support are specified in Section 40 05 07. Seismic restraints are specified in Section 40 05 07.13. Pipe expansion control systems are specified in Section 40 05 07.16. Incorporate these specific elements into the design prepared by the Design Professional.

4. Pipe support and seismic restraint placement is subordinate to the function of anchorage, flexibility, and expansion control provisions. Do not interfere with the function of anchorage, flexibility, and expansion control provisions specified on the drawings.
5. Where pipe anchors are specified, they have been designed for longitudinal (axial) seismic loading, in addition to other longitudinal forces associated with expansion control, and pipe thrust for the associated piping. Rely on the specified anchors for longitudinal seismic bracing of the pipe in these instances.
6. There may be situations where the Construction Manager wants to control where certain anchors are located, the level of forces that can be transmitted to structures, the direction that expansion growth is allowed, or requires use of particular piping elements. In such cases these elements will be specified on the drawings and incorporated into the Design Professional's design. Mandatory anchorage locations identified on the drawings and maximum limitations, if any, for structure loads from the anchor will be as indicated on the drawings, identifying location and the maximum force that can be imposed on the structure. Where structural load would be exceeded, provide piping flexibility or expansion joints to reduce the maximum loading imposed on the structure.
7. For general understanding of intent and bidding purposes, general support locations, arrangements, types and means of attachment may be shown on the drawings. Some of the elements may be specifically designed and detailed. If a particular type of support, anchor, seismic restraint or expansion element is detailed on the drawings, then incorporate those elements into the Contractor's design. Include all elements of the piping system in Piping submittals by the Contractor, including those portions directed by the Construction Manager and complete piping runs.
8. Calculate the structural reaction loads for all fixed supports and indicate the calculated reaction loads on the submitted layout drawings. Notify the Construction Manager if any elements specified on the Drawings are incompatible with the overall piping system and its function.
9. Include consideration of and provisions for:
    a. Support and restrain pipe independent of support or restraint provided by equipment or without equipment supported loads exceeding equipment manufacturer's nozzle loading recommendations. Obtain maximum nozzle loads from the equipment manufacturer.
    b. Routing of pipe to provide access aisles free of obstruction and worker hazards. Unless otherwise specified or approved by the Construction Manager, the minimum clear space between equipment is 36 inches horizontally. Minimum vertical clearance is 7 ft above the floor or local grade at pedestrian access aisles and egress paths. Minimum clearance for equipment access aisles in galleries, tunnels and utilidors is 10 ft by 10 ft.
    c. Electrical bonding for all gas, fuel, and pneumatic conveyance systems.
    d. Dielectric separation, as specified.
10. Include all elements of piping systems required for fabrication and construction in the piping layout submittals. Depict couplings, support, restraint, anchorage, expansion control measures and other elements of the piping system.
11. Depict fitting angles and vertical and horizontal pipe locations, as determined by the Contractor, on piping layout drawings.
12. Do not interfere with maintenance functions and access around equipment, including monorails and hoists.

PART 2 PRODUCTS

2.01 PIPE MATERIALS - GENERAL

A. All pipe materials to be new, free from defects and conforming to the requirements and standards identified in the Piping System Schedules (Section 40 05 02.00 through 40 05 02.99) and related sections.

B. New and existing piping is designated by process service rather than pipe material. Existing pipe material types may not be the same as material types specified for new piping. Investigate connections to existing piping and provide suitable connections, including electrical isolation, as necessary.

C. Fittings and Coupling Compatibility: To assure uniformity and compatibility of piping components, furnish fittings and couplings for grooved-end or shouldered-end piping systems from the same manufacturer.

D. Buried Piping: Size temporary and/or permanent thrust restraints. Design restraint systems to allow complete piping system disassembly without destruction of any portion of the piping system.

2.02 MATERIAL FOR PIPING SUPPORT, SEISMIC RESTRAINTS AND PIPE ANCHORS

A. This paragraph specifies materials for pipe supports specified in Section 40 05 07, seismic restraints specified in Section 40 05 07.13, pipe anchors, certain expansion control elements specified in Section 40 05 07.16, and all associated appurtenances. Section 01 61 45 defines environmental exposures by physical location. Pipe Support, Seismic Bracing, and Pipe Anchor materials are specified based on the environmental exposure specified in Section 01 61 45. Provide Pipe Support, Seismic Bracing and Pipe Anchor components fabricated from materials as specified in the following table:

Environmental Exposure or Pipe Material	Materials [1]	Nuts, bolts, washers, and fasteners
Outdoor	Steel, hot dip galvanized after fabrication	Type 304/316 stainless steel
Indoor, Dry	Steel, hot dip galvanized after fabrication	Steel, Zinc plated or hot-dip galvanized after fabrication
Indoor, Wet	Type 316 stainless steel or FRP	Type 316 stainless steel
Chemical Corrosive	Fiberglass (FRP)	Type 316 stainless steel
Head Space	Type 316 stainless steel or FRP	Type 316 stainless steel
Submerged	Type 316 stainless steel or FRP	Type 316 stainless steel
Undefined	Type 316 stainless steel or FRP	Type 316 stainless steel
Stainless steel piping	Same type of stainless steel as the pipe or FRP	(per area as defined in this table)

Notes:

1. *Where materials as designated in drawing details or indicated in other specification sections, those requirements govern over the provisions of this table.*

2.03 PIPE AND VALVE COMPATIBILITY

A. Coordinate the selection of pipe materials, linings, and end connections so that valves operate properly over their entire range (e.g., sufficient disk clearance for butterfly valves). Support wafer style valves or spectacle flanges between flanges of equal inside diameter.

2.04 BONDING JUMPERS

A. Provide plated, flexible copper braid jumpers with unplated copper ferrules for attachment to pipe flanges, rated for a 100 amp minimum. Provide Burndy Electrical, Type B series, or Approved Equal, and sufficient conductive, anti-oxidant compound (Burndy Electrical Penetrox series or Approved Equal) to protect ferrules.

2.05 JOINTS – GENERAL

A. Provide joints for disassembly within 3.0 ft of any connection to equipment, on both sides of structural penetrations, and within 2.0 ft of all threaded end valves.

B. Unless otherwise specified on the drawings or in equipment specifications, adapt all equipment connections to a flanged connection compatible with the connected piping system.

C. Flexible Joints at Structural Joint Crossings: Provide a flexible joint (or joints) on all piping crossing structural joints.

2.06 FLANGES AND OTHER COUPLINGS

A. Pipe connections are specified in the Piping System Schedules in Sections 40 05 02.00 through 40 05 02.99

B. General requirements for flanges are as follows:
   1. Where raised-face and flat flanges are provided for connection, reface the raised-face flanges. Flange face to be flush with flat-faced companion flanges on flat-faced valve or equipment flanges.
   2. Provide flat-faced flanges on each side of butterfly valves.
   3. For steel piping, provide weld neck flanges on both sides of wafer or lug body valves.

C. Slip-on flanges that are attached to a pipe by means of set screws and gaskets (uni-flange, etc.) are not acceptable.

2.07 FITTINGS – GENERAL

A. Fittings are specified in the Piping System Schedules.

B. Provide eccentric reducers in horizontal lines with the flat side on top, unless specified otherwise on the drawings (e.g., flow meters in horizontal runs requiring submergence).

C. Provide concentric reducers in vertical lines, unless otherwise specified on the drawings.

D. Provide reducers upstream and downstream of flow measurement devices to adapt line size to the specified flow measurement device dimension. Coordinate with the specific instrument requirements.

E. Provide long radius (greater than or equal to 1.5 x nominal diameter) elbows unless otherwise specified on the drawings.

2.08 GASKET MATERIALS

A. For flat faced flanges, use full-face gaskets. For raised-face flanges, use ring type gaskets. Conform to ANSI B16.21.

B. Refer to the Piping System Schedule for the specified gasket material. Material designations used in the detailed pipe specification sheets are as follows:
   1. EPDM: ethylene-propylene-diene-terpolymer 70 durometer
   2. Neoprene: neoprene (black) 70 durometer
   3. Nitrile: nitrile (Buna N)
   4. SBR: Styrene-butadiene (red)
   5. Natural rubber: natural rubber
   6. Compressed synthetic fibers (Kevlar): ASTM F104 (F712400), and neoprene binder: 1.7 MPa (ASTM F152), 0.2 mL/h Leakage Fuel A (ASTM F37)
   7. Compressed synthetic fibers (Kevlar): ASTM F104 (F712400) and SBR binder: 1.7 MPa (ASTM F152), 0.1 mL/h Leakage Fuel A (ASTM F37)
   8. Gylon - Type 1: Garlock Style 3500: 1.35 MPa (ASTM F152), 0.22 mL/h Leakage Fuel A (ASTM F37)
   9. Gylon - Type 2: Garlock Style 3510: 1.35 MPa (ASTM F152), 0.04 mL/h Leakage Fuel A (ASTM F37)
   10. CPE - Chlorinated Polyethylene
   11. Spiral-wound: per ASME B16.20, rated to 1200 degree Fahrenheit Flexitallic SS316L or approved equal
   12. PTFE bonded EPDM, full-face gaskets
   13. Viton/FKM – Fluoroelastomer, 75 Durometer

2.09 DISSIMILAR METAL CONNECTIONS

A. Where dissimilar metals are to be connected, provide dielectric fittings and/or isolating flanges, including bolt sleeves and washers, according to Section 40 05 06.

2.10 CATHODIC PROTECTION

A. Provide cathodic protection of piping, pipe fittings, and appurtenances where specified on the drawings.

2.11 STRUCTURAL ELEMENT PENETRATIONS

A. Penetrations through structural elements are referenced to a custom detail or Standard Detail. Where a penetration detail is not specified, conform to the Standard Detail relevant to the type of structure, exposure, and type of pipe.

B. Provide pipe sleeves capable of supporting the loads applied during placement of concrete or during block work erection.

2.12 PIPE MARKERS, DETECABLE WARNING TAPE, AND TRACER WIRE

A. Pipe marker, detectable warning tape, and tracer wire materials per Section 40 05 45.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to installation, inspect, and field measure to ensure that previous work is not prejudicial to the proper installation of piping.

B. Pothole existing pipe at connections to new pipe to confirm material and joints prior to submittal of pipe layout drawings.

C. The Drawings are, in part, diagrammatic, make all minor modifications to suit installed equipment and structural element locations and elevations and coordinate with electrical construction.

D. Provide details of connections to new and existing equipment, piping, and structures in piping layout drawing submittals. Unless otherwise specified on Drawings, piping fitting angles and vertical and horizontal pipe locations shall be determined by Contractor.

E. Piping arrangements indicated on the drawings have been estimated from the approximate configuration of the type of equipment listed in the equipment specifications. If the equipment to be provided does not have the same configuration, modify the piping arrangement as necessary. Include any piping modifications in shop drawings submitted prior to fabrication or installation.

3.02 PIPE SUPPORT, ANCHORAGE, AND SEISMIC BRACING

A. Support piping with anchor brackets, guides, saddles, or hangers. Pipe movement due to thermal expansion and internal pressure and dynamic forces shall be accommodated by pipe springing, anchors, expansion joints, and guides selected for the specific purpose by the Design Professional retained under the provisions of this Section. Provide supports on each run at each change of direction.

B. Provide seismic bracing as required to resist seismic loads.

C. Do not use existing pipes and supports to support new piping. Existing tunnel pipe support racks can be used for new pipe if the Design Professional determines that the existing rack components are adequate to support the additional load.

D. Install expansion loops, anchors, expansion joints, and guides where specified on the drawings.

3.03 PIPING CONNECTIONS TO MACHINES

A. Align piping at machine connections in all planes to permit insertion of bolts at bolted connections or coupling screwed connections without using jacks, come-a-longs or other mechanical means to align field piping with the connections at the machines.

B. Do not force bolts into mating flange bolt holes. Align flange bolt holes to permit insertion of bolts by hand (without tools, hammering, or prying).

C. Use of 'dutchmen' mitered sections or similar specials to achieve the required alignment with machine connections are strictly prohibited.

D. Provide equipment connection fittings per Section 40 05 06 as specified on the drawings.

3.04 JOINT AND COUPLING OPTIONS

A. Provide pipe connection (joint and coupling) options as specified in the Piping System Schedule.

B. If a Piping System Schedule lists several connection options, then any of the listed options may be used for a particular pipe material, but the selected option shall be used consistently. For example, if flanged or grooved connections are specified and grooved are represented on the Drawings, then flanged may be installed in lieu of the grooved couplings specified on the drawings.

C. Connecting straight runs of pipe by welding is acceptable only where the individual Piping System Schedule allows welding as a connection option.

D. Where connections other than those indicated on the Piping System Schedule are specified on the Drawings, locate the connection specified on the drawing at the specific location indicated on the drawing.

E. Provide rigid, non-rotating connections at all valves and equipment.

3.05 SMALL BORE UTILITY PIPING

A. Field route small bore (generally less than 3-inch) diameter branch piping for utility services.

B. In general, small bore utility branch piping is not specified on the Drawings unless a specific pipe routing or configuration is to be provided or where necessary to show valves or instrumentation requiring electrical connections.

C. Distribution lines for small bore utility piping are specified on the Drawings along with service connection routes to locations that require utility service piping.

D. Install small bore utility piping that must be drained to provide freeze protection with a continuous slope down to the drain.

3.06 BONDING

A. Bonding jumpers shall be as specified in this Section.

B. Bonding shall be provided for all gas, fuel, and pneumatic conveyance systems to control static electricity. Provide bonding jumpers to the following piping systems: NG

C. Construct electrically continuous piping for the process services listed above and connect directly or indirectly to earth ground.

D. Provide bonding jumpers where sections of pipe are interrupted with non-conducting sections, fully lined valves that are not through-bolted or other interruption in continuity.

E. Remove any coatings, dirt, grease or other contaminants from flanges where jumpers are to be installed. Apply sufficient conductive, anti-oxidant compound to protect the entire ferrule from galvanic action and hydrogen sulfide attack.

3.07 SEWER AND DRAIN PIPING

A. Run horizontal drainage piping as straight as practicable and at uniform pitch.

B. Install pipe 3-inch or less in diameter with slope of not less than two percent, unless otherwise specified on the Drawings.

C. Install pipe larger than 3-inch diameter with slope of not less than one percent, unless otherwise specified on the Drawings or required by the Plumbing Code.

3.08 SLEEVES

A. Unless otherwise noted in the specified pipe penetration details or otherwise approved by the Construction Manager, provide sleeves where piping passes through a wall, floor, or ceiling.

B. Locate and place sleeves prior to construction of cast-in-place elements and prior to the construction of concrete and masonry building elements.

3.09 PIPE JOINTS AND CONNECTIONS

A. Field cuts for glass-lined pipe are not permitted.

B. Cut pipe with appropriate tool and deburr.

C. Make joints tight. Test and remake leaking joints with new materials. Do not use thread cement or caulking to remake joints.

D. Do not use sharp toothed wrench in making up brass pipe, or chrome plated items.

E. Provide thread forms and length in accordance with ASME standards. Use lubricant or sealant on male threads suitable for proposed pipe service.

F. Clean joints before soldering. Use flux and alloy appropriate for specified operating temperature and pressure.

G. Welding procedures, welder certification/qualification, and weld testing per ASME Section IX, Boiler and Pressure Vessel Code. Make welds per the specified standard when ASME B31.1 or ASME B31.3 are specified for a Piping System in the Piping System Schedules (Sections 40 05 02.00 through 40 05 02.99).

H. Coat gasket with gasket manufacturer's recommended lubricant between flange faces.

3.10 TAKEDOWN COUPLINGS

A. Takedown Couplings: Provide takedown couplings at the locations specified on the Drawings in accordance with this Section.

B. Provide takedown couplings at changes in piping direction and where specified in the Drawings on straight runs of pipe.

C. Provide screw unions, flanged or grooved end coupling type joints as takedown couplings.

D. Use flanged or grooved end joints on pipelines 1.5-inch diameter and larger.

E. Where piping passes through walls provide takedown couplings within 40 inches of the wall.

F. Provide a union or flanged connection within 24 inches of each threaded end valve.

3.11 INSTALLATION OF BURIED PIPE AND PIPE BELOW STRUCTURES

A. Trenching and backfill for buried pipe: conform to Section 31 23 00.

B. Pipe laying and bedding: conform to Section 31 23 00.

C. Restrain all plugs, caps, tees and bends in buried pressure piping systems by means of restrained joints as specified in the respective Piping System Schedule.

D. In accordance with Section 40 05 06, and where specified on the Drawings, provide flexibility per specified details where buried pipe passes under, through, or is connected to structures. Provide restrained joint connections or provide restraints across each un-restrained joints.

E. Install pipe in straight alignment. Do not exceed 3/8-inch variance over 30 ft from the true alignment in any direction.

F. Slope gravity lines uniformly from point of origin to discharge.

G. Ensure the pipe alignment stays true during and after placement of concrete encasement.

H. Ensure that the method used to prevent pipe uplift during placement of concrete encasement results in an invert and crown true to intended grade.

I. Maintain circular cross section of pipe.

J. Provide lean concrete below the underside of the slab or footing for backfill over pipe laid below structures when pipe is less than 6 inches below the underside of the slab or footing, unless specified otherwise. Place concrete in accordance with Section 03 30 00.

K. Provide Heat-Shrinkable Cross-Linked Polyolefin Coating or Tape Wrap coating on all flanged, grooved, and welded joints that are buried or below structures.

L. Provide Petrolatum Tape wrap on all valves and mechanical pipe couplings that are buried or below structures. Install per manufacturer's recommendations. Candidate Manufacturers:
   1. Denso Densyl Tape
   2. #1 Wax Tape
   3. Approved Equal

M. Use anti-seize compound with all stainless steel nuts and bolts.

N. Provide detectable warning tape for all buried pipe. Provide tracer (locate) wire as specified in Section 40 05 45.

3.12 EXPOSED INSTALLATION

A. Fabricate and install domestic hot and cold water piping, sanitary piping and storm drainage piping in accordance with the Plumbing Code.

B. Provide pipe system layout in accordance with the following criteria:
   1. Drawings show general layout of piping. Exact dimensions determined by Contractor.
   2. Maintain minimum clear areas through tunnels and principal access aisles as specified in this Section.
   3. Expanding or swaging of tubing to fit IPS (Iron Pipe Size) fitting sockets is not permitted.
   4. Use reducing fittings where change in pipe size occurs.
   5. Use couplings only where pipe runs are longer than standard supplied pipe lengths.
   6. Make exposed polished or enameled connections to fixtures or equipment with special care to avoid damage to finished surfaces.
   7. Make changes in direction only with fittings.
   8. Install piping with not less than minimum slope to ensure adequate drainage and venting.
   9. Maintain clear areas around equipment to allow adequate access for maintenance as specified in this Section.
   10. Ensure valve operators are accessible from floor level. Provide chain wheel operators for valves with centerline elevations of 7 feet or above.
   11. Ensure piping ancillaries and in-pipe instrumentation is installed in accessible locations which do not create problems for traffic in the clear areas.

C. Make adequate provision in piping and pipe support systems for expansion, contraction, slope, and anchorage.

D. Install pipe support system to adequately secure the pipe and to prevent undue vibration, sag or stress.

E. Install expansion joints where specified on the Drawings or where required by the Design Professional, to allow for piping expansion and contraction.

F. Install expansion loops or bends where specified, or required by the Design Professional, to allow for proper pipe expansion. Construct expansion loops with long radius welded bends.

G. Provide temporary supports as necessary during construction to prevent overstressing of equipment, valves or pipe.

H. Accurately cut all piping for fabrication to field measurements.

I. Install pipes in straight alignment and parallel to wall. Do not exceed 3/8-in variance over 30 ft from the true alignment, in any direction.

J. Fabricate and assemble pipe runs so that the pipework is not stressed to achieve the desired alignment and that no stresses are transferred to equipment or equipment flanges. Unless stipulated by the Design Professional to address significant thermal strain, and accepted by the Construction Manager, the "springing" of pipe and fittings to ensure alignment is not permitted. Undo and subsequently remake all pipework connections where so instructed by the Construction Manager to ensure that unintended springing does not occur. Take care not to damage equipment, valves, or flanges.

K. Slope instrument air piping to condensate traps.

L. Do not cut or weaken the building structure to facilitate installation of piping.

M. In parallel pipe runs, offset flanges and/or grooved joint fittings by a minimum of 8 inches longitudinally to allow for proper access.

N. In vertical pipe runs of pipe diameter greater than 10 inches, provide 8-inch long spool piece on lower side of each valve.

O. Do not install water piping over electric switchboards, transformers, cable tray or electric motor starters.

P. Provide pipe markers for all exposed pipe.

3.13 THREADED JOINTS

A. Conform to the requirement of ANSI B31.1.

B. Ream the end of all pipes to remove all burrs and cuttings when fabricating threaded joints.

C. Clean out pipe and repair linings and coatings prior to joining.

D. Apply Teflon tape to male threads and join pipe. Use both Teflon tape and Teflon sealing compound on stainless steel pipe threads. Do not apply extra tape to make up for slack in the joint.

3.14 FLANGED JOINTS

A. Maintain consistent flange bolt hole positions along the entire length or run of the pipe.

B. For pipe installed with a horizontal axis, position flange bolt holes so that the vertical centerline of the flange face bisects the arc between flange bolt holes (“Two-Holed”).

C. For pipe installed with a vertical axis, position flange bolt holes so that the horizontal centerline of the flange face bisects the arc between flange bolt holes and is perpendicular to the closest structural wall (“Two-Holed”).

D. Clean flanges and gaskets prior to connection.

E. Lubricate gaskets with gasket manufacturer’s recommended lubricant and apply anti-seize compound to all bolts.

F. Bring flanges into close parallel and lateral alignment.

G. Tighten bolts progressively. Proceed from side to side of the flange.

H. Use proper length bolts for each size flange on flanged connections. Washers may not be used to take up excess bolt length. Provide approximately two full threads bolt projection beyond nuts. Bolts with excessive length of exposed threads will not be permitted. All-thread rod is not acceptable for bolting flanges.

I. When joining steel to cast iron flanges, take care to avoid damage to the cast iron flange. Ensure both flanges are flat-faced and use full face gaskets.

J. Align flanges which connect piping to mechanical equipment to close parallel and lateral alignment prior to tightening bolts. Do not place strain on the equipment.

K. Allow a minimum of 6 inches’ clearance to face or 8 inches to edge of flange to wall, floor, or ceiling unless otherwise specified.

3.15 INSULATION

A. Insulate piping systems in accordance with the Piping System Schedules (Sections 40 05 02.00 through 40 05 02.99) and Section 40 42 00.

3.16 FLEXIBLE HOSE CONNECTORS

A. Accurately align pipelines to receive flexible connectors before installing the connectors. Do not stretch, compress, misalign or offset the connectors.

B. Align and install each flexible connector in accordance with the manufacturer's instructions.

C. Support, anchor and guide the piping so that the flexible hose connectors are not required to absorb any axial compression or elongation.

D. Do not torque or twist the flexible connectors.

E. Check bolt tightness and tighten where necessary, a maximum of one week after commissioning and periodically thereafter.

3.17 EXPANSION JOINTS

A. Accurately align pipelines to receive expansion joints before installing the joint. Do not stretch, compress or offset the joint to fit the piping. Install expansion joints in accordance with manufacturer's instructions prior to releasing preload.

B. Align and install each expansion joint in accordance with EJMA standards and with the manufacturer's written instruction; properly guide and anchor all expansion joints. No lateral movement is permitted on compensator type expansion joints.

C. On rubber expansion joints, check bolt tightness, and tighten where necessary one week after Commissioning is completed.

3.18 REPAIR/RESTORATION

A. Repair pipe with damaged shop-applied protective linings in accordance in accordance with specified standard (e.g. AWWA C210) or accordance with the lining manufacturer's directions, if no standard is cited.

B. Damaged glass lining cannot be repaired. Replace piping with damaged glass lining.

C. Patching inserts, overlays, or pounding out of dents is not be permitted.

D. Repair pipe with damaged protective coatings and holdback areas for welding and other field fabrication, as follows:
   1. For shop-applied coatings, not subject to Section 09 90 00 requirements, in accordance with specified standard (e.g. AWWA C210) or in accordance with the coating manufacturer's directions, if no standard is cited.
   2. For coatings applied pursuant to Section 09 90 00 requirements, apply repair coatings in conformance with the applicable Section 09 90 00 coating system, including thickness and stipulated preparation of the lowest full thickness coating layer (i.e. exposed metal would require full profile preparation and specified multi-layer coating restoration).
   3. Prepare areas to be repaired not less than 2-inches beyond damaged areas and feather repair coating into adjacent areas.
   4. Repair to provide equivalent protection to undamaged coatings and a uniform appearance when judged from 4 feet away.

E. Other requirements may be stipulated in related piping sections.

3.19 FIELD QUALITY CONTROL

A. Inspections:
   1. Inspect and provide reports as specified in Section 40 05 07, Section 40 05 07.13, and Section 40 05 07.16.
   2. Submit the Design Professional's final report before beneficial occupancy by the Owner.

3.20 TESTING

A. Provide 24 hours notice prior to testing.

B. Do not insulate or conceal work until piping systems are tested and have met all required criteria.

C. Complete any required weld tests.

D. Supply all water, air, and inert gases required for pressure testing.

E. Supply all pumps, compressors, gauges, etc. required for testing.

F. Install air threadolets, air relief valves, and line fitting valves as necessary to complete testing. Remove after testing and plug threadolets.

G. Cap or plug all lines which are normally open ended. Remove on completion of testing.

H. Provide all temporary thrust restraints necessary for testing. Remove upon completion of testing.

I. Test all underground lines prior to backfilling. Do not place concrete encasement until lines are tested and have met all required criteria.

J. Test all existing piping where it connects to new piping to the first valve in the existing piping. Repair any failures in existing piping which occur as a result of the test after informing the Construction Manager of such failure.

K. Isolate all pumps and low pressure equipment and appurtenances during testing so as not to place any excess pressure or thrust forces on the equipment.

L. Where defective material or equipment is identified, repair or replace using new material.

M. Flush and drain liquid pipes after pressure tests. Purge all gas pipes after pressure tests using inert gas.

N. Dispose of flushing water in manner approved by the Construction Manager, which causes no damage to buildings or siteworks.

3.21 HYDROSTATIC PRESSURE TESTING OF LIQUID LINES

A. Hydrostatically test all lines normally used for the conveyance of liquids using water as the test medium, unless otherwise specified in this Section.

B. Test pressures and durations as specified in the Piping System Schedules.

C. Ensure all lines are filled with water. Bleed air from all high spots using the taps provided specifically for that purpose.

D. Lined pipelines: Allow filled pipeline or section thereof to stand under a slight pressure for at least 8 hours (24 hours for cement mortar lining) to allow the lining to absorb water and to allow the escape of air from air pockets.

E. Zero leakage is permitted throughout the specified test period for all exposed piping, buried insulated piping, and any liquid chemical lines.

F. Show evidence of leakage rates below 0.02 gal per hour per inch pipe diameter per 100 ft of pipe length for buried piping, unless otherwise specified.

G. Test drains in accordance with the Plumbing Code.

H. For hydraulic and lube oil systems, test using the medium of service. Provide zero loss of pressure throughout the specified test period.

3.22 PNEUMATIC PRESSURE TESTING

A. Use nitrogen gas or oil free dry air to test piping systems where nitrogen or air is the specified testing medium in the Piping System Schedule.

B. Submit a testing plan and a safety plan for each piping system that will be pressure tested with nitrogen gas or oil free dry air. Do not perform pressure testing with air or nitrogen until a favorable review of the safety plan and testing plan for the piping system has been returned from the Construction Manager. Comply with all workplace safety and pressure vessel safety codes and guidelines.

C. Provide a separate pressure relief valve for pneumatic pressure testing.

D. Locate pressure relief valve within visual range of the test gauge and with exhaust to a safe location.

E. Set relief valve at not more than full test pressure plus 10 percent.

F. Continuously monitor and control testing to assure personnel safety and piping integrity.

G. Remove all personnel from areas where piping will be subjected to pressure tests and prevent entry into testing areas until test pressure has been relieved.

H. Protect installed work from potential damage from pressure testing failures. The Contractor is responsible for any damage or injury resulting from failed pressure testing with air or nitrogen.

I. When using nitrogen or air to test steel or stainless steel pipelines, gradually introduce the test gas up to a pressure of 45 psig or 1/3 of specified test pressure, whichever is less.

J. While maintaining this pressure, test lines for leaks using soapy water.

K. When the line is free from leaks at this pressure, increase by increments of 50 psig or 1/3 of specified test pressure (whichever is less) to the specified test pressure.

L. After each increment, retest using soapy water; take corrective action as necessary.

M. When the system is free from leaks at the test pressure, depressurize the system slowly.

N. To prevent the entrance of water or moisture into the medium source, disconnect the test source from the system and cap.

O. Where specified, maintain nitrogen pad after testing until the line is put into service. Label any piping for which a pad is provided and maintained.

P. Provide high purity nitrogen gas used for testing, in cylinders fitted with pressure regulators for 0 to 300 psig and all necessary fittings and adaptors necessary to complete the connection between the source and the system header. Provide self-relieving type pressure regulator that vents to the atmosphere and include a throttling valve.

Q. Provide oil free air with a relative humidity of zero for testing. Provide all fittings, adaptors, accessories, and the pressure regulator and throttling valve that are suitable for pressure testing with air and rated for 300 psig service.

3.23 PRESSURE TESTING OF GAS, AIR, AND VAPOR LINES

A. Hydrostatically or pneumatically pressure test, as specified in the Piping System Schedules, all lines normally used for the conveyance of gas, air, and/or vapor in accordance with ASME procedures for testing pressure piping and CAN/CGA B149.6 for buried digester gas piping. Pneumatically test all instrument air lines in accordance with ISA-S7.0.01 and digester gas piping in accordance with CAN/CGA B149.6.

B. For gas and air lines to be hydrostatically tested, check support system to ensure it is capable of withstanding loads imparted by test method. Provide any additional supports necessary in a manner acceptable to the Construction Manager. At the Construction Manager's request, provide calculations indicating design of temporary support system.

C. Test pressures are identified in the Piping System Schedule.

D. Zero leakage rate is required at the specified test pressure through the test period. Prior to commencing test using air, ensure air will be at ambient temperature and specified test pressure.

E. Do not exceed the maximum specified leakage rate during the test period for all other systems tested with air.

F. Remake all joints which display leakage and retest.

3.24 TESTING OF HAZARDOUS GAS AND LIQUID LINES

A. The following process pipes shall be tested as Hazardous Gas or Liquid lines: NG.

B. Remove components which may be damaged by test pressures and plug openings. Provide tee in any existing lines to be tested adjacent to the terminal valve.

C. Pressure test after cleaning.

D. Zero leakage at specified test conditions is required. Repair and retest lines until successful test is achieved. Test all digester gas lines in accordance with CAN/CGA B149.6.

E. Plug and/or disconnect all vents to the atmosphere, close all valves to the atmosphere, and open all in-line valves. Return the system to its appropriate operating condition after testing, including resetting of vents and valves.

F. Hydrostatically test PVC and CPVC pipelines using water as the test medium, as specified in the Piping System Schedules. Where support systems are not designed for hydrostatic testing or drying of steel pipelines is impractical, with the Construction Manager's approval, the Contractor may use nitrogen gas or dry air as the test medium, providing the specified safety plan is submitted and necessary safety precautions are implemented to minimize the risk incurred when performing such a test.

G. Replace all moisture absorbing gaskets and valve packing after hydrostatic testing.

H. After testing, dry all lines.
   1. Steel or stainless steel Lines: Pass steam through the lines from the high end until all lines are thoroughly heated. Allow condensate and foreign material to drain during steaming. Disconnect and drain lines from all low points. While lines are warm, blow dry, oil-free air with a dew point below -40 degrees F through the system until the existing dew point is the same as the supply air. Fix valves in the half open position during drying. Ensure that valves temporarily removed from the system during drying operations are completely free of moisture prior to reinstallation.
   2. PVC Lines: Drying applies solely to vacuum lines. Drain and remove all free water and moisture from the system. Swab the pipe to remove any excess water. Air dry the pipe in the same manner as steel lines, additionally ensuring that the entering air temperature is not greater than 120 degrees F.

I. Fill the line with inert gas if service gas is reactive with air.

J. Introduce service gas immediately after testing and drying and inert gas filling. Test the system for leaks. Allow time for the complete replacement of air or inert gas from the piping with the service gas.

K. Use an appropriate sensing device when testing for leaks.

L. If leaks are detected when the system is tested with service gas, do not implement repairs until all gas has been purged from the system. Repeat the hydrostatic testing and drying sequence prior to retesting the line with service gas.

3.25 CLEANING AND FLUSHING

A. After installation and prior to testing, perform initial cleaning of process and utility lines. Clean piping greater than 6 inches and less than 24 inches by passing a tightly fitting cleaning ball or swab through the pipeline, unless specified otherwise. Lines greater than 24 inches may be cleaned manually or with a cleaning ball or swab. Give lines smaller or equal to 6 inches an initial flush or purge.

B. After initial cleaning, connect the piping systems to related process and mechanical equipment. Insert temporary screens, provided with visible locator tabs, in the suction of pumps and compressors in accordance with the following table:

Suction size, in.	Maximum screen opening, in.
0 – 1	1/16
1-1/4 – 3	1/4
3-1/2 – 6	1/2
Over 6	1

C. Maintain the screens during testing, flushing/purging, initial startup, and the initial operating phases of the commissioning process. In special cases and with the Construction Manager's acceptance, screens may be removed for performance tests. Install screens for clear water testing and initial operation on liquid systems handling solids. Initial operation on solids systems following clear water testing may be without screens.

D. Unless specified otherwise, flush liquid systems after testing, with clean water and screens in place. Maintain flushing for a minimum period of 15 minutes and until no debris is collected in the screens.

E. Remove the screens and make the final connections after the screens have remained clean for a minimum of 24 consecutive hours of operation. Keep screens in place for 24 hours of clean water operation on solids handling systems; remove prior to placing the system into solids handling service.

F. In air or gas systems with pipe sizes less than or equal to 6 inches, purge with air and/or inert gases before testing. Upon completion of testing and cleaning, drain and dry the piping with a dry air stream. Satisfy ANSI/ISA-S7.0.01 standards for instrument air systems.

G. Purge digester gas, natural gas, and propane systems with nitrogen gas and provide a nitrogen pad maintained at 10 psig until put in service. Purge and dry digester gas systems in accordance with CGA B149.6.

H. For hazardous gas and liquid systems, clean interior of the pipelines by drawing a cloth or swab impregnated with an appropriate solvent (carbon tetrachloride or trichloroethylene) through the pipe. Do not clean interior of refrigerant lines. Dismantle valves and hand clean. Plug lines at the end of each day. Properly dispose of all waste solvents.

I. Clean and flush piping connecting to HVAC equipment in accordance with Division 23.

3.26 DISINFECTION

A. Flush and disinfect lines intended for potable water service after testing in accordance with AWWA C651.

END OF SECTION

SECTION 40 05 02

PIPING SYSTEM SCHEDULES

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies a Piping System Schedule for each Process Service. Each Piping System Schedule specifies piping system materials for groups of similar process piping services.

B. The table in paragraph 1.01C lists process services and the corresponding Piping System Schedule that specifies piping system material requirements for the associated process piping service. See Part 4 for Piping System Schedules that define materials for piping services.

1. All Civil Yard Piping buried and 5 ft outside facilities see Civil drawings yard piping plans and profiles. Piping specification and materials are listed on plans and profiles.

C. Piping System Schedule assignments are listed in the following table:

Process Service	Process Service	Piping System Schedule	Test Pressure	Fluid Category	Pipe Marker Background Color
AW	AIRWASH	40 05 02.01	Air	Compressed Air	Blue
BW	BACKWASH	40 05 02.AA	High Head	Water	Green
CAR*	CARRIER PIPE	40.05.31.19	High Head	Solution	Gray/Orange
CAW	CHANNEL AGITATION AIR	40 05 02.01	Air	Compressed Air	Blue
CD	CHEMICAL DRAIN	40 05 02.BB	Gravity	Solution	Green
DR	DRAIN	40 05 02.89	Gravity	Wastewater	Green
DW	DECANT WATER	40 05 02.43	Gravity	Water	Blue
FEC*	FERRIC CHLORIDE	40 05 02.65	High Head	Toxic/Corrosive	Orange
FI	FILTER INFLUENT	40 05 02.23	Gravity	Water	Blue
FLR*	FLUORIDE	40 05 02.65	High Head	Solution	Gray
FMX	FLASH MIX	40 05 02.66	High Head	Solution	Gray
FTW	FILTER TO WASTE	40 05 02.AA	Gravity	Water	Green
FW	FILTERED WATER	40 05 02.23	Gravity	Water	Blue
HWR	HOT WATER RETURN	40 05 02.25	Test/Balance	Solution	Gray
HWS	HOT WATER SUPPLY	40 05 02.25	Test/Balance	Solution	Gray
NG	NATURAL GAS	40 05 02.17	Air	Flammable	Yellow
OF	OVERFLOW	40 05 02.AA	Gravity	Water	Green
PD	PROCESS DRAIN	40 05 02.AA	Gravity	Water	Green
PEA	ANIONIC POLYMER	40 05 02.63	High Head	Solution	Gray

Process Service	Process Service	Piping System Schedule	Test Pressure	Fluid Category	Pipe Marker Background Color
PEC	CATIONIC POLYMER	40 05 02.63	High Head	Solution	Gray
PEN	NONIONIC POLYMER	40 05 02.63	High Head	Solution	Gray
PW	POTABLE WATER	40 05 02.23	High Head	Water	Blue
RCW	RECYCLE WATER	40 05 02.23	High Head	Water	Blue
RDL	ROOF DRAIN LEADER	40 05 02.89	Gravity	Stormwater	Green
RW	RAW WATER	40 05 02.23	High Head	Water	Blue
SC*	SPARE CHEMICAL	40 05 02.63	High Head	Solution	Gray
SD	STORM DRAIN	40 05 02.CC	Gravity	Stormwater	Green
SH*	SODIUM HYPOCHLORITE	40 05 02.65	High Head	Toxic/Corrosive	Orange
SL	SOLIDS	40 05 02.53	High Head	Sludge	Green
SMP	SAMPLE	40 05 02.66	High Head	Water	Blue
SPD	SUMP PUMP DISCHARGE	40 05 02.AA	High Head	Water	Green
SS	SANITARY SEWER	40 05 02.89	Gravity	Wastewater	Green
SU	STRUCTURE UNDERDRAIN	40 05 02.CC	Gravity	Stormwater	Green
SUC	UNDERDRAIN COLLECTOR	40 05 02.CC	Gravity	Stormwater	Green
SW	SETTLED WATER	40 05 02.23	Gravity	Water	Blue
TWP	TEPID WATER	40 05 02.23	High Head	Water	Blue
UW1	UTILITY WATER	40 05 02.27	High Head	Water	Green
UW2	UTILITY WATER	40 05 02.27	High Head	Water	Green
VT	VENT	40 05 02.89	Gravity	Wastewater	Green
WBW	WASTE BACKWASH	40 05 02.AA	Gravity	Water	Green

* Extents of double containment pipe systems for chemical services are indicated on the drawings – double contained pipe shall be per Specification 40.05.31.19.

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.

1.03 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:

B. Pipe Connections and Joints:
1. BABS – Bell and Ball Spigot
2. BAS – Bell and Spigot
3. BFW – Butt Fusion Weld
4. BSS – Bolted Split Sleeve Coupling
5. BW – Butt Weld
6. BSW – Butt-Strap Weld
7. CGRV – Cut (or Cast) Grooved End Coupling
8. CPLG – Coupling
9. CPO – Compression Type Push-On
10. CPRSN – Compression
11. DLW – Double Lap Weld (Bell and Spigot)
12. EFSW - Electro-Fusion Socket Weld
13. FLG – Flanged
14. FLRD – Flared
15. FP – Full Penetration
16. FSW – Fusion Socket Weld
17. HAS – Hub and Spigot, Compression (Cast Iron Soil Pipe)
18. HBLS - Shielded Hubless (Cast Iron Soil Pipe)
19. HGRV – HDPE Groove Coupling
20. HLF CPLG – Half Coupling
21. HPEG – HDPE Plain End with Gripping Teeth
22. HXGT - HDPE by Grooved End Transition
23. LR ELL – Long Radius Elbow
24. MJ – Mechanical Joint
25. PGRV - Proprietary Groove Coupling
26. PO – Push-on
27. RBAS – Restrained (Lap Welded) Bell and Spigot with O-ring rubber gasket
28. RGRV – Rolled Grooved End Coupling
29. RJC – Ring Joint Coupling
30. RMJ – Restrained Mechanical Joint

31. RPO – Restrained Push-On joint
32. SLV – Solvent Weld
33. SLDR – Solder or Brazing
34. SLW – Single Lap Weld (Bell and Spigot)
35. SR ELL – Short Radius Elbow
36. SW – Socket Weld
37. THD – Threaded
38. UN – Union

C. Flanges:
   1. FF – Full Face
   2. LF – Loose Flange
   3. LJ – Lap Joint
   4. LWN – Long Weld Neck
   5. RF – Raised Face
   6. SO – Slip-On
   7. THD – Threaded
   8. WN – Weld Neck

D. Materials:
   1. DI – Ductile Iron
   2. RCP – Reinforced Concrete Pipe
   3. RCP-LHP – Reinforced Concrete Low Head Pressure Pipe
   4. SS – Stainless Steel
   5. SV – Service (Cast Iron Soil Pipe available with SV rating or XH, extra heavy, rating)

E. Welding:
   1. FP – Full Penetration
   2. SML – Seamless
   3. WLD – Welded

F. Test Pressure:
   1. AM – Air Method
      a. Set nominal test to (110%* Pdesign) or (Pdesign + 50 psi), whichever is lower
   2. GR – Gravity Method
      a. 10 ft – coordinate with most-recent, local plumbing authority requirements.
   3. HH – High Head Method
      a. Set nominal test to (150%*Pdesign)
   4. TB – Test/Balance
      a. HVAC/Plumbing - See Divisions 22 and 23
   5. Pdesign
      a. Either the maximum utility pressure, or the pump or blower shutoff head, whichever is greater.

G. Other:
   1. CFT - Cured Film Thickness
   2. DFT – Dry Film Thickness
   3. Dim – Dimensions
   4. M or E Pipe – Matches or exceeds rating of connecting pipe
   5. Thk – Thickness
   6. Sch – Schedule
   7. Std – Standard
   8. STD – Standard Weight or Standard

PART 2 PRODUCTS

2.01 MATERIALS

A. Pipe size (nominal diameter) and the Process Service Identifier for the contents of the pipeline are specified in pipe line labels on the drawings.

B. Provide piping system materials and components per the Piping System Schedule assigned for the specified process service and pipe size.

C. The Rating column in the Piping System Schedule specifies the minimum acceptable pressure rating or wall thickness for the component of the piping system.

PART 3 NOT USED

PART 4 SCHEDULES

4.01 PIPESPEC SYSTEM SHEETS/DETAILED PIPING SPECIFICATION SHEETS.

A. Piping System Schedules follow this Section. Piping System Schedules are assigned a Section number in the range from 40 05 02.00 through 40 05 02.99.

END OF SECTION

Section 40 05 02. 01

Piping System Schedule, Process Air (Stainless Steel)

Process Service	Aeration Wash	Channel Agitation Wash						
Process Service Identifier	***AW***	***CAW***						

General Requirements

A. Testing Requirements: Pressure: 20 psig. Duration: 120 min. Medium: Air

B. Comply with the provisions of Section 40 05 01 in addition to the requirements specified herein. Refer to Section 40 05 02 for definitions of abbreviations and acronyms used in this schedule.

C. Full-Faced flanges mated with raised face flanges are not permitted.

D. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.

E. Pipe threads per ASME B1.20.1.

F. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel; weld Type 304L to Type 304L pipe material.)

Key Notes (Indexed to Key Notes in the Piping System Schedule)

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Apply Anti-seize to stainless steel bolts before turning nut on flange bolts.
3. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
4. Provide long radius five cut mitered elbows for segmentally welded fittings.
5. Stainless steel stub end for use with Lap Joint flanges. Stub end dimensions and materials to match pipe. Fillet radius of stub ends compatible with inner corner radius of backing flange bore.
6. For Headspace, Process Corrosive, and Submerged area exposures, use stainless steel flanges with stainless steel bolts and nuts.
7. Factory coat carbon steel/ductile iron backing ring flanges with Liquid Epoxy per AWWA C210, 16 mils DFT, minimum.
8. Provide stainless steel flange bolts, nuts, and washers with stainless steel flanges.
9. Insulate for Energy Conservation in Indoor Dry and Indoor Wet area exposures. Insulate for Personnel Protection in other area exposures.
10. Provide weld neck flanges on both sides of wafer, lug body, and flanged valves ½ thru 24 inch. Provide Slip on flanges on both sides of wafer, lug body, and flanged valves 26 thru 72 inch.

END OF SECTION

Section 40 05 02. 17

Piping System Schedule, Natural Gas

Process Service	Natural Gas							
Process Service Identifier	***NG***							

General Requirements

A. Testing Requirements: Pressure: 50 psig. Duration: 120 min. Medium: Air or Water

B. Full-Faced flanges mated with raised face flanges are not permitted.

C. Mating flanges shall be of the same drilling pattern.

D. Threads per ASME B1.20.1.

E. Match metal alloy/grade/type for any metal welded to pipe or fittings. (Do not weld carbon steel to stainless steel. e.g. Weld Type 316L to Type 316L pipe material.)

F. For buried applications, install natural gas piping in accordance with ASTM F2620, NFPA 54 and the local plumbing codes, as applicable.

G. Transition MDPE or HDPE piping to metallic piping in the ground, exterior to the structure, in accordance with NFPA 54 requirements.

Key Notes (Indexed to Key Notes in the Piping System Schedule)

1. Bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows.
3. Provide magnetic tracer tape.
4. Extension stem and valve box required.
5. Provide with yellow exterior color or co-extruded yellow stripes per manufacturer's standard.
6. Provide Concrete Surround for pipe buried below structures.
7. Bolts and nuts with metallurgy specified in AWWA C111.
8. Ductile iron backing flanges are unlisted materials per ASME B31.1. Design and fabricate fittings per requirements for unlisted materials specified in ASME B31.1 Power Piping Code.
9. HDPE stub end adapters fused to MDPE pipe are not permitted.

Section 40 05 02. 23

Piping System Schedule, Potable Water

Process Service	Filtered Water	Hot Water Supply / Return	Potable Water	Tepid Water	Filter Influent	Recycle Water	Raw Water	
Process Service Identifier	***FW***	***HWS / HWR***	***PW***	***TWP***	***FI***	***RCW***	***RW***	

General Requirements

A. **Testing Requirements: Pressure: 200 psig. Duration: 60 min. Medium: Water**

B. Full-Faced flanges mated with raised face flanges are not permitted.

C. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.

D. Threads per ASME B1.20.1.

E. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel. Weld Type 316L to Type 316L pipe material.)

F. Solvent welding of PVC piping performed with Weld-On 724 (ASTM F 493, NSF/ANSI 14, NSF/ANSI 61) or Approved Equal. Universal plastic pipe solvent is not acceptable. Prior to solvent welding, clean pipe joints to remove all loose debris and prime with a compatible primer. Primer shall stain piping.

Key Notes (Indexed to Key Notes in the Piping System Schedule)

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
3. Provide long radius five cut mitered elbows for segmentally welded fittings.
4. Weld Threadolet or Half Coupling prior to installing lining and coating.
5. Provide concrete surround or encasement for pipe buried below structures.
6. Except at flanged connections at valves, flanged connections/joints not permitted on buried Ductile Iron Pipe.
7. FNPT tap at factory installed tapping boss. Taps at other locations on pipe and fittings are not permitted.
8. Provide magnetic tracer tape.
9. Bolts and nuts with metallurgy specified in AWWA C111.
10. RJC (Ring Joint Coupling): Victaulic Vic-Ring Coupling or Approved Equal with welded pipe shoulders or ring adapters
11. Provide AWWA standard 2-inch square nut operator, extension stem, and valve box for buried valves.
12. Hard, drawn, furnished in straight lengths.
13. Provide annealed tube for flared fittings. Furnished in straight lengths or coils.
14. 3/8-inch-thick wall required for installation of CGRV on 24-inch pipe.
15. PGRV (Proprietary Groove): Victaulic Advanced Groove System or Approved Equal.
16. Provide rigid couplings for 3-inch thru 12-inch except pipe installed on pipe racks (pipe/utility tunnels or chases) or for connections to pumps and blowers.
17. NSF 61 certified.

Section 40 05 02. 23 — Piping System Schedule, Potable Water

Process Service Identifier	***FW***	***SW***	***PW***	***TWP***	***FI***	***RCW***	***RW***	

18. Coating may be omitted for pipe encased in concrete or grout.
19. HPEG (HDPE Plain End with Gripping Teeth): Victaulic Style 995N, Victaulic Style 905, or Approved Equal.
20. HGRV (HDPE Groove Coupling): Victaulic Style 908 or Approved Equal.
21. In addition to the design pressure and test pressure indicated in this schedule, surge pressure and pipe bedding conditions for concrete cylinder pipe are specified in 40 05 39.13 and 40 05 39.16.
22. Wall thickness and pressure rating as calculated per AWWA Manual M11 will match or exceed that of connecting piping. Increase wall thickness as necessary.

Section 40 05 02. 25

Piping System Schedule, Hydronic Systems

Process Service	Hot Water Return	Hot Water Supply						
Process Service Identifier	***HWR***	***HWS***						

General Requirements

A. Testing Requirements: Pressure: 75 psig. Duration: 120 min. Medium: Water

B. Provide manual air vents at the high points and drains provided at the low points of each reach of pipeline as specified in section 40 05 06.

C. Full-Faced flanges mated with raised face flanges are not permitted.

D. Mating flanges shall be of the same drilling pattern.

E. Threads per ASME B1.20.1.

F. Match metal alloy/grade/type for any metal welded to pipe or fittings. (Do not weld carbon steel to stainless steel. e.g. Weld Type 316L to Type 316L pipe material.)

G. Fittings shall match material, ends and wall thickness of pipe.

Key Notes (Indexed to Key Notes in the Piping System Schedule)

1. Bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows.
3. Hard Drawn, finished in straight lengths
4. Repair prime coat at welds and other locations where the prime coat has been damaged.
5. Furnish threaded adapters at connections to valves.

Schedule 40 05 02.27 - Plant Utility Water, Low Pressure

Process Service	Utility Water No. 1	Utility Water No. 2			
Process Service Identifier	UW1	UW2			

Test Conditions

Pressure (psig)	Duration (min.)	Medium
200	120	Water

General Requirements

1. Full-Faced flanges mated with raised face flanges are not permitted.
2. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.
3. Threads per ASME B1.20.1.
4. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel; weld Type 316L to Type 316L pipe material.)
5. Solvent welding of PVC piping performed with Weld-On 724 (ASTM F 493, NSF/ANSI 14, NSF/ANSI 61) or Approved Equal. Universal plastic pipe solvent is not acceptable. Prior to solvent welding, clean pipe joints to remove all loose debris and prime with a compatible primer. Primer shall stain piping.

Notes:

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
3. Provide long radius five cut mitered elbows for segmentally welded fittings.
4. Install lining and coating prior to welding Threadolet or Half Coupling.
5. Provide Concrete Surround for pipe buried below structures.
6. Except at flanged connections at valves, flanged connections/joints not permitted on buried Ductile Iron Pipe.
7. FNPT tap at factory installed tapping boss. Taps at other locations on pipe and fittings are not permitted.
8. No lining or coating for Concrete Cylinder Pipe.
9. Bolts and nuts with metallurgy specified in AWWA C111.
10. BW (butt weld) connections/joints not permitted for 14-inch through 24 inch pipe.
11. Provide square nut operator, extension stem, and valve box for buried valves.
12. 3/8 inch thick wall required for installation of CGRV on 24-inch pipe.

Process Service	Pumped Drainage	Raw Sewage	Septage.	Tank Drain	
Process Service Identifier	PD	RS	SEP	TD	

Test Conditions

Pressure (psig)	Duration (min.)	Medium
200	120	Water

General Requirements

1. Full-Faced flanges mated with raised face flanges are not permitted.
2. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.
3. Pipe Threads per ASME B1.20.1.
4. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel; weld Type 316L to Type 316L pipe material.)
5. Solvent welding of PVC piping performed with Weld-On 724 (ASTM F 493, NSF/ANSI 14, NSF/ANSI 61) or Approved Equal. Universal plastic pipe solvent is not acceptable. Prior to solvent welding, clean pipe joints to remove all loose debris and prime with a compatible primer. Primer shall stain piping.

Notes:

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
3. Provide long radius five cut mitered elbows for segmentally welded fittings.
4. Install lining and coating prior to welding Threadolet or Half Coupling.
5. Provide Concrete Surround for pipe buried below structures.
6. Except at flanged connections at valves, flanged connections/joints not permitted on buried Ductile Iron Pipe.
7. FNPT tap at factory installed tapping boss. Taps at other locations on pipe and fittings are not permitted.
8. No lining or coating for HDPE Pipe.
9. Bolts and nuts with metallurgy specified in AWWA C111.
10. BW (Butt Weld) and RJC (Ring Joint Coupling) connections/joints not permitted for 14-inch through 24 inch pipe.
11. Install plug valve with seat at the inlet or upstream connection to piping.
12. Provide square nut operator, extension stem, and valve box for buried valves.
13. PGRV (Proprietary Groove): Victaulic Advanced Groove System or Approved Equal
14. RJC (Ring Joint Coupling): Victaulic Vic-Ring Coupling or Approved Equal with welded pipe shoulders or ring adapters
15. Where specified pipe wall thickness (Rating) is insufficient for cut grooves, provide shouldered ends, ring adapters, or increase pipe wall thickness as necessary for installation of cut grooves.
16. Provide rigid couplings except for pipe installed on pipe racks in below pipe/utility tunnels or chases.
17. HPEG (HDPE Plain End with Gripping Teeth): Victaulic Style 995N, Victaulic Style 905, or Approved Equal.

Test Conditions

Pressure (psig)	Duration (min.)	Medium
200	120	Water

General Requirements

1. Full-Faced flanges mated with raised face flanges are not permitted.
2. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.
3. Pipe Threads per ASME B1.20.1.
4. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel; weld Type 316L to Type 316L pipe material.)
5. Solvent welding of PVC piping performed with Weld-On 724 (ASTM F 493, NSF/ANSI 14, NSF/ANSI 61) or Approved Equal. Universal plastic pipe solvent is not acceptable. Prior to solvent welding, clean pipe joints to remove all loose debris and prime with a compatible primer. Primer shall stain piping.

Notes:

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
3. Provide long radius five cut mitered elbows for segmentally welded fittings.
4. Install lining and coating prior to welding Threadolet or Half Coupling.
5. Provide Concrete Encasement for pipe buried below structures.
6. Except at flanged connections at valves, flanged connections/joints not permitted on buried Ductile Iron Pipe.
7. FNPT tap at factory installed tapping boss. Taps at other locations on pipe and fittings are not permitted.
8. No lining or coating for HDPE Pipe.
9. Bolts and nuts with metallurgy specified in AWWA C111.
10. BW (Butt Weld) and RJC (Ring Joint Coupling) connections/joints not permitted for 14-inch through 24 inch pipe.
11. Install plug valve with seat at the inlet or upstream connection to piping.
12. Provide square nut operator, extension stem, and valve box for buried valves.
13. PGRV (Proprietary Groove): Victaulic Advanced Groove System or Approved Equal
14. RJC (Ring Joint Coupling): Victaulic Vic-Ring Coupling or Approved Equal with welded pipe shoulders or ring adapters
15. Where specified pipe wall thickness (Rating) is insufficient for cut grooves, provide shouldered ends, ring adapters, or increase pipe wall thickness as necessary for installation of cut grooves.
16. Provide rigid couplings except for pipe installed on pipe racks in pipe/utility tunnels or chases.
17. HPEG (HDPE Plain End with Gripping Teeth): Victaulic Style 995N, Victaulic Style 905, or Approved Equal.

Schedule 40 05 02.53 – Thickening and Dewatering

END OF SECTION

Schedule 40 05 02.63 – Chemical Solution

Process Service	Anionic Polymer	Cationic Polymer	Nonionic Polymer	Sodium Hypochlorite	
Process Service Identifier	PEA	PEC	PEN	SH	

Test Conditions

Pressure (psig)	Duration (min.)	Medium
70	120	Water

General Requirements

1. Solvent welding of PVC piping performed with Weld-On 724 (ASTM F 493, NSF/ANSI 14, and NSF/ANSI 61) or Approved Equal. Universal plastic pipe solvent is not acceptable. Prior to solvent welding, clean pipe joints to remove all loose debris and prime with a compatible primer. Primer shall stain piping.
2. For SHS (VENT) provide pipe as for SHS
3. Full-Faced flanges mated with raised face flanges are not permitted.
4. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.
5. Pipe threads per ASME B1.20.1.

Notes:

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Apply Anti-seize to stainless steel bolts before turning nut on flange bolts.
3. Provide square nut operator, extension stem, and valve box for buried valves.
4. Install Secondary Containment on Exposed pipe and fittings to the limits specified on the Drawings. Secondary Containment Pipe per Section 40 05 31.19.
5. Install Secondary containment on all Buried and Encased pipe and fittings. Secondary Containment Pipe per Section 40 05 31.19.
6. Coat all pipe exposed to sunlight. Omit coating for insulated pipe.
7. For HOCL service, provide clear PVC vent lines on the discharge of automatic degassing valves.
8. Ball valves are not permitted on sodium hypochlorite service.

THIS PAGE INTENTIONALLY LEFT BLANK

Section 40 05 02. 66

Piping System Schedule, Chemical Solution, Stainless Steel Pipe

Process Service	Flash Mix							
Process Service Identifier	***FMX***							

General Requirements

A. Testing Requirements: Pressure: 150 psig. Duration: 120 min. Medium: Water

B. Comply with the provisions of Section 40 05 01 in addition to the requirements specified herein. Refer to Section 40 05 02 for definitions of abbreviations and acronyms used in this schedule.

C. Design, fabricate, inspect, and test in accordance with the ASME B31.3 Process Piping Code.

D. ASME B31.3 Design Requirements: Pressure: 100 psig. Temperature: 120 F Fluid Service Category: Normal

E. Full-Faced flanges mated with raised face flanges are not permitted.

F. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.

G. Pipe threads per ASME B1.20.1.

H. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel. Weld Type 316L to Type 316L pipe material.)

Key Notes (Indexed to Key Notes in the Piping System Schedule)

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Apply Anti-seize to stainless steel bolts before turning nut on flange bolts.
3. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
4. Provide stainless steel flange bolts, nuts, and washers with stainless steel flanges.

Area Exposure Types: Indoor Dry, Indoor Wet, Outdoor, Process Corrosive, Headspace, Submerged (Exposed)

Component	Line Size, in	Material	Rating	Conn./Joints	Spec. Section	Key Notes

END OF SECTION

Schedule 40 05 02.89 – Building Mechanical Drainage

Piping Service	Drain	Roof Drain Leader	Sanitary Sewer		
Piping Service Abbreviation	DR	RDL	SS		

Test Conditions

Pressure (psig)	Duration (min.)	Medium
5.0	15	Water

General Requirements

1. Minimum test conditions specified above. Comply with applicable local plumbing code.
2. Sleeve drain, waste and vent piping through structural concrete and masonry.
3. Piping under structures, concrete encased pipe from the structure, and piping extended from the structure through the interface between piped commodities common to process/mechanical and yard piping, shall be either CISP or DIP, as specified.
4. Provide a union or flanged connection within 2 ft of any threaded valve and within 3 ft of any wall penetration.
5. Refer to Section 22 40 00 for plumbing fixtures and trim.
6. Provide copper tube for Outdoor HVAC equipment condensate drains.
7. Pipe Threads per ASME B1.20.1.

Notes:

1. Provide cast iron soil pipe for buried pipe within 5 feet of building perimeter. Pipe materials transition to be at least 6 in above slab or 6 inches inside building perimeter wall.
2. Provide long radius elbows.
3. Provide magnetic tracer tape,
4. Provide BAS joints with embedded steel joint rings for 30-inch and larger RCP.
5. Pipe Tape Wrap is not required for pipe installed in Indoor Dry, Indoor Wet, and Outdoor Area Exposures.
6. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
7. Provide Non Corrosive, High-Strength, Low-Alloy Steel Bolts or fluoropolymer coated Carbon Steel Bolts for flanges installed in Buried Area Exposure.
8. PVC lining is not required for D, RWP, and STD service.
9. Fabricated (miter cut pipe) PVC fittings are not acceptable.
10. Unreinforced Precast Concrete Manholes: 6 inch minimum wall thickness. Reinforced Precast Concrete Manholes: 4 inch minimum wall thickness. Provide Rubber gasket joints or mastic sealant joints between Precast Concrete Manhole Sections.
11. Bolts and nuts with metallurgy specified in AWWA C111.
12. Install per Cast Iron Soil Pipe Institute recommended practice specified in Cast Iron Soil Pipe and Fittings Handbook.
13. Provide Polyethylene Encasement: per AWWA C105, Field Applied, for Buried pipe under buildings and within 5 feet of building perimeter.

END OF SECTION

Schedule 40 05 02.AA – Process Drains

Process Service	Backwash / Waste Backwash	Filter to Waste / Overflow	Process Drain / Sump Pump Discharge	Decant Water	
Process Service Identifier	BW / WBW	FTW / OF	PD / SPD	DW	

Test Conditions

Pressure (psig)	Duration (min.)	Medium
200	120	Water

General Requirements

1. Full-Faced flanges mated with raised face flanges are not permitted.
2. Mating flanges for pipe shall be of the same Standard, Class and Series. Mating flanges at valves and equipment shall have specified rating and matching drilling pattern.
3. Pipe Threads per ASME B1.20.1.
4. Match metal alloy/grade/type for any metal welded to pipe or fittings. (e.g. Do not weld carbon steel to stainless steel; weld Type 316L to Type 316L pipe material.)
5. Solvent welding of PVC piping performed with Weld-On 724 (ASTM F 493, NSF/ANSI 14, NSF/ANSI 61) or Approved Equal. Universal plastic pipe solvent is not acceptable. Prior to solvent welding, clean pipe joints to remove all loose debris and prime with a compatible primer. Primer shall stain piping.

Notes:

1. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
2. Provide Long Radius Elbows. Provide full flow fittings. Segmentally welded fittings are not acceptable.
3. Provide long radius five cut mitered elbows for segmentally welded fittings.
4. Install lining and coating prior to welding Threadolet or Half Coupling.
5. Provide Concrete Surround for pipe buried below structures.
6. Except at flanged connections at valves, flanged connections/joints not permitted on buried Ductile Iron Pipe.
7. FNPT tap at factory installed tapping boss. Taps at other locations on pipe and fittings are not permitted.
8. No lining or coating for HDPE Pipe.
9. Bolts and nuts with metallurgy specified in AWWA C111.
10. BW (Butt Weld) and RJC (Ring Joint Coupling) connections/joints not permitted for 14-inch through 24 inch pipe.
11. Install plug valve with seat at the inlet or upstream connection to piping.
12. Provide square nut operator, extension stem, and valve box for buried valves.
13. PGRV (Proprietary Groove): Victaulic Advanced Groove System or Approved Equal
14. RJC (Ring Joint Coupling): Victaulic Vic-Ring Coupling or Approved Equal with welded pipe shoulders or ring adapters
15. Where specified pipe wall thickness (Rating) is insufficient for cut grooves, provide shouldered ends, ring adapters, or increase pipe wall thickness as necessary for installation of cut grooves.
16. Provide rigid couplings except for pipe installed on pipe racks in below pipe/utility tunnels or chases.
17. HPEG (HDPE Plain End with Gripping Teeth): Victaulic Style 995N, Victaulic Style 905, or Approved Equal.

See Civil Yard Piping Plans For Materials and Specification Reference

END OF SECTION

Schedule 40 05 02.BB – Gravity Chemical Drainage

Piping Service	Chemical Drain				
Piping Service Abbreviation	CD				

Test Conditions

Pressure (psig)	Duration (min.)	Medium
5.0	15	Water

General Requirements

1. Minimum test conditions specified above. Comply with applicable local plumbing code.
2. Sleeve drain, waste and vent piping through structural concrete and masonry.
3. Piping under structures, concrete encased pipe from the structure, and piping extended from the structure through the interface between piped commodities common to process/mechanical and yard piping, shall be either CISP or DIP, as specified.
4. Provide a union or flanged connection within 3 ft of any wall/slab penetration.
5. Refer to Section 22 40 00 for plumbing fixtures and trim.
6. Provide copper tube for Outdoor HVAC equipment condensate drains.
7. Pipe Threads per ASME B1.20.1.

Notes:

1. Provide high silicon cast iron soil pipe as shown on the drawings. Pipe materials transition to be at least 6 in above slab or 6 inches inside building perimeter wall.
2. Provide long radius elbows.
3. Provide magnetic tracer tape.
4. Provide DWV pattern fittings.
5. Pipe Tape Wrap is not required for pipe installed in Indoor Dry, Indoor Wet, and Outdoor Area Exposures.
6. Flange bolt length per ASME B16.5 plus three additional threads. Hex head bolt dimensions per ASME B18.2.1. Class 2A standard coarse series threads per ASME B1.1, standard coarse thread series. Hex nut dimensions per ASME B18.2.2 (Heavy Hex). Class 2B standard coarse series threads per ASME B1.1.
7. Provide fluoropolymer coated Carbon Steel Bolts for flanges installed in Buried Area Exposure.
8. Fabricated (miter cut pipe) PVC fittings are not acceptable.
9. Bolts and nuts with metallurgy specified in AWWA C111.
10. Install per Cast Iron Soil Pipe Institute recommended practice specified in Cast Iron Soil Pipe and Fittings Handbook.

SECTION 40 05 06.13

JOINT GASKETS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies rubber gaskets for push-on compression type joints used with fabricated steel pipe, steel pipe, reinforced concrete pipe, concrete cylinder pipe, and cement mortar lined and coated steel pipe.

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM D395	Rubber Property--Compression Set, Test for
ASTM D412	Rubber Properties in Tension, Test for
ASTM D471	Rubber Property--Effect of Liquids, Test for
ASTM D573	Rubber--Deterioration in an Air Oven, Test for
ASTM D1149	Rubber Deterioration--Surface Ozone Cracking in a Chamber (Flat Specimens), Test for
ASTM D2240	Rubber Property--Durometer Hardness, Test for

B. Testing:

1. Certified copies of test reports indicating that the gasket material has been tested and that the results of the tests comply with the requirements specified in paragraph 2.02 shall be provided as product data.

PART 2 PRODUCTS

2.01 MATERIALS

A. Gasket stock shall be a synthetic rubber compound in which the elastomer is neoprene. The compound shall contain no less than 50 percent by volume neoprene and shall be free from factice, reclaimed rubber and other deleterious substances.

2.02 PHYSICAL REQUIREMENTS

A. The compound shall meet the following physical requirements when tested in accordance with the specified ASTM standards.

B. Tensile (ASTM D412):
   1. The tensile strength shall be 1500 psi minimum and the ultimate elongation shall be 350 percent minimum.

C. Hardness (ASTM D2240, TYPE A DUROMETER):
   1. The compound shall have a hardness in the range of 35 to 50 for concrete spigots and 50 to 65 for steel spigots.

D. Compression Set (ASTM D395):
   1. The compression set shall not exceed 20 percent when compressed for 22 hours at 70 degrees C.
   2. The test specimens shall be circular discs cut from the gaskets. Test specimens shall be 0.500 ($\pm$ 0.005 - 0.025) inches in height. The diameter of the test specimen shall be that of the gasket but not to exceed 1.129 $\pm$ 0.010 inches in diameter.

E. Aging (ASTM D573):
   1. The test specimen deterioration shall be less than 20 percent reduction in tensile strength, 40 percent reduction in ultimate elongation, and 15 points increase in hardness.

F. Effect Of Liquids (ASTM D471):
   1. The maximum volume change in oil and in water shall be as follows:
      a. Oil: 100 percent in ASTM oil No. 3.
      b. Water: 15 percent.
   2. The test specimens shall have a thickness of 0.080 $\pm$0.005 inches and shall be circular discs cut from the gasket.

G. Ozone Cracking (ASTM D1149):
   1. The test specimen shall be a gasket loop mounted to give at least 20 percent elongation. There shall be no cracking visible at two times magnification of the gasket after 100 hours exposure to 1 mg/l ozone at 40 degrees C.

2.03 PRODUCT DATA

A. In accordance with Section 01 33 00, the Contractor shall provide certified copies of test reports specified in paragraph 1.02 Testing.

PART 3 EXECUTION

3.01 INSTALLATION

A. The gaskets shall be installed in accordance with the manufacturer's recommendations.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 06.16

PIPING CONNECTIONS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies the following methods of connecting metallic piping: flanges, threading, mechanical couplings, equipment connection fittings, dielectric unions, and welding.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 SUBMITTALS

A. In addition to the material listed in the detailed specification, the following submittals shall be provided in accordance with Section 01 33 00:
   1. For Equipment Connection Fittings used in pumping applications submit thrust rod stretch calculations in accordance with paragraph 2.02 Equipment Connection Fittings. and dimensional layout data.

PART 2 PRODUCTS

2.01 FLANGE ASSEMBLIES

A. Flanges:
   1. General: Flanges shall either be flat flanges or convoluted ring flanges as specified in the following paragraphs.
   2. Flat Flanges: Cast iron flanges shall be faced in accordance with ANSI B16.1. Where companion flanges are used, the flanges on pipe shall be refaced to be flush with the companion flange face. Class 150 and Class 300 forged steel flanges shall be raised face conforming to ANSI B16.5. Lightweight slip-on flanges shall be plain face conforming to AWWA C207, Class B and ANSI B16.5. Unless otherwise specified, steel flanges shall be ANSI B16.5, Class 150 or AWWA C207, Class D. Class E AWWA flanges shall be provided where test pressure exceeds 175 psi. Plain faced flanges shall not be bolted to raised face flanges.
   3. Convoluted Ring Flanges: Convoluted ring flanges shall be ductile iron, forged steel or cast stainless steel, designed to bear on hubs welded to the pipe and shall be as manufactured by Improved Piping Products. The Construction Manager knows of no equal. The flange joints shall be rated for not less than 150 percent of the test pressures listed in Section 40 05 01 and shall conform to the requirements of ANSI B 16.5 and AWWA C207. The flange manufacturer shall be prepared to demonstrate, by certified pressure test that the flanges will meet these requirements.

B. Gaskets:
   1. Gasket material shall be as specified in paragraph 2.03.
   2. Gaskets for plain faced flanges shall be the full face type. Thickness shall be 1/16 inch for pipe 10 inches and less in diameter and 1/8 inch for pipe 12 inches and larger in diameter. Unless otherwise specified, gaskets for raised face flanges shall match the raised face and shall be 1/16 inch thick for pipe 3-1/2 inches and less in diameter and 1/8 inch thick for pipe 4 inches and larger.

C. Bolts:

1. Flange assembly bolts shall be ANSI B18.2.1 standard square or hexagon head bolts with ANSI B18.2.2 standard hexagon nuts. Threads shall be ANSI Bl.1, standard coarse thread series; bolts shall be Class 2A, nuts shall be Class 2B. Bolt length shall conform to ANSI B16.5.
2. Unless otherwise specified, bolts shall be carbon steel machined bolts with hot pressed hexagon nuts. Bolts for submerged service shall be made of Type 316 stainless steel in conformance with ASTM F593, marking F593F. Nuts for submerged service shall be made of copper-silicon alloy bronze conforming to ASTM B98, alloy C65100, designation H04 or alloy C65500, designation H04. Bolts and nuts for buried service shall be made of noncorrosive high-strength, low-alloy steel having the characteristics specified in ANSI/AWWA C111/A21, regardless of any other protective coating. Where washers are required, they shall be of the same material as the associated bolts.

2.02 MECHANICAL COUPLINGS

A. Sleeve-Type Couplings:

1. Unless otherwise specified, sleeve-type mechanical pipe couplings shall be Smith-Blair Type 411, Dresser Style 38, or equal, with the stop removed from the middle ring. Reducing couplings shall be Smith-Blair Type 415, Dresser Style 62, or equal. Sleeve-type flanged coupling adapters shall be Smith-Blair Type 913, Dresser Style 128, or equal. Insulating couplings shall be Smith-Blair Type 416, Dresser Style 39, or equal.
2. Bolts for submerged service shall be made of Type 316 stainless steel in conformance with ASTM F593, markingF593F. Nuts for submerged service shall be made of copper-silicon alloy bronze conforming to ASTM B98, alloy C65100, designation H04, or alloy C65500, designation H04. Bolts and nuts for buried service shall be made of noncorrosive high-strength, low-alloy steel having the characteristics specified in ANSI/AWWA C111/A21, regardless of any other protective coating. Where washers are required, they shall be of the same material as the associated bolts.
3. Gaskets shall be as specified in paragraph 2.03 and AWWA C111.

B. Plain End Couplings:

1. Plain end pipe couplings for pipe sizes 6 inches and smaller shall be Gustin-Bacon 200, Victaulic Style 99, or equal for Schedule 80 pipe and Gustin-Bacon 205, Victaulic Style 90, or equal for lighter weight pipe. Plain end couplings for pipe sizes 8 inches and larger shall be Gustin-Bacon 200, Victaulic Style 99, or equal. Unless otherwise specified, bolts and nuts shall comply with AWWA C606.
2. Gaskets shall be as specified in paragraph 2.03 and AWWA C606.

C. Grooved End Couplings:

1. Grooved end flexible-type couplings shall be Gustin-Bacon 100, Victaulic Style 77, or equal. Grooved end rigid-type couplings shall be Gustin-Bacon 120 Rigi-Grip, Victaulic Style 07 Zero-Flex, or equal. Flexible-type couplings shall be used for all piping greater than 12 inches in diameter; for pipe 12 inches in diameter and less in rack-mounted tunnel piping applications; and for grooved joints adjacent to pump or blower suction and discharge where grooved couplings are used for noise and vibration control. All other applications for piping 12 inches in diameter and less shall utilize rigid-type couplings. Grooved end flanged coupling adapters shall be either Gustin-Bacon 154, Victaulic Style 741, or equal. Snap-joint grooved end couplings shall be Gustin-Bacon 115, Victaulic Style 78, or equal. Cut grooves are not permitted on fabricated or lightwall pipe.
2. Unless otherwise specified, bolts and nuts shall comply with AWWA C606. Bolts for submerged service shall be Type 316 stainless steel in conformance with ASTM F593, marking F593F. Nuts for submerged service shall be made of copper-silicon alloy bronze conforming to ASTM B98, alloy C65100, designation H04 or alloy C65500, designation H04. Bolts and nuts for buried service shall be made of noncorrosive high-strength, low-alloy steel having the characteristics specified in ANSI/AWWA C111/A21, regardless of any other protective coating. Where washers are required, they shall be of the same material as the associated bolts.
3. Gaskets shall be as specified in paragraph 2.03 and AWWA C 606.

D. Equipment Connection Fittings

1. Equipment connection fittings shall provide both lateral and angular misalignment adjustment between equipment connection flanges and the connection to field piping systems by providing individually adjustable flexible joints at each connection. In addition, equipment connection fittings shall provide full pressure thrust restraint between the field piping connection and equipment connection flanges.
2. Equipment connection fittings shall consist of two flanged coupling adapters, a plain end section of pipe and thrust restraint rods and associated fittings designed to transmit thrust without transmitting shear to the thrust restraint rods and without compromising provisions for accommodating angular and parallel misalignment. Materials and features shall conform to the requirements established in this paragraph. Standard “dismantling joints” incorporate only one flanged coupling adapter and are not acceptable substitutes. Equipment connection fittings shall be Romac ECF Series, or Baker Coupling Company, Los Angeles or equal, modified as specified to provide the required features.

3. Equipment connection fittings shall each consist of a single sleeve of plain end piping conforming to the requirements of the specified piping system of sufficient length to span the gap between the connection at the equipment and the connection at the field piping with gasketed flange adapters at each end. Thrust restraint shall be provided by means of all threaded rod spanning between flanges and male rod nuts and female washers that are rounded to provide a ball-joint type self aligning feature. All threaded restraint rod shall project through flange and mating flange coupling adapter bolt holes or through holes in restraint lug plates that extend above the flanges and are secured to the flanges with a minimum of two flange bolts. Where the all threaded rods project through flange bolt holes, ball joint type nut and washer combinations and lock washers shall be provided at each face, each end. Where restraint lug plates are employed, ball joint type nuts and washers shall be provided only on the outside faces of the plates and the nuts shall have a self locking feature that prevents nut movement due to vibration or other operational or environmental causes. Double nutting with non-locking nuts shall not be an acceptable method of providing the self locking feature. Thrust rod diameter and material shall be selected to provide sufficient freedom of movement through all bolt holes to allow unrestricted maximum adjustment of equipment connection fittings to accommodate piping misalignment without transmitting any shear to the thrust rods and also to permit full development of thrust restraint at all thrust rod tension take-ups. Design of equipment connection fittings shall conform to AWWA C219.
4. Thrust rods, restraint lug plates, nuts, washers and lock washers shall be Type 316 stainless steel, all selected to develop full rated piping system pressure thrust forces. Equipment connection fittings for pump applications shall have thrust rod number and diameter selected such that thrust rod stretch under piping system operating pressure does not exceed 2 mils. Calculations shall be submitted. Dry film molybdenum di-sulfide anti-galling compound shall be factory applied to ends of thrust rods, covering all threads subject to nut travel and tightening. Gaskets shall be as specified in paragraph 2.03. Flange gaskets shall be full face type. Follower gaskets shall be compression wedge type.
5. Sleeves shall be carbon steel or as specified for the specific piping system. Pressure rating of flange adapters shall equal or exceed the pressure rating of mating flanges. All metal portions of equipment connection fittings, with the exception of 316 stainless steel components, shall be coated and lined with fusion bonded epoxy conforming to AWWA C550 and NSF 61.

E. Dismantling Joints:
1. Dismantling joints may be used as takedown couplings in accordance with paragraph 3.03. Dismantling joints shall fully restrained double flange fittings consisting of a flange coupling adapter and flanged spool piece that allows for longitudinal adjustment. Thrust restraint shall be provided by means of all threaded rod spanning between flanges and secured to the flanges with a minimum of two flange bolts. Design of equipment connection fittings shall conform to AWWA C219. Sleeves shall be carbon steel or as specified for the specific piping system. Pressure rating of flange adapters shall equal or exceed the pressure rating of mating flanges. All metal portions of equipment connection fittings, with the exception of 316 stainless steel components, shall be coated and lined with fusion bonded epoxy conforming to AWWA C550 and NSF 61. Dismantling joints shall be Romac DJ-400, Smith Blair 975, or Crane-Viking Johnson Dismantling Joint.

F. Sleeve Band Couplings:

1. Sleeve band couplings shall be Victaulic Depend-O-Lock. Unless otherwise noted, couplings for liquid service shall be Model F x F Type 2 fully restrained, shouldered high deflection couplings with standard width band. Couplings shall comply with AWWA C-219. Couplings for use with air systems shall be Airmaster restrained Depend-O-Lock couplings in conformance with AWWA C-606. Sleeve band couplings are acceptable wherever sleeve type couplings are used (paragraph 2.02 Sleeve Type Coupling).

G. Flexijoint:

1. Where specified Flexijoint couplings shall be Flanged Romac Flexijoint couplings. The Flexijoint is a flexible, ductile iron joint that can accommodate expansion, contraction, rotation and bending and is rated at 350 psi working pressure. The joint can accommodate 15 to 20 degree deflection depending on size. Body shall be ductile iron, lock rings Type 410 stainless steel, and ring gasket, casing, ball and cover shall be EPDM molded watertight construction. All metal portions of Flexijoint coupling including the stainless steel lock rings shall be coated and lined with fusion bonded epoxy conforming to AWWA C550 and NSF 61. For buried installations, install with polyethylene baggy cover in accordance with the manufacturer's instructions.

2.03 GASKETS

A. Gaskets designated in Section 40 05 01 shall be as follows:

1. EPDM: ethylene-propylene-diene-terpolymer.
2. Neoprene: neoprene.
3. Nitrile: nitrile (Buna N).
4. Compressed gasketing consisting of organic fibers (Kevlar) and neoprene binder; ASTM F104 (F712400), 2500 psi (ASTM F152), 0.2 ML/HR LEAKAGE FUEL A (ASTM F37).
5. Compressed gasketing consisting of organic fibers (Kevlar) and SBR binder; ASTM F104 (F712400), 2500 PSI (ASTM F152), 0.1 ml/hr leakage Fuel A (ASTM F37).
6. Gylon gasketing, Garlock Style 3500, 2000 psi (ASTM F152), 0.22 ml/hr Fuel A (ASTM F37).
7. Gylon gasketing, Garlock Style 3510, 2000 psi (ASTM F152), 0.04 ml/hr Fuel A (ASTM F37).
8. Gylon gasketing, Garlock Style 3504, 2000 psi (ASTM F152), 0.12 ml/hr Fuel A (ASTM F37).
9. TFE: noncreeping tetrafluoroethylene (TFE) with insert filler.
10. PTFE bonded EPDM: PTFE bonded to EPDM in full-face gasket having concentric-convex molded rings; Garlock Stress Saver 370 or equal.

2.04 THREAD

A. Pipe thread dimensions and size limits shall conform to ANSI Bl.20.1.

2.05 DIELECTRIC UNIONS

A. Dielectric unions shall be EPCO, Capitol Manufacturing, or equal.

2.06 COATINGS

A. Unless otherwise specified, flange assemblies and mechanical type couplings for buried installation shall be field coated with System M-1 as specified in Section 09 90 00.

2.07 PRODUCT DATA

A. In accordance with Section 01 33 00, the Contractor shall provide for each welder, a welder qualification certificate indicating the welder is certified for pipe welding in accordance with ASME Boiler and Pressure Vessel, Section IX. Each welder's certificate shall be provided to the Construction Manager prior to that welder working on the job.

PART 3 EXECUTION

3.01 PIPE CUTTING, THREADING AND JOINTING

A. Pipe cutting, threading and jointing shall conform to the requirements of ANSI B31.1.

3.02 PIPE WELDING

A. Pipe shall be welded by ASME-certified welders using shielded metal arc, gas shielded arc or submerged arc welding methods. Welds shall be made in accordance with the requirements of ANSI B31.1 for piping Systems 8, 26, and 28 specified in Section 40 05 01. Welds shall be made in accordance with the requirements of ANSI B31.3 for piping System 20 specified in Section 40 05 01.

B. Welds for piping systems not specified above shall be made in accordance with AWWA C206.

3.03 TAKEDOWN COUPLINGS

A. Takedown couplings shall be screw unions, flanged or grooved end mechanical coupling type joints and shall be provided as specified. Flanged or grooved end joints shall be employed on pipelines 2-1/2 inches in diameter and larger. Where piping passes through walls, takedown couplings shall be provided within 3 feet of the wall, unless specified otherwise.

B. A union or flanged connection shall be provided within 2 feet of each threaded end valve.

3.04 FLEXIBILITY

A. Unless otherwise specified, piping passing from concrete to earth shall be provided with two pipe couplings or flexible joints (or a single Flexijoint) as specified on the buried pipe within 2 feet of the structure for 2-inch through 6-inch diameter pipe; within 3 feet of the structure for 8-inch through 24-inch diameter pipe; and within one and one-half pipe diameters of the structure for larger pipe. Where required for resistance to pressure, mechanical couplings shall be restrained in accordance with Chapter 13 of AWWA M11, including Tables 13-4, 13-5 and 13-5A, and Figure 13-20.

3.05 DIELECTRIC CONNECTIONS

A. Where a copper pipe is connected to steel or cast iron pipe, an insulating section of rubber or plastic pipe shall be provided. The insulating section shall have a minimum length of 12 pipe diameters. Dielectric unions as specified in paragraph 2.05 may be used instead of the specified insulating sections. Where copper pipe is supported from hangers, it shall be insulated from the hangers, or copper-plated hangers shall be used.

3.06 EQUIPMENT CONNECTION FITTINGS

A. Where shown, equipment connection fittings shall be provided between field piping systems and equipment inlet and outlet connections.

END OF SECTION

SECTION 40 05 06.23

EXPANSION JOINTS AND FLEXIBLE METAL HOSE

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies piping expansion joints and flexible metal hose.

B. Provide professional engineering services for a piping system design engineer (hereinafter the "Design Professional") as specified in Section 40 05 01, this Section, and related sections.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 66 00 – Product Storage and Handling Requirements
   3. Section 40 05 01 – Piping Systems
   4. Section 40 05 02 – Piping System Schedules
   5. Section 40 05 06 – Specialty Couplings and Adapters for Process Piping
   6. Section 40 05 07 – Hangers and Supports for Process Piping
   7. Section 40 05 07.13 – Seismic Restraints for Piping
   8. Section 40 05 07.16 – Expansion Control for Piping

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ASTM A276	Stainless and Heat-Resisting Steel Bars and Shapes
EJMA STDS	Standards of Expansion Joint Manufacturers' Association, Edition No. 5

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Expansion Joint: Any device used to absorb dimensional changes and/or misalignment.
   2. Pipe Section: the portion of pipe between two anchors.
   3. Lateral Direction: Direction perpendicular to the pipe axis.
   4. Longitudinal Direction: Direction parallel to the pipe axis.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordination required with the design of piping systems, piping supports (hangers, guides, anchors, structural attachments, etc.), and expansion control and seismic restraints.
   2. Select and install expansion joints and flexible metal hose in conformance with the expansion control system designed by the Design Professional, retained under the requirements of Section 40 05 01, and the criteria specified herein. This requirement, however, shall not be construed as relieving the Contractor of responsibility for this portion of the work.
   3. Refer to Section 40 05 01 for additional coordination requirements.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with addenda updates, and all referenced sections with each paragraph check marked to show specification compliance or marked to show deviations.
   3. Design and construction details of formed metal bellows type expansion joints.
   4. Percent elongation over range of design temperatures.
   5. Pressure thrust force and spring rate data for formed metal bellows expansion joints.
   6. Materials, design and construction, and temperature and pressure rating for elastomer and fabric expansion joints.
   7. Details for the installation of all expansion joints.
   8. Listing of all flexible metal hose applications.

1.07 QUALITY ASSURANCE

A. Refer to Section 40 05 01 for additional quality assurance requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Additional requirements: 40 05 01.

PART 2 PRODUCTS

2.01 PERFORMANCE / DESIGN CRITERIA

A. General:
   1. All expansion joints and flexible hose materials shall be new, free from defects and conforming to the requirements and standards specified in this Section.
   2. Furnish expansion joints and flexible metal hose as specified in Part 4 of this specification.

3. Provide control units (tie rods or restraints) to prevent excessive axial elongation and to accept the pressure thrust in the piping system. Number and sizes of control rods or restraints shall be as determined by the manufacturer.

B. Expansion Joints:
   1. Expansion joints shall be designed in accordance with EJMA Standards for pressure, temperature and service as specified in the Piping System Schedules (Section 40 05 02.00 through 40 05 02.99) without crimping of corrugations.
   2. Corrugated type expansion joints shall be suitable for a minimum of 10,000 pressure, temperature and deflection cycles (non-concurrent).
   3. Supply bellows type expansion joints suitable for a minimum of 10,000 pressure, temperature and deflection cycles (non-concurrent).

C. Flexible Metal Hose:
   1. Flexible metal hose shall be suitable for a line pressure equal to the test pressure listed in the Piping System Schedules (Section 40 05 02.00 through 40 05 02.99).
   2. Live lengths for flexible metal hose shall be based on service as specified and a design life of 1,000,000 full displacement cycles.

2.02 EXPANSION JOINTS

A. Metal Construction
   1. Formed Bellows Type
      a. Medium Temperature:
         1) Formed bellows-type expansion joints for temperatures up to 800 degrees F shall have 300 series stainless steel multi-ply bellows rated for the specified design temperature and pressure.
         2) Test pressures are specified in the Piping System Schedules (Section 40 05 02.00 through 40 05 02.99). Each expansion joint shall be factory tested at the test pressure.
         3) Ductwork expansion joints may be rated at less than 50 psig but must be rated equal to the design pressure specified and, in no case, less than 2 psig.
         4) Expansion joint design shall be determined by the amount and kind of movement specified (axial, lateral, angular). Unless otherwise specified, end connections shall be flanged.
         5) Acceptable manufacturers: Formed bellows type expansion joints shall be as manufactured by U.S. Bellows, Senior Flexonics, Inc., Hyspan Precision Products, Inc., American BOA Inc. or approved equal.
      b. High Temperature:
         1) Engine and gas turbine exhaust expansion joints for temperatures up to 1300 degrees F shall be the multi-ply bellows type designed for 15 psig. Bellows shall be constructed of 300 series stainless steel.
         2) Unless otherwise specified, end connections shall be either the fixed flange or Vanstone flange configuration. Flange material shall be carbon steel for temperatures up to 1000 degrees F and stainless steel for temperatures 1000-1300 degrees F. Vanstone materials and flow liners, where specified, shall be the same as bellows material.

3) Exhaust expansion joints shall be Flexonics DEX Series, Hyspan Series 2500, American BOA Series 025E, or equal.

2. Expansion Compensator Type
   a. Steel Expansion Compresor:
      1) Compensators shall have 2-ply stainless steel bellows and carbon steel shroud and end fittings. Compensators shall be rated for 175 psi maximum working pressure and 750 degrees F.
      2) Steel expansion compensator type expansion joints shall be Flexonics Model H Expansion Compensator, Hyspan Series 8500, Keflex 7Q, or equal.
   b. Bronze Expansion Compensator:
      1) Compensators shall have multi-ply phosphor bronze or stainless steel bellows and copper tube end fittings. Compensators shall be rated for 150 psi maximum working pressure and 400 degrees F.
      2) Bronze expansion compensator type expansion joints shall be Flexonics Model HB Expansion Compensator, Hyspan Series 8500, Keflex 7Q, American BOA Inc., or equal.

B. Elastomer and Fabric Construction
   1. General Requirements:
      a. Standard spool arch type or the precision molded spherical design type as specified.
      b. Single arch and sphere type expansion joints, unless otherwise indicated, have 150-mm face-to-face dimension for pipe up to 200 and 200-mm face-to-face dimension for pipe 250 and 300. For use with larger diameters, Contractor must obtain approval from the Owner's Representative.
      c. Cover elastomer constructed of chlorobutyl, neoprene, or EPDM.
      d. Tube elastomer constructed of chlorobutyl or EPDM for temperatures between 80 and 115 degrees C. Neoprene or Buna N liners are acceptable for temperatures up to 80 degrees C.
   2. Spool Type:
      a. Resilient arch type and standard or tapered as specified. Unless otherwise specified, all tapered connectors shall be eccentric.
      b. Constructed of multiple plies of woven fabric impregnated with elastomer and reinforced with steel rings or wire embedded in the body.
      c. Provide retaining or backup rings for standard arch type expansion joints suitable for the specified temperature and pressure. Rings shall be 10-mm-thick steel, split, either galvanized or zinc shield coated.
      d. Use filled arch type expansion joints on all piping systems carrying fluids containing solids.
      e. Acceptable manufacturers for single, multiple, or filled arch: Unisource Series 1200, Garlock Style 204, Mercer Style 500, or approved equal.
      f. Acceptable manufacturers for high pressure couplings suitable for 240 degree F operating temperatures: Unisource Series 1500, Mercer Style 510, Garlock Style 204-HP, General Style 1015, or approved equal.

3. Spherical Molded Type:
    a. Spherical molded type expansion joints shall be precision molded of multiple plys of nylon tire cord fabric and elastomer suitable for specified temperature and pressure.
    b. Spherical molded type expansion joints shall have steel or ductile iron floating flanges, and no metal parts shall come in contact with the fluid.
    c. Acceptable manufacturers for single sphere molded connectors shall be Mason Type MFNC, Mercer Type 5500, Goodall Type E-611, General Type 1010, Garlock Style 8100, or approved equal.
    d. Provide double sphere or triple sphere connectors where required to provide for the specified movement.

C. Polymer Expansion Joints
    1. Provide expansion joints for PVC or CPVC piping that are EPDM elastomer flexible double-bellows. Attach expansion joints to pipe using union-type couplings.
    2. PVC/CPVC acceptable manufacturers: Spears; Flexicraft; Approved Equal.
    3. Provide PTFE expansion joint with external stainless steel reinforcing rings, limit rods, and flanges. Expansion joints shall be designed to the FSA 0012 design standard. Use polymer-coated tie rods or grommets between the tie rods and flanges; metal-to-metal contact between the rods and flanges are not acceptable. Flanges must be completely isolated from the chemical by the molded PTFE bellows.
    4. Provide safety shields over PTFE joints and connections.
    5. Molded PTFE expansion joints acceptable manufacturers: Garlock Style 214/215, Crane Resistoflex R-series, Flexicraft Teflex Series, or approved equal.

2.03 FLEXIBLE METAL HOSE

A. Flexible Metal Hose:
    1. General:
        a. Unless otherwise specified, flexible metal hose shall be corrugated type 321 stainless steel with stainless steel fittings and shall be provided with stainless steel single braid.
        b. Attach end connections by helical crest welding.
        c. Provide bronze flexible metal hose for copper and brass systems.
    2. Braided Type:
        a. Type A: Type A (stainless steel) braided flexible metal hose shall be Senior Flexonics, or equal.
        b. Type B: Type B (bronze) braided flexible metal hose shall be Senior Flexonics, or approved equal.

2.04 FLEXIBLE TEFLON HOSE

A. Provide teflon flexible connectors consisting of molded teflon bellows and 150-pound ductile iron flanges. The flanges shall be completely isolated from the chemical by the molded teflon bellows.

B. Provide integral steel limit bolts and Monel reinforcing rings on the connectors. Provide connectors with nonasbestos gaskets. The connectors shall allow for an axial transverse movement of at least 1/2-inch, and an offset of at least 3/8-inch. The connectors shall be rated for a pressure of 130 psi, at a temperature of 70 degrees F.

C. Acceptable manufacturers: Jackson Industrial, Metraflex Teflon Expansion Joint, Garlock, modified as necessary to provide the specified features, or approved equal.

2.05 FLEXIBLE METAL HOSE LOOP

A. Flexible metal hose loops consist of two parallel sections of corrugated stainless steel metal hose and single braid with 180 degree return bend, flanged inlet and outlet connections.

B. Furnish flexible metal hose loops that provide the amount and kind of movement (axial, lateral, angular, torsional) scheduled in this Section. Provide supports at 180 degree return bend per manufacturer's recommendations.

C. For loops using hanger supports, provide seismic break-away coupling to allow separation during seismic event.

D. Acceptable Manufacturers: Metraflex; Flexicraft; Anvil International; Approved Equal.

PART 3 EXECUTION

3.01 INSTALLATION

A. Located expansion joints as specified. Location and number of guides shall be determined from EJMA Standards.

B. For piping services operating at less than 170 degree F, do not install expansion joints during times of extreme temperature or in a fully compressed or fully expanded condition.

C. For piping services operating at over 170 degree F, install expansion joints at percent elongation corresponding to installation temperature as a percent of maximum operating temperature.

D. Unless otherwise specified, expansion joints 4 inches and larger shall be furnished with control rods.

3.02 ALIGNMENT

A. Align piping systems prior to installation of expansion joints.

B. Do not use expansion joints to correct piping misalignment during installations.

C. Install expansion joints normally preset at the factory for rated axial compression and expansion in this preset condition.

D. Set control units/tie rods/restraints after all pressure testing of the piping system is complete.

PART 4 SCHEDULE

4.01 EXPANSION JOINT AND CONNECTOR SCHEDULE

A. Expansion joints and/or flexible metal hose connectors provided for specific equipment items or piping systems are specified on the following schedule. The location of piping system expansion joints and design criteria, including temperature, pressure and movement for each joint, are specified and/or shown on the drawings.

B. Expansion joints and connectors shall be provided in accordance with the following table. If a particular joint or connector is shown or specified for a given location, that more detailed selection shall apply.

Expansion Joint and Connector Schedule

Type of Expansion Joint/Connector	Type of Service/Use
Formed metal bellows; medium temperature (2.01 Medium Temperature)	Boiler exhaust, hot water, high pressure air, and gas and steel lines subjected to ambient temperature differentials sufficient to require expansion joints.
Steel expansion compensator (2.02 Steel Expansion Compensator Type)	Same type service/use as for "formed metal bellows type expansion joint" except size of piping is limited to 3 inch diameter or less.
Bronze expansion compensator (2.02 Bronze Expansion Compesator Type)	Copper piping.
Elastomer spool arch (2.02 Spool Type.)	Blower connectors and expansion joints for piping 14 inch diameter and larger.
Elastomer spherical molded (2.02 Spherical Molded Type)	Blower connectors and expansion joints for piping 12 inch diameter and less[1].
PVC (2.02 Polyvinylchloride Construction)	PVC piping.
Teflon (2.02 Teflon Construction)	RTRP (FRP) piping.
Stainless steel braided hose (2.03 Type A)	CS, LSG and mixed service connections to digester and stand pipe.
Bronze braided hose (2.03 Type B)	Air compressor discharge and pump connectors for copper lines.
Teflon flexible connector (2.04)	Connection of PVC piping to chemical storage tanks.

1. Excludes steam and chemical services.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 07

HANGERS AND SUPPORTS FOR PROCESS PIPING

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies hangers and supports for all exposed piping systems specified in Section 40 05 01. This section does not include pipe supports for fire sprinkler systems or seismic restraints.

B. Scope Of Contractor Design: The Contractor shall provide the services of a "Design Professional" as specified in Section 40 05 01 to conduct all necessary piping and support design for exposed piping.
   a. Whether a design or general arrangement is shown or not, Contractor's Design Professional shall design all pipe supports, anchorage, restraints and expansion control, as specified. Where a conflict arises, Contractor's Design Professional shall present any conflict to Construction Manager for resolution.
   b. The Design Professional's work shall incorporate design criteria and other conditions as specified herein, in related sections and as shown on the drawings.
   c. Additional requirements are specified in related sections.
   d. Bidding: For purposes of bidding supports within Design Professional's Scope of Responsibility, Contractor may use the support and seismic restraint tables presented in Appendix A of this Section and information shown on the Drawings.
      1. Additional supports are required for concentrated loads, changes in direction and disassembly.
      2. Support frequency shall be determined based upon hanger load capacity, with minimum indicated factor of safety specified. Rod hanger support frequency indicated in Table A (Appendix A) shall not be represented as being sufficient to address seismic loads.
      3. Notwithstanding the Mechanical Standard Details and direction as shown on the Drawings, the full scope of supports, specified and shown, including those within the Design Professional's Scope of Responsibility is required work and differences between bid quantities and actual requirements will not be considered as extra work subject to adjustment by change order.

C. Scope Of Work By Design Engineer: Design Engineer has undertaken design details for supports and anchors for: Select piping 24" and larger. Contractor's Design Professional shall incorporate these features into the Contractor's design.
   a. Where shown, Design Engineer has also provided guidance in the form of general arrangements that may include specific types of supports or anchorage details. In addition, allowable anchor points and load capacities for potential support structures are shown or otherwise described herein.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures

2. Section 01 61 45 – Area Exposure Designations
3. Section 01 66 00 – Product Storage and Handling Requirements
4. Section 01 73 24 – Design Requirements for Non-Structural Components and Non-Building Structures
5. Section 03 30 00 – Cast-in-Place Concrete
6. Section 05 05 20 – Anchor Bolts
7. Section 40 05 01 – Piping Systems
8. Section 40 05 02 – Piping System Schedules

1.04 DEFINITIONS [NOT USED]

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordination required with the design of piping systems, expansion joints, and expansion control and seismic restraints.
   2. Refer to Section 40 05 01 for additional coordination requirements.
   3. Refer to paragraph 1.09 Hanger and Supports Selection and Design for additional coordation requirements.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.

2. A copy of this specification section with addenda updates, and all referenced sections with each paragraph check marked to show specification compliance or marked to show deviations.
3. Hanger and support locations and components shall be indicated on the piping layout drawings required by Section 40 05 01.

B. Informational Submittals:
1. Procedures: Section 01 33 00.
2. Design Professional's reports as specified in paragraph 3.05.

1.07 QUALITY ASSURANCE

A. Refer to Section 40 05 01 for additional quality assurance requirements.

B. Refer to paragraph 1.09 Pipe Hanger and Support Selection and Design for additional quality assurance requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Additional requirements: 40 05 01.

1.09 PIPE HANGER AND SUPPORT SELECTION AND DESIGN

A. Hanger And Support Selection:
1. The Contractor shall cause the pipe hangers and supports to be designed and selected by the Design Professional retained under the provisions of Section 40 05 01. This provision, however, shall not relieve the Contractor of overall responsibility for this portion of the work. Hanger and support selection shall be based on the following:
   a. The Contractor shall select pipe hangers and supports as specified in the project manual. Selections shall be based upon the pipe support classifications specified in MSS-SP 69, the piping insulation thickness specified in Section 40 42 00, and any special requirements which may be specified in the project manual.
   b. The Contractor shall review the piping layout in relation to the surrounding structure and adjacent piping and equipment before selecting the type of support to be used at each hanger point.
   c. Where a particular pipe support arrangement is shown, a design incorporating that arrangement shall be used.
   d. Where a particular pipe support design is shown, that design shall be used.
   e. Pipe supports shall be spaced such that pipe span deflections do not exceed 0.1-inch.
   f. Pipe support design shall incorporate applicable criteria of ASME or other recognized standard.
   g. The pipe hanger and support system shall be coordinated with the seismic restraint system specified under Section 40 05 07.13.

h. Hangers and supports shall withstand all static and specified dynamic conditions of loading to which the piping and associated equipment may be subjected. As a minimum, consideration shall be given to the following conditions:
    1) Weights of pipe, valves, fittings, insulating materials, suspended hanger components, and normal fluid contents.
    2) Weight of hydrostatic test fluid or cleaning fluid if normal operating fluid contents are lighter.
    3) Reaction forces due to test and operational conditions.
    4) Reaction forces due to the operation of safety, relief, or other valves.
    5) Wind, snow or ice loadings on outdoor piping.
    6) Supports shall be designed to prevent transfer of the weight of piping, valves and piping appurtenances to equipment piping connections. All supports adjacent at equipment connections to piping systems shall have provisions for vertical and horizontal adjustment. Two flexible piping connections not less than one pipe diameter apart shall be provided between piping supports and any equipment piping connection.
i. Hangers and supports shall be sized to fit the outside diameter of pipe, tubing, or, where specified, the outside diameter of insulation.
j. Where negligible movement occurs at hanger locations, rod hangers shall be used for suspended lines, wherever practical. For piping supported from below, bases, brackets or structural cross members shall be used.
k. Hangers for the suspension of size 2 1/2 inches and larger pipe and tubing shall be capable of vertical hanger component adjustment under load.
l. The supporting systems shall provide for and control the free or intended movement of the piping including its movement in relation to that of connected equipment.
m. Where there is horizontal movement at a suspended type hanger location, hanger components shall be selected to allow for swing. The vertical angle of the hanger rod shall not, at any time, exceed 4 degrees.
n. There shall be no contact between a pipe and hanger or support component of dissimilar metals. Prevent contact between dissimilar metals when supporting copper tubing by use of copper-plated, rubber, plastic or vinyl coated, or stainless steel hanger and support components.
o. Stock hanger and support components shall be used wherever practical.
p. Fiberglass framing channel shall be provided where specified.

B. The following structural criteria shall also be applied:
1. Unless otherwise specified, existing pipes and supports shall not be used to support new piping.
2. Unless otherwise specified, pipe support components shall not be attached to pressure vessels.
3. Where critical support load requirements have been identified, limiting structural load requirements are shown.
4. Pipe support hangers, brackets etc. shall be of suitable capacity and shall be appropriate to the individual structural member that is used to support the pipe.

5. The structural integrity of existing and new members shall in no way be impacted by the placement of connections for pipe supports. For example, the tension reinforcement in reinforced concrete members shall not be impacted in any way by the placement of fasteners for pipe supports.
6. Spacing and arrangement of hangers supporting pipe shall be provided in such a manner that the loads from the pipes on existing and new structural members shall be quasi-uniform. These quasi-uniform loads shall not exceed the allowable design loads for mechanical equipment as shown on existing (not necessarily contract) drawings and as listed under Design Live Loads in the General Notes.
7. For new construction, unless otherwise shown, pipe may be supported from nearest structural element (floor, ceiling, or wall). The Design Loads for mechanical equipment, as listed in the General Notes sheet of the Structural drawings shall not be exceeded.
8. The loads and specific attachment requirements for pipe supports on new concrete Tees shall be coordinated with the Tee manufacturer and incorporated into the design of the Tees.
9. Unless otherwise specified, pipe supports from existing Tees or other roof types shall not be constructed without an evaluation of capacity and appropriate design from Contractor's Design Professional.

C. The following, project-specific criterion shall also be applied:
1. The spacing for pipe hangers shall not be less than 5 feet and shall not exceed 375 lbs of load for all existing pre-cast, Double Tee roof elements. For hangers off flanges of existing Tees, a washer shall be provided having minimum dimensions of 1/4 inch thick by 4 inch long and 4 inch wide. The design and projection of those hangers above the roof shall be coordinated with the architectural roofing system.
2. For sodium hydroxide systems, pipe supports shall be 60 percent closer than the maximum spacing indicated for plastic piping for water service.

PART 2 PRODUCTS

2.01 PERFORMANCE/ DESIGN CRITERIA

A. Service Conditions:
1. The hangers and supports specified in this section are provided to resist pipe loads occurring primarily in the downward (gravity) direction. For the purpose of pipe hanger and support selection, this section establishes pipe support classifications based on the operating temperatures of the piping contents. Pipe support classifications are as follows:
   a. Hot Systems
      1) A - 1. 120 degrees F to 450 degrees F
      2) A - 2. 451 degrees F to 750 degrees F
      3) A - 3. Over 750 degrees F
   b. Ambient Systems
      1) B. 60 degrees F to 119 degrees F
   c. Cold Systems
      1) C - 1. 33 degrees F to 59 degrees F
      2) C - 2. -20 degrees F to 32 degrees F

B. Design:
   1. The Contractor shall cause the design of pipe hanger and support systems to be developed in conjunction with preparation of the design seismic restraints and expansion control system by the Design Professional selected in accordance with Section 40 05 07-1.01 and 1.09. The pipe system drawings specified in Section 40 05 07-1.06 shall show the hanger and support locations as well as the details of the seismic restraints and expansion control systems. The pipe hanger and support design drawings and calculations shall be prepared and signed by the design professional and shall bear the Design Professional's registration seal.

2.02 MATERIALS

A. Standard pipe supports and components shall be manufactured by B-Line, Carpenter & Patterson, Kin-Line, Grinnell, Michigan, Pipe Shields Incorporated, Superstrut, Unistrut, or equal. Pipe support components shall conform to the requirements of MSS SP-69 and FEDSPEC WW-H-171e.

B. Pipe support materials shall conform to the requirements of MSS SP-58. Metal framing system components shall conform to the metal framing manufacturers' Association Standard MFMA-2.

2.03 CONFIGURATION, COMPONENTS, FEATURES

A. General:
   1. Unless otherwise specified, pipe hangers and supports, structural attachments, fittings and accessories shall be hot-dip or mechanically galvanized after fabrication. Nuts, bolts and washers may be zinc-plated except for those subject to moisture or corrosive atmosphere, as specified in Section 26 05 00-1.05 Corrosive Areas as shown on the drawings, which shall be type FRP or 304 stainless steel.

B. Pipe Hangers And Supports:
   1. Pipe hangers and supports of dissimilar metals than pipe shall be insulated. Pipe hangers and supports shall support pipe in the manner recommended by the pipe manufacturer and/or applicable building or piping codes.

C. Rack And Trapeze Supports:
   1. Unless otherwise specified, trapeze and pipe rack components shall have a minimum steel thickness of 12 gage, with a maximum deflection 1/240 of the span.

D. Structural Attachments:
   1. Type A - Malleable Iron Concrete Insert: Concrete inserts shall be malleable iron and comply with MSS and FEDSPEC Type 18. Grinnell Fig. 282, Carpenter & Patterson Fig. 108, or equal.
   2. Type B - Side Beam Bracket: Bracket shall be malleable iron and comply with MSS Type 34 and FEDSPEC Type 35. Grinnell Fig. 202, B-Line B3062, or equal.
   3. Type C - Malleable Beam Clamp With Extension Piece: Clamp and extension piece shall be malleable iron, tie rod shall be steel. Beam clamp shall comply with MSS and FEDSPEC Type 30. Grinnell Fig. 218 with Fig. 157 extension piece, B-Line B3054, or equal.

4. Type D - Steel Beam Clamp With Eye Nut: Beam clamp and eye nut shall be forged steel. Configuration and components shall comply with MSS and FEDSPEC Type 28. Grinnell Fig. 292, Carpenter & Patterson Fig. 297, or equal.
5. Type E - Framing Channel Post Base: Post bases shall be carbon steel, of standard design manufactured by framing channel manufacturer. Single channel: Unistrut P2072A, B-Line B280, or equal. Double channel: Unistrut P2073A, B-Line B281, or equal.
6. Type F - Welded Beam Attachment: Beam attachment shall be carbon steel and comply with MSS and FEDSPEC Type 22. B-Line B3083, Grinnell Fig. 66, or equal.
7. Type G - Welded Steel Bracket: Bracket shall be carbon steel and comply with MSS Type 32 and FEDSPEC Type 33 for medium welded bracket. Heavy welded bracket shall comply with MSS Type 33 and FEDSPEC Type 34.
8. Type H - Cast Iron Bracket: Bracket shall be cast iron, Carpenter & Patterson Fig. 340, or equal.
9. Type J - Adjustable Beam Attachment: Beam attachment shall be carbon steel, Carpenter & Patterson Fig. 151, B-Line B3082, or equal.
10. Type K - Double Channel Bracket: Wall channel shall be single channel framing channel as specified in paragraph 2.03 Framing Channel. Cantilever bracket shall be a carbon steel double framing channel assembly, Unistrut P2542 through P2546, B-Line B297-12 through B297-36, or equal.
11. Type L - Single Channel Bracket: Wall channel shall be single channel framing channel as specified in paragraph 2.03 Framing Channel. Cantilever bracket shall be a carbon steel single framing channel assembly, Unistrut P2231 through P2234, B-Line B198-6, B198-12, B196-18 and B196-24, or equal.
12. Type M - Wall Mounted Channel: Wall channel shall be single channel framing channel as specified in paragraph 2.03 Framing Channel.
13. Type N - Pipe Stanchion Floor Attachment: Baseplate shall be carbon steel with 1/2 inch minimum thickness. Anchor bolt holes shall be 1/16 inch larger than the anchor bolt diameter. The space between the baseplate and the floor shall be filled with nonshrink grout.
14. Type Q - ContinuoUs Concrete Inserts: shall be 1 5/8 by 1 3/8 Channel, cold formed 12 Ga. steel conforming to ASTM A 1001, stainless steel GR 33 or ASTM GR 33 A., hot dip galvanized conforming to ASTM A123 or A153, UNISTRUT P3200 Series, or approved equal.

E. Accessories:
1. Hanger Rods: Rods shall be carbon steel, threaded on both ends or continuous threaded and sized as specified.
2. Weldless Eye Nut: Eye nut shall be forged steel and shall comply with MSS and FEDSPEC Type 17. Eye nut shall be Grinnell Fig. 290, B-Line B3200, or equal.
3. Welded Eye Rod: Eye rod shall be carbon steel with eye welded closed. Inside diameter of eye shall accommodate a bolt diameter 1/8 inch larger than the rod diameter. Eye rod shall be Grinnell Fig. 278, B-Line B3211, or equal.
4. Turnbuckle: Turnbuckle shall be forged steel and shall comply with MSS and FEDSPEC Type 13. Turnbuckle shall be Grinnell Fig. 230, B-Line B3202, or equal.

5. Framing Channel: Framing channel shall be 1 5/8 inches square, roll formed, 12-gage carbon steel. Channel shall have a continuous slot along one side with in-turned clamping ridges. Single channel: Unistrut P1000, B-Line B22, or equal. Double channel: Unistrut P1001, B-Line B22A, or equal. Triple channel: Unistrut P1004A, B-Line B22X, or equal.

2.04 THERMAL PIPE HANGER SHIELD:

A. Thermal shields shall be provided at hanger, support and guide locations on pipe requiring insulation. The shield shall consist of an insulation layer encircling the entire circumference of the pipe and a steel jacket encircling the insulation layer. The thermal shield shall be the same thickness as the piping system insulation specified in Section 40 42 00. The standard shield shall be used for hot systems and the vapor barrier shield shall be used for cold systems. Stainless steel band clamps shall be used where specified to ensure against slippage between the pipe wall and the thermal shield.

B. Standard Shield:
   1. Insulation:
      a. Hydrous calcium silicate, high density, waterproof
      b. Compressive strength: 100 psi average
      c. Flexural strength: 75 psi average
      d. K factor: 0.38 at 100 degrees F mean
      e. Temperature range: 20 degrees F to 500 degrees F
   2. Steel Jacket: Galvanized steel. Gage shall be the manufacturer's standard supplied for the given pipe size.
   3. Connection: Shield shall have butt connection to pipe insulation. Steel jacket and insulation shall be flush with end.

C. Vapor Barrier Shield:
   1. Insulation:
      a. Hydrous calcium silicate, high density, waterproof
      b. Compressive strength: 100 psi average
      c. Flexural strength: 75 psi average
      d. K factor: 0.38 at 100 degrees F mean
      e. Temperature range: 20 degrees F to 500 degrees F
   2. Steel Jacket: Galvanized steel. Gage shall be the manufacturer's standard supplied for the given pipe size.
   3. Connection: Shield shall have butt connection to pipe insulation. Insulation shall extend 1 inch each side of steel jacket for vapor tight connection to pipe insulation vapor barrier.

PART 3 EXECUTION

3.01 HANGER AND SUPPORT LOCATIONS

A. Locate hangers and supports as near as possible to concentrated loads such as valves, flanges, etc. Locate hangers, supports and accessories within the maximum span lengths specified in the project manual to support continuous pipeline runs unaffected by concentrated loads.

B. Locate at least one hanger or support within 2 feet from a pipe change in direction.

C. Locate hangers and supports to ensure that connections to equipment, tanks, etc., are substantially free from loads transmitted by the piping.

D. Where piping is connected to equipment, a valve, piping assembly, etc., that will require removal for maintenance, support the piping in such a manner that temporary supports shall not be necessary for this procedure.

E. Pipe shall not have pockets formed in the span due to sagging of the pipe between supports caused by the weight of the pipe, medium in the pipe, insulation, valves and fittings.

3.02 INSTALLATION

A. Weld and bolt attachments to the building structural steel shall be in accordance with the requirements of the AISC Manual of Steel Construction. Unless otherwise specified, there shall be no drilling or burning of holes in the building structural steel.

B. Hanger components shall not be used for purposes other than for which they were designed. They shall not be used for rigging and erection purposes.

C. Install items to be embedded before concrete is poured. Fasten embedded items securely to prevent movement when concrete is poured.

D. Embedded anchor bolts shall be used instead of concrete inserts for support installations in areas below water surface or normally subject to submerging.

E. Install thermal pipe hanger shields on insulated piping at required locations during hanger and support installation. Butt joint connections to pipe insulation shall be made at the time of insulation installation in accordance with the manufacturer's recommendations.

F. Hanger and support components in contact with plastic pipe shall be free of burrs and sharp edges.

G. Rollers shall roll freely without binding.

H. Finished floor beneath Type N structural attachments and framing channel post bases shall be roughed prior to grouting. Grout between base plate and floor shall be free of voids and foreign material.

I. Baseplates shall be cut and drilled to specified dimensions prior to welding stanchions or other attachments and prior to setting anchor bolts.

J. Plastic or rubber end caps shall be provided at the exposed ends of all framing channels that are located up to 7 feet above the floor.

3.03 ADJUSTMENTS

A. Adjust hangers and supports to obtain required pipe slope and elevation. Shims made of material that is compatible with the piping material may be used. Stanchions shall be adjusted prior to grouting their baseplates.

3.04 ANCHOR BOLTS

A. Anchor bolts in new concrete shall be cast in place. Refer to Section 05 05 20.

3.05 INSPECTION AND CERTIFICATION

A. The Design Professional retained by the Contractor under the provisions of Section 40 05 01 shall inspect the pipe hangers, support and restraint systems at not less than bi-weekly intervals during construction and furnish the Construction Manager with monthly reports. The Design Professional shall inspect the completed pipe hanger, support and restraint system before the Owner assumes beneficial occupancy and provide written certification, without any qualification statements, that the installation conforms to the design professional’s design and the Contract Document requirements as may be described in other Sections or on the drawings. All reports shall bear the Design Professional's seal and signature in accordance with the laws, rules and regulations of the state.

10 FEET FOR SOIL PIPE

TABLE A NOTES:

1. DESIGN WEIGHT SHALL BE TWICE THE WEIGHT OF THE PIPE FULL OF WATER PLUS THE WEIGHTS OF VALVES, FITTINGS, INSULATING MATERIALS AND SUSPENDED HANGER COMPONENTS ON THE RUN OF PIPE BEING SUPPORTED.
2. ROD SIZES SHOWN ARE FOR THE SUPPORT OF A SINGLE PIPE. WHEN SUPPORTING MORE THAN ONE PIPE, ROD SHALL BE SIZED USING DESIGN WEIGHTS (SEE NOTE 1) TO DETERMINE THE TOTAL DESIGN LOAD. THE TOTAL DESIGN LOAD SHALL NOT EXCEED THE MAXIMUM LOADS IN THE TABLE ABOVE.
3. PIPE SHALL NOT HAVE POCKETS FORMED IN THE SPAN DUE TO SAGGING OF THE PIPE BETWEEN SUPPORTS CAUSED BY THE WEIGHT OF THE PIPE, MEDIUM IN THE PIPE, INSULATION, VALVES AND FITTINGS.
4. SPAN SHOWN IS FOR SCHEDULE 80 PVC PIPE AT 100°F. SPANS FOR OTHER PLASTICS, OTHER PVC PIPE SCHEDULES AND PIPES AT HIGHER TEMPERATURES SHALL BE SHORT- ENED IN ACCORDANCE WITH THE PIPE MANUFACTURER'S RECOMMENDATIONS. "CONTINUOUS" MEANS PIPE SHALL BE IN UNISTRUT OR SIMILAR CHANNEL.
5. PROVIDE A MINIMUM OF ONE HANGER PER PIPE LENGTH, WITHIN 4-INCHES OF THE BELL.
6. PIPE HANGER AND SUPPORT SELECTION SHALL BE IN ACCORDANCE WITH TABLE B (M2302) AND SPECIFICATION SECTION 15096.

SECTION 40 05 07.13

SEISMIC RESTRAINTS FOR PIPING

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies seismic restraints for bracing all piping systems specified in Section 40 05 01. This section does not include seismic restraints for fire sprinkler systems.

B. Provide professional engineering services for a piping system design engineer (hereinafter the "Design Professional") as specified in Section 40 05 01, this Section, and related sections.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 61 45 – Area Exposure Designations
   3. Section 01 66 00 – Product Storage and Handling Requirements
   4. Section 01 73 24 – Design Requirements for Non-Structural Components and Non-Building Structures
   5. Section 03 30 00 – Cast-in-Place Concrete
   6. Section 05 05 20 – Anchor Bolts
   7. Section 40 05 01 – Piping Systems
   8. Section 40 05 02 – Piping System Schedules
   9. Section 40 05 06 – Specialty Couplings and Adapters for Process Piping
   10. Section 40 05 07 – Hangers and Supports for Process Piping
   11. Section 40 05 07.16 – Expansion Control for Piping
   12. Section 40 05 45 – Piping System Identification
   13. Section 40 42 00 – Insulation for Exposed Piping and Equipment

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.

Reference	Title
AISC Manual of Steel Construction	American Institute of Steel Construction Manual of Steel Construction, Allowable Stress Design, 9th Edition

Reference	Title
MSS SP-69	Pipe Hangers and Supports - Selection and Application
MSS-SP-89	Pipe Hangers and Supports – Fabrication and Installation Practices
SMACNA	Seismic Restraint Manual—Guidelines for Mechanical Systems

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Longitudinal direction: direction parallel to the pipe axis.
   2. Lateral direction: direction perpendicular to the pipe axis.

1.05 ADMISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordination required with the design of piping systems, expansion joints, pipe supports, and expansion control and seismic restraints.
   2. Refer to Section 40 05 01 for additional coordination requirements.
   3. Refer to paragraph 1.09 Seismic Restraint Design for additional coordination requirements.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. Seismic restraint system drawings and calculations as specified in paragraph 1.09 Seismic Restraint Design.
   3. Seismic restraint locations and legend as specified in paragraph 3.01.

B. Informational Submittals:
   1. Procedures: Section 01 33 00
   2. The Design Professional's reports and certification of final installation as specified in Section 40 05 01 and paragraph 3.03.

1.07 QUALITY ASSURANCE

A. Refer to Section 40 05 01 for additional quality assurance requirements.

B. Refer to paragraph 1.09 Seismic Restraint Design for additional quality assurance requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Additional requirements: 40 05 01

1.09 SEISMIC RESTRAINT DESIGN

A. Design Professional:
   1. The seismic restraint system shall be designed by the Design Professional retained under Section 40 05 01. Seismic restraint details shall be designed in conjunction with preparation of pipe system hangers and drawings specified in Section 40 05 01.
   2. All drawings and work product for the seismic restraint system shall bear the design professional's registration seal and signature. The requirement, however, shall not be construed as relieving the Contractor of responsibility for this portion of the work.

B. Restraint Selection:
   1. The Contractor shall select, locate and provide seismic restraints for piping in accordance with this section. As set forth in Section 40 05 01, this work shall be the product of a Design Professional retained by the Contractor.
   2. The Contractor shall review the piping layout in relation to the surrounding structure and adjacent piping and equipment before selecting the restraint to be used at each point.
   3. Seismic restraints may be omitted from the following installations:
      a. Gas piping less than 1-inch inside diameter.
      b. All other piping less than 2 1/2-inch inside diameter.
   4. Piping systems shall not be braced to dissimilar parts of a building or to dissimilar building systems that may respond in a different mode during an earthquake. Examples: wall and a roof; solid concrete wall and a metal deck with lightweight concrete fill.
   5. Restraints shall be sized to fit the outside diameter of the pipe, tubing, or, where specified, the outside diameter of insulation.
   6. There shall be no contact between a pipe and restraint component of dissimilar metals. The contractor shall prevent contact between dissimilar metals when restraining copper tubing by the use of copper-plated, rubber, plastic or vinyl coated, or stainless steel restraint components.
   7. Branch lines shall not be used to brace main lines.
   8. Seismic bracing shall not limit the expansion and contraction of the piping system.

PART 2 PRODUCTS

2.01 PERFORMANCE/ DESIGN REQUIREMENTS

A. Service Conditions:
   1. Provide seismic bracing to resist seismic loading caused by forces applied at the individual pipe's center of gravity. Designed seismic bracing for seismic loading as specified in Section 01 73 24. Seismic loading shall be assumed to be acting in the lateral, longitudinal, and vertical directions simultaneously.
   2. Provide all piping systems with seismic restraints conforming to governing state and local codes.
   3. Seismic restraints shall conform to the guidelines given in the SMACNA Seismic Restraint Manual for the Seismic Hazard Level consistent with the requirements of governing state and local codes. In case of conflict, the governing state or local code shall be followed.

2.02 MANUFACTURERS

A. Standard pipe restraints and components shall be manufactured by Carpenter & Patterson, B-Line, Kin-Line, ITT Grinnell, Michigan, Pipe Shields Incorporated, Superstrut, Unistrut, or approved equal.

B. Pipe restraint materials, design, manufacture, installation, and application shall conform to the requirements of MSS SP-58, MSS-SP-69, MSS-SP-89, MFMA-1, and MFMA-101.

2.03 MATERIALS

A. General:
   1. Unless otherwise specified, restraints manufactured of iron or steel, including braces, pipe and structural attachments, shall be hot-dip galvanized after fabrication.
   2. Nuts, bolts and washers, fittings and accessories, may be mechanically zinc-coated except for those subject to moisture or corrosive atmosphere, which are listed in Section 26 05 00-1.05 Corrosive Areas; those compounds shall be type 304 stainless steel.
   3. Also listed in Section 26 05 00-1.05 Corrosive Areas are corrosive areas specifically requiring fiberglass materials. In those areas, all pipe supports, anchor and seismic brace components (not just fittings and accessories) shall be made of fiberglass.

2.04 CONFIGURATION, COMPONENTS, AND FEATURES

A. Thermal Pipe Hanger Shield:
   1. Thermal shields shall be provided at seismic restraint locations on pipe requiring insulation. Thermal pipe hanger shields shall be as specified in Section 40 05 07-2.04. Stainless steel band clamps shall be provided on thermal shields at longitudinal pipe restraint locations.

PART 3 EXECUTION

3.01 PIPE RESTRAINT LOCATIONS

A. Locate the first seismic restraint on a piping system not more than 10 feet from the main riser, entrance to a building or piece of equipment.

B. Brace ductile and cast iron pipe on each side of a change in direction of 90 degrees or more. Brace or stabilize joints in risers between floors.

C. At a minimum, brace no-hub and bell and spigot cast iron soil pipe longitudinally every 20 feet and laterally every 10 feet.

D. Lateral bracing for one pipe section may also act as longitudinal bracing for the pipe section connected perpendicular to it, if the bracing is installed within 24 inches of the elbow or tee of the same size.

E. Indicate seismic restraint locations and components on the piping layout drawings required by Section 40 05 01. The drawings shall bear a legend giving load information and restraint component selection at each restraint location and shall be sealed and signed by the Design Professional retained by the Contractor for design of the pipe hanger and support system under the provisions of Section 40 05 01.

3.02 INSTALLATION

A. Use rod stiffener assemblies at seismic restraints for hanger rods over 6 inches in length. Use a minimum of two rod stiffener clamps on any rod stiffener assembly.

B. Install lateral and longitudinal bracing between 45 degrees above and 45 degrees below horizontal, inclusive, relative to the horizontal centerline of the pipe.

C. Weld and bolt attachments to the building structural steel in accordance with the requirements of AISC M011. There shall be no drilling or burning of holes in the building structural steel without approval of the Engineer.

D. Use embedded anchor bolts instead of concrete inserts for seismic brace installations in new concrete areas below water surface or normally subject to submerging. Otherwise, design and provide anchor bolts in accordance with Section 05 05 20.

E. Install thermal pipe hanger shields on insulated piping at required locations during restraint installation. Make butt joint connections to pipe insulation at the time of insulation installation in accordance with the manufacturer's recommendations.

F. Restraint components in contact with plastic pipe shall be free of burrs and sharp edges.

G. Rollers shall roll freely without binding.

H. Provide plastic or rubber end caps at the exposed ends of all framing channels that are located up to 7 feet above the floor.

3.03 INSPECTION AND CERTIFICATION

A. The Design Professional retained by the Contractor under the provisions of Section 40 05 01 shall inspect the seismic restraint system at not less than bi-weekly intervals during construction and furnish the Engineer with monthly reports.

B. The Design Professional shall inspect the completed seismic control system before the Owner assumes beneficial occupancy and provide written certification in accordance with Section 40 05 07 requirements.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 07.16

EXPANSION CONTROL FOR PIPING

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies expansion control for the piping systems specified in paragraph 2.01 Service Requirements. This section addresses pipe anchorage, pipe guides, and expansion control by either expansion joints or pipe deflection.

B. Provide professional engineering services for a piping system dsign engineer (hereinafter the "Design Professional") as specified in Section 40 05 01, this Section, and related sections.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 61 45 – Area Exposure Designations
   3. Section 01 66 00 – Product Storage and Handling Requirements
   4. Section 01 73 24 – Design Requirements for Non-Structural Components and Non-Building Structures
   5. Section 03 30 00 – Cast-in-Place Concrete
   6. Section 05 05 20 – Anchor Bolts
   7. Section 09 90 00 – Coating Systems
   8. Section 40 05 01 – Piping Systems
   9. Section 40 05 02 – Piping System Schedules
   10. Section 40 05 06 – Specialty Couplings and Adapters for Process Piping
   11. Section 40 05 07 – Hangers and Supports for Process Piping
   12. Section 40 05 07.13 – Seismic Restraints for Piping
   13. Section 40 05 45 – Piping System Identification
   14. Section 40 42 00 – Insulation for Exposed Piping and Equipment

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.

AISC Manual of Steel Construction	American Institute of Steel Construction, Manual of Steel Construction, Allowable Stress Design - 9th Edition
ASTM A276	Stainless and Heat-Resisting Steel Bars and Shapes

Reference	Title
EJMA STDS	Standards of Expansion Joint Manufacturers' Association, Edition No. 5

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:

Term	Definition
Expansion joint	Any device containing one or more bellows used to absorb dimensional changes.
Main anchor	An attachment between a structure and a pipe which must withstand the full pipeline thrust due to pressure, pipe bending, pipe compression, flow, spring forces, pipe and contents weight and other pipe forces.
Intermediate anchor	An attachment between a structure and a pipe which withstands the same forces as a main anchor except the pressure forces.
Sliding anchor	An attachment between a structure and a pipe which absorbs forces in one direction while permitting motion in another.
Pipe guide	A device fastened to a structure, which permits the pipeline to move freely in only one direction, along the axis of the pipe.
Pipe section	That portion of pipe between two anchors.
Planar pipe guide	A device fastened to a structure, which permits transverse movement or bending of the pipeline in one plane.
Lateral direction	Direction perpendicular to the pipe axis
Longitudinal direction	Direction parallel to the pipe axis

1.05 ADMISTRATIVE REQUIREMENTS

A. Cordination:
   1. Coordination required with the design of piping systems, expansion joints, pipe supports, and expansion control and seismic restraints.
   2. Refer to Section 40 05 01 for additional coordination requirements.
   3. Refer to paragraph 1.09 Expansion Control Design for additional coordation requirements.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations.
   3. Identify expansion control locations and components indicated on piping layout drawings as specified in Section 40 05 01.
   4. Expansion control schedules as specified in paragraph 4.01.

B. Information Submittals:
   1. Procedures: Section 01 33 00.
   2. Anchor bolt calculations in accordance with Section 05 05 20 requirements.

3. The Design Professional's reports and final certification, as specified under paragraph 3.02

1.07 QUALITY ASSURANCE

A. Refer to Section 40 05 01 for additional quality assurance requirements.

B. Refer to paragraph 1.09 Expansion Control Design for additional quality assurance requirements.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Additional requirements: 40 05 01.

1.09 EXPANSION CONTROL DESIGN

A. Design:
   1. The expansion control system shall be designed by the Contractor's Design Professional selected under Section 40 05 01.
   2. Expansion control details shall be designed in conjunction with preparation of pipe system hangers and seismic restraint systems drawings specified in Section 40 05 01.
   3. The resulting drawings, calculations, and work product for the expansion control system shall bear the Design Professional's registration seal and signature. The requirement, however, shall not be construed as relieving the Contractor of responsibility for this portion of the work.

B. Design Guidelines:
   1. The Design Professional shall use the following guidelines in preparation of the designs and calculations specified in paragraph 1.09 Expansion Control Design.
      a. The difference between the minimum and maximum temperatures listed in the table in paragraph 2.01 Service Requirements shall be used for calculating pipe expansion.
      b. Published coefficients of thermal expansion for pipe materials shall be used for the listed temperature range. The source of the coefficients of expansion used in the calculations shall be included with the information provided as Product Data.
      c. Expansion control systems shall be designed for maximum reliability. Unless otherwise indicated on the Drawings, "L", "U", or "Z" bends shall be employed to control expansion in preference over expansion joints.
      d. Expansion control systems using pipe bends shall be designed to limit bending stress in the pipe associated with deflection at the worst case temperature difference. The maximum allowable bending stress shall be 1/3 of the yield stress for the pipe material. If loading conditions or uncertainties warrant, a lower allowable stress value shall be used. A recognized pipe bending stress calculation method and documentation supporting its use shall be provided as Product Data.

e. The requirements set forth in Section 40 05 06.23 shall prevail if expansion joints are used. Expansion control design for expansion joints shall conform to the guidelines given in the Standards of The Expansion Joint Manufacturers Association, Inc. (EJMA).

f. If the Design Professional chooses to use expansion control or pipe support methods that involve higher loadings on the structure than are specified and/or shown on the drawings, the Construction Manager shall be notified in the submittal required in Section 40 05 01. The requested loads shall be listed and the Construction Manager will redesign the structure as necessary at the Contractor's expense.

g. The test pressures listed in the Piping Systems Schedules sheets shall be used when calculating pressure forces.

h. Pipe guides or planar pipe guides shall be provided to control the movement of pipes when "L", "U", or "Z" bends are used for expansion control. The guides shall be located as indicated in EJMA standards. An alternative recognized standard may be used for this purpose only upon approval by the Construction Manager.

i. For piping systems with potentially large loads, recommended main anchor locations are shown on the drawings. Intermediate anchors shall be provided as needed. Maximum forces that the structure can withstand at the main anchor points are noted on the drawings. Anchors shall be designed to attach to the structure and solidly to the pipe. Pipe clamps or U-bolts are not allowed unless they are designed to withstand the forces imposed upon the anchor and have stops welded to the pipe so that the pipe cannot slip in the anchor.

j. Anchors and guides shall be coordinated with the pipe support systems specified in Section 40 05 07 and seismic restraints specified in Section 40 05 07.13.

k. The design of the expansion control, pipe support and seismic restraints for the listed piping systems shall be integrated to provide maximum flexibility for maintenance access to equipment, appurtenances such as valves etc., and to the pipe itself.

l. The piping layout indicated shall be reviewed in relation to, surrounding structures, adjacent piping and equipment before selecting the anchors, guides, and expansion control method to be used at each point.

m. There shall be no metal-to-metal contact between a pipe and restraint component of dissimilar metals.

n. Branch lines shall not be used to anchor main lines.

o. For elevated pipe sections, fabricated support frames or other appropriate structures shall be designed to withstand the specified loads plus gravity and seismic loads. The supports shall be designed to provide access to equipment, walkways, gates, and other piping.

PART 2 PRODUCTS

2.01 PERFORMANCE/ DESIGN REQUIREMENTS

A. Service Conditions:

1. Expansion control as specified in this section shall be provided to control pipe movements and loads occurring as a result of pipeline temperature changes.
2. Those piping systems listed in the following table shall be provided with expansion control conforming to good engineering practice.

Piping system	Minimum temperature, degrees F	Maximum temperature, degrees F
A, AA, BA, CA, IA, SA	17 (exterior –20)	300 (exterior 200)
CS, DS, LSG, MSG (and combinations)	30 (exterior –20)	120
EE	-20	1000
GRR/S	-20	200
HW, HRR/S	70	230
Unlisted Piping (exterior)	-20	120
Unlisted Piping (interior)	30	120

2.02 MATERIALS

A. Unless otherwise specified, anchors, and guides shall be manufactured of iron or steel, including braces, pipe and structural attachments, and shall be hot-dip galvanized after fabrication. Supports cast integrally with cast iron fittings are specifically prohibited for use in any application where shear forces may be imposed on the support.

B. Structural anchors may be fabricated from structural steel and coated as specified in Section 09 90 00.

C. Nuts, bolts and washers may be zinc-plated except for those subject to moisture or corrosive atmosphere, as specified in Sections 26 05 00-1.05 Corrosive Areas and 1.05 Hazardous (Classified) Areas, which shall be Type 304 stainless steel.

D. Also listed in Section 26 05 00-1.05 Hazardous (Classified) Areas are corrosive areas specifically requiring fiberglass materials. In those areas, all pipe support, anchor and brace components (not just fittings and accessories) shall be made of fiberglass.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install the expansion control system in accordance with the drawings required in paragraph 1.09 Expansion Control Design.

B. Metal-to-metal contact between a pipe and pipe anchor of dissimilar metals is not permitted.

C. Weld and bolt attachments to the building structural steel in accordance with the requirements of the AISC Manual of Steel Construction. There shall be no drilling or burning of holes in the building structural steel without approval of the Construction Manager.

D. Provide embedded anchor bolts instead of concrete inserts, wedge anchors, expansion anchors, adhesive, or other non-embedded type of anchor for expansion control installations in areas below water surface or normally subject to submergence. Anchor bolt installation as specified in Section 05 50 20.

E. Install thermal pipe hanger shields on insulated piping at required locations during guide installation. Butt joint connections to pipe insulation shall be made at the time of insulation installation in accordance with the manufacturer's recommendations.

F. Components in contact with plastic pipe shall be free of burrs and sharp edges.

G. Roller assemblies are specified in the Drawings. Roller shall roll freely without binding.

H. Provide plastic or rubber end caps at the exposed ends of all framing channels that are located up to 7 feet above the floor.

3.02 INSPECTION AND CERTIFICATION

A. The Design Professional retained by the Contractor under the provisions of Section 40 05 01 and this Section shall inspect the completed expansion control system at not less than bi-weekly intervals during construction and furnish the Construction Manager with monthly reports.

B. The Design Professional shall inspect the completed expansion control system before the Owner assumes beneficial occupancy and provide written certification in accordance with Section 40 05 07 requirements.

PART 4 SCHEDULES

4.01 EXPANSION CONTROL SCHEDULES

A. General: Anchor, guide, and expansion joint locations shall be indicated on the piping layout drawings required by Section 40 05 01 and paragraph 1.09 Expansion Control Design. In addition, schedules shall be prepared as specified below.

B. Anchors:
   1. The anchor schedule shall list as a minimum:
      a. Anchor Point Label
      b. Pipe Size and Service
      c. Contract Drawing No.
      d. Layout Drawing No.
      e. Forces
      f. Load, pounds
      g. Direction
      h. Anchor Description
      i. Remarks

C. Guides:
   1. The guide schedule shall list as a minimum:
      a. Guide Label
      b. Pipe Size and Service
      c. Contract Drawing No.
      d. Layout Drawing No.

e. Guide Description
f. Remarks

D. Expansion Joints:
1. The expansion joint schedule shall list as a minimum:
a. Expansion Joint Label
b. Pipe Size and Service
c. Contract Drawing No.
d. Layout Drawing No.
e. Movement, inches
1) Lateral movement
2) Compression movement
3) Extension movement
4) Angular movement
f. Maximum Spring Force, pounds
g. Test Pressure, PSIG
h. Pressure Force, pounds
i. Total Forces
j. Load, pounds
k. Direction
l. Expansion Joint Description
m. Special Features
n. Remarks

A. Action Submittals:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager is the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Manufacturers' product data, catalog cuts, typical installation details, and dimensions demonstrating compliance with the requirements of this Section.

3. Indicate on the submittal each piping system where the product will be used.

B. Informational Submittals:
   1. Procedures: Section 01 33 00.
   2. Manufacturers' certificates of compliance with specified industry standards.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00 for Shipment and Storage.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Candidate manufacturers are listed below for double ferrule compression fittings.
   1. Swagelok.
   2. Gyrolok.
   3. Equal.

2.02 MATERIALS

A. All pipe system materials to be new, free from defects and conforming to the requirements and standards identified in the Piping System Schedules specified in Section 40 05 02 .00 through Section 40 05 02.99.

B. Couplings and Fittings.
   1. Double ferrule compression fittings capable of holding the full bursting strength of connected tubing.
   2. Provide tapered piping reducers/enlargers. Bushing type adapters are not permitted.

C. Joint Solder
   1. Except where otherwise specified in the Piping System Schedules, use ASTM B32, Alloy Grade Sn95 solder for general use in copper piping.
   2. ASTM B32 Alloy Grade E, or Silvabrite 100, for high pressure and high temperature services, where specified.
   3. Brazing, for saturated steam, AWS Classification BCuP-5 (AWS A5.8/A5.8M) or Sil-Fos® 15, where specified.

PART 3 EXECUTION

3.01 INSTALLATION

A. Cleaning.
   1. Remove foreign material from the pipe interior prior to assembly. Swab the pipe interior.
   2. Deburr pipe end and sand using fine emery cloth.

B. Dielectric protection.

1. Copper tubing or fittings in contact with dissimilar metal piping, reinforcing steel, or other dissimilar metal at any location is not permitted.
2. Make electrical checks to assure no contact is made between copper tubing and ferrous elements.
3. Wherever electrical contact is demonstrated by such tests, provide dielectric protection as specified in Section 40 05 06.16.

3.02 REPAIR/RESTORATION

A. Per Section 40 05 01.

3.03 COMPONENT TEST PHASE

A. Per Section 40 05 01.

END OF SECTION

1.04 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00
   2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager is the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   3. Manufacturer's product data, catalog cuts, dimensions and materials. Indicate each Piping System Schedule where the product will be used.

B. Informational Submittals:
   1. Procedures: Section 01 33 00
   2. Certifications indicated in the following documents:
      a. ASTM A716, sworn statement of inspection and certification.
      b. AWWA C110, certification of inspection and testing.
      c. AWWA C111, record of specified tests.
      d. AWWA C115, affidavit of compliance.
      e. AWWA C151, manufacturer's statement and affidavit of compliance.
      f. AWWA C606, affidavit of compliance.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00 for shipment and storage.

PART 2 PRODUCTS

2.01 MATERIALS

A. All pipe system materials to be new, free from defects and conforming to the requirements and standards identified in Section 40 05 02 and related sections.

B. Pipe.
   1. Provide increased wall thickness where specified on the Drawings.

2.02 PIPE LINING

A. Provide pipe and fittings with lining as specified in Piping System Schedules in Section 40 05 02.00 through 40 05 02.99 or on the Drawings. Requirements for each lining type are specified in this Section.
   1. Cement Mortar Lining.
      a. Factory applied.
      b. Line pipe and fittings with cement mortar as specified in AWWA C104.
      c. Cement shall be ASTM C150, Type II or V, low alkali, containing less than 0.60 percent alkalis
      d. Patch field welds, cuts, connections, and damaged lining in accordance with AWWA C104.
   2. Ceramic Epoxy
      a. Factory applied.
      b. Line pipe and fittings with amine cured novolac epoxy containing at least 20 percent ceramic quartz pigment.
      c. 40 mils minimum thickness.
      d. Candidate Manufacturers:
         1) Protecto 401
         2) Approved Equal
   3. Unlined
      a. Provide pipe and fittings with a bare metal (no coating) interior.

2.03 PIPE COATING

A. Provide pipe with coating as specified in Piping System Specification Sheets in Section 40 05 02. Requirements for each coating type are specified in this Section.
   1. Asphaltic Coating
      a. Factory applied.
      b. Coat pipe and fittings with 1 mil, minimum, of asphaltic material as specified in AWWA C151.
   2. Zinc Coating with Asphaltic Top Coat
      a. Factory applied.
      b. Coat pipe and fittings with a layer of arc-sprayed zinc per ISO 8179-1. Zinc applied at not less than 200 g/m^2 of pipe surface area. Apply a finishing layer asphaltic topcoat per AWWA C151.
   3. Polyethylene Encasement.
      a. Field installed.
      b. Encase pipe and fittings in polyethylene wrap as specified in AWWA C105.
      c. Polyethylene tubing shall be Anti-microbial, Low Density Polyethylene (LDPE) or High Density Polyethylene (HDPE):
         1) LDPE: 8-mil linear low density polyethylene film meeting the requirements of AWWA C105, impregnated with ½ percent NM-100 anti-microbial compound. Fulton Enterprises Biofilm, or Approved Equal.

2) HDPE: 4-mil high-density, cross-laminated polyethylene film meeting the requirements of AWWA C105.

d. Seam/Joint Tape – Acceptable manufacturer:
   1) Polyken No. 900 (polyethylene).
   2) Scotchwrap No. 50 (polyvinyl).
   3) Approved Equal.

4. V-Bio Enhanced Polyethylene Encasement
   a. Field installed
   b. Encase pipe and fittings in polyethylene tubing as specified in AWWA C105.
   c. Three layer, co-extruded, linear low density polyethylene wrap.
   d. 8 mils minimum wrap thickness
   e. Inner surface of polyethylene wrap infused with anti-microbial biocide and corrosion inhibitor.
   f. Candidate Manufacturers:
      1) V-Bio
      2) Approved Equal
5. Epoxy Primer.
   a. Factory or shop applied.
   b. Coat pipe and fittings with Amide or Polyamide cured epoxy, 4 to 6 mils DFT
5. Uncoated
   a. Provide pipe and fittings with a bare metal (no coating) exterior.

2.04 FUSION-BONDED EPOXY LINING AND COATING FOR FITTINGS

A. Factory or shop applied.

B. Fusion Bonded Epoxy lining and coating per AWWA C116.

2.05 JOINTS, AND COUPLINGS

A. Push-On (PO) Joint (Unrestrained)
   1. Rubber ring compression gasket, push-on type joints conforming to AWWA C111.
   2. 5 degree deflection at rated operating pressure for joints on 4-inch through 30-inch pipe.
   3. Candidate manufacturers:
      a. American Cast Iron Pipe Company Fastite
      b. U.S. Pipe Tyton Joint
      c. Approved Equal

B. Restrained Push-On (RPO) Joint
   1. Restrained, rubber ring compression gasket, push-on joints conforming to AWWA C111

2. Restrained by the interference of metallic rings, bolts, locking segments or other interlocking components with flanges, lugs, beads, grooves or retainer rings that are integrally cast into or welded onto both ends of the joint. Restrained joints with gripping wedges, or gripping gaskets, radial pads, or other devices that penetrate, grip, or embed in the pipe material to resist axial thrust loads are not acceptable.
3. Candidate manufacturers:
    a. American Cast Iron Pipe Company, Flex-Ring or Lok-Ring
    b. U.S. Pipe, TR Flex or HP LOK
    c. Approved Equal

C. Mechanical Joint (MJ)
1. Mechanical Joints per AWWA C110 and AWWA C111.

D. Restrained Mechanical Joint (RMJ)
1. Restrained by tie-rods/bolts tying the gasket gland to a second retainer/follower gland behind a welded ring on the spigot end of the joint. Restrained joints with gripping wedges, or gripping gaskets, radial pads, or other devices that penetrate, grip, or embed in the pipe material to resist axial thrust loads are not acceptable.
2. Fully restrained mechanical joints for above or below ground service conforming to AWWA C110 and AWWA C111.
3. Candidate manufacturers:
    a. American Cast Iron Pipe Company, Mechanical Joint Coupled Joint
    b. U.S. Pipe, MJ HARNESS-LOK
    c. Approved Equal

E. Grooved couplings (CGRV) and fittings.
1. When pipe wall thickness does not meet the minimum requirements of AWWA C606 for rolled or cut groove joints, provide shouldered ends per the requirements of AWWA C606.
2. Candidate manufacturers.
    1) Victaulic
    2) Gruvlok
    3) Approved equal.
3. Grooved end flanged coupling adapters candidate manufacturers:
    a. Victaulic Style 341
    b. Approved Equal
4. Grooved end transition couplings to steel pipe candidate manufacturers:
    a. Victaulic Style 307
    b. Approved Equal

F. Bell and Ball Spigot Flexible (BABS) Joint.
1. Boltless type with retainer lock to prevent rotation after assembly
2. Up to 15 degrees of deflection at operating pressure
3. Candidate manufacturers.
    a. Flex-Lok Joint by American Cast Iron Pipe

b. USIFlex by US Pipe
c. Approved equal.

G. Sleeve/Transition Coupling.
1. When connecting new ductile iron piping to existing piping, field verify outside diameters of existing pipe prior to connection. See drawings for location and installation requirements.
2. Candidate Manufacturers.
a. Romac, "501"
b. JCM, "212"
c. Smith-Blair, "461"
d. Approved Equal

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
1. Follow piping routes specified on the drawings as closely as possible. Submit proposed deviations in accordance with Section 01 33 00.
2. Install pipe in accordance with AWWA C600.
3. Make connections to existing structures and manholes so that the finished work will conform as nearly as practicable to the requirements specified for new manholes, including necessary concrete work, cutting and shaping. Shape concrete mortar within any structure and manhole as specified.

B. Insulating Sections: Where a metallic nonferrous pipe/appurtenance connects to ferrous pipe/appurtenance, provide an insulating section per Section 40 05 06.16.

C. Anchorage: Provide as specified on the Drawings.

3.02 REPAIR/RESTORATION

A. Per Section 40 05 01.

3.03 COMPONENT TEST PHASE

A. Buried Piping: Test hydrostatic pressure in accordance with Section 5 of AWWA C600, using the test pressures and allowable leakage specified in Section 40 05 01.

B. Exposed and Concrete Encased Piping: Conduct hydrostatic pressure tests in accordance with Section 40 05 01.

3.04 POLYETHYLENE ENCASEMENT

A. Install polyethylene as specified in AWWA C105 and within this Section.

B. Potable Water Pipe: Single wrap, 4-mil high density polyethylene.

C. Wrapping:
   1. Wrap buried pipe, fittings, valves, and couplings.
   2. Prior to the placing of concrete, wrap fittings that require concrete backing.
   3. Wrap the polyethylene tube seams and overlaps and hold in place by means of a 2-inch-wide plastic backed adhesive tape.
   4. The tape shall be such that the adhesive shall bond securely to both metal surfaces and polyethylene film.
   5. Bedding and initial backfill for polyethylene wrapped pipe shall be a well-graded granular material to avoid cutting or damaging the polyethylene tube during placement and backfilling.

END OF SECTION

SECTION 40 05 23

STAINLESS STEEL PROCESS PIPE AND TUBING

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies stainless steel pipe and fittings.

1.02 RELATED SECTIONS

A. Section 40 05 01 – Piping Systems

B. Section 40 05 02 –Piping System Schedules

1.03 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI B31.3	Process Piping
ASME Section IX	Boiler and Pressure Vessel Code; Welding and Brazing Requirements
ASTM A480	General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
AWWA M11	Steel Pipe-A Guide for Design and Installation
AWWA C227	Bolted, Split-Sleeve Restrained and Non-Restrained Couplings for Plain-End Pipe
AWWA C606	Grooved and Shouldered Joints
CSA W48.3	Low Alloy Steel Covered Electrodes for Shielded Metal Arc Welding

1.04 SUBMITTALS

A. Action Submittals:

1. Procedures: Section 01 33 00.

2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the CONTRACTOR, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The CITY shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the CONTRACTOR with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
3. Piping layout drawings as specified in Section 40 05 01.
4. Manufacturers' product data, catalog cuts, typical installation details, and dimensions. Indicate on the submittal each piping system where the product will be used.
5. Pipe wall thickness calculations for pipe fabricated per AWWA C220. Demonstrate the maximum permissible internal design pressure in the pipe based on the wall/shell thickness specified in the Piping System Schedule for the associated Process Service and pipe size and the support and/or bedding conditions specified on the Drawings. Steel pipe design calculations conform to AWWA M11.
6. Pipe wall thickness and reinforcement calculations for fittings fabricated per AWWA C226. Demonstrate that the maximum permissible internal design pressure for fabricated fittings matches or exceeds the maximum permissible internal design pressure in the connecting pipe for the support and/or bedding conditions specified on the Drawings. Fabricated steel pipe fitting design calculations conform to AWWA M11.
7. Calculations for any pipe and fittings that are not fabricated per one of the components standards listed in the specified ASME B31 code.
8. Submit calculations for engineered flange face rings in accordance with Appendix D of ASME Section VIII Division 1.

B. Informational Submittals:
1. Procedures: Section 01 33 00.
2. Manufacturers' certificates of compliance with specified industry standards.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00 for Shipment and Storage.

B. Deliver pipe and fittings with end protectors in place. Do not remove protectors until materials are about to be installed.

C. Prevent carbon steel contamination of stainless steel pipe and fittings during storage, handling, fabrication, and installation.

PART 2 PRODUCTS

2.01 MATERIALS

A. All pipe system materials to be new, free from defects and conforming to the requirements and standards specified in Piping System Schedules (Section 40 05 02.00 through Section 40 05 02.99) and this Section.

B. Pipe.
   1. Use pickled and annealed sheet or plate for manufacture of fabricated stainless steel pipe.
   2. Finish.
      a. 8-gage through 16-gage material: No. 1 or 2B per ASTM A480.
      b. 3/16-inch and heavier plate material: No. 1 mill finish per ASTM A480, "Hot-Rolled or Cold-Rolled, and Annealed or Heat Treated, and Blast Cleaned or Pickled."

C. Shop-fabricated stainless steel pipe and fittings.
   1. Furnished by a single manufacturer who is experienced and qualified in the manufacture and fabrication of the items to be provided.
   2. Manufacture using Weld Procedure Specifications (WPS) that have been qualified under ASME Section IX. Document qualifications in Procedure Qualification Reports (PQR). Use only certified welders who have successfully completed performance qualification tests per ASME Section IX for manufacture of stainless steel pipe.

D. Flanges.
   1. Plate steel backing ring flanges, AWWA C207 Class D minimum thickness.
   2. Ductile iron backing ring flanges with the following flange thicknesses.

Flange Size, in	Flange Thickness, minimum, in.
3	1/2
4	9/16
6 thru 10	5/8
12 thru 16	3/4
18 thru 22	7/8
24 thru 30	1
36	1-1/8
42	1-1/4
46 to 54	1-3/8
60	1-1/2

   3. Stub ends.
      a. Wall thickness equal to or greater than pipe or fitting to which it is welded.
      b. Lap face/gasket mating surfaces clean, free of debris, with welds ground flush and surface roughness between 3.18 and 12.7 microns RMS.

E. Fittings.
   1. Double ferrule compression fittings capable of holding the full bursting pressure of connected tubing.
   2. Candidate manufacturers for double ferrule compression fittings.
      a. Swagelok.
      b. Gyrolok.
      c. Approved Equal.
   3. Provide straight tapered reducers. Flanged & flued reducers and bushing type adapters are not permitted.
   4. Pressure rating and thickness of elbows, tees, crosses, and wyes equal to or greater than connecting pipe.

F. Grooved couplings and fittings.
   1. Flexible and rigid coupling with pipe grooves compliant with AWWA C606.
   2. When pipe wall thickness does not meet the minimum requirements of AWWA C606 for rolled or cut groove joints, provide shoulder ends per the requirements of AWWA C606.
   3. Candidate manufacturers.
      a. Victaulic
      b. Gruvlok
      c. Approved equal.

G. Bolted split sleeve couplings.
   1. AWWA C227 compliant sleeve with single or double arch cross section of the same material as pipe. Body thickness equal to or greater than that of connecting pipe wall thickness.
   2. Candidate manufacturers.
      a. Victaulic, Style 231S through 234S.
      b. Approved equal.

2.02 SHOP FABRICATION

A. Metal forming processes.
   1. Use pinch rolls with a hard chrome finish to form cylinders. Thoroughly clean the rolls using Avesta BlueOneTM 130 Pickling Paste or approved equal, prior to roll forming the pipe. Alternatively, provide a protective barrier between the stainless steel plate/sheet and the plate rolls during the forming process.
   2. Provide a protective barrier between pipe welding rollers and the stainless steel pipe cylinder. Alternately, new rollers or rollers that have been turned down on a lathe to provide a new and clean working face may be used.

B. All saws, drills, files, wire brushes, grinding wheels, etc. will be free of carbon contamination and designated for stainless steel use only.

C. Provide nonferrous, stainless steel, or rubber-lined pipe storage and fabrication racks.

D. Use nylon slings or straps for handling stainless steel piping.

E. Preparation of surfaces to be welded.
   1. Surfaces of joints to be welded are to be free from mill scale, slag, grease, oil, paint, rust, and other foreign material.
   2. Use only stainless wire wheels and grinding wheels that have not come into contact with carbon steel.
   3. Flame cutting or any use of oxy-acetylene gas cutting tools is prohibited. Use plasma arc torch with a nitrogen or argon-hydrogen carrier gas, laser or waterjet processes for cutting and plate beveling.
   4. Air arc and gas backgouging are prohibited. Use grinding and plasma gouging methods to achieve full penetration welds.

F. Welding.
   1. Welding and production processes are to conform to ASME B31.3.
   2. Use of Solar Flux is prohibited.
   3. Use of FCAW welding is prohibited.
   4. Pipe and fittings with wall thickness up to 11-gage (1/8-inch): weld using the GTAW process.
   5. Pipe and fittings with wall thicknesses greater than 1/4-inch may be welded using an automated SAW process.
   6. Pipe and fittings with wall thickness greater than 11-gage (1/8-inch): Bevel and complete root pass using the GTAW process, followed by subsequent passes with the GTAW, GMAW, or Metallic Arc SMAW process.
   7. Filler material:
      a. Add only ELC wire grades to provide a cross section at the weld equal to or greater than the parent metal.
      b. SMAW electrodes to conform to CSA W48.3.
   8. Make weld deposit smooth and evenly distributed and with a crown of no more than 1/16-inch on the I.D. and 3/32-inch on the O.D. of the piping. Concavity, undercut, cracks, or crevices are not permitted.
   9. Full penetration butt welds: provide inert gas shielding to the interior and exterior of the joint.
   10. Lap joints: provide full thickness seal welds on both joints.

G. Remove excessive weld deposits, slag, spatter, and projections by grinding. Grind welds smooth on gasket surfaces. Tack welds, clips, and other attachments.
   1. Repair nicks, gouges, notches, and depressions in the base metal in the area before the joint weld is made.
   2. Remove tack welds, clips, and other attachments and repair defects, except where the tack welds occur within the weld area and these tack welds do not exceed the size of the completed weld. Remove cracked tack welds.
   3. Grind those areas to be repaired down to clean metal and then repair by building up with weld metal. Grind the repaired areas smooth to form a plane surface with the base metal.

H. Defects and repairs.
   1. Remove welds with cracks, slag inclusions, porosity, undercutting, incomplete penetration, or which are otherwise deficient in quality or made contrary to any provisions of these specifications, by chipping or grinding throughout their depth to clean base metal.
   2. Do not perform calking or peening of welds to correct defects.
   3. Enlarge welds found deficient in dimension but not in quality by additional welding after thoroughly cleaning the surface of previously deposited metal and the adjoining plate.
   4. Remove weld deposits, slag, weld spatter, and projections into the interior of the pipe by grinding.

I. Finish.
   1. Treat all welded joints with Avesta BlueOne™ 130 Pickling Paste or approved equal and rinse with clean water.
   2. If rusting of embedded iron occurs, pickle the affected surface with Avesta BlueOne™ 130 Pickling Paste or approved equal.
   3. Rinse clean using Avesta FinishOne Passivator 630 or approved equal.

PART 3 EXECUTION

3.01 GENERAL

A. Field Installation Weather conditions.
   1. Perform welding only when the surfaces are clean and completely free of any moisture or mineral deposits. Protect pipe and fittings from salt water spray or deposition or clean and protect pipe and fitting joints prior to welding.
   2. Do not weld the pipe during periods of high winds or rain unless the areas being welded are properly shielded.

B. Field welding.
   1. Use couplings and prefabrication of pipe systems at the factory to minimize field welding to the greatest extent possible. Pipe butt welds may be performed at the job site, providing the butt welds are performed only with an inert gas shielded process and that the welding requirements of this Section are rigidly adhered to.
   2. On the interior and exterior of the pipe, remove all residue, oxide, and heat stain from any type of field weld and the affected areas adjacent by the use of stainless steel wire brushes, followed by cleaning with an agent such as Avesta BlueOne™ 130 or approved equal, followed by complete removal of the agent.

C. Use wooden scaffolding and/or ladders if possible to gain access to work areas. If metal scaffolding and/or ladders must be used, tape or otherwise shield the contact points between scaffolding/ladders and the stainless steel.

D. After installation, wash and rinse all foreign matter from the piping surface. Adhere to the passivation manufacturer's recommendations and local regulations for safety and disposal of any waste chemicals.

3.02 REPAIR/RESTORATION

A. Per Section 40 05 01 and as specified herein.

B. Paint all steel or iron flanges, couplings, and appurtenances in accordance with Section 09 90 00. Painting of the stainless steel pipe is not required.

C. Restore areas damaged or discolored by field welding or handling, iron contamination or soiled to a uniform surface finish and consistently clean surface with methods specified for shop fabrication.

D. Identifying spool piece marks shall be removed with paint thinner or solvents and the entire stainless steel surface shall be washed with detergent and hot water and rinsed clean.

3.03 COMPONENT TEST PHASE

A. Per Section 40 05 01.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 24

STEEL PROCESS PIPE

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies steel pipe and fittings.

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

B. Testing:
   1. Factory testing shall conform to the requirements of ASTM A53, ASTM A106, or AWWA C200 as applicable.

PART 2 PRODUCTS

2.01 PIPE MATERIALS

A. Steel pipe and fittings shall be provided in accordance with ASTM A53, ASTM A106, or AWWA C200 as specified in Section 40 05 01.

B. Steel for pipe fabricated to meet requirements of AWWA C200 shall conform to the requirements of ASTM A36, ASTM A572, Grade 42, ASTM A570, Grades 33 and 36, or ASTM A283, Grade D. Steel for ASTM A53 and ASTM A106 pipe shall be Grade B.

C. Steel pipe for 5ft outside yard piping buried to meet requirements of AWWA C200, Gr 36 ASTM A1018.

2.02 PIPE MANUFACTURE

A. Unless otherwise specified, ASTM A53 pipe shall be Type E, electric resistance welded or Type S, seamless pipe as specified in Section 40 05 01. The minimum wall thickness for ASTM A53 or ASTM A106 pipe shall be Schedule 40 for pipe 10 inch diameter and less and 3/8 inch for pipe 12 inch through 24 inch diameter. Increased shell thickness shall be provided where specified.

B. AWWA C200 pipe shall be straight or spiral seam. The minimum wall thickness shall be 7 gage for pipe 6 inch through 24 inch diameter and 1/4 inch for pipe 26 inch diameter and larger. Increased shell thickness shall be provided where specified.

2.03 CONNECTIONS

A. Connections shall be as specified in Section 40 05 01 and shall conform to Section 40 05 06.16. Coating for buried connections shall be as specified in Section 40 05 06.16-2.06.

2.04 FITTINGS AND APPURTENANCES

A. Malleable iron threaded fittings and appurtenances shall conform to the requirements of ASTM A47 or ASTM A197, ANSI B16.3.

B. Unless otherwise specified, steel fittings and appurtenances shall conform to the requirements of ASTM A234, ASTM A105, or ANSI B16.11; and fabricated steel fittings and appurtenances shall conform to AWWA C208.

C. Fittings for grooved end piping systems shall be full flow cast fittings, steel fittings, or segmentally welded fittings with grooves or shoulders designed to accept grooved end couplings. Cast fittings shall be cast of ductile iron conforming to ASTM A536 or malleable iron conforming to ASTM A47. Standard steel fittings, including large size elbows, shall be forged steel conforming to ASTM A106. Standard segmentally welded fittings shall be fabricated of Schedule 40 carbon steel pipe.

D. Unless otherwise specified, all fittings shall be rated for pressure and loadings equal to the pipe.

2.05 PIPE LINING

A. Epoxy:
   1. Unless otherwise specified, pipe and fittings shall be lined with a liquid epoxy as specified in AWWA C210 with the following exceptions:
      a. No coal tar products shall be incorporated in the liquid epoxy.
      b. The curing agent may be an amidoamine as well as the other curing agents listed in AWWA C210.
   2. The lining shall be applied to a minimum thickness of 16 mils in not less than two coats.

B. Cement Mortar:
   1. Where specified, pipe and fittings shall be lined with cement mortar as specified in AWWA C205. Fittings and specials larger than 24 inches, not fabricated from centrifugally lined straight sections, shall require 2-inch by 4-inch by 13-gage self-furring wire mesh reinforcement for hand-applied lining.

C. High Temperature Service Epoxy:
   1. Where specified, steel pipe and fittings shall be epoxy lined with not less than 10 mils of epoxy suitable for temperatures of 225 degrees F. Epoxy lining shall be 3M Scotchkote 306, Porter MCR 65 High Solids Epoxy, or equal. Surfaces shall be prepared in accordance with SSPC-SP 10 Near White Blast Cleaning, and the lining applied as recommended by the manufacturer.

D. Glass Lining:
   1. Where specified, pipe and fittings shall be glass lined with a dual layer coating system of vitreous material to a minimum thickness of 10 mils. Glass lining shall provide continuous coverage as tested by a low voltage holiday detector with only isolated voids permitted due to casting anomalies. Voids, other than isolated pinholes, shall be cause for rejection.

2. Pipe and fittings shall have all internal welds ground smooth and any voids or slag holes ground out, rewelded and ground smooth.
3. Glass lining shall be Ferrock MEH-32, Vitco SG-14, or equal.

2.06 PIPE COATING

A. Epoxy:
   1. Unless otherwise specified, pipe and fittings shall be coated with a liquid epoxy as specified in AWWA C210 with the following exceptions:
      a. No coal tar products shall be incorporated in the liquid epoxy.
      b. The curing agent may be an amidoamine as well as the other curing agents listed in AWWA C210.
   2. The coating shall be applied to a minimum thickness of 16 mils in not less than two coats.

B. Polyethylene Tape:
   1. Where specified, pipe and fittings shall be coated and wrapped with prefabricated multilayer cold applied polyethylene tape coating in accordance with AWWA C214. The coating application shall be a continuous step operation in conformance with AWWA C214, Section 3. The total coating thickness shall be not less than 50 mils for pipe 24 inches and smaller and not less than 80 mils for pipe 26 inches and larger.

2.07 FUSION EPOXY COATING AND LINING

A. Where specified, steel pipe and fittings shall be fusion epoxy coated and lined. The fusion epoxy coating shall be 3M Scotchkote 203, or equal. Surface preparation shall be in accordance with SSPC-SP 10 Near White Blast Cleaning. The application method shall be by the fluidized bed method and shall attain 12 mils minimum dry film thickness.

B. Field welds, connections and otherwise damaged areas shall be coated and patched according to the manufacturer's instructions with 3M Scotchkote 306.

2.08 JOINT GASKETS

A. Joint gaskets shall be as specified in Section 40 05 06.13.

2.09 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Affidavits of Compliance with AWWA C200, ASTM A53, or ASTM A106 as applicable.
   2. Contractor's layout drawings as specified in Section 40 05 01-2.04.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Pipe shall be installed in accordance with AWWA M11, Chapter 16. Welded joints shall be in accordance with AWWA C206 and Section 40 05 06.16.

2. Sleeve-type mechanical pipe couplings shall be provided in accordance with AWWA M11 and Section 40 05 06.16-2.02 Sleeve-Type Couplings.
3. Pipe lining and coatings at field joints shall be applied as specified in paragraphs 2.05 and 2.06.
4. Unless otherwise specified, buried mechanical couplings and valves shall be field coated as specified in Section 40 05 06.16-2.06.

B. Anchorage:
1. Anchorage shall be provided as specified. Calculations and drawings for proposed alternative anchorage shall be submitted in accordance with Section 01 33 00.

3.02 TESTING

A. Hydrostatic testing shall be in accordance with Section 4 of AWWA C600 except that test pressures and allowable leakage shall be as listed in Section 40 05 01.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 31

THERMOPLASTIC PROCESS PIPE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies polyvinylchloride, chlorinated polyvinylchloride, polyethylene, and polypropylene pipe and fittings.

B. Pipe Designations:

1. For use in the Piping System Specification Sheets (PIPESPEC) in Section 40 05 01 and in this section, the following plastic pipe designations are defined:

Designation	Definition
PVC	Polyvinylchloride
CPVC	Chlorinated polyvinylchloride
PE	Polyethylene
PP	Polypropylene

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

ASTM D1784	Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds
ASTM D1785	Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120
ASTM D2241	Poly (Vinyl Chloride) (PVC) Plastic Pipe (SDR-PR)
ASTM D2464	Threaded Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
ASTM D2466	Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40
ASTM D2467	Socket-Type Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80

Reference	Title
ASTM D2564	Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Pipe and Fittings
ASTM D2657	Heat-Joining Polyolefin Pipe and Fittings
ASTM D2665	Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings
ASTM D3034	Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings
ASTM D4101	Propylene Plastic Injection and Extrusion Materials
ASTM F402	Safe Handling of Solvent Cements and Primers Used for Joining Thermoplastic Pipe and Fittings
ASTM F437	Threaded Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80
ASTM F438	Socket-Type Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 40
ASTM F439	Socket-Type Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80
ASTM F441	Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80
ASTM F477	Elastomeric Seals (Gaskets) for Joining Plastic Pipe
ASTM F493	Solvent Cements for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe and Fittings

PART 2 PRODUCTS

2.01 PVC PIPE

A. Pressure Pipe:

1. PVC material for pipe and fittings shall conform to ASTM D1784, Class 12454-B. Pipe and fittings shall either be in accordance with ASTM D1785 or shall conform to ASTM D2241 for standard dimension ratios: 160 psi pipe–SDR 26; 200 psi pipe–SDR 21; 250 psi–SDR 17. Pressure rating for pipe shall be in excess of test pressure specified in Section 40 05 01. Neoprene gaskets with push-on joints shall conform to ASTM F477.
2. Schedule 80 PVC socket type fittings shall conform to ASTM D2467. Schedule 40 PVC fittings shall conform to ASTM D2466. PVC solvent weld cement for socket connections shall meet the requirements of ASTM D2564. Schedule 80 PVC threaded fittings shall conform to ASTM D2464. Fittings for gasketed pipe shall be ductile iron or steel push-on IPS-sized pressure fittings rated for use with the specified class of PVC pipe. Unless otherwise specified, fittings shall be lined and coated in accordance with Section 40 05 24 or Section 33 05 31 as applicable.

B. Nonpressure Pipe:

1. Gravity Sewer Pipe: PVC material for sewer pipe and fittings shall conform to Class 12454-B, as defined in ASTM D1784. Pipe and fittings shall meet the requirements of ASTM D3034 for SDR 35. Neoprene gaskets with push-on joints shall conform to ASTM F477.
2. DRAIN, Waste and Vent Pipe: PVC material for drain waste and vent (DWV) pipe and fittings shall conform to Class 12454-B, ASTM D1784. Pipe and fittings shall conform to ASTM D2665. Unless otherwise specified, connections shall be solvent weld. Connections to traps, closet flanges, and nonplastic pipe shall be with approved adapter type fittings designed for intended use. Solvent weld cement for socket connections shall meet requirements of ASTM D2564.

2.02 CPVC PIPE

A. CPVC material for pipe and fittings shall conform to ASTM D1784, Class 23447-B. Pipe and fittings shall be in accordance with ASTM F441. Neoprene gaskets with push-on joints shall conform to ASTM F477.

B. Schedule 80 CPVC socket type fittings shall conform to ASTM F439. Schedule 40 CPVC socket type fittings shall conform to ASTM F438. CPVC solvent weld cement for socket connections shall meet the requirements of ASTM F493. Schedule 80 CPVC threaded type fittings shall conform to ASTM F437.

2.03 PE PIPE

A. PE pipe shall meet the requirements of ASTM D1248, Type III, Grade P 34, Class C, 100 psi or as specified in Section 40 05 01, whichever is higher. Fittings shall be of the same material, molded socket fusion for sizes 4 inch diameter and smaller and molded or fabricated butt fusion for sizes 6 inch and larger. Fittings shall be 125 psi or as specified in Section 40 05 01, whichever is higher. Heat fusion welding shall be in conformance with ASTM D2657.

2.04 PP PIPE

A. Pressure Pipe:
   1. PP pipe and fittings shall be formulated of polypropylene conforming to ASTM D4101, SDR 11, butt fusion type. Pipe shall be 150 psi rated in all sizes. Heat fusion welding shall be in conformance with manufacturer's recommendation.

B. Drain, Waste and Vent Pipe:
   1. PP drain, waste and vent (DWV) pipe and fittings shall be made from flame retardant, Schedule 40, polypropylene (PPFR) plastic as defined in ASTM D4101. Pipe and fittings used for buried piping and in concealed locations shall be joined by electrical fusion coils energized by a variable low-voltage power supply to completely fuse the interface between the pipe and socket and form a completely homogenous structure. Unless otherwise specified, mechanical joint fittings may be used under bench or in exposed locations where future disassembly is desired. The mechanical method shall be in conformance with the manufacturer's recommendation.

2.05 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's certificates of compliance with the specified standards and Contractor's layout drawings.

PART 3 EXECUTION

3.01 INSTALLATION

A. PVC pipe 3 inches in diameter and smaller shall be joined by means of socket fittings and solvent welding in conformance with ASTM F402. Solvent-cemented joints shall be made in strict compliance with the manufacturer's/supplier's instructions and recommended procedures. Unless otherwise specified, PVC pipe 4 inches in diameter and greater shall be joined by means of gasketed push-on joints and steel or ductile iron push-on or mechanical joint fittings. Fittings shall be lined and coated as specified in Section 40 05 24 or Section 33 05 32. Unless otherwise specified, PVC and CPVC piping exposed to sunlight shall be painted with coating system L-2 as specified in Section 09 90 00.

B. Connections to different types of pipe shall be by means of flanges, specified adapters or transition fittings. Where sleeve type couplings are used, both shall be uniformly torqued in accordance with pipe manufacturer's recommendation. Foreign material shall be removed from the pipe interior prior to assembly.

C. Unless otherwise specified, PE pipe and fittings 4 inch diameter and smaller shall be joined by means of thermal socket fusion and pipe 6 inch and larger by thermal butt fusion. Butt-fusion joining of the pipes and fittings shall be performed with special joining equipment in accordance with procedures recommended by pipe manufacturer. Tensile strength at yield of butt-fusion joints shall not be less than pipe. Flanged adapters shall be provided for connection to valves and where specified.

3.02 TESTING

A. Testing of plastic piping shall be as specified in Section 40 05 01.

END OF SECTION

SECTION 40 05 31.17

PVC GRAVITY SEWER PIPE AND DWV (DRAIN, WASTE, AND VENT) PIPE AND FITTINGS

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies Polyvinylchloride (PVC) Gravity Sewer Pipe and DWV (Drain, Waste, and Vent) Pipe. This Section also specifies fittings and joints for Polyvinylchloride (PVC) Gravity Sewer Pipe and DWV (Drain, Waste, and Vent) Pipe.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 66 00 – Product Storage and Handling Requirements
   3. Section 09 90 00 – Painting and Coating Systems
   4. Section 40 05 02 – Piping System Schedules

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ASTM D1784	Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. PVC: Polyvinylchloride

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check-marks (✓) denote full compliance with a paragraph as a whole. Underline deviations and denote each deviation with a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification section along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   3. Piping layout drawings as specified in Section 40 05 01.
   4. Manufacturer's product data, catalog cuts, typical installation details, and dimensions. Indicate each Piping System Schedule where the product will be used.

1.06 DELIVERY, STORAGE AND HANDLING

A. Procedures: Section 01 66 00 for shipment and storage.

PART 2 PRODUCTS

2.01 MATERIALS

A. Provide PVC piping system materials as specified in Piping System Schedule on the Drawings for the specified Process Service.

2.02 COMPONENTS

A. PVC Solvent Weld Cement:
   1. Pipe and fittings 12-inch diameter and smaller: IPS 711 Weld-on Cement or Approved Equal.
   2. Pipe and fittings greater than 12-inch diameter: IPS 719 Weld-on Cement or Approved Equal.
   3. Heavy bodied, medium setting.
   4. ASTM 2564, 100 percent solvent and PVC resin. No fillers permitted.
   5. Universal plastic pipe solvent is not acceptable.

B. Primer:
   1. Staining solvent conforming to standard ASTM F656.
   2. Manufactured by solvent weld cement manufacturer.

PART 3 EXECUTION

3.01 INSTALLATION

A. Drain, Waste and Vent Pipe
   1. Join by means of socket fittings and solvent cement welding in conformance with ASTM D2855 and ASTM F402.
   2. Make solvent-cemented joints in compliance with the manufacturer's/supplier's instructions and recommended procedures.
   3. Connections:
      a. Connect to different pipe materials by means of flanges, specified adapters, or transition fittings.
      b. Foreign material to be removed from the pipe interior prior to assembly.
   4. Bedding and Backfill: Blocking under pipe is not permitted.

B. Gravity Sewer Drainage Pipe
   1. Join by means of Push-On Joints with Flexible Elastomeric Seals conforming to ASTM D3212.
   2. Make push-on joints in compliance with the pipe manufacturer’s recommended installation practice.
   3. Connections:
      a. Connect to different pipe materials by means of specified adapters, or transition fittings.
      b. Foreign material to be removed from the pipe interior prior to assembly.
   4. Bedding and Backfill: As specified in ASTM D2321, blocking under pipe is not permitted.

3.02 FIELD QUALITY CONTROL

A. Conduct tests in accordance with Section 40 05 01.

END OF SECTION

SECTION 40 05 31.19

CHLORINATED POLYVINYLCHLORIDE DOUBLE CONTAINMENT PIPING

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies Chlorinated Polyvinylchloride (CPVC) pipe and fittings for double containment piping systems.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 60 00 – Product Requirements

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. CPVC: Chlorinated Polyvinylchloride

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check-marks (✓) denote full compliance with a paragraph as a whole. Underline deviations and denote each deviation with a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification section along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   3. Piping layout drawings as specified in Section 40 05 01.
   4. Manufacturer's product data, catalog cuts, typical installation details, and dimensions. Indicate each Piping System Schedule where the product will be used.
   5. Double containment piping system manufacturer's experience. Document years of experience manufacturing double containment piping systems.

1.06 QUALITY ASSURANCE

A. Qualifications:
   1. Double containment pipe system manufacturer must have a minimum of five years' experience producing double containment pipe systems.

1.07 DELIVERY, STORAGE AND HANDLING

A. Procedures: Section 01 66 00 for shipment and storage.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. The manufacturer's standard product may require modification to conform to specified requirements:
   1. IPEX Guardian Centra-Lok system.

2.02 MATERIALS

A. Furnish PVC and CPVC piping system materials as specified in Piping System Schedule on the Drawings for the specified Process Service.

B. Carrier Pipe as specified in Piping System Specification Sheets.

C. Secondary Containment Pipe and Fittings: CPVC Pipe, ASTM D1784-Class 12454-B, NSF 61 certified, Dim. Per ASTM D1785.

2.03 COMPONENTS

A. Secondary Containment Fittings:
   1. Secondary Containment Fittings manufactured by the double containment pipe system manufacturer.
   2. Molded components. Materials per ASTM D184.

B. Carrier Pipe Support at Fittings:
   1. Match Carrier Pipe materials for Secondary Containment Supports at Fittings.
   2. Designed for field assembly of carrier pipe fittings in secondary containment fittings using self-centering, locking support clips.
   3. Carrier pipe fittings and secondary containment pipe fittings anchored together using support clips.
   4. Support clips consist of male by female, solvent weld, socket fittings with centering legs.
   5. Support clips must permit uninterrupted drainage along the invert of the secondary containment pipe.

C. Carrier Pipe Support Clips:
   1. IPEX Guardian Centra-Guide or approved equal.
   2. Carrier pipe supports to support and center the carrier pipe inside the secondary containment pipe.
   3. Carrier pipe supports must permit uninterrupted drainage along the invert of the secondary containment pipe.
   4. Provide carrier pipe supports at intervals recommended by the double containment system manufacturer.

D. Leak detection:
   1. Provide 24 VDC plastic encapsulated proximity type leak detections sensors consisting of an external clip-on sensor, drip leg, and drain valve with hose connection.
   2. Each sensor removable for periodic testing and provided with LED testing lamp and adjusting potentiometer.
   3. IPEX Guardian Centra-Guard or approved equal.
   4. Leak detection sensors mounted on the exterior of the secondary containment pipe using a saddle mount configuration.
   5. Penetration of the secondary containment pipe is not permitted for leak detection sensor installations.
   6. Install leak detection sensors at leak detection station locations indicated on the Drawings.
   7. Slope pipe system down toward leak detection stations.

8. Provide NEMA 4X FRP control panel with leak detection sensitivity adjustment and 24 VDC SPDT general alarm relay switch for communication with the plant control system.
9. Consolidate leak detection sensors at each cluster of leak detection wells into a single control panel.

E. CPVC Solvent Weld Cement:
1. Pipe and fittings 6-inch diameter and smaller: IPS 724 Weld-on Cement or Approved Equal.
2. Pipe and fittings greater than 6-inch diameter: IPS 729 Weld-on Cement or Approved Equal.
3. Heavy bodied, medium setting.
4. ASTM F493, 100 percent solvent and CPVC resin. No fillers permitted.
5. Universal plastic pipe solvent is not acceptable.
6. Formulated for use with sodium hypochlorite solution and other caustic solutions.

F. PVC Solvent Weld Cement:
1. Pipe and fittings 12-inch diameter and smaller: IPS 711 Weld-on Cement or Approved Equal.
2. Pipe and fittings greater than 12-inch diameter: IPS 719 Weld-on Cement or Approved Equal.
3. Heavy bodied, medium setting.
4. ASTM 2564, 100 percent solvent and PVC resin. No fillers permitted.
5. Universal plastic pipe solvent is not acceptable.

G. Primer:
1. Staining solvent conforming to standard ASTM F656.
2. Manufactured by solvent weld cement manufacturer.

PART 3 EXECUTION

3.01 INSTALLATION

A. Solvent Cement Welded PVC and CPVC Pipe:
1. Join by means of socket fittings and solvent cement welding in conformance with ASTM D2855 and ASTM F402.
2. Make solvent-cement welded joints in strict compliance with the manufacturer's/supplier's instructions and recommended procedures.

B. Connections:
1. Connect to different pipe materials by means of flanges, specified adapters, or transition fittings.
2. Foreign material to be removed from the pipe interior prior to assembly.

C. Plastic pipe installation personnel trained to ASME B31.3.

D. Bedding and Backfill: Blocking under pipe is not permitted.

3.02 FIELD QUALITY CONTROL

A. Carrier Pipe Testing: Conduct hydrostatic pressure tests in accordance with Section 40 05 01.

B. Secondary Containment Pipe Testing: Pneumatic Test.
   1. Medium: Instrument Grade Air or Nitrogen.
   2. Test Pressure: 5 psig maximum.
   3. Duration: 2 hours.
   4. Maximum Allowable Pressure Drop: 0.1 psig over 2 hours.
   5. Maintain 10 psig, minimum, in primary containment pipe during testing of secondary containment pipe.
   6. Test Safety: As specified in Section 40 05 01 for Pneumatic Pressure Testing.
   7. Conform to double containment pipe system manufacturer's compressed gas testing procedures.

SECTION 40 05 33.13

HIGH DENSITY POLYETHYLENE PIPE - SOLID WALL

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Heat fusible, uniform thickness, solid wall, constant outside diameter, high-density polyethylene (HDPE) pressure pipe, fittings, and appurtenances.
   2. This Section does not specify HDPE pipe with a corrugated, tubular, or structured wall profile.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 31 23 00 – Excavation, Trenching, and Backfill
   2. Section 40 05 01 – Piping Systems
   3. Section 40 05 07 – Pipe Hangers and Supports

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.
   1. ANSI/AWWA C906 - Polyethylene (PE) Pressure Pipe and Fittings, 4-inch through 63-inch, for Water Distribution
   2. AWWA M-55 - PE Pipe – Design and Installation
   3. AWWA C901-20 – Polyethylene (PE) Pressure Pipe and Tubing, 3/4 in. (19 mm) through 3 in. (76 mm), for Water Service
   4. ASTM D2321 - Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications
   5. ASTM D2513 - Polyethylene Gas Pressure Pipe, Tubing, and Fittings
   6. ASTM D2657 - Heat Joining Polyolefin Pipe and Fittings
   7. ASTM D2774 - Underground Installation of Thermoplastic Pressure Piping
   8. ASTM D3035 – Polyethylene Plastic Pipe Based on Controlled Outside Diameter
   9. ASTM D3261 - Butt Heat Fusion Polyethylene Plastic Fittings for PE Plastic Pipe and Tubing
   10. ASTM D3350 - Polyethylene Plastics Pipe and Fitting Materials
   11. ASTM F1055 - Electrofusion Type Polyethylene Fittings for OD Controlled PE Pipe and Fittings
   12. ASTM F1668 - Construction Procedures for Buried Plastic Pipe
   13. ASTM F2164 - Standard Practice for Field Leak Testing of Polyethylene Pressure Piping Systems Using Hydrostatic Pressure.

14. ASTM F2206 - Fabricated Fittings of Butt-Fused Polyethylene
15. ASTM F2620 - Standard Practice for Heat Fusion Joining of Polyethylene Pipe and Fittings
16. ASTM F714 - Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter.
17. PPI TR 31 - Underground Installation of Polyolefin Piping

1.04 SUBMITTALS

A. Procedures: Section 01300

B. Action Submittals:
   1. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations.
   2. Qualifications of the certified fusion technician.
   3. Piping layout drawings as specified in Section 40 05 01.
   4. Manufacturers' product data, catalog cuts, typical installation details, and dimensions. Indicate each piping system where the product will be used on the submittal.
   5. Pipe Manufacturers' joint assembly procedure.

C. Informational Submittals:
   1. Procedures: Section 01300
   2. Records of each field butt-fusion joint installation, as specified in this specification.
   3. Manufacturer's affidavit affirming that the materials furnished for the project comply with the standard specified in the Piping System Schedule (Section 40 05 02.00 through 40 05 02.99).

1.05 QUALITY ASSURANCE

A. Qualifications: Field welding by butt fusion and/or electrofusion performed by a factory trained and certified fusion technician. Training and/or certification by fusion equipment manufacturer or pipe manufacturer.

B. Certifications: Furnish affidavit (as specified in AWWA C901 and AWWA C906) documenting compliance AWWA C901 and/or AWWA C906, as appropriate for the pipe material specified in the Piping System Schedule.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00

B. Store on clean, level ground to prevent undue scratching or gouging of the pipe. If the pipe must be stacked for storage, stack in accordance with the pipe manufacturer's recommendations.

C. Prevent damage to pipe from dragging over sharp objects or cutting by chokers or lifting equipment while handling pipe.

D. Handle pipe in accordance with pipe manufacturer's recommendations.

E. Pipe with gouges, cuts, or scratches deeper than 10% of the pipe wall thickness will be rejected.

F. Pipe with cuts, gouges, and/or scratches of the pipe interior will be rejected.

G. Store pipe in accordance with pipe manufacturer's recommendations until installation.

H. Store pipe at ambient outdoor temperature.

I. Provide temporary shading.

J. Avoid coverings that will raise pipe temperature over ambient temperature.

PART 2 PRODUCTS

2.01 MATERIALS

A. All pipe system materials to be new, free from defects and conforming to the requirements and standards specified in this identified in the Piping System Schedule on the Drawings

B. Pipe Color:
   1. Black
   2. Where specified in the Piping System Schedule on the Drawings, provide co-extruded longitudinal color stripes equally spaced around the circumference of the pipe. Stripe color as specified in the Piping System Schedule.

C. Fittings:
   1. Provide ARC™ sweep bends manufactured by Pipestar International, or approved equal, for 2-inch through 14-inch long radius bends. Bend radius 3 times the nominal pipe size, measured to the centerline of the bend.
   2. Increase wall thickness to next nominal pressure rating (next lower SDR) for mitered bends and fabricated fittings. 2 miter segments, minimum for deflections of 45 degrees or less. 4 miter segments, minimum for deflections greater than 45 degrees.

D. Flange Ends:
   1. HDPE stub end flange adapter and back up ring.
   2. Furnish beveled flange adapters for disk clearance on flanged connections to butterfly valves.
   3. Furnish stub end flange adapters with radius or chamfered outer diameter transition from pipe wall to stub end.
   4. Chamfer or radius flange ring bore to match transition on stub end flange adapter.
   5. Ductile iron back up rings encapsulated in polypropylene or CF8 (304) Stainless Steel back up rings: Improved Piping products – PPDI, Improved Piping Products - SS-SDR, or approved equal.

E. Couplings:
   1. HGRV – HDPE Groove Coupling

a. HGRV couplings consist of two coupling halves and gasket. Designed to join double-grooved HDPE pipe ends.
b. HGRV (HDPE Grooved Coupling): Victaulic Style 908 or Approved Equal.

2. HPEG – HDPE Plain End with Gripping Teeth
   a. HPEG couplings consist of two coupling halves, gasket, and gripping teeth that engage and grip the exterior of plain end HDPE pipe segments.
   b. HPEG (HDPE Plain End with Gripping Teeth): Victaulic Style 995N, Victaulic Style 905, or Approved Equal.
3. HXGT – HDPE by Grooved End Transition
   a. HDPE by Grooved End Transitions consist of a carbon steel grooved end pressed onto a plain end HDPE pipe stub. Join HDPE by Grooved End Transitions with Flexible Grooved End Coupling.
   b. Carbon steel grooved end transition furnished with cut grooves and fitted with multiple rows of integral circumferential barbs on the inside diameter.
   c. Coat carbon steel components with NSF 61 compliant epoxy prior to pressing onto HDPE pipe.
   d. HDPE by Grooved End Transition: Poly-Cam Series 701 or Approved Equal.
   e. Flexible Grooved End Couplings: Victaulic Style 77, Anvil Gruvlok Figure 7001 or Approved Equal.

PART 3 EXECUTION

3.01 INSTALLATION, BURIED

A. Install piping system in accordance with ASTM D2321, AWWA C901 or AWWA C906 and the pipe manufacturer's recommendations.

B. Joining:
   1. Join pipes and fittings above grade, out of the trench.
   2. Butt fusion welds in accordance with the pipe manufacturer's recommendations and ASTM D2657
   3. Obtain optimum fusion parameters from the pipe manufacturer, with regard to fusion temperature, interface pressure, and cooling time.
   4. Follow the manufacturer's recommendations with regard to the optimum fusion parameters, and use proper equipment for the fusion process.
   5. Provide record of each butt fusion joint using McElroy Datalogger, or equal. Record date, time, joint number, operator identification, fusion machine make and model, pipe size and SDR, interfacial pressure during fusion and cooling, and fusion temperature.
   6. Butt fusion joint strength exceeds tensile strength of pipe.
   7. Extrusion welding and hot gas welding is not permitted.
   8. Pipe joints completed by factory trained and certified fusion technicians.
   9. Provide flange joints for connections to different pipe materials, equipment, valves, and other appurtenances unless otherwise specified on the Drawings.
   10. Install electrofusion welds where required for closures and joining HDPE to fixed/installed HDPE pipe or where specified on the drawings. Electrofusion welds installed in accordance with manufacturer's instructions and ASTM F1055.

C. Trench Excavation: per Section 31 21 33.

D. Location and Alignment: Place pipe and fittings in the trench with the invert conforming to the elevations, slopes, and alignments specified on the Drawings.

E. Bedding and Backfill:
   1. Bedding and backfill per Section 31 23 00 and as specified on the Drawings.
   2. Place materials by methods that will not disturb or damage the pipe.
   3. Adjust temperature of HDPE pipe to the temperature of the surrounding soil at the time it is backfilled and compacted.
   4. Work in and tamp the bedding material in the area under the pipe and up to the spring line before placing and compacting the remainder of the embedment.
   5. Blocking under the pipe is not permitted.
   6. Place sufficient backfill to prevent damage, excessive deflections, or other disturbances of the pipe before using heavy compaction or construction equipment directly over the pipe.
   7. Control flotation of pipe when backfilling with flowable materials. Provide sufficient pipe weight, anchor blocks, fill with water, or backfill in lifts.

3.02 INSTALLATION, EXPOSED AND SUBMERGED

A. Install piping system in accordance with Chapter 8 of the Plastic Pipe Institute *PE Handbook*, ASTM F2620, AWWA C901 or AWWA C906, and the manufacturer's recommendations.

B. Joining:
   1. Butt fusion welds in accordance with the pipe manufacturer's recommendations and ASTM D2657
   2. Obtain optimum fusion parameters from the pipe manufacturer, with regard to fusion temperature, interface pressure, and cooling time.
   3. Follow the manufacturer's recommendations with regard to the optimum fusion parameters, and use proper equipment for the fusion process
   4. Butt fusion joint strength exceeds tensile strength of pipe.
   5. Extrusion welding and hot gas welding is not permitted.
   6. Pipe joints completed by factory trained and certified fusion technicians.
   7. Provide flange joints for connections to different pipe materials, equipment, valves, and other appurtenances unless otherwise specified on the Drawings.
   8. Install electrofusion welds where required for closures and joining HDPE to fixed/installed HDPE pipe or where specified on the drawings. Install electrofusion welds per the manufacturer's instructions and ASTM-F1055.

C. Pipe Support:
   1. Conform to Section 40 05 07.
   2. Accommodate thermal expansion and contraction movement.
   3. Support pipe at intervals of 8 feet or less.
   4. Provide pipe cradles supporting the bottom 120 degrees of pipe circumference.

5. Cradle length (measured parallel to pipe axis) not less than half of the pipe's outside diameter.
6. Edges of pipe cradles rounded or rolled to prevent cutting or gouging pipe.

3.03 SYSTEMS START UP

A. Procedures: Section 01 45 20

B. Pressure Testing:
   1. Pressure test pipe per Section 40 05 01.
   2. Install pipe supports, anchors, seismic bracing, and flexibility provisions prior to pressure testing.
   3. Perform pressure testing prior to encasement in concrete or backfilling buried pipe.
   4. Retest following repair of leaks.
   5. Apply initial pressure without makeup pressure for 1-2 hours to allow for diametric expansion or pipe stretching to stabilize.
   6. After the equilibrium period, restore the test section to the test pressure.
   7. Makeup water quantities during the pressure test per the Plastic Pipe Institute Technical Report TR 31-88. No visual leaks or pressure drops permitted during the final test period.

C. Deflection Testing for Buried Pipe:
   1. Perform deflection testing for the entire length of buried pipe.
   2. Deflection testing performed not less than 30 days after completion of any work adjacent to and over the pipeline, including leakage tests, backfilling, placement of fill, grading, paving, concreting, and any other superimposed loads.
   3. Maximum permissible pipe deflection: 4.0 percent of the average inside diameter of the pipe.
   4. Deflection testing device capable of detecting pipe internal dimensions to within 1 percent of the average internal diameter of the specified pipe dimensions.
   5. Remove, replace, and retest pipe sections that fail the deflection testing.

END OF SECTION

SECTION 40 05 45

PIPING SYSTEM IDENTIFICATION

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies the supply and installation of permanent identification labels and markers for piping systems.

B. Requirements for the supply and installation of permanent identification tags for valves are specified in Section 40 05 60.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 33 00 – Submittal Procedures
   2. Section 01 45 00 – Area Exposure Designations
   3. Section 40 05 02 – Piping System Schedules
   4. Section 40 05 60 – Valves

1.03 REFERENCES

A. References:
   1. This section contains references to the documents listed below. They are a part of this section as specified and modified. Where a referenced document cites other standards, such standards are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, has been discontinued or has been replaced.

Reference	Title
ASME A13.1	Scheme for the Identification of Piping Systems
ANSI Z535.1	Safety Colors/APWA Uniform Color Code for Marking Underground Utilities

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Embedded/Encased piping: Piping enveloped in concrete, typically under structures or under roadways.

2. Exposed: All area exposures specified in Section 01 45 00 other than buried, submerged, or encased/embedded.
3. Buried: Below grade walls or roofs; locations covered and in contact with earth/soil.

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. Provide a full line product brochure showing available Piping System Marker and Detectable Warning Tape standard text and color options. Submit all text and colors proposed for use.
   3. Provide manufacturer's recommended installation instructions for Detectable Warning Tape.
   4. Provide product brochures and data sheets for tracer wire and splice kits. Submit all wire insulation colors proposed for use.
   5. Submit proposed tracer wire access box(es) for test leads. Submit electrical continuity test results upon completion.
   6. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations from Section requirements.

B. Informational Submittals:
   1. Procedures: Section 01 33 00
   2. Electrical continuity test results.
   3. Sample of each piping identification plastic marker used.
   4. Sample of each detectable warning tape used.

PART 2 PRODUCTS

2.01 PIPING SYSTEM MARKERS FOR EXPOSED PIPE

A. Identify material contained in exposed piping systems using a colored plastic marker legend system conforming to ASME A13.1.

B. For exposed piping, provide pre-coiled mechanically attached type colored markers that are easily removable. Adhesive type markers are not acceptable.
   1. Resistant to petroleum based oils and grease and meet criteria for humidity, solar radiation, rain, salt, fog, leakage and fungus specified by MIL-STD-810.
   2. Withstand a continuous operating temperature range of -40 to 250 degrees.
   3. Manufactured and applied in one continuous length of plastic including directional arrows. Markers comprised of letters and directional arrows individually applied to the maker are not acceptable. Legends and arrows printed on polyester subsurface and over laminated with Tedlar.
   4. Text size per ASME A13.1.
   5. Marking Services Style MS-995, Brady Style B-689, or approved equal.

C. Each piping system marker to be color coded for identification and labelled with the Process Service Identifier and directional flow arrows indicating the direction of flow in the pipe. Piping System marker background colors are specified in Section 40 05 02 for each process service. Except for piping system markers with an orange, yellow or white background color, provide white text and directional arrows for all piping system markers. Provide black text and directional arrows for pipe markers with an orange, yellow or white background.

2.02 DETECTABLE WARNING TAPE AND TRACER WIRE FOR BURIED PIPE

A. Provide Detectable Warning Tape for all buried piping:
   1. Detectable Warning Tape shall be 6 inches wide, colored per ANSI Z535.1 (APWA Uniform Color Code for Marking Underground Utilities) and made of inert plastic material suitable for direct burial with solid aluminum foil core. Minimum 5 mil laminate thickness. Tin or nickel plated clips for joining sections of tape, as provided by the tape manufacturer.
   2. Allen Systems, W. H. Brady Co., Seton Name Plate Corporation, Marking Services Inc., or approved equal.
   3. Print two messages on buried Detectable Warning Tape. The first message reads **"CAUTION CAUTION CAUTION _____ PIPE BURIED BELOW"** with bold letters approximately 2 inches high. Fill the blank with the Process Service name. The second message reads **"CALL____"** with letters approximately 3/4 inch high. Both messages printed at maximum intervals of 2 feet. Fill the blank with phone number provided by the Construction Manager.

B. Install tracer (locate) wire along the buried portion of pipe alignments for the following piping services: [Edit as required for the project. Examples: LSG, CD, ML, NG, POL]
   1. Direct burial rated, 12 gauge solid copper, 600-volt UF tracer wire with heavy-duty PVC insulation. Tracer wire insulation color-coded to match each utility service as designated in ANSI Z535.1 (APWA Uniform Color Code for Marking Underground Utilities).
   2. SPLICES: Silicone-filled UL-Listed product specifically designed for waterproof direct bury splicing of tracer wire. 3M DBR-6; or approve equal.
   3. WIRE ACCESS BOXES: Cast iron valve box top piece frame and cover set within a concrete ring cast flush with grade, as appropriate for the location in which it will be installed and for the traffic loading it may be subject to, and in accordance with the applicable elements of the Standard Detail for valve box installations. Mark lids in raised or recessed lettering with the word “Test”. Submit all wire access boxes proposed for use to the Construction Manager for review.

PART 3 EXECUTION

3.01 INSTALLATION OF PIPING SYSTEM MARKERS

A. Provide piping system markers and direction arrows at locations conforming to ASME A13.1 and at the following locations:
   1. Apply intermittent markings on straight pipe runs, close to all valves, fittings, and adjacent to all changes in direction.
   2. Where pipes pass through walls, partitions, and floors, apply markings on both sides of walls, partitions, and floors.
   3. At point of entry and leaving each pipe chase and/or confined space, and piping accessible at each access opening.

4. Adjacent to valves and where valves are in series at intervals of no more than 6 feet.
5. At least once in each room and at maximum spacing of 40 feet. Exception: gas piping to be identified at 6-ft intervals in ceiling plenums.
6. Spacing for markings not less than 1 foot.
7. At the beginning and end points of each run; and, at each piece of equipment in each run.

B. Visibility
1. Place identification on the bottom of the piping system for pipe systems located near ceiling or above the normal line of sight.
2. Place identification on the side of the piping systems for pipe systems located at the normal line of sight or below.
3. Place identification at approximate line of sight for vertical pipe systems.

3.02 INSTALLATION OF DETECTABLE WARNING TAPE

A. Install a continuous ribbon of Detectable Warning Tape as specified for ALL buried piping.

B. Multiple pipes less than 4 inches in diameter installed in a common trench may be provided with a single ribbon of tape per trench. If the total width of such utilities within the common trench exceeds 3 feet, provide two parallel ribbons of tape spaced equally.

C. Provide a separate detectable warning tape for each pipe that is 4 inches or greater in size.

D. Install the tape in accordance with manufacturer recommendations.

E. At end-to-end and branch connections, provide electrical continuity connectors for detectable tape to mechanically and electrically connect ends together as recommended by the manufacturer.

F. Provide a single line of tape 2.5 feet above the centerline of buried pipe. For pipelines buried 8 feet or greater below finished grade, provide a second line of tape 12 inches below finished grade, above and parallel to each buried pipe. Spread tape flat with message side up before backfilling.

3.03 INSTALLATION OF TRACER WIRE

A. Tracer wire shall be a continuous, fully functioning, and tested system to include all appurtenances including splices and wire access boxes at grade.

B. Tracer wire laid along the top of the pipe prior to backfilling. Secure in place with tape every 20 feet. Where the pipe is encased or provided with concrete collars or cut-off walls, lay the wire on top of the encasement (do not encase the wire). Do not pull the wire taut; leave sufficient slack to allow for pipe movement and future repairs.

C. Splice tracer wire using the specified silicone-filled splice kits in accordance with manufacturer recommendations. Ensure the silicone fully encapsulates un-insulated wire ends and are made watertight.

D. Pull tracer wire up into all valve boxes, cleanout access boxes, and into all utility cabinets and meter boxes installed on the pipeline. For each wire end, provide an 18-inch long length of extra wire (coiled and tucked out of the way in an accessible location) for connection to utility locating equipment.

E. Where the pipeline enters structures, vaults, tanks, or buildings, provide a wire access box at grade adjacent to the structure or building for termination of the tracer wire. Provide an 18-inch long length of extra wire (coiled and tucked into the box) for connection to utility locating equipment. Also provide boxes at each pipeline branch, cross or tee, and at intermediate spacing along the pipeline not to exceed 1,000 feet (except where pipeline valves with valve boxes provide the required wire access at those locations and intervals).

F. Upon completion and backfill of the pipeline, test and demonstrate electrical continuity of each segment of tracer wire. Submit test results to the Owner indicating the location of the tested segment. Use conductive testing method; inductive test methods are not acceptable. Repair all faulty work at no additional cost to the Owner until the system is functional and approved.

3.04 FIELD QUALITY CONTROL

A. Comply with manufacturer's handling and installation instructions.

B. Provide continuity testing of tracer wire as specified herein.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 57.13

MANUAL ACTUATORS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies manual operators for valves and gates, and operator appurtenances.

1.02 REFERENCES

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
AWWA C500	Gate Valves 3 through 48 inch NPS, for Water and Sewage Systems

PART 2 PRODUCTS

2.01 GENERAL

A. Except as specified in valve and gate specification sections, manual operators shall be as specified herein. Operators shall be mounted on the valve or gate and provided as a unit. Each valve body or operator shall have cast thereon the word "OPEN," an arrow indicating the direction to open, and flow direction arrows.

2.02 OPERATORS

A. General:
   1. Manual operators shall have operating torques less than 80 foot-pounds. Unless specified otherwise, each manual operator shall be provided with an operating wheel. Unless specified otherwise, the direction of rotation of the operator shall be counterclockwise for opening.

B. Wrench Nuts:
   1. Wrench nuts shall comply with Section 3.15 of AWWA C500. A minimum of two operating keys, but no less than one key per every ten valves, shall be provided for operation of the wrench nut operated valves.

C. Chain Wheels:
   1. Chain wheels shall be ductile iron. Operating chains shall be galvanized.

2.03 OPERATOR APPURTENANCES

A. Valve Boxes:
   1. Valve boxes shall be cast iron and shall have suitable base castings to fit properly over the bonnets of their respective valves and heavy top sections with stay-put covers. Covers shall be hot-dip galvanized.

B. Floor Boxes:
   1. Floor boxes shall be hot-dip galvanized. Where the operating nut is in the concrete slab, the floor box shall be bronze bushed. Where the operating nut is below slab, the opening in the bottom of the box shall be sufficient for passage of the operating key.

C. Adjustable Shaft Valve Boxes:
   1. Adjustable shaft valve boxes shall be concrete or cast iron Brooks No. 3RT, Christie G5, Empire 7-1/2 valve extension box, or equal. Box covers on water lines shall be impressed with the letter "W." Gas line covers shall be impressed with the letter "G."

2.04 PRODUCT DATA

A. Manufacturer's catalog information and other data confirming conformance to design and material requirements shall be provided in accordance with Section 01 33 00.

PART 3 EXECUTION

3.01 GENERAL

A. Installation shall be as specified herein. Valve operators shall be located so that they are readily accessible for operation and maintenance. Valve operators shall be mounted for unobstructed access, but mounting shall not obstruct walkways. Valve operators shall not be mounted where shock or vibration will impair their operation. Support systems shall not be attached to handrails, process piping, or mechanical equipment.

3.02 OPERATORS

A. General:
   1. Valves and gates shall be provided with manual operators, unless specified otherwise. Where possible, manual operators shall be located between 48 inches and 60 inches above the floor or a permanent work platform.

B. Wrench Nuts:

1. Wrench nuts shall be provided on buried valves, on valves which are to be operated through floor boxes, and where specified. Extended wrench nuts shall be provided if necessary so that the nut will be within 6 inches of the valve box cover.

C. Chain Wheels:

1. Unless otherwise specified, valves with centerlines more than 7 feet, 6 inches above the specified operating level shall be provided with chain wheels and operating chains. Chain wheel operated valves shall be provided with a chain guide. Operating chains shall be looped to extend within 4 feet of the specified operating level below the valve. For plug-type valves 8 inches and larger, the operator shall be provided with a hammer blow wheel. Hooks shall be provided for chain storage where the chain may hang in a walkway.

3.03 OPERATOR APPURTENANCES

A. Valve Boxes:

1. Valve boxes extending to finished surfaces shall be provided for buried valves.

B. Floor Boxes:

1. Floor boxes shall be provided for wrench operation of valves located below concrete slabs. Each floor box and cover shall be of the depth required for installation in the slab.

SECTION 40 05 57.23

POWERED ACTUATORS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies powered actuators for valves and gates and actuator appurtenances.

B. Types:
   1. For use in the control valve schedule in Section 40 06 20.13 and in this section, powered actuators are defined as follows:

Actuator Type (ACTUSPEC)	Service	Definition
EMTT	Throttling (Modulating)	Electric motor multi-turn
EQTT	Throttling (Modulating)	Electric motor quarter-turn
EMTI	Isolating (Open-Close)	Electric motor multi-turn
EQTI	Isolating (Open-Close)	Electric motor quarter-turn
PDT	Throttling (Modulating)	Pneumatic diaphragm
PDI	Isolating (Open-Close)	Pneumatic diaphragm
PCT	Throttling (Modulating)	Pneumatic cylinder
PCI	Isolating (Open-Close)	Pneumatic cylinder

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A519	Seamless Carbon and Alloy Steel Mechanical Tubing
ASTM B584	Copper Alloy Sand Castings for General Applications

Reference	Title
JIC P-1	Pneumatic Standards for Industrial Equipment and General Purpose Machine Tools
NEMA ICS-2	Industrial Control Devices, Controllers and Assemblies

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
2. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
3. Manufacturer's catalog information and other data confirming conformance to design and material requirements.
4. Application sheets and schedules for each valve and actuator showing required mounting, operating torque for valve, torque capacity of actuator, and power or air pressure requirements. Valve identification (tag) number shall be clear for each application.
5. List of components being provided for each valve, actuator and positioner.

PART 2 PRODUCTS

2.01 GENERAL

A. Actuators shall be factory-mounted on the valve or gate and provided as a unit. Each valve body or actuator shall have cast thereon the word "OPEN," an arrow indicating the direction to open, and flow direction arrows.

2.02 POWERED ACTUATORS

A. General:

1. Actuators shall be sized to produce an operating torque equal to twice the maximum required valve operating torque under the specified flow conditions. Specific requirements for each type powered actuator are specified on the actuator specification sheets in paragraph 3.04.

B. Electric Actuators

1. General: Unless otherwise specified, electric actuators shall be provided in accordance with the actuator specification sheets and the following requirements.
2. Motor: Actuator motors shall be heavy duty, specifically designed for valve or gate actuator service. Motors shall be of totally-enclosed, non-ventilated construction. Motor shall have an internal space heater with nominal rating of 25-watts. Motors shall be rated as specified in Section 40 06 20.13 and shall be or shall incorporate:
    a. Four-pole 1800 RPM or provide pole-speed as required for the application.
    b. Suitable for use with 460 volt, 3-phase, 60-Hertz power with +/- 10% voltage fluctuation.
    c. NEMA Class F insulation.
    d. Thermistor for thermal protection embedded in the motor windings.
    e. Automatic motor overload relay reset.
    f. Four conduit openings.
3. Enclosure: Motor and electrical enclosures shall be rated for the application and location specified:
    a. NEMA-4 Weatherproof
    b. NEMA-6 Submersible [Rating TBD]
    c. NEMA-7 Explosion proof
4. Motor Starter: Actuator shall be provided with a three phase full voltage reversing starter rated at 30-amperes both mechanically and electrically interlocked with overload protection or elements in each of the three poles.
    a. Control Transformer shall be epoxy encapsulated and impregnated and rated at a minimum of 75VA with 120Vac secondary and other required secondary voltages of 18 Vac and 12 Vac as required, with short-circuit and overload protection.
    b. Provide lockable internal circuit breaker or internal disconnect switch where possible.
5. Disconnect Switch: Actuator shall be provided with a lockable, heavy-duty, nonfused-disconnect switch that is close-coupled to the motor actuator.

6. Gearing: Gearing shall be double-reduction, with a helical gear and pinion forming the first reduction and a worm and worm gear forming the second. The helical gear and pinion shall be fabricated from heat-treated alloy steel with hobbed and finished shaved teeth. The worm shall be fabricated from heat-treated alloy steel, ground, carburized and hardened. The worm gear shall be fabricated from high tensile strength bronze with hobbed teeth.
    a. The stem nut shall be fabricated from high tensile strength bronze and shall be the two-piece type, when possible. It shall be possible to remove the stem nut from rising stem actuators from the top without removing the actuator from the valve or gate, disconnecting any electrical wiring, or disassembling any of the gearing. All gearing shall be designed to withstand a 100 percent overload.
7. Torque Switch: Electric actuators shall be provided with a double-torque switch set to disengage motor power at 75 percent of the shaft's design torque. The torque switch shall operate in both the opening and closing directions and shall operate during the complete cycle without the use of auxiliary relays, linkages, latches, or other devices.
    a. Each side of the torque switch shall have a numbered dial for set point adjustment. A calibration tag shall be mounted near each switch for correlating the dial settings with output torque.
8. Manual Actuator: Electric actuators shall be provided with a handwheel for manual operation. The handwheel shall not rotate during motor operation nor shall a locked motor prevent manual operation. Motor or manual selection shall be accomplished by a positive declutching knob or lever which will disengage the motor and motor gearing mechanically but not electrically. Prohibit manual and motor simultaneously operation. Hand operation shall not require more than 100 pounds of rim effort at maximum torque.
9. Hammer Blow Device: Electric actuators shall be provided with a built-in lost-motion device that allows sufficient travel of the worm gear, prior to engaging the stem nut, for the motor to reach full speed. This action shall impart a "hammer blow" to start the valve or gate in motion in either direction. The load shall be shared equally by two lugs cast integrally on the drive sleeve.
10. Conduit Openings: Electric actuators shall be provided with the largest available: power conduit opening; control conduit opening; and instrument conduit opening.

C. Pneumatic Diaphragm Actuators:
1. General: Unless otherwise specified, pneumatic diaphragm actuators shall be provided in accordance with the actuator specification sheets and the following requirements.
2. Body And Cylinder. Cylinder size shall be sufficient to produce the torque specified in paragraph 2.02 General, with a supply air pressure of not more than 65 psig.
3. Body And Diaphragm: Actuators shall be provided with a pressed steel diaphragm casing and a cast-iron spring barrel and housing. Diaphragm shall be polyester reinforced nitrile rubber. Diaphragm size shall be sufficient to produce the torque specified in paragraph 2.02 General, with a supply air pressure of not more than 40 psig.

4. Manual Handwheel Actuator: Actuators shall be provided with a manual worm gear, handwheel actuator. Unless otherwise specified, the actuator shall have a 90-degree rotation, and shall be equipped with travel stops capable of limiting the valve closing to any angle between 0 and 30 degrees and the valve opening to any angle between 60 and 90 degrees.
    a. The actuator body shall be cast iron with a steel cover. The worm shall be steel, and the worm gear shall be cast iron. The worm gear shaft and handwheel shaft shall be Type 630 stainless steel. The handwheel shall be 12 inches in diameter and shall be cast iron. It shall be possible to mount the actuator in various positions relative to the pipeline. It shall be possible to mechanically disengage the manual actuator from the valve shaft when not in use; no tools shall be required to accomplish this operation. The manual actuator shall be Fisher Controls, Type 1078, or equal.

D. Pneumatic Cylinder Actuators:
1. General: Unless otherwise specified, pneumatic cylinder actuators shall be provided in accordance with the actuator specification sheets and the following requirements.
2. Mechanism: Actuators shall be double-acting unless otherwise specified in Section 40 06 20.13. Actuators shall be designed so that the spring return option may be added in the field after installation. Unless otherwise specified, actuators shall be double-piston, rack-and-pinion type and shall provide a 90-degree rotation of the output shaft. Actuators shall be totally enclosed, with no external moving parts, except for the output shaft which shall be accessible for manual operation of the valve. Bearing surfaces, including the inside cylinder wall and guides, shall be coated with a permanent, dry-film lubricant and corrosion inhibitor.
    a. Cylinder, end caps, and spring cartridge, shall be made of precision extruded, hard-anodized aluminum. Pistons shall be made of hard-anodized aluminum alloy and the output shaft and pinion shall be hardened and tempered alloy steel. Actuators shall be suitable for operating in temperatures ranging from -20 to +160 degrees F. Piston seals shall be O-ring type. Actuators shall be suitable for use with non-lubricated dry instrument quality air at up to 120 psig. Actuators shall have internal porting with no external piping.
    b. Heavy-duty, totally enclosed scotch-yoke type mechanisms, where specified, shall comply with applicable portions of the specification for double-piston type actuators and shall be suitable for use with non-lubricated dry instrument quality air. Cylinder shall be steel, ASTM A519, Grade 1018; piston shall be gray iron; bearings shall be bronze, ASTM B584, Grade 88-10-2; and seals shall be lip-or cup-type of duro-nitile elastomer. Steel cylinder rod shall be electroplated with nickel.
    c. Scotch-yoke type mechanisms may also be provided when the double-piston type is unable to comply with the requirements of paragraph 2.02 General.
3. Mounting: The actuator output shaft shall attach directly to the valve stem with no intermediate linkages. Actuators shall be suitable for operation in any valve mounting attitude and either parallel or perpendicular to the pipeline.

2.03 ACTUATOR APPURTENANCES

A. Tubing:
1. Unless otherwise specified, tubing furnished with powered actuators shall be in accordance with Section 40 79 00-2.04 Copper Tubing.

B. Tube Fittings:
   1. Unless otherwise specified, tube fittings furnished with powered actuators shall be in accordance with Section 40 79 00-2.04 Plastic Tubing.

C. Air Pressure Filter Regulators:
   1. Filter regulators shall be provided where specified. Filter regulators shall have aluminum bodies and a second tapped output gage connection. Filter regulators shall be provided with an output pressure gage and range spring appropriate for the intended application. The output pressure gage shall be a minimum of 2 inches in diameter and shall have an accuracy of plus or minus 2 percent of scale, or better.
   2. The filter element shall be 40 micron, replaceable and shall be made of resin-impregnated cellulose. The filter dripwell shall be equipped with a drain cock. Filter regulators shall be adjustable over the spring range by means of a wrench-adjustable set screw. The set screw shall be equipped with a lock nut. Filter regulators shall be equipped with an internal relief valve to maintain the output pressure at set point during periods of no flow. Filter regulators shall be Fisher Type 67FR, or equal.

D. Identification Tags:
   1. Each powered actuator shall be provided with a 16-gage stainless steel identification tag that bear the equipment description and tag number of the actuator, as specified. Characters shall be 1/4 inch, die-stamped. Identification tags shall be securely attached to the actuator in a readily visible location using stainless steel screws or wire.

2.04 PRODUCT DATA

A. The following information, and technical data for all equipment specified in this section shall be provided in accordance with Section 01 33 00.
   1. Testing procedures and forms specified in paragraph 3.02 General Requirements.
   2. Training Certification Section 43 05 11-Form B specified in paragraph 3.03.
   3. Operating and maintenance data in conformance with Section 01 78 23.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Installation shall be as specified herein. Valve actuators shall be located so that they are readily accessible for operation and maintenance and mounted for unobstructed access.
      a. Valve actuator mounting shall not obstruct walkways.
      b. Valve actuator support systems shall not be attached to handrails, process piping, or mechanical equipment.
      c. Valve actuators mounting shall not be located where shock or vibration will impair their operation.

B. Powered Actuators:
   1. General: Powered actuators shall have their manual operating accessory, where possible, located between 48 inches and 60 inches above the floor or a permanent work platform
   2. Identification Tags: Tags shall be located in a clearly visible location on the valves. If necessary, reposition and reattachment with stainless steel screws or wire.
   3. Electrical Power Wiring: Electric power wiring and equipment shall be in compliance with Division 26.
   4. Signal Wiring: Electrical signal wiring and equipment shall be in compliance with Division 26.
   5. Instrument Supply And Signal Air Connections: Instrument supply and signal air connections shall comply with Section 40 79 00.

3.02 TESTING

A. General Requirements:
   1. Testing shall be performed in accordance with Section 01 45 20, and this section. No required test shall be applied without prior notice to the Construction Manager to witness any test. At least 14 days before the commencement of any testing activity, a detailed step-by-step test procedure, complete with forms for the recording of test results shall be provided. All equipment necessary to perform the required tests shall be provided.

B. Piping Testing:
   1. Pneumatic Piping Systems: Pneumatic piping systems shall be tested for leaks in compliance with Section 40 79 00.
   2. Liquid Piping Systems: Liquid piping systems shall be tested for leaks in compliance with Section 40 05 01.

3.03 TRAINING

A. Operation and maintenance training for the equipment provided under this section shall be provided for the Owner's personnel in accordance with Section 01 79 00. Training shall be certified on Form 43 05 11-B specified in Section 01 99 90.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 59.23

FABRICATED SLIDE GATES

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies the minimum requirements for corrosion-resistant fabricated slide gates (gates) for control of drinking water as shown on the Drawings and specified herein. Gates shall be all 316L stainless steel construction. The scope of supply shall include gate frames, slides, seals, stems, stem guides, operators, floor stands, gate enclosures where specified, and all other appurtenances, in-place and complete. Powered operators for gates are specified in Section 40 06 20.13.

B. EQUIPMENT LIST: Equipment provided under this section is listed in paragraph 1.04, Service Requirements.

1.02 QUALITY ASSURANCE

A. REFERENCED STANDARDS: This Section incorporates by reference the latest revisions of the following documents. In case of conflict between the requirements of this Section and the listed documents, the requirements of the Contract Specifications shall prevail.

Reference	Title
ASTM A240	Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
ASTM A276	Standard Specification for Stainless Steel Bars and Shapes
ASTM D2000	Standard Classification System for Rubber Products in Automotive Applications
AWWA C561-12	Fabricated Stainless Steel Slide Gates
ASTM A380	Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems

B. UNIT RESPONSIBILITY: Unit responsibility, as specified in Section 43 05 11, is assigned to the gate manufacturer (Manufacturer) for the gates and appurtenances specified in this Section and for the powered operators specified in Section 40 06 20.13.

C. All gates for this project shall be supplied by the same Manufacturer, who shall be fully experienced, reputable and qualified in the manufacturing of the equipment furnished and who has been fabricating gates and appurtenances for a minimum period of 10 years.

1.03 SUBMITTALS

A. PROCEDURES: Section 01 33 00.

B. Product information, calculations, charts, and graphs demonstrating compliance with the requirements of this Section and the Drawings.

C. Plans, elevations, sections, and details showing dimensions and mounting requirements for each gate specified.

D. Manufacturer's data including materials of construction, construction details of equipment, and weight of equipment.

E. Manufacturer's product literature.

F. Electric motor operator data, where applicable, including manufacturer's catalog information, complete dimensional data, drive unit size, calculations substantiating selection and wiring diagrams.

G. Certificate of unit responsibility attesting that unit responsibility has been assigned as specified in this Section. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.

H. Results of factory testing including leak testing per AWWA C-561, Section 5.22.

I. Name, location, and qualifications of the passivation shop.

J. Certification attesting that all gate components have been cleaned, passivated and tested in accordance with the procedures described in this section

K. Manufacturer's operation and maintenance manual defining maintenance requirements.

1.04 SERVICE REQUIREMENTS

A. PERFORMANCE REQUIREMENTS
   1. Gates are intended to isolate channels and pipes or to control water surface elevations.
   2. Gates shall be designed for the Design Head specified. The Design Head is defined as the maximum head that will be applied to the gate. The Design Head is measured from the maximum water surface elevation to the bottom of the gate.
   3. Slides and frames shall have a safety factor of 5 with regard to ultimate tensile, compressive and shear strength; calculations shall be submitted to show conformance.
   4. Gates shall comply with field leakage tests as defined in AWWA C561.
   5. Gates shall not require exercise at a frequency of more than once per year to meet the extended warranty requirements described in this section.
   6. Gates shall be passivated prior to shipping in accordance with the requirements of this section.

B. See the Gate Schedule in drawings for specific dimensional and design requirements.

1.05 COMPONENT SIZING

A. Operating forces used for determining the strength of gate components (yokes, frames, slides, stems, slide nut pockets, and other load-bearing members) shall be based on the sum of the guide friction force (computed using an opening breakaway friction factor of 0.2) and the weight of slide and stem.

B. When the gate is in motion, the operating forces shall be based on the sum of the frictional force (using a guide friction factor of 0.25) and the weight of slide and stem.

1.06 PICKLING AND PASSIVATION OF STAINLESS STEEL

A. PASSIVATION:
   1. Stainless steel surfaces shall be cleaned, physically or chemically descaled, passivated, and tested for presence or absence of free iron in accordance with ASTM A380. The test results shall indicate an absence of free iron. Submit manufacturer's certification that all stainless-steel surfaces have been cleaned, descaled, passivated, and tested in accordance with ASTM A380 and that the surfaces are free from free iron. Equipment that is not certified will not be accepted. Manufacturer shall submit for approval their cleaning, descaling, passivation, and testing procedures to ensure proper cleaning and passivation has occurred.
   2. For purposes of this section, passivation is defined as the removal of exogenous iron or iron compounds from the surface of stainless steel by means of treatment with an acid solution that will remove the surface contamination but will not significantly affect the stainless steel itself.
   3. Equipment components that bolt together shall be disassembled prior to passivation treatment to allow for effective circulation and removal of cleaning solutions.

B. PROTECTION:
   1. All passivated stainless steel shall be protected by applying shrink wrap to all parts of the equipment sufficient to prevent exposure of passivated surfaces to contaminants during handling, shipping, and installation. Protected equipment shall be tagged with highly visible warning sights stating the equipment has been passivated and shall only be opened by authorized personnel. Equipment arriving at the project site without proper protection will require retesting for the presence of free iron and re-passivation if free iron is detected.

C. Assembly of equipment following passivation – If assembly of bolted parts is required following passivation, it shall be done at the manufacturing facility under clean conditions such that the parts will not be contaminated with exogenous iron or iron compounds. Following assembly, retest for the presence of free iron per ASTM A967 and treat any contaminated areas with citric acid solution. Equipment requiring assembly shall be re-shrink wrapped sufficient to prevent exposure of passivated surfaces to contaminants during handling, shipping and installation.

D. WITNESS OF PASSIVATION PROCESS:
   1. The Owner retains the right to witness the stainless steel passivation process. Provide at least 30-days notice prior to start of passivation process.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Gates shall be all stainless steel construction. Acceptable manufacturers include the following:
   1. Stainless steel slide gate manufacturers:
      a. Whipps, Inc. Athol, Massachusetts
      b. Fontaine International Corporation, Orange Massachusetts
      c. Hydrogate, Denver Colorado
      d. Waterman Industries, Exeter California
      e. Approved equal

B. The manufacturer's standard models or products may require modifications to conform to specified requirements.

2.02 MATERIALS

A. Materials of construction shall be as follows:

Component	Material
Slide	ASTM A240 Type 316L stainless steel
Frame	ASTM A276 Type 316L stainless steel
Slide Seats	ASTM D4020 UHMW Polyethylene
Seating faces or seals	ASTM D4020 UHMW PE
Stem and supports	ASTM A276 Type 316 stainless steel
Fasteners, adjusting hardware, and anchors	ASTM A276 Type 316 stainless steel
Yoke	ASTM A276 Type 316L stainless steel
Flush bottom seal	Resilient synthetic rubber bonded to frame or ASTM D2000 neoprene
Pedestal/Torque Tube	ASTM A276 Type 316L stainless steel

2.03 FEATURES

A. GENERAL:
   1. Mounting requirements as shown on the Drawings and specified in this section.
   2. Unless otherwise indicated, provide gates with rising stems with clear, graduated plastic covers in accordance with AWWA C561.
   3. Weir gates having a width greater than 60 inches shall have dual stems mechanically linked to a common operator.
   4. Stainless Steel Passivation: All stainless steel components to be cleaned, descaled, and passivated after fabrication in accordance with ASTM A380 and the specific requirements of this section.

B. SLIDE:
   1. Slides shall consist of steel plate reinforced with steel members welded to the plate. Minimum thickness of the steel plate shall be ¼".

2. Slides shall be reinforced with horizontal stiffeners welded to vertical stiffeners. Slides shall not deflect more than 1/16 of an inch or 1/1000 of the span of the gate, which ever is less, under the design head.
3. The slide manufacturer shall submit drawings and comprehensive design criteria to substantiate that the maximum deflection for each slide has not exceeded 1/16 of an inch or 1/1000 of the span, whichever is less, regardless of the type used. Comprehensive safety factor calculations shall include bending moments, buckling stress, and bonding stress with thermal expansion factors. Safety factors shall be calculated for the slide under the maximum head indicated in this section, and for shear at the slide/seal interface.

C. FRAME:
1. Guide frames extending above operating floors or slabs shall be self-contained and sufficiently strong so that no further support or reinforcement is required. Frames for self-contained gates shall be designed for maximum loads imposed by gate operators in the stalled condition plus the weight of the slide, stem, torque tube or pedestal, and operator.
2. The yoke shall be formed by two structural members welded at the top of the guides to provide a one-piece rigid frame and configured to enable slide removal without removing the yoke. The yoke shall be designed to support the maximum stall force applied by the operator in addition to the weight of the stem, torque tube or pedestal, and operator where this equipment is being supported at the yoke.
3. The frame shall be designed with a minimum factor of safety of 4 with regard to ultimate tensile, compressive, and shear strength.
4. Wall-mounted frames shall be the flanged type. Guides for wall mounted frames shall be formed from one plate with wrap around gussets. Bolted together guides are not accepted.
5. Embedded frame gates shall be installed in block-out recesses formed in the channel walls and floor.
6. Thimble-mounted gates shall be drilled to match the wall thimble. Wall thimbles shall conform to AWWA C561.

D. SEALS:
1. Gates shall incorporate factory-set self-adjusting seals utilizing a sealing surface of UHMW PE to achieve the leakage rates specified. Self adjusting seals shall not require adjustment and shall be replaceable without removing the guide frame.
2. All moving contact surfaces shall be incompatible to each other thereby minimizing sticking or jamming.

E. STEMS:
1. All stems shall be of the rising type unless otherwise specified.
2. Provide stem diameter to withstand at least twice the rated output of the electric operator or the manual operator at 40-pounds pull. Stems shall be minimum 1-3/8-inch diameter.
3. Stem guides shall be provided at intervals necessary to maintain a slenderness ratio (L/R) of the unsupported stem length of less than 200, where R is the radius of gyration of the stem.

4. Stems shall be designed to withstand tensile and compressive loads that occur under maximum operating conditions. Design for compressive loading shall meet AWWA C561 standard using Euler's formula where C=2 with a minimum safety Factor of 2 to 1.
5. Stem sections shall be joined together by solid couplings, threaded and keyed to the stems. All couplings of the same size shall be interchangeable.
6. The threaded portion of the stem shall have dual lead, machine rolled, full depth ACME type threading with a 16 micro-inch finish or better. Stub threads are not acceptable.
7. Stems shall be fixed to the slide by a bolted connection or threaded and keyed assembly into a stem block or thrust nut attached to the disc in a stem block pocket, which is welded to the disc.

F. OPERATORS:
1. See Gate Schedule for operator requirements.
2. Unless otherwise indicated, manual operators shall meet requirements of AWWA C561 as appropriate.
3. Yoke-supported operators shall be provided with 316 SS pedestals between the top of the yoke and the operator. See drawings for length requirements.
4. Unless otherwise indicated and whenever possible, operator base shall be set 42" above the walking surface.
5. Manual operators are specified in Section 40 05 57.13.
6. Electric operators are specified in Section 40 05 57.23.

2.04 FACTORY TESTING

A. Conduct shop performance test per AWWA C561. All gates shall be factory leak tested and field leak tested following installation. Submit written report of results.

B. The Owner retains the right to witness the stainless steel preparation and passivation process. Provide at least 30-days notice prior to start of passivation process for gates and appurtenances.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install gates and appurtenances in accordance with manufacturer's instruction and as shown on the Drawings.

B. For embedded gates, fill blockouts along guide frames and gate sill with grout following installation.

C. Provide all 316 SS anchors; size anchors in accordance with the design requirements specified in this section and in accordance with Sections 01 73 24, 05 10 00, and 43 05 11.

D. Proper handling shall incorporate all practices described in Section 8.5 – Protection of Cleaned Surfaces, ASTM A380. Passivated parts contaminated due to improper handling and installation will require retesting for the presence of free iron and re-passivation if free iron is detected.

3.02 FIELD TESTING

A. Operation and Leakage Tests: In accordance with AWWA C563 or AWWA C 561 as appropriate.

B. Leakage rates shall not exceed 0.05 gpm per linear foot of seating perimeter.

C. Provide the following manufacturer's services during startup and testing: 1. Two trips with one day per trip for gate installation inspection with no water in basin. 2. Two trips with one day per trip for gate functional testing and leakage testing with water in the basin.

3.03 TRAINING

A. Provide four hours of training as specified in Section 01 66 00. Training shall be certified on Form 43 05 11-B specified in Section 01 73 24.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 60

VALVES

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies the supply, installation and testing of valves. Materials and performance requirements for valves are specified in Detailed Valve Specifications. Detailed Valve Specifications are provided in Sections 40 05 61.01 through 40 05 89.99. Additional Detailed Valve Specifications for some valves used for HVAC service are provided in Division 23.

B. Determining Valve Type:
   1. Drawings specify valve types (gate, plug, butterfly, check, globe, etc.) used in each pipeline. Process fluids that will be conveyed in pipelines are identified by the Process Service Identifiers shown on the Drawings.
   2. Piping System Schedules (Sections 40 05 02.01 through 40 05 02.99) specify piping system materials and components, including valve requirements, based on the Process Service Identifier specified on the Drawings for the pipeline or piping system. Piping System Schedules reference Detailed Valve Specifications that specify requirements for each valve type used in the pipeline or piping system.
   3. Provide valves conforming to the Detailed Valve Specifications listed in the Piping System Schedule for the valve/line size, process service, and valve type specified on the Drawings. Example: The Drawings specify a ball valve on a 1-inch line. The Piping System Schedule for the process service specified on the Drawings refers to Section 40 05 63.01 for 1/2 through 2 1/2 inch ball valves. For this example, provide the subject ball valve per the requirements specified in 40 05 63.01.
      a. Example: The Drawings specify a ball valve on a 1-inch line. The Piping System Schedule for the process service specified on the Drawings refers to Section 40 05 63.01 for 1/2 through 2-1/2-inch ball valves. For this example, provide the subject ball valve per the requirements specified in 40 05 63.01.

C. Section 40 06 20.13 specifies electric, pneumatic, and hydraulic powered control valves, complete with valve, actuator, and other ancillaries.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 58 01 – Identification Systems
   2. Section 01 78 23 – Operation and Maintenance Manual
   3. Section 40 05 02 – Detailed Piping Specification Sheets
   4. Section 40 06 20.13 – Actuated Valve and Gate Schedules

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.04 SUBMITTALS

A. Action Submittals:

1. Procedures: Section 01 33 00
2. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations from specification requirements. Check-marks (✓) denote full compliance with a paragraph as a whole. Underline deviations and denote with a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal will be sufficient cause for rejection of the entire submittal with no further consideration.
3. Catalog cuts and/or shop drawings for each type of valve indicating the valve type (Detailed Valve Specification Section Number), materials of construction, dimensions, operating torque, valve end connection configuration, pressure rating, and operating temperature range.
   a. For all chemical, toxic, or corrosive service applications, as identified in Section 40 05 02 – Piping System Schedules, a letter or certification that materials of construction are compatible with the designated service fluid.
   b. All pressure rating information and Cv factor data.
4. An amended Detailed Valve Specification for all valve types provided for this contract. Indicate with check marks where the valve supplied meets the requirements specified and with written amendments where the product differs from the specification.
5. Factory Acceptance Test results and/or Certified Statement of Proof-of-Design testing results when specified in Detailed Valve Specifications.
6. Action Submittal Items listed on Detailed Valve Specifications

B. Informational Submittals:

1. Affidavits and registration numbers as specified.
2. Operating and Maintenance data for incorporation in operation and maintenance manual, as specified in Section 01 78 23 and individual specs.

3. Informational Submittal Items listed on Detailed Valve Specifications.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Deliver valves to site in accordance with Section 01 66 00 and using loading methods which do not damage any valve components or coatings.

C. Tag loose valves as specified in Section 01 66 00, stating size, type, coatings and mating parts shipped loose or separate.

D. Store on site until ready for incorporation in the work using methods recommended by the manufacturer to prevent damage, undue stresses, or weathering.

1.06 WARRANTY

A. Where a warranty duration is specified by the Detailed Valve Specification, provide a special warranty valid for the specified duration.

B. Where no special warranty requirements are specified in the Detailed Valve Specification, provide manufacturer's standard warranty.

PART 2 PRODUCTS

2.01 VALVE CONFIGURATION REQUIREMENTS

A. General
1. Provide valves of the same type, size range and service from a single manufacturer.
2. Provide new, unused valves for the work.
3. Provide valve materials free from defects or flaws, with true alignment and bores.
4. Provide valves that open by turning the valve shaft to rotate counter-clockwise unless otherwise specified in the Detailed Valve Specification Section.

B. Provide padlockable lockout feature on all valves.

C. Manual Operators
1. Provide valves with manual operators as specified in the Detailed Valve Specification, unless specified otherwise in Section 40 06 20.13.
2. For hand wheels, clearly show the direction of opening in raised lettering and symbols.
3. The maximum rim pull on a hand wheel is not to exceed 65 lb. when one side of the valve is at test pressure and the other side is at atmospheric pressure. Where a shaft mounted hand wheel would require greater force to operate, provide a torque reduction gearbox operator. Unless different operators are scheduled or specified on the Drawings, conform to the following minimum requirements.
4. Provide 6 (total) eight-point operating wrenches for use on all valves with square nut operators.
5. Quarter turn lever operators are to be perpendicular to the pipe runs when the valves are closed.

6. Provide butterfly valves with 10 position latching levers except where used to balance air flows. Where used to balance air flows provide infinite position, screw down levers.
7. The maximum pull at the end of the lever arm is not to exceed 65 lb. when one side of the valve is at test pressure and other side is at atmospheric pressure. Where greater force would be required to operate the valve with a lever, provide a torque reduction gearbox operator.
8. Provide grease lubricated, worm gear type operators for torque reduction gearbox operators. Gearbox operators equipped with a hand wheel and a visual indicator of the valve position. Provide gear operators with adjustable mechanical stop-limiting devices to prevent over travel of the disc/ball/plug in the open and closed positions and which are self-locking and designed to hold the valve in any intermediate position between full open and full closed. Where gearbox operators are intended for direct bury or submergence, seal units with long life lubricant.
9. For manual valves on lines 3 inches and greater, mounted over 7.0 feet above the operating floor, provide chain wheel gear operators. Design chain wheel operators so that a force of 30 lb. is sufficient to open the valve when one side of the valve is at test pressure and the other side is at atmospheric pressure. Provide chain pulley that positively engages the chain links. The chain will extend from the valve operator to an operating height of 4 feet above the floor or as directed by the Owner. The exact dimensions will be field determined. Provide approved chain hooks where required to prevent chain from hanging within traffic paths.
10. Where manual operators are installed over 7.0 feet above the operating floor and the Drawings specify a vertical valve shaft, revise the gear operator and/or chain wheel position to provide a horizontal chain wheel shaft. Retain the valve orientation specified on the Drawings.
11. Provide ductile iron chain wheels. Provide galvanized steel operating chains.

D. Valve Stem Extensions and Wrench Nuts
1. Provide valve stem extensions where additional clearance is required for pipe insulation or where valve operation without the extension is difficult; and in manholes.
2. Where angle valve stem extensions are employed, they will be angle geared. Universal joint types are not permitted.
3. Wrench nuts shall comply with AWWA C500. A minimum of two operating keys, but no less than one key per every ten valves, shall be provided for operation of wrench nut operated valves.

E. Operator Appurtenances
1. Valve Boxes: Valve boxes shall be cast iron and shall have suitable base castings to fit properly over the bonnets of their respective valves and heavy top sections with stay-put covers. Covers shall be hot-dip galvanized. Valve boxes extending to finished surfaces shall be provided for buried valves.
2. Floor Boxes: Floor boxes shall be hot-dip galvanized. Where the operating nut is in the concrete slab, the floor box shall be bronze bushed. Where the operating nut is below slab, the opening in the bottom of the box shall be sufficient for passage of the operating key. Floor boxes shall be provided for wrench operation of valves located below concrete slabs. Each floor box and cover shall be of the depth required for installation in the slab.

3. Adjustable Shaft Valve Boxes: Adjustable shaft valve boxes shall be concrete or cast iron Brooks No. 3RT, Christie G5, Empire 7-1/2 valve extension box, or equal. Box covers on water lines shall be impressed with the letter "W." Gas line covers shall be impressed with the letter "G."
4. Floor Stand: Provide floor stands with wall bracket where indicated on the drawings.

2.02 VALVE IDENTIFICATION TAGS

A. Provide valve identification tags for all valves with an identification tag number on the drawings (Mechanical and PI&D drawings).

B. Match tag numbers shown on the drawings.

C. General: Type 316 stainless steel tags, minimum 2.5-inches x 0.75 inches, with 0.1875 inch numbers and letters. Complete tag number shall be embossed on the tag. Tags shall be attached using stainless steel wire.

D. Chemical Service: Engraved Micro-surface Impact Acrylic, minimum 0.0625-inches thick, minimum 2.5-inches wide x 0.75 inches hieght. Colors to match pipe tag color scheme per Section 40 05 02. Tags shall be attached using plastic zip ties.

PART 3 EXECUTION

3.01 PREPARATION

A. The valve and piping arrangement indicated on the Drawings is based on typical dimensions for valves of the specified type. Make the necessary modifications in the piping to allow for discrepancies between the valve dimensions shown and those supplied for the Work.

B. Prior to installation of valves, field measure and check all equipment locations, pipe alignments, and structural installations. Ensure that the valve location and orientation provides suitable access to manual operators and that sufficient space and accessibility is available for hydraulic, pneumatic, and electric power actuators.

C. Where conflicts are identified, inform the Owner.

3.02 INSTALLATION

A. Install valves in conjunction with the piping specified in the Piping System Schedules (Sections 40 05 02.01 through 40 05 02.99), and with control valves and their appurtenances specified in Section 40 06 20.13.

B. In horizontal pipe runs, other than in locations where space does not permit, install all valves (except for butterfly valves, eccentric plug valves, and trunnion ball valves) with a vertical operating shaft with the actuator at the top. In no case install a valve with the operator below the valve.

C. Unless otherwise specified on the drawings, install butterfly valves, eccentric plug valves, and trunnion ball valves with the shaft in a horizontal orientation. Install eccentric plug valves with the plug above the valve shaft centreline when the valve is full open.

D. When joining valves to pipe or fittings, do not over torque bolts to correct for misalignment.

E. Support valves in position using temporary supports until valves are fixed in place.

F. Permanently support valves to prevent transmission of loads to adjacent pipework and/or equipment.

G. Where valves are installed in plastic pipelines (PVC, CPVC, HDPE, polypropylene etc.) greater than 4-inch diameter, support valves independent of the piping and brace valves against operating loads and torque to prevent transmission of stresses to the adjacent pipework.

H. Install gate valves in the closed position.

I. Install valves which are bubble tight in one direction to provide bubble tight seal of flow in normal direction of flow unless otherwise noted or directed by the Owner.

J. Unless otherwise specified, install single seated valves with the seat downstream. Install valves at tank connections with seat away from tank. Install valves on pump discharge and suction lines with seat end towards the pump.

K. Install all valves in accordance with the manufacturer's recommendations.

L. Protect valves installed below grade with a shrink sleeve or polyethylene sheath attached to the pipe with tape wrap.

M. Wrench nuts shall be provided on buried valves, on valves which are to be operated through floor boxes, and where specified. Extended wrench nuts shall be provided if necessary so that the nut will be within 6 inches of the valve box cover.

3.03 FIELD QUALITY CONTROL

A. Field or Site Tests and Inspections per Detailed Valve Specifications.

B. Pressure test all valves in conjunction with the pipes in which the valves are installed at test pressures specified in the applicable Piping System Schedule.

GATE VALVE, RESILIENT WEDGE

GENERAL

1. Line Size: 2 through 12 inches
2. Rated Limits: Pressure 250 psi; Temperature 100 °F

VALVE MATERIALS

1. Body: Cast Iron
2. Disc: Cast Iron
3. Disc Trim: Buna N or Urethane Rubber
4. Stem: Bronze with double or triple O-ring

VALVE CONFIGURATION

1. Valve End/Connections: Flanged, ANSI B16.1 Class 125
2. Type of Disc: Vulcanized Resilient Wedge capable of sealing in both directions.
3. Provide O-ring seal between valve body and bonnet.
4. Operator: As indicated in the Valve Schedule in the drawings.
5. Coating: Coat interior and exterior of valve with fusion bonded epoxy in accordance with AWWA C550.

SUBMITTALS

1. The following information shall be provided in accordance with Section 01 33 00:
   a. Product data
   b. NSF 61 certification

CANDIDATE MANUFACTURERS

1. Clow 2638, 2639, 2640
2. M&H Style 4067
3. Or approved equal

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

40 05 62.01

PLUG VALVE, AWWA C517 STANDARD PORT

GENERAL

1. Line Size: 3 through 12 inches
2. Rated Limits: Pressure 175 psi; Temperature 125 °F
1. Line Size: 14 through 72 inches
2. Rated Limits: Pressure 150 psi; Temperature 125 °F

VALVE MATERIALS

1. Body: Cast Iron
2. Plug: Cast Iron or Ductile Iron
3. Plug Facing: EPDM
4. Seatings: Ni or Stainless Steel
5. Packing: Buna V-flex or TFE
6. Bearings: Stainless Steel
7. Grit Excluder: PTFE or Buna-N

VALVE CONFIGURATION

1. Valve End/Connections: ANSI B16.1 Class 125# Flange
2. Pattern: One-piece, Standard Port; provide 100% minimum port area of adjacent pipe for valves 4 inches and less, provide 80 to 85% port area of adjacent pipe for valves 6 to 24 inches, provide 75% minimum port area of adjacent pipe for valves 30 inches and larger
3. Reference Standard: AWWA C517
4. Installation: install with shaft in horizontal position where possible, valve seat located upstream
5. Operator: Lever/Handwheel; provide lever for valves 4 inches and smaller, totally enclosed worm gear for valves 6 inches and larger, operator components shall be sized in accordance with AWWA C504 Section 3.8.
6. Special: upper and lower journal bearings shall be replaceable, sleeve-type, corrosion resistant, and permanently lubricated; packing shall be self-adjusting chevron type replaceable without disassembling the valve

SUBMITTALS

1. As required in Section 40 05 60 – Valves.
2. Furnish three certified copies of a report from an independent testing laboratory certifying successful completion of proof-of-design testing conducted in accordance with AWWA C517, Section 5.2. In lieu of testing the valves at an independent testing laboratory, proof-of-design testing may be performed at the valve manufacturer's laboratory but must be witnessed by a representative of a qualified independent testing laboratory, and all test reports must be certified by the laboratory representative. Proof-of-design testing shall have been performed on not less than three 3-inch diameter valves, with all three test units demonstrating full compliance with the test standards. Failure to satisfactorily complete the test shall be deemed sufficient evidence to reject all valves of the proposed make or manufacturer's model number.
3. Provide letter of certification that valves are compatible and recommended with slurry applications.

CANDIDATE MANUFACTURERS

1. Dezurik, PEC (2”), PEC or PEF (3” through 6”).
2. Clow Valve, (3” through 6”).
3. Val Matic, Cam-Centric Series (3” through 6”).

BALL VALVE, BRONZE/BRASS, FULL PORT

GENERAL

1. Line Size: ¼ through 2 ½ inches
2. Rated Limits: Pressure 600 psi; Temperature 400 °F (CWP)

VALVE MATERIALS

1. Body: Bronze or Brass
2. Ball: Bronze or Chrome-Plated Brass
3. Seats: PTFE or RPTFE
4. Shafts: Bronze, Brass, or Stainless Steel; blowout-proof stem

VALVE CONFIGURATION

1. Valve End/Connections: Threaded, Female; provide threaded end cap and chain in drain pipes
2. Pattern: 2 Piece; regular port
3. Ball Mount: Floating
4. Manual Operator: Lever
5. Reference Standard: MSS SP-110, NSF/ANSI/CAN 61

SUBMITTALS

1. As required in Section 40 05 60 – Valves.
2. Manufacturer's standard product data
3. NSF/ANSI/CAN 61 Certification

BUTTERFLY VALVE, AWWA C504, CLASS 150B

GENERAL

1. Line Size: 3 through 48 inches
2. Rated Limits: Pressure 125 psi; Temperature 120 °F

VALVE MATERIALS

1. Body: AWWA C504, Class 150B, Short Body
   a. Cast Iron, ASTM A126, Class B
   b. Ductile Iron, ASTM A536, Grade 65-45-12
2. Disc:
   a. Ductile Iron, ASTM A536, Grade 65-45-12 with 316 Stainless steel edge
   b. Stainless Steel, Type 316 ASTM A743
3. Seats:
   a. Acrylonitrile-Butadiene (NBR)
   b. Buna-N
   c. EPDM
   d. For valves 24 inches and larger, provide valve seats with seals vulcanized bonded, mechanically secured, or clamped to the body, valve seats to be field adjustable and field replaceable.
4. Shaft: Type 316 Stainless Steel, ASTM 276
   a. For valves 24-inch and larger Type 304 or 316 Stainless Steel, ASTM A276.
5. Shaft Packing: V-Type Chevron
   a. Buna-N, Acrylonitrile-Butadiene (NBR), or EPDM

VALVE CONFIGURATION

1. Valve End/Connections:
   a. Flange, Class 125 Faced and Drilled per ANSI B16.1
2. Type of Disc: Concentric or Eccentric
3. Manual Operator: Lever or Handwheel; provide geared operators for valves 6 inches and larger
4. Valve Direction to Open: Counterclockwise
5. Reference Standard: AWWA C504

SUBMITTALS

1. As required in Section 40 05 60 – Valves.
2. Manufacturer's standard data including product literature, materials of construction, construction details of equipment, and weight of equipment.
3. Affidavits of compliance with AWWA C504.
4. Documentation of compliance with ANSI/NSF 61

CHECK VALVE, BALL TYPE IRON BODY

GENERAL

1. Line Size: 2 through 14 inches
2. Rated Limits: Pressure 145 psi; Temperature 175 °F

VALVE MATERIALS

1. Body: Ductile Iron, ASTM A 536
2. Cover: Ductile Iron, ASTM A 536
3. Ball: Floating hollow metal (aluminum or steel) ball filled with foundry sand, with nitrile or Buna-N coating
4. Bolts and Nuts: Stainless steel

VALVE CONFIGURATION

1. Valve End/Connections: ANSI B16.1 Class 125# Flange
2. Check Mechanism: Fully automatic floating ball check
3. Maintenance: Valve shall be constructed with bolted lifting cover that allows for access and removal of floating ball without removal of the valve from the piping.

SUBMITTALS

1. As required in Section 01 33 00 and 40 05 60.
2. Valve and coating certification.
3. Affidavits of compliance with AWWA C504.
4. Documentation of compliance with ANSI/NSF 61

CANDIDATE MANUFACTURERS

STAINLESS STEEL, AIR/GAS SERVICE, SPLIT DISC, 400 DEGREE F RATED

GENERAL

1. Line Size: 2 through 36 inches
2. Rated Limits: Pressure 175 psi; Temperature 400 °F

VALVE MATERIALS

1. Body: ASTM A351, CF-8M Stainless Steel
2. Disc: ASTM A351, CF-8M Stainless Steel
3. Seals: ASTM A351, CF-8M Stainless Steel
4. Hinge Pin: Stainless Steel (316)
5. Spring: Inconel X-750® Nickle-chromium alloy

VALVE CONFIGURATION

1. Valve End/Connections: Lugged, ASME B16.5 Class 150
2. Check Mechanism: Split Disc/Double Leaf
3. Special: provide lifting lugs on valves greater than 100 lb., valves shall open with not more than 0.5 psig differential pressure and be sprung such that the doors shut without slamming

SUBMITTALS

1. As required in Section 40 05 60 – Valves.
2. Action Submittals:
   a. Certified Hydrostatic and Seat Test Report

CANDIDATE MANUFACTURERS

1. APCO 9000T
2. Crane Duo-Check

SECTION 40 05 65.23

SWING CHECK VALVES

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies spring-loaded swing check valves.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A126	Gray Iron Castings for Valves, Flanges, and Pipe Fittings
ASTM A276	Stainless and Heat-Resisting Steel Bars and Shapes
ASTM A536	Ductile Iron Castings
ASTM B148	Aluminum-Bronze Sand Castings
AWWA C508	Swing-Check Valves for Waterworks Service, 2 In. Through 24 In. NPS

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following:
   1. APCO Model 250
   2. Crispin, SWL Series
   3. Golden Anderson 240/242
   4. Mueller, A-2600
   5. Or approved equal.

2.02 MATERIALS

A. Materials of construction shall be as follows:

Component	Material
Body, cover	Ductile iron, ASTM A536
Disc	Ductile iron, ASTM A536
Seat rings	Aluminum bronze, ASTM B148 or Stainless steel, ASTM A276, Type 316
Hinge shafts and hinge pins	Stainless steel, ASTM A276, Type 301 or 304
Shaft bushings	Bronze, AWWA C508

B. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

2.03 MANUFACTURE

A. Disc, disc arm, shaft, keyways, lever and spring shall be capable of closing within .05 seconds of pump stoppage and fluid moving at velocity of 8 feet per second. Spring tension shall be adjustable. The valve design shall permit mounting levers and springs on either side of the valve. The design of the spring attachment shall permit adjustment of closing force by tensioning the spring or replacement with different active length springs.

B. Valves shall be provided with a clear opening equal to or greater than the connecting piping, with no raised seating surface. Seats shall be threaded onto the body or fitted with an O-ring seal and locked in place with stainless steel screws or pins and shall be replaceable. Shafts shall be provided with stuffing box and packing or O-ring seals at each end. Seals shall be externally replaceable.

C. The pivot arm shall be secured to the disc with either twin bolted connections with lockwashers or a pinned nut. In either instance, the connection shall be designed to prevent disc movement relative to the arm. Shaft bearings shall extend the entire length of the shaft other than the section required for the disc arm attachment. Disc and lever arms shall be keyed to the shaft and retained by bushings or pins.

D. Unless otherwise specified, valves shall, as a minimum, conform to the following pressure ratings:

Size, inches	Working pressure, pressure, PSIG	Hydrostatic shell test
2 through 36	250	500

E. Check valves wetted parts shall be coated with fusion bonded epoxy.

2.04 PRODUCT DATA

A. Manufacturer's catalog information including dimensions, cross-sectional views, details of construction and materials list shall be provided in accordance with Section 01 33 00.

2.05 LINING AND COATING

A. Valve shall be lined with 12 mils and coated with 8 mils of NSF 61 certified fusion bonded epoxy.

PART 3 EXECUTION

3.01 INSTALLATION

A. Spring loaded swing check valves shall be installed in accordance with the manufacturer's recommendations.

CHECK VALVE, PVC SWING TYPE

GENERAL

1. Line Size: ¾ through 8 inches
2. Rated Limits:
   a. Pressure 70 psi; Temperature 70 °F, Non-shock (3/4" – 3"),
   b. Pressure 100 psi; Temperature 120 °F, Non-shock (4" – 6"),
   c. Pressure 150 psi; Temperature 120 °F, Non-shock (8"),

VALVE MATERIALS

1. Body: PVC, ASTM D1784
2. Bonnet: PVC, ASTM D1784
3. Disc: PVC, ASTM D1784
4. Seats, Gasket: EPDM, PTFE, or FKM
5. Hinge Pin: PVC, ASTM D1784
6. Fasteners: Stainless Steel (304 or 316)
   a. **(Sodium Hypochlorite Service)** Hastelloy C 276 (UNS 10276) Bolts: ASTM F467, and Hastelloy C 276 (UNS 10276) Nuts: ASTM F468

VALVE CONFIGURATION

1. Valve End/Connections: Flange, ANSI Class 150
2. Type: Bonneted Flap Style Check

SUBMITTALS

1. As required in Section 40 05 60 – Valves.
2. Manufacturer's standard product data.
3. Manufacturer's data indicating acceptable for use with intended fluid service.
4. NSF/ANSI 61 Certification

CANDIDATE MANUFACTURERS

1. Hayward SW Series (3" – 8")
2. Asahi (3/4" – 8")
3. Spears

SECTION 40 05 67.13

REDUCED-PRESSURE ZONE BACKFLOW PREVENTERS FOR PROCESS SERVICE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies reduced pressure principle backflow preventers.

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
AWWA C511	Standard for Reduced-Pressure Principle Backflow Prevention Assembly

B. Testing:
   1. Backflow preventers shall meet the factory, laboratory and field test provisions of AWWA C511.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers include Cla-Val, Febco, Watts, or equal.

2.02 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Affidavit of Compliance with AWWA C511.
   2. Certificate of Approval as specified in AWWA C511.

PART 3 EXECUTION

3.01 INSTALLATION

A. Backflow preventers shall be installed in accordance with the manufacturer's instructions.

END OF SECTION

SECTION 40 05 67.36

PRESSURE-REGULATING VALVES

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies direct acting and pilot controlled pressure regulating valves for air, water and chemical service including pressure regulating/relief valves (PRVs), pressure safety valves (PSVs) and back-pressure regulating valves (BPVs).

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI B16.5	Pipe Flanges and Flanged Fittings

   3. Additional Sections and Paragraphs Required for Compliance:
      a. The equipment specified in this section shall be provided in accordance with the following additional sections and paragraphs. This is not a comprehensive list of related and referenced sections and paragraphs and additional related and referenced sections and paragraphs requiring compliance may be specified throughout this section and within other sections.
         1) Section 01 33 00 – Submittal Procedures.
         2) Section 01 99 90 – Reference Forms.
         3) Section 43 05 11 - General Requirements for Equipment.

B. Unit Responsibility:
   1. The Manufacturer shall take Unit Responsibility for the valves as specified in Section 43 05 11.

2. Unit Responsibility extends to all equipment, accessories and all coordinating items provided by the Contractor required for a fully functioning unit. This includes items specified in this Section, accessories or items referenced to other Sections, whether provided by the Manufacturer or the Contractor.
3. A completed, signed, and notarized Certificate of Unit Responsibility (Section 01 99 90-Form 43 05 11-C) shall be provided.

C. Performance:
1. Direct acting type pressure regulating valves shall control the discharge pressure within ±5 percent of set pressure.
2. Pilot controlled type pressure regulating valves shall maintain the set discharge pressure regardless of fluctuations in inlet pressure.

D. Testing:
1. Hydrostatic tests shall be conducted by the manufacturer for one valve of each type supplied for a particular service. Steel-bodied valves shall be hydrostatically tested in accordance with the requirements of ANSI B16.5. Aluminum-, bronze-, and brass-bodied valves shall be hydrostatically tested at double the MAX pressure specified. Leakage, sweating or visible deformation at any point on the valve shall be cause for rejection of valves of that type and manufacture.

1.03 SUBMITTALS

A. As required in Section 40 05 60 – Valves.

B. Action Submittals:
1. Procedures: Section 01 33 00 – Submittal Procedures
2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Owner shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
3. Manufacturers' product data, catalog cuts, typical installation details, and dimensions. Indicate on the submittal each piping system where the product will be used.

C. Information Submittals:
1. Procedures: Section 01 33 00 – Submittal Procedures
2. The Contractor shall provide certified copies of test reports specified in paragraph 1.02 Testing.

PART 2 PRODUCTS

2.01 REQUIREMENTS

A. General:
   1. Pressure regulating valve connections shall be as specified in the piping system schedules.
   2. Moving parts requiring lubrication shall have means provided for lubrication and shall be lubricated prior to delivery.

B. Pressure regulating/relief valves (PRVs).
   1. Water Service:
      a. Valves less than 1-1/4 inches shall be direct acting, spring-operated type. Valves less than 1-1/4 inches shall be Cash-Acme E-41 Series 3, Watts LF223, or equal, with separate Y-pattern strainer.
      b. Valves 1-1/4 inches and larger shall be pilot-controlled type, unless otherwise specified. Valves 1-1/4 inches and larger shall be diaphragm actuated type or differential piston pressure type and shall be Cla-Val Co. Clayton 90-01 Series, GA Industries, Inc., or equal.
   2. Air Service:
      a. Valves for air service shall be Cash-Acme E-41 Series 3, Watts 152A, or equal, with separate Y-pattern strainer.
   3. Chemical Service
      a. Adjustable pressure relief type valves for chemical service shall be suitable for the chemical solution service specified and shall be installed on pump discharge at the feed panel as shown the drawings.
      b. Valves shall be sized to handle a maximum flow through the valves of not less than 1.5 times the maximum flow supplied by the associated pump.
      c. Pressure relief valves shall be Griffco, Plast-O-Matic, or equal.
      d. Valve body:
         1) For acetic acid, phosphoric acid, and sodium hydroxide service, the valve body shall be SS-316L.
         2) For ACH service, the valve body shall be PVC.
         3) For hydrogen peroxide service, the valve body shall be SS-316L.
         4) For sodium hypochlorite service, the valve body shall be FRP.
      e. Diaphragm
         1) The diaphragm material shall be PTFE.

C. Pressure Safety Valves (PSVs):
   1. Valves for air service shall be ASME certified, Watts Figure 41A, Lonergan L14/L40 Series, or equal.
   2. Valves for CO2 service shall be ASME certified. Size, type, and materials of construction shall be selected by the CO2 system supplier and shall be compatible with CO2 service as recommended by CO2 system supplier.

D. Back Pressure Regulating Valves (BPVs):
   1. Backpressure valves for chemical service shall apply a continuous discharge back pressure downstream of the metering pumps and serve as anti-siphoning valves. Backpressure valves shall be non-metallic and suitable for the pumped liquid characteristics. Backpressure valves shall match line size as shown on drawings. Backpressure valves shall be adjustable from 10-150 psi with a tamper-resistant adjustment screw. The valves shall be as close to the pump discharge as feasible, but downstream of pulsation dampeners and pressure gauges. Adjustable diaphragm backpressure regulating type valves shall be installed on pump discharge as shown on the drawings. Valve shall be suitable for the chemical solution service specified.
   2. Back-pressure valves shall be Griffco, Plast-O-Matic, or equal.
      a. Valve body:
         1) For acetic acid, phosphoric acid, and sodium hydroxide service, the valve body shall be SS-316L.
         2) For ACH service, the valve body shall be PVC.
         3) For hydrogen peroxide service, the valve body shall be SS-316L.
         4) For sodium hypochlorite service, the valve body shall be PVC.
      b. Diaphragm
         1) Diaphragms shall be PTFE.

2.02 ACCEPTABLE PRODUCTS

A. General:
   1. Pressure regulating valves shall be flanged or threaded connections as specified. Moving parts requiring lubrication shall have means provided for lubrication and shall be lubricated prior to delivery.
   2. Valves less than 1-1/4 inches shall be direct acting, spring-operated type. Valves less than 1-1/4 inches shall be Cash-Acme E-41 Series 3, Watts 223, or equal, with separate Y-pattern strainer.
   3. Valves 1-1/4 inches and larger shall be pilot-controlled type, unless otherwise specified. Valves 1-1/4 inches and larger shall be diaphragm actuated type or differential piston pressure type and shall be Cla-Val Co. Clayton 90-01 Series, GA Industries, Inc., or equal.

B. Air Service:
   1. Valves for air service shall be Cash-Acme E-41 Series 3, Watts 152A, or equal, with separate Y-pattern strainer.

C. Chemical Service:
   1. Valves for chemical service shall conform to all AGA regulations and criteria. Valves shall be sized as recommended by the manufacturer for the intended use.

2.03 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's product data.
   2. Hydrostatic test results.

PART 3 EXECUTION

3.01 INSTALLATION

A. Pressure regulating valves shall be installed in accordance with the manufacturer's recommendations.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 72

SPECIALTY VALVES

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies specialty valves which are auxiliary to process piping systems.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASME SEC VIII D2	Boiler and Pressure Vessel Code, Pressure Relief Devices
ASTM A126	Gray Iron Castings for Valves, Flanges, and Pipe Fittings

1.03 SUBMITTALS

A. As required in Section 40 05 60 – Valves

B. Action Submittals:
   1. Procedures: Section 01 33 00 – Submittal Procedures

2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Owner shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
3. Manufacturers' product data, catalog cuts, typical installation details, and dimensions. Indicate on the submittal each piping system where the product will be used.

C. Information Submittals: None

PART 2 PRODUCTS

2.01 SHEAR GATES (NOT USED)

2.02 FLAP GATES

A. Flap gates shall be heavy-duty, double-hinge type. Body and cover shall be cast iron conforming to ASTM A126, Class B. The body shall be provided with a resilient neoprene seat bonded in a groove machined in the body. The seal shall provide positive shutoff. The cover shall have a phosphor bronze seat facing, securely mounted in a dovetail groove around the periphery of the gate opening. Upper pivot shall be adjustable for gate sensitivity, and lower pivot shall incorporate a provision to align the cover. Gate design shall prevent cover from wedging into gate opening. Lubrication fittings shall be provided for each pivot.

B. Unless otherwise specified, wall thimbles shall be minimum 8-inch deep F-section, formed of ASTM A126, Class B cast iron with the gate mounting face machined flat to form a true bearing surface.

C. Thimble opening shall be the same as the gate size specified on the drawings. All anchor bolts shall be hot-dip galvanized. Fasteners and bushings shall be naval bronze.

D. Flap gates shall be Rodney Hunt Series FV-AC or FV-ACP, Waterman F-55, or equal.

2.03 KNIFE GATE VALVES

A. Electrically actuated knife gate valves shall be of a wedge design wherein the sealing gasket shall not be in constant contact with the blade while opening or closing. The blade shall move upward at the closing point to provide a watertight seal and include an "anti-racking" mechanism to prevent the gate from becoming misaligned during operation. Gates and actuators shall be furnished with all necessary parts and accessories required for a complete and fully functional unit.
   1. Gate valve and fasteners material shall all be type 304/304L stainless steel.
   2. In the closed position the knife gate valve blade deflection shall not exceed 1/360th of the maximum gate span based on 1200 lb./ft2 loading. Manufacturer shall submit calculations verifying this requirement.
   3. The blade shall be supported on heavy-duty stainless-steel rollers with a minimum diameter of 1.5 inches with pre-lubricated sealed bearings.
      a. Roller and bearing assembly shall be located out of the material flow.
      b. Bearings shall have a minimum 100,000 hours AMBA L10 rating life.
   4. Electric actuator shall be in accordance with Section 40 05 57.23 – Powered Actuators.

B. Submittals shall be in accordance with Section 40 05 60 – Valves and Section 40 05 57.23 – Powered Actuators.
   1. For the applications of seed silo and pellet storage hopper, knife gate valves and electric actuators shall require approval from pellet softening System Supplier or pellet storage hopper Supplier, respectively, that selected products conform to all requirements of supplier's unit responsibility for a fully functional system which reliably operates in a manner such that potential for bridging is minimized.

2.04 MUD VALVES

A. Unless otherwise specified, mud valves shall be iron body, bronze mounted, flange type with nonrising stems. Stems shall be bronze with steel extension shafts where indicated. Operating nuts shall be enclosed in floor boxes or mounted on angle supports as specified and shall be suitable for operation with T-handle wrenches provided with the valves. Operating nuts shall be AWWA standard size. Mud valves shall be Clow F-3080, Waterman MV-11, or equal.

B. Provide extension stems to the operating floor and intermediate guides as recommended by the manufacturer and as required in Section 40 05 60.

C. Valve boxes shall be stainless steel cannister and cover with bolted lid, O-ring seal, bushing, position indicator and operating nut.

D. Manufacturers
   1. Trumbull
   2. Approved Equal.

2.05 PRESSURE RELIEF VALVES

A. Pressure relief valves for air shall be ASME certified, Watts Fig 41A, Lonergan L14/L40 Series, or equal. Size and pressure settings shall be as specified or as required for the service intended. Pressure relief valves for cold and hot water shall be McDonnell and Miller 230, Watts 174A, Cash Acme F-82, Lonergan L14/L40 Series, or equal.

2.06 COMBINATION TEMPERATURE-PRESSURE RELIEF VALVES

A. Combination temperature-pressure relief valves for use with boilers and hot water storage tanks shall be ASME certified and rated.

B. Valves shall be provided with a safety relief testing lever. Connections shall be threaded type.

C. Valves shall be Watts 40-140-N240-340 series, Cash Type NCLX, or equal.

2.07 HOSE VALVES

A. Unless specified otherwise, hose valves shall be a brass angle valve, composition disc, Crane 17, Lunkenheimer 214, Powell 151, or equal with threaded nipple adapter for hose connection.

B. Submerged hose valve shall be 316 stainless steel and NSF/ANSI/CAN 61 certified.

2.08 FLUSHING COCKS

A. Flushing cocks shall consist of a DeZurik 159/118-S, Keystone Fig 541, or equal, neoprene-faced eccentric plug valve with a hose nipple adapter if required. Unless specified otherwise, flushing cocks shall be 1 inch in diameter.

2.09 QUICK DISCONNECTS

A. Quick disconnects shall not be disconnectable under pressure. Quick disconnects for air service shall be Swagelok, Tomco, or equal, and shall be 1/2 inch, unless otherwise specified. Quick disconnects for water service shall be EverTite Part B, Gate Part B, or equal, and shall be 1 inch, unless specified otherwise.

2.10 STOP AND DRAIN VALVES

A. Stop and drain valves shall be Mueller H-10284, or equal.

2.11 VACUUM RELIEF VALVES – CHEMICAL SERVICE

A. Pressure and vacuum relief valves shall be provided for acetic acid bulk storage tanks. To allow air to enter the tank during drain down operations, and not allow air out during filling.
   1. Maximum Liquid Flowrate: 86 gpm
   2. Valve Size: 6-inch
      a. Contractor to confirm size and pressure settings as required for the service intended.

3. Valve Set Point: 0.5 psig.
    a. Pressure and vacuum vent shall not restrict the flow of air, induce a pressure, or vacuum on the tanks. Contractor to coordinate final size requirements with tank manufacturer (Section 43 41 13) and vent scrubber manufacturer (Section 44 31 19) prior to equipment fabrication.

B. Materials of Construction
    1. Housing/Body: Type 316 SS
    2. Pallet: Type 316 SS
    3. Pallet Diaphragm: Teflon (FEP) Film
    4. Weight Material: Type 316 SS

C. Manufacturer
    1. Protectoseal 6240 Series
    2. Approved equal.

2.12 RUBBER DUCKBILL CHECK VALVES

A. The check valve between the South Platte Forebay and the Raw Water Blend Tank shall be Rubber Duckbill type that allows flow in the direction shown on the drawings and prevents flow in the reverse direction.

B. Design

    1. Cracking pressure to open the valve shall be less than 2-inch.

    2. Headloss through the valve at 5600 gpm shall be less than 6-inch.

    3. Maximum water depth above valve centerline on the upstream side is 8 feet.

C. Materials of construction:

    1. ANSI/CAN/NSF 61-600 Certified suitable for service in potable water.

    2. Duckbill: one-piece EPDM elastomer matrix with internal fabric reinforcing.

    3. Flange: integral with the nozzle and fabric reinforcing spanning across the joint between the flange and nozzle body.

    4. Flange drilling: ANSI B16.1 Class 125/ANSI B16.5, Class 150 standards.

    5. Backing/retainer ring: stainless steel 316.

    6. Flange bolts: 316 stainless stee

    7. l.

D. Manufacturer

    1. Red Valve, 35 Series

2. Proco, 710 Series

3. Approved Equal

2.13 PRODUCT DATA

A. Manufacturer's product data shall be provided in accordance with Section 01 33 00.

PART 3 EXECUTION

3.01 INSTALLATION

A. Specialty valves shall be installed in accordance with the manufacturer's recommendations.

END OF SECTION

40 05 72.82

DEGASSING VALVE, CPVC

GENERAL

1. Line Size: ½ inch
2. Rated Limits: Pressure 100 psi; Temperature 85 °F

VALVE MATERIALS

1. Body: CPVC
2. Float: Polypropylene
3. Linkage: CPVC
4. Seals: Viton

VALVE CONFIGURATION

1. Valve End/Connections: THD

SUBMITTALS

1. As required in Section 40 05 06 - Valves
   a. Manufacturer's standard product data
   b. Manufacturer's data indicating acceptable for use with intended fluid service
   c. NSF / ANSI 61 Certification

CANDIDATE MANUFACTURERS

1. Plast-o-Matic DGV Series

SECTION 40 05 78.13

AIR/VACUUM VALVES FOR WATER SERVICE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies air release valves, air and vacuum valves, and combination air valves for clean water service, pumping, and storage applications.

B. Types:
   1. Air Release Valves: Air release valves (ARV) shall have a small venting orifice to vent the accumulation of air and other gases with the line or system under pressure. Size and capacity shall be as specified.
   2. Air and Vacuum Valves: Air and vacuum valves (AVV) shall have a large venting orifice to permit the release of air as the line is filling or relieve the vacuum as the line is draining or is under negative pressure. Size and capacity
   3. Combination Air Valves: Combination air valves (CAV) shall have operating features of both the air and vacuum valve and the air release valve. They include both single- and dual-body construction. Size and capacity shall be as specified.
   4. Combination Air and Vacuum Break Zero Pressure: Combination air release and vacuum break valves (CAVZ) shall seat with zero psi pressure and shall have operating features of both the air and vacuum valve and the air release valve. Size and capacity shall be as specified.
   5. Air Valves for Vertical Turbine Pumps: Air valves for vertical turbine pumps (ATP) shall consist of an air and vacuum valve with throttling device for sizes 3-inch and less, and a dual body construction combination air valve mounted on top of a surge check for sizes 4-inch and larger. Size and capacity shall be as specified.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A126	Gray Iron Castings for Valves, Flanges, and Pipe Fittings
ASTM A240	Heat-Resisting Chromium and Chromium Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels

1.03 SUBMITTALS

A. As required in Section 40 05 60 – Valves

B. Action Submittals:
   1. Procedures: Section 01 33 00 – Submittal Procedures
   2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Owner shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will cfm signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   3. Manufacturers' product data, catalog cuts, typical installation details, and dimensions. Indicate on the submittal each piping system where the product will be used.

C. Information Submittals:
   1. Procedures: Section 01 33 00 – Submittal Procedures
   2. Applicable O&M instruction manuals per Section 01 78 23.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Air release and vacuum valves shall be APCO as manufactured by Valve and Primer Corporation, Crispin as manufactured by Multiplex Manufacturing Company, or equal, modified to provide the specified features and to meet the specified operating conditions.

B. Combination air release and vacuum break zero pressure valves shall be Vent Tech Model WZW.

2.02 MATERIALS

A. Air and Vacuum Valves (ARV, AVV, CAV, and ATP)

Component	Material
Body, cover	Cast iron, ASTM A126, Grade B
Float	Type 316 SS, ASTM A240
Seat	Buna-N or Type 316 SS
Trim	Type 316 SS, ASTM A240

B. Combination Air and Vacuum Break Zero Pressure Valves (CAVZ):

Component	Material
Body, cover	Type 316 SS, ASTM A240
Float	Type 316 SS, ASTM A240
Seat	Type 316 SS, ASTM A240
Trim	UHMW-PE

C. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

2.03 CONSTRUCTION

A. Air release valves shall be float operated, compound lever type, except air release valves less than 1-inch may be simple lever type.

B. Air and vacuum valves shall be designed to protect the float from direct contact of the rushing air and water to prevent the float from closing prematurely in the valve. The seat shall be fastened into the valve cover and shall be easily removed if necessary. The float shall be center or peripheral guided for positive shutoff into the seat.

C. Combination air valves, unless otherwise specified, shall be single-body construction in sizes 1- through 6-inch and dual-body construction in sizes 8-inch and larger. Single-body construction shall be designed to provide all functions within one housing. The body inlet shall be baffled to protect the float and the large and small orifices shall be designed so that during large orifice closure, the small air release orifice will open to allow small amounts of air to escape. Dual-body construction shall combine one air and vacuum valve and one air release valve with interconnecting piping and gate valve.

D. Combination air release and vacuum break zero pressure valves shall be tubular, single chamber design with anti-surge, nozzle, and control floats. Valves shall include a lower bleed port for depressurizing the valve. The valve shall be designed to form an airtight seal at an internal pressure of zero (0) psi.

E. Air valves for vertical turbine pumps (sizes 3-inch and less) shall be designed and constructed as specified for air and vacuum valves except the discharge orifice shall be fitted with a throttling device to regulate and restrict air venting and establish a pressure

loading on the rising column of water on pump start. Unless otherwise specified, air valves, 4-inch and larger, shall be dual body combination air valves except the inlet shall be fitted with a surge check to prevent water column entering the valve on pump start.

F. Valves shall be suitable for pressures up to 150 psi.

2.04 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's product data.
   2. Applicable O&M instruction manuals per Section 01 78 23.

PART 3 EXECUTION

3.01 INSTALLATION

A. Air release and vacuum valves shall be installed in accordance with the manufacturer's recommendations. Unless otherwise specified, isolation valves per Section 40 05 01 shall be provided below each air valve.

END OF SECTION

SECTION 40 05 82

SOLENOID VALVES FOR PROCESS SERVICE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies 2- and 3-way solenoid valves, direct or pilot operated type, for control of process fluids. Valves for air cylinder pilot duty are specified in Section 40 05 57.23.

B. Type:
   1. Valves with piping connections less than 1-1/2 inches in diameter shall be direct-acting type.
   2. Valves with piping connections 1-1/2 inches in diameter and greater shall be pilot operated globe body type.

C. Design Requirements:
   1. Unless otherwise specified, solenoid valves shall be designed to seal or unseal the pressurized (supply) port upon the action specified in the paragraph 1.03.
   2. Valves shall be listed by Underwriters Laboratories Inc. in accordance with UL 429 and UL 1002. Solenoid valves for gas service shall be approved by Factory Mutual Engineering Corporation. The minimum acceptable operating pressure differential for pilot operated valves shall be 5 psi.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A48	Gray Iron Castings
UL 429	Electrically Operated Valves
UL 1002	Electrically Operated Valves for Use in Hazardous Locations, Class I, Groups A, B, C, and D, and Class II, Groups E, F, and G

1.03 SUBMITTALS

A. As required in Section 40 05 60 – Valves

B. Action Submittals:
   1. Procedures: Section 01 33 00 – Submittal Procedures
   2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Owner shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   3. Manufacturers' product data, catalog cuts, typical installation details, and dimensions. Indicate on the submittal each piping system where the product will be used.

C. Information Submittals:
   1. Procedures: Section 01 33 00 – Submittal Procedures
   2. Applicable O&M instruction manuals per Section 01 78 23.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section.

B. Direct Acting Type:
   1. Candidate manufacturers include:
      a. Automatic Switch Company (ASCO)
      b. Honeywell-Skinner
      c. or equal

C. Pilot Type:
   1. Candidate manufacturers include:
      a. Cla-Val Co.
      b. Golden Anderson

c. or equal

2.02 MATERIALS

A. Direct Acting Type:

1. Materials of construction shall be as follows:

Component	Material
Body	Brass or stainless steel, Type 304
Seal	Teflon or Buna-N
Disc	Teflon or Buna-N

B. Pilot Type:

1. Materials of construction shall be as follows:

Component	Material
Main valve body	Cast iron, ASTM A48
Pilot control body	Brass

2.03 EQUIPMENT

A. General:

1. Solenoid valves shall be rated for continuous duty at 24 volts DC or 120 volts AC as indicated. Valves shall be threaded for sizes 2-inch and smaller and flanged for sizes 2-1/2 inch and larger.

B. Direct Acting Type and Pilot Type:

1. Solenoid valves shall be suitable for the area location and usages as indicated in the schedule with fully encapsulated Class H coils. Enclosure type:
   a. NEMA 1 general purpose, molded epoxy construction
   b. NEMA 4X watertight / dust tight / corrosion resistant
   c. NEMA 6P submersible
   d. NEMA 7 explosion proof

C. Unspecified solenoid valves enclosures shall be NEMA 4X.

2.04 PRODUCT DATA

A. Manufacturer's product data shall be provided in accordance with Section 01 33 00.

PART 3 EXECUTION

3.01 INSTALLATION

A. Solenoid valves shall be installed in accordance with the manufacturer's recommendations.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 05 EE

THERMOPLASTIC PROFILE WALL PIPE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section includes construction polyethylene and polyvinyl chloride pipe for storm drainage culverts including appurtenances normally installed as a part of these systems. Construction may include surface preparation, trench excavation, shoring, dewatering, lay, align, and join pipe, installation of appurtenances, bedding and backfilling, surface restoration, and other related work.

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

ASTM F2620	Standard Practice for Heat Fusion Joining of Polyethylene Pipe and fittings
PPI	Handbook of Polyethylene Pipe
PPI TR 33	Generic Butt Fusion Joining Procedure for Field Joining of Polyethylene Pipe

B. Manufacturer Requirements:
   1. All HDPE pipe shall be from a single manufacturer.
   2. All PVC pipe shall be from a single manufacturer.
   3. Experienced in the design, manufacture, and commercial supplying of the specific material for a minimum period of five (5) years.
   4. Experienced in the design, manufacture, and commercial supplying of the specific size of pipe for a period of one (1) year.
   5. Certify to above minimum experience requirements.

C. Inspection and Testing:
   1. Inspection of the pipe shall be made by the Engineer or other representatives of the Owner after delivery. The pipe shall be subject to rejection at any time on account of failure to meet any of the specification requirements, even though pipes may have been accepted as satisfactory at the place of manufacture. Pipe rejected after delivery shall be marked for identification and shall immediately be removed from the job.

1.03 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Detail drawings which show the type and location of all fittings, joints, and connections to structures and manholes.

PART 2 PRODUCTS

2.01 GENERAL

A. HDPE pipe, which does not conform to ASTM D3350, ASTM D 4976, ASTM F667, ASTM F894, ASTM F2306, or ASTM F2562 or to any other requirement specified herein, shall not be approved for storm sewer, culvert, or sanitary sewer installations.

B. PVC pipe, which do not conform to ASTM D1784, F794, D2412, F949, and F477, ASTM D 4976, ASTM F667, ASTM F894, ASTM F2306, or ASTM F2562 or to any other requirement specified herein, shall not be approved for storm sewer, culvert, or sanitary sewer installations.

2.02 MATERIALS

A. Allowable ASTM Specifications: All material, manufacturing operations, testing, inspection, and making of HDPE or PVC pipe shall conform to the requirements of the appropriate allowable ASTM Standard Specifications, latest revision thereof, listed in Article References.

2.03 PIPE

A. Allowable Pipe diameters for this specification shall be between four (4) inches to sixty (60) inches unless approved by Engineer and Owner.

B. Pipe shall have the nominal dimensions shown with an inside diameter basis and the dimensions and tolerances specified in the appropriate ASTM Specification.

C. Wall Thickness and Class of Pipe:
   1. The wall thickness shall comply with the appropriate ASTM Specification and the class of pipe designated on the Drawings.
   2. HDPE
      a. HDPE pipe and fittings shall have a smooth interior and corrugated exterior. 4 inch through 10 inch shall meet the requirements of AASHTO M252 Type S. 12-inch through 60-inch pipe shall meet the requirements of AASHTO M294 Type S and ASATM F2306. The pipe shall have a full circular cross-section with annular corrugations. Pipe shall be produced to constant internal diameters.
      b. Pipe and fittings shall be made of high-density, high-molecular weight polyethylene material meeting the requirements of cell classification 424420C or higher for 4-inch through 10-inch diameter and 435420C or higher for 12-inch through 60-inch diameter in accordance with ASTM D3350.
      c. Clean rework material generated by the manufacturer's own production may be used so long as the pipe or fittings produced meet all the requirements of this Specification.
   3. PVC
      a. PVC pipe and fittings shall have a smooth interior and corrugated exterior. 4 inch through 36 inch shall meet the requirements of ASTM F949. The pipe shall have a full circular cross-section with annular corrugations. Pipe shall be produced to constant internal diameters.
      b. Pipe shall have minimum cell class 12454 per ASTM D1784.
      c. Clean rework material generated by the manufacturer's own production may be used so long as the pipe or fittings produced meet all the requirements of this Specification.

2.04 FITTINGS AND SPECIALS

A. Elbows and fittings shall be mitered from pipe sections welded together on the interior and exterior at all junctions.

B. The pipe sections forming the miters shall be cut to fit with no gap.

C. Tolerances on the angle of all elbows shall be plus or minus 1 degree.

D. The standard turning radius of elbows shall be 1.5 times the inside diameter. Special turning radii shall be used for special applications.

E. Elbows shall conform to the following requirements:

Angle of Elbow (Degrees)	Number of Miters
0 to 45	1
45 to 90	2

F. Elbows shall be designed to prevent joint rupture resulting from dynamic forces or application of a test pressure of 25 psi.

G. Standards
   1. HDPE fittings shall be ASHTO M252 below 12 inches and ASTM F2306 for larger pipe.
   2. PVC Fittings shall be per ASTM F949 or F794.

2.05 PIPE MARKINGS

A. The following shall be clearly marked on both the interior and exterior surface of the pipe:
   1. Class and size.
   2. Date of manufacture.
   3. Name or trademark of manufacturer.
   4. Deflection angle for bends.

2.06 PIPE JOINING

A. Joints:
   1. Watertight joints shall be accomplished by rubber gasket, in accordance with ASTM D3212.
   2. Gaskets shall be closed-cell synthetic, expanded rubber meeting the requirements of ASTM D1056, Grade 2A2 or made of polyisoprene meeting ASTM F477. Gaskets shall be installed on the connection by the pipe manufacturer.
   3. Lubricant shall have no detrimental effect on the gasket of on the pipe.
   4. Integral bell and spigot gasketed joints shall be designed so that when assembled, the elastomeric gasket, contained in a machined groove on the pipe spigot, is compressed radially in the pipe bell to form a positive seal. The joint shall be designed to avoid displacement of the gasket when installed in accordance with the manufacturer's recommendations.

PART 3 EXECUTION

3.01 PIPE HANDLING AND STORAGE

A. The Contractor shall use care in handling and storage of the pipe. Pipe shall be stored on clean, level ground to prevent undue scratching or gouging of the pipe. If the pipe must be stacked for storage, such stacking shall be done in accordance with the pipe manufacturer's recommendations. The handling of the pipe shall be done in such a manner that it is not damaged by dragging over sharp objects or cut by chokers or lifting equipment.

B. Sections of pipe with cuts, gouges, or scratches on the outside diameter (OD) surface that exceed 10-percent of the wall thickness of the pipe shall be removed completely and the ends of the pipeline rejoined. The inside diameter (ID) surface shall be free of cuts, gouges, and/or scratches.

C. The pipe and pipe coatings shall be inspected by Engineer for damage or defects before being placed in the trench. Damaged or defective pipe shall not be installed.

3.02 INSTALLATION

A. General:
   1. All pipes, which do not meet the requirements of Part 2 of this section, will be rejected and replaced at Contractor's expense.
   2. Contractor shall install storm sewer pipe of the type and diameter that is shown on the Drawings.
   3. Proper equipment, implements, tools, and facilities shall be provided and used by Contractor for safe and convenient installation of the type of pipe being installed.
   4. Unless otherwise specified, the piping system shall be installed in accordance with ASTM D2321 and the manufacturer's recommendations.
   5. Precautions shall be taken to prevent foreign material from entering the pipe before or while it is being placed in the line. During laying operations, no debris, tools, clothing or other materials shall be placed in the pipe.

B. Pipe Fittings:
   1. Pipe fittings shall be laid so as to form a close concentric joint with the adjoining pipe to avoid sudden offsets of the flowline. Pipe sections shall be joined together in accordance with the manufacturer's recommendations.
   2. Pipe fittings and appurtenances shall be carefully lowered into the trench with suitable tools or equipment to prevent damage to the pipe and protective coatings and linings; pipe and accessory materials shall not be dropped or dumped into the trench.

C. Gaskets: No gaskets that show signs of deterioration, such as surface cracking or checking, shall be installed in a pipe joint. The neoprene gaskets used, when the air temperature is ten degrees Fahrenheit (10°F) or lower shall be warmed to temperature of sixty degrees Fahrenheit (60°F) for a period of thirty (30) minutes before being placed on the pipe.

D. Trench Excavation:
   1. Trenches shall be excavated to ensure that sides will be stable under all working conditions. Trench walls or supports shall comply with all local and national standards for safety.

E. Location and Alignment:
   1. Pipe and fittings shall be placed in the trench with the invert conforming to the elevations, slopes, and alignments shown.
   2. Variation from the prescribed grade and alignment shall not exceed one-tenth (0.10) foot, and the rate of departure from, or return to, the established grade or alignment shall be not more than one (1) inch in ten (10) feet, unless approved by Engineer. No deviation from grade shall cause a depression in the sewer invert that could retain fluids or solids. Any pipe which is not in true alignment or which shows undue settlement after laying shall be taken up and re-laid at Contractor's expense.
   3. Lift or roll pipe to protect coating. Do not drag over gravel or rock. Avoid striking rocks or hard objects when lowering into trench.
      a. Pipe on which coatings have been damaged may be rejected at the site of the Work regardless of previous approvals.

4. Obstructions not shown on the Drawings may be encountered during the progress of the WORK. Should such an obstruction require an alteration to the pipe alignment or grade, Engineer will have authority to order a deviation from the Drawings, or Engineer may arrange for the removal, relocation, or reconstruction of any structure which obstructs the pipeline

F. Bedding and Backfill:
   1. Materials used for bedding and backfill shall be as specified in Section 31 23 00 and as shown.
   2. Place materials by methods that will not disturb or damage the pipe. All HDPE pipe shall be at the temperature of the surrounding soil at the time it is backfilled and compacted. Work in and tamp the bedding material in the area under the pipe and up to the spring line before placing and compacting the remainder of the embedment. Blocking under the pipe shall not be permitted.
   3. Use compaction equipment and techniques that are compatible with materials specified and location in the trench. Before using heavy compaction or construction equipment directly over the pipe, place sufficient backfill to prevent damage, excessive deflections, or other disturbances of the pipe.

3.03 TESTING

A. General:
   1. Testing of piping shall be as specified in Section 40 05 01 and this section. In case of conflict, the requirements of this section shall prevail.

B. Acceptance Tests for Gravity and Low-Pressure Pipelines:
   1. Alignment:
      a. Sewer shall be inspected by flashing a light between manholes or by physical passage where space permits.
      b. Contractor shall clean pipe of joint sealant, other dirt, and debris prior to inspection.
      c. Determine from Illumination or Physical Inspection:
         1) Presence of any misaligned, displaced, or broken pipe. 2)
         2) Presence of visible infiltration or other defects.

C. Deflection Testing:
   1. General: Deflection testing shall be performed on the entire length of installed pipe no sooner than 30 days after completion of work adjacent to and over the pipeline, including leakage tests, backfilling, placement of fill, grading, paving, concreting, and any other superimposed loads. Deflection of pipe and fittings in the installed pipeline under external loads shall not exceed the maximum deflection specified.
   2. Maximum installed deflections of flexible pipe shall be five percent (5%) of mean internal diameter.
   3. Pipe exceeding deflection limits, as defined in ASTM D2321, shall be replaced or re-compacted at Contractor's expense.

4. Either of the following devices and procedures may be used to measure deflection:
    a. Pull-Through Deflection Testing: The Contractor shall determine whether the allowable deflection has been exceeded by use of a pull-through device.
        1) Pull-Through Device: This device shall be a spherical, spheroidal, or elliptical ball, a cylinder, or circular sections fused to a common shaft. Circular sections shall be so spaced on the shaft that distance from external faces of front and back sections will equal or exceed diameter of the circular section. Pull-through device may also be of a design promulgated by the Uni-Bell Plastic Pipe Association, provided that the device meets the applicable requirements specified in this paragraph, including those for diameter of the device. Ball, cylinder, or circular sections shall conform to the following:
            a) A diameter, or minor diameter as applicable, equal to the average inside diameter of the pipe minus the dimension equivalent of the maximum installed deflection specified. A tolerance of plus 0.5 percent in the diameter of the test device will be permitted.
            b) A homogeneous material throughout, with a density greater than 1.0 as related to water at 39.2 degrees F, and a surface Brinell hardness of not less than 150.
            c) Center bored and through bolted with a 1/4-inch minimum diameter steel shaft having a yield strength of not less than 70,000 pounds per square inch, with eyes or loops at each end for attaching pulling cables.
            d) Each eye or loop shall be suitably backed with a flange or heavy washer such that a pull exerted on opposite end of shaft will produce compression throughout remote end.
        2) Pull-Through Device Procedure: Pass the pull-through device through each run of pipe, either by pulling it through or flushing it through with water. If the device fails to pass freely through a pipe run, replace pipe which has the excessive deflection and completely retest in same manner and under same conditions as specified.
    b. Deflection Device: The Contractor shall determine whether the allowable deflection has been exceeded by use of a deflection measuring device.
        1) Deflection Measuring Device: This device shall be sensitive to 1.0 percent of the diameter of the pipe being tested and accurate to 1.0 percent of the indicated dimension. The deflection measuring device shall be approved by the Construction Manager prior to use.
        2) Deflection Measuring Device Procedure: Measure deflections through each run of installed pipe. If deflection readings in excess of the maximum allowable specified are obtained, retest pipe by a run from the opposite direction. If retest continues to show a deflection in excess of the allowable, remove pipe which has excessive deflection, replace with new pipe, and completely retest in the same manner and under the same conditions.

END OF SECTION

SECTION 40 06 70

SCHEDULES FOR INSTRUMENTATION OF PROCESS SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Instrument List.

B. Related sections:
   1. Section 40 61 13 – Process Control System General Provisions
   2. Section 40 61 21 – Process Control System Testing
   3. Division 40 instrument specifications

1.02 SUBMITTALS

A. Procedures: Section 01 33 00.

B. Process Control System General Provisions, submittal requirements: Section 40 61 13.

C. Action Submittal:
   1. Submit updated schedule with field instrumentation submittal to match equipment being provided.

PART 2 NOT USED

PART 3 EXECUTION

3.01 INSTALLATION

A. Refer to Section 40 61 13 for requirements.

3.02 FIELD QUALITY CONTROL

A. Refer to Section 40 61 21 for requirements.

B. Maintain a copy of the complete Instrument List with modifications during construction in Excel format. Provide a copy of the latest version to the Engineer or Construction Manager upon request.

3.03 ATTACHMENTS

A. 40 06 70 Attachment A: INSTRUMENT INDEX
   1. Description of headings in Instrument Index.

Instrument Field or Heading	Example	Comment or Description
Tag No. Function Abbreviation	PDIT	See P&ID sheet legend.
Tag No. Area Code	01	See P&ID sheet legend.
Tag No. Loop Identifier	23	See P&ID sheet legend.

Instrument Field or Heading	Example	Comment or Description
Tag No. Suffix 1	A	See P&ID sheet legend.
Tag No. Suffix 2	1	See P&ID sheet legend.
Device Function	Primary sludge Pump 1 Discharge flow	Provides the functional description of the instrument, analyzer, or device.
Size or Connection	4" flange	Provides the application data relative to sizing the instrument; flow tube diameter, probe length, associated pipe sizes, etc. 4-inch, 6-inch flange, 3/4-inch tap
Operating Range	25–65	25 to 65, -10 to 90, etc.
Min Calibration or Setpoint	00	00, 24
Max Calibration Or Deadband	24	20
Units	mgd	mgd, kW, psi, etc.
Signal Type	4-20 mA	4-20 mA, Ethernet, DeviceNet, etc., discrete contact, etc.
Power Requirements	120 V	None, loop, 120-volt, 24-volt, internal battery, etc.
Comments	Class 1 Div 2 Area, Owner-supplied for installation by contractor. Provide grounding ring to match instrument.	Provides the features, interlocks, and information applicable to the instrument, analyzer, or device. Describes special installation instructions, area classifications, modifiers to standard instrument specs, Owner-supplied, existing, accessories, signal surge protection, options, etc.
Device Type	FM	Instruspec type or other name in specification listed below
Specification Number	40 71 00	Specification under which device is provided or specified.
P&ID Number	P-003	P&ID sheet number
Installation Detail Number		Installation detail number if provided.

END OF SECTION

SECTION 40 42 00

INSULATION FOR EXPOSED PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section includes thermal insulation for exposed piping, related equipment, and appurtenant surfaces.

1.02 RELATED SECTIONS

A. Section 40 05 02 – Detailed Piping Specification Sheets

B. Section 40 50 07 – Pipe Supports and Hangers

C. Section 40 05 07.13 – Seismic Restraints for Piping

D. Section 40 05 45 – Piping System Identification

E. Section 40 41 13.13 – Electric Heat Tracer Tape

1.03 REFERENCES

A. This Section incorporates by reference the following documents. They are part of this Section insofar as specified and modified herein. In the event of conflict between the requirements of this Section and those of a listed document, the requirements of this Section prevail.

B. ASTM B209 – Aluminum and Aluminum-Alloy Sheet and Plate

C. ASTM C533 – Calcium Silicate Block and Pipe Thermal Insulation

D. ASTM C534 – Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form

E. ASTM C547 – Standard Specification for Mineral Fiber Pipe Insulation

F. ASTM C553 – Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications

G. ASTM C592 – Mineral Fiber Blanket Insulation and Blanket-Type Pipe Insulation

H. ASTM C610 – Expanded Perlite Block and Pipe Thermal Insulation

I. ASTM C795 – Thermal Insulation for Use in Contact with Austenitic Stainless Steel

J. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials

K. ASTM E96 – Water Vapor Transmission of Materials

L. FEDSPEC L-P-535E -- Plastic Sheet (Sheeting) “Plastic Strip” Poly (Vinyl Chloride) and Poly (Vinyl Chloride-Vinyl Acetate), Rigid

M. ASTM C1676 – Microporous Thermal Insulation

N. ASTM C1729 – Aluminum Jacketing and Insulation

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:

B. Low-temperature range: operating temperature range of -100 to +100 degrees F.

C. Medium-temperature range: operating temperature range of 100 to 800 degrees F.

D. High-temperature range: operating temperature range of 800 to 1200 degrees F.

E. Very-high-temperature range: operating temperature range of 1200 to 1800 degrees F.

F. Jacket: protective outer layer placed over insulation on straight runs of pipe

G. Cover: protective outer layer placed over insulation on valves, strainers, expansion joints, flanges, pipe fittings, couplings, and equipment.

H. Exposed: All area exposures specified in Section 01 61 45 other than buried, submerged, or encased/embedded.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Sequencing: After installation of insulation for pipe and equipment is complete, provide identification as described in Section 40 05 45.

1.06 SUBMITTALS

A. Procedures: Section 01 33 00

B. Action Submittals:
   1. A copy of this Section, addendum updates included, with each paragraph check-marked to indicate compliance or marked to indicate requested deviations.
   2. Manufacturer’s descriptive literature, including insulation and jacket thickness, heat transfer coefficient, and methods of installation.
   3. Certification of jacket ratings for water vapor transmission, puncture and stiffness as specified.
   4. ASTM C795 certification, for insulation applied to stainless steel pipe.

C. Informational Submittals:
   1. Samples of each insulation material type and thickness along with typical jackets and covers for pipe, fittings, valves and appurtenances. Provide a full diameter segment for each insulation sample, 6 inches in length.

D. Closeout Submittals:
   1. Warranty Documentation

1.07 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00

B. Deliver insulation, jackets and covering to site using methods which do not damage the materials.

C. Deliver insulation materials to site clearly identified as to type and temperature rating.

D. Store insulation materials on site as recommended by the manufacturer to prevent damage or and weathering.

E. Replace damaged or weathered insulation materials with new materials.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Candidate manufacturers and models are listed below. The manufacturer's standard product may require modification to conform to specified requirements.

B. Cellular Elastomeric Tube
   1. Armacell, AP Armaflex
   2. K-Flex, Insul-Tube
   3. Approved Equal

C. Mineral Wool
   1. Roxul, ProRox PS960
   2. Johns Manville, Min-Wool 1200
   3. Owens Corning, Thermafiber Pro Section WR
   4. Approved Equal

D. Fiberglass
   1. Johns Manville, Micro-Lok HP
   2. Owens Corning, FIBERGLAS
   3. Approved Equal

E. Calcium Silicate
   1. Johns Manville, Thermo-1200
   2. Approved Equal

F. Cellular Elastomeric Flexible Blanket
   1. Armacell, AP Armaflex
   2. K-flex, Insul-Sheet

3. Approved Equal

G. Fiberglass Flexible Blanket
   1. Amatex, Amamat
   2. Lewco, E Glass
   3. Approved Equal

H. Mineral Wool Flexible Blanket
   1. Johns Manville, Min-Wool 1200 Pipe and Tank Wrap
   2. Roxul, Enerwrap MA 960
   3. Approved Equal

I. Silica or Ceramic Fiber Flexible Blanket (Very High Temperature Range)
   1. Morgan Thermal Ceramics, Superwool 607 Blanket AC2
   2. Unifrax, Fiberfrax
   3. Harbison Walker, Inswool-HP
   4. Hitco, Refrasil
   5. Approved Equal

J. Expanded Perlite
   1. Johns Manville, Sproule WR-1200
   2. Approved Equal

K. Thin Flexible Blanket
   1. Johns Manville, InsulThin HT
   2. Approved Equal

2.02 INSULATION SERVICE CONDITIONS

A. Insulation Service Types
   1. Insulation service types define the function of the insulation. The extent and location of insulation application is based on the function of the insulation. This Section specifies the following insulation service types: Condensate Control, Personnel Protection, Freeze Protection, and Energy Conservation. Insulation Service Types and insulation materials for piping systems are specified in Piping System Schedules.
   2. Condensate Control is specified for piping that is to be insulated for condensate control. Where Condensate Control is specified for a piping service, furnish insulation for all pipe and pipeline appurtenances with a line size of ½-inch and larger that are located in Indoor Dry or Indoor Wet areas.
   3. Personnel Protection is specified for piping that is to be insulated to protect personnel from injury related to exposure to temperatures above 140 degrees F or below 32 degrees F. Where Personnel Protection is specified for a piping service in the Piping System Schedules, furnish insulation for all pipe and pipeline appurtenances where all of the following conditions are present:
      a. Piping is connected to the discharge or exhaust of equipment (includes equipment and pipeline appurtenances).

b. Equipment, pipe, or pipeline appurtenances are located within 0.0 to 8.0 feet above a floor, stair, landing, or other type of walkway accessible by plant staff, or within 4.0 feet of a guardrail or ladder cage. Pipe, pipeline appurtenances, joints, flanges, valves, and equipment in vaults, utilidors, and other spaces that are not designed for pedestrian access by plant staff are not insulated for Personnel Protection.

4. Freeze Protection is specified for piping that is to be insulated and heat traced to protect against freezing the contents of the pipe. Where Freeze Protection is specified for a piping service in the Piping System Schedules, furnish insulation for all piping to be freeze protected by electric heat trace tape as specified in Section 40 41 13.13. Coordinate electric heat trace tape installation with specified insulation requirements for freeze protection to provide freeze protection for piping as specified in Section 40 41 13.13.
5. Energy Conservation is specified for piping that is to be insulated to conserve energy. Where Energy Conservation is specified for a piping service in the Piping System Schedules, furnish insulation for all pipe and pipeline appurtenances for the entire portion of the piping system that is exposed.

B. General:
1. Provide materials that are new and undamaged.
2. Match specified pipe insulation and jacket/cover material for insulation on valves, strainers, fittings, expansion joints, flanges, and other pipe couplings. Furnish flexible blanket insulation and soft covers if insulation on valves, strainers, fittings, expansion joints, flanges, and other pipe couplings is not available in the same materials as the specified pipe insulation and jacket/cover.
3. Provide rigid insulation and shields at pipe supports for insulated pipe. Match specified jacket/cover material for pipe shields at pipe supports.
4. Provide insulating and sealing materials, including cements, coverings, etc., that do not contain asbestos, mercury, or lead.
5. When covering stainless steel pipe, pipeline appurtenances, or equipment, use insulation that complies with ASTM C795..
6. Flame spread classification for insulation materials is not to exceed 25 when tested in accordance with ASTM E84.
7. Use fibrous loose fill insulation for joint filler around insulated expansion joints.

C. Fiberglass Flexible Blanket: Flexible fiberglass blanket insulation designed for continuous 1200 degree F service. 8.0 pounds per cubic foot density, minimum. Long fiber, random orientation, needled.

D. Mineral Wool Flexible Blanket: Flexible mineral wool blanket insulation designed for continuous 1200 degree F service.

E. Silica or Ceramic Fiber Flexible Blanket: High purity alumina and silica non-asbestos white ceramic fiber insulation designed for continuous 1800 degree F service.

F. Aluminum Insulation Jackets/Covers
1. Aluminum jackets and covers constructed of smooth finish aluminum sheet conforming to ASTM B209, alloy 3003, or 3105 temper H14, with integral vapor barrier.

2. Pipe Insulation Jacket thickness per ASTM C1729, as follows.

Outer Insulation Diameter (inches)	Aluminum jacket thickness, rigid insulation (inch)	Aluminum jacket thickness, flexible and semi-rigid insulation (inch)
≤ 8	0.016	0.016
8 thru 11	0.016	0.020
11 thru 24	0.016	0.024
24 thru 36	0.020	0.032
≥ 36	0.024	0.040

3. Furnish 0.030 inch, minimum thickness, for aluminum insulation covers at valves, strainers, fittings, expansion joints, flanges, and other pipe couplings.
4. Aluminum or stainless steel sheet metal screws.
5. Jackets secured with 0.020 inch thick by ¾ inch wide Type 304 stainless steel expansion bands.
6. Flashing includes aluminum caps, sealant and reinforcing.
7. Provide aluminum caps, 20 gauge. Cut to completely cover the insulation.
8. Provide sealants as recommended by the insulation manufacturer.
9. Provide wire mesh reinforcement or nylon fabric reinforcement in sealant at jacket and cover joints. Reinforcement material as recommended by the insulation manufacturer.

G. PVC Insulation Jackets and Covers
1. One piece PVC covers and jackets. 20 mil thickness, minimum.
2. Pre-molded polyvinylchloride conforming to FEDSPEC L-P-535E, Composition A, Type II, Grade E4.

H. Non-combustible Fabric Cover
1. Custom fit reusable covers. Sewn or stapled covers encapsulating insulation with stainless steel staples/hog rings. Close fit to the piping, pipeline appurtenance, or equipment housing.
2. Fabricated from 32 ounce TFE-coated or silicone coated fiberglass cloth with concealed/interior stitching, staples or hog rings (not exposed). For flexible blanket insulation installed for High-Temperature and Very High-Temperature Range applications, eliminate non-combustible fabric material on hot face of covers and provide stainless steel wire mesh on hot face of covers.
3. Fabric rated for continuous exposure to the temperature range of the insulation (Low, Medium, High, or Very High Temperature Range).
4. Secured in place with stainless steel lacing hooks, lock washers, and lacing wire.
5. Stitched or quilted to prevent consolidation, shifting, or settlement of insulation when subjected to vibration.

PART 3 EXECUTION

3.01 PREPARATION

A. Apply insulation over clean, dry surfaces.

B. Ensure insulation is dry before and during application.

C. Do not apply protective pipe coatings to outside surface of insulation jackets or covers.

D. Do not paint PVC, aluminum, or fabric covers.

E. Do not install insulation or jackets/covers before piping and equipment has been tested and approved. Thermal shields at pipe hangers and supports may be installed prior to testing.

F. Provide thermal pipe hanger shields at pipe supports and bracing as specified on the Drawings, Details, Section 40 05 07 and Section 40 05 07.13.

3.02 INSTALLATION

A. General
   1. Where insulation thickness exceeds 3 inches, double layer insulation must be provided. Install double layer insulation with staggered section joints.
   2. Supply insulated thermal pipe hanger shields and install during pipe support installation. Where insulated thermal pipe hanger shields are used, apply the following to all butt joints:
      a. For pipe insulation with a medium, high, or very high Operating Temperature Range, apply 3 inch wide vapor barrier tape or band over the butt joints.
      b. For pipe with a low Operating Temperature Range, apply a wet coat of vapor barrier lap cement on all butt joints and seal the joints with a minimum 3 inch wide vapor barrier tape or band.

B. Protect insulation and jackets from crushing, denting, and similar damage during construction. Do not penetrate or otherwise damage vapor barriers. Remove any insulation, jacket, and vapor barriers damaged during construction and install new material.

C. Provide flashing at joints between insulation jackets, between insulation jackets and insulation covers, and at endcaps. Provide flashing around flange sets, pipe couplings/connections, and joint fittings. Allow adequate clearance between insulation rings, jackets and the joint connection for the removal and reinstallation of hardware during inspection and maintenance activities.

D. Piping Insulation
   1. Install uninterrupted (continuous) insulation as indicated for the specified Insulation Service Conditions (Condensation Control, Energy Conservation, Personnel Protection, or Freeze Protection). Insulate over pipe and all in-line devices such as valves, fittings, flanges, couplings, strainers and other piping appurtenances. Butt insulation firmly together and provide jacket laps and joint strips with lap adhesive. Provide a minimum of 2 inches of lap length. Install jackets with their seams located on the underside of pipe.
   2. Covers overlap the adjoining pipe insulation and jackets.
   3. Install covers with their seams located on the underside of valves, fittings, flanges, couplings, strainers and other piping appurtenances.

4. Low Operating Temperature Range
    a. Seal off ends of pipe insulation with a vapor barrier coating.
    b. Seal covers at edges with vapor barrier adhesive. Secure the ends of covers with vinyl tape. Overlap the jacket and the cover at least one inch with vinyl tape. Do not penetrate vapor barrier.
5. Medium, High, and Very High Operating Temperature Range
    a. Seal ends of insulation with end joint strips and use waterproof adhesive to hold them in place.
    b. Mechanically secure covers using corrosion-resistant tacks pushed into the overlapping throat joint.
6. Insulation for Outdoor Piping
    a. Where insulated pipe emerges from soil, concrete or asphalt terminate insulation for exposed pipe at the interface with insulation for buried pipe. If buried pipe is not insulated, extend insulation to within an inch above the finished surface. Do not push insulation into contact with soil, finished concrete, or asphalt surface.
    b. Provide heat tracing as specified in Section 40 41 13.13. Install insulation over heat tracing according to the specifications of the heat trace tape and insulation manufacturers.

E. Mechanical Equipment Insulation
1. Unless otherwise specified in this Section, fit insulation to the contours of equipment and secure it with 1/2 by 0.015 inch stainless steel bands. Weld pins or stick clips with washers may be used for flat surfaces and spaced a maximum 18 inches apart. Stagger joints and fill voids with insulating cement.
2. Overlap ends of blanket segments to prevent gaps and voids when the piping and equipment are heated.
3. Secure blankets snugly under nuts and bolt heads to assure complete coverage during operation and to prevent vibration-induced gaps or voids.
4. Secure blankets in strict accordance with the manufacturer's instructions.

F. Flashing
1. Provide flashing at jacket penetrations and terminations. Provide clearance for flashing between insulation system and piping supports.
2. Form aluminum caps to fit over the adjacent jacketing and to completely cover coated insulation. Hold cap in place with a jacket strap.

END OF SECTION

SECTION 40 61 13

PROCESS CONTROL SYSTEM GENERAL PROVISIONS

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies general requirements applicable to Sections 40 60 00 through 40 79 99 of these specifications for the process control, instrumentation, communication, network, and signal systems. This work will be referenced as the Process and Instrumentation Control System (PICS) to be provided by a single Systems Integrator (SI) meeting the qualifications section of this specification.

B. System overview. Detailed requirements are in individual related specification sections.
   1. Field Instrumentation:
      a. New field instruments.
   2. Process Control Hardware:
      a. Expansion of Owner's existing control system.
      b. Field controllers use programmable logic controllers (PLC).
      c. New control panels.
   3. Process Control Software, Programming, and Integration:
      a. Expansion of Owner's existing control system.
      b. Integrated hardware and software across controllers and operator interface systems from separate manufacturers.
      c. All integration shall be provided by IS. Programming of Contractor-supplied PLCs and SCADA/HMI shall be provided by others.
      d. Coordinated programming and testing responsibilities between supplier and Owner.
      e. Integration with packaged system controls in other sections.
      f. Integration with existing plant security system, andplant network and communication system.
   4. Communications and Networking
      a. Interface to and expansion of existing Owner networks.
      b. Hardwired fiber-optic and copper communications systems.

1.02 RELATED SECTIONS:

A. The requirements of this section are applicable to work specified in Sections 40 60 00 through [40 79 99] of these specifications.

B. Section 40 06 70 – Schedules for Instrumentation of Process Systems.

C. Division 26 - Electrical

1.03 REFERENCES

A. Reference Standards:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.
   2. Unless otherwise specified, references to documents mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids).
   3. If referenced documents have been discontinued by the issuing organization, references to those documents mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.
   4. Where document dates are given in the following listing, references to those documents mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued, or replaced.

Reference	Title
IEEE 100	Standard Dictionary of Electrical and Electronics Terms
ISA 5.4	Instrument Loop Diagrams
ISA 20	Specification Forms for Process Measurement and Control Instrumentation, Primary Elements, and Control Valves
ISA 51.1	Process Instrumentation Terminology
ISA TR20.00.01	Specification Forms for Process Measurement and Control Instruments Part 1: General Considerations
NFPA 70	National Electrical Code (NEC)
NEMA ICS 1	General Standards for Industrial Control and Systems

1.04 DEFINITIONS

A. Abbreviations:
   1. dBm: decibel-milliwatts
   2. DCS: distributed control system
   3. DCU: distributed control unit, or digital control unit.
   4. HIM: human interface module
   5. HMI: human-machine interface
   6. OIT: operator interface terminal
   7. PCS: plant control system
   8. PICS: Process and Instrumentation Control System
   9. PLC: programmable logic controller
   10. RTU: remote terminal unit
   11. SCADA: supervisory control and data acquisition
   12. SI: Systems Integrator

B. Definitions General:

1. General: Definitions of terminology related to Instrumentation and Industrial Electronic Systems used in the specifications as defined in IEEE 100, ISA 51.1, and NEMA ICS 1.
2. Data sheets: Data sheets refer to ISA 20 or ISA TR20.00.01, as referenced within ISA-20-1981 specification.
3. Two-wire transmitter: A transducer that derives operating power supply from the signal transmission circuit and requires no separate power supply connections. A two-wire transmitter produces a 4- to 20-milliampere current regulated signal in a series circuit with a 24-volt direct current (VDC) driving potential and a maximum circuit resistance of 600 ohms.
4. Four-wire transmitter: A transducer that derives operating power from separate power supply connections. A four-wire transmitter produces a 4- to 20-milliampere current regulated signal in a series circuit with a maximum circuit resistance of 600 ohms. Four-wire transmitters typically require 120-volt alternating current (VAC) or 24VDC input power supply.
5. Galvanic isolation: An electrical node having no direct current path to another electrical node. Galvanic isolation refers to a device with electrical inputs and/or outputs that are isolated from ground, the device case, the process fluid, and separate power supply terminals. Inputs and/or outputs may be externally grounded without affecting the characteristics of the devices or providing a path for circulation of ground currents.
6. Panel: An instrument support system that may be a flat surface, partial enclosure, or complete enclosure for instruments and other devices used in process control systems including consoles, cabinets, and racks. Panels provide mechanical protection, electrical isolation, and environmental protection from dust, dirt, moisture, and chemical contaminants that may be present in the atmosphere.
7. Systems Integrator: A firm engaged in the business of detailed control system design and engineering, instrumentation component purchase, system and panel assembly, control device programming, and implementing of the specified process control and industrial automation systems.
8. Impulse line: A small-gauge pipe that is used to connect a point in a pipe in which the pressure is measured at an instrument. In flow measurement using a primary device such as an orifice plate, nozzle or Venturi meter, impulse lines are used to connect upstream and downstream (or throat) points of the meter to a secondary device for measuring the differential pressure.

C. Definitions—Signal Types:

1. Analog, low level: Signal with full output level of 100 millivolts or less including thermocouples and resistance temperature detectors.
2. Analog, high level: Signals with full output level greater than 100 millivolts but less than 30 volts, including 4 to 20 mA transmission.
3. Audio signals, high level: Audio signals exceeding plus 4 dBm, including loudspeaker circuits.
4. Digital code: Coded information from the output of an analog-to-digital converter or digital transmission terminal.
5. Discrete control or events: Dry contact closures and signals monitored by solid-state equipment, relays, or control circuits.

6. Discrete control or events, low voltage: Dry contact closures and signals monitored by solid-state equipment, relays, or control circuits operating at less than 30 volts and 250 milliamperes.
7. Modulated signals: Signals from modems or low-level audio signals. Normal signal level: plus 4 dBm to minus 22 dBm. Frequency range is 300 to 10,000 hertz.
8. Pulse frequency: Counting pulses emitted from speed or flow transmitters.
9. Radio frequency (RF) signals: Continuous wave alternating current signals with fundamental frequency greater in a range of 310 kilohertz to 300 gigahertz.

D. Definition—Drawing Types:
   1. Elementary or schematic diagram:
      a. Use graphic symbols to indicate the electrical connections and functions of a specific circuit arrangement. The schematic diagram facilitates tracing of the circuit and its functions without regard to the actual physical size, shape, or location of the component devices or parts.
      b. Indicate connections to internal and external components connected to the panel. Note which devices are external to the panel.
      c. Depicted in ladder logic format.
      d. Indicates contact arrangement of internal and external devices such that circuits are complete and match equipment furnished.
      e. Indicates equipment designations/tag numbers to match contract drawings and P&IDs.
   2. Block diagram: A diagram of a system, instrument, computer, or program in which selected portions are represented by annotated boxes and interconnecting lines.
   3. Network block diagram:
      a. A diagram of the overall control system, containing annotated boxes showing the primary network components (controllers, hubs, routers, switches, computers, displays).
      b. Include annotated interconnecting lines showing the system communication media and communication protocols.
      c. Indicate manufacturer and model of the primary network components and software.
      d. Indicates functions performed by each device (e.g., Historical Data Server, Field controller, Database Server, Operator workstation, etc.)
   4. Connection diagram:
      a. Purpose is to show wiring requirements between internal panel components.
      b. Show components of a control panel in an arrangement similar to the actual panel layout.
      c. Indicate internal wiring between components.
      d. Show terminal blocks used for internal wiring and field wiring, with identification as such.
      e. Indicate insulation color code, signal polarities, wire numbers, and terminal block numbers.
   5. Interconnection diagram:
      a. Purpose is to show wiring requirements between panels, standalone devices, components, and instruments.

b. Indicate wire numbers, cable numbers, raceway numbers, terminal box numbers, terminal block numbers, panel numbers, and field device tag numbers.
c. Show external connections between terminals of equipment and outside points, such as motors and auxiliary devices.
d. Indicate references to connection diagrams that interface to the interconnection diagrams.
e. Interconnection diagrams are to be of the continuous line type. Show bundled wires as a single line with the direction of entry/exit of the individual wires clearly shown. Wireless diagrams and wire lists are not acceptable.
f. Show termination of each cable. Clearly mark each termination point. Show each wire's identification as actually installed. The wire identification for each end of the same wire shall be identical. Identify devices and equipment.
g. Depict terminal blocks as actually installed and identified in the equipment with individual terminal identification.
h. Indicate external jumpers, shielding, and grounding terminations.
i. Indicate polarities for signal and DC circuit.
j. Depict spare wires and cables installed or slated for installation.

6. Arrangement, layout, or outline drawings:
   a. Show the physical space and mounting requirements of a piece of equipment.
   b. Indicate ventilation requirements and space provided for connections or the location to which connections are to be made.
   c. Indicate clearance requirements for ventilation and access.
   d. Show the dimensioned external and interior control panel views with components and Bill of Material.
7. Loop diagrams:
   a. Prepared per ISA 5.4 – Loop Diagrams using the sample Loop Diagrams attached to this section.
   b. Show device element wiring of the system. Indicate device terminations, with terminal numbers.
   c. Show circuits for hardwired device interlocks.
   d. Show circuit cable and wire cable numbers, signal polarities, and terminal block numbers.
   e. Show connection to power supplies. Include alternating current (AC) and direct current (DC) power supplies and circuit information for instruments furnished under this contract.
   f. Indicate controller or I/O card address/node, rack, slot, and point wiring terminals.
   g. Show power supplies for signal loops. Indicate in which panel components reside and power originates with circuit numbering/name. Where new/modified loops connect to an existing power supply, show the existing power supply name, location, and circuit.
   h. Indicate surge protection type, manufacturer, and model number (i.e., types include floating ground reference or grounded reference).
   i. Show new and modified terminal blocks with numbering in new and existing panels.
   j. Indicate signal loop grounding terminations.

k. Indicate loop numbers, wire numbers, and cable numbers used in field wiring and panel wiring.

l. Indicate field element being controlled or monitored (i.e., normally open contact from relay CR17, or FIT 365).

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate the process and instrumentation control system for proper operation with related equipment and systems specified in other Divisions.
2. Integrate equipment in conformance with the drawings, specifications, and recommendations of the equipment manufacturer and the related processes equipment manufacturers.
3. Obtain manufacturer's technical information for items of equipment not provided with, but connected to, the control system. Provide the necessary coordination and components for correct signal interfaces between equipment and the control system.
4. Coordinate interface requirements and schedule with other project subcontractors and equipment suppliers.
5. Present to the Construction Manager conflicts between the plans, specifications, manufacturer/vendor drawings, and installation instructions, etc. for resolution before proceeding.

B. Pre-submittal conference:

1. Schedule a pre-submittal conference with the Contractor, Systems Integrator, Owner, Engineer, and Construction Manager within 30 calendar days after Contract award to discuss the work, equipment, and submittal format, and to establish the framework for project coordination and communication.
2. Provide the following materials 10 days prior to the conference:
   a. Proposed Systems Integrator that will meet the qualifications requirements of this section.
   b. Indicate full conformance with the specification sections covered by this section with a contract deviations request. Requested contract deviations to reference and to be attached to the applicable contract specifications and drawings. Provide justification for requested deviations.
   c. Proposed "equal" products that differ from specified manufacturers/models with comparative listing of the published specifications for the specified item and the proposed item.
   d. Project schedule with deliverables and milestones through project completion.
   e. Sample submittal drawings, as specified to be provided for this project. Samples can be a copy from a previous project provided that represents the format being proposed for this project.
      1) Control system block diagram.
      2) Documented controller and operator interface program.
      3) Control panel schematic diagram.
      4) Interconnection diagram.
      5) Analog and discrete loop diagrams.
      6) Control panel arrangement drawing.

3. The pre-submittal conference will not replace the Product and Shop Drawing Submittal review process.

1.06 SUBMITTALS

A. General:
   1. Procedures: Section 01 33 00.
   2. This article indicates general requirements applicable to all PICS submittals. Additional information to be submitted with each section will be listed under Action Submittals or Closeout Submittals in this and each related section.
      a. Submit all information for sections covered by a submittal as a complete package in one submittal. Partial submittals of a section from multiple vendors showing contractor's division of equipment, labor, or portions of the work are not acceptable.
      b. Include a table of contents in each submittal divided by specification section and content of each section such as drawings and components. Clearly indicate the article or paragraph to which each table of content item applies.
      c. Related sections indicate additional detail for each submittal.
      d. Bookmark PDF submittals to match the table of contents of each submittal. Submitted information is to conform to the following:
         1) Shop Drawings: Prepare drawings in .pdf format with borders and title blocks identifying the project, system, revisions to the drawing, and type of drawing. Include a date and description for each revision of a drawing including the date and description of the revisions. Drawing prints shall be 11" by 17" with a minimum lettering size of 1/8". Where directed, Contractor shall generate drawings using Owner-furnished drawing borders and title blocks, and in adherence to Owner's latest standards.
         2) Product Literature: Provide manufacturer's specifications, data sheets, and catalog literature for the equipment and components that clearly and unambiguously show what is being provided and that it meets the requirements specified. Indicate provided and available options, materials of construction, environmental characteristics, electrical characteristics, and connection requirements. Include only applicable information.
      e. Conformance with Contract Documents:
         1) Provide a copy of sections applicable to the submittal group with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
         2) Check-marks (✓) shall be used to denote full compliance with a paragraph as a whole. Underline deviations and denote them with a number in the margin to the right of the identified paragraph. Paragraph portions not underlined signify specification compliance. Include a detailed, written justification for each deviation. Show conformance with all paragraphs in a section. Failure to include a copy of the marked-up specification sections and justification(s) for requested deviations is cause for rejection of the entire submittal with no further consideration.

3) Mark a copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, mark the drawing or drawings "no changes required." Failure to include copies of the relevant drawings with the submittal is cause for rejection of the entire submittal with no further review. Contract drawings would include the following:
    a) Network system block diagrams
    b) Cabinet and panel arrangement drawings
    c) Control single-line diagrams
    d) Process and instrumentation diagrams
    e) Instrument installation details
4) Show conformance across suppliers and vendors in one submittal. Partial submittals from multiple vendors showing contractor's division of labor or portions of the work are not acceptable.
5) Provide a detailed written request and explanation for each deviation. Failure to include a copy of the marked-up specification sections and drawings, along with justification(s) for requested deviations to the contract requirements, with the submittal, is cause for rejection of the entire submittal with no further consideration.

B. Closeout submittal general requirements.
    1. Procedures: Section 01 78 23.
    2. Provide record drawing prints of drawings and schedules following project startup, but prior to acceptance of the work, showing the final constructed state of the process instrumentation and control systems.
    3. Include the following in each operation and maintenance manual:
        a. Final reviewed submittals, including revised as-built record drawings.
        b. Manufacturer's operation and maintenance instructions, edited for this project.
        c. Written record of menu configuration, jumpers, switch settings, and other configurable parameters for each instrument.
        d. Final hardware and software configurations for Contractor-supplied equipment in the native format. Include a comprehensive report print-out from each Contractor- and vendor-supplied CPU in full color. Provide in .pdf format on electronic media, including a hard copy.
        e. Final network equipment software configurations.
    4. Markup of existing O&M documentation that show modifications to existing panels, communications, and loops/wiring.
    5. Maintenance Material Submittals
        a. Provide one listing of spare parts that is divided by specification section.
        b. Include list prices for spare parts, expendable supplies, and tools.
        c. Indicate spare parts packaging and storage methods.
        d. Indicate spare parts or components that could be deleted or reduced based on manufacturer's recommendations.

e. Indicate where manufacturer's recommendations exceed the spare parts specified.

f. Obtain spare parts from the equipment manufacturer. Do not provide third-party equivalent replacements.

g. Packaging, Testing, and Storage:

1) Provide protective toolboxes for special tools.

2) Test spare boards, circuit cards, power supplies, and similar spare electronic assemblies on site prior to acceptance.

3) Carefully repackage operable parts. Immediately remove inoperable parts from the site and order replacement parts. Test replacement parts prior to acceptance.

4) Package spare parts for protection against dirt and moisture. Label each package as to its contents with a description and part number.

5) Do not place spare parts for different equipment items in the same package.

C. Action Submittals

1. Quality Assurance (within 30 days of contract Notice to Proceed):

a. Systems Integrator qualifications per paragraph 1.08, Quality Assurance.

b. Project personnel qualifications per paragraph 1.08, Quality Assurance.

2. Interconnection Diagrams per paragraph 1.02.

a. Between all Contractor-supplied, vendor-supplied, and System Integrator-provided equipment.]

b. Between all System Integrator-provided equipment and all other connected equipment. Include terminal numbers for all other connected equipment.

D. Closeout Submittals

1. Provide record drawing prints of drawings and schedules following project startup, but prior to acceptance of the work, showing the final constructed state of the process instrumentation and control systems.

1.07 QUALITY ASSURANCE

A. All work covered by Sections 40 60 00 through 40 79 99 shall be the responsibility of a single SI as defined within this article.

B. The instrumentation and control system functions are shown on the drawings and specified in subsequent sections of Division 40. The SI drawings and integration practices shall be as defined in IEEE 100, ISA 51.1, and NEMA ICS 1.

C. Demonstrate the overall system performance to the Owner for acceptance.

D. SI qualifications:

1. The following Systems Integrators are pre-qualified to perform the work specified in Division 40 without the need to provide Evidence of Experience:

a. (Need input from SLC DPU and CCWTP for qualified Sis)

b. Only the firms above will be allowed to provide this work.

2. Evidence of Experience—Company specializing in the products and work of this section and related sections:
    a. Minimum of 10 years of documented experience with the equipment specified as well as overall systems responsibility for systems of similar size and complexity.
    b. Experience in performing three similar successful projects (equipment type, software type, SI responsibilities, complexity, and dollar value of work performed by SI) in the last 5 years. At least one project currently in progress or completed within the last 2 years.
    c. End-user satisfaction of projects in the past 3 to 5 years based on end-user interviews by the Owner or Engineer. Submit project descriptions of projects completed within the past 5 years with contact names, addresses, and telephone numbers from the project Owner, General Contractor, and Principal Design Firm.
    d. Panel fabrication and staging facilities adequate to provide services for this project. Demonstrate by including the following:
        1) Minimum 10,000 square feet of dedicated space for panel fabrication and testing.
        2) Panel shop shall be UL 508/508A recognized to produce panels to UL 508/508A and UL 698 standards and labeling.
    e. Financial resources available and projected for successful completion of this project. Submit financial data for SI division when subsidiary to a parent corporation. Include 2 years of financial data:
        1) Financial statement.
        2) Balance sheet.
        3) Dun & Bradstreet Report.

E. SI Personnel Qualifications: Provide qualified personnel to complete the work specified for this project. Demonstrate by including the following:
    1. Organization chart and resumes for proposed project personnel showing experience for the proposed roles on this project.
    2. Training and certification information. Completion of the following training courses or appropriate portions thereof or possession of the following certifications included with the Systems Integrator's personnel experience requirements described above:
        a. Project manager: Control System Engineer (CSE) registration, Professional Engineer (PE) registration, or Project Management Professional (PMP) certification.
        b. Systems engineer: Control System Engineer (CSE) registration, Professional Engineer (PE) registration, or completion of the relevant core courses in the Engineering Skills Training program as certified by ISA.
        c. Programmer: Certified by the software/hardware manufacturer for the software and hardware being used on the project, or Control System Engineer (CSE), or Professional Engineer (PE) registration.
        d. Field instrument technician: Certified Control Systems Technician (CCST) registration or completion of the relevant core courses in the Technical Skills Training program as certified by ISA.

1.08 ENVIRONMENTAL CONDITIONS

A. Ambient conditions: Per Section 01 11 80

B. Corrosive locations: Per Division 26.

C. Hazardous (Classified) areas: Per contract drawings.

D. Seismic:
   1. Brace equipment and supports per Structural Drawings.

PART 2 PRODUCTS

2.01 EQUIPMENT/MATERIALS

A. General requirements:
   1. New.
   2. Free from defects.
   3. Rated for the installed environment.

B. Similar control system components, instrument, instrument accessory, and devices used throughout the work shall be manufactured by one firm, where possible.

C. The components, modules, devices, and control system equipment shall be recognized industrial-quality products. Recognized commercial- or office-grade products are prohibited.

D. Identification of Listed Products: Provide process measurement devices listed and labeled for the purpose for which they are to be used and the installation environment, by an independent testing laboratory. Three such organizations are Underwriters Laboratories (UL), Canadian Standards Association (CSA), and Factory Mutual (FM). Independent testing laboratory need be acceptable to the inspection authority having jurisdiction.

E. Use electronic equipment of solid-state construction with printed or etched circuit boards of glass epoxy of sufficient thickness to prevent warping.

F. Printed circuit boards in field-mounted equipment are to be coated with 2 mils of conformal coating in compliance with MILSPEC MIL-I-46058C.

G. Equipment supports: shall be 316L stainless steel, as shown, or as specified.

2.02 SOFTWARE

A. Software packages are to be latest versions available or compatible with existing software currently in use, as specified in Section 40 68 13.

2.03 ENCLOSURES

A. Table A specifies the instrument and control panel enclosure material and minimum NEMA rating for the location and application where not identified in other specification sections.

TABLE A

Location	Enclosure Material and NEMA Rating
Indoor: architecturally finished area	NEMA 12: mild steel
Indoor: electrical room	NEMA 12: mild steel
Indoor: process areas	NEMA 4X: compatible with environment
Indoor: corrosive area	NEMA 4X: compatible with environment
Outdoor: corrosive area	NEMA 4X: 316 stainless steel
Outdoor: non-corrosive areas	NEMA 4X: 316 stainless steel
Corrosive area (hypochlorite)	NEMA 4X: non-metallic
Hazardous area	NEMA 7: galvanized malleable iron or aluminum or NEMA 4X and UL listed or FM approved for the hazardous area. Where no such enclosure is available, enclosure ratings shall be for the indoor or outdoor area and shall be made intrinsically safe.
Hazardous and corrosive area	NEMA 7: iron or aluminum with factory-applied corrosion-resistant coating or NEMA 4X and UL listed or FM approved for the hazardous area. Where no such enclosure is available, enclosure ratings shall be for the indoor or outdoor area and shall be made intrinsically safe.

2.04 NAMEPLATES

A. Provide nameplates for field-mounted instrument, analyzer, or equipment covered by this section with the following requirements:
   1. Include the equipment or instrument loop title and the instrument or equipment tag number, where nameplate engraving is not specified or shown.
   2. Machine engraved with black lettering on white phenolic with 5/32-inch-high lettering, as minimum, unless otherwise specified or shown.

B. Nameplate wording may be changed without additional cost or time if changes are made prior to commencement of engraving.

C. Attach nameplates to support hardware with a minimum of two self-tapping type 316 stainless steel screws in a readily visible location so the nameplate will remain to identify the service when the device is removed. Attach field instrument nameplates with braided stainless steel straps where not stand-mounted.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify field measurements prior to fabrication.

3.02 INSTALLATION

A. General:
   1. Install equipment in locations that are accessible for operation and maintenance services.
   2. Installation, calibration, settings, and testing procedures are specified in Section 40 61 13, Section 40 06 70, and subsequent sections of Divisions 26 and 40.
   3. Equipment and instruments located in classified areas shall be installed in accordance with the manufacturer's requirements for installation; including classified areas. The installation shall meet the requirements for protection techniques or methods required by the NEC.

B. Field Equipment:
   1. Provide equipment with ports and adjustable items accessible for in-place testing and calibration. Install equipment between 48 inches and 60 inches above the floor or permanent work platform. Equipment shall be mounted to avoid shock or vibration that may impair operation. Equipment shall be mounted for unobstructed access and walkways. Equipment support systems shall not be attached to handrails, process piping or mechanical equipment.
   2. Instruments and cabinets supported by concrete walls shall be spaced 5/8 inch by framing channel between instrument or cabinet and wall. Block wall shall have additional installation supports, as required, to avoid damage to the wall. Equipment support material shall be, as shown or specified.
   3. Support systems including panels shall be designed in accordance with Section 01 73 23 to prevent deformation greater than 1/8 inch in any direction under the attached equipment load and under an external load of 200 pounds.
   4. In wet or outdoor areas, conduit penetrations for connection shall be made through the bottom (preferred) or side of enclosures to minimize water entry from around or from inside of conduits. Provide conduit hubs for connections and waterproof mastic for moisture sealant.

C. Electrical Power Connections:
   1. Equipment electric power devices and wiring shall comply with Division 26.
   2. Provide power disconnect switches for all instruments, equipment, and panels within sight of equipment and labeled to indicate the specific equipment served and the power source location. "Within sight of" is defined as having an unobstructed view from the equipment served and within 50 feet of the equipment served.
   3. Equipment power disconnect switches shall be mounted between 36 inches and 72 inches above the floor or permanent work platform. Where equipment location requirements cannot be met by a single disconnect switch, provide two disconnect switches: one at the equipment and one at the work platform.
   4. Provide a surge arrestor on each 120 VAC disconnect switch serving equipment located outdoors.

D. Signal Connections:
   1. Equipment electric signal connections shall be made on terminal blocks or by locking plug and receptacle assemblies. Flexible cable, receptacle and plug assemblies shall be used where shown or specified.

2. Jacketed flexible conduit shall be used between equipment and rigid raceway systems. Flexible cable assemblies may be used where plug and receptacle assemblies are provided and the installation is not subject to mechanical damage in normal use. The length of flexible conduit or cord assemblies shall not exceed 2 feet except where sufficient length is required to allow withdrawal of instruments for maintenance or calibration without disconnection of conduit or cord assemblies.

3.03 INTEGRATION WITH OTHER SYSTEMS:

A. Integrate new equipment with the existing control system network as shown on the project drawings.

3.04 FIELD QUALITY CONTROL

A. Delivery Inspection:
   1. Notify the Owner's Representative upon arrival of material or equipment to be incorporated into the work. Remove protective covers or otherwise provide access in order that the Owner's Representative may inspect such items.
   2. Provide receipt verification prior to installation. Check:
      a. Equipment received is equipment ordered.
      b. Equipment meets specified requirements and approved submittals.
      c. Equipment has correct manufacturer manuals.
      d. Equipment has been factory calibrated, bench calibrated or has method for field calibration.

B. Inspection and Installed Tests:
   1. Refer to Section 40 61 21.

3.05 CLEANING

A. Execute final cleaning prior to final project assessment.

B. Clean surfaces exposed to view, remove temporary labels, stains, and foreign substances.

C. Replace filters of operating equipment.

D. Remove waste and surplus materials, rubbish, and construction facilities from site.

3.06 MAINTENANCE

A. Refer to contract documents regarding maintenance scope, period, and duration.

PART 4 ATTACHMENTS

A. Attachment A – Sample Loop Drawings

END OF SECTION

Item	Area	Loop Number	Tag	Description	P&ID	Specification	INSTRUSPEC Symbol	Instrument Type	Power Requirement	Size	Calibration Range	Set Point	Installation Detail	Equipment Vendor Provided	Application Notes

SECTION 40 61 21

PROCESS CONTROL SYSTEM TESTING

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies testing requirements applicable to Sections 40 60 00 through 40 79 99 of these specifications for the process control, instrumentation, communication, network, and signal systems. This work will be referenced as the Process and Instrumentation Control System (PICS) to be provided by a PICS Testing Manager meeting the Qualifications section of this specification. Section includes:

1. Testing documentation.
2. Testing organization and sequencing.
3. Factory Acceptance Testing (FAT)
4. Performance testing.
5. Loop testing.
6. Functional testing.
7. Operational testing.

B. Related sections:

1. Section 40 61 13 – Process Control System General Provisions
2. Section 40 61 93 – Process Control System Input/Output List
3. Section 40 61 96 – Process Control Descriptions

1.02 REFERENCES

A. Definitions:

1. The term “instrumentation” covers field and panel instruments, analyzers, primary sensing elements, transmitters, power supplies, and monitoring devices.

B. Reference Standards:

1. This section contains references to the following documents with additional references listed in Section 40 61 13.
    a. References are part of this section as specified and modified. In case of conflict between the requirements of this section and those of the referenced documents, the requirements of this section prevail.
    b. Version: Latest documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no bids) unless noted otherwise.
    c. If referenced documents have been discontinued by the issuing organization, use the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

d. Where document dates are given in the following listing, reference to those documents means the specific document version associated with that date, whether the document has been superseded by a version with a later date, discontinued, or replaced.

Reference	Title
ISA RP7.1	Pneumatic Control Circuit Pressure Test
ISA S51.1	Process Instrumentation Terminology

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordinate testing with Section 01 45 20.
   2. Provide notice to the Construction Manager prior to conducting a test.
   3. Provide a detailed step-by-step test procedure, between 60 and 70 days before the commencement of testing activity, complete with forms for the recording of test results, testing equipment used, and a place for identification of the individuals performing and witnessing the test.
   4. Provide detail assistance to the Contractor in generating Section 01 45 20 Form A, customized for this project. Submit detailed form prior to testing per the requirements of Section 01 45 20.
   5. Equipment and System Performance and Operational Testing: Section 01 45 20 specifies testing of the mechanical, electrical, instrumentation, and HVAC systems. Coordinate, manage, and supervise the work with the quality assurance program including:
      a. Testing plan with the sequence for the test work.
      b. Calibration program for instruments and analyzers.
      c. Documentation program that records tests results.
      d. Performance testing program systems.

1.04 SUBMITTALS

A. Procedures: Section 01 33 00.

B. Action Submittals:
   1. Quality Assurance submittal:
      a. PICS Testing Manager Qualifications.
      b. Testing Technician Qualifications
      c. Network Testing Firm Qualification
      d. Proposed process area and process system organization
   2. Testing submittal:
      a. Submit detailed testing plan and proposed testing documentation after review of the Quality Assurance submittal showing conformance with Part 2 of this specification. Obtain approved submittal prior to testing.
         1) Control descriptions.
         2) Input/Output (I/O) interface.
         3) Testing status spreadsheets.

4) Test procedures.
5) Proposed test forms per this section, detailed for each test for this project.

3. FAT:
   a. FAT schedule and location.
   b. FAT procedures and test forms

C. Closeout Submittals
1. Final Test Report assembled in a three-ring binder, including a CD-R, and submitted at the completion of the inspection and testing activities for a process area.
   a. Label the binder cover and spine to identify the project name and process area. Include in the test report the applicable test procedures for the process area and the completed inspection and test report forms associated with the equipment and systems of that area.
   b. Organize test results by equipment item or system with individual, labeled tab dividers to identify each. The responsible testing entity is to acknowledge system deficiencies and noncompliant test results identified in the final test report as corrected.
   c. Documentation of network data communication nodes for network-type instruments, devices, and variable-frequency drives.
   d. Test equipment and test equipment calibration date.
   e. Certified factory calibration reports for flow and temperature transmitters.
   f. Performance test results.
   g. Loop test results.
   h. Functional test results.
   i. Operational test results.

1.05 QUALITY ASSURANCE

A. Addressed in Section 40 61 13.

PART 2 PRODUCTS

2.01 TESTING DOCUMENTATION

A. Documentation Records:
1. Develop a record-keeping system to document progress and completion for each task in each process area or system. Coordinate overall organization of areas and systems with overall testing required by Section 01 45 20, Equipment and System Performance and Operational Testing.
2. Always keep documentation current and available for inspection on site in a location designated by the Construction Manager:
   a. PICS Testing Manager's qualifications, project startup, and testing history.
   b. List of names of Contractor's and SI's personnel associated with final construction and testing, and normal and emergency contact telephone numbers.
   c. Testing Status spreadsheet with breakdown for each process area and process system, with percentage complete on each testing sequence task.

d. Testing status specific to pre-loop test and loop testing status spreadsheet to include the I/O list organized by area and system and loop number. Percent complete of the PICS system will be based on percentage of I/O points tested.
e. Test Report Volumes.

B. Test Report Volumes:
1. Develop and maintain testing documentation for each process area or system in separate volumes. Always keep each volume current and available for inspection on site in a location designated by the Construction Manager. Include the following as a minimum:
a. Three-ring binder with front cover and spine labeled: “Testing Documentation for (applicable) Process Area / Process System” including project labeling.
b. Table of Contents with same labeling as the volume cover with tabs for each section:
c. Section 1: Control Description
d. Section 2: I/O Interface
e. Section 3: Instrument Index
f. Section 4: Test Procedures and Forms
g. Section 5: Certified Factory Calibration Reports
h. Section 6: Test Report

C. Control Description:
1. Provide a control description outlining operation for each process area’s system. The Control Description Specification Section 40 61 96 may be used as a basis.

D. I/O Interface:
1. Provide I/O spreadsheets for each process area’s system. Spreadsheets are to include the following for each I/O point:
a. Information shown in Section 40 61 93
b. Signal number/tag
c. Annotation description that may be logically abbreviated and that is subject to approval
d. Complete physical I/O channel designation and addressing or communication I/O register designation
e. True/false status designations for digital I/O
f. Process range; engineering units and multipliers; and raw signal range count for analog I/O
g. Signals: Fixed point and scaled at the controller with minimum four significant implied digits of scaling; e.g., 0 to 1,400 at controller for a pH range of 0 to 14 at operator interface
h. Provide operator interface scaling to display decimal digits required
i. Indicate pass/fail for each point for both pre-loop test and loop tests
j. Indicate date of tests and comment for failed points

E. Instrument List:
   1. Provide a detailed Instrument List. Indicate actual calibration ranges, set points, and deadbands.

F. Field Test Procedure Documentation:
   1. Organize and assemble test procedures for each analog and discrete loop in the process control system in separate volumes for each process area or test group. Organize by I/O point. Submit final test records in electronic form by scanning and converting the records and files to .pdf format, to preserve actual signatures and signoffs.
   2. Include a detailed, step-by-step description of the required test procedure, panel and terminal block numbers for points of measurement, input test values, expected resultant values, test equipment required, process setup requirements, and safety precautions.
   3. Include test report forms for each loop, including forms for wiring, piping, and individual component tests, with the test procedure documentation. Record the actual test results on these forms and assemble them into final test reports.
   4. Preprint and populate information in the test report forms to the extent possible prior to commencing testing.
   5. Include on the test report forms:
      a. Project name
      b. Process area associated with the equipment under test
      c. Instrument loop description
      d. Instrument loop identification number
      e. Instrument nameplate data
      f. Instrument setup and configuration parameters
      g. Time and date of test
      h. Inspection checklist and results
      i. Reference to applicable test procedure
      j. Expected and actual test results for each test point in the loop including programmable controller data table or register values
      k. Test equipment used
      l. Space for remarks regarding test procedure or results, observations, etc.
      m. Name, date, and signature of testing personnel
      n. Test witness's name and signature

2.02 SOURCE QUALITY CONTROL

A. Factory Acceptance Test (FAT):
   1. Provide a FAT with the test and subsequent retests witnessed by the Construction Manager and Owner or Owner's Representative. This modified FAT shall address only the new equipment, hardware, and software to be added to the facility as part of this project.
   2. Load software and configuration for control system panels, network components, operator interfaces, servers, and the programming and graphic configuration application at the control system equipment supplier's factory prior to the FAT.

3. Inspect equipment, panel instruments, panels, or cabinets with factory testing performed
4. Provide written notice to the Construction Manager 30 working days before the commencement of the FAT activity and include:
    a. Schedule for the FAT
    b. Location of the FAT
    c. Testing equipment used
    d. Detailed test procedure with forms for the recording of test results
    e. Sign-off spaces for the individuals performing and witnessing the tests
5. Network and interwire equipment and panels as applicable. Operate and check out equipment prior to the FAT. Submit certification indicating that the panels are ready for the FAT. Include the following:
    a. Visual inspection of equipment, instruments, control panels, and graphic displays
    b. Validation of each input loop and output loop by simulated signals for analog inputs and by shorting discrete inputs
    c. Validation includes:
        1) Monitoring state changes on operator interface screens based on the inputs state change
        2) Observation of online controller programming application software with the associated outputs state change
        3) Outputs triggered by operator interface software devices (pushbuttons, sliders, manually entered values, etc.)
        4) Calibration and operation of instruments on or in the control panels
    d. Repair of loops that do not pass validation
    e. Retest of the FAT at no additional cost.

PART 3 EXECUTION

3.01 GENERAL

A. General Requirements:
1. Provide the labor, tools, material, power, and services necessary to provide the process instrumentation and control system inspection and testing specified herein.
2. Inspect materials, equipment, and construction included under this specification in accordance with this section and subsequent sections of this division. Perform testing in accordance with this and subsequent sections of this division.
3. Have a certified instrument technician qualified to calibrate the instrumentation calibrate and set up field instruments and analyzers.

B. Test Equipment and Materials:
1. Provide test equipment to conduct the specified tests that simulate inputs and read outputs with a rated accuracy at the point of measurement at least three times greater than the component under test.
2. Provide a calibration sticker on test instruments showing date of calibration, deviation from standard, name of calibration laboratory and technician, and date recalibration is required. Include certified calibration reports traceable to the National Institute of Standards and Technology with the final test report.

3. Provide a documenting calibration system to conduct process instrumentation calibration activities that consist of a documenting process calibrator and an instrumentation data management software system that captures the calibration results and electronically document instrument data, date of calibration, calibration procedures, and as-found and as-left instrument calibration data.
4. Provide an instrument calibration system such as Fluke 743B with Fluke DPC/Track Instrumentation Management software, or similar system. Submit calibration files with the final test report in hard-copy and electronic formats that does not require specialized equipment or software to read and print the files.
5. Provide buffer solutions and reference fluids for tests of analytical equipment.
6. Provide a communications and software package to record final configuration parameters and settings for variable-frequency drives with the parameters acquired by connection to the network that record the configuration settings without manual data entry or transcription of values.
7. Vendor software tools may document the systems where a licensed copy of the identical software including connectors, cables, keys, interface cards, and devices required for operation is submitted with the final documentation files.

C. Performance Deviation Tolerances:
1. Tolerances are specified in individual sections. Where tolerances are not specified, refer to the manufacturer's published performance specifications.
2. Calculate overall accuracy requirements for loops consisting of two or more components, by the root-summation-square (RSS) of the component accuracy specifications. Calculate and record tolerances for each required calibration point on the associated test report form.

D. Witnessing:
1. The Engineer reserves the right to observe factory and field instrumentation testing and calibration procedures. Notify the Construction Manager prior to testing, as specified herein.

3.02 TESTING SEQUENCE

A. Perform tests for each area or system in the following sequence:
1. Performance testing
2. Loop testing
3. Functional testing
4. Operational testing

B. Group equipment and I/O based on the relationship of the equipment to operate safely as specified, including full automatic and manual control and monitoring through the control system. Equipment and I/O in a given area or system shall pass testing prior to proceeding to the next set of tests in the sequence above.

3.03 PERFORMANCE TESTING

A. Perform tests in the order below.

B. Wiring Tests:
   1. Verify that electrical power and signal cable ring-out and resistance testing has been performed as specified in Sections 26 05 00 and 26 08 00. Conduct wiring tests after cables have been properly terminated, tagged, and inspected.

C. Pre-Loop Testing:
   1. Test every I/O point from the field device to the termination on the I/O card in the panel.
   2. Perform tests with loop wiring complete and terminated for each point being tested between initial field device and I/O termination point.
   3. For each discrete I/O point, verify and document contact status value for both the opened and closed positions of the contact.
   4. For analog points, verify analog value matches local display. Confirm calibration at 0, 25, 75, and 100 percent of value.

3.04 LOOP TESTING

A. Provide a request to perform loop testing at least 2 weeks prior to the requested loop test date. Include the following with the request:
   1. Area/system for which request is being made.
   2. Written certification that performance testing has been completed, documented, and passed for the area/system for which loop testing is being requested.
   3. Submittal numbers that define the tests and data points for the I/O to be tested. Provide updates to the I/O list or instrument calibration as an outcome of the performance testing.

B. Commence loop testing after the performance testing has been completed and documented to the satisfaction of the Owner or Owner's Representative.

C. Test each instrument loop as an integrated system. Check operation from field instruments to transmitter to receiving components to the vendor panel or the Plant Control System Operator Interface Station. Inject test signals at the process impulse line connection where the measuring technique permits, and otherwise at the most primary signal access point.

D. For each discrete I/O point, verify and document field contact status value for both the opened and closed position of the contact.

E. For analog points, verify that analog value matches local display. Confirm calibration at 0, 25, 75, and 100 percent of value.

F. Where loops are interfaced to a controller, verify the controller I/O assignment and operation of the input/output system and processor. Inspect the data table or register in the PLC memory to verify proper operation.

G. If the output control or monitoring device fails to indicate properly, make corrections to the loop circuitry or device. Repeat the test until devices and instruments operate as required.

H. Correct loop circuitry and repeat the test until the instruments operate properly.

3.05 FUNCTIONAL TESTING

A. Process Control Strategy/Functional Testing:
   1. Commence control strategy testing after loop testing has been completed and documented to the satisfaction of the Owner or Owner's Representative.
   2. Coordinate control strategy testing with the PLC/HMI programmer. Testing to consist of installing and debugging the PLC equipment, verifying the interface points between the controller I/O cards and field devices and equipment, and exercising the control strategies. Control strategy testing to be performed on one PLC at a time.
   3. Provide qualified personnel to immediately correct deficiencies in the work that may be encountered during control strategy testing. Failure of the Contractor to provide such personnel in a timely manner may prolong the time allotted to complete control strategy testing.

B. Control System Closed-Loop Testing:
   1. Coordinate and commence closed-loop commissioning after the control strategy testing has been successfully completed and documented to the satisfaction of the Owner or Owner's Representative.
   2. Where a loop is controlled under the direction of a PLC, the Programmer, along with the SI, will perform the necessary adjustment of loop tuning parameters and set points, record the loop response, adjusting final elements, and ensuring total integrated loop performance as specified.

C. Functional Checkout:
   1. Conduct to verify the operation of discrete and hardwired control devices, refer to Section 01 45 20. Exercise the operable devices and energize the control circuit. Operate control element, alarm device, and interlocks to verify that the specified action occurs.

3.06 OPERATIONAL TESTING

A. Coordinate with the PLC/HMI programmer. Perform the Operational Tests after component and subsystem tests have been completed. Perform the test of the completed system in full operation and demonstrate that functional requirements of this specification have been met. Demonstrate the following:
   1. Each component of the system operates correctly with other components of the system.
   2. Analog control loops operate in a stable manner.
   3. Hard-wired and software equipment interlocks perform correctly.
   4. Process control sequences perform correctly.
   5. Application program performs monitoring and control functions correctly.
   6. Operator interface graphics represent the monitoring and control functions correctly.

SECTION 40 61 93

PROCESS CONTROL SYSTEM INPUT/OUTPUT LIST

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Input/output (I/O) list showing the following types of points that interface with the control system:
      a. Points that are hardwired into the control system.
      b. Points that are interfaced to the control system over a communications link.
   2. The I/O list does not include internal software points generated by the control system and used solely within the control system.

B. Related sections:
   1. Refer to Section 40 61 13.01 – Process Control Systems General Provisions for Small Projects.
   2. Refer to Section 40 61 21 – Process Control System Testing.

1.02 SUBMITTALS

A. Procedures: Section 01 33 00.

B. Submittal grouping:
   1. Submit process and instrument control system instrumentation, hardware, and software together as an integrated system in staged submittal groupings as defined in Section 40 61 13.01. What should be in each submittal grouping is clarified in the following paragraphs.

C. Action Submittal:
   1. Panels and Consoles submittal group. Submit I/O information applicable to the equipment and panels within the submittal group.

D. Informational Submittal: Provide a copy of the electronic version of the complete list to the Owner, at least monthly, when requested.

PART 2 NOT USED

PART 3 EXECUTION

3.01 FIELD QUALITY CONTROL

A. Refer to Section 40 61 21.

B. Maintain a copy of the complete Input/Output List with modifications during construction in Excel format.

3.02 ATTACHMENTS

A. Attachment A: Input/Output (I/O) List

1. Description of headings in Input/Output (I/O) List.

Field or Heading	Example	Comment or Description
Tag No. Function Abbreviation	PDI	See tagging on instrument legend sheets.
Tag No. Area Code	01	See tagging on instrument legend sheets.
Tag No. Loop Identifier	23	See tagging on instrument legend sheets.
Tag No. Suffix 1	A	See tagging on instrument legend sheets.
Tag No. Suffix 2	1	See tagging on instrument legend sheets.
Description		Match contract drawings.
Panel	LCP-14	Number or tag to match contract documents
PLC or DCU	PLC-14	Number or tag to match contract documents
RIO		Number or tag to match contract documents
Rack or IP Address	01	Match contract drawing, or if not shown, match to submittal information.
Slot or Segment	03	Match contract drawing, or if not shown, match to submittal information.
Point or Node	07	Match contract drawing, or if not shown, match to submittal information.
Comm Channel or Module		Match contract drawing, or if not shown, match to submittal information.
I/O Type	AI	AI, DI, DO, AO
Module or Signal Type	4-20 mA	-20 mA, Ethernet, DeviceNet, Discrete Contact, etc.
Min Calibration or Function Low	0	0, Open, Normal
Max Calibration or Function High	55	55, Not Open, Fail
Units	PSIG	mgd, kW, psi, etc.
Application Notes or Comments		Optional, as required for clarification.
P&ID Number		Contract P&ID drawing
Wiring Diagram		Contract Wiring diagram.
Internal Address		Internal address associated with I/O point.
Alarm	No	Yes or No
Alarm Priority		1, A, 7A, etc.
Testing Group System	Secondary.	As required for testing
Testing Group SubSystem	RSS Pumping	As required for testing
Testing Group Equipment	RSS Pump No. 1	As required for testing

SECTION 40 61 96

PROCESS CONTROL DESCRIPTIONS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies control by the Programmable Logic Controller (PLC) based Supervisory Control and Data Acquisition (SCADA) system for the City Creek Water Treatment Plant.

B. [Control strategies for packaged equipment are specified in the respective equipment specifications.]

C. These control strategies are not intended to apportion work or responsibility for work among subcontractors, suppliers and manufacturers, but are offered as a guide for programming, testing, and commissioning. They describe how the system is to operate, and do not necessarily include every component required to make the system function.

D. Control strategies describe sequential and interlocking control functions, analog control functions, color-graphic video display SCADA Computers and Operator Interfaces and alarm and event logging. All control functions shall be programmed in the control system PLC controller, the Operator Interfaces and SCADA computers shall perform supervisory functions only.

E. The Contractor shall provide the labor and equipment to test the specified control strategies per Section 40 61 21.

F. Programming: Refer to Section 40 61 13.

PART 2 NOT USED

PART 3 EXECUTION

3.01 STANDARD INTERLOCKS

A. Interlocks:
   1. Standard Interlocks (I) shut down and prevent equipment from operating. These are defined here and referenced in Control Strategies below.
   2. Hardwired interlocks are effective whether the PLC system is in operation or not. These are specified in the respective equipment specifications.
   3. Software interlocks are provided by the PLC and are usually only effective when the equipment is operating in Remote mode unless noted. For this reason, software interlocks are not always in effect for equipment or personnel protection.

I1 – MOTOR PROTECTION

Equipment motor protection includes motor starter overload and/or Variable Frequency Drive (VFD) or Reduced Voltage Solid State Starter (RVSS) fault, hardwired only. Manual reset required at the starter, VFD, or RVSS.

I2 – HIGH DISCHARGE PRESSURE

Equipment protection from pressure switch, hardwired only. Time delayed; no time delay for positive displacement pumps. Manual reset required at the starter, VFD, or RVSS. (Note: For protection from a discharge pressure transmitter instead, refer to Control Strategy 7 High Alarm below, software interlock.)

I3 – HIGH MOTOR TEMPERATURE

Equipment motor protection from temperature switch or temperature sensors and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for large (perhaps over 100 hp) or VFD driven motors and submersible pumps.)

I4 – HIGH MOTOR BEARING TEMPERATURE

Equipment protection from temperature switch or temperature sensors and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for large (perhaps over 100 hp) motors or per Owner or Vendor recommendations.)

I5 – HIGH PUMP/FAN BEARING TEMPERATURE

Equipment protection from temperature switch or temperature sensors and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for large pump/fan or per Owner or Vendor recommendations.)

I6 – HIGH PUMP/FAN VIBRATION

Equipment protection from vibration switch or vibration sensors and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for large pump/fan or per Owner or Vendor recommendations.)

I7 – HIGH PUMP STATOR TEMPERATURE

Equipment protection from temperature switch or temperature sensors and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for progressive cavity pumps as an indication of loss of suction product.)

I8 – LOW SPEED

Equipment protection from speed switch or speed sensors and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for conveyors.)

I9 – EMERGENCY STOP

Personnel command from maintained pushbutton or pull-cord, hardwired only. Manual reset required at the pushbutton or pull-cord. (Note: Typical for equipment, required for conveyors.)

I10 – HIGH MOISTURE

Equipment motor protection from moisture sensor and switching relay, hardwired only. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for submersible sewage pumps.)

I11 – LOW FLUSH WATER FLOW

Equipment protection from flow switch, hardwired only. Time delayed. Manual reset required at the starter, VFD, or RVSS. (Note: Typical for pumps with mechanical seals, refer to process mechanical. May require a pre-flushing sequence.)

I13 – DIAPHRAGM LEAK

Equipment protection from conductivity sensor and switching relay, hardwired only. Manual reset required at the starter or VFD.

I14 – OVERTORQUE

Equipment protection from torque switch, hardwired only. Manual reset required at the starter or VFD.

I15 – LOW MOTOR CURRENT

Equipment protection from motor current switch, hardwired only. Time delayed. Manual reset required at the starter, VFD, or RVSS.

I16 – LOW OIL PRESSURE

Equipment protection from pressure switch, hardwired only. Time delayed. Manual reset required at the starter, VFD, or RVSS.

I17 – LOW OIL LEVEL

Equipment protection from level switch, hardwired only. Time delayed. Manual reset required at the starter, VFD, or RVSS.

I18 – LOW SUCTION TANK LEVEL

Equipment protection from level switch, hardwired only. Self-resetting.

I19 – LOW SUCTION PRESSURE

Equipment protection from pressure switch, hardwired only. Time delayed; no time delay for positive displacement pumps. Self-resetting.

I30 – TRANSFER SWITCH TRANSFERRING POSITION AND DELAYED EQUIPMENT RESTARTING

Nuisance circuit breaker trip protection from automatic transfer switch or controls via the PLC, software only. Grouped equipment is prevented from being called to start in REMOTE mode when the transfer switch or means is transferring between the utility and standby positions (either direction), and for a time delay thereafter as defined below.

I31 – TRANSFER SWITCH TRANSFERRING POSITION – GROUP 1

Refer to Interlock I30 above, 5 second delay.

I32 – TRANSFER SWITCH TRANSFERRING POSITION – GROUP 2

Refer to Interlock I30 above, 10 second delay.

I33 – TRANSFER SWITCH TRANSFERRING POSITION – GROUP 3

Refer to Interlock I30 above, 15 second delay.

I34 – TRANSFER SWITCH TRANSFERRING POSITION – GROUP 4

Refer to Interlock I30 above, 20 second delay.

3.02 STANDARD CONTROL STRATEGIES

A. Control Strategies:

1. Standard Control Strategies (CS) define common equipment operations performed by the PLC software.
2. Hardwired control strategies are effective whether the PLC system is in operation or not. These are specified in the respective equipment specifications.
3. Control strategies unique to each process system are defined starting in paragraph 3.03 below.
4. Standard Control Strategies denoted with an asterisk (*) shall be provided as applicable, unless noted otherwise.
5.

CS1 - EQUIPMENT RUN TIME TOTALIZATION*

Equipment run time totalization will be calculated and maintained by the PLC based on equipment run status. Totalize in hours from 0 to 9999. Provide unless physical run time hour meters are specified.

SCADA: Display total in hours.

CS2 - FLOW TOTALIZATION*

Flow totalization will be calculated and maintained by the PLC whenever flow signals exceeds 2-1/2 % of full-scale value and analog signal has not failed (refer to CS10). Totalize in gallons times 1,000 (kGal) or gallons times 1,000,000 (MGal) as shown on the P&ID. Totalize from 0 to 9999.

SCADA: Display total in kGal or MGal as shown on P&ID.

CS3 - PROCESS ALARM(S), SELF-RESETTING*

Process alarms as shown on the P&ID will be determined and maintained by the PLC:

1. Low-Low Alarm: Point value is equal to or less than a predetermined alarm value.
2. Low Alarm: Point value is equal to or less than a predetermined alarm value.
3. High Alarm: Point value is equal to or greater than a predetermined alarm value.
4. High-High Alarm: Point value is equal to or greater than a predetermined alarm value.

An analog point which is in alarm status will not be changed to normal status until the point value changes by the predetermined deadband value for the point, initial setting of 5% of full-scale range. Alarm setpoints are provided in paragraph 40 06 70 instrument index.

SCADA: Display alarms. Display active and cleared-but-unacknowledged alarms in the alarm summary.

CS7 - PROCESS ALARM(S), MANUAL RESET REQUIRED

Process alarms as shown on the P&ID will be determined and maintained by the PLC:

1. Low-Low Alarm: Point value is equal to or less than a predetermined alarm value. This is typically an equipment shutdown alarm.
2. Low Alarm: Point value is equal to or less than a predetermined alarm value.
3. High Alarm: Point value is equal to or greater than a predetermined alarm value.
4. High-High Alarm: Point value is equal to or greater than a predetermined alarm value. This is typically an equipment shutdown alarm.

An analog point which is in alarm status will not be changed to normal status until reset by the SCADA Operator and the point value changes by the predetermined deadband value for the point, initial setting of 5% of full-scale range. PLC alarm setpoints are provided in paragraph 40 06 70-3.03.

SCADA: Display alarms. Display active and cleared-but-unacknowledged alarms in the alarm summary. SCADA allows Operator reset of alarms.

CS9 - DISCRETE LOGICAL POINT STATUS*

The status of each discrete logical point will also be maintained in the PLC. Discrete logical points are points which depend upon the status of one or several discrete input points. For example, equipment failed logical status will result from a loss of ready status when running. Loss of ready status when NOT running will not result in a failed logical status.

SCADA: Display the status of all discrete and logical discrete status points.

CS10 - ANALOG POINT STATUS*

Analog input points will be checked by the PLC for the following status conditions:

1. Failed: Point value is less than or greater than the specified value range typically, less than 3.6 milliamps (mA) and greater than 21.6 mA.

SCADA: Display alarm. Display active and cleared-but-unacknowledged alarm in the alarm summary

CS11 - EQUIPMENT FAILURE*

The failure of PLC controlled equipment (pumps, blowers, compressors, fans, etc.) will be monitored by the PLC system. Equipment will be considered failed under the following conditions:

1. The equipment is in REMOTE and the PLC system attempts to operate the equipment and it does not respond within a defined time period, typically for 30 seconds.
2. The equipment is in REMOTE and running and for whatever reason other than the PLC system requesting the equipment to "STOP," the equipment stops.

CS12 – PLC INPUTS AND OUTPUTS STATUS*

The PLC will monitor status of each individual input, output, communication module, and all processor statuses available.

SCADA: Display racks with status for each module, using descriptive terms for alarms. Display processor battery status. Display alarms. Display active and cleared-but-unacknowledged alarm in the alarm summary

CS13 - GENERAL RECORDING SYSTEM*

The Remote SCADA workstation will store historical input point data and generate reports based upon process variables (pressure, flow, temperature, level and analytical) and equipment status (speed, and motor current or run/off status) in real-time and from recent historical data. The exact report requirements will be determined by the OWNER and will be configured by others during the project construction period.

CS15 - GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM

All analog control functions will be provided as required and will include but not be limited to the following:

1. Proportional-Integral-Derivative (PID) Control--Standard controller functions with balanceless, bumpless transfer from manual to automatic, manual overrides, external reset and output summing capabilities. Provision for cascade, rationing gain, bias, lead-lag, dead-time, feed forward and feedback control will be available.
2. SCADA display system will have a common PID controller operator interface for all equipment utilizing PID control. Controller operator interface will include alphanumeric and graphic indication of the following features as a minimum:
    a. ID of controlled equipment.
    b. ID of process variable input.
    c. Controller setpoint value.
    d. Process variable value.
    e. Controller output value.
    f. Setpoint adjustment interface.
    g. Indication if setpoint is under LOCAL or REMOTE control.
    h. Local/Manual control output adjustment interface.
    i. Indication if control output is under local/manual control or under control of process controller.
3. Computational Functions--On-line mathematical functions will be available to provide real-time computational capability of control variables for use in feed-forward and other advanced control functions.
4. Appropriate control action(s) will be provided as needed.

CS16 - TREND PLOTS*

SCADA workstations will graphically plot trends of process variables (pressure, flow, temperature, level and analytical), controller setpoints, and equipment status (motor current) in real-time and from historical data. The plant operator will be able to select the plotting interval, within the limits of the actual data collection. Four trends per display view will be possible.

In addition to the plotted data, a trend will include:

1. Time.
2. Date.
3. Tag number.
4. Plotting interval.
5. Time at start.
6. Time at latest value.

CS17 – COLOR NOTATION FOR DYNAMIC OBJECTS ON CONTROL GRAPHIC DISPLAY SCREENS*

All dynamic objects on control graphic display screens will be provided with multiple-color display to identify status as tabulated below:

Equipment	Status	Required color
Motor	Running	Red
Motor	Ready or Off	Green
Valve/Gate	Opened position	Red
Valve/Gate	Closed position	Green
All	Power on	White
All	Abnormal condition	Amber (Yellow)
All	Advisory, Control Mode	Blue

CS18 - DIGITAL ALARM SYSTEM*

Alarms as shown on the P&ID will be determined and maintained by the PLC, whether specific control strategies are provided. Digital inputs can be from field instruments (level switches, pressure switches, etc.), local control panels (relay outputs, alarm module outputs, switches), and packaged systems (designated terminals with packaged units).

SCADA: Display alarms. Display active and cleared-but-unacknowledged alarms in the alarm summary.

CS20 - DIGITAL STATUS SYSTEM*

Digital input status will be displayed on SCADA screens as required by the reference drawings and specifications regardless whether specific control strategies are provided. Each digital input will be shown in its appropriate process screen and/or equipment status screen.

Digital inputs can be originated from field instruments (motorized actuators, HVAC related air handling units, power management related contact inputs, level switches, pressure switches, etc.), local control panels (relay outputs, alarm module outputs, switches), and packaged systems (designated terminals with packaged units).

CS24 - DATA TRANSFER REQUIREMENTS BETWEEN THE PLC's AND THE SCADA SYSTEM

Digital inputs and analog inputs to the SCADA system and the software logic generated alarms will be displayed or annunciated at the SCADA workstation as shown on P&IDs, the Instrument Index paragraph 40 06 70-3.03, and this Section. The SCADA system will generate separate alarms if communication is lost with any PLC.

CS34 - EQUIPMENT RUN STATUS

Equipment start/stop control based on run status of other equipment, hardwired or PLC.

CS35 – SEAL FLUSH

Pump seal water flush solenoid valve open/close control based on run status of associated equipment, hardwired. Solenoid should be normally opened type, verify.

CS36 – BEARING FLUSH

Pump bearing water flush solenoid valve open/close control based on run status of associated equipment, hardwired. Solenoid should be normally opened type, verify.

CS37 – BEARING LUBRICATION

Lubrication oil solenoid valve open/close control based on run status of associated equipment, hardwired. Solenoid should be normally opened type, verify.

CS38 – TRAP PRIMER

Trap primer solenoid valve open/close control based on interval and duration timers, hardwired or PLC. Solenoid should be normally closed type, verify.

CS39 – ALTERNATION

Equipment run-time equalization by alternating the lead/lag assignment of two or more equipment items, hardwired or PLC.

1. Hardwired: Alternation occurs when all equipment items stop.
2. PLC: Alternation occurs by SCADA Operator request.

CS40 – PUMP LEAD/LAG SEQUENCING

Pump control in Remote by level switches, hardwired only. Lead pump starts upon medium level. Lag pump starts upon high level. Pumps stop upon low level.

CS41 – PUMP LEVEL CONTROL

Pump control in Remote by level switches, hardwired only. Pump starts upon high level. Pump stops upon low level.

CS42 – PUMP REDUNDANT LEVEL CONTROL

Pump control in Remote by level switches, hardwired only. Pump starts upon high-high level. Pump stops upon low-low level.

CS43 – VALVE OPENS WHEN EQUIPMENT RUNS

Valve open/close control based on run status of other equipment, hardwired or PLC. Typical for spray valves.

CS44 - HYDROPNEUMATIC TANK – ADD AIR

Solenoid Valve control by level and pressure switches, hardwired only. Valve opens upon high level. Valve closes upon high pressure or when level falls below high-level switch setting.

CS45 – HYDROPNEUMATIC TANK – VENT AIR

Solenoid Valve control by level switch, hardwired only. Valve opens upon low level. Valve closes when level rises above low level switch setting.

CS50 – ALARM WHEN NOT RUNNING

PLC generated alarm if unit is not running for 30 seconds, self-resetting.

CS51 – ALTERNATION - SOFTWARE

Equipment run-time equalization by alternating the lead/follow/2nd follow/etc. assignment of two or more pumps, PLC. Alternation occurs when all the pumps in that group stop. Similarly, alternation occurs for the last group of pumps occurs when all the pumps in that group stop. Upon failure of a pump, the standby pump is assigned in place of the failed pump. A typical PLC determined fail alarm for each pump includes:

Hardwired pump equipment related shutdowns (determined by the Process/Mechanical Engineer) including, but not limited to: High motor temperature, VFD fault, and submersible pump moisture detected if applicable. Normally reset at the VFD.

VFD selector switch removal from the REMOTE position. Reset at the selector switch.

Equipment failure refer to CS11 above.

Speed discrepancy in control system speed signal vs. VFD feedback speed, refer to CS61 - Variable Frequency Drive Speed below.

CS61 – VARIABLE FREQUENCY DRIVE SPEED

The minimum pumping speed shall be configured into the VFD for both LOCAL and REMOTE modes, preventing unintentional under-speed and motor overheating in either mode. The PLC shall not be configured to provide an artificial zero of the 4-20 milliamp (mA) or related network control signal, such as 12-20mA to prevent under-speed in VFD REMOTE mode. The requirement to configure the VFD minimum speed setting at the VFD is included in Part 3 of Section 26 29 23.

Although the minimum pumping speed must be configured into the VFD for following the control system speed signal, the feedback speed configuration is a separate VFD setting. This setting shall be left at default, with 4 milliamps or zero network value for 0% speed and 20 milliamps or 100% network value for 100% speed. Display of speed on the SCADA system shall reflect 0% when the pump is stopped and 100% when the pump is running at full speed.

One component of PLC determined pump failure is speed discrepancy as mentioned in CS51 above. The control system speed signal range is instead 0% for minimum pumping speed rather than 0% speed. For comparison with the control system speed signal, the feedback speed range must then be extrapolated from minimum pumping speed to maximum pumping speed for 0% to 100% and clamped to prevent a negative speed value by the PLC. Speed discrepancy in control system speed signal vs. VFD feedback speed is determined by the PLC when they deviate from each other by 10% or more for twenty seconds. The alarm is monitored by and requires reset from the SCADA system.

The PLC minimum feedback pumping speed for the calculation shall match the VFD configured setting for the control signal. Verification of the calculation is performed by comparing PLC calculated speed feedback with PLC control system speed signal at various steady VFD speeds.

CS71 – MOTORIZED VALVE OR GATE CONTROL - ISOLATING

Valve control in REMOTE. When control requests the valve to open, the valve control open command signal is activated until the valve signals opened position. When control requests the valve to close, the valve close command signal is activated until the valve signals closed position. Includes CS75.

CS72 – MOTORIZED VALVE OR GATE CONTROL – MODULATING - ANALOG

Valve control in REMOTE. When control requests a valve position in % opened, the valve control analog signal is set to the % opened required. Includes CS75.

CS73 – MOTORIZED VALVE OR GATE CONTROL – MODULATING - DISCRETE

Valve control in REMOTE. When control requests a valve position in % opened, the valve control open command discrete signal or close command discrete signal is activated until the valve signals the % opened position required. Includes CS75.

CS75 – VALVE OR GATE FAILURE

The failure of control valves or gates will be monitored by the PLC system. Valve or gate actuators will be considered failed under the following conditions:

1. The isolating actuator is in REMOTE and the PLC system attempts to open or close the valve or gate and it does not respond within a defined time period. Time delay field set based on testing, initial setting 60 seconds for valves, 240 seconds for gates.
2. The modulating actuator is in REMOTE and the PLC system attempts to change position of the valve or gate and it does not respond within 2% of valve position within a defined time period. Time delay field set based on testing using a change from 0 to 100% opening, initial setting 60 seconds for valves, 240 seconds for gates.

3.03 CONTROL STRATEGY – FILTER BACKWASH

A. Reference Drawings: 35-PI-16 through 35-PI-21, 35-PI-24, 70-PI-05.

B. System Components
   1. This control strategy will describe the filter backwash process for Filter 1 but is applicable to filters 1 through 6.
   2. 70-B-00010 Blower 1
   3. 70-B-00020 Blower 2

C. Description:
   1. This control strategy describes the filter backwash process which will be run regularly to maintain proper functionality of the filters.
   2. The system is designed such that one filter may be in backwash at any given time and full process flow can be achieved with only 5 operational filters.
   3. There is one duty and one standby blower, only blower 1 will be used for this control strategy description.

D. Control Descriptions:
   1. Drawdown
      a. From the Filter Control screen, the operator selects a filter for backwash and presses start.
      b. The influent valve CV-10011 is given a close command, and the effluent valve holds its current position which initiates the filter drawdown.
      c. As the water level in the filter drops below the trough level, the waste wash water valve CV-10051 is given an open command. This allows water in the gullet to drain.
      d. When the water level in the filter reaches the low level setpoint the effluent valve CV-10021 is given a close command.
   2. Air Scour
      a. The air scour vent valve CV-00017 is given an open command.
      b. The air scour blower is given a start command and blower inlet valve CV-00013 modulates to achieve the desired air flow of 4 SCFM/FT^2.

c. Simultaneously the air scour vent valve CV-00017 is given a close command, and the individual air scour valve CV-10061 is given an open command. This forces the air flow into the filter underdrain to begin the air only scour.

d. The air only scour continues for an operator adjustable time set point (2-3 minutes).

e. The individual backwash valve CV-10031 is given an open command.

f. The Backwash Pumps ramps up to achieve an operator adjustable low backwash rate (6-8 GPM/FT^2) which is controlled via level in the constant head box. The concurrent air/water air scour cycle starts.

g. When the water level in the filter reaches and operator adjustable setpoint (the bottom of the filter troughs) air scour vent valve is given an OPEN command, and the individual air scour valve is given a CLOSE command (simultaneously).

h. The blower is given a STOP command, and the air scour portion of the backwash is concluded.

3. High Backwash

   a. The backwash flow rate is increased to an operator adjustable high backwash flow setpoint (typically 20-22 GPM/FT^2) to achieve 25-30% bed expansion.

   b. When the operator adjustable high backwash timer expires, the filter backwash rate ramps down to a low flow SP of 6-8 GPM/FT^2 to begin the rinse to waste cycle.

4. Rinse to Waste

   a. The rinse to waste (Low Backwash Flowrate) continues for an operator adjustable time setpoint (usually 10 minutes) to allow for one filter box of water to be rinsed from the filter box at a sub fluidized rate.

   b. The backwash flow rate is reduced to zero flow.

   c. The individual backwash valve CV-10031 and waste wash water valve CV-10041 are given simultaneous close commands.

   d. A ready word is sent to the filter control screen indicating to the operator that this filter is now available and ready for service (filter to waste) and the backwash sequence is complete.

5. Setpoints:

Air Scour Air Flow Rate	4 SCFM/FT^2
Air Scour Time	2-3 Minutes
Backwash Flow Rate	6-8 GPM/FT^2
High Backwash Flow Rate	20-22 GPM/FT^2
Rinse to Waste Time	10 Minutes

6. Standard Control Strategies per 40 61 96-3.02:

   a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG SYSTEM)

   b. CS18 – DIGITAL ALARM SYSTEM

   c. CS34 – EQUIPMENT RUN STATUS

   d. CS51 – ALTERNATION - SOFTWARE

   e. CS61 – VARIABLE FREQUENCY DRIVE SPEED

   f. CS71 – MOTORIZED VALVE OR GATE CONTROL – ISOLATING

   g. CS72 – MOTORIZED VALVE OR GATE CONTROL – MODULATING – ANALOG

h. CS75 – VALVE OR GATE FAILURE

7. Standard Interlocks per 40 61 96-3.01:
   a. I1 – MOTOR PROTECTION
   b. I3 – HIGH MOTOR TEMPERATURE
   c. I18 – LOW SUCTION TANK LEVEL
8. Software Interlocks:
   a. None.

3.04 CONTROL STRATEGY – FILTER TO WASTE

A. Reference Drawings: 35-PI-16 through 35-PI-21.

B. This control strategy will describe the filter to waste process for filter 1 but is applicable to filters 1 through 6.

C. Description:
   1. The purpose of the Filter to Waste is to ensure that the first water produced by each filter is below the plant particulate and turbidity goals for treated water quality, and well below regulatory guidelines. Well run surface water treatment plants have goals in place to ensure that filtered water quality is always below 0.10 NTU – including at the beginning of each filter run.
   2. Filter to Waste provides the capability, though piping, valving, and procedure to ripen filters and reject water of lesser quality being produced at the beginning of the filter run. The filter to waste stream is directed to a waste wash water collection and recycling facility where it is equalized and returned to the headworks of the plant for retreatment. After water quality is of acceptable quality, the filter is allowed to transition into service by sending water into the finished water system of the facility.

D. Control Descriptions:
   1. From the Filter Control screen, the operator selects an offline filter for service and presses start.
   2. The filter influent valve CV-10011 is given an open command.
   3. After the filter fills to bottom of the established operational level band, the filter to waste valve CV-10041 begins to open and modulates based on the filter level through linear level control. As the level rises, the valve continues to open until equilibrium is achieved.
   4. The filter to waste rate will be equal to the flow being produced at all other filters to ensure when the filter goes online that the flowrate will be unchanged.
   5. The Filter to Waste cycle continues until it meets operator adjustable water quality parameter set points that include:
      a. Initial timer
         1) During this period particle counts and turbidity are ignored to ensure that time is allowed for the ripening spike to occur. During this time the filter cannot go into service.
      b. Particle counts
      c. Turbidity
      d. Ending timer

1) When this time expires, the filter will go into service regardless of any other parameter.

6. When any of the FTW parameters (b – d) are met, the filter transitions into service:
   a. The filter to waste valve CV-10041 receives a close command and simultaneously the effluent valve CV-10021 receives an open command. The effluent valve is then allowed to modulate to maintain the filter level based on linear level control.
   b. When the filter to waste valve CV-10041 achieves a close limit the filter to waste cycle is complete and the ready word in the filter control screen is cleared and the filter is in service.
   c. The filter run timer begins counting.
7. Setpoints:

Filter Level	TBD
Initial Timer	TBD
Particle Count	TBD
Turbidity	TBD
Ending Timer	TBD

8. Standard Control Strategies per 40 61 96-3.02:
   a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG SYSTEM)
   b. CS18 – DIGITAL ALARM SYSTEM
   c. CS71 – MOTORIZED VALVE OR GATE CONTROL – ISOLATING
   d. CS72 – MOTORIZED VALVE OR GATE CONTROL – MODULATING – ANALOG
   e. CS75 – VALVE OR GATE FAILURE
9. Standard Interlocks per 40 61 96-3.01:
   a. None.
10. Software Interlocks:
    a. None.

3.05 CONTROL STRATEGY – FLASH MIX

A. Reference Drawings: 35-PI-01 through 35-PI-03.

B. System Components:
   1. 20-P-10010 Flash Mix Pump 1
   2. 20-P-20010 Flash mix Pump 2

C. Description:
   1. Flash mix is vital to ensure that the primary coagulant it dispersed quickly in the steam of flow. It is accomplished by introducing short duration and high intensity mixing up to 1000 g-1. The primary coagulant is introduced at the point of highest energy to ensure thorough dispersion.
   2. There is one duty and one standby pump.

D. Control Descriptions:

1. The Flash Mix Pumps are normally operated in remote mode. In this mode, start/stop and speed is controlled by the PLC.
2. Flash Mix Pumps are arranged in a duty/standby configuration via the HMI.
3. As the plant influent flowrate and/or raw water temperature changes, the pump speed will adjust via PID loop to maintain the energy applied to the water at the desired energy gradient setpoint.
4. Current energy gradient calculation will be displayed on HMI.
5. An operator adjustable dead band setting will be used to prevent pumps from excessive variation based on inherent minor flow meter variations.
6. Setpoints:

Energy Gradient Setpoint	TBD
Pressure Setpoint	TBD

7. Standard Control Strategies per 40 61 96-3.02:
   a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
   b. CS51 – ALTERNATION - SOFTWARE
   c. CS61 – VARIABLE FREQUENCY DRIVE SPEED
8. Standard Interlocks per 40 61 96-3.01:
   a. I1 – MOTOR PROTECTION
   b. I2 – HIGH DISCHARGE PRESSURE
   c. I19 – LOW SUCTION TANK PRESSURE
9. Software Interlocks:
   a. None.

3.06 CONTROL STRATEGY – FLOCCULATORS

A. Reference Drawings: 35-PI-04 through 35-PI-10

B. System Components:
   1. BASIN 1:
      a. 30-MX-11010 FLOCCULATOR 1A
      b. 30-MX-11020 FLOCCULATOR 1B
      c. 30-MX-12010 FLOCCULATOR 2A
      d. 30-MX-12020 FLOCCULATOR 2B
      e. 30-MX-13010 FLOCCULATOR 3A
      f. 30-MX-13020 FLOCCULATOR 3B
   2. BASIN 2:
      a. 30-MX-21010 FLOCCULATOR 1A
      b. 30-MX-21020 FLOCCULATOR 1B
      c. 30-MX-22010 FLOCCULATOR 2A
      d. 30-MX-22020 FLOCCULATOR 2B
      e. 30-MX-23010 FLOCCULATOR 3A
      f. 30-MX-23020 FLOCCULATOR 3B

C. Description:

1. Flocculation follows Flash Mix/Coagulation in the treatment unit process chain. It is primarily a 'mechanical' process in which energy is imparted into the water with mixers to promote collisions between particles, thus allowing the opportunity for very small particles to aggregate and increase in size. There are three stages of flocculation within a single basin. The stages are separated by baffle walls to increase the actual time water spends in the mixing zones. The mixing energy from stage to stage is decreased as floc forms to prevent floc shear; thus, allowing particles to aggregate into a discreet, pinhead size, floc particles that ideal for settling in the sedimentation basins.
2. Control Descriptions:
3. The Flocculators are normally operated in remote mode. In this mode, start/stop and speed is controlled by the PLC.
4. As raw water temperature value changes, the flocculator speed will adjust to maintain the energy applied to the water at the desired energy gradient setpoint.
5. The current energy gradient calculation will be displayed on the HMI for operator information.
6. Setpoints:

Energy Setpoint	TBD
Influent Flow Rate	TBD

7. Standard Control Strategies per 40 61 96-3.02:
   a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
   b. CS34 – EQUIPMENT RUN STATUS
   c. CS50 – ALARM WHEN NOT RUNNING
   d. CS61 – VARIABLE FREQUENCY DRIVE SPEED
8. Standard Interlocks per 40 61 96-3.01:
   a. I1 – MOTOR PROTECTION
   b. I9 – EMERGENCY STOP
9. Software Interlocks:
   a. None.

3.07 CONTROL STRATEGY – HOSELESS SLUDGE COLLECTORS

A. Reference Drawings: 35-PI-11 through 35-PI-14.

B. System Components:

1. Note that this section will describe the operation of one sludge collector but is applicable to all collectors listed.
2. 40-COL-10010 Solids Collector 1A
3. 40-COL-10020 Solids Collector 1B
4. 40-COL-20010 Solids Collector 1A
5. 40-COL-20020 Solids Collector 2B

C. Description:

1. Solids removal at proper intervals is important to ensure that the sludge collectors continue to work properly. If solids become too thick, the nozzles will become clogged, and flow will be restricted through the sludge collectors causing insufficient solids removal. If this is allowed to happen, the collectors will eventually fail due to over torque and the basin will have to be removed from service. Hoseless collectors require solids to be ≤ 1.5 percent solids; regular samples of the basin solids should be taken and analyzed for percent solids.
2. Best practice for solids removal is for solids accumulation to be calculated in real time within SCADA and for basins to run the collectors based on a known good solids' accumulation setpoint. 500 lbs. per basin is a good starting point but will be tuned by the operator and lab analysis over time. Removing solids too soon is a waste of water and can overwhelm the drying beds. Removing solids too late can cause too much accumulation within the basin and lead to floc carry over, solids turning septic, and solids becoming too dense for the collectors to function as designed.

D. Control Descriptions:
1. The sludge collectors are normally operated in remote mode. In this mode, start/stop is controlled by the PLC.
2. Sludge collectors are started and stopped in response to a vendor calculation of solids accumulated or when the operator adjustable time limit is reached.
3. Sludge valve CV-10011 opens
4. Collectors wait for an operator adjustable delay timer to expire.
5. The hoseless collectors begin a cycle which consists of one full-length travel of the basin.
6. The sludge valve CV-10011 closes.
7. The hoseless collectors return to the retracted home position.
8. The cycle completes and the time and accumulated solids setpoint is reset to zero.
9. Setpoints:

Accumulated Solids	TBD
Delay Timer	TBD
Operation Interval Timer	TBD

10. Standard Control Strategies per 40 61 96-3.02:
    a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
    b. CS34 – EQUIPMENT RUN STATUS
    c. CS71 – MOTORIZED VALVE OR GATE CONTROL - ISOLATING
11. Standard Interlocks per 40 61 96-3.01:
    a. I1 – MOTOR PROTECTION
    b. I9 – EMERGENCY STOP
    c. I14 – OVERTORQUE
12. Software Interlocks:
    a. None.

3.08 CONTROL STRATEGY – ANIONIC POLYMER (PEA) BLENDING/AGING SYSTEM

A. Reference Drawings: 35-PI-28, 35-PI-29.

B. System Components:
   1. 84-P-00010 Neat PEA Mixing Pump
   2. 84-BLND-10010 Polymer Blending Unit 1
   3. 84-BLND-20010 Polymer Blending Unit 2
   4. 84-T-00020 PEA Batch Tank

C. Description:
   1. Anionic Polymers (PEA) have a high molecular weight and are commonly purchased as an emulsion in either 5-gallon totes or 55-gallon drums. Emulsion PEA requires mixing in some type of two stage mixing chambers; that provide a short duration/high intensity mixing, followed by a less intensive lower energy mixing stage. The mixing is designed to allow for the tightly wound polymer chains to 'unravel' prior to reaching the applications point to ensure maximum benefit.
   2. After the polymer has passed through a blending unit, it goes immediately to a day tank 84-T-00020. The purpose of the day tank is to serve as a supply to the downstream blended PEA feeders and to ensure that an adequate supply of chemical is available at peak flow and peak dosages. The day tank also serves another very important purpose, it provides time for the blended PEA to age thereby allowing for the polymer chains to continue to unravel; this enhances the performance of this chemical. Once blended, PEA is susceptible to decay and should not be allowed to sit more than 24 hours. Ideally the batch size should allow for 2-3 batch cycles to run each day to avoid decay and loss of effectiveness.
   3. There is one duty and one standby polymer blending unit.

D. Control Descriptions:
   1. The PEA blending pumps are normally operated in remote mode. In this mode, start/stop is controlled by the PLC.
   2. When the batching tank drops to a Low Level setpoint, the Neat PEA Mixing Pump 84-P-00010 and the Polymer Blending Unit 84-BLND-10010 receive a start command from SCADA.
   3. When the batching tank rises to the High Level setpoint, the blending unit receives a stop command from SCADA
   4. In the event of a blending unit failure, the standby blender automatically is set to duty and runs the batch.
   5. Setpoints:

Concentration	0.15-0.25% solution
Batch Volume	TBD
Blending Water Flow Rate	TBD
Chemical Feed Rate	TBD (mL/min)
Batch Tank Low Level	TBD
Batch Tank High Level	TBD

   6. Standard Control Strategies per 40 61 96-3.02:
      a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
      b. CS34 – EQUIPMENT RUN STATUS
      c. CS41 – PUMP LEVEL CONTROL

d. CS51 – ALTERNATION – SOFTWARE

7. Standard Interlocks per 40 61 96-3.01:
   a. I1 – MOTOR PROTECTION
   b. I2 – HIGH DISCHARGE PRESSURE
8. Software Interlocks:
   a. None

3.09 CONTROL STRATEGY – PEA FILTER AID POLYMER FEEDERS

A. Reference Drawings: 35-PI-15, 35-PI-29.

B. System Components:
   1. 84-P-00020 PEA Feed Pump 1
   2. 84-P-00030 PEA Feed Pump2

C. Description:
   1. In this application, PEA is fed at very small dosages within the filter influent channel, upstream of the filters, to improve particulate removal at the filters. Filter-aids work by increasing the 'stickiness' of the filter media and proves beneficial particularly when plant filtration rates are high or when upstream processes are less than optimal. Dosages range from 0.005 – 0.030. Operators should take great care not to overfeed filter-aid as it can promote rapid head loss accumulation as well as increasing the likelihood of forming mudballs within the filter media.
   2. Continuous and consistent chemical dosing is critical to achieve optimized plant performance. It is important that chemical dosing is done with feeders that are in automatic operation and controlled by SCADA; this allows them to pace off plant flowrates and ensures that th
   3. e chemical dosages remain accurate at all times.
   4. There is one duty and one standby pump.

D. Control Descriptions:
   1. The PEA Feed Pumps are normally operated in remote mode. In this mode, start/stop and speed is controlled by the PLC.
   2. As the plant influent flowrate changes, the chemical feed pump speed will automatically adjust to maintain the desired chemical dosage.
   3. When the operator changes the dosage setpoint the chemical feed pumps speed will automatically adjust to maintain the desired chemical dosage.
   4. By using calibration columns, the operator ensures that chemical feeders are feeding accurately; and as necessary, fine tunes the feed rate using the proportion/ration feature provided within the HMI
   5. In the event of a chemical feed pump failure, the standby pump is automatically set to duty to maintain continuity thus avoiding upsets due to loss of chemical feed.
   6. Setpoints:

Chemical Dosage Rate	TBD
Chemical Concentration	TBD lbs/gallon

7. Standard Control Strategies per 40 61 96-3.02:
    a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
    b. CS34 – EQUIPMENT RUN STATUS
    c. CS51 – ALTERNATION – SOFTWARE
    d. CS61 – VARIABLE FREQUENCY DRIVE SPEED
8. Standard Interlocks per 40 61 96-3.01:
    a. I1 – MOTOR PROTECTION
    b. I2 – HIGH DISCHARGE PRESSURE
    c. I18 – LOW SUCTION TANK LEVEL
9. Software Interlocks:
    a. None.

3.10 CONTROL STRATEGY – PEC COAGULANT AID POLYMER FEEDERS

A. Reference Drawings: NA

B. System Components:
    1. Pumps are existing.

C. Description:
    1. PEC is very beneficial in achieving charge neutralization. PEC is much more effective at reducing *zeta potential* on particulates than primary coagulants and can achieve charge reduction with a fraction of the dosage. Because of this, primary coagulant dosages can be reduced thus causing a net reduction in plant solids production. Lower primary coagulant dosages also reduce the suppression of pH of the treated water.
    2. PEC dosages are adjusted to optimize charge neutralization as measured by a *zeta meter*. Primary coagulant dosages are used in response to the amount of turbidity and organics in the source water; and to form the desired floc characteristics that will produce optimal settled water turbidity.
    3. Continuous and consistent chemical dosing is critical to achieve optimized plant performance. It is important that chemical dosing is done with feeders that are in automatic operation and controlled by SCADA; this allows them to pace off plant flowrates and ensures that the chemical dosages remain accurate at all times.
    4. There is one duty and one standby pump.

D. Control Descriptions:
    1. The PEC Feed Pumps are normally operated in REMOTE mode. In this mode, start/stop and speed is controlled by the PLC.
    2. As the plant influent flowrate changes, the chemical feed pump speed will automatically adjust to maintain the desired chemical dosage.
    3. When the operator changes the dosage setpoint the chemical feed pumps speed will automatically adjust to maintain the desired chemical dosage.
    4. By using calibration columns, the operator ensures that chemical feeders are feeding accurately; and as necessary, fine tunes the feed rate using the proportion/ration feature provided within the HMI

5. In the event of a chemical feed pump failure, the standby pump is automatically set to duty to maintain continuity thus avoiding upsets due to loss of chemical feed.
6. Setpoints:

Chemical Dosage Rate	TBD
Chemical Concentration	TBD lbs/gallon

7. Standard Control Strategies per 40 61 96-3.02:
   a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
   b. CS34 – EQUIPMENT RUN STATUS
   c. CS51 – ALTERNATION – SOFTWARE
   d. CS61 – VARIABLE FREQUENCY DRIVE SPEED
8. Standard Interlocks per 40 61 96-3.01:
   a. I1 – MOTOR PROTECTION
   b. I2 – HIGH DISCHARGE PRESSURE
   c. I18 – LOW SUCTION TANK LEVEL
9. Software Interlocks:
   a. None.

3.11 CONTROL STRATEGY – PRIMARY COAGULANT AID POLYMER FEEDERS

A. Reference Drawings: NA

B. System Components:

C. Pumps are existing.

D. Description:
   1. Primary coagulants are metal salts, usually Iron or Aluminum based chemicals. When fed into the raw water, these chemicals precipitate hydroxides and start the process of coagulation – for example the precipitant formed by ferric products is ferric hydroxide. Charge neutralization is another very important part of coagulation. Charge neutralization can be achieved using primary coagulants, but it is more effective when used together with cationic polymers.
   2. Continuous and consistent chemical dosing is critical to achieve optimized plant performance. It is important that chemical dosing is done with feeders that are in automatic operation and controlled by SCADA; this allows them to pace off plant flowrates and ensures that the chemical dosages remain accurate at all times.
   3. There is one duty and one standby pump.

E. Control Descriptions:
   1. The Primary Coagulant Feed Pumps are normally operated in REMOTE mode. In this mode, start/stop and speed is controlled by the PLC.
   2. As the plant influent flowrate changes, the chemical feed pump speed will automatically adjust to maintain the desired chemical dosage.
   3. When the operator changes the dosage setpoint the chemical feed pumps speed will automatically adjust to maintain the desired chemical dosage.

4. By using calibration columns, the operator ensures that chemical feeders are feeding accurately; and as necessary, fine tunes the feed rate using the proportion/ration feature provided within the HMI
5. In the event of a chemical feed pump failure, the standby pump is automatically set to duty to maintain continuity thus avoiding upsets due to loss of chemical feed.
6. Setpoints:

Chemical Dosage Rate	TBD
Chemical Concentration	TBD lbs/gallon

7. Standard Control Strategies per 40 61 96-3.02:
   a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
   b. CS34 – EQUIPMENT RUN STATUS
   c. CS51 – ALTERNATION – SOFTWARE
   d. CS61 – VARIABLE FREQUENCY DRIVE SPEED
8. Standard Interlocks per 40 61 96-3.01:
   a. I1 – MOTOR PROTECTION
   b. I2 – HIGH DISCHARGE PRESSURE
   c. I18 – LOW SUCTION TANK LEVEL
9. Software Interlocks:
   a. None.

3.12 CONTROL STRATEGY – PEA FLOCCULANT AID POLYMER FEEDER

A. Reference Drawings: 35-PI-30.

B. System Components:

C. 84-P-00040 PEA Feed Pump 3

D. Description:
1. PEA is fed at the midpoint of flocculation stages to enhance the formation of floc particles within the floc basins and potentially improve settled water turbidities. Typical dosages can range from 0.10 – 1.0 PPM.
2. Continuous and consistent chemical dosing is critical to achieve optimized plant performance. It is important that chemical dosing is done with feeders that are in automatic operation and controlled by SCADA; this allows them to pace off plant flowrates and ensures that the chemical dosages remain accurate at all times.
3. Control Descriptions:
4. The PEA Feed Pump is normally operated in remote mode. In this mode, start/stop and speed is controlled by the PLC.
5. As the plant influent flowrate changes, the chemical feed pump speed will automatically adjust to maintain the desired chemical dosage.
6. When the operator changes the dosage setpoint the chemical feed pumps speed will automatically adjust to maintain the desired chemical dosage.

7. By using calibration columns, the operator ensures that chemical feeders are feeding accurately; and as necessary, fine tunes the feed rate using the proportion/ration feature provided within the HMI
8. Setpoints:

Chemical Dosage Rate	TBD
Chemical Concentration	TBD lbs/gallon

9. Standard Control Strategies per 40 61 96-3.02:
    a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
    b. CS34 – EQUIPMENT RUN STATUS
    c. CS61 – VARIABLE FREQUENCY DRIVE SPEED
10. Standard Interlocks per 40 61 96-3.01:
    a. I1 – MOTOR PROTECTION
    b. I2 – HIGH DISCHARGE PRESSURE
    c. I18 – LOW SUCTION TANK LEVEL
11. Software Interlocks:
    a. None.

3.13 CONTROL STRATEGY – PEA SOLIDS HANDLING POLYMER FEEDER

A. Reference Drawings: 35-PI-30.

B. System Components:

C. 84-P-00060 PEA Feed Pump 5

D. Description:

1. In this application, PEA is fed into streams leading to clarifiers or solids settling basins to improve the speed and efficiency of the settling process and the clarity of the settled water being returned to the headworks of the plant during the recycling process. Typical dosages range between 0.10 – 1.0 PPM.
1. Continuous and consistent chemical dosing is critical to achieve optimized plant performance. It is important that chemical dosing is done with feeders that are in automatic operation and controlled by SCADA; this allows them to pace off plant flowrates and ensures that the chemical dosages remain accurate at all times.
2. Control Descriptions:
3. The PEA Feed Pump is normally operated in remote mode. In this mode, start/stop and speed is controlled by the PLC.
4. As the plant influent flowrate changes, the chemical feed pump speed will automatically adjust to maintain the desired chemical dosage.
5. When the operator changes the dosage setpoint the chemical feed pumps speed will automatically adjust to maintain the desired chemical dosage.
6. By using calibration columns, the operator ensures that chemical feeders are feeding accurately; and as necessary, fine tunes the feed rate using the proportion/ration feature provided within the HMI
7. Setpoints:

Chemical Dosage Rate	TBD
Chemical Concentration	TBD lbs/gallon

8. Standard Control Strategies per 40 61 96-3.02:
    a. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
    b. CS34 – EQUIPMENT RUN STATUS
    c. CS61 – VARIABLE FREQUENCY DRIVE SPEED
9. Standard Interlocks per 40 61 96-3.01:
    a. I1 – MOTOR PROTECTION
    b. I2 – HIGH DISCHARGE PRESSURE
    c. I18 – LOW SUCTION TANK LEVEL
10. Software Interlocks:
    a. None.

E. CONTROL STRATEGy – infiltration gallery

F. Reference Drawings: 01-PI-01.

G. System Components:

H. 01-P-00010 Infiltration Gallery Pump 1

I. 01-P-00020 Infiltration Gallery Pump 2

J. Description:
1. [This process does this, for this reason].
2. [Capacities, considerations, and limits from the design report/technical memorandum].
3. [There are [two] duty and [one] standby [pump].]
4. [The pumps operate in lead and follow sequencing.]

K. Control Descriptions:
1. The [_____] are normally operated in REMOTE mode. In this mode, start/stop [and speed] is controlled by the PLC.
2. [_____] are started and stopped [by the Operator] [to maintain/in response to _____].
3. [Speed is controlled to maintain/in response to _____].
4. In the event of utility power failure, [_____] will stop due to loss of power. If [_____] are operating on standby power and utility power is restored, the [_____] will be called to stop when the automatic transfer [switch][controller] returns to the utility power position. [This is required as the transfer [switch][controller] does not provide for phase synchronized make-before-break transfer from standby to utility power, to prevent motor back-emf from tripping circuit breakers.]
5. [Pumps will restart on standby or return to utility power in the same mode, number of pumps, and speeds as they were running before. Pumps will be delay-started by the PLC, however. The Lead pump will be restarted 5 seconds after power availability, and the Lag 1 pump 15 seconds after (if called previously).]

6. [The standby generator is sized to operate two duty pumps, with one as standby. The control system shall not attempt automatic start or permit SCADA manual start of all three pumps when on standby power.]

4. In the event of utility power failure, [_____] will stop due to loss of power. If [_____] are operating on standby power and utility power is restored, the [_____] will be called to stop when the automatic transfer [switch][controller] returns to the utility power position. [This is required as the transfer [switch][controller] does not provide for phase synchronized make-before-break transfer from standby to utility power, to prevent motor back-emf from tripping circuit breakers.]
5. [Pumps will restart on standby or return to utility power in the same mode, number of pumps, and speeds as they were running before. Pumps will be delay-started by the PLC, however. The Lead pump will be restarted 5 seconds after power availability, and the Lag 1 pump 15 seconds after (if called previously).]
6. [The standby generator is sized to operate two duty pumps, with one as standby. The control system shall not attempt automatic start or permit SCADA manual start of all three pumps when on standby power.]
7. Setpoints:

Lead Pump Pressure Off Setpoint	176 psig default, range 160 to 180 adjustable
Lead Pump Pressure On Delay Setpoint	60 sec. fixed
Lead Pump Pressure On Setpoint	171 psig default, range 160 to 180 adjustable
Lag 1 Pump Pressure Off Setpoint	171 psig default, range 160 to 180 adjustable
Lag Pump Pressure On Delay Setpoint	60 sec. fixed
Lag 1 Pump Pressure On Setpoint	166 psig default, range 160 to 180 adjustable
Pressure Setpoint	170 psig default, range 160 psig to 180 psig adjustable

8. Standard Control Strategies per 40 61 96-3.02:
   a. [CS2 – FLOW TOTALIZATION
   b. CS11 – GENERAL READY, RUNNING AND FAILURE SYSTEM
   c. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
   d. CS19 – DATA ARCHIVING HISTORIAN AND HISTORICAL FUNCTIONS
   e. CS51 – ALTERNATION – SOFTWARE
   f. CS61 – VARIABLE FREQUENCY DRIVE SPEED]
9. Standard Interlocks per 40 61 96-3.01:
   a. [I1 – MOTOR PROTECTION
   b. I2 – HIGH DISCHARGE PRESSURE
   c. I3 – HIGH MOTOR TEMPERATURE
   d. I18 – LOW SUCTION TANK LEVEL (PRESSURE)]
10. Software Interlocks:
    a. [None.] [_____].

3.17 CONTROL STRATEGY – CLEARWELL

A. Reference Drawings: 70-PI-01

B. System Components:

C. 70-PI-00040 Clearwell Drain Pump 1

D. 70-PI-00050 Clearwell Drain Pump 2

E. Description:

1. [This process does this, for this reason].
2. [Capacities, considerations, and limits from the design report/technical memorandum].
3. [There are [two] duty and [one] standby [pump].]
4. [The pumps operate in lead and follow sequencing.]

F. Control Descriptions:

1. The [_____] are normally operated in REMOTE mode. In this mode, start/stop [and speed] is controlled by the PLC.
2. [_____] are started and stopped [by the Operator] [to maintain/in response to _____].
3. [Speed is controlled to maintain/in response to _____].
4. In the event of utility power failure, [_____] will stop due to loss of power. If [_____] are operating on standby power and utility power is restored, the [_____] will be called to stop when the automatic transfer [switch][controller] returns to the utility power position. [This is required as the transfer [switch][controller] does not provide for phase synchronized make-before-break transfer from standby to utility power, to prevent motor back-emf from tripping circuit breakers.]
5. [Pumps will restart on standby or return to utility power in the same mode, number of pumps, and speeds as they were running before. Pumps will be delay-started by the PLC, however. The Lead pump will be restarted 5 seconds after power availability, and the Lag 1 pump 15 seconds after (if called previously).]
6. [The standby generator is sized to operate two duty pumps, with one as standby. The control system shall not attempt automatic start or permit SCADA manual start of all three pumps when on standby power.]
7. Setpoints:

Lead Pump Pressure Off Setpoint	176 psig default, range 160 to 180 adjustable
Lead Pump Pressure On Delay Setpoint	60 sec. fixed
Lead Pump Pressure On Setpoint	171 psig default, range 160 to 180 adjustable
Lag 1 Pump Pressure Off Setpoint	171 psig default, range 160 to 180 adjustable
Lag Pump Pressure On Delay Setpoint	60 sec. fixed
Lag 1 Pump Pressure On Setpoint	166 psig default, range 160 to 180 adjustable
Pressure Setpoint	170 psig default, range 160 psig to 180 psig adjustable

8. Standard Control Strategies per 40 61 96-3.02:
   a. [CS2 – FLOW TOTALIZATION
   b. CS11 – GENERAL READY, RUNNING AND FAILURE SYSTEM

c. CS15 – GENERAL PROCESS CONTROL FUNCTION (ANALOG) SYSTEM
d. CS19 – DATA ARCHIVING HISTORIAN AND HISTORICAL FUNCTIONS
e. CS51 – ALTERNATION – SOFTWARE
f. CS61 – VARIABLE FREQUENCY DRIVE SPEED]

9. Standard Interlocks per 40 61 96-3.01:
   a. [I1 – MOTOR PROTECTION
   b. I2 – HIGH DISCHARGE PRESSURE
   c. I3 – HIGH MOTOR TEMPERATURE
   d. I18 – LOW SUCTION TANK LEVEL (PRESSURE)]
10. Software Interlocks:
   a. [None.] [_____].

END OF SECTION

SECTION 40 62 00

COMPUTER SYSTEM HARDWARE AND ANCILLARIES

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies industrial computer software and hardware systems for location in wet and corrosive process environments.

1.02 QUALITY ASSURANCE

A. References
   1. Refer to Section 40 61 13, References.

B. Systems Responsibility
   1. Refer to Section 40 61 13, Corrosive Locations.

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Manufacturer's product literature for all software systems, marked to show products included.
   3. Manufacturer's product literature for all hardware components, marked to show products included.

PART 2 PRODUCTS

2.01 INDUSTRIAL COMPUTER WORKSTATIONS (PANEL MOUNT)

A. Heavy Duty Industrial PC Hardware:
   1. Provide Protech Solutions, Advantech, or Owner-approved panel mounted workstations with factory installed components, licensed in the Owner's name
   2. NEMA 4X exposed parts
   3. IP65 compliant front panel protection

4. Operating temperature: 0 to 50ºC
5. Processor Controller:
    a. Intel Core i7 series CPU, or approved equal, fanless design
    b. 16 GB DDR4 RAM
    c. 256 GB SSD
    d. 2 x 10/100/1000 Mbps Ethernet LAN port
    e. Four USB 3.0 ports
    f. Two RS-232 serial ports
    g. Minimum one spare PCI-e slot
6. Minimum 21" diagonal color display, touchscreen, 16:9
7. Projected capacitive
8. Power: 120VAC
9. Optical Mouse with scroll for configuration purposes
10. Two year warranty from shipment date.

B. Enclosure:
    1. Enclosures for the panel-mounted PCs shall be in accordance with Section 40 67 00, Control System Equipment Panels and Racks

C. Operating System Software:
    1. Provide one of the following for each workstation, licensed in the Owner's name. Request licensee name and address from the Construction Manager prior to ordering.
    2. Windows 11 IoT Enterprise (64-bit) latest version.

2.02 WORKSTATION SOFTWARE

A. General:
    1. License all software products in the Owner's name. Request licensee name and address from the Construction Manager prior to ordering. Provide latest versions.

B. OIS Software:
    1. Refer to Section 40 68 13.

2.03 SOURCE QUALITY CONTROL

A. The Owner and Construction Manager require the specified manufacturers to provide the equipment and/or products to be furnished under this section. The Owner and Construction Manager believe the manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed to mean that the named manufacturer's standard product will comply with the requirements of this Section. Manufacturers shall be as specified for the purpose of compatible and efficient utilization of existing equipment, supplies, and personnel training and experience.

2.04 PRODUCT DATA

A. The following data shall be provided in accordance with Section 01 33 00.

B. Operation And Maintenance Information:
   1. One set of all software and hardware manuals shall be provided at time of delivery to the Owner, including maintenance information. Include written warranty and final reviewed submittal.

PART 3 EXECUTION

3.01 GENERAL

A. Provide workstations and equipment as shown. Troubleshoot and repair any intermittent or inoperative network connections.

3.02 SOFTWARE INSTALLATION

A. Provide workstation operating system software pre-loaded by the workstation manufacturer.

B. Programmer:
   1. Industrial computer workstation (ICW) software installation.

3.03 APPLICATIONS CONFIGURATION

A. Programmer:
   1. Configure ICW operating system software.
   2. Configure ICW application software.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 63 43

PROGRAMMABLE LOGIC CONTROLLERS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope

1. This Section specifies requirements for programmable logic controllers (PLC) designed to execute discrete and continuous control logic with high reliability in industrial applications. Enclosures and components are specified in Section 40 67 00.
2. All PLCs provided for this project shall comply with the requirements of this Section. PLCs provided with equipment specified in Divisions 23, 41, 43, 44, and 46 are provided by the Contractor, unless specified otherwise in the project documentation.

B. PLC Schedule

PLC Designation	Testing	Spares Required?
35-PLC-9000	Factory Acceptance	Yes
35-PLC-9001	Factory Acceptance	Yes
35-PLC-9002	Factory Acceptance	Yes
35-PLC-9003	Factory Acceptance	Yes
35-PLC-9004	Factory Acceptance	Yes
35-PLC-9005	Factory Acceptance	Yes
35-PLC-9006	Factory Acceptance	Yes
70-PLC-9000	Factory Acceptance	Yes
87-PLC-9000	Factory Acceptance	Yes

C. General Requirements:

1. General requirements shall be as specified in Sections 40 61 13.01 and 40 67 00.

1.02 QUALITY ASSURANCE

A. References

1. This Section contains references to the following documents or documents listed in Sections 26 05 00, 40 61 13, and 40 67 00. They are a part of this Section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this Section as if referenced directly. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids).
3. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

4. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
IEC 61131-3	Programmable Controllers – Part 3: Programming Languages
NEMA IA 2.2	Programmable Controllers – Equipment Requirements and Tests
NEMA IA 2.3	Programmable Controllers – Programming Languages

B. Systems Integrator
   1. Responsibilities and qualifications shall be as specified in Section 40 61 13.

C. Factory Acceptance Tests (FAT):
   1. FAT are specified in Section 40 61 21 and scheduled in the PLC Schedule.
      a. Submit factory test forms for approval prior to tests.
      b. Provide all expenses for one Owner staff member and one Engineer staff member to witness factory testing. Travel shall be during business hours on weekdays.
      c. After FAT, complete programmable logic controllers including chassis, I/O modules, associated cabling, and miscellaneous hardware shall be turned over to the Owner during construction to facilitate Owner-directed programming and configuration.

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Sections 01 33 00 and 40 61 13:

B. Shop Drawings:
   1. Submit under Section 40 67 00, including:
      a. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. A check mark shall denote full compliance with a paragraph as a whole.
      b. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
      c. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the Specifications.
      d. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Submittal requirements per Section 40 67 00 for the equipment specified herein

3. PLC Input/Output (I/O) loop diagram drawings
4. Internal power distribution schematic diagram drawings
5. PLC power supply loading calculations
6. List of spare parts to be provided

C. FAT Schedule And Forms
1. Submit under Section 40 61 21 and per the requirements of this Section

D. Operating and Maintenance Information:
1. Operating and maintenance information shall be provided in accordance with Section 01 78 23, including the following for the PLC system:
a. Manufacturer, Representative, and Supplier contact information.
b. Manufacturer instruction manuals shall include only the following as applicable to the PLC system:
1) Safety precautions
2) Environmental conditions
3) Troubleshooting guides and diagnostic techniques
4) Component connection diagrams
5) Removal and replacement instructions
c. Warranty information
d. Final reviewed submittal
e. As-built drawings with record of switch and jumper settings for all components
f. List of spare parts provided

PART 2 PRODUCTS

2.01 GENERAL

A. Manufacturer
1. The Owner and Construction Manager require the specified Contractor to provide the manufacturer-supplied equipment and/or products to be furnished under this Section.
2. Manufacturers and models shall be as specified for the purpose of compatible and efficient utilization of existing equipment, supplies, and personnel training and experience, no substitutions are permitted.

B. Materials
1. Equipment and/or products shall be new and unused at the time of system assembly.

C. Controller conforming to NEMA IA 2.2, and with required memory and functional capacity to perform specified sequence of operation with scheduled input and output points.
1. RFI/EMI Susceptibility: MIL STD 461B CS02.
2. Showering Arc Test: NEMA Pub No ICS2-230.42.
3. Surge Withstand: ANSI C37.90a.
4. RFI Immunity: IEC 801-3.

5. Ground Continuity: IEC 801-5.
6. Electrostatic Discharge: IEC 801-2.
7. Electromagnetic Field: IEC 61000-4-3.
8. Fast transients: IEC 61000-4-4.

2.02 PROGRAMMABLE LOGIC CONTROLLER

A. Manufacturer:
   1. Schneider Electric Modicon M580 and X80 platforms
   2. Schneider Electric Modicon M340 and X80 platforms
   3. No substitutions

B. Networking Connections: Provide communication interfaces, network cables, taps, terminators, power supplies, and accessories for a complete operating network.
   1. Modbus TCP
   2. ASCII RS485 to particle counter(s)

C. Processor:
   1. With ethernet port(s) and serial port(s) dedicated solely for programming use, minimum 200k bytes (8 bit) for IEC 1131 control programs, and 24k words (16-bit) for storage of data in battery-backed RAM memory. Provide additional serial communications adapters required for other serial interfacing. Include real-time clock.

D. Input and Output Modules:
   1. Discrete Inputs: BMXDAI1604H
   2. Discrete Outputs: BMXDDO1602H
   3. Analog Inputs: BMXAMI0810H
   4. Analog Outputs: BMXAMO0410H
   5. I/O module terminations:
      a. By manufacturer to match module.
   6. I/O module interface modules:
      a. Provide as necessary including cabling to interface all I/O to processor.
   7. Spare Input/Outputs:
      a. The greater of a minimum one channel or 15% of each type provided per control panel.

E. Power Supplies: Schneider Electric Modicon BMXCPS3020H

F. Miscellaneous:
   1. Provide all cables, taps, terminators, power supplies, and accessories for a complete operating PLC system.

2.03 PROGRAMMING SOFTWARE

A. The following software shall be provided by the Systems Integrator for this project.

B. Programmable Logic Controller
   1. PLC Manufacturer:
      a. Schneider Electric EcoStruxture Control Expert (formerly Unity Pro)
   2. Licenses: Provide 1 license to the Owner

2.04 SPARE PARTS

A. Programmable Logic Controller
   1. One of each unique processor card
   2. One of each unique remote I/O and communication card
   3. One for each ten I/O card, minimum of one for each unique I/O card
   4. One of each unique power supply
   5. One of each unique pre-fabricated cable

2.05 CONTROL PANEL FABRICATION

A. Refer to Section 40 67 00.

B. Detail shop drawings showing field connections and any terminal block jumpering required.

C. Terminate all used and spare I/O wiring to terminal blocks.

D. Provide terminal blocks for field connections to PLC discrete inputs:
   1. One fused terminal with LED for each group of 8 inputs, connected to control power
   2. Fused terminal connected to eight terminal blocks to provide power to each field input circuit
   3. One terminal per PLC input
   4. One common terminal for each group of 8 inputs, connected to control power common

E. Provide terminal blocks for field connections to PLC discrete outputs:
   1. One fused terminal with LED for each output, connected to control power
   2. Provide interposing relay for each solid-state PLC output. Connect output and control power common to relay coil
   3. One common terminal for each output, connected to control power common

F. Provide terminal blocks for field connections to PLC analog inputs:
   1. One fused terminal with LED for each input, connected to 24VDC
   2. Two terminals per PLC input
   3. One common terminal for each input, connected to 24VDC common
   4. One ground terminal for each input shield, connected to signal ground bus.
   5. Two surge protecting terminals for each field mounted instrument or equipment, grounded to the frame ground bus.

G. Provide terminal Blocks for field connections to PLC Analog Outputs:
   1. One fused terminal with LED for each output, connected to 24VDC.

2. Two terminals per PLC output.
3. One common terminal for each output, connected to 24VDC common
4. One ground terminal for each output shield, connected to signal ground bus
5. Two surge protecting terminals for field mounted equipment, grounded to the frame ground bus

2.06 PRODUCT DATA

A. The following Product Data shall be provided in accordance with Section 01 33 00.

B. FAT Results:
   1. Submit under Section 40 61 21 and per the requirements of this Section.

C. Operating and Maintenance Information:
   1. Operating and maintenance information shall be provided in accordance with Section 01 78 23, including the following.
      a. Manufacturer, representative, and supplier contact information.
      b. Manufacturer instruction manuals shall include only the following as applicable to the PLC system:
         1) Safety precautions
         2) Environmental conditions
         3) Troubleshooting guides and diagnostic techniques
         4) Component connection diagrams
         5) Removal and replacement instructions
      c. Warranty information
      d. Final reviewed submittal
      e. As-built drawings with record of switch and jumper settings for all components

D. PLC Program – Systems Integrator
   1. Provide the as-built programmable controller program prepared using the software type specified in this specification and per Section 40 68 03

PART 3 EXECUTION

3.01 INSTALLATION

A. Refer to Section 40 67 00

B. Connect input and output devices to the PLC via control panel terminal blocks. Direct wiring directly to the PLC is prohibited.

3.02 FIELD INSPECTION AND TESTING

A. Refer to Section 40 67 00

B. Equipment manufacturer and Systems Integrator: The supplier of each PLC system shall provide a qualified service representative to perform the following:
   1. Inspect the PLC installation including I/O and network systems, hardware configuration switch and jumper settings.
   2. Monitor all PLC system diagnostic indicators, both hardware and software, and certify that the PLC system performance meets or exceeds the manufacturer's published specifications.
   3. Assist in all testing. The Systems Integrator will provide a minimum of two man-weeks on-site for each PLC I/O enclosure.
   4. Modify PLC programs as required
   5. Certify in writing to the Construction Manager that the PLC system has been installed and configured in accordance with the manufacturer's published guidelines.

C. Contractor
   1. Fault or trouble conditions shall be investigated and resolved by the Contractor to the satisfaction of the PLC supplier.

3.03 TRAINING

A. Operations and Troubleshooting
   1. The Systems Integrator shall conduct application program maintenance, modification, and re-loading training conforming to the requirements of Section 01 79 00. A minimum of four man-hours on-site including training materials and expenses shall be provided for four maintenance personnel.

B. PLC Programming
   1. Off-site training shall be provided for the Owner's personnel on the operation and troubleshooting of the PLC system and fundamental programming techniques. Training shall be conducted by a certified instructor in the direct employ of the PLC manufacturer.
   2. The training shall be structured as a lecture/lab course with hands-on lab exercises utilizing PLC system hardware similar to the hardware installed as work of this contract. Hardware simulators and programming terminals shall be furnished by the PLC manufacturer. A minimum of 3 days of formal training shall be presented.
   3. Travel shall occur one day before and one day after training. Contractor shall include the cost of training and all expenses for 2 personnel.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 66 00

NETWORK AND COMMUNICATION SYSTEMS TESTING

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies updates to the facility's existing data communication network configuration verification and validation including performance testing with certified testing equipment. This section specifies the documentation of network configuration verification and data communication validation for the networks shown on the drawings. This specification does not address testing the existing network and communications system(s).

B. This section specifies the work that service firms with the technical staff trained on network system test equipment, test results interpretation, and report preparation for network systems. Firms shall be EIA/TIA members and meet the performance and safety requirements of local laws, regulations, codes, and standards governing the work.

C. The firms shall demonstrate network systems training on:
   1. Modbust TCP protocol

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
EIA	Electronics Industries Alliance
TIA	Telecommunications Industry Association
NEC	National Electrical Code
NESC	National Electrical Safety Code

1.03 SUBMITTALS

A. Submit the information in of this specification in accordance with Section 01 33 00

1.04 PROJECT / SITE CONDITIONS

A. The equipment shall be designed and manufactured to meet the specified requirements of Section 01 11 80 and 01 73 23 for environmental and seismic conditions.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND SERVICE PROVIDERS

A. Candidate manufacturers and service providers include:
   1. Schneider Electric/Modicon
   2. Or approved equal

2.02 PRODUCT DATA

A. Applicable information shall be provided in the product submittal, including:
   1. Test Equipment calibration certification for any testing devices used.
   2. Network block diagram and network routing site plan drawings.
   3. Testing Services Report sealed by a Registered Electrical or Control System Engineer.

PART 3 EXECUTION

3.01 ONSITE NETWORK INSPECTION AND VALIDATION SERVICES:

A. Coordinate the network inspection, validation and testing services with the Construction Manager.

3.02 FIELD TESTING

A. The network equipment shall be tested in accordance with this specification and service provider's standard procedures.
   1. Test operation of communication ports
   2. Test data communication circuit from end-to-end for each link of the network
   3. Test for validation of 802.1 spanning tree to detect and eliminate bridging loops with each domain
   4. Test for validation of snooping within each domain
   5. Test the performance of the network

3.03 FIELD VERIFICATION

A. The network equipment shall be tested in accordance with this specification herein and the service providers' standard procedures.
   1. Correct node and subnet configuration
   2. Proper usage of equipment i.e. switches, routers, hubs
   3. Node count

4. Repeater configuration and optical power loss for fiber circuits
5. Redundant network function
6. Utilization, errors, collisions, broadcasts, protocols, stations, device detection, and connectivity for components shown on the network block and connection diagrams
7. Proper network and equipment safety grounding

3.04 NETWORK CONFIGURATION VALIDATION REPORT

A. Provide written verification results and recommendations.
   1. Operation of communication ports results
   2. Data communication circuit from end-to-end for each link of the network results
   3. Validation of 802.1 spanning tree to detect and eliminate bridging loops with each domain, results
   4. Validation of snooping within each domain, results
   5. Network performance results

SECTION 40 66 13

SWITCHES AND ROUTERS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies the switches and routers required to provide the network configuration as specified in the project documentation.

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

TIA	Telecommunications Industry Association
NEC	National Electrical Code
NESC	National Electrical Safety Code

1.03 SUBMITTALS

A. The following information shall be submitted in accordance with Section 01 33 00. The submittal shall contain a cover sheet, indexed by item, and cross-referenced to the appropriate specification paragraph, and be organized in the following order:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.

2. A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
3. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
4. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
5. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
6. A copy of Specification Sections 01 11 80 and 01 73 23, with addendum updates included, with each paragraph check-marked to indicate specification compliance. Failure to a copy of the marked-up specification sections shall be cause for rejection of the entire submittal with no further review.

1.04 PROJECT / SITE CONDITIONS

A. The equipment shall be designed and manufactured to meet the specified requirements of Section 01 11 80 and 01 73 23 for environmental and seismic conditions.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND SERVICE PROVIDERS

A. Candidate manufacturers and service providers include:
   1. Cisco
   2. Phoenix Contact
   3. Or approved equal

2.02 PRODUCT DATA

A. Applicable information shall be provided in the product submittal, including:
   1. Test Equipment calibration certification for any testing devices used.
   2. Network block diagram and network routing site plan drawings.
   3. Testing Services Report sealed by a Registered Electrical or Control System Engineer.

B. Industrial Ethernet Fiber Optic Transceiver: Network fiber optic to ethernet transceiver to provide connectivity between the control system network components. The transceiver shall be used as shown on the System Architecture drawing. Provide the switch with the following minimum features:
   1. Steel industrial-strength enclosure
   2. DIN-rail mounted
   3. (1) RJ-45 connector

4. 100 Mbps operation (100Base TX)
5. Owner-approved fiber optic connectors
6. Phoenix Contact FO converter FL MC 2000 series, or approved equal

C. DIN-rail Mounted Ethernet Switch
1. Fully Managed, Layer 3 ethernet switch
2. 10/100/1000 Mbps ethernet
3. 2 x SFP ports
4. 6 RJ-45 ports
5. Cisco IE3100 Series, Phoenix Contact FL Switch 2200 series, or approved equal

D. Rack-mounted Ethernet Switch
1. Fully Managed, Layer 3 ethernet switch
2. 10/100/1000 Mbps ethernet
3. 4 x SFP ports
4. Minimum 24 RJ-45 ports
5. PoE support, with power supply
6. Cisco IE9320 Series, or approved equal

PART 3 EXECUTION

2.03 ONSITE NETWORK INSPECTION AND VALIDATION SERVICES:

A. Coordinate the network inspection, validation and testing services with the Construction Manager.

2.04 FIELD TESTING

A. The network equipment shall be tested in accordance with Section 40 66 00 and service provider's standard procedures.
1. Test operation of communication ports.
2. Test data communication circuit from end-to-end for each link of the network.
3. Test for validation of 802.1 spanning tree to detect and eliminate bridging loops with each domain.
4. Test for validation of snooping within each domain.
5. Test the performance of the network.
6. Test segment attenuation against segment propagation delay calculation.

2.05 FIELD VERIFICATION

A. The network equipment shall be tested in accordance with Section 40 66 00 herein and the service providers' standard procedures.
1. Correct node and subnet configuration.
2. Proper usage of equipment i.e. switches, routers, hubs.
3. Node count.
4. Repeater configuration and optical power loss for fiber circuits.

5. Redundant network function.
6. Utilization, errors, collisions, broadcasts, protocols, stations, device detection, and connectivity for components shown on the network block and connection diagrams.
7. Proper network and equipment safety grounding.

2.06 NETWORK CONFIGURATION VALIDATION REPORT

A. Provide written verification results and recommendations.
   1. Operation of communication ports results.
   2. Data communication circuit from end-to-end for each link of the network results.
   3. Validation of 802.1 spanning tree to detect and eliminate bridging loops with each domain, results.
   4. Validation of snooping within each domain, results.
   5. Network performance results.

END OF SECTION

SECTION 40 66 33

METALLIC AND FIBER-OPTIC COMMUNICATION CABLING AND CONNECTORS

PART 1 GENERAL

1.01 SCOPE

A. Provide the fiber optic appurtenances required to complete the fiber optic cabling system as shown on the project documentation. Section 26 specifications address requirements for fiber optic data communication cables including installation, terminations, and testing.

1.02 QUALITY ASSURANCE

A. References:

1. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

TIA/EIA-598-C	Standard for Optical Fiber Cable Color Coding

1.03 SUBMITTALS

A. The following information shall be submitted for review in accordance with Section 01 33 00:

1. Product Literature:
    a. Manufacturer's catalog literature and catalog data sheets for the following items, marked to indicate products proposed, as applicable to the project:
        1) Fiber optic patch cords

2) Fiber optic termination panels

b. Shop drawings:

1) Termination panel fabrication and layout drawings with complete list of materials and nameplate engraving list.

2) Interconnection cable diagrams for the complete system, showing each fiber and color in each cable. Each termination point shall be clearly marked.

PART 2 PRODUCTS

2.01 FIBER OPTIC CABLE PATCH CORDS

A. General:

1. Provide preparation for the connections including polishing, connectors, hardware, cleaving tool, continuity tester, visual fault locator, and supplies for installation of connectors. Terminations shall be LC type. Fusion-spliced pigtails are acceptable.
2. Fiber optic cable connections shall be provided with ceramic ferrules; polycarbonate ferrules are not acceptable.

B. Single Mode Patch Cord Characteristics:

1. Patch cords shall be OS2 duplex fiber with jacket and connectors on both ends. Attenuation shall be a maximum of 0.2 dB. Provide length required for connection from patch panel to equipment.

2.02 FIBER OPTIC PANELS

A. General:

1. Fiber optic patch panels shall consist of a system of components for routing, supporting, and terminating the fiber optic cables specified herein. Terminations shall be LC type. Fiber optic cable connections shall be provided with ceramic ferrules; polycarbonate ferrules are not acceptable.

B. Description:

1. Provide the following:
   a. Wall-mounted type fiber optic patch panels constructed of aluminum or steel with removable hinged doors.
   b. Provide mounting hardware, cable clamps and grommets, cable routers, storage decks, connector racks, and items for a complete system.
   c. Cable routers and storage decks to retain cables' minimum bending radius.
   d. Sufficient quantity of ports to terminate the number of fiber strands specified and blank covers for unused port spaces.
   e. One port for each fiber in accordance with the specified cable type.
   f. Panel shall be Corning Cable Systems Pretium PWH, or approved equal.

2.03 PRODUCT DATA

A. The following information and product data specified under individual specification sections shall be provided in accordance with Section 01 33 00.

1. Provide a manual which includes manufacturer's operation and maintenance information as specified in Section 01 78 23. Manual shall include final reviewed submittal.

PART 3 EXECUTION

3.01 INSTALLATION

A. Patch panels and patch cords shall be installed in accordance with the manufacturer's instructions.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 67 00

CONTROL SYSTEM EQUIPMENT PANELS AND RACKS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies requirements for panels, enclosures, and control stations for instruments, control and communications per the Panel Schedule herein.
2. This section specifies requirements for power supply and conditioning equipment required to support the instrumentation and communication systems specified.
3. Provide the instrument, control, and monitoring features indicated on the P&ID and electrical drawings. Panels shall be arranged to separate control and instrument devices from power wiring. Panels shall be arranged for dedicated field wiring terminations rated for 600VAC or less for power, control, and instrument signal wiring, in accordance with NEC Article 409. Panels shall be fabricated by a UL 508A recognized facility and shall bear the appropriate UL 508A Industrial Control Panel label. Panels for hazardous (classified) locations shall bear the appropriate UL 698A label. Panels shall be labeled in accordance with Article 409 of the National Electrical Code.
4. Transmitters, analyzers, signal conditioning modules, and other equipment or devices as specified in other Division 40 sections.
5. Panels that contain programmable logic controllers (PLC) and operator interface terminals (OIT) units shall be as indicated in the Panel Schedule. Specific panel devices are specified herein and in Division 26 sections.
6. PLC and OIT shall comply with those specified in Division 40. Panels that do not comply with the specified products and specified logic method, hardwired or PLC logic, shall not be accepted. Cost to retrofit the panel as specified shall be borne by the panel supplier. Corrections or modifications to UL 508A Industrial Control Panels shall be transported to the panel supplier's facility for corrections, testing, relabeling and inspection.
7. Field modifications require a UL inspector site inspection for approval of panel corrections and to re-label the panel after the field modifications are completed.
8. Vendor and Manufacturer panels specification Sections are referenced in the Panel Schedule and specify specific requirement for these panel. Contractor custom panels are specified herein and shown on the drawings.
9. The vendor or manufacturer-supplied package equipment and Contractor custom field panels shall adhere to the requirements in specifications in Division 26 for motor starters, controllers, and devices and the circuits shall be arranged for fail-safe wiring and electrical operation, as defined hereinafter.

B. Panel Design:

1. General:
   a. Panel hardware and software is specified in other sections within Division 40.

2. Control Power Distribution:
    a. Panel containing 120VAC-powered equipment shall use the DIN-rail power distribution method with fuses and blown fuse indication. Power is restricted to 120VAC and 24VDC, unless otherwise noted.
3. Panels containing voltages greater than 480VAC shall be separated from the control section by a physical barrier(s).
4. Power Supplies:
    a. Panels containing direct current powered instruments or serving as the termination point for transmission loop powered field instruments shall contain direct current power supply systems as specified herein.
5. Electrical Control Devices:
    a. Pushbuttons, indicating lights, relays, and similar equipment located in panels specified in this section shall comply with the requirements in Division 26.
6. Uninterruptible Power Supplies (UPS):
    a. UPS 120VAC input and 120VAC output are specified herein.

C. Control Panel Schedule is in Attachment A

1.02 QUALITY ASSURANCE

A. References:
1. This section contains references to the following documents that are part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid or on the effective date of the Agreement if there were no Bids. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.
3. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/UL 497-1995	Standard for Protectors for Paired Conductor Communications Circuits
UL 1012	Power Supplies
EIA RS-310C	Racks, Panels, and Associated Equipment
UL 1449	UL Standard for Safety for Surge Protective Devices

4. This Section references other sections with associated work specified therein:
    a. Section 01 45 20 specifies Equipment and System Performance and Operational Testing with reference to Contractor's Quality Assurance Manager that is responsible for startup commissioning of systems including mechanical, HVAC, electrical, and instrumentation.
    b. Section 26 05 00
    c. Section 40 61 21
    d. Section 40 63 43
    e. Section 40 61 96

B. Listed Products:
    1. Equipment and components shall be UL listed for the purpose or UL recognized.
    2. The control panels shall have factory applied UL 508A labels. Where intrinsic safety barriers are used within a control panel, provide UL 698A factory applied label as required by UL.
    3. All panels shall be labeled in accordance with NEC Article 409.

C. Factory Testing:
    1. Prior to shipment, the manufacturer shall test the functional operation of the control panel as described in Section 40 61 96.

D. Shipment, Protection and Storage:
    1. Equipment shipment, protection and storage shall conform to the requirements specified in Section 01 66 00.

1.03 SUBMITTALS

A. General:
    1. Submittals and transmittal procedures for submittals are defined in Section 01 33 00. Submit In accordance with the procedures set forth in the General Conditions of the Contract Documents and Section 01 33 00 that include drawings, information and technical data for equipment and as required in Section 40 61 13.01. Submittal information shall be included in one complete submittal.
        a. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
            1) A <u>check mark</u> shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.

2) The Owner's Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.

3) Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

b. A copy of the contract document process and instrumentation diagrams (P&ID) relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.

c. Marked contract document control schematic diagrams related to the submitted equipment.

d. Marked contract document control single line diagrams related to the submitted equipment.

e. Marked product literature of all the enclosure electrical devices and components mounted on or within the control panel.

f. List of miscellaneous items, cables, spare and replenishment parts, and chemicals to be provided, including MSDS information.

g. Dimensioned drawings:
   1) Exterior panel and layout
   2) Interior devices and layout
   3) Door-in-door construction devices, where required

h. Panel assembly drawings including sections showing clearances between face and rear mounted equipment.

i. Nameplate engraving schedule:
   1) Indicate engraving by line
   2) Character size
   3) Nameplate size
   4) Panel and equipment tag number and description

j. Heat load calculations for each cabinet based on the highest ambient temperature listed in Section 40 61 13 for the area in which the subject panel will be located.

k. Wiring drawings:
   1) Schematic diagrams
   2) internal wiring diagrams
   3) Connection diagrams
   4) Power and control single line diagrams to comply with NEC Article 409.

1.04 ENVIRONMENTAL CONDITIONS

A. Refer to Section 40 61 13

PART 2 PRODUCTS

2.01 FABRICATION

A. General:

1. Panels shall be designed for the seismic requirements of the project specifications. Structures, equipment, and devices shall be braced to prevent damage from specified forces. Equipment panels shall be capable of operation following a disturbance.
2. Nameplates with tag number and equipment description shall identify face-mounted instruments. Instruments shall be mounted for access to components and ease of removal. Cutouts for future equipment shall be blanked off with suitable covers. Instrument tag numbers shall be identified on the panel rear.
3. Face-mounted equipment shall be flush or semi-flush with flat-black escutcheons. Face-mounted instruments that are more than 6" deep, weigh more than 10 pounds, or exert more than a 4 ft-lb moment force on the face of the panel shall be supported underneath at the rear by a 1" x 1/8" thick steel angle.
4. Panels less than 60" high shall be provided with floor stands to raise the top of the panel to 60" above the floor or work platform. Panels that weigh less than 100 pounds may be wall mounted.
5. Panels with specified requirements including stainless steel or aluminum mounting requirements that are indicated on the project drawings or on the project details take precedence over the panel types or panel features indicated herein.

B. Panel Layout:

1. Provide 20% spare contiguous sub-panel area for future expansion
2. Provide minimum of 20% spare terminal blocks, with a minimum of 10 analog, discrete, and power
3. Separation between the power components (>120VAC) and the control / instrument components (≤120VAC) by locating the power components and the control/instrument components in separate sections of the cabinet enclosure
4. Power cabinet section and the control/instrument cabinet section with separate door handles
5. Separation between the power components and the control/instrument components using barriers
6. External lockable circuit breaker handle for the main panel disconnect
7. Individual power and control components with internal circuit breakers, as required
8. Motor controllers, as required by the equipment specifications
9. Displays with door-in-door construction accessible by opening the cabinet outer door
10. Face-mounted equipment flush or semi-flush with flat-black escutcheons
11. Panel tops of wall-mounted panels: mounted at the same elevation
12. Panel inner door contains a copy of the record elementary and wiring diagrams, or reference as allowed per NEC Article 409
13. Panel inner door contains a drawing holder
14. Panel drawings enclosed in a transparent, protective jacket
15. Panel functions as specified

16. Panels with floor stands, to raise the top of the panel to 60” above the floor or work platform
17. Wall mounting of panel weighs less than 100 pounds, where wall space is available,

C. Enclosures:
   1. Panel enclosures shall comply with the requirements of NEC Article 409 and NEMA 250
   2. Manufacturer:
      a. nVent Hoffmann
      b. Rittal
      c. Or approved equal

2.02 ENVIRONMENTAL CONTROL

A. Environmental controls shall be provided as required to maintain the environmental ratings of the enclosed components and shall maintain the NEMA enclosure rating as required by its location.

B. Heating: Panels located in unconditioned areas or outdoors shall be provided with thermostatically-controlled space heaters as required to maintain the panel temperature 10°F above ambient to prevent condensation within the panel. Space heaters with surface temperatures that exceed 120°F require an expanded metal guard. Thermostats shall be Honeywell T631 series, Johnson Controls A28AA-4, or approved equal.

C. Ventilation: Fans shall be equipped with UL-approved washable filters and provide at least 240 cubic feet per minute (CFM). Fans shall be thermostatically controlled. Noise level at 3’ from exterior wall and 30° off axis shall not exceed 60 NC units.

D. Air Conditioning: Systems shall not exchange cabinet interior air with ambient air.
   1. The cooling system shall be either a closed glycol loop heat exchange system or a CFC-free refrigeration system as required for heat load and ambient temperature conditions.
   2. Panel air conditioner coils shall be Heresite, or approved equal, coated and protected from corrosion.

2.03 PROTECTION COATING AND FINISH

A. Panels located outdoors or located in corrosive areas shall be bottom coated with waterproof coatings.

2.04 NAMEPLATES

A. External door-mounted components and the panel description shall be identified with plastic nameplates. Machine-embossed metallic adhesive labels shall identify tag number of instruments inside panels. Nameplates shall be attached to panel surfaces, not to instruments.

B. The machine engraved laminated nameplates, composed of white phenolic stock with black lettering, shall be provided for panel-mounted equipment. Nameplate engraving shall include the instrument tag number and description in 3/32" minimum size lettering.

C. The machine-embossed metallic adhesive labels shall identify tag number of instruments inside panels. Nameplates shall be attached to panel surfaces, not to instruments.

D. The nameplates shall be attached to the panel with a minimum of two self-tapping 316 stainless steel screws. Provide RTV sealant for nameplates for NEMA 4X stainless steel panels.

E. The nameplate wording may be changed without additional cost or time prior to commencement of engraving. Submit nameplate legend with the panel submittal.

2.05 PANEL FEATURES

A. Interconnection Wiring: Panel Interconnecting Wiring:
   1. Panel control wiring: Single conductor stranded copper NEC rated Type MTW 16 AWG minimum (rated 10A per NFPA 79, Table 12.5.1), with an exception for factory supplied PLC wiring harnesses that are UL approved
   2. Panel instrument wiring: Twisted 16 AWG shielded pair or tri conductors
   3. Panel power wiring: Conductors specified in Division 26 and meet the NEC requirements for power including phase, grounded, and grounding conductors
   4. Wiring shall be supported independently of terminations by lacing to panel support structure or by slotted flame retardant plastic wiring channels.
   5. Wiring channels shall comply with UL 94, Type V.
   6. Plastic wireway with covers shall be used to route groups of wires. Wireway fill shall be sized to provide 50% maximum fill.
   7. Plastic spiral wrap shall be used for exposed wires. Wires that cross door hinges shall be enclosed in plastic spiral wrap.

B. Conductor Identification:
   1. Wiring shall be tagged at every termination with machine printed plastic sleeves or pre-printed self-sticking labels as manufactured by W.H. Brady, 3M, or approved equal. No hand-written labels are permitted.
   2. Three-part wire numbers for instrument and control panel internal conductors:
      a. Part 1: Prefix of the wire number shall be the instrument loop number or equipment tag number.
      b. Part 2: Code letter and wire colors per the following tables
      c. Part 3: Number that identifies individual circuit conductor

Code	120VAC Conductor	Color
L	Power	Black
C	Control	Red
N	Neutral	White
PG	Ground	Green

Code	VDC Conductor	Color
PS	24VDC Power	Blue
PS	12VDC Power	Violet
S+	Signal (+)	Black
SG	Signal Ground	White
EG	Equipment Ground	Green
FV	Panel Foreign Voltage	Yellow

C. Conductor Installation and Protection:
   1. Power and control wiring shall be carried in covered channels separate from low voltage signal circuits. An interior steel barrier shall be provided between AC control devices and the electronic equipment.
   2. Terminal blocks shall be strap screw type rated for 600V. Each terminal trip shall have a unique identifying alphanumeric code at one end and a vinyl-marking strip running the entire length of the terminal strip with a unique number for each terminal. Numbers shall be machine printed and 1/8" high.
   3. No more than two connections shall be made to one terminal.
   4. Wire connectors shall be locking fork tongue or ring tongue insulated crimp type terminals.
   5. Terminal blocks shall be;
      a. Buchanan 0621-1
      b. Allen-Bradley 1492-HM1 600V 30A, finger-safe terminal block.
      c. Allen-Bradley 1492-CD3 600V 35A with #8 screw terminal block for ring or spade terminals.
      d. Phoenix Contact or Weidmuller, or approved equal

D. Field Wiring:
   1. Field wiring shall be connected to separate dedicated terminal blocks in a dedicated part of the panel where the field cables enter the panel. Provide a dedicated raceway on the field side of the terminal block for field wiring use only.

E. Fuse And Fuse Holders:
   1. Fuses for 120VAC circuits shall have a minimum of 12,000A interrupting capacity and blown fuse indicators.
   2. Fuses for 24VDC circuits shall be fast acting glass tube type rated 1/8A or 1/10A for 4-20 mA loops.
   3. Fuses for 24VDC circuits shall be 1/2A for the power supply to individual instruments.
   4. Fuse holders shall be tip-out or draw-out type.
   5. Provide Phoenix Contact, or approved equal products.

F. Control Power:
   1. 120VAC control power source: Single power source for all control and DC power
      a. Provide control power transformers, as required for the load.
      b. Provide direct current power supplies, as required for the load.

c. Provide UPS for PLC and derived loop power as defined above, as required for the load.

G. Panel Power: Panel power source:
   1. Provide a 120VAC circuit for the panel equipment, as required.

H. Accessories:
   1. All panels with a PLC, OIT, or panel-mounted PC, shall include GFCI convenience receptacles and LED utility lights.
   2. Where included, receptacles and utility lights shall not be powered by the UPS.
   3. Print pocket
   4. Fold-up shelf of sufficient size, sufficient weight capacity, and the proper angle for supporting a laptop computer mounted to the exterior.
   5. External access port including GFCI 120VAC/15A duplex receptacle and RJ-45 network connection

I. Fail-Safe Wiring:
   1. Fail-safe wiring of control relay or other on/off device or instrument provides the condition that will occur upon loss-of-power or internal failure in the device such that the relay is de-energized in the failure or loss-of-power condition such that the control relay contact operation provides for equipment failing in a safe mode.

2.06 ALARM AND TROUBLE DETECTION

A. The equipment control system shall incorporate a non-energized, open-state, output contact to activate on an alarm or trouble condition or on loss-of-power. Detection of a critical alarm or trouble condition shall cause the control system to initiate the shutdown or the operation of the equipment's controlled components to achieve a "Fail-Safe" condition.

B. Devices that signal an alarm or a trouble conditions shall latch in the alarm position and require a manual reset at the equipment control panel.

C. Alarm and trouble output shall:
   1. Open an output dry-contact
   2. Remain open until manually reset
   3. Not indicate abnormal condition when the equipment shutdown manually or automatically
   4. Indicate the alarm at the equipment control panel

D. Fail-Safe Design and Operation:
   1. Failure of part of a system shall not result in the failure of the rest of the system
   2. Failure of equipment or process shall not propagate beyond the failing device or equipment component
   3. Control design and operation shall prevent improper system functioning due to a circuit malfunction or operator error
   4. Control system design shall cause the controlled equipment to operate in a safe mode in the event of loss-of-power or the failure of a control system component.

2.07 CONTROL DEVICES

A. Control devices shall comply with Division 26.

2.08 INDICATING PILOTS

A. Indicating pilots shall be equipped with colored lenses as specified in Division 26.

2.09 POWER SUPPLY AND CONDITIONING EQUIPMENT

A. Except for power supply units which form an integral part of an individual piece of equipment, all power supply and conditioning equipment shall comply with UL 1012 and shall be approved by UL, CSA, or FM for the application.

B. All power supply equipment shall be provided in redundant configurations such that failure of a single unit will not disable all or any part of the instrumentation and communication systems.

C. DC power supplies:
   1. Redundancy step-diode isolation shall be provided for redundant DC power supply units and the power supply negative output terminal shall be grounded. Redundancy unit shall be Phoenix Contact, Model STEP-DIODE/5-24DC/2X5/1X10, or approved equal.
   2. Nominal 24VDC instrumentation and control power supply:
      a. Convection-cooled linear type or switching type
      b. Line regulation: 0.4% for line variations from 105V to 132V
      c. Load regulation: 0.4% for load variations from 0 to full load
      d. Ripple and noise: Not exceed 100mV peak-to-peak
      e. Hold-up time at maximum load: Not less than 16 milliseconds
      f. Continuous duty from 0 to 50ºC at rated load
      g. Output electronically current limited
      h. Over-voltage crowbar shutdown
      i. Output voltage:
         1) Rated 28VDC
         2) Adjustable ±5%
         3) Set to provide 26.4V to the panel direct current bus
      j. Power Supply: TDK-Lambda, or approved equal.
      k. Provide dry contact for failure alarm. Dry contact to be wired as an input to the nearest PLC.

D. Uninterruptible Power System (UPS):
   1. The UPS shall be on-line, computer-grade, double conversion type, with electrical isolation including output neutral. UPS shall be in a tower format and placed in the floor of the enclosure.
      a. Nominal input voltage: 120VAC
      b. Nominal output voltage: 120VAC

2. The online UPS system shall be provided with integral sealed no maintenance batteries, sized to provide full capacity backup power for 30 minute minimum at connected load with integral battery charger.
3. The panel supplier shall calculate the required kVA rating at 150% of connected load. Submit load calculations, schematic diagrams, and wiring connection diagrams. Provide battery cabling and other required cabling for a complete system.
4. The UPS shall provide space for wire entry and passage.
5. [The UPS shall be configured with a maintenance bypass switch to allow ease of removal from the panel and allow the panel to operate on utility power.
6. Uninterruptible power supply systems shall be as manufactured by Best Power Technology, Inc.; American Power Conversion; or approved equal.

2.10 SURGE PROTECTION

A. General: Surge protection shall be provided to protect the electronic instrumentation systems from surges propagating along the signal and power supply lines. The protection systems shall be such that the protection level shall not interfere with normal operation, but shall be lower than the instrument surge withstand level, be maintenance free, and self restoring.
   1. Provide lightning and surge protection devices at all antennas, as well as signal lines, communication networks, and power feeds for all lines that originate or are routed outside a building on any part of the existing or proposed circuits.
   2. Lightning and surge protection devices shall provide full protection from line to line and from line to ground. Units shall be DIN-rail mounted, rated for a minimum of 10kA maximum surge current and voltage suitable for the type of circuit being protected. Reaction time shall be on the order of nanoseconds.

B. Surge protectors shall be removable without changing the impedance of the circuit. Surge protectors product manufactures shall be:
   1. AC power lines shall comply with all requirements of UL 1449 3rd edition with listed devices having a minimum 18kA surge protection and RFI filtering.
      a. MTL MA30
      b. Joslyn Model 1663-08
      c. Taylor 1020FA
      d. Phoenix Contact
      e. Telematic
      f. Edco
      g. Liebert
      h. Powerware
      i. Or approved equal.
   2. For analog signal lines use ANSI/UL497 listed device with minimum 15kA protection SD Series, as manufactured by MTL, or approved equal.
   3. For Ethernet BaseT communications use UL 497A & UL 497B listed ZoneBarrier Model ZB24540IE, Category 6 Universal LAN Protector as manufactured by MTL, or approved equal.

2.11 PANEL GROUNDING

A. Each panel shall be provided with two copper ground bars.
   1. One bar (NEC required) shall be bonded to the panel or panel frame or back-plate and to the facility grounding system.
   2. Second (signal) ground bar shall be mounted on insulated stand-offs and shall be bonded to the panel ground bar only at one point.

B. Signal circuits, signal cable shields, and low-voltage DC power supply commons shall be bonded to the signal ground bar.

C. Field analog wiring shields shall only be grounded at the signal ground bar. Test to verify that single ground point at panel signal ground bar.

D. Surge protectors and separately derived AC power supplies shall be bonded to the frame ground bar.

E. Ground bars for panels exceeding 36" width shall be ¼" x by 1" copper bars extending the entire length of the panel interior at the bottom of the panel.

2.12 PANEL DRAWING PROTECTION

A. Provide wiring diagrams in accordance with Section 01 33 00. Provide a panel-wiring diagram and schematic for each panel in a plastic bag or plastic container to avoid water damage and aging.

2.13 SPARE PARTS

A. The following spare parts shall be provided per panel:
   1. Five each of each type of pilot used in the panels
   2. Five each of each type and rating of fuse used in the panels
   3. Five each of each type primary protector surge suppressor used in the panels
   4. Two each of each type of surge protective device used in the panels

2.14 PRODUCT DATA

A. The following data shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's operation and maintenance information as specified in Section 01 78 23. Manual shall include final reviewed submittal and separate record of all final configuration, jumper, and switch settings.
   2. Test results as specified in Section 40 61 21.
   3. Manufacturer's certification for the performance of features of the specified equipment that cannot be readily inspected.
   4. Special requirements for delivery of the information such as time, manner, place, or quantity.
   5. Installation and training forms specified in Part 3.

PART 3 EXECUTION

3.01 GENERAL

A. Floor-mounted cabinets shall be mounted and shimmed to precise alignment so doors operate without binding. Sealant shall be provided for conduit entering the panels.

B. Floor-mounted panels except in dry control rooms or electrical equipment rooms shall be mounted on 3-1/2" minimum height concrete pads or grouted bases as specified. Coating shall be provided for outdoor panels in contact on concrete.

C. For panels located in unconditioned areas, terminals and terminal blocks shall be sprayed after all terminations have been completed with a silicone resin conformal coating, Fine-L-Coat Type SR, Dow Corning, or approved equal.

D. Provide panels with the record as-built schematic, connection, and interconnection diagrams mounted behind plexiglass holder on the inside of the door. Place documentation in a waterproof clear bag in the panel document holder.

E. Verify that all panels have been labeled with Arc Flash warning labels per NEC 110.16. Provide labels, with Arc Flash protection boundary and PPE levels, in accordance with Division 26 specifications.

3.02 MOUNTING

A. Control panels supported directly by concrete or concrete block walls shall be spaced out not less than 5/8" by framing channel between instrument and wall. Sills shall be leveled so panel structures will not be distorted.

B. Support systems shall not be attached to handrails, process piping or mechanical equipment. Control panels supported directly by concrete or concrete block walls shall be spaced out from the wall to provide for air circulation around the panels.

C. Steel used for support of equipment shall be 316 stainless steel. Support systems including panels shall be designed to prevent deformation greater than 1/8" under the attached equipment load and an external load of 200 pounds in any direction.

D. Floor-mounted cabinets, except in dry control rooms or electrical equipment rooms, shall be mounted on 3-1/2" minimum height concrete pads or grouted bases as specified.

E. Sealant shall be provided under panels not located in dry control or electrical equipment rooms.

F. Center-line of wall-mounted panels shall be 48" above the floor.

G. Panel tops of wall-mounted panels shall be mounted at the same elevation.

H. Panels shall be shimmed to precise alignment so doors operate without binding and mounted where shock or vibration will impair its operation.

3.03 OUTDOOR PANEL SHADE COVERS

A. Fabricate the custom aluminum panel shade cover and mount the panels facing away from the prevailing sun or wind.

B. Where called out, Contractor shall provide sun/rain covers per Electrical Detail for outdoor vendor, manufacture, and custom panels. Covers shall be fabricated based upon known panel dimensions or accepted submittal drawing dimensions.

3.04 PANEL POWER SUPPLY

A. Power supply and conditioning equipment shall be mounted and connected in compliance with the manufacturer's instructions.

B. Line side disconnect switches shall be provided for power supply and conditioning equipment. Line and load side overcurrent protection shall be provided for power supply and conditioning equipment in compliance with NFPA 70. Disconnect switches shall comply with Division 26 specifications.

C. Small power supply and conditioning equipment may be mounted in the panel served. Larger units shall be mounted adjacent to the equipment served. Where unconditioned power is brought into control panels, it shall be enclosed in metallic raceways within the panel.

D. Power supply and conditioning equipment larger than 5kVA load capacity supported from surfaces other than concrete shall be provided with sound isolators.

E. Final raceway connections shall be a flexible conduit in compliance with Division 26.

3.05 FACTORY TESTING

A. The control panel shall be assembled, interconnected, and functionally tested at the assembly shop prior to shipment. The Owner/Engineer shall have the option of witnessing the functional shop test. The Contractor shall notify the Owner/Engineer at least 2 weeks in advance prior of the scheduled functional shop test.

3.06 FIELD TESTING

A. Field verify the following for Instrument and Control Panels:
   1. Control circuits grounded with one terminal of each load device connected to the grounded conductor.
   2. Control contacts installed in the ungrounded side of the circuit
   3. Panel signal and control wiring separated and installed in separate wireways with barriers between the power wiring and the signal and control wiring
   4. Barriers between the power wiring and the signal and control wiring
   5. Connected to the plant grounding system, as specified
   6. Panel functions as specified
   7. Mounted with stainless steel unistrut, fittings, and fasteners

SECTION 40 68 00

PROCESS CONTROL SOFTWARE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies the general requirements applicable to the development and programming of the process control system graphical operator interface, historical data management system, and process control logic.
   2. The services described in this specification will be provided by the owner and are NOT included in the Contractors Scope of Work. This specification is provided to the Contractor for information only.

1.02 QUALITY ASSURANCE

A. Implementation Plan Meetings:
   1. The Systems Integrator shall include as work of this section of the specifications the requirement for 2 meetings to be held at the project site. The primary function of the meetings shall be to solicit input from the Owner regarding the implementation of the process control system and to facilitate preparation of the Process Control System Implementation Plan specified herein.
   2. The Systems Integrator shall have in attendance at each meeting a representative who is responsible for the preparation of the Process Control System Implementation Plan. The preliminary schedule and agenda for each of the meetings shall be as described below. The specific dates for each of the meetings shall be scheduled by the Systems Integrator and approved by the Construction Manager.
   3. The Construction Manager shall be provided with 2 weeks minimum advanced written notice of proposed scheduled meeting dates. The System Integrator shall prepare a detailed meeting agenda and submit it to the Construction Manager with the notice of proposed scheduled meeting dates.
      a. Meeting 1 shall be held within 60 days of receipt of Notice to Proceed. The purpose of this meeting shall be to begin preparation of the Process Control System Implementation Plan. The System Integrator shall be prepared to present the capabilities of the proposed process control system software and the alternatives available for each of the major areas of implementation described by the Process Control System Implementation Plan.
      b. Meeting 2 shall be held within 30 days of completion of the Engineer's review of the Process Control System Implementation Plan submittal. The purpose of this meeting shall be to discuss the submittal review comments and resolve any related issues.

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Process Control System Implementation Plan

PART 2 PRODUCTS

2.01 PRODUCT DATA

A. The following data shall be provided in accordance with Section 01 33 00:
   1. Process Control System Developer's Guidelines: The Process Control System Implementation Plan shall be modified and updated during the course of development of the process control system control logic and graphical operator interface to reflect the conventions and standards used in the final system development. Upon final acceptance of the work, the updated implementation plan shall be re-published and submitted as the Process Control System Developer's Guidelines.
   2. Process Control System Configuration Report:
      a. Report documenting the final configuration of the process control system including the following:
         1) Hardware Configuration: Final switch settings and jumper positions shall be documented for all process control system components including processors, communications adapter modules, motor controllers and adjustable frequency drives, power metering systems, etc.
         2) Process Control Logic: Bound hard copy of the annotated process controller program listing. The program listing for each processor shall be separately bound and shall have tab dividers for each program file listing. Program listing shall include cross references.

PART 3 EXECUTION

3.01 PROCESS CONTROL SYSTEM IMPLEMENTATION PLAN

A. General:
   1. The Systems Integrator shall prepare an implementation plan for the process control system development and programming work. The implementation plan shall establish guidelines for development of the graphical operator interface, the historical data management system and the PLC process control logic and shall insure the consistent application of conventions and methods through the course of development. The implementation plan shall specifically address the following:
      a. Tag database structure and configuration
      b. Tag naming conventions
      c. Graphical operator interface standards
      d. Process control system configuration
      e. PLC program file organization
      f. PLC data file organization
      g. List and description of graphic displays

B. Tag Database Structure and Configuration:
   1. The implementation plan shall define how the tag database will be organized to logically associate tags with specific input/output types, functions, or process areas. In addition, the plan shall prescribe guidelines for configuration of tag alarm handling and annunciation and tag data logging.

C. Tag Naming Conventions:
   1. A tag naming convention shall be established which provides a structured organization to the tag database facilitating tag searches and substitutions during system development and provide for effective and efficient design, management and operation of the process control system. The tag naming convention shall be developed to take full advantage of the capabilities of the process control system software and not impose any artificial constraints in the operation or management of the process control system. Tag names shall minimally be comprised of the following information:
      a. Equipment type designation
      b. Equipment loop number
      c. Signal type designation

D. Graphical Operator Interface Standards:
   1. The configuration and development of the graphical operator interface shall be based on standards prepared specifically for this application. The interface standards shall be consistently applied to the development of the interface to insure optimum usability.
   2. All HMI development including tag naming scheme, screen navigation methods, use of pop-ups, etc. shall be implemented in a manner that is consistent with HMI systems in use elsewhere in the Owner's existing operations at other facilities. Graphic screens shall utilize the same colors, symbols, fonts, and features to provide an interface to operators that is uniform and consistent with existing HMI screens serving Owner's other facilities.
   3. The interface standards shall specifically address the following topics:
      a. Graphical Display Type: The user interface will be comprised of various types of graphic displays including schematic overviews, control panels, faceplates, utility displays, and trend displays. The content and layout of each type of interface including navigational and utility features shall be defined by the standard. The standard shall also define the naming conventions for graphic display files.
      b. Symbology: The symbology used in the preparation of the graphical interface shall be defined by this standard. The symbology standard shall address the following symbol types:
         1) Symbols representing process equipment, structures, piping, and systems
         2) Navigational and utility system icons
         3) Dynamic data display objects including numeric displays, bar graphs, indicating lights, text labels, etc.
         4) Control objects including pushbuttons, selector switches, slider bars, setpoint entry, etc.
      c. Colors: The color standard shall define the foreground, background, and border colors used to indicate dynamic conditions (run, stop, alarm, trouble, ready, etc.), process-specific applications (raw water, settled water, finished water, chemicals, etc.), graphic display backgrounds, dynamic data objects, text, control objects, etc.
      d. Visibility: The visibility standard shall define the following:
         1) Application of blinking to graphic objects
         2) Application of font styles and sizes

3) Manipulation of graphic object color to represent different conditions

e. Terminology: All terminology used to annotate the graphical interface shall be defined by these standards. The terminology standards shall define the following:
   1) Descriptive names used to identify the treatment processes, systems, structures, equipment, process variables, etc.
   2) Units of measurement for all process variables
   3) Alarm condition descriptors
   4) Abbreviations

f. Navigation: The navigation standard shall define the organization of the user interface and the features of the navigational system. This standard shall address all techniques used to implement the navigation system and where and how the navigation system is accessed including button bars, shortcut icons, hot links, continuation labels, and graphic menus.

E. Process Control Logic Configuration:
   1. Guidelines shall be developed which define the organization and structure of the process control logic and data memory within the process controller. These guidelines shall address the following:
      a. Structure of the control logic including the use of subroutines and the allocation of memory to accommodate modifications and expansion of the control logic.
      b. Methodology for handling common control functions shall be standardized such that similar functions are implemented in a consistent manner across the entire project. Standardized routines for motor control, VFD control, instrument data handling, alarm management, etc., shall be developed and reviewed by the Owner prior to final programming.
      c. Assignment of data storage memory including data formats and method of documenting memory mapping.
      d. Methodology for implementing peer to peer communications including allocation of memory or register addresses is such a way as to organize data for optimum efficiency of data exchanges between peer processors.

F. Process Control Strategies:
   1. Process control strategies shall be reviewed with the Owner and refinements made as agreed to by the Systems Integrator. Modifications to the control strategies that are determined to be a change in scope will be addressed by change order. The final process control strategies shall be incorporated into the Implementation Plan.

3.02 TAG DATABASE DEVELOPMENT

A. General:
   1. The process control system tag database development shall include the definition of all device, derived and soft tags and the required alarm processing and data logging and archiving definitions for each tag. Conventions used in the development of the tag database shall be as defined in Process Control System Implementation Plan.

B. Tag Definition:

1. The definition of tags in the tag database shall comply with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    a. Tag Naming Conventions:
        1) Tag names shall minimally consist of two distinct components. The leading component shall represent the tag equipment number. The trailing component (tag descriptor) shall be an abbreviated description of the associated process variable or the function of the tag. Each component shall be assigned a fixed maximum length which shall be dependent on the available tag name length supported by the process control system software.
        2) The tag equipment number shall be derived from the primary item of process equipment or instrumentation most closely associated with the process variable and shall be comprised of an equipment type prefix followed by process loop number. The equipment numbers shall be as defined by the Contract Documents.
        3) The tag descriptor shall provide a description of the process variable referenced by the tag name or a description of the function associated with the tag. Tag descriptors shall be based on ANSI/ISA-S5.1 and Appendix B of ISA-RP60.6. The tag descriptor may be comprised of several parts to clearly define the tag function. The following typographical convention shall be used to create the tag descriptor:
            a) Symbol identification letters (ANSI/ISA-S5.1) shall be all upper case.
            b) The first letter of an abbreviation (ISA-RP60.6) shall be upper case. The remainder of the abbreviation shall be lower case.
        4) Examples of the tag names are provided in Table 3.02.B.1:

Table 3.02.B.1

Tag Name	Tag Function
P1121PSH	Pump P1121 pressure switch high
FIT1101	Flow transmitter 1101
P1121Run	Pump P1121 run status

2. Tag Descriptions:
    a. Describe the tag in terminology consistent with this application. Abbreviations and equipment numbers shall be not be used in the tag description without prior approval of the Owner. Tag descriptions shall not include any wording which implies the state or condition of the tag. For example, the tag description for P1121PSH shall read “Backwash Water Pump 1 Discharge Pressure” in lieu of “Backwash Water Pump 1 Discharge Pressure High.”
3. ON/OFF and Alarm State Labels:
    a. The ON/OFF and alarm state labels shall consist of words which describe the state of the tag. For digital tags, the logic TRUE state of the tag will generally be the state labeled.
        1) Examples of ON/OFF and alarm state labels include RUN, OFF, OPEN, CLOSED, READY, ALARM, NORMAL, HIGH, LOW, HIGH-HIGH, LOW-LOW, etc. Abbreviations shall not be used in ON/OFF or alarm state labels.

C. Tag Types:

1. Tags shall be classified as either device tags, derived tags or soft tags. Device tags shall be those tags which have a physical device as the data source. Derived tags are those tags whose value is calculated or otherwise derived from another tag. Derived tags have no data source address. Soft tags are those tags whose value is obtained from another process software application. Tags shall be defined for each of the following tag data sources:
    a. Physical input/output process variables derived from the process control input/output subsystems. Refer to the Input/Output Summary, Section 40 63 43.
    b. Control and status data derived from the process control logic required to fully implement the process control strategies specified in Section 40 61 96. This data shall include the following types of information:
        1) Operating setpoints
        2) Process operations setup and control parameters including start/stop, lead/lag, auto/manual, enable, etc.
        3) Operating status and fault data including ready, fail-to-run, etc.
        4) Timing/counting function data including preset and accumulated values
    c. Operating, fault and diagnostic data derived from the external systems, such as chlorine generator, metering pump systems, including the following:
        1) Process variable transmitters and analyzers
        2) Operating status of all system equipment including run and ready status
        3) Power parameters
        4) System trouble and alarm conditions
        5) Process control system diagnostic data
        6) System status, control and configuration parameters including lead/lag selection, operating setpoints, etc.
        7) Refer to the particular equipment specification section in Divisions 23, 41, 43, 44, or 46 for specific data to be produced, consumed and transmitted by external systems
    d. Operating data derived from electronic power metering systems including the following power parameters:
        1) Kilowatts
        2) Kilowatt-hours
        3) Kilowatt demand
        4) Kilovars
        5) Kilovolt-amperes
        6) Kilovolt-ampere-hours
        7) Kilovolt-ampere demand
        8) Power factor
        9) Line currents
        10) Voltage (phase-to-phase and phase-to-ground)
        11) Line frequency

e. Operating, fault and diagnostic data derived from solid-state adjustable frequency motor speed controllers including the following:
   1) Run status
   2) Drive fault
   3) Start/stop control
   4) Speed setpoint
   5) Running speed
   6) Running amps
f. Diagnostic data derived from the process control system controllers, I/O subsystems, and communications controllers including the following:
   1) Controller operating mode
   2) Controller performance (e.g. Scan time)
   3) Controller fault status and fault code
   4) Controller time and date values
   5) Controller network address
   6) I/O subsystem fault status
   7) I/O module channel health
   8) Communication controller fault status
g. Analytical, operating and diagnostic data derived from turbidity instruments including, but not limited to the following:
   1) Instrument operating mode
   2) Particle count in each of the particle size ranges configured.
   3) Instrument diagnostic or fault status and status code
   4) Instrument network address
   5) Communication link status or fault condition.
h. Table 3.02.C.8 specifies the types of derived process variables and the associated real-time process variable.

Table 3.02.C.8

Real-time Process Variable Type	Derived Process Variable	Description
Flow	Totalized Flow	Totalized flow process variable shall be defined for all flow process variables.
Level	Volume	A process variable representing tank volume shall be defined for all chemical and fuel storage tanks and shall be based on the real-time level process variable and the geometry of the storage tank.
Run Status	Accumulated Runtime	An accumulated runtime process variable shall be defined for all rotating equipment which has an associated run status tag defined in the tag database.

D. Data Logging:
   1. Tags representing the following types of process variables shall be defined in the tag database for data logging. This data shall support historical and real-time dynamic trending functions.
      a. Flow or chemical feed rate

b. Process pressure
c. Storage tank level or volume
d. All analytical instrument values including pH, turbidity, particle count, temperature, and chemical residual
e. Filter loss of head
f. Chemical storage weight
g. Power parameters representing line current, kilowatts, kilovars, kilovolt-amperes, and power factor.

E. Alarm Handling, Annunciation, And Logging:
1. All discrete tags representing alarm or trouble conditions shall be defined in the tag database to be processed as alarms. All analog tags shall have alarm thresholds defined in the tag database. The value of the alarm thresholds shall be defined by the Owner during the preparation of the Process Control System Implementation Plan.
2. The tag database shall be configured to implement alarm processing and annunciation as defined by the Process Control System Implementation Plan. Each tag's alarm definition shall prescribe whether the occurrence of the alarm condition is logged to journal, printed, or audibly annunciated or any combination thereof.

3.03 GRAPHICAL OPERATOR INTERFACE DEVELOPMENT

A. General:
1. The process control system graphical operator interface development shall include the preparation of the specified graphic displays in accordance with the Process Control System Implementation Plan and the requirements of this specification. The Systems Integrator shall prepare additional graphic displays as may be required to provide a comprehensive process and system management graphical operator interface.

B. Development Guidelines:
1. The graphical operator interface shall be developed in accordance with recognized usability practices to insure efficient and effective use of the process control system. The completed graphical operator interface shall adhere to the following three principles of usability:
a. Learnability: The graphical operator interface shall be easy to learn so that the user can quickly start being productive with the tools provided by the system.
b. Efficiency: The graphical operator interface shall be efficient to use, so that once the user has learned the system, a high level of productivity is possible.
c. Memorability: The graphical operator interface shall be easy to remember, so that the casual user is able to return to the system after some period of absence without the need to learn the interface over again.

2. Adherence to the stated principles of usability shall be achieved through consistent application of the following development standards defined herein and as defined in the Process Control System Implementation Plan.
    a. Graphic Design: The layout and organization of each graphic display shall be consistent among the graphic display types and shall adhere to the following standards:
        1) Position similar information and features of the graphical operator interface at the same location on each display
        2) Enclose groupings of associated data in a frame or box
        3) Color conventions shall be consistently applied throughout the graphical interface. Foreground colors shall be selected to provide contrast to the background color. Verify that all colors chosen can be viewed by the end-user.
        4) Text font sizes, colors and types shall be consistently applied throughout the graphical interface.

C. General Graphic Display Configuration:
    1. Graphic displays shall be configured as either full screen displays or pop-up displays. Each type of display configuration shall include the following features:
        a. Full Screen Display
            1) Full screen displays shall be maximized, occupying the full, usable area of the window.
            2) Controls to close or minimize the window shall be disabled.
            3) Window exit control shall be embedded in the graphic display's navigational controls.
            4) Full screen displays shall remain in the background when a pop-up display is called from navigational hot links within the full screen display.
            5) Navigational and utility button bars shall be provided.
        b. Pop-up Display
            1) Pop-up displays shall not occupy the full window and shall appear in the foreground when called from a full screen display.
            2) Pop-up displays shall appear at a user-defined location on the background display when called, but shall have the capability to be dragged to a different location on the screen.
            3) Pop-up displays shall not be resizable.
            4) Pop-up displays shall be provided with close control.

D. Graphic Display Types:
    1. Graphic displays shall be categorized as either schematic overview, control panel, faceplate, trend or utility.
        a. Schematic Overview: The schematic overview graphic display shall be presented as a process flow diagram and shall represent major process piping, major equipment, process variable data, and process alarm and status data.

b. Schematic overview displays shall be prepared in accordance with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    1) Numeric display objects shall be provided to indicate the instantaneous value of all analog process data associated with the process. In addition, dynamic fill shall be used to indicate analog process data representing level.
    2) Dynamic equipment symbols shall be provided to indicate run, off, and fault conditions for all major equipment associated with the process.
    3) An alarm summary object indicating only those alarms related to the associated process shall be provided at the bottom of the display.
    4) Continuation labels shall be provided to access associated schematic overview displays.
    5) Hot links shall be provided on equipment symbols to provide access to an associated control panel display or faceplate.
    6) Hot links shall be provided on numeric display objects to access associated trend displays.
    7) Navigational and utility button bars shall be provided.
    8) Schematic overview shall be a full screen display.
c. Control Panel: The control panel graphic display shall be presented as a virtual control panel providing a point of operator interface for control of a specific equipment item or system.
d. Control panel graphic displays shall be prepared in accordance with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    1) Graphical control objects representing selector switches, pushbutton, slider bars, etc., shall be provided to initiate the appropriate control function.
    2) All pertinent operating status data associated with the equipment or system controlled by the panel shall be indicated.
    3) Navigational control in the form of short-cut icons or labels shall be provided to access associated graphic displays.
    4) Control panels shall be configured as pop-up graphic displays.
e. PID controller Faceplate (if used): The PID controller faceplate graphic display shall represent the appearance and functionality of a typical PID controller. The PID controller faceplate graphic display shall provide a point of operator interface for control of a specific process.
f. PID controller faceplate graphic displays shall be prepared in accordance with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    1) Analog data shall be presented in numerical and bar graph format.
    2) PID operating status such as mode, high/low limiting, deadband in effect, etc., shall be indicated.
    3) Navigational control in the form of short-cut icons or labels shall be provided to access associated graphic displays.
    4) PID controller faceplates shall be configured as pop-up graphic displays.
g. Trend Display: The trend graphic display shall present a graphical trend object with the associated controls to adjust the time scale and scroll the time axis.

h. Trend graphic displays shall be prepared in accordance with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    1) A pen legend shall be provided which associates the trend plot to a process variable description through the use of color.
    2) Y-axis shall be graduated and labeled in the appropriate engineering units.
    3) Controls shall be provided to adjust the time scale and to scroll the X-axis backwards and forwards.
    4) Navigational control in the form of short-cut icons or labels shall be provided to access associated graphic displays.
    5) Trend graphic displays shall be configured as pop-up graphic displays.

i. Utility Display: The utility graphic display shall present all pertinent data associated with an ancillary support system. The utility graphic display shall provide a point of operator interface for control, monitoring and management of the specified utility system.

j. Utility graphic displays shall be prepared in accordance with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    1) Provide a schematic representation of the utility system where specified.
    2) Numeric display objects shall be provided to indicate the instantaneous value of all analog process data associated with the utility.
    3) Dynamic symbols or labels shall be provided to indicate current condition of the utility and its components.
    4) Graphical control objects representing selector switches, pushbutton, slider bars, etc., shall be provided to initiate the appropriate control function.
    5) Navigational control in the form of short-cut icons or labels shall be provided to access associated graphic displays.
    6) Control panels shall be configured as either full screen displays or pop-up graphic displays, as specified.

k. PLC System Status Display: The PLC system status graphic display shall present all pertinent data associated with the process PLC system itself. The PLC system status graphic display shall provide a diagnostic interface for troubleshooting, monitoring and management of the PLC system. No control is associated with the PLC system status graphic displays.

l. PLC system status graphic displays shall be prepared in accordance with the following guidelines except as otherwise modified by the Process Control System Implementation Plan:
    1) Provide a schematic representation of the PLC system where specified.
    2) Provide detailed displays for each PLC processor showing the processor status, including diagnostic and fault codes. Display shall include communication status of Ethernet, I/O bus and any additional communication links associated with the processor.
    3) Status of all discrete I/O points shall be indicated by dynamic text or colored graphical object. Status and raw data value of all analog I/O points shall be indicated by dynamic text.
    4) Dynamic symbols or labels shall be provided to indicate current condition of the processor and its components.

5) Navigational control in the form of short-cut icons or labels shall be provided to access associated graphic displays.

E. Navigation System:

1. The navigation system shall be configured to provide a logical, intuitive path through the graphical operator interface and also provide the flexibility to directly access graphic displays and system utilities. The graphical operator interface shall be generally organized by process area; however, shortcuts shall be provided to navigate beyond process boundaries.
2. The graphical operator interface shall incorporate features to accommodate mouse-oriented navigation throughout the process control system. Scrollable menus, button bars, embedded hotlinks and continuation labels shall be used to create a navigational system which provides ready-access to commonly used displays and utilities.
3. The navigation system shall be implemented in accordance with the following guidelines unless otherwise modified by the Process Control System Implementation Plan:
   a. Process Overview Graphic Display: A process overview display schematically representing the overall facility shall be function as the system startup display and "home base" for conventional system navigation. Embedded hot links shall be provided on this display to permit access to all other displays.
   b. Continuation Labels: Continuation labels shall be provided on all process schematic displays where a process line continues to another process area. These labels shall have embedded hot links to the process schematic display referenced by the label.
   c. Graphic Menu System: A graphic menu system shall be provided where the navigational control action can result in multiple options. A graphic menu display shall be configured as a pop-up display and shall provide short cuts to associated graphic displays.
   d. Short Cut Icons: Short cut icons shall be utilized to provide direct access to typical display types. Short cut icons shall be provided to represent schematic displays, control panels, trend displays, and PID controller faceplates. Short-cut icons shall typically be applied to pop-up displays such as graphic menus, control panels, faceplates, and trend displays.
   e. Hot Links: Hot links shall be embedded in each of the following types of display objects to provide access to an associated display or menu:

Table 3.03.E.5

Display Object	Hot Link
Equipment Symbol	Associated trend, PID controller faceplate, control panel or graphic menu display
Numeric Display	Associated trend display

3.04 PROCESS CONTROL LOGIC DEVELOPMENT

A. The process control system control logic development shall include the preparation of control logic required to implement the specified control strategies and support the specified operator interface functions.

B. Organization:
   1. The control logic shall be organized in a hierarchical structure which correlates to the actual process relationships. Individual control logic program files shall be prepared for each system or equipment item and shall be organized by process area. Data table files shall be similarly organized by process area. Data types shall be consistently applied throughout the control logic in accordance with the Process Control System Implementation Plan.
   2. The control logic and data table organization shall facilitate the addition of future control logic.

C. Documentation:
   1. All control logic shall be completely annotated down to and including the instruction level. Each rung or statement of control logic shall be provided with annotation specific to its function. Each program file shall have a title and a detailed description of the control strategy represented by the control logic. Terminology consistent with the Process Control System Implementation Plan shall be applied throughout.

D. Control Logic Implementation:
   1. The project control strategies outline the general control requirements of the treatment process and associated utility systems. In addition to the requirements of the control strategies, the following control features shall be implemented in the process control logic:
      a. Fail to operate: All automatically operated equipment shall be monitored for failure to respond to control requests from the process control system. Upon a call to start, stop, open, close, etc., a fail timer shall be initiated. If the appropriate equipment status signal (run, off, full open, full closed) is not reported back to the process control system within the time duration defined by the fail timer, an alarm shall be initiated through the process control system human machine interface (HMI).
      b. Time based control: Process control logic for all equipment and processes' controlled on the basis of time duration shall provide for operator access to the preset value of the time function through the HMI and report back to the HMI the instantaneous value of the time function associated value.
      c. PID Regulatory control: Every PID regulatory control function implemented in the process control logic shall be interfaced with the HMI to provide the following functions:
         1) Report to the HMI the instantaneous values of the process variable, setpoint, and control variable.
         2) Report to the HMI the current operating mode, high/low limiting in effect, deadband in effect, cascade mode in effect, etc.
         3) Provide operator control of the operating mode, setpoint value, and the control variable in manual mode.

4) PID tuning parameters shall be accessible via password protected screens. Supervisor level access is required for modification of tuning parameters.

d. Control Setup Control functions which are described in the control strategies as operator initiated or invoked through the process control system HMI shall be interfaced with the HMI to permit operator manipulation of that control function and to report back the current status of the control configuration. Functions of this type include manual start/stop, lead/lag selection, hand/off/automatic selection, enable, setpoint adjustment, etc.

e. Real Time Data Server Communication: Control logic shall be implemented to facilitate and optimize the communication of data between the process control system real-time data server and the process controllers. Control logic shall be implemented as required to make the specified real-time data available to the tag database. Control logic shall also be provided to support optimization of the communication between the process control system HMI real-time data server and the process controllers. Data of similar format (binary, integer, floating point, string, etc.) shall be grouped in data tables designated a communication buffer files. All tags defined in the tag database shall be addressed to the designated communication buffer files.

3.05 ON-LINE HELP

A. An on-line help system shall be developed to provide an on-line reference for the use of the process control interfaces and a description of the conventions used throughout the graphical operator interface. The on-line help utility shall be WinHelp or HTML-based and shall address the following topics:

1. Graphical conventions used in the operator interface including symbols, icons, colors, etc.
2. Graphical operator interface navigation system
3. Standard procedures for login/logoff, printing, etc.
4. Functional description of each control panel graphic display including a graphic image of the display and descriptions of each object on the display

B. Topics in the help system shall be dynamically-linked with other related topics through the use of hypertext-sensitive jumps and popups. All help pages shall be indexed with keywords to facilitate the use of the help utility. The on-line help utility shall include a table of contents, index and glossary.

C. The on-line help system shall be called from the utility button bar within the graphical operator interface.

3.06 HISTORICAL DATA MANAGEMENT SYSTEM

A. The historical data management system development shall include the preparation of extracts to enter the following real-time process variable types and associated attributes into the historical database.

Table 3.06

Process Variable Type	Sample Interval	Attribute			
		Total	Average	Maximum	Minimum
Flow	Hourly		X	X	X
	Daily	X			
Level	Daily		X	X	X
Power	Daily	X	X	X	X
Pressure	Daily		X	X	X
Equipment Run	Daily	X			
Water Quality Analysis	Hourly		X	X	X
	Daily				
Volume/Weight	Daily		X	X	X

3.07 TESTING AND COMMISSIONING

A. The graphical operator interface shall be tested and commissioned in accordance with Section 40 61 21.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 68 03

PROCESS CONTROL SOFTWARE COORDINATION AND DOCUMENTATION

PART 1 GENERAL

1.01 DESCRIPTION

A. This section contains requirements for the Contractor and Programmer performance in programming the control systems, progress tracking, testing, and documenting the work using the control specifications in Division 40.

1.02 QUALITY ASSURANCE

A. Contractor's Programming Manager
   1. The Contractor shall appoint a software engineer or qualified specialist as Programming Manager to manage, coordinate, and supervise the Contractor's programming work.
   2. The Programming Manager shall have at least 5 years of total experience, or experience on at least five separate projects, in managing the programming and startup of similar electrical and instrumentation control systems. The quality assurance program shall include:
      a. Definition of process areas and systems, with programming executed on an area by area basis, based on the P&ID drawings
      b. Programming for each process area executed in sequential tasks
      c. Regularly updated programming status tracking
      d. Regularly updated separate programming documentation for each process system
      e. Regularly updated application program software media

B. Definitions
   1. Control System: Controllers and any associated Operator Interfaces
   2. Controller:
      a. Programmable Logic Controller (PLC)
      b. Remote Terminal Unit (RTU)
   3. Operator Interface:
      a. Operator Interface Terminal (OIT), entire plant
      b. Human Machine Interface (HMI), for equipment, equipment panel
   4. Process Area: Area comprised of one or more process systems
   5. Process system: Packaged equipment system or subsystem. Refer to P&ID drawings and associated panels in project documentation.
   6. Input and/or output (I/O) signals:
      a. Physically hard-wired
      b. Via network
      c. Digital communication via ethernet or serial network

7. Operating System/Application Manufacturer's software used to program:
    a. Controller
    b. OIT
    c. HMI
8. Application Software: OIT and/or computer software used to display the process and alarms, create reports, enable communications, dial-out alarms, or otherwise enhance OIT functionality
9. Application Programs: Programs created using programming software and/or application software for control and interface specific to this project

C. Project Labeling
    1. The items specifying project labeling herein shall include the following as a minimum: Owner's name, facility name, project name, project number, and "Specification 40 68 00".

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Sections 01 33 00 and 40 61 13.01:
    1. Qualification Submittal:
        a. Provide the following submittal in accordance with Section 01 33 00:
            1) Programming Manager Qualifications and resume
            2) Proposed process area and process system breakdowns
            3) Example programming status spreadsheet per programming documentation
            4) Example I/O interface summary per I/O interface summary
            5) Initial schedule of operational testing for each process area and system
            6) Proposed final application program software media type
    2. Definition Submittal:
        a. Provide the following submittal after review of the Qualification Submittal, in accordance with Section 01 33 00:
            1) A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from Specification requirements. A check mark shall denote full compliance with a paragraph as a whole.
                a) If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
                b) The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.

c) Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

2) A marked copy of specification Section 40 61 21.

3) A marked copy of specification Section 01 45 20

4) A marked copy of specification Section 40 61 96

5) I/O interface summary

6) Programming status spreadsheets

7) Revised schedule of operational testing for each process area and system

3. Operating And Maintenance Information Submittal:
   a. Provide O&M information upon completion of testing and commissioning in accordance with Section 01 78 23.

PART 2 PRODUCTS

2.01 GENERAL

A. The Programming Manager shall provide application programs, documentation, records, and software media as specified in the following paragraphs.

2.02 PROGRAMMING DOCUMENTATION

A. Documentation Records
   1. The Programming Manager shall develop a records keeping system to document progress and completion for each task in each process area or system. The following shall be kept current and available for inspection on-site at all times in a location designated by the Construction Manager:
      a. Programming Manager's qualifications, project programming history
      b. List of names of project programmers, and normal and emergency contact telephone numbers
      c. Programming status spreadsheet with percentage complete on each programming sequence task
      d. Programming documentation volumes
      e. Application program media

B. Documentation Volumes
   1. The Contractor shall develop and maintain programming documentation for each process area in separate volumes. Each volume shall be kept current and available for inspection on-site at all times in a location designated by the Construction Manager. Each volume shall include the following as a minimum:
      a. Three-ring binder with front cover and spine labeled:
      b. “Programming Documentation for (applicable) Process Area/Process System”
      c. Table of Contents with same labeling as the volume cover with tabs for each section:
         1) Section 1 – Control Description
         2) Section 2 – I/O Interface Summary

3) Section 3 – Control Program
4) Section 4 – Graphics
5) Section 5 – Reports

C. Control Description
   1. Provide an updated control description outlining application program operation for each process area's system. Section 40 61 96 may be used as a basis. Provide details on operator interaction, manual and automatic mode operation, setpoints, graphic indications, trending, and reports.

D. I/O Interface Summary
   1. Provide I/O spreadsheets which are to include the following for each I/O point:
      a. Signal number/tag
      b. Annotation description that may be logically abbreviated and that is subject to approval
      c. Complete physical I/O channel designation and addressing or communication I/O register designation
      d. True/False status designations for digital I/O
      e. Process range; engineering units and any multipliers; and raw signal range count for analog I/O
      f. Signals: Fixed point and scaled at the Controller with minimum four significant implied digits of scaling, e.g.: 0 to 1400 at Controller for a pH range of 0 to 14 at Operator Interface.
      g. Provide OIT scaling to display decimal digits required

E. Control Program
   1. Provide Controller program printout with annotation for the I/O, storage registers, results, and functions. Programs to include brief periodic descriptions of process area's system and specific operation performed. Control elements annotated to indicate function, description/tag, range, or other details.

F. Graphics
   1. Graphics shall be provided in cartoon format. Provide operator interface system program printouts:
      a. Color prints of each graphic screen
      b. Printout of graphic I/O and function block database, including all data fields available

G. Reports
   1. Provide printouts of example reports
   2. Reports to include:
      a. Accumulated total flow for each flow signal at midnight of each day
      b. Regulatory agency-mandated data

2.03 SOFTWARE MEDIA

A. Programming Software
   1. Controller and OIT manufacturer's original programming software media and documentation shall be kept complete and on-site.
   2. Upon receipt from the manufacturer, the warranties and registrations shall be provided to the Construction Manager for completion by the Owner.

B. Application Software
   1. Additional Operator Interface and/or Computer manufacturer's software media and documentation shall be kept complete and on-site.
   2. Upon receipt from the Manufacturer, the warranties and registrations shall be provided to the Construction Manager for completion by the Owner.

C. Application Programs
   1. The software application programming shall be kept current on on-site media that shall be on CD-ROM or USB thumb drive, as submitted and accepted.
   2. Media shall be permanently labeled "Application Programs For (applicable) Process Area/Process System" including controller or OIT manufacturer's programming software used name; model; and revision/version, and project labeling.

2.04 PRODUCT DATA

A. Software
   1. Programming software, application software, and application program media shall be turned over to the Construction Manager upon completion of the project as a submittal.

PART 3 EXECUTION

3.01 COORDINATION

A. Scheduling
   1. The Programming Manager shall coordinate scheduling and programming activities with the Contractor's Quality Control Manager, specified in Section 01 45 20.
      a. System schedules shall be coordinated prior to Progress Meetings.
      b. Programming status spreadsheets shall be presented at Progress Meetings.
      c. No programs will be considered substantially complete until all programming and related testing activities are determined complete by the Construction Manager.

B. Related Contract Document And Product Submittals
   1. The Contractor shall provide Programming Manager with the referenced and pertinent Specifications and Drawings with Addenda updates marked to indicate submitted and requested deviations from the specified and indicated requirements.
   2. The Contractor shall provide current reviewed product submittals for the instruments, analyzers, VFDs, MCCs, control panels, and vendor or manufacturer packaged control systems to the Programming Manager.

C. Changes
   1. The Contractor shall provide copies of the pertinent contract correspondence which may effect control system changes to the Programming Manager.
   2. The Programming Manager may request information and clarifications in a Request For Information (RFI) that is routed through the Contractor.

D. Temporary Facilities
   1. The Contractor shall provide temporary power, network connections, personal communication devices such as radios, work surfaces, and chairs as required for Programmer to insure controller and operator interface readiness prior to loop tests and to complete the testing.

3.02 PROGRAMMING EXECUTION

A. Scheduling
   1. The Programming Manager shall coordinate with the Contractor and prioritize programming in the order of schedule completion.

B. Sequence Tasks
   1. Programming shall be performed in the following order:
      a. Control description approval
      b. I/O interface summary approval
      c. Program I/O and annotation
      d. Program controller program
      e. “Force” or simulate I/O and verify/debug controller program
      f. Program graphics database
      g. Program graphics
      h. “Force” or simulate I/O and verify/debug graphics
      i. Program and verify/debug reports

3.03 TESTS

A. The Programming Manager or designated programmer shall witness and assist with Loop Tests, Functional Tests, and Operational Tests as outlined in Sections 01 45 20 and 40 61 21.

B. A minimum of 32 man-hours shall be provided per each of the process systems identified in Section 40 61 96. Programming errors noted shall be corrected during tests. Contractor shall keep on site and submit a log on the request of the Construction Manager for the Tests and man-hours expended.

3.04 TRAINING

1. The Programming Manager shall conduct application program/process operation training conforming to the requirements of Section 01 79 00. A minimum of 2 sessions of 8 man-hours on-site including training materials and expenses shall be provided, one for each of 2 shifts of 4 operators.
2. The Programming Manager shall conduct application program maintenance, modification, and re-loading training conforming to the requirements of Section 01 79 00. A minimum of 4 man-hours on-site, including training materials and expenses, shall be provided for 2 maintenance personnel.

END OF SECTION

SECTION 40 68 13

PROCESS CONTROL (HMI) SOFTWARE

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies software systems for the process control system real-time human-machine interface (HMI) and historical data management system. The programming and configuration of these software systems shall be performed in accordance with Division 40.

1.02 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's product literature for all software systems
   2. Manufacturer's recommended hardware requirements for optimum operation of each software system
   3. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. *Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.*

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. This specification is based on Inductive Automation's Ignition HMI products and, by virtue of this reference, establishes the level of performance, functionality, and quality for any products offered in lieu of the referenced products including the named manufacturers. Upon election to use products of another manufacturer, named or otherwise, the Contractor shall be responsible for all changes required in hardware and software configuration to provide the established level of performance and quality.

B. The process control software systems are listed in the "Proposed Major Equipment Supplier List" in the Contract Documents. The acceptable manufacturers of process control software systems are as follows:
   1. Real-time HMI
      a. Inductive Automation Ignition HMI
   2. Process Database System
      a. Microsoft SQL Server

C. Substitutions to the above listed manufacturers may be offered by the Contractor in accordance with the Instructions to Bidders.

2.02 SOFTWARE LICENSING

A. All process control system software products shall be licensed in the Owner's name. The number of licenses for each process control system server application including communication drivers shall be as required to implement the process control system as specified herein and detailed on the Drawings. The number of licenses for process control system client applications shall be as specified in Table 2.02:

Table 2.02

Software Application	Number of Licensed Copies	Notes
Process Control System Real-time HMI Data Server, Client and Trending	1	Unlimited tag count, Development license, includes PLC communications drivers, Ethernet driver, and configuration utilities.
Process Control System Real-time HMI Data Server, Client and Trending	2	Unlimited tag count, Runtime license
Historical Data Management System	1	

PART 3 EXECUTION

3.01 PROCESS CONTROL SOFTWARE SYSTEM PROGRAMMING

A. Process control system software shall be programmed and configured in accordance with the requirements of Division 40.

3.02 TRAINING

A. Contractor shall include as work of this specification the cost of all enrollment fees, round trip air travel, local ground transportation, and lodging for 4 of the Owner's personnel to attend a 2-day training course addressing the programming and development of the process control software systems.

B. The Contractor shall provide the services of the systems integrator for the purpose of training the Owner's personnel in the proper operation of the process control system graphical operator interface.

C. Training shall address the use of each graphical interface display and the underlying control logic associated with each control and monitoring function as well as the use of all system utilities.

D. Training shall consist of 16 hours of classroom training conducted in two 4-hour sessions per day. The same material shall be presented in each session.

E. Training shall comply with Section 01 79 00 and Section 01 99 90.

END OF SECTION

SECTION 40 71 00

FLOW MEASUREMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies requirements for instrumentation elements that quantitatively convert the measured variable energy into a form suitable for measurement and process measurement accessories. Application requirements are specified in Section 40 06 70.

B. This section specifies requirements for process flow transmitters, associated indication devices, and accessories.

C. This section specifies requirements for process flow activated switches, devices, and accessories.

D. This section specifies requirements for instrumentation elements which form a part of the process control systems specified in Section 40 61 13 and Section 40 06 70. Application requirements are specified in the instrument schedule, Section 40 06 70.

1.02 QUALITY ASSURANCE

A. Manufacturer: Equipment furnished under this section shall be the products of firms regularly engaged in the design and manufacture of such equipment for a minimum of five years.

B. Installer: Installation, calibration and testing of equipment furnished under this section shall be performed by qualified, skilled, Certified Technicians specified in Section 40 61 13, who are regularly engaged in such activities involving systems of similar complexity.

C. References: References are listed in Section 40 61 13 and are a part of this section as specified and modified.

1.03 ENVIRONMENTAL CONDITIONS

A. Equipment provided under this section shall be suitable for operation under ambient conditions described in Section 40 61 13.

1.04 SUBMITTALS

A. Submittals shall be provided as specified in Section 40 06 70.

B. Submittals shall be provided as specified in Sections 01 33 00 and 40 61 13, including:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:

   a. Section 01 79 00 – Demonstration and Training

b. Section 01 78 23 – Operating and Maintenance Data
c. Section 40 61 13 – Process Control System General Provisions
d. Section 40 06 70 – Instrument Index

A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.

The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.

Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

2. A copy of the contract document Control Diagrams and Process and Instrumentation Diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
3. Marked Contract Document Mechanical and/or Electrical Plan drawings, sections, and details showing sensor installation locations and details. Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
4. Marked product literature of all equipment and features to be provided.
   a. Installation drawings for only the transmitters, sensors, and mounting accessories to be provided.
   b. Electrical and signal connection drawings for only the transmitters and sensors to be provided.
5. List of miscellaneous items, cables, spare parts, that will be provided in accordance with INSTRUSPEC sheet requirements.
6. Marked product literature for surge protectors.

PART 2 PRODUCTS

2.01 INSTRUMENTATION SPECIFICATION SHEETS (INSTRUSPEC)

A. General requirements for instruments specified in this section are specified on the INSTRUSPEC sheets in the Appendix at the end of this section.

B. Application requirements are specified in the Instrument Index, and/or on the drawings.

2.02 SYSTEM EQUIPMENT

A. General:
   1. In accordance with Section 01 33 00, the General Conditions of the Contract Documents, drawings, information, and technical data for all equipment as, required in Section 40 61 13 and this section shall be provided. All required product data for this section shall be included in one complete package.

B. Process switches and devices shall comply with the following requirements:
   1. Contact outputs used for alarm actuation shall be normally-closed or normally-opened as required by the process condition to open to initiate the alarm.
   2. Contact outputs used to control equipment shall be normally-opened and shall close to start the equipment.
   3. Contacts monitored by solid state equipment such as programmable controllers or annunciators shall be hermetically sealed and rated for switching currents from 20 to 100 mA at 24 VDC.
   4. Contacts, monitored by electromagnetic devices such as mechanical relays, shall be rated as NEMA ICS 2, designation B300.
   5. Double barriers provided between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.
   6. Switch electrical enclosures rated as NEMA 250, Type 4 minimum.
   7. Switch contacts located in Class I, Division 1 areas and monitored by solid-state circuits shall be made safe by intrinsic safety barriers.
   8. Switch range shall be selected so that the specified set point is at least 30% but not more than 70% of the span, between the upper range limit and the lower range limit.

C. Measuring elements and transmitters shall comply with the following requirements:
   1. Measured parameter output indicators complying with this specification shall be provided with any transmitter that does not include an integral indicator. Indicators, whether integral or separate, shall be calibrated in process units, and engraved on the indicator scale plate.
   2. The two-wire type transmitters shall have operating power derived from the signal transmission circuit.
   3. Transmitters shall meet specified performance requirements with load variations within the range of 0 to 600 ohms with the power supply at a nominal 24 VDC with the default range of 0 to 100% linearly corresponding to 4 to 20 mA.
   4. Transmitter output shall increase with increasing measurement.
   5. Time constant shall be adjustable from 0.5 to 5.0 seconds for transmitters used for flow, level transmitters used for flow measurement, or pressure measurement.
   6. Transmitter output shall be galvanically isolated via electro-mechanical or optical technology.
   7. Transmitter enclosures shall be rated NEMA 250, Type 4, unless otherwise specified.
   8. Transmitters located outdoors shall be provided with surge protectors:
      a. Signal: Emerson/Rosemount Model 470 D, Emerson/EDCO SS64-036-2, CCI SPN-42 FS28 Series, or approved equal.
      b. AC Power: UL 1449, LED indicator, screw terminal connections, NEMA 4X. EDCO HSP121A or approved equal.

9. Two-wire transmitter located in a facility area classified as hazardous per the NFPA and the NEC shall be made safe by means of an intrinsic safety barrier.
10. Four-wire transmitters shall be isolated from the process and power or provided with a loop-powered signal current isolator in the output signal circuit.

2.03 PROCESS PARAMETER OUTPUT INDICATOR

A. Provide digital LED or LCD indicators that integral to the instrument housing where available from the manufacturer. Displays shall be scaled in engineering units, over the calibrated range of the instrument. Calibrate the indicator scale in process units.

B. Analog output indicators shall be 2-1/2" milliammeter with 90-degree movement enclosed in a NEMA 7/9 rated meter case. Provide indicators with accuracy within 2% of span. Provide a diode to maintain loop continuity for indicator removal.

2.04 INTRINSIC SAFETY BARRIERS

A. Intrinsic safety barriers for two-wire transmitters shall be of the active, isolating, loop powered type. Barrier shall be Measurement Technology LTD Type MT3042, Stahl Series 9000, or approved equal.

2.05 SIGNAL CURRENT ISOLATOR

A. Isolator shall provide galvanic isolation of milliampere transmission signals from transmitters. Isolator shall be housed in a NEMA 250, Type 4/7 conduit body and derive operating power from the signal input circuit.

B. Input and output signals shall be 4 to 20 mA, and error shall not exceed 0.1% of span. Input resistance shall not exceed 550 ohms with an output load of 250 ohms.

C. Isolator shall be Moore Industries SCX 4-20madc to 4-20madc/5.5VPL/-RF, DIN rail mounted with maximum 250 ohm output impedance, or approved equal.

2.06 PRODUCT DATA

A. Additional Information: The following product data shall be provided:
   1. Flow calculation for each differential-type flow element.
   2. Record documentation shall include the data sheets specified in this section.

B. The following data provided in accordance with Section 01 33 00:
   1. Operating and maintenance information as specified in Section 40 61 13. Include final reviewed submittal and separate record of all final configuration, jumper, and switch settings for each instrument.
   2. Test results as specified in Section 40 61 21.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. General requirements for the installation of primary elements specified in this section are listed on INSTRUSPEC sheets.
   2. Installation requirements are specified in paragraph 40 61 13.

B. Process Connections:
   1. General: Unless otherwise specified, process taps shall comply with Section 40 05 01. Process connections shall be arranged such that instruments may be readily removed for maintenance without disruption of process units or draining of large tanks or vessels. Unions or flange connections shall be provided as necessary to permit removal without rotating equipment.
      a. Where process taps are not readily accessible from instrument locations, an isolation valve shall be provided at the instrument.
      b. Isolation valves shall be provided for each instrument where multiple instruments are connected to one process tap.
      c. Pipe between the process connection and instruments shall be 1/2" stainless steel with treatment material for easy removal, as specified herein.
   2. Safety Instruments: No valves shall be installed at pressure taps for safety instruments. Safety instruments shall not be connected to the same process tap as instruments used for control, indication, or recording except when annular chemical seals are used.
   3. Root Valves: Root valves shall be provided at all process taps, except as follows:
      a. Temperature taps, where valves are unnecessary.
      b. Pump discharge pressure taps where no instrument is permanently installed. Isolation valves shall be provided.
      c. Process taps for safety instruments.
      d. Where gauge valves are provided.
      e. Where chemical seals are used.
   4. Gauge Valves: Gauge valves shall be provided for each pressure gauge tap except where chemical seals are used.
   5. Flushing/Calibration Connection: Provide a tee and isolation valve between the root or gauge valve and the instrument or diaphragm seal.

C. Tubing:
   1. Tubing shall be installed on supports spaced not more than 3 feet apart and shall run parallel of perpendicular to walls structural members, or intersections of vertical planes and the ceiling. Unless otherwise shown, tubing shall follow building surfaces closely or shall be carried in trays or conduit.
   2. Tubing shall not be supported from piping or equipment except at process taps or connections to the device served. Tubes supported directly on concrete surfaces shall be spaced at least 1/8 inch from the concrete. Tubing support shall be one-hole malleable iron clamps with clamp backs as required. Bends shall be formed to uniform radii without flattening.

3. Ends of tubing shall be square-cut and de-burred before installation in fittings. Fittings shall be used for splices, connections, and turns near final connections. Bulkhead fittings shall be used when tubing enters a panel.

D. Electrical Connections:

1. Final connections between rigid raceway systems and instruments shall be made with jacketed flexible conduit with a maximum length of 2 feet.

3.02 TESTING

A. Applicable testing requirements are specified in Section 40 06 70.

B. Testing requirements are specified in Section 40 61 21.

3.03 PROCESS CONNECTIONS:

A. Process connection piping and tubing shall be tested in accordance with Section 40 05 01.

3.04 TRAINING

A. Training requirements are specified in Sections 01 79 00. Provide two training sessions, each with one-half hour for each type of level transmitter.

PART 4 APPENDIX - INSTRUSPECS

4.01 INSTRUSPECS

A. General requirements for instruments specified in this section are listed on INSTRUSPEC sheets herein. Application requirements are specified in the Instrument Index, and/or on the drawings.

Table A

INSTRUSPEC Symbol	Instrument description	Instrument function
FM	Magnetic Flow Transmitter	Flow Measurement
FTS	Thermal Flow Switch	Flow Measurement
FVA2	Variable Area Flow Meter	Flow Measurement

4.02 INSTRUMENT IDENTIFICATION: FM

A. Instrument Function: Flow Measurement

B. Instrument Description: Magnetic Flow Metering System

C. Signal Input: Process

D. Signal Output: Analog signal as specified in this section

E. Process Connection:
   1. Flow tubes of less than 4" diameter may be wafer-style ductile-iron or full-body flanged construction.
   2. Flow tubes larger than above shall be flanged, ANSI B16.5, Class 150, raised face.
   3. Flow tubes larger than 30 inches shall be AWWA Class D carbon steel flanges.

F. Product Requirements: Magnetic flow meter provided as a system consisting of a flow tube with separate indicating transmitter, unless otherwise scheduled in the Section 40 06 70 Instrument Index, complete with interconnecting cables of sufficient length between the flow tube and the transmitter. Magnetic flow meters to be used for drinking water shall be NSF approved. Contractor shall confirm compatibility of flow meter for potentially low-conductive fluid measurement.
   1. Indicating transmitter for full-scale flow rates from 1.0 to 30 feet per second. System error shall not exceed the greater of 0.5% of flowrate or 0.1 foot per second from 3 to 30 feet per second.
   2. Flow Tube: Shall be rated NEMA 6P for continuous submergence up to 20 feet. Flow tube shall be suitable for installation in "Hazardous" classified spaces.
   3. Grounding Rings: Provide up-stream and downstream 316L stainless steel grounding rings shall be fabricated from the same metal as for the electrodes below.
   4. Electrodes: Shall have conical shaped probes that are cleaned by the velocity of the flow stream. Probes shall be manufactured of 316L stainless steel unless otherwise specified.

5. Liner: As follows unless otherwise specified.
    a. Less than a 4” diameter shall be provided with metallic mesh reinforced PFA liners.
    b. 6” to 30” diameters shall be hard rubber, NSF approved liners.
    c. 30 inches in diameter and larger shall have [Hard rubber, Polyurethane] liners.
6. Transmitter: Contain electronics associated with the magnetic flow meter system. Enclosure rating NEMA-4X, cast aluminum or metal compartment for power, field connections and calibration adjustments separate from digital circuitry.
    a. Means to calibrate the metering system without use of external calibration units. Transmitter self-diagnostics. Traceability certificate of actual flow lab certification provided with each flowtube.
    b. Integral 4-digit LCD flow indication calibrated in process units. Data retained in non-volatile memory.
    c. Internal circuitry to drive flow signal to zero upon flow meter determined empty pipe condition.

G. Manufacturers:
    a. ABB Magmaster MFE
    b. Endress + Hauser Promag 50W/53W
    c. Krohne Optiflux 4000 (Optiflux 4300 for polymer feed)
    d. Or approved equal.

4.03 INSTRUMENT IDENTIFICATION: FTS

A. Instrument Function: Flow Measurement

B. Instrument Description: Thermal Flow Switch

C. Power Supply: 24 VDC

D. Signal Input: Process

E. Signal Output: Contact as specified in this section

F. Process Connection: As specified

G. Product Requirements:
1. Flow switch shall be the thermal convection type. Switch point shall not be affected by process fluid temperature changes in the range of 32 to 140°F and shall have a repeatability of ±5% of range.
2. Control unit shall operate with the specified repeatability in an ambient temperature range of 25 to 120°F.

H. Approved Manufacturers: Fluid Components Inc., Flow Technology Inc., or equal.

I. Execution: Install in accordance with manufacturer's instructions.

4.04 INSTRUMENT IDENTIFICATION: FVA2

A. Instrument Function: Flow measurement

B. Instrument Description: Variable area flow meter

C. Power Supply: N/A

D. Signal Input: Process

E. Signal Output: Contacts, when specified, shall be in accordance with this section.

F. Process Connection: Flange, ANSI B16.5, Class 150, raised face, unless otherwise specified

G. Product Data: Flowmeter shall be straight-through construction with a borosilicate glass metering tube. Float shall be 316 stainless steel unless otherwise noted. 200 mm minimum length detachable aluminum scale shall be engraved in direct reading units.
   1. Maximum working pressure shall be at least 75 psig at 200°F. Accuracy shall be ± 2.0% of scale or better above 10% of scale.
   2. When specified in Section 40 06 70, flowmeter shall be equipped with a hermetically sealed reed switch with a biasing magnet.
   3. Switch shall be sealed in a shock absorbing housing and shall be actuated by a permanent magnet embedded in the metering float. Switch shall be adjustable over the entire range of the meter.

H. Execution:
   1. Installation: Install in accordance with the manufacturer's instructions.
   2. Test: In accordance with Section 40 06 70.
   3. Application/Calibration: Application, calibration, and set points shall be as specified in Section 40 06 70.
   4. Manufacturers:
      a. Brooks model 1121
      b. Or approved equal.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 72 00

LEVEL MEASUREMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies requirements for instrumentation elements that quantitatively convert the measured variable energy into a form suitable for measurement and process measurement accessories. Application requirements are specified in Section 40 06 70.

B. This section specifies requirements for process level transmitters, associated indication devices, and accessories.

C. This section specifies requirements for process level activated switches, devices, and accessories.

D. Scope:

1. This section specifies requirements for instrumentation elements which form a part of the process control systems specified in Section 40 61 13 and Section 40 06 70. Application requirements are specified in the instrument schedule, Section 40 06 70.

1.02 QUALITY ASSURANCE

A. Equipment furnished under this section shall be the products of firms regularly engaged in the design and manufacture of such equipment for a minimum of five years.

B. Installation, calibration and testing of equipment furnished under this section shall be performed by qualified, skilled, Certified Technicians specified in Section 40 61 13, who are regularly engaged in such activities involving systems of similar complexity.

C. References are listed in Section 40 61 13 and are a part of this section as specified and modified.

1.03 ENVIRONMENTAL CONDITIONS

A. Equipment provided under this section shall be suitable for operation under ambient conditions described in Section 40 61 13.

1.04 SUBMITTALS

A. Submittals shall be provided as specified in Section 40 06 70.

B. Submittals shall be provided as specified in Sections 01 33 00 and 40 61 13, including:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
   a. Section 01 79 00 – Demonstration and Training
   b. Section 01 78 23 – Operating and Maintenance Data

c. Section 40 61 13 - Process Control System General Provisions

d. Section 40 06 70 – Instrument Index

A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

2. A copy of the contract document Control Diagrams and Process and Instrumentation Diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
3. Marked Contract Document Mechanical and/or Electrical Plan drawings, sections, and details showing sensor installation locations and details. Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
4. Marked product literature of all equipment and features to be provided.
   a. Installation drawings for only the transmitters, sensors, and mounting accessories to be provided.
   b. Electrical and signal connection drawings for only the transmitters and sensors to be provided.
5. List of miscellaneous items, cables, spare parts, that will be provided in accordance with INSTRUSPEC sheet requirements.
6. Marked product literature for surge protectors.

PART 2 PRODUCTS

2.01 INSTRUMENTATION SPECIFICATION SHEETS (INSTRUSPEC)

A. General requirements for instruments specified in this section are specified on the INSTRUSPEC sheets in the Appendix at the end of this section.

B. Application requirements are specified in the Instrument Index, and/or on the drawings.

2.02 PRODUCT DATA

A. General:

1. In accordance with Section 01 33 00, the General Conditions of the Contract Documents, drawings, information, and technical data for all equipment as, required in Section 40 61 13 and this section shall be provided. All required product data for this section shall be included in one complete package.

B. Process switches and devices shall comply with the following requirements:
   1. Contact outputs used for alarm actuation shall be normally-closed or normally-opened as required by the process condition to open to initiate the alarm.
   2. Contact outputs used to control equipment shall be normally-opened and shall close to start the equipment.
   3. Contacts monitored by solid state equipment such as programmable controllers or annunciators shall be hermetically sealed and rated for switching currents from 20 to 100 mA at 24 VDC.
   4. Contacts, monitored by electromagnetic devices such as mechanical relays, shall be rated as NEMA ICS 2, designation B300.
   5. Double barriers provided between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.
   6. Switch electrical enclosures rated as NEMA 250, Type 4 minimum.
   7. Switch contacts located in Class I, Division 1 areas and monitored by solid-state circuits shall be made safe by intrinsic safety barriers as specified in Section 40 78 00.
   8. Switch range shall be selected so that the specified set point is at least 30% but not more than 70% of the span, between the upper range limit and the lower range limit.

C. Measuring elements and transmitters shall comply with the following requirements:
   1. Measured parameter output indicators complying with this section shall be provided with any transmitter that does not include an integral indicator. Indicators, whether integral or separate, shall be calibrated in process units, and engraved on the indicator scale plate.
   2. The two-wire type transmitters shall have operating power derived from the signal transmission circuit.
   3. Transmitters shall meet specified performance requirements with load variations within the range of 0 to 600 ohms with the power supply at a nominal 24 VDC with the default range of 0 to 100% linearly corresponding to 4 to 20 mA.
   4. Transmitter output shall increase with increasing measurement.
   5. Time constant shall be adjustable from 0.5 to 5.0 seconds for transmitters used for flow, level transmitters used for flow measurement, or pressure measurement.
   6. Transmitter output shall be galvanically isolated via electro-mechanical or optical technology.
   7. Transmitter enclosures shall be rated NEMA 250, Type 4, unless otherwise specified.
   8. Transmitters located outdoors shall be provided with surge protectors:
      a. Signal: Emerson/Rosemount Model 470 D, Emerson/EDCO SS64-036-2, CCI SPN-42 FS28 Series, or approved equal.
      b. AC Power: UL 1449, LED indicator, screw terminal connections, NEMA 4X. EDCO HSP121A or approved equal.
   9. Two-wire transmitter located in a facility area classified as hazardous per the NFPA and the NEC shall be made safe by means of an intrinsic safety barrier as specified in this section.
   10. Four-wire transmitters shall be isolated from the process and power or provided with a loop-powered signal current isolator connected in the output signal circuit.

2.03 PROCESS PARAMETER OUTPUT INDICATOR

A. Provide digital LED or LCD indicators that integral to the instrument housing where available from the manufacturer. Displays shall be scaled in engineering units, over the calibrated range of the instrument. Calibrate the indicator scale in process units.

B. Analog output indicators shall be 2.5" milliammeter with 90-degree movement enclosed in a NEMA 7/9 rated meter case. Provide indicators with accuracy within two percent of span. Provide a diode to maintain loop continuity for indicator removal.

2.04 INTRINSIC SAFETY BARRIERS

A. Intrinsic safety barriers for two-wire transmitters shall be of the active, isolating, loop powered type. Barrier shall be Measurement Technology LTD Type MT3042 or Stahl Series 9000, or approved equal.

2.05 SIGNAL CURRENT ISOLATOR

A. Isolator shall provide galvanic isolation of milliampere transmission signals from transmitters. Isolator shall be housed in a NEMA 250, Type 4/7 conduit body and derive operating power from the signal input circuit.

B. Input and output signals shall be 4 - 20 mA, and error shall not exceed 0.1% of span. Input resistance shall not exceed 550 ohms with an output load of 250 ohms.

C. Isolator shall be Moore Industries SCX 4-20madc to 4-20madc / 5.5VPL / -RF DIN rail mounted with maximum 250 ohm output impedance, or approved equal.

2.06 PRODUCT DATA

A. Additional Information: The following product data shall be provided:
   1. Flow calculation for each differential-type flow element.
   2. Record documentation shall include the data sheets specified in this section.

B. The following data provided in accordance with Section 01 33 00:
   1. Operating and maintenance information as specified in Section 40 61 13. Include final reviewed submittal and separate record of all final configuration, jumper, and switch settings for each instrument.
   2. Test results as specified in Section 40 61 21.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. General requirements for the installation of primary elements specified in this section are listed on INSTRUSPEC sheets.
   2. Installation requirements are specified in Section 40 61 13.

B. Process Connections:

1. General: Unless otherwise specified, process taps shall comply with Section 40 05 01. Process connections shall be arranged such that instruments may be readily removed for maintenance without disruption of process units or draining of large tanks or vessels. Unions or flange connections shall be provided as necessary to permit removal without rotating equipment.
    a. Where process taps are not readily accessible from instrument locations, an isolation valve shall be provided at the instrument.
    b. Isolation valves shall be provided for each instrument where multiple instruments are connected to one process tap.
    c. Pipe between the process connection and instruments shall be 1/2" stainless steel with treatment material for easy removal, as specified herein.
2. Safety Instruments: No valves shall be installed at pressure taps for safety instruments. Safety instruments shall not be connected to the same process tap as instruments used for control, indication, or recording except when annular chemical seals are used.
3. Root Valves: Root valves shall be provided at all process taps, except as follows:
    a. Temperature taps, where valves are unnecessary.
    b. Pump discharge pressure taps where no instrument is permanently installed. Isolation valves shall be provided.
    c. Process taps for safety instruments.
    d. Where gauge valves are provided.
    e. Where chemical seals are used.
4. Gauge Valves: Gauge valves shall be provided for each pressure gauge tap except where chemical seals are used.

C. Tubing:

1. Tubing shall be installed on supports spaced not more than 3' apart and shall run parallel of perpendicular to walls structural members, or intersections of vertical planes and the ceiling. Unless otherwise shown, tubing shall follow building surfaces closely or shall be carried in trays or conduit.
2. Tubing shall not be supported from piping or equipment except at process taps or connections to the device served. Tubes supported directly on concrete surfaces shall be spaced at least 1/8" from the concrete. Tubing support shall be one-hole malleable iron clamps with clamp backs as required. Bends shall be formed to uniform radii without flattening.
3. Ends of tubing shall be square-cut and de-burred before installation in fittings. Fittings shall be used for splices, connections, and turns near final connections. Bulkhead fittings shall be used when tubing enters a panel.

D. Electrical Connections:

1. Final connections between rigid raceway systems and instruments shall be made with jacketed flexible conduit with a maximum length of 2'.

3.02 TESTING

A. Applicable testing requirements are specified in Section 40 06 70.

B. Testing requirements are specified in Section 40 61 21.

3.03 PROCESS CONNECTIONS:

A. Process connection piping and tubing shall be tested in accordance with Section 40 05 01.

3.04 TRAINING

A. Training requirements are specified in Sections 01 79 00. Provide two training sessions, each with one-half hour for each type of level transmitter.

PART 4 APPENDIX - INSTRUSPECS

4.01 INSTRUSPECS

A. General requirements for instruments specified in this section are listed on INSTRUSPEC sheets herein. Application requirements are specified in the Instrument Index, and/or on the drawings.

Table A

INSTRUSPEC Symbol	Instrument description	Instrument function
LFS	Float Switch, Free floating	Level Measurement
LRM	Radar Level Transmitter (Pulse)	Level Measurement
LSS	Side-Mounted Float Switch	Level Measurement

4.02 INSTRUMENT IDENTIFICATION: LFS

A. Instrument Function: Level Measurement

B. Instrument Description: Float Switch, Free-floating

C. Power Supply: N/A

D. Signal Input: Process

E. Signal Output: Contacts, in accordance with this section.

F. Process Connection: N/A

G. Product Data:

1. Switch shall be free-floating type, suspended from an oil resistant waterproof cable. The cable designed to support the weight of the float without additional strain relief and permanently sealed where it enters the float body.
2. The conductors shall be a minimum size of 18 AWG. The switch shall be a SPDT dry contact type and rated at not less than 10 A at 120 VAC. The float shall have a PVC or ABS corrosion and impact resistant shell and be NSF approved.

H. Execution:
   1. Installation: Install in accordance with the manufacturer's instructions, Section 40 06 70, and the specified functional requirements.
   2. Test: In accordance with Section 40 06 70.
   3. Application/Calibration: In accordance with Section 40 06 70. Switch set point and reset point adjusted as specified.

I. Approved Manufacturers: Magnetrol Model T10, Dwyer FSW2, or approved equal.

4.03 INSTRUMENT IDENTIFICATION: LRM

A. Instrument Function: Level Measurement

B. Instrument Description: Radar Level Transmitter:

C. Pulse Type: Loop Powered

D. Power Supply: 24 VDC

E. Signal Input Process

F. Signal Output: As specified in this section

G. Signal Converter/Transmitter:
   1. Signal type: 6.3 to 26 GHz range with the maximum output power of 100 milliwatt.
   2. Enclosure: NEMA 4X [integral] mount.
   3. Operator Interface: LCD display, scaled in engineering units, with soft-keys for scrolling and configuration.
   4. Networks: HART
   5. Measuring range: 0 - 33’
   6. Accuracy: ±0.2”
   7. Analog Output: One isolated 4-20 mA, minimum of 300 ohms
   8. Ambient Temperature Range: -20 to +140°F.
   9. Process Temperature Range: -40 to +300°F
   10. Pressure Range: full vacuum to 580 psig.
   11. Sensor: As noted in the schedule
   12. Process Connection: As noted in the schedule
   13. Wetted Materials: 316 SS, PTFE, PP, or as approved.
   14. Accessories:
      a. Provide stainless steel mounting hardware, including stainless brackets, flanges, and cable length glands.
      b. Provide remote level indication where noted.
   15. Acceptable Manufacturer:
      a. Vega Vegapuls 11
      b. Or approved equal.

H. Execution:
   1. Installation: Install in accordance with manufacturer's instructions and the Engineer's installation detail.
   2. Contractor to verify size and type of specified tank connection with approved tank submittals.

4.04 INSTRUMENT IDENTIFICATION: LSS

A. Instrument Function: Level Measurement

B. Instrument Description: Side-mounted float Switch

C. Power Supply: N/A

D. Signal Input: Process

E. Signal Output: Contacts, in accordance with this section.

F. Process Connection: 1" female NPT

G. Product Data:
   1. Switch stem and float shall be polypropylene unless otherwise specified. Switch shall be SPDT rated at 15 A.
   2. The switch rated for use in Class I, Division 1, Groups BCD hazardous areas. The housing rated NEMA 4X. The float magnetically coupled to the switch such that no seals are required. The process temperature rating to 220°F and the pressure rating of -15 to +2250 psig.

H. Execution:
   1. Installation: Install in accordance with the manufacturer's instructions, Section 40 06 70, and the specified functional requirements.
   2. Test: In accordance with Section 40 06 70.
   3. Application/Calibration: In accordance with Section 40 06 70. Switch set point and reset point adjusted as specified.

I. Approved Manufacturers: Delta Controls type 735, or approved equal.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 73 00

PRESSURE, STRAIN, AND FORCE MEASUREMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies requirements for instrumentation elements that quantitatively convert the measured variable energy into a form suitable for measurement and process measurement accessories. Application requirements are specified in Section 40 06 70.

B. This section specifies requirements for process pressure transmitters, associated indication devices, and accessories.

C. This section specifies requirements for process pressure activated switches, devices, and accessories.

D. This section specifies requirements for instrumentation elements which form a part of the process control systems specified in Sections 40 61 13 and Section 40 06 70. Application requirements are specified in the instrument schedule.

1.02 QUALITY ASSURANCE

A. Equipment furnished under this section shall be the products of firms regularly engaged in the design and manufacture of such equipment for a minimum of five years.

B. Installation, calibration and testing of equipment furnished under this section shall be performed by qualified, skilled, Certified Technicians specified in Section 40 61 13, who are regularly engaged in such activities involving systems of similar complexity.

C. References are listed in Section 40 61 13 and are a part of this section as specified and modified.

1.03 ENVIRONMENTAL CONDITIONS

A. Equipment provided under this section shall be suitable for operation under ambient conditions described in Section 40 61 13.

1.04 SUBMITTALS

A. Submittals shall be provided as specified in Section 40 06 70.

B. Submittals shall be provided as specified in Sections 01 33 00 and 40 61 13, including:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
      a. Section 01 79 00 – Demonstration and Training
      b. Section 01 78 23 – Operating and Maintenance Data
      c. Section 40 61 13 – Process Control System General Provision

d. Section 40 06 70 – Instrument Index

2. A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
3. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
4. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
5. A copy of the contract document Control Diagrams and Process and Instrumentation Diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
6. Marked Contract Document Mechanical and/or Electrical Plan drawings, sections, and details showing sensor installation locations and details. Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
7. Marked product literature of all equipment and features to be provided.
   a. Installation drawings for only the transmitters, sensors, and mounting accessories to be provided.
   b. Electrical and signal connection drawings for only the transmitters and sensors to be provided.
8. List of miscellaneous items, cables, spare parts, that will be provided in accordance with INSTRUSPEC sheet requirements.
9. Marked product literature for surge protectors.

PART 2 PRODUCTS

2.01 INSTRUMENTATION SPECIFICATION SHEETS (INSTRUSPEC)

A. General requirements for instruments specified in this section are specified on the INSTRUSPEC sheets in the Appendix at the end of this section.

B. Application requirements are specified in the Instrument Index, and/or on the drawings.

2.02 EQUIPMENT

A. General:
   1. In accordance with Section 01 33 00 the General Conditions of the Contract Documents, drawings, information, and technical data for all equipment as, required in Section 40 61 13 and this section shall be provided. All required product data for this section shall be included in one complete package.

B. Process switches and devices shall comply with the following requirements:
   1. Contact outputs used for alarm actuation shall be normally-closed or normally-opened as required by the process condition to open to initiate the alarm.
   2. Contact outputs used to control equipment shall be normally-opened and shall close to start the equipment.
   3. Contacts monitored by solid state equipment such as programmable controllers or annunciators shall be hermetically sealed and rated for switching currents from 20 to 100 mA at 24 VDC.
   4. Contacts, monitored by electromagnetic devices such as mechanical relays, shall be rated as NEMA ICS 2, designation B300.
   5. Double barriers provided between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.
   6. Switch electrical enclosures rated as NEMA 250, Type 4 minimum.
   7. Switch contacts located in Class I, Division 1 areas and monitored by solid-state circuits shall be made safe by intrinsic safety barriers as specified in Section 40 78 00.
   8. Switch range shall be selected so that the specified set point is at least 30 percent but not more than 70% of the span, between the upper range limit and the lower range limit.

C. Measuring elements and transmitters shall comply with the following requirements:
   1. Measured parameter output indicators complying with this section shall be provided with any transmitter that does not include an integral indicator. Indicators, whether integral or separate, shall be calibrated in process units, and engraved on the indicator scale plate.
   2. The two-wire type transmitters shall have operating power derived from the signal transmission circuit.
   3. Transmitters shall meet specified performance requirements with load variations within the range of 0 to 600 ohms with the power supply at a nominal 24 VDC with the default range of 0 to 100% linearly corresponding to 4 to 20 mA.
   4. Transmitter output shall increase with increasing measurement.
   5. Time constant shall be adjustable from 0.5 to 5.0 seconds for transmitters used for flow, level transmitters used for flow measurement, or pressure measurement.
   6. Transmitter output shall be galvanically isolated via electro-mechanical or optical technology.
   7. Transmitter enclosures shall be rated NEMA 250, Type 4, unless otherwise specified.
   8. Transmitters located outdoors shall be provided with surge protectors:
      a. Signal: Emerson/Rosemount Model 470 D, Emerson/EDCO SS64-036-2, CCI SPN-42 FS28 Series, or approved equal.
      b. AC Power: UL 1449, LED indicator, screw terminal connections, NEMA 4X. EDCO HSP121A, or approved equal.
   9. Two-wire transmitter located in a facility area classified as hazardous per the NFPA and the NEC shall be made safe by means of an intrinsic safety barrier.
   10. Four-wire transmitters shall be isolated from the process and power or provided with a loop-powered signal current isolator as specified in in this section connected in the output signal circuit.

2.03 PROCESS PARAMETER OUTPUT INDICATOR

A. Provide digital LED or LCD indicators that integral to the instrument housing where available from the manufacturer. Displays shall be scaled in engineering units, over the calibrated range of the instrument. Calibrate the indicator scale in process units.

B. Analog output indicators shall be 2.5-inch milli-ammeter with 90-degree movement enclosed in a NEMA 7/9 rated meter case. Provide indicators with accuracy within two percent of span. Provide a diode to maintain loop continuity for indicator removal.

2.04 INTRINSIC SAFETY BARRIERS

A. Intrinsic safety barriers for two-wire transmitters shall be of the active, isolating, loop powered type. Barrier shall be Measurement Technology LTD Type MT3042, Stahl Series 9000, or approved equal.

2.05 SIGNAL CURRENT ISOLATOR

A. Isolator shall provide galvanic isolation of milliampere transmission signals from transmitters. Isolator shall be housed in a NEMA 250, Type 4/7 conduit body and derive operating power from the signal input circuit.

B. Input and output signals shall be 4 to 20 mA, and error shall not exceed 0.1% of span. Input resistance shall not exceed 550 ohms with an output load of 250 ohms.

C. Isolator shall be Moore Industries SCX 4-20madc to 4-20madc/5.5VPL/-RF [DIN rail mounted with maximum 250 ohm output impedance, or approved equal.

2.06 PRODUCT DATA

A. Additional Information: The following product data shall be provided:
   1. Flow calculation for each differential-type flow element.
   2. Record documentation shall include the data sheets specified in this section.

B. The following data provided in accordance with Section 01 33 00:
   1. Operating and maintenance information as specified in Section 40 61 13. Include final reviewed submittal and separate record of all final configuration, jumper, and switch settings for each instrument.
   2. Test results as specified in Section 40 61 21.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. General requirements for the installation of primary elements specified in this section are listed on INSTRUSPEC sheets.
   2. Installation requirements are specified in Section 40 61 13.

B. Process Connections:
   1. General: Unless otherwise specified, process taps shall comply with Section 40 05 01. Process connections shall be arranged such that instruments may be readily removed for maintenance without disruption of process units or draining of large tanks or vessels. Unions or flange connections shall be provided as necessary to permit removal without rotating equipment.
      a. Where process taps are not readily accessible from instrument locations, an isolation valve shall be provided at the instrument.
      b. Isolation valves shall be provided for each instrument where multiple instruments are connected to one process tap.
      c. Pipe between the process connection and instruments shall be 1/2" stainless steel with treatment material for easy removal, as specified herein.
   2. Safety Instruments: No valves shall be installed at pressure taps for safety instruments. Safety instruments shall not be connected to the same process tap as instruments used for control, indication, or recording except when annular chemical seals are used.
   3. Root Valves: Root valves shall be provided at all process taps, except as follows:
      a. Temperature taps, where valves are unnecessary.
      b. Pump discharge pressure taps where no instrument is permanently installed. Isolation valves shall be provided.
      c. Process taps for safety instruments.
      d. Where gauge valves are provided.
      e. Where chemical seals are used.
   4. Gauge Valves: Gauge valves shall be provided for each pressure gauge tap except where chemical seals are used.
   5. Flushing/Calibration Connection: Provide a tee and isolation valve between the root or gauge valve and the instrument or diaphragm seal.

C. Tubing:
   1. Tubing shall be installed on supports spaced not more than 3’ apart and shall run parallel of perpendicular to walls structural members, or intersections of vertical planes and the ceiling. Unless otherwise shown, tubing shall follow building surfaces closely or shall be carried in trays or conduit.
   2. Tubing shall not be supported from piping or equipment except at process taps or connections to the device served. Tubes supported directly on concrete surfaces shall be spaced at least 1/8” from the concrete. Tubing support shall be one-hole malleable iron clamps with clamp backs as required. Bends shall be formed to uniform radii without flattening.
   3. Ends of tubing shall be square-cut and de-burred before installation in fittings. Fittings shall be used for splices, connections, and turns near final connections. Bulkhead fittings shall be used when tubing enters a panel.

D. Electrical Connections:
   1. Final connections between rigid raceway systems and instruments shall be made with jacketed flexible conduit with a maximum length of 2’.

A. Outdoor Transmitters:
   1. Transmitters mounted outdoors shall be provided with rain/sun hood per Drawing Details.

3.02 TESTING

A. Applicable testing requirements are specified in Section 40 06 70.

B. Testing requirements are specified in Section 40 61 21.

3.03 PROCESS CONNECTIONS:

A. Process connection piping and tubing shall be tested in accordance with Section 40 05 01.

3.04 TRAINING

A. Training requirements are specified in Sections 01 79 00. Provide two training sessions, each with one-half hour for each type of level transmitter.

PART 4 APPENDIX - INSTRUSPECS

4.01 INSTRUSPECS

A. General requirements for instruments specified in this section are listed on INSTRUSPEC sheets herein. Application requirements are specified in the Instrument Index, and/or on the drawings.

Table A

INSTRUSPEC Symbol	Instrument description	Instrument function
PDHS	Differential Pressure Indicating Switch	Pressure Measurement
PG	Pressure gauge	Pressure measurement
PGT	Gauge Pressure Transmitter	Pressure Measurement
PS	Pressure Switch	Pressure Measurement
WS	Floor Scale	Weight Measurement

4.02 INSTRUMENT IDENTIFICATION: PDHS

A. Instrument Function: Pressure Measurement

B. Instrument Description: Differential Pressure Switch

C. Power Supply: N/A

D. Signal Input: Process

E. Signal Output: Contacts, in accordance with this section.

F. Process Connection: 1/4-inch male NPT

G. Product Data:
   1. Gauge: Differential pressure switch shall have a 4-1/2", 210 degree dial face with shatterproof glass window. Bourdon tube shall be bronze unless otherwise specified. Gauges manufactured to Grade A accuracy (±2.5%) in compliance with ANSI specification B40.1. The zero position shall be at the 105-degree point on the dial.
   2. Switch: The number and type of switches as specified in Section 40 06 70.
   3. The switch points visible on the face of the gauge. The switch set point externally adjustable, using a tamper proof key. The contacts set to open or close at the set point.

H. Execution:
   1. Installation: Install in accordance with manufacturer's instructions, Section 40 06 70, and the specified functional requirements.
   2. Differential pressure indicating switch mounted on a separate stand and connected to the device using 3/8-inch copper tubing in accordance with Part 3 of this section.

I. Test: In accordance with Section 40 06 70.

J. Application/Calibration: Application, calibration, and set points as specified in Section 40 06 70.

K. Approved Manufacturers: Ashcroft Type 1125A with model 2265 electric contact accessory, or approved equal.

4.03 INSTRUMENT IDENTIFICATION: PG

A. Instrument Function: Pressure measurement

B. Instrument Description: Pressure gauge

C. Power Supply: N/A

D. Signal Input: N/A

E. Signal Output: N/A

F. Process Connection: 1/2" male NPT

G. Product Requirements: Pressure gauges shall be 4-1/2-“ premium grade, glycerin filled units with bourdon tube element, 270-degree milled stainless steel movement, phenolic case, and shatterproof glass window. Accuracy shall be 1% of span or better. All exposed metal parts shall be stainless steel. Pressure gauge manufacturers:
   1. Ashcroft Duragauge Figure 1279
   2. Ametek 1981L
   3. Or approved equal.

H. Execution:
   1. Installation: Install in accordance with manufacturer's instructions and the recommendations of API RP551 to the specified requirements.

      Root valves shall be provided at all process pressure taps except taps made for safety instruments. Gauge valves shall be provided at the instrument where the instrument is not within sight of the root valve or where two or more instruments are connected to a single tap.

      Safety instruments shall not be connected to the same process tap as instruments used for control, indication, or recording. Unless otherwise specified, pressure instruments shall be located as close as practical to the process tap but shall be positioned to permit observation and maintenance. Pressure gauges may be supported from the process tap if this location permits observation from the floor or a permanent work platform. Pressure instruments shall be installed in such a manner that blowout discs are not obstructed.
   2. Application/Calibration: Application, calibration, and set points shall be as specified in Section 40 06 70.

4.04 INSTRUMENT IDENTIFICATION: PGT

A. Instrument Function: Pressure Measurement

B. Instrument Description: Gauge Pressure Transmitter

C. Power Supply: Loop powered, as specified in this section

D. Signal Input: Process

E. Signal Output: Analog transmission signal as specified in this section

F. Process Connection: 1/2" female NPT flange adapter

G. Product Requirements:
   1. Pressure Transmitter: Capacitance or piezoresistive type.
   2. Wetted Parts: Type 316 stainless steel or as specified in Section 40 06 70.
   3. Range: 100:1.
   4. Accuracy: 0.075% of calibrated span.
   5. Static Pressure Rating: 2,000 psi.
   6. Indicator: LCD display.
   7. HART standard data communication protocol
   8. Acceptable Manufacturer:
      a. Rosemount 3051CG.
      b. Or approved equal.

H. Execution:
   1. Installation: Install in accordance with manufacturer's instructions and the Engineer's installation detail.
   2. Root valves provided at all process pressure taps.
   3. Gauge valves provided at the instrument where the instrument is not within sight of the root valve or where two or more instruments are connected to a single tap.
   4. Safety instruments shall not be connected to the same process tap as instruments used for control, indication, or recording.
   5. Pressure instruments located as close as practical to the process tap and be positioned to permit observation and maintenance.
   6. Pressure instruments shall not be supported from process piping.
   7. Pressure instruments for use with integral seals, or remote seals and capillary tubing provided by a single manufacturer, and all components factory-assembled prior to shipping.

I. Seals:
   1. Type: Diaphragm
   2. Process Connection: 3-1/2" saddle style, flush surface or inline style.
   3. Diaphragm and Wetted Parts: Type 316L stainless steel unless otherwise specified.
   4. Upper Housing and Mounting Flange: Type 316L stainless steel. Lower Housing: Type 316 stainless steel
   5. Temperature Limit, High Side: -40 - 300°F
   6. Acceptable Manufacturer:
      a. Rosemount 1199.
      b. Or approved equal.

J. Capillary option:
   1. Seal Location: High pressure side of transmitter, direct mounting.
   2. Fill Fluid: DC 200 Silicone
   3. Capillary Seal Connection Material: Type 316 stainless steel armored sleeving

4.05 INSTRUMENT IDENTIFICATION: PS

A. Instrument Function: Pressure Measurement

B. Instrument Description: Pressure Switch

C. Signal Input: Process

D. Signal Output: As specified in this section

E. Process Connection: 1/2" female NPT

F. Product Requirements:
   1. Pressure switch shall consist of a pressure transducer and a precision switch. Pressure transducer shall be the diaphragm piston type with wetted materials as recommended by the switch manufacturer. Piston backed by a cylinder disc to permit 10 times over-range pressure without affecting calibration.
   2. Range spring and piston shall be isolated from process fluids by the diaphragm. Switch provided with two 3/4" conduit connections. Switch assembly housing shall be cast aluminum rated types 3, 4, and 7D per NEMA ICS6. Contractor shall select pressure transducer so that set point falls between 30% and 70% of maximum range.
   3. Approximate set point and, if applicable, reset point indicated on calibrated scales. Repeatability and sensitivity shall be 1.0% of operating range. Unless otherwise specified, switches nonadjustable deadband type.

G. Approved Manufacturers: SOR Inc. Static-O-Ring, Mercoid Series 1000, or approved equal.

H. Execution:
   1. Installation: Install in accordance with manufacturer's instructions and to the specified requirements.
   2. Application/Calibration: Application, calibration, and set points as specified in Section 40 06 70.

4.06 INSTRUMENT IDENTIFICATION: WS

A. Instrument Function: Weight Measurement

B. Instrument Description: Floor Scale

C. Power Supply: 120 VAC, 60 Hz, nominal

D. Signal Input: N/A

E. Signal Output: 4 – 20 mAAs specified in paragraph 2.02

F. Process Connection: N/A

G. Product Requirements: Platform floor scale rated for industrial use with an analog 4 – 20 mA output..

H. Construction:
   1. Stainless steel platform
   2. Stainless steel load cells
   3. Platform Dimensions: 48" x 48", no more than 3" high

I. Parameters:
   1. Power Requirements: 120 VAC, 60 Hz
   2. Accuracy: 0.1% of full scale
   3. Operating Temperature: -14 – 104°F
   4. Display: 1" LCD with annunciators with pushbuttons for tare and conversion
   5. Nominal Resolution: 1:5000
   6. Maximum Weight: 2500 lb
   7. Overload Condition: Warning display at 102% of scale capacity
   8. Display Speed: 0.5 seconds, adjustable

J. Approved Manufacturers: Arlyn Scales, or approved equal.

K. Execution:
   1. Installation: Install in accordance with manufacturer's instructions and to the specified requirements.
   2. Calibration: Calibration and set points per manufacturer's recommendation.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 74 00

TEMPERATURE MEASUREMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies requirements for instrumentation elements that quantitatively convert the measured variable energy into a form suitable for measurement and process measurement accessories. Application requirements are specified in Section 40 06 70.

B. This section specifies requirements for process temperature transmitters, associated indication devices, and accessories.

C. This section specifies requirements for process temperature activated switches, devices, and accessories.

D. This section specifies requirements for instrumentation elements which form a part of the process control systems specified in Section 40 61 13 and Section 40 06 70. Application requirements are specified in the instrument schedule, Section 40 06 70.

1.02 QUALITY ASSURANCE

A. Equipment furnished under this section shall be the products of firms regularly engaged in the design and manufacture of such equipment for a minimum of five years.

B. Installation, calibration and testing of equipment furnished under this section shall be performed by qualified, skilled, Certified Technicians specified in Section 40 61 13, who are regularly engaged in such activities involving systems of similar complexity.

C. References are listed in Section 40 61 13 and are a part of this section as specified and modified.

1.03 ENVIRONMENTAL CONDITIONS

A. Equipment provided under this section shall be suitable for operation under ambient conditions described in Section 40 61 13.

1.04 SUBMITTALS

A. Submittals shall be provided as specified in Section 40 06 70.

B. Submittals shall be provided as specified in Sections 01 33 00 and 40 61 13, including:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
      a. Section 01 79 00 – Demonstration and Training
      b. Section 01 78 23 – Operating and Maintenance Data
      c. Section 40 61 13 – Process Control System General Provisions

d. Section 40 06 70 – Instrument Index

2. A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.
3. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications.
4. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
5. A copy of the contract document Control Diagrams and Process and Instrumentation Diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
6. Marked Contract Document Mechanical and/or Electrical Plan drawings, sections, and details showing sensor installation locations and details. Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
7. Marked product literature of all equipment and features to be provided.
   a. Installation drawings for only the transmitters, sensors, and mounting accessories to be provided.
   b. Electrical and signal connection drawings for only the transmitters and sensors to be provided.
   c. List of miscellaneous items, cables, spare parts, that will be provided in accordance with INSTRUSPEC sheet requirements.
8. Marked product literature for surge protectors.

PART 2 PRODUCTS

2.01 INSTRUMENTATION SPECIFICATION SHEETS (INSTRUSPEC)

A. General requirements for instruments specified in this section are specified on the INSTRUSPEC sheets in the Appendix at the end of this section.

B. Application requirements are specified in the Instrument Index, and/or on the drawings.

2.02 PRODUCT DATA

A. General:
   1. In accordance with Section 01 33 00 the General Conditions of the Contract Documents, drawings, information, and technical data for all equipment as, required in Section 40 61 13 and this section shall be provided. All required product data for this section shall be included in one complete package.

B. Process switches and devices shall comply with the following requirements:
   1. Contact outputs used for alarm actuation shall be normally-closed or normally-opened as required by the process condition to open to initiate the alarm.
   2. Contact outputs used to control equipment shall be normally-opened and shall close to start the equipment.
   3. Contacts monitored by solid state equipment such as programmable controllers or annunciators shall be hermetically sealed and rated for switching currents from 20 to 100 mA at 24 volts DC.
   4. Contacts, monitored by electromagnetic devices such as mechanical relays, shall be rated as NEMA ICS 2, designation B300.
   5. Double barriers provided between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.
   6. Switch electrical enclosures rated as NEMA 250, Type 4 minimum.
   7. Switch contacts located in Class I, Division 1 areas and monitored by solid-state circuits shall be made safe by intrinsic safety barriers as specified in Section 40 78 00 01.
   8. Switch range shall be selected so that the specified set point is at least 30% but not more than 70% of the span, between the upper range limit and the lower range limit.

C. Measuring elements and transmitters shall comply with the following requirements:
   1. Measured parameter output indicators complying with this section shall be provided with any transmitter that does not include an integral indicator. Indicators, whether integral or separate, shall be calibrated in process units, and engraved on the indicator scale plate.
   2. The two-wire type transmitters shall have operating power derived from the signal transmission circuit.
   3. Transmitters shall meet specified performance requirements with load variations within the range of 0 to 600 ohms with the power supply at a nominal 24 VDC with the default range of 0 to 100% linearly corresponding to 4 to 20 mA.
   4. Transmitter output shall increase with increasing measurement.
   5. Time constant shall be adjustable from 0.5 to 5.0 seconds for transmitters used for flow, level transmitters used for flow measurement, or pressure measurement.
   6. Transmitter output shall be galvanically isolated via electro-mechanical or optical technology.
   7. Transmitter enclosures shall be rated NEMA 250, Type 4, unless otherwise specified.
   8. Transmitters and analyzers located outdoors shall be provided with surge protectors:
      a. Signal: Emerson/Rosemount Model 470 D, Emerson/EDCO SS64-036-2, CCI SPN-42 FS28 Series, or approved equal.
      b. AC Power: UL 1449, LED indicator, screw terminal connections, NEMA 4X. EDCO HSP121A or approved equal.
   9. Two-wire transmitter located in a facility area classified as hazardous per the NFPA and the NEC shall be made safe by means of an intrinsic safety barrier as specified in this section.
   10. Four-wire transmitters shall be isolated from the process and power or provided with a loop-powered signal current isolator as specified in this sectionconnected in the output signal circuit.

2.03 PROCESS PARAMETER OUTPUT INDICATOR

A. Provide digital LED or LCD indicators that integral to the instrument housing where available from the manufacturer. Displays shall be scaled in engineering units, over the calibrated range of the instrument. Calibrate the indicator scale in process units.

B. Analog output indicators shall be 2.5" milli-ammeter with 90-degree movement enclosed in a NEMA 7/9 rated meter case. Provide indicators with accuracy within two percent of span. Provide a diode to maintain loop continuity for indicator removal.

2.04 INTRINSIC SAFETY BARRIERS

A. Intrinsic safety barriers for two-wire transmitters shall be of the active, isolating, loop powered type. Barrier shall be Measurement Technology LTD Type MT3042 or Stahl Series 9000, or approved equal.

2.05 SIGNAL CURRENT ISOLATOR

A. Isolator shall provide galvanic isolation of milliampere transmission signals from transmitters. Isolator shall be housed in a NEMA 250, Type 4/7 conduit body and derive operating power from the signal input circuit.

B. Input and output signals shall be 4 - 20 mA, and error shall not exceed 0.1% of span. Input resistance shall not exceed 550 ohms with an output load of 250 ohms.

C. Isolator shall be Moore Industries SCX 4-20madc to 4-20madc / 5.5VPL / -RF DIN rail mounted with maximum 250 ohm output impedance, or approved equal.

2.06 PRODUCT DATA

A. Additional Information: The following product data shall be provided:
   1. Flow calculation for each differential-type flow element.
   2. Record documentation shall include the data sheets specified in this section.

B. The following data provided in accordance with Section 01 33 00:
   1. Operating and maintenance information as specified in Section 40 61 13. Include final reviewed submittal and separate record of all final configuration, jumper, and switch settings for each instrument.
   2. Test results as specified in Section 40 61 21.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. General requirements for the installation of primary elements specified in this section are listed on INSTRUSPEC sheets.
   2. Installation requirements are specified in Section 40 61 13.

B. Process Connections:
   1. General: Unless otherwise specified, process taps shall comply with Section 40 05 01. Process connections shall be arranged such that instruments may be readily removed for maintenance without disruption of process units or draining of large tanks or vessels. Unions or flange connections shall be provided as necessary to permit removal without rotating equipment.
      a. Where process taps are not readily accessible from instrument locations, an isolation valve shall be provided at the instrument.
      b. Isolation valves shall be provided for each instrument where multiple instruments are connected to one process tap.
      c. Pipe between the process connection and instruments shall be 1/2" stainless steel with treatment material for easy removal, as specified herein.
   2. Safety Instruments: No valves shall be installed at pressure taps for safety instruments. Safety instruments shall not be connected to the same process tap as instruments used for control, indication, or recording except when annular chemical seals are used.
   3. Root Valves: Root valves shall be provided at all process taps, except as follows:
      a. Temperature taps, where valves are unnecessary.
      b. Pump discharge pressure taps where no instrument is permanently
      c. installed. Isolation valves shall be provided.
      d. Process taps for safety instruments.
      e. Where gauge valves are provided.
      f. Where chemical seals are used.
   4. Gauge Valves: Gauge valves shall be provided for each pressure gauge tap except where chemical seals are used.

C. Tubing:
   1. Tubing shall be installed on supports spaced not more than 3' apart and shall run parallel of perpendicular to walls structural members, or intersections of vertical planes and the ceiling. Unless otherwise shown, tubing shall follow building surfaces closely or shall be carried in trays or conduit.
   2. Tubing shall not be supported from piping or equipment except at process taps or connections to the device served. Tubes supported directly on concrete surfaces shall be spaced at least 1/8" from the concrete. Tubing support shall be one-hole malleable iron clamps with clamp backs as required. Bends shall be formed to uniform radii without flattening.
   3. Ends of tubing shall be square-cut and de-burred before installation in fittings. Fittings shall be used for splices, connections, and turns near final connections. Bulkhead fittings shall be used when tubing enters a panel.

D. Electrical Connections:
   1. Final connections between rigid raceway systems and instruments shall be made with jacketed flexible conduit with a maximum length of 2'.

3.02 TESTING

A. Applicable testing requirements are specified in Section 40 06 70.

B. Testing requirements are specified in Section 40 61 21.

3.03 PROCESS CONNECTIONS:

A. Process connection piping and tubing shall be tested in accordance with Section 40 05 01.

3.04 TRAINING

A. Training requirements are specified in Sections 01 79 00. Provide two training sessions, each with one-half hour for each type of level transmitter.

PART 4 APPENDIX - INSTRUSPECS

4.01 INSTRUSPECS

A. General requirements for instruments specified in this section are listed on INSTRUSPEC sheets herein. Application requirements are specified in the Instrument Index, and/or on the drawings.

Table A

INSTRUSPEC Symbol	Instrument description	Instrument function
TI	Temperature indicator	Temperature measurement
TMP	Temperature Transmitter	Temperature measurement
TRE	Resistance temperature insertion type RTD	Temperature measurement

4.02 INSTRUMENT IDENTIFICATION: TI

A. Instrument Function: Temperature measurement

B. Instrument Description: Temperature indicator

C. Power Supply: N/A

D. Signal Input: Process

E. Signal Output: N/A

F. Process Connection: 1/2-inch male NPT

G. Product Requirements: Temperature indicators shall be 4-1/2” gas pressure operated bourdon tube elements, 270-degree movement, phenolic case, shatterproof glass window, and 1/2" NPT process connection.

   Bulb shall be 3 inches long by 3/8” diameter for all ranges. Stem lengths shall be selected to place bulb in middle third of pipe. Indicator head shall be swivel mounted to the stem.

H. Temperature indicator manufacturer:
   1. Ashcroft Duratemp Type 600B, or equal.

I. Execution:
   1. Installation: Temperature instruments shall be installed in accordance with the manufacturer's instructions and the recommendations of API RP551 to the specified requirements.
   2. For pipelines less than 4” diameter, temperature elements shall be installed at a pipeline elbow if possible.
   3. Where an elbow is not available, a wye fitting shall be installed in the pipeline for installation of the temperature element at a 45-degree angle with the flow.

4.03 INSTRUMENT IDENTIFICATION: TMP

A. Instrument Function: Temperature Measurement

B. Instrument Description: Temperature Transmitter

C. Power Supply: As specified in this section

D. Signal Input: Process temperature monitored by RTD

E. Signal Output: Analog transmission signal as specified in this section

F. Process Connection: Integral or remote mounting to sensor and thermowell, as specified in Section 40 71 00.

G. Product Requirements:
   1. Temperature Transmitter: 2-wire device, powered from the PLC analog input power supply.
   2. Temperature Limits: 0 - 160°F.
   3. Humidity Limits: 0 - 100% RH.
   4. Accuracy: 0.25°F + 0.02% span, using 100 Ohm Platinum RTD.
   5. Output: One isolated 4-20 mA into a maximum of 600 ohms.
   6. Sensor update time: 0.5 seconds.
   7. Failure mode: Transmitter shall have a configurable failure mode to drive the analog signal either high (>21 mA) or low (<3.75 mA) in the event of microprocessor failure.
   8. Rating: NEMA 4X or as specified in 40 06 70 Instrument Index.
   9. Indicator: LCD display.
   10. Acceptable Manufacturers:
      a. Rosemount 3144P.
      b. Central Station Steam CSTMP Series.
      c. Or approved equal.

H. Execution:
   1. Installation: Install in accordance with manufacturer's instructions and the Engineer’s installation detail.

4.04 INSTRUMENT IDENTIFICATION: TRE

A. Instrument Function: Temperature measurement

B. Instrument Description: Resistance temperature detector element, inserting type

C. Power Supply: N/A

D. Signal Input: Process

E. Signal Output: 100 ohms nominal at 0 degrees C, resistance temperature coefficient of 0.385%/degree C

F. Process Connection: 1/2" male NPT

G. Product Requirements:
   1. Temperature element shall be tip sensitive, three- or four-wire platinum resistance temperature detector (RTD) in 1/4" ASTM A269, Type 316 stainless steel sheath with watertight connection head.
   2. Time constant in agitated water shall not exceed 8 seconds. RTD shall comply with ASTM E1137, tolerance Grade A
   3. RTDs for installation in wells shall be provided with spring loading device and union coupler. Union shall extend out beyond pipe lagging.
   4. Three- or four-wire lead configuration for ambient temperature compensation shall be provided. RTD extension cable conductors shall be shielded triads as specified in Division 26.
   5. Bushings and wells for temperature elements shall comply with ASME B40.200 and unless otherwise specified shall be machined from ASTM A276, Type 316 stainless steel bar stock. Union couplers shall be provided for all temperature elements.

H. Execution:
   1. Installation: Temperature elements shall be installed in accordance with the manufacturer's instructions.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 75 00

PROCESS LIQUID ANALYTICAL MEASUREMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies requirements for process fluid analyzer indicating transmitters.

1.02 REFERENCES

A. References shall be as specified in Section 40 61 13.

1.03 SUBMITTALS

A. Submittals shall be provided as specified in Sections 01 33 00 and 40 61 13, including:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Referenced and applicable sections to be marked up and submitted include:
   a. Section 01 79 00 – Demonstration and Training
   b. Section 01 78 23 – Operating and Maintenance Data
   c. Section 40 61 13 – Process Control System General Provisions
   d. Section 40 06 70 – Instrument Index

   A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation.

   The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. *Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.*

2. A copy of the contract document Control Diagrams and Process and Instrumentation Diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal.

   If no changes are required, the drawing or drawings shall be *marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.*

3. Marked Contract Document Mechanical and/or Electrical Plan drawings, sections, and details showing sensor installation locations and details. *Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.*

4. Marked product literature of all equipment and features to be provided.
    a. Installation drawings for only the analyzers, sensors, and mounting accessories to be provided.
    b. Electrical and signal connection drawings for only the analyzers and sensors to be provided.
5. List of miscellaneous items, cables, spare parts, replenishment parts, and chemicals that will be provided in accordance with INSTRUSPEC sheet requirements.
6. Marked product literature for surge protectors.

1.04 ENVIRONMENTAL CONDITIONS

A. Refer to Section 40 61 13.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the candidate manufacturers listed in the INSTRUSPEC sheets included in this Section are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section.

2.02 GENERAL

A. Process fluid analyzers shall comply with the following requirements:
    1. Measured parameter output indicators shall be calibrated in process engineering units.
    2. Two wire Analyzers shall be 4 to 20 mA output with operating power derived from the signal transmission circuit.
    3. Transmitter shall support an external load of 0 to 500 ohms with the power supply at a nominal 24 VDC with the range of 0 to 100% corresponding to 4 to 20 mA.
    4. Transmitter output shall be galvanically isolated from the process and the analyzer case.
    5. Analyzers located outdoors shall be provided with surge protectors.
        a. Signal: Emerson/Rosemount Model 470 D, Emerson/EDCO SS64-036-2, CCI SPN-42 FS28 Series, or accepted equal.
        b. AC Power: UL 1449, LED indicator, screw terminal connections, NEMA 4X. EDCO HSP121A or accepted equal.
    6. Transmitter output shall increase with increasing process measurement, except where specified as "reverse action" in the Instrument Index.
    7. Electrical parts of analyzer transmitter and/or primary element mechanisms shall housed in enclosures meeting NEMA 250, Type 4 requirements.
    8. Electrical equipment and analyzer transmitters located outdoors or in areas specified as corrosive shall have enclosures meeting NEMA 250, Type 4X requirements.
    9. Two-wire transmitters, located in a facility hazardous classified area per the NFPA and the NEC, shall be made safe by an intrinsic safety barrier.

10. Four-wire transmitters shall be isolated from the process and power or be provided with a loop-powered signal current isolatorand shall be connected in the output signal circuit.
11. One analyzer transmitter shall be provided for each sensor. Dual sensor analyzer capability shall not be utilized.

2.03 PRODUCT DATA

A. The following data shall be provided in accordance with Section 01 33 00:
   1. Operating and maintenance information as specified in Section 40 61 13. Include final reviewed submittal and separate record of all final configuration, jumper, and switch settings for each analyzer.
   2. Test results as specified in Section 40 61 21.

PART 3 EXECUTION

3.01 INSTALLATION

A. Installation requirements are specified in Section 40 61 13.

3.02 TESTING

A. Testing requirements are specified in Section 40 61 21.

3.03 TRAINING

A. Training requirements are specified in Sections 01 79 00 and 40 61 13. Provide two training sessions, each with one hour per type of analyzer.

3.04 INSTRUMENTATION SPECIFICATION (INSTRUSPEC) SHEETS

A. General requirements for instruments specified in this section are listed on INSTRUSPEC sheets herein. Application requirements are specified in the Instrument Index, Section 40 70 00, and/or on the drawings.

B. INSTRUSPEC sheets for the analyzers listed in the following Table A are included in this paragraph:

Table A: List of Process Fluid Analyzer Indicating Transmitters

INSTRUSPEC Symbol	Analyzer Description	Instrument Function
AC	Conductivity Analyzer	Analyzer Indicating Transmitter
SC	Streaming Current	Analyzer Indicating Transmitter
AH	Hydrogen-ion Analyzer (pH)	Analyzer Indicating Transmitter
PC	Particle Counter	Analyzer Indicating Transmitter
ATI	Optical Turbidimeter Analyzer	Analyzer Indicating Transmitter
CLR	Chlorine Residual Analyzer	Analyzer Indicating Transmitter
FL	Fluoride Analyzer	Analyzer Indicating Transmitter

3.05 AC INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: AC

B. Instrument Description: Conductivity Analyzer

C. Power Supply: 120 VAC

D. Signal Output:
   1. 4 to 20 mA into 0 to 500 ohms, isolated
   2. Two Form C relay outputs

E. Process Connection: Insertion

F. Product Requirements:
   1. Analyzer: Analyzer transmitter shall be pipe/surface mount, NEMA 4X with integral keypad/display and self-diagnostics, system FM approved for Class I Division 2 hazardous area. Unit shall be Invensys/Foxboro 875EC, Emerson/Rosemount 1066, or approved equal.
   2. Sensor: Conductivity measurement shall be made with an electrode-less sensor with epoxy or glass-filled polyetheretherketone (PEEK) encapsulated large bore toroidal sensor body with integral temperature sensor designed for immersion service water quality monitoring. Sensor shall be Invensys/Foxboro 871EC-EV, Emerson/Rosemount 226, or approved equal.
   3. Junction Box: Invensys/Foxboro 51052, Emerson/Rosemount 23550-00, or approved equal.
   4. Extension Cable: Invensys/Foxboro 6000130, Emerson/Rosemount 23294-04, or approved equal.
   5. Calibration Buffers: Two sets of two different conductivity buffers. Use one set for testing/calibration and training, second set for Owner.
   6. Insertion Mounting: Accessories as required for the installation specified on the drawings, provided by sensor Manufacturer.

G. Execution:
   1. Installation: Insertion assemblies shall be installed per Manufacturer instructions.

3.06 SC INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: SC

B. Instrument Description: Streaming Current monitor

C. Power Supply: 120 VAC

D. Signal Output:
   1. 4 to 20 mA into 0 to 500 ohms, isolated
   2. Two Form C relay outputs, minimum

E. Process Connection: ½ in BSP, flow-through

F. Product Requirements:
   1. Measure optimization of coagulation process in drinking water and shall be Hach AF7000, or approved equal.
   2. Operating Ranges:
      a. Humidity: Maximum relative humidity 95% for temperatures up to 122°F
      b. Temperature: 0 – 122°F at 95 relative humidity (non-condensing)
   3. Outputs:
      a. 4 – 20 mA, isolated, maximum load 500 ohms
      b. 2 SPST relays, 5 A, 30 VDC resistive loads
   4. Response time: 1 – 60 seconds, adjustable average
   5. Sample flow rate: 2 – 4 L/min, variable
   6. Sample temperature: 45 – 95°F
   7. Wetted materials: stainless steel, UHMW, epoxy
   8. Options: Parts and kit(s) necessary for auto flush and water connection (115 VAC)

G. Execution:
   1. Installation: Installed in accordance with the manufacturer's recommendation.
   2. Application/Calibration: In accordance with manufacturer's calibration procedures.
   3. Calibration: Calibrate with the Owner. Schedule Owner's Lab and maintenance personnel in advance with the Construction Manager.
   4. Manufacturer Services: One day per analyzer on-site, minimum two days.

3.07 AH INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: AH

B. Instrument Description: Hydrogen-ion Activity (pH) Analyzer

C. Power Supply: 120 VAC

D. Signal Output:
   1. One 4 to 20 mA per sensor, isolated
   2. Three Form-C relay outputs

E. Process Connection: Insertion

F. Product Requirements:
   1. Analyzer: Analyzer transmitter shall be pipe/surface mount, NEMA 4X with integral keypad/display and self-diagnostics, and shall be Hach SC4500, or approved equal.
   2. Sensor: pH measurement shall be made with a differential glass electrode, titanium ground electrode, integral preamplifier, 15 foot cable, and glass-filled polyetheretherketone (PEEK) body with 1" NPT threading on both ends. Sensor rated 100 psig, 10 fps flow with digital cable connection. Sensor shall be Hach DPD1P1, or approved equal.

3. Replenishment Parts: One salt bridge and one bottle of standard cell solution for each sensor/analyzer.
4. Junction Box: Hach / GLI 60A2053, or equal.
5. Extension Cable: Hach / GLI 1W1100, or equal.
6. Calibration Buffers: Two sets of each of pH 4 and 7 buffers. Use one set for testing/calibration and training, second set for Owner.
7. Mounting Accessories: Pipe insertion mounting kit or as required for the installation specified on the drawings, provided by sensor manufacturer

G. Execution:
1. Installation: Insertion assemblies shall be installed per manufacturer's instructions.
2. Application/Calibration: In accordance with manufacturer's recommendations.
3. Manufacturer services: Two hours per analyzer on-site, minimum one day.

3.08 PC INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: PC

B. Instrument Description: Particle Counter

C. Power Supply: 120 VAC

D. Signal Output:
1. RS485 with analog I/O
2. Three Form C relay outputs

E. Process Connection: ¼-inch OD tubing, flow-through design

F. Product Requirements:
1. Counter: Counter shall be surface mount, NEMA 4X, and shall be Hach 2200 PCX, or approved equal.
2. Sample Flow Rate: 100 mL/min
3. Operating Temperature: 0 – 122°F
4. Particle Size Range: 2 – 750 microns
5. Pressure Range: 55 psig continuous

G. Execution:
1. Installation: Counter shall be installed per manufacturer instructions.
2. Manufacturer services: Two hours per counter on-site, minimum one day.

3.09 ATI INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: ATI

B. Instrument Description: Optical Indicating Turbidimeter (ultra low range for potable water applications)

C. Power Supply: 120 VAC

D. Signal Output:
   1. 4 to 20 mA into 0 to 500 ohms, isolated
   2. Three Form C relay outputs

E. Process Connection: Input,1/4" NPT; output, 1/2" NPT

F. Product Requirements:
   1. Analyzer: Analyzer transmitter shall be pipe/surface mount, NEMA 4X with integral keypad/display and self-diagnostics, and shall be Hach SC200, or approved equal.
   2. Sensor:All optical and hydraulic components shall be housed in the turbidimeter body which shall incorporate a built-in bubble trap. 0 to 5 NTU range. Turbidimeter shall be Hach FilterTrak 660, or approved equal.
   3. Junction Box: Hach, or equal.
   4. Extension Cable: Hach 57962-00, or equal.
   5. Calibration Equipment: One Calibration Kit shall be provided consisting of a 1-liter calibration cylinder simulating the turbidimeter body and funnel, Hach 52364-00, or equal. One 1-liter calibration standard, 800 mNTU, Hach, or equal. One 1-liter verification standard, [100][300][500][5000] mNTU, Hach, or equal.

G. Execution:
   1. Installation: Installation shall be in accordance with the manufacturer's recommendations.
   2. Application/Calibration: Application, calibration, and set points shall be as specified in project documents.
   3. Manufacturer Services: Two hours per analyzer on-site, minimum one day.

3.10 CLR INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: CLR

B. Instrument Description: Chlorine Residual Analyzer

C. Power Supply: 120 VAC

D. Signal Output:
   1. 4 to 20 mA into 0 to 500 ohms, isolated
   2. Three relay outputs, configurable NO or NC

E. Process Connections: 1/2-inch NPT sample line; 1-1/4" drain line

F. Product Requirements:
   1. Analyzer: Analyzer transmitter shall be surface mount and shall be specific to free chlorine as specified.
   2. The sample-flow system shall be composed of plug-in components on a swing-out panel. It shall contain large ports throughout, grit bombardment of the measuring and counter electrodes, continuous metering of reagent chemicals and detergent into the sample, a self-cleaning main orifice and a solenoid valve for automatic back-flushing cycles.

3. A motor-driven impeller shall maintain a constant sample velocity at the measuring electrode. The reagent pump shall be a valve-less, peristaltic type with brushless stepping motor.
4. The analyzer's electronics shall be microprocessor-based with a touch key pad and alphanumeric display. Electronic components shall be housed in NEMA 4X enclosures.
5. Two security-coded menus shall give access to two levels of operation: a scrollable, informative operator's menu with easy change of operating parameters; and a supervisor's set-up menu with instructions and error messages to assure proper operation.
6. On-line and off-line diagnostics shall also be presented for servicing and calibration. The analyzer shall be easily reprogrammed for different measurement ranges.
7. Calibration accuracy shall be one percent of full scale; operating range shall be 40:1; and residual-measurement ranges shall be 0 – 10- mg/l.

G. Instrument Identification
1. Analyzer shall be Siemens/Wallace & Tiernan (W&T) Micro/2000.
2. Sensor:
a. Amperometric three electrode measuring cell. The measuring cell shall be of the flow-through type with three dissimilar metal electrodes which shall produce a signal proportional to chlorine residual.
b. The cell shall provide continuous on-line analysis of chlorine residual sensitive to one part per billion (.001 mg/l) and be capable of continuous feedback control of chlorine residual down to ten parts per billion (.01 mg/l). It shall not lose sensitivity due to extended periods of samples containing no chlorine.
3. Replacement Parts:
a. One sensor, W&T.
b. One preventive maintenance kit, W&T G2416.
4. Replenishment Parts: One bottle of electrolyte for each sensor/analyzer, W&T U28039.
5. Calibration Buffers:
a. One carton of four bottles of pH 4 reagant for each sensor/analyzer, W&T U13765.
b. Two bottles of potassium iodide for each sensor/analyzer for measuring total chlorine, W&T U23661.

H. Execution: Install and calibrate instrument in accordance with manufacturer’s recommendations.
1. Application/Calibration: In accordance with manufacturer’s recommendation. Owner will assist with calibration and provide hand-held test kit.
2. Manufacturer Services: Two hours per analyzer on-site, minimum one day.

3.11 FL INSTRUMENT SPECIFICATION SHEET–INSTRUSPEC

A. Instrument Identification: FL

B. Instrument Description: Fluoride Analyzer - Indicating Transmitter with continuous monitoring of fluoride concentration in drinking water using an ion selective electrode with replaceable tip.

C. Power Supply: 120 VAC

D. Accuracy: ±10% or ±0.10 mg/L, whichever is greater

E. Inlet Pressure: 1 – 10 psig

F. Detection Range: 0.1 – 10.0 mg/L fluoride

G. Sample Flow Rate: 200 – 500 mL/minute

H. Sample Temperature: 41 – 104°F

I. Operating Humidity: 90% at 140°F

J. Signal Outputs:
   1. 4 to 20 mA, isolated
   2. Selectable, 2 SPDT relays with contacts rated for 5 A resistive load at 230 VAC

K. Process Connections: Inlet, 1/4" OD tubing; Outlet, 1/2" ID flexible hose

L. Product Requirements:
   1. Analyzer shall be surface mount with integral keypad/display, auto calibration, and self-diagnostics. Analyzer shall be Hach CA610.
   2. Power Cable: 6' with North American plug; provided by manufacturer.

M. Execution: Installation shall be in accordance with the manufacturer's recommendations.
   1. Accessories:
      a. Maintenance kit
      b. Electrode kit
      c. Reagent set
   2. Application/Calibration: In accordance with manufacturer's recommendations.
   3. Calibration: Calibrate with the Owner. Schedule Owner's Lab and maintenance personnel in advance with the Construction Manager.
   4. Manufacturer Services: One day per analyzer on-site, minimum three days.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 78 00

PANEL MOUNTED INSTRUMENTS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies general requirements for universal case instruments which form a part of process control systems as specified in Division 40. Universal case instruments shall include complete assemblies of measuring, transmitting, control, indicating, and recording elements and accessories.

B. This section specifies requirements for panel mounted signal conditioning modules.

C. This section specifies requirements for panel mounted electronic instruments used to provide process control and interface between the operator and the process.

D. This section specifies requirements for miscellaneous panel mounted instruments used to provide process control and interface between the operator and the process.

E. Definitions:

1. Large Case Instruments: Large case instruments shall be nominally 18" high by 14" wide by 6" deep and capable of mounting one to four pressure or temperature elements and a 12" circular chart recording mechanism.
2. Medium Case Instruments: Medium case instruments shall be nominally 12" high by 10" wide by 6" deep and capable of mounting one measuring element, an eccentric scale indicator, and output functions as specified.
3. Circular Case Instruments: Circular case instruments shall accommodate one measuring element, a 6" concentric scale indicator, and electric contact control functions as specified.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/ISA S51.1	Process Instrumentation Terminology
SAMA PMC6-10-63	Filled System Thermometers, 2nd edition
NEMA 250	Enclosures for Electrical Equipment
NFPA 70	National Electrical Code (NEC)
UL 1012	Power Supplies
EIA RS-310C	Racks, Panels, and Associated Equipment

1.03 PLANT ELECTRICAL SUPPLY SYSTEM

A. Electric power for instrumentation and communication systems shall be obtained from the power distribution system specified in Division 26. This power is not regulated, wave forms may be distorted, and significant amounts of electrical noise may be present. The Contractor shall provide all necessary power supply and conditioning equipment to provide electrical power of the required voltages and current capacities and of adequate quality to ensure reliable operation of the instrumentation and communication systems. Unless otherwise specified, the Contractor shall assume that the power supply for instrumentation systems is 120VAC, ±15%, 60 Hz, ± 3 Hz, 5% maximum harmonic distortion.

1.04 SUBMITTALS

A. Submittals shall be provided as specified in Section 40 61 13.01.

PART 2 PRODUCTS

2.01 INSTRUMENTATION SPECIFICATION (INSTRUSPEC) SHEETS

A. General requirements for instruments specified in this section and are listed on INSTRUSPEC sheets in the appendix to this section. Application requirements are specified in project documentation.

2.02 MINIATURE CASE INSTRUMENTS

A. Unless otherwise specified, panel instruments shall comply with the following requirements:
   1. Analog instruments shall be miniature-case drawout type nominally 6” H x 3” W by not more than 20” D.
   2. Operator, tuning, and configuration adjustments shall be accessible without disconnecting the instrument from the process.
   3. Analog signal indicators shall be solid-state, LED or gas-discharge type, bar-graph displays with not less than 200 segments.
   4. Analog signal inputs shall be 1 – 5VDC into not less than 250K ohms.
   5. Analog signal outputs shall be 1 – 5VDC into 10 ohms except where instrument provides final output signal to field in which case output shall be 4 - 20 mA current regulated into 0 to 600 ohms.
   6. Power supply shall be 24VDC, ±10%.
   7. Signal and power supply connections shall be galvanically isolated from the instrument case.

B. Panel instruments specified in this section shall be the product of a single manufacturer, and shall match and line up to form an integrated appearance and operator interface strategy.

2.03 UNIVERSAL CASE INSTRUMENTS

A. Cases
   1. Cases shall be nonmetallic weather and corrosion resistant types. Windows shall be shatterproof glass or Lexon plastic.

B. Measuring Elements
   1. General: Measuring elements shall include internal and/or external components as specified to produce linkage motion within the instrument case which is indicative of the measured variable.
   2. Pressure: Pressure elements shall be bellows or helicals as applicable for the specified range. Unless otherwise specified wetted materials shall be type 316 stainless steel for liquids and process gasses, and brass for instrument air and oxygen.
   3. Temperature: Temperature elements shall be SAMA PMC6-10, Type 1A. Capillary tubing and bulbs shall be type 316 stainless steel, and tubing shall be armored.
   4. Differential Pressure Unit: Differential pressure elements shall be American Meter Dri-Flo, Barton 199, or approved equal, for specified spans ≤50 psid. Differential pressure elements shall be Barton 224, Meriam 1020, or approved equal, for specified spans ≥ 50 psid.
   5. Electronic: Measurement system shall be a self-balancing servo-potentiometer with solid state electronics. Balancing system shall be step-less, utilizing noncontact or conductive plastic feedback potentiometer. Error shall not exceed 0.25% of span and deadband hysteresis shall not exceed 0.1% of span. Servo shall accept thermocouple, resistance temperature, and electronic transmission signals as specified.

C. Output Functions
   1. Current Transmission: Transmitter shall be two-wire motion-balance current-regulator type capable of driving 0 to 400Ω with a loop power supply of 24VDC. Error, including measuring element and linkages, shall not exceed 0.5% of span.
   2. Integration: Integrator shall be a mechanical type with eight-digit nonreset cyclometer. Cam cycle shall not exceed 15 seconds. Error, including measuring element and linkages shall not exceed 0.5% of span.
   3. Recorder: Recorder shall be 12-inch circular chart type with 120VAC, 60 Hz drive and capillary inking system. Chart rotation shall be 24-hour unless otherwise specified.
   4. Pneumatic Transmission: Pneumatic transmitter shall be 3 - 15 psig output motion-balance type with air delivery capacity of not less than 1.5 scfm and error, including measuring element and linkages not to exceed 0.5% of span.

5. Pneumatic Control: Pneumatic controller shall be of the motion-balance type with modes as indicated and 3 - 15 psig, 1.5 scfm minimum output. Control modes shall be as defined in ISA S51.1. Controller output shall be readily reversible without additional parts or necessitating realignment. Controllers shall be provided with a four-position (bumpless transfer type) manual/automatic transfer valve, supply gage, manual regulator, and output gage. Proportional action gain shall be continuously adjustable 0.2 - 50; integral and derivative time constants shall be adjustable from 0.2 - 30 minutes except when fast response is specified where 0.02 - 5 minutes adjustment range shall be provided. When specified, antireset wind-up is specified, relays and pneumatic circuitry shall be provided to eliminate the effect of reset wind-up when the process variable remains off set point for an extended period.
6. Electric Contacts: Electric contacts shall be provided as specified. Actuation point error shall not exceed 0.5% of span. Process switches and devices shall comply with the following requirements:
    a. Contact outputs used for alarm actuation shall be normally-closed or normally-opened as required by the process condition to open to initiate the alarm.
    b. Contact outputs used to control equipment shall be normally-opened and shall close to start the equipment.
    c. Contacts monitored by solid state equipment such as programmable controllers or annunciators shall be hermetically sealed and rated for switching currents from 20 - 100 mA at 24VDC.
    d. Contacts, monitored by electromagnetic devices such as mechanical relays, shall be rated as NEMA ICS 2, designation B300.
    e. Double barriers provided between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.
    f. Switch electrical enclosures rated as NEMA 250, Type 4 minimum.
    g. Switch contacts located in Class I, Division 1 areas and monitored by solid-state circuits shall be made safe by intrinsic safety barriers.
    h. Switch range shall be selected so that the specified set point is at least 30% but not more than 70% of the span, between the upper range limit and the lower range limit.

2.04 SIGNAL CONDITIONING MODULES (FUNCTION MODULES):

A. Unless otherwise specified, signal conditioning modules shall comply with the following requirements:
    1. Analog signal inputs shall be 1 – 5VDC into 20 MΩ.
    2. Analog signal outputs shall be 1 – 5VDC into 20 kΩ.
    3. Discrete output contacts shall be SPDT rated 5A at 120VAC and 28VDC.
    4. Power supply shall be 24VDC, ±10%. Power supply effect shall not exceed 0.005% per 1.0%.
    5. Electronic trips shall be arranged so that output contact opens in case of loss of signal or loss of power supply.
    6. Signal and power supply terminals shall be galvanically isolated from the card cage frame.
    7. DIN-rail mounted

2.05 PRODUCT DATA

A. The following data shall be provided in accordance with Section 01 33 00:
   1. Data specified in Section 40 61 13-2.03.
   2. Test results as specified in Section 40 06 70-3.02 Installed Equipment – Tests and Inspection.
   3. Catalog data including performance parameters.
   4. Wiring diagrams.
   5. Applicable operation and maintenance information as specified in Section 01 78 23.

PART 3 EXECUTION

3.01 INSTALLATION

A. Installation requirements are specified in Division 40.

B. Mount and connect instruments furnished in this section in accordance with manufacturer's instructions to the specified functional requirements.

3.02 TESTING

A. Testing requirements are specified in Division 40.

PART 4 APPENDIX INSTRUSPEC SHEETS

4.01 INSTRUSPECS

A. Table A, which follows, is edited to reflect only those instrument components which are identified in the instrument index. INSTRUSPECS are categorized generally according to function within the process system. Each sheet has an identifying symbol which should be used in the instrument index to reference the particular instruments required. Table A lists in alphabetical order by instrument identification coding the various instruments specified together with instrument function and instrument description.

Table A

INSTRUSPEC symbol	Instrument description	Instrument function
YPC	Potentiometer converter	Function module
ISS	Solid state indicator	Miscellaneous panel instrument

4.02 FUNCTION MODULE

A. Instrument Identification: YPC
   1. Instrument Function: Function module
   2. Instrument Description: Potentiometer converter
   3. Power Supply: 24VDC
   4. Signal Input: N/A
   5. Signal Output: Standard panel instrument voltage signal
   6. Process Connection: N/A
   7. Product Requirements: Potentiometer shall provide constant current slidewire excitation. Span shall be adjustable from 80 - 100% of slidewire travel; zero shall be adjustable from 0 - 10% of slidewire travel. Excitation current shall not exceed 1 mA for 1000Ω slidewires. Accuracy shall be 0.1% of span or better, time constant 50 milliseconds or less, temperature drift 0.02% of span per ºC or less over a range of 0 - 50ºC. Power supply effect shall not exceed 0.1% of span with power supplies provided. Module shall be Moore Industries, AGM Electronics, or equal.
   8. Execution: As specified in Part 3 of this section.

4.03 MISCELLANEOUS PANEL INSTRUMENTS

A. Instrument Identification: ISS
   1. Instrument Type: Miscellaneous panel instrument
   2. Instrument Description: Solid state indicator
   3. Power Input: 120VAC
   4. Signal Input: 4 – 20 mA or 1 – 5V, 10Ω minimum, 700Ω maximum loop resistance
   5. Signal Output: 4 – 20 mA
   6. Relays: 2 Form C (SPDT) rated 3A at 30VDC or 3A at 250VAC resistive load
   7. Power Supply: 24VDC
   8. Process Connection: N/A

9. Product Requirements: Indicator shall be housed in 1/8-DIN enclosure, NEMA 4X front, field programmable to accept voltage or current inputs, adjustable display brightness, 4 x 0.5" high red LED digits.
10. Execution: As specified in Part 3 of this section.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 40 79 00

MISCELLANEOUS INSTRUMENTS, CALIBRATION EQUIPMENT, INSTRUMENT VALVES, AND FITTINGS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies requirements for instrument air supply equipment and pneumatic signal transmission systems and accessories. Additional requirements for mechanical equipment and piping are specified in Divisions 23, 40, 41, 43, and 46.

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASME SECTION VIII	Boiler and Pressure Code, Pressure Vessels
ASTM B68	Seamless Copper Tube, Bright Annealed
ASTM D883	Definition of Terms Relating to Plastics
ASTM D1248	Polyethylene Plastics Molding and Extrusion Materials
ISA S7.3	Quality Standard for Instrument Air

1.03 SUBMITTALS:

A. The following information shall be submitted in accordance with Section 01 33 00:
   1. Catalog and technical data for instrument air compressor system.
   2. Outline dimensions, weight, and foundation requirements for instrument air compressor system.

PART 2 PRODUCTS

2.01 INSTRUMENT AIR COMPRESSOR SYSTEM

A. General:

1. Air compressor system shall consist of a skid assembly with the following listed components prepiped and wired to provide a complete and operable air supply system to provide instrument quality air between 60 and 75 psig in compliance with ISA S7.3. Each air compressor shall have a continuous duty capacity rating of not less than two times the air supply requirements of the instrumentation and control system including final elements.
    a. Two nonlubricated air compressors with electric motors.
    b. Air cooled aftercooler.
    c. ASME receiver with automatic drain.
    d. Dry-type intake-air filter.
    e. Moisture separator with automatic trap.
    f. Dryer.
    g. Complete control and protection package.
2. Air compressor system shall be Corken International Corporation A-90 series, or equal. Engineer knows of no equal.

B. Compressors:

1. Each compressor shall be single stage, single acting, vertical reciprocating type, requiring no lubrication in the compression cylinder(s) or valve area, and utilizing a distance-piece, cross-head, and cross-head guide between the crankcase and cylinder(s). Cylinder(s) shall be provided with two sets of self-lubricating seals on the piston rod(s). The distance piece design shall be such that no portion of the piston rod(s) which enters the crankcase and cross-head guide may alternately enter the compression cylinder(s).
2. The piston(s) shall be designed to be removable from the cylinder(s) and piston rod(s) without disturbing the cylinder(s), and shall be equipped with one-piece glass-filled self-lubricating Teflon piston rings. Rider rings are not acceptable.
3. The crankcase shall be of the atmospheric type, totally enclosed with a breather valve to prevent the entrance of foreign matter. It shall include a force-feed lubrication system for lubricating the crankshaft bearings, connecting rod bearings, wrist pins, and cross head through rifle-drilled crankshaft and connecting rod(s).

C. Motors:

1. Motors shall comply with Section 43 05 21-2.04.

D. Receiver:

1. Receiver shall be fabricated from carbon steel, shall be fitted with pressure-type handholes, and semi-elliptical pressure heads. Tank shall be provided with threaded bosses for inlet, outlet, and gage connection fitted with gauge, 1-inch drain connection fitted with an automatic drain device, and safety valve connection fitted with approved safety valve. Tank interior shall be protected with a baked marine epoxy coating, factory applied after fabrication. The coating shall be applied in two coats and shall be free of pinholes and thin spots.

2. Receiver shall meet the requirements of Section VIII, Division 1 or Division 2 of the ASME Boiler Code; and shall bear an ASME inspector's stamp, complete with design working pressure, date, and place of manufacture.

E. Control and Monitoring Equipment:
   1. Compressor system shall be provided with an automatic pressure control and monitoring panel, complete except for motor starters. Control and monitoring panel shall provide the following features:
      a. Lead/follow selector switch.
      b. Lead/follow and start/stop controls with mode selector.
      c. Individual alarm annunciators for low oil level, high discharge temperature, low receiver pressure, and dryer failure with one normally closed common contact for connection to remote monitoring equipment.
   2. Receiver shall be fitted with a pressure governor and gauge complying with the requirements of Section 40 73 00.

2.02 AIR SETS

A. Air sets shall consist of service regulator and 10 micron filter of capacity to serve 200 percent of the connected instrument or final element load. Air sets for individual field mounted instruments shall be nonadjustable or otherwise sealed to prevent tampering, shall be provided with 2-inch gage, and shall be Conoflow FH-60, Fairchild-Hiller 61112GF, or equal. Air sets for panels shall be adjustable with 3-1/2-inch or larger gage and shall be Conoflow-FH-60, Fairchild-Hiller 65232GF, or equal.

2.03 AIR SUPPLY PIPING, FITTINGS AND VALVES

A. Piping, fittings and valves shall comply with Section 40 05 01, System 2. Minimum pipe size shall be 3/8 inch for individual instrument supply connections and 1/2 inch for multiple instruments or panels with pneumatic instruments. Larger size piping shall be provided where specified.

2.04 SIGNAL PIPING, FITTINGS AND VALVES

A. Copper Tubing:
   1. Signal tubing shall be ASTM B68 DHP soft annealed copper with an ASTM D883 PVC jacket. Tubing shall be 1/4-inch O.D. by 0.03-inch wall or 3/8-inch O.D. by 0.032-inch wall as specified.

B. Stainless Steel Tubing:
   1. Tubing shall be seamless annealed ASTM A269 Type 316 stainless steel 1/2-inch and 3/8-inch tubing shall have a wall thickness of 0.035 inches and 1/4-inch tubing shall have a wall thickness of 0.028 inches.

C. Plastic Tubing:
   1. Tubing shall be extruded from high molecular weight, low density polyethylene compound. Tubing shall be 1/4-inch outside diameter and shall be black, unless otherwise specified or shown. Tubing shall meet the standard ASTM #D-1693 test for stress cracking of base materials. Wall thickness shall be 0.040 inches plus or minus 0.005 inches. Maximum working pressure shall be 80 psig, at 100 degrees F, or higher.
   2. Tubing manufacturers: Dekoron "P", Parker Hannifin "E", or equal.

D. Plastic Tubing:
   1. Plastic tubing shall be high molecular weight virgin polyethylene in accordance with ASTM D1248, Type III, Class C, Grade 3 with 0.04 inch minimum wall thickness.

E. Tubing Fittings:
   1. Tubing fittings shall be Type 316 stainless steel and shall be the double-ferrule swage type. Flare, ball sleeve compression or single-ferrule swage type are not acceptable.
   2. Fitting manufactures: Crawford "Swagelok", Hoke "Gyrolok", or equal.

F. Fittings:
   1. Fittings shall be Type 316 stainless steel. Fittings shall be of the swage ferrule design and shall have components (nut, body and ferrule system) interchangeable with those of at least one other manufacturer. Flare and ball sleeve compression type fittings are not acceptable. Fittings shall be Parker CPI, Crawford Swagelok, Hoke Gyrolok, or equal.

2.05 VALVES

A. Isolation Valves:
   1. Valves shall be full port ball valves with ASTM A276, Type 316 stainless steel trim and body and with Teflon seats and packing. Valves shall be Parker CPI, Whitey, Hoke, or equal.

B. Gage Valves:
   1. Gage valves shall be machined from ASTM A276, Type 316 stainless steel bar stock and shall be provided with 1/2-inch NPT connections and integral bleed plug. Valves shall be Anderson, Greenwood & Company M9 VIS-44, Hoke 6801L8Y, or equal.

C. Root Valves:
   1. Root valves shall be ASTM A276, Type 316 stainless steel bar stock with 1/2-inch NPT male process connection and three 1/2-inch NPT female instrument connections. One instrument connection shall be provided with an ASTM A276, Type 316 stainless steel bleed valve. ASTM A276, Type 316 stainless steel plugs shall be provided for unused ports.
   2. Lagging type units shall be provided for insulated vessels and pipes.
   3. Root valve manufactures: Anderson, Greenwood & Company M5 VIS-44, Hoke 6802L8Y, or equal.

D. Manifolds:
   1. Manifolds shall be three-valve bar-stock type. Manifold body shall be machined from ASTM Type 316 stainless steel bar stock. Valves shall be globe configuration with 316 stainless steel ball seats and Teflon stem packing.
   2. Manifolds shall be designed for direct mounting to differential pressure transmitters in place of the flanges normally furnished. Fabricated manifolds or manifolds employing needle or soft seat valves are not acceptable. Purge taps, 1/8-inch NPT shall be furnished on manifolds where water purge is specified.
   3. Manifold manufacturers: Anderson Greenwood AX3T VIS-4, Hoke GP831211F8YL, or equal.

2.06 CHEMICAL SEALS

A. Diaphragm Seals – Chemical Service:
   1. Seal shall be the diaphragm type with flushing connection, Type 316 stainless steel body and Type 316L diaphragm unless otherwise specified. Wetted materials shall be submitted with proof of compatibility with the chemical service.
   2. Diaphragm seal manufactures: Ametek U.S. Gauge/Mansfield and Green Type SG, Ashcroft Type 101, or equal.

B. Diaphragm Seals – Pressure Service 15 psig and Lower:
   1. Seal shall be the diaphragm type with flushing connection, Type 316 stainless steel body and Elastomer diaphragm unless otherwise specified. Wetted materials shall be submitted to be compatible with the chemical service.
   2. Diaphragm seal manufactures: Ametek U.S. Gauge/Mansfield and Green Type L, Ashcroft Type 741, or equal.

C. Diaphragm Seals – Chlorine or Sodium Hypochlorite Service:
   1. Seal shall be the diaphragm type with flushing connection, Hastelloy C, Monel, or Tantalum body and diaphragm unless otherwise specified.
   2. Diaphragm seal manufactures: Ametek U.S. Gauge/Mansfield and Green Type SG, Type L for low pressure, Ashcroft Type 201, Type 741 for low pressure, or equal.

D. Diaphragm Seals – General:
   1. Provide ½" process and instrument connections. Provide 316 stainless steel reducer for instrument connection if required.
   2. Provide seal flushing connection Type 316 stainless steel interconnecting fitting, and flush valve per Paragraph 2.05 A.

E. Annular Seals:
   1. Seal shall be the in-line full stream captive sensing liquid type. Metallic wetted parts shall be Type 316 stainless steel. Flexible cylinder shall be Buna-N unless otherwise specified. Seals shall be rated 200 psig with not more than 5-inch water column (WC) hysteresis.
   2. Annular seal manufactures: OPW Engineered Systems/Ronningen-Petter Iso-Ring, Red Valve series 40, or equal.

F. Fill Fluid:
   1. Chemical seals and associated instruments shall be factory filled as follows:
      a. Instrument side of seal, capillary tubing, and instrument shall be evacuated to an absolute pressure of 1.0 Torr or less; filled; and sealed. Provide silicone oil fill fluid, halocarbon fill fluid for chlorine applications, unless otherwise recommended by the seal manufacturer.
      b. Chemical seal manufacture: Dow Corning DC200, Syltherm 800, or equal.

2.07 PURGE ASSEMBLIES

A. The purge assembly for air or water for flushing seals on sludge level measurement applications with a choice of Buna, Viton, Etylene Propylene O-Rings.

B. Air:
   1. Air purge assembly shall consist of a constant-differential relay, needle valve, check valve and 0.2 to 2.0 standard cubic feet per hour rotameter.
   2. Assembly manufacturer: ABB Purgemaster Series 10A6100, or equal.

C. Water:
   1. Water purge assembly shall consist of a strainer, constant-differential regulator, needle valve, check valve, and 20 to 200 cc/m rotameter. Provide 155 micron wye-type strainer.
   2. Strainer manufacturer: ASCO 8600A2, Crane, or equal.
   3. Assembly manufacturer: ABB Purgemaster Series 10A6100, or equal.

2.08 PRODUCT DATA

A. Applicable operating and maintenance information shall be provided in accordance with Section 01 33 00 as specified in Section 01 78 23.

PART 3 EXECUTION

3.01 INSTRUMENT AIR COMPRESSOR SYSTEM

A. Instrument air compressor system shall be installed and tested as specified in accordance with the manufacturer's instructions.

3.02 INSTRUMENT AIR PIPING

A. Instrument air piping shall be installed and tested as specified in Section 40 05 01. Taps to instrument air headers shall be made on the top of the header and provided with an isolation valve. An additional isolation valve and air set shall be provided at each instrument or panel requiring instrument air.

3.03 PNEUMATIC SIGNAL PIPING

A. Signal tubing shall be 1/4-inch copper unless otherwise specified. Tubing for control air to pneumatic actuators shall be 3/8-inch copper. Copper tubing shall be supported at intervals not to exceed 3 feet. Plastic tubing shall be used only where specifically specified and shall be continuously supported in trays or conduits provided as specified in Division 26. Tubing shall be run parallel or perpendicular to walls and structural members. Signal tubing shall follow building surfaces closely unless carried in trays or conduit. Tubing supported directly from concrete or concrete block surfaces shall be spaced at least 1/8 inch from said surface by the use of suitable clamp backs.

B. Bends shall be formed to uniform radii without flattening the tube. Ends of tubing shall be square-cut and cleaned before being inserted into fittings. Compression fittings shall be used for splices, turns, and connections near instruments. Bulkhead assemblies shall be provided for termination of field tubing on panels.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 41 22 13.13

BRIDGE CRANES AND HOISTS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope

1. This Section specifies an electrically operated bridge crane system complete with hoist, trolley, bridge, end trucks, and associated drive units and controls, for installation above the Clearwell (Area 70).

B. Type

1. Bridge crane shall be single girder top-running type mounted on individual drive end trucks designed to travel on ASCE runway rails, with underhung heavy-duty wire rope hoist and four-wheel trolley, equipped for electric lift and travel in both directions, with pendant control. All motor controller drives shall be adjustable speed type.

C. Equipment List

1. Equipment numbers are as follows:

Item	Equipment No.
Clearwell Bridge Crane	TBD

1.02 QUALITY ASSURANCE

A. Reference Standards

1. This Section incorporates by reference the latest revisions of the following documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). They are part of this Section. In case of conflict between the requirements of this Section and the listed documents, the Contractor shall point out the conflict to the Construction Manager; lacking a definitive answer otherwise, the requirements of the Contract Specifications shall prevail.

Reference	Title
AISC 360-16	Specifications for the Design, Fabrication, and Erection of Structural Steel for Buildings
AGMA	American Gear Manufacturers Association
ASME B30.10	Hooks
ASME B30.11	Monorails and Underhung Cranes
ASME B30.16	Overhead Hoists (Underhung)
ASME B30.17	Overhead and Gantry Cranes (Top Running Bridge, Single Girder, Underhung Hoist)
ASME HST-4	Performance Standard for Electric Wire Rope Hoists
ASTM A36	Standard Specification for Carbon Structural Steel
ASTM A992	Standard Specification for Structural Steel Shapes
HMI	Hoist Manufacturer's Institute
CMAA 70	Specifications for Top Running Bridge & Gantry Type Multiple Girder Electric Overhead Traveling Cranes

Reference	Title
CMAA 74	Specification for Top Running and Under Running Single Girder Electric Overhead Travelling Cranes Utilizing Under Running Trolley Hoist
NFPA 70	National Electric Code
ASME	American Society of Mechanical Engineers
CMAA	Crane Manufacturers Association of America
NEMA	National Electrical Manufacturers Association
OSHA	Occupational Safety and Health Administration
UL	Underwriters Laboratories

2. All equipment furnished under this Section shall comply in all respects with the requirements of OSHA, the standards of the Crane Manufacturer's Association of America (CMAA), the Hoist Manufacturer's Institute (HMI), ANSI/ASME HST-4 Performance Standards for Electric Wire Rope Hoists, and the National Electric Code (NFPA 70).

B. Unit Responsibility

1. The Contractor shall assign unit responsibility as specified in paragraph 43 05 11-1.02C to the bridge crane manufacturer for all equipment specified in this Section. The crane manufacturer is the unit responsibility manufacturer and has unit responsibility, as defined in Section 43 05 11, for the equipment specified in this Section. A completed and signed certificate of unit responsibility (Form 43 05 11-C, Section 01 99 90) shall be submitted as specified herein.

C. Factory Tests:

1. Manufacturer shall test the equipment in accordance with industry standards and federal regulations prior to shipment of the equipment. Crane, trolley, and hoist shall be completely assembled and no load run tested in the factory prior to shipment to the job site. Crane shall be disassembled to the least amount possible for shipment. Certification of the factory test results shall be provided as specified herein.

1.03 SUBMITTALS

A. Submittals shall comply with the requirements of Section 01 33 00. Submittals shall include the following information.

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.Completed Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts unit responsibility, in accordance with the requirements of this Section. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
2. Manufacturer's catalog data confirming rated capacity, equipment speeds, motor horsepower, electrical requirements, and component sizes and dimensions.
3. Bridge crane shop drawings showing physical details, dimensions of the bridge crane, and hoist equipment, details of construction for crane installation, and all information listed in this Section.
4. Runway beam design calculations. Loads to the building frame structure shall be provided in calculations. Calculations shall be stamped by a Utah registered structural engineer.
5. Anchor bolt calculations in accordance with Section 05 05 20.
6. Motor data.
7. Electrical diagrams and schematics.

1.04 PEFORMANCE REQUIREMENTS

A. Service Conditions

1. Bridge crane will be used to lift and maintain process equipment and related components for occasional maintenance.
2. Bridge crane will be installed above the Clearwell area (Area 70).
3. Environmental conditions are described in Section 01 11 80.
4. Electrical equipment, supports, and anchorage shall be designed and installed in accordance with the seismic design requirements specified in Section 01 73 24.
5. Except as noted, bridge crane shall be CMAA Class C. Bridge drive shall be CMAA Type A4. A heavy-duty hoist shall be suspended from the trolley.
6. Operating and dimensional data are specified in paragraph 41 22 13.13 1.04B.

7. Runway beams, rails, and bridge beams shall be as specified in this Section. Runway beams shall be complete with connections to the building structural system, splices, and crane stops, and shall be furnished by the crane manufacturer. Runway beam minimum size is shown on the Drawings. All beams shall be designed by a structural engineer registered in the State of Utah.
8. Hook approach distances shall be as shown on the Drawings.
9. Vertical Impact: An impact allowance shall be included in design calculations for trolleys, cranes and runways. The impact allowance shall be ½ percent of the rated load for each foot per minute of hoisting speed with a minimum allowance of 15 percent and a maximum allowance of 50 percent.
10. The Contractor shall examine the drawings for interferences and obstructions which might impose additional limitations upon the equipment.

B. Operating and Dimensional Data

Item	Value
Rated capacity, tons	7.5
Runway span, feet-inches	57'-8"
Runway length, feet-inches	80'-0"
Elevation of hook in highest position[a], minimum, feet	Per Drawings
Vertical lift, feet-inches	14'-0"
Speeds, fpm, infinitely variable[b]:	
Hoist	3.2 to 20.0
Bridge (travelling)	65 ft/min
Trolley (traversing)	100 ft/min
Motors[c]	Per CMAA and HMI Duty Class

Notes:

a. Actual hook position shall be the elevation required to lift and move blower equipment between clear space at roll up door and the installed locations.

b. Motors shall be controlled by adjustable frequency drives.

c. See Section 43 05 21.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Bridge cranes and hoists shall be KoneCranes, Stahl, R&M Materials Handling, American Equipment or equal, modified to provide the specified features. All products specified herein shall be provided by a single supplier.

2.02 MATERIALS

Component	Material
Runway beams	Steel, ASTM A992
Bridge beams and trolley	Steel, ASTM A992
Hoist gearing, trolley wheels, end truck wheels, hook	Steel
Wire rope	Steel

2.03 EQUIPMENT FEATURES

A. Runway Beams and Rails:

1. Runways shall be straight, parallel, and level and specially designed for this application. At full load, the runway beams shall be designed for a maximum deflection of 1/600 of span. Runway rails shall be selected for proper loading, and shall be ASCE 30# minimum. Runways shall be provided with bolted end stops.

B. Runway Supports:

1. Anchor bolts and clamps shall be provided to secure runway rails. Provide lateral bracing to walls for runways as recommended by manufacturer.

C. Bridge Beam:

1. The crane bridge assembly shall be a top-running, single girder bridge beam, electrically driven. The bridge beam shall be rigidly attached to end trucks and serve as the hoist runway. Permanent stops shall be provided to prevent trolley overrun. At full load, the bridge beam shall be designed for a maximum deflection of 1/800 of span.

D. End Trucks:

1. The bridge crane end trucks shall carry the rated load between the end truck wheels while the rated load is lifted at one end of the crane bridge. End truck wheel bases shall be 1/8 of the span. The crane and trucks shall contain diaphragm members welded to truck frames to maintain alignment and distribute truck loads on the inner and outer truck members.
2. An impact absorbing rubber bumper shall be mounted on each end of the end trucks. Rail sweeps shall be provided. Safety lugs shall be provided to limit drop of the end trucks to 1 inch or less in the event of wheel or axle failure.
3. Wheel bearings shall be roller type with life time lubrication, fitted with seals to exclude dust and moisture, and provided with a suitable reservoir of lubricant to eliminate the need for field lubrication.
4. Crane wheels shall be steel with flat tread surfaces hardened to 280 Brinell minimum. Wheel treads shall be smooth, true, and uniform within 0.01-inch tread diameter on all wheels. Wheel mounting shall be designed so that axles and wheels can be removed without disturbing other truck elements of their alignment.

E. Bridge Drive:

1. Bridge drive shall be CMAA Type A4. Bridge motors and drives shall be as specified in Paragraph 41 22 13.13-2.03H. The motors shall be provided with cushion start and controller for smooth travel and load control. The motors shall drive the bridge through gear reducers. Gear reducers shall be enclosed heavy-duty helical, or spur gear type, of a self-lubricating design, with anti-friction bearings. The drive shafts shall provide synchronous drive from the gear reduction units to both end trucks. Both motorized trolley wheels shall be driven simultaneously. Brakes shall be solenoid actuated. The crane drive shall include integrally mounted spring set electrically released AC or DC rectified disc brake.

F. Trolley:

1. The trolley shall be a four-wheel motorized assembly designed for under running hoist application. The trolley shall be framed by a structural shape welded into a stable assembly for proper wheel and bearing alignment. Trolley bumpers shall be provided. The trolley assembly shall be supported by trolley wheels with flat tread surfaces. The wheel tread shall be accurately machined to assure concentricity of axle and tread, and hardened to 280 Brinell minimum. Wheels shall be mounted on permanently lubricated anti-friction bearings. Bearings must have a minimum B-10 life of 10,000 hours. Trolley motor and drive shall be as specified in this Section. The motor shall be provided with cushion start and controller for smooth travel and load control. The motor shall drive the trolley through a gear reducer. Gear reducer shall be enclosed heavy-duty helical, or spur gear type, of a self-lubricating design, with anti-friction bearings. Brakes shall be solenoid actuated. Trolley drive shall include integrally mounted spring set electrically released AC or DC rectified disc brake.

G. Wire Rope Hoist:

1. The hoist shall be double reeved. The hoisting drum shall be grooved and designed for one layer of wire rope, with at least two (2) full turns of rope to remain on the drum at the lowest hook position. Hoist gearing shall be heat-treated hardened steel, running in an oil bath. Gear bearings shall be the oil-lubricated anti-friction type, and all bearings shall be designed for a Class M2 (20,000 hour) bearing life.
2. A gravity type and upper and lower geared limit switch shall be provided to assure safe operation and positive stopping under all conditions. The hoist shall be provided with a geared limit switch to automatically stop the motor and engage the hoist brake when the hook reaches either the upper or lower limit of travel. The hoist shall be provided with a load limiting device adjusted not to exceed 100 percent of rated capacity.
3. The load hook shall be mounted on ball thrust bearings to swivel without twisting the wire rope. The load hook shall be of the safety type, and the hook shall be of hardened steel equipped with a safety latch. Sheaves shall be properly guarded and shall be heavy pattern, deep flanged, and properly grooved. Sheaves shall be fitted with ball bearings and supported on fixed pins. Wire rope shall be improved plow steel with steel center complete with swaged fittings. Wire rope shall be grease impregnated. The rated capacity load divided by the number of parts of hoisting rope shall not exceed 20 percent of the published breaking strength of the rope.
4. Hoist motor brake shall be magnetically operated disc type or shoe type, mounted on the extended pinion shaft, and designed for a torque rating to 150 percent of the motor full load torque. Brake shall be equally effective in both directions of motor rotation and of sufficient size to stop motor and hold rated capacity load. Brake shall be set automatically when current is not flowing to the motor. A second “load brake” shall be included and applied automatically on lowering and require the motor to drive the load down. Brake shall be self-adjusting to allow for normal wear of the brake lining.
5. The Contractor shall furnish and install an identification plate on the hoist housing. The identification plate shall be of clearly legible permanent lettering giving the manufacturer's name, model number, rated capacity, and other essential information. In addition, the identification plate shall display the equipment number for the hoist that is identified herein.

H. Motors and Controllers:

1. Motors shall be 1750 rpm, TEFC, 30-minute-duty-cycle, rated for inverter duty, comply with CMAA No. 70 for AC Motors, and shall be suitable for the class and type of crane service specified herein. Hoist, trolley, and bridge motion shall be through adjustable frequency drive operation. All motors shall be provided with lifetime lubricated anti-friction bearings. The hoist motor bearings shall be designed for a Class M2 (20,000 hour) bearing life.
2. Controllers shall be capable of providing the control speed ranges specified in Paragraph 41 22 13.13-1.04B. Controllers shall provide soft start/soft stop (dynamic braking), acceleration control, phase loss protection, user programming, and ability to store and retrieve fault history.

I. Electrification and Controls:

1. All electrical and control equipment shall comply with the requirements of Division 26 and 40.
2. The crane manufacturer shall furnish and mount all electrical equipment on the crane including motors, adjustable frequency drives, controls, conduit, and wiring. Bridge conductors may be removed for shipment. All wiring on the crane shall be furnished, installed, and terminated by the crane manufacturer, as far as practical for shipment.
3. The crane manufacturer shall also provide a NEMA 4X main control panel and a NEMA 4X push-button pendant controller suspended from the trolley and capable of controlling all crane motions (hoist, bridge, and trolley). The main control panel shall include: service disconnect for mainline power feeding the panel; reversing controller for hoist, bridge, and trolley; thermal overload relays; control transformers; control relays; power terminal blocks and control terminal blocks all prewired, as required for a complete system and fully operational via a single 460V, 3-phase, 60 Hz power feed. A torque reel shall be supplied to allow easy adjustment of the pendant height for hoist use at anticipated elevations shown in 41 22 13.13-1.04B. Hoist, bridge, and trolley motion control shall be adjustable speed actuated from the pendant push button station suspended from the movable trolley. The pendant controller shall be equipped with an emergency stop pushbutton to disable all crane motions. All controls shall be clearly marked with etched or engraved nameplates.
4. The Contractor shall provide the power feed and a NEMA 4X lockable local main disconnect switch of suitable rating for the crane system and accessible from the operating floor.
5. Electrification of the bridge shall be by enclosed bus bar conductors. Conductor bars shall be stainless steel clad hard copper enclosed in insulation. Conductors shall be complete with all necessary insulation, supports, and appurtenances, and shall meet the NFPA 70 (NEC) requirements. Current collectors shall be the sliding noncopper bearing, carbon shoe type, with adjustable spring tension arms for contact between bus bars and controls. Collector mechanism components shall be aluminum, stainless steel, or other noncorrosive materials (excluding plastic). Electrification of the trolley and hoist shall be by flat insulated festooned cable supported in an enclosed track. Conductors shall be complete with all necessary insulation, supports and appurtenances as required. All other wiring of the crane shall be in rigid or flexible conduit and in accordance with National Electrical Code and complying with Fire Underwriters specifications. When a crane is shipped knocked down, the wiring shall terminate in approved terminal boxes and the wire ends shall be provided with permanent marking tags.

2.04 PAINTING

A. Contact wheel and rail surfaces shall not be coated. All other metal surfaces including the runway beams shall receive proper metal preparation and cleaning prior to application of protective coating. Finish color shall be alert orange except for trolley, which shall be a different color (e.g., blue) for good positioning contrast. Coating system shall be E-2 epoxy as specified in Section 09 90 00. Runway rails shall be coated after installation. All other components shall be factory coated, tested, and defects corrected prior to shipment. Field touch-up will be permitted for minor scratches but defective coatings shall be corrected in the shop. Manufacturer's standard epoxy finish is acceptable for the hoist.

2.05 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Applicable operations and maintenance information as specified in Section 01 78 23.
   2. Factory test certification.
   3. Installation Certification Form 43 05 11-A specified in this Section.
   4. Training Certification Form 43 05 11-B specified in this Section.

PART 3 EXECUTION

3.01 INSTALLATION

A. The runway rails, bridge crane, trolley, and hoist shall be installed at the location shown and in accordance with the manufacturer's recommendations, within the tolerances recommended by CMAA, and under the supervision of the manufacturer's authorized field representative.

3.02 INSPECTION AND TESTING

A. After completion of the installation, the Contractor shall test all hoist and crane equipment under load in the presence of the manufacturer's field representative, who shall certify in writing that the equipment meets all applicable standards and specified performance requirements. Form 43 05 11-A shall be completed and submitted.

B. As a minimum, testing shall be by operating the equipment through a complete lift and lowering cycle and through a complete travel of the bridge and trolley to determine that the equipment performs smoothly and safely without failure.

C. The tests shall be carried out with the hoisting equipment loaded as near to the specified capacity as possible. Any defects shall be corrected or replaced immediately by the Contractor and at no expense to the Owner.

3.03 USE BY CONTRACTOR

A. Any hoist and crane equipment used by the Contractor shall be repaired, repainted and otherwise refurbished to like-new condition prior to its acceptance. After equipment refurbishment, the manufacturer's field representative shall re-inspect and re-test the crane unloaded, and certify in writing that the equipment meets all applicable standards and specified performance requirements. The certification shall be submitted. The Contractor assumes all responsibility for operation and maintenance until the equipment has been accepted.

3.04 WARRANTY

A. A written, one year warranty for equipment shall be provided. Warranty shall include parts and labor for any repair work.

3.05 TRAINING

A. Furnish the services of a factory trained representative for one (1) eight hour man-day for instruction of the Owner's personnel in the proper operation and maintenance of the equipment.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 43 05 11

GENERAL REQUIREMENTS FOR EQUIPMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies general requirements which are applicable to all mechanical equipment. The Contractor is responsible for ensuring that all mechanical equipment meets the requirements of this section in addition to the specific requirements of each individual equipment specification section.

B. Equipment Lists:

1. Equipment lists, presented in these specifications and as specified on the drawings, are included for the convenience of the Construction Manager and Contractor and are not complete listings of all equipment, devices and material required to be provided under this contract. The Contractor shall prepare his own material and equipment takeoff lists as necessary to meet the requirements of this project manual.

1.02 QUALITY ASSURANCE

A. Arrangement:

1. The arrangement of equipment shown on the drawings is based upon information available to the Owner at the time of design and is not intended to show exact dimensions conforming to a specific manufacturer. The drawings are, in part, diagrammatic, and some features of the illustrated equipment installation may require revision to meet actual submitted equipment installation requirements; these may vary significantly from manufacturer to manufacturer. The contractor shall, in determining the cost of installation, include these differences as part of his bid proposal. Structural supports, foundations, connected piping, valves, and electrical conduit specified may have to be altered to accommodate the equipment actually provided. No additional payment shall be made for such revisions and alterations.

B. References:

1. This section contains references to the documents listed below. They are a part of this section as specified and modified. Where a referenced document cites other standards, such standards are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, has been discontinued or has been replaced.

Reference	Title
ABMA Std 9	Load Ratings and Fatigue Life for Ball Bearings
ABMA Std 11	Load Ratings and Fatigue Life for Roller Bearings
ANSI B1.1	Unified Inch Screw Threads (UN and UNR Thread Form)
ANSI B1.20.1	Pipe Threads, General Purpose (Inch)
ANSI B16.1	Gray Iron Pipe Flanges and Flanged Fittings, (Classes 25, 125, and 250)
ANSI B18.2.1	Square and Hex Bolts and Screws (Inch Series)
ANSI B18.2.2	Square and Hex Nuts (Inch Series)
ANSI S2.19	Mechanical Vibration – Balance Quality Requirements of Rigid Rotors, Part 1: Determination of Permissible Unbalance, Including Marine Applications

C. Unit Responsibility:

1. The Contractor shall cause equipment assemblies made up of two or more components to be provided as a working unit by the unit responsibility manufacturer, where specified. The unit responsibility manufacturer shall coordinate selection, coordinate design, and shall provide all mechanical equipment assembly components such that all equipment components furnished under the specification for the equipment assembly, and all equipment components specified elsewhere but referenced in the equipment assembly specification, is compatible and operates reliably and properly to achieve the specified performance requirements. Unless otherwise specified, the unit responsibility manufacturer shall be the manufacturer of the driven component equipment in the equipment assembly. The unit responsibility manufacturer is designated in the individual equipment specifications found elsewhere in this project manual. Agents, representatives or other entities that are not a direct division of the driven equipment manufacturing corporation shall not be accepted as a substitute for the driven equipment manufacturer in meeting this requirement. The requirement for unit responsibility shall in no way relieve the Contractor of his responsibility to the Owner for performance of all systems as provided in the General Conditions of the Contract Documents.

D. The Contractor shall ensure that all equipment assemblies provided for the project are products for which unit responsibility has been accepted by the unit responsibility manufacturer(s), where specified. Unit responsibility for related components in a mechanical equipment assembly does not require or obligate the unit responsibility manufacturer to warranty the workmanship or quality of component products not manufactured by them. Where an individual specification requires the Contractor to furnish a certificate from a unit responsibility manufacturer, such certificate shall conform to the content, form and style of Form 43 05 11-C specified in Section 01 99 90, shall be signed by an officer of the unit responsibility manufacturer's corporation and shall be notarized. No other submittal material will be processed until a Certificate of Unit Responsibility has been received and has been found to be satisfactory. Failure to provide acceptable proof that the unit responsibility requirement has been satisfied will result in withholding approval of progress payments for the subject equipment even though the equipment may have been installed in the work.

E. Balance:

1. Unless specified otherwise, for all machines 10 HP and greater, all rotating elements in motors, pumps, blowers and centrifugal compressors shall be fully assembled, including coupling hubs, before being statically and dynamically balanced. All rotating elements shall be balanced to the following criteria:

$$U_{per} = 6.015\frac{GW}{N}$$

a. Where:

1) U_{per} = permissible imbalance, ounce-inches, maximum
2) G = Balance quality grade, millimeters per second
3) W = Weight of the balanced assembly, pounds mass
4) N = Maximum operational speed, rpm

2. Where specified, balancing reports, demonstrating compliance with this requirement, shall be submitted as product data. Equipment balance quality grade shall be *G* 2.5 (*G* = 2.5 mm/sec) or better in accordance with ANSI S2.19.

PART 2 PRODUCTS

2.01 FLANGES AND PIPE THREADS

A. Flanges on equipment and appurtenances provided under this section shall conform in dimensions and drilling to ANSI B16.1, Class 125. Pipe threads shall conform in dimension and limits of size to ANSI B1.1, coarse thread series, Class 2 fit.

B. Threaded flanges shall have a standard taper pipe thread conforming to ANSI B1.20.1. Unless otherwise specified, flanges shall be flat faced.

C. Flange assembly bolts shall be heavy pattern, hexagonal head, carbon steel machine bolts with heavy pattern, hot pressed, hexagonal nuts conforming to ANSI B18.2.1 and B18.2.2. Threads shall be Unified Screw Threads, Standard Coarse Thread Series, Class 2A and 2B, ANSI B1.1.

2.02 BEARINGS

A. Unless otherwise specified, equipment bearings shall be oil or grease lubricated, ball or roller type, designed to withstand the stresses of the service specified. Each bearing shall be rated in accordance with the latest revisions of ABMA Methods of Evaluating Load Ratings of Ball and Roller Bearings. Unless otherwise specified, equipment bearings shall have a minimum L-10 rating life of 50,000 hours. The rating life shall be determined using the maximum equipment operating speed.

B. Grease lubricated bearings, except those specified to be factory sealed and lubricated, shall be fitted with easily accessible grease supply, flush, drain and relief fittings. Extension tubes shall be used when necessary. Grease supply fittings shall be standard hydraulic alemite type.

C. Oil lubricated bearings shall be equipped with either a pressure lubricating system or a separate oil reservoir type system. Each oil lubrication system shall be of sufficient size to safely absorb the heat energy normally generated in the bearing under a maximum ambient temperature of 60 degrees C and shall be equipped with a filler pipe and an external level indicator gage.

D. All bearings accessible to touch, and located within 7 feet measured vertically from floor or working level or within 15 inches measured horizontally from stairways, ramps, fixed ladders or other access structures, shall either incorporate bearing housings with sufficient cooling to maintain surface temperature at 65 degrees C or less for continuous operation at bearing rated load and a 50 degrees C ambient temperature or shall be provided with appropriate shielding shall be provided that will prevent inadvertent human contact.

2.03 V-BELT ASSEMBLIES

A. Unless otherwise specified, V-belt assemblies shall be Dodge Dyna-V belts with matching Dyna-V sheaves and Dodge Taper-lock bushings, Wood's Ultra V-belts with matching Ultra-V sheaves and Wood's Sure-Grip bushings, or equal.

B. Sheaves and bushings shall be statically balanced. Additionally, sheaves and bushings which operate at a peripheral speed of more than 5500 feet per minute shall be dynamically balanced. Sheaves shall be separately mounted on their bushings by means of three pull-up grub or cap tightening screws. Bushings shall be key seated to the drive shaft.

C. Belts shall be selected for not less than 150 percent of rated driver horsepower and, where two sheaves sizes are specified, shall be capable of operating with either set of sheaves. Belts shall be of the antistatic type where explosion proof equipment is specified.

2.04 PUMP SHAFT SEALS

A. General:

1. Seals for water and wastewater pump shafts shall be either stuffing box or mechanical seals. For industrial wastewater service, or for fluids other than water or municipal wastewater, the recommendations of the seal manufacturer shall be followed for selection of appropriate seals. Unless specified otherwise, stuffing boxes and mechanical seals shall conform to the requirements set forth in this paragraph.

B. Mechanical Seals:

1. Unless otherwise specified in the detailed pump specifications, mechanical seals shall be split mechanical seals requiring no field assembly, other than assembly around the shaft and insertion into the pump. They shall be self-aligning, and self-centering, single seals. They shall be of a nondestructive (nonfretting) type requiring no wearing sleeve for the shaft. Shafts for pumps specified with mechanical seals shall be furnished with no reduction in size through the seal area (no shaft sleeve). Where the detailed specifications call for cartridge instead of split seals, all other requirements of this paragraph apply.
2. Metal parts shall be Type 316 or 316L stainless steel. Springs shall be Hastelloy C, Elgiloy, or other Duplex SS selected for resistance to chloride attack. Rotary faces shall be silicon carbide or chrome oxide. Stationary faces shall be silicon carbide for solids bearing fluid service and carbon for clean water service. Elastomers shall be ethylene propylene or fluorocarbon. Mechanical seals shall be suitable for operation between full vacuum (0 psia) up to 200 percent of the maximum specified operating pressure, but in any event not less than 200 psig.
3. Seal chambers shall be provided with vented solids removal restriction bushings except for enclosed line shaft pumps where the seal barrier fluid is used for line shaft bearing lubrication. The bushing shall both control the amount of flushing water flow and restrict solids and gas accumulation from the seal face area.
4. Candidate seals include:
    a. Chesterton 442 seals provided with Chesterton/SpiralTrac solids removal restriction bushings Version N or D, as recommended by EnviroSeal Engineering Products, Ltd, Nova Scotia, Canada.
    b. AESSEAL RDSX seals with restriction bushing.
    c. John Crane 3710 seals with Type 24SL bushing.
5. Seals on pumps for contaminated water service (sludge, grit, wastewater, scum, reclaimed water, etc.) shall be drilled and tapped for connection of a clean water flushing supply.
6. Seals for all vertical pumps (whether column or volute type) shall be provided with a second flush connection. Vertical pumps shall have a vent valve attached to the mechanical seal to eliminate air from the seal chamber prior to pump start; start-up procedures shall include venting instructions; and for remotely started pumps, the vent system shall be automated. Where specified in the detailed specifications, permissive confirmation automatic vent systems shall be provided.

C. Shaft Packing:

1. Where shaft packing is specified, stuffing boxes shall be tapped to permit introduction of seal liquid and shall hold a minimum of five rows of packing. Stuffing boxes shall be face attached. Stuffing box and shaft shall be suitable for field installation, without machining or other modifications, of the mechanical seal specified in paragraph 2.04 Mechanical Seals for the applicable pump and operating conditions.
2. Unless otherwise specified, lantern rings shall be bronze or Teflon, packing shall be die-molded packing rings of non-asbestos material suitable for the intended service and as recommended by the manufacturer, and glands shall be bronze, two piece split construction. Lantern rings shall be of two-piece construction and shall be provided with tapped holes to facilitate removal. Lantern rings shall be drilled and tapped 1/4 NC-20. The impeller end of the packing on all but line shaft pumps with external source water lubricated bearings shall be fitted with a SpiralTrac, Version P packing protection system as manufactured by EnviroSeal Engineering Products, Ltd, Nova Scotia, Canada.
3. The section of each shaft or impeller hub that extends through or into the stuffing box shall be fitted with a replaceable stainless steel sleeve with a Brinell hardness of not less than 500. The sleeve shall be held to the shaft to prevent rotation and shall be gasketed to prevent leakage between the shaft and the sleeve. Minimum shaft sleeve thickness shall be 3/8 inch.

2.05 COUPLINGS

A. Unless otherwise specified in the particular equipment sections, equipment with a driver greater than 1/2 HP, and where the input shaft of a driven unit is directly connected to the output shaft of the driver, shall have its two shafts connected by a flexible coupling which can accommodate angular misalignment, parallel misalignment and end float, and which cushions shock loads and dampens torsional vibrations. The flexible member shall consist of a tire with synthetic tension members bonded together in rubber. The flexible member shall be attached to flanges by means of clamping rings and cap screws, and the flanges shall be attached to the stub shaft by means of taper lock bushings which shall give the equivalent of a shrunk-on fit. There shall be no metal-to-metal contact between the driver and the driven unit. Each coupling shall be sized and provided as recommended by the coupling manufacturer for the specific application, considering horsepower, speed of rotation, and type of service.

B. Where torque or horsepower capacities of couplings of the foregoing type is exceeded, Thomas-Rex, Falk Steel Flex, or equal, couplings will be acceptable provided they are sized in accordance with the equipment manufacturer's recommendations and sizing data are submitted. They shall be installed in conformance to the coupling manufacturer's instructions.

2.06 GUARDS

A. Exposed moving parts shall be provided with guards which meet all applicable OSHA requirements. Guards shall be fabricated of 14-gage steel, 1/2-13-15 expanded metal screen to provide visual inspection of moving parts without removal of the guard. Guards shall be galvanized after fabrication and shall be designed to be readily removable to facilitate maintenance of moving parts. Reinforced holes shall be provided. Lube fittings shall be extended through guards.

2.07 CAUTION SIGNS

A. Equipment with guarded moving parts which operates automatically or by remote control shall be identified by signs reading "Caution Automatic Equipment May Start At Any Time". Signs shall be constructed of fiberglass material, minimum 1/8 inch thick, rigid, suitable for post mounting. Letters shall be white on a red background. The sign size and pattern shall be as shown on the drawings. Signs shall be installed near guarded moving parts.

2.08 GAGE TAPS, TEST PLUGS AND GAGES

A. Gage taps shall be provided on the suction and discharge sides of pumps, blowers and compressors. Pressure and vacuum gages shall be provided where specified. Gage taps, test plugs, and gages shall be as specified in Division 40.

2.09 NAMEPLATES

A. Nameplates shall be provided on each item of equipment and shall contain the specified equipment name or abbreviation and equipment number. Equipment nameplates shall be engraved or stamped stainless steel and fastened to the equipment in an accessible and visible location with stainless steel screws or drive pins.

2.10 LUBRICANTS

A. The Contractor shall provide for each item of mechanical equipment a supply of the required lubricant adequate to last through the specified commissioning period. Lubricants shall be of the type recommended by the equipment manufacturer and shall be products of the Owner's current lubricant supplier. The Contractor shall limit the various types of lubricants by consolidating them, with the equipment manufacturer's approval, into the least number of different types. Not less than 90 days before the date shown in his construction schedule for starting, testing and adjusting equipment (Section 01 45 20), the Contractor shall provide the Owner with three copies of a list showing the required lubricants, after consolidation, for each item of mechanical equipment. The list shall show estimated quantity of lubricant needed for a full year's operation, assuming the equipment will be operating continuously. All lubricant shall be food grade.

2.11 ANCHOR BOLTS

A. Anchor bolts shall be designed for lateral forces for both pullout and shear in accordance with the provisions of Section 05 05 23. Unless otherwise stated in the individual equipment specifications, anchor bolt materials shall conform to the provisions of Section 05 05 23.

2.12 SPARE PARTS

A. Spare parts, wherever required by detailed specification sections, shall be stored in accordance with the provisions of this paragraph. Spare parts shall be tagged by project equipment number and identified by part number, equipment manufacturer, and subassembly component (if appropriate). Spare parts subject to deterioration, such as ferrous metal items and electrical components, shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping. Spare parts with individual weights less than 50 pounds and dimensions less than 2 feet wide, or 18 inches high, or 3 feet in length shall be stored in a wooden box with a hinged wooden cover and locking hasp. Hinges shall be strap type. The box shall be painted and identified with stenciled lettering stating the name of the equipment, equipment numbers, and the words "spare parts." A neatly typed inventory of spare parts shall be taped to the underside of the cover.

PART 3 EXECUTION

3.01 GENERAL

1. Installation of equipment accessories included in this section shall be as recommended by the equipment manufacturer unless otherwise specified in the individual equipment specification section.

END OF SECTION

SECTION 43 05 13

RIGID EQUIPMENT MOUNTS

PART 1 GENERAL

1.01 SUMMARY

1. Section includes: This Section specifies requirements for rigid equipment mounts. Rigid equipment mounts consist of equipment pads, equipment anchors, and mounting plates (baseplates, soleplates, or fabricated steel frames) set in grout.
2. Conform to the requirements specified in the Equipment Mounting Schedule (Part 4 of this Section) or equipment mounting configuration requirements specified in individual equipment specifications . Where equipment mounting requirements are not specifically identified, the default mounting configuration for equipment consists of Pad Anchored Equipment Pads per Standard Detail D01007 with adhesive dowels anchoring the equipment pad to the foundation, equipment and driver mounted on a common mounting plate, mounting plate leveled within 0.005 inch/foot, equipment anchored to the equipment pad with cast-in-place equipment anchors per Standard Detail D01002, equipment anchor sleeve length is 10 times the bolt diameter, and the mounting plate is grouted in position using non-shrink grout.
3. If a conflict exists between this Section and requirements of individual equipment manufacturers, the more restrictive requirements shall prevail.
4. Requirements for non-rigid equipment mounts (vibration isolation systems) are specified in the associated equipment specification. Furnish rigid equipment mounts conforming to the requirements of this Section for the equipment pad and other equipment mounting components supporting the vibration isolation system.

1.02 RELATED SECTIONS

A. This Section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 61 45 – Area Exposure Designations
   2. Section 01 73 23 - Structural Design and Anchorage Requirements for Nonstructural Components and Non-Building Structures
   3. Section 01 99 90 - Reference Forms
   4. Section 03 60 00 – Grouting
   5. Section 05 05 20 – Anchor Bolts
   6. Section 09 90 00 – Painting and Coating
   7. Section 43 05 11 – General Requirements for Equipment
   8. Section 43 05 14 – Machine Alignment
   9. Section 43 05 17 – Vibration and Critical Speed Limitations

1.03 REFERENCES

A. This Section contains references to the following documents. They are a part of this Section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this Section as if referenced directly. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section prevail.

1.04 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Baseplate: A mounting plate configured with a top plate and a perimeter edge of the mounting plate that is below the top plate. Baseplates have a cavity between the top plate and a horizontal plane at the bottom edge of the perimeter of the mounting plate.
   2. Soleplate: A machined or pre-formed mounting plate with a uniform horizontal surface across the entire underside of the mounting plate, excepting shear lugs/keys, grout pour holes, vent holes, and attachment hardware (nuts, bolts, tapped holes, etc.). Soleplates have a top plate but lack the perimeter bottom edge that extends below the underside of the top plate that is a defining feature of baseplates.
   3. Fabricated Steel Frame: An equipment mounting plate constructed of rolled steel shapes and plates welded into a frame. Fabricated steel frames do not have top plates.
   4. Equipment Pad: Concrete foundation (block or slab) supporting and elevating mounting plates above the supporting structural floor slab or local grade.
   5. Mounting Pads: Milled/machined areas of baseplates, soleplates, and fabricated steel frames where the feet or mounting surfaces of mounted equipment and drivers are bolted to the baseplate, soleplate, or fabricated steel frame.
   6. Leveling Blocks: Steel blocks temporarily placed under baseplates, soleplates, or fabricated steel frames at leveling positions (at equipment anchors) for the purpose of leveling baseplates, soleplates, or fabricated steel frames prior to grouting.
   7. Shims: Thin stainless steel plates of uniform thickness used for fine adjustment of level. Shims are used on top of leveling blocks for mounting plate leveling or used between equipment drivers and baseplates, soleplates, or fabricated steel frames for equipment alignment.

8. Wedges: Pairs of uniformly tapered metal blocks that are stacked with the tapered surfaces reversed (relative to the other wedge) so that the top and bottom surfaces of the wedges are parallel. Wedges are used between equipment pads and baseplates, soleplates, or fabricated steel frames for the purpose of leveling mounting plates.
9. Mounting Stud: Threaded rod or bolts anchored to baseplates, soleplates, or fabricated steel frames for the purpose of mounting equipment or ancillary devices onto baseplates, soleplates, or fabricated steel frames.
10. Reinforcement Dowels or Reinforcement Hooks: Steel reinforcement rods embedded in concrete, across a cold joint, for the purpose of transferring loads or force across the joint.
11. Leveling Position: A location on the top of a concrete equipment pad where leveling tools and equipment will be temporarily installed or used for the purpose of leveling baseplates, soleplates, and fabricated steel frames prior to grouting.
12. Grout Manufacturer: Refers to the manufacturer of the grout product used for installation of rigid equipment mounts.
13. Grout Manufacturer's Technical Representative(s): Refers to the technical representative(s) of the Grout Manufacturer. The Grout Manufacturer's Technical Representative shall not be an employee of the Contractor.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Pre-installation Meetings:
   1. Conduct a pre-installation meeting with the Construction Manager's representative prior to installation of equipment mounts.
   2. Schedule a pre-installation meeting for the equipment mounts associated with each system or group of identical equipment items.
   3. Where equipment anchors are cast in the floor slab or foundation, schedule the pre-installation meeting prior to pouring the floor slab or foundation.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this Section, including addendum updates, (referenced sections need not be included for this Section) with each paragraph check-marked to indicate compliance or marked to indicate requested deviations from specification requirements. Check marks denote full compliance with a paragraph as a whole. Underline each deviation and denote with a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. Mark copies of this Section with the specification number and equipment number for inclusion (filing) with submittal materials furnished for individual equipment specifications.
   3. Name, employer, and a copy of the employee's Qualified Millwright card or other equivalent certificate of journeyman qualifications for millwrights who will install rigid equipment mounts, as specified in paragraph 3.02, Leveling.
   4. Certificates or other documentation issued by the epoxy grout manufacturer that demonstrates that the grout manufacturer's technical representative has been factory trained on installation of epoxy grout for equipment mounts, as specified in paragraph 1.07 Quality Control by Contractor.

5. List of Contractor's equipment installation staff that have completed epoxy grout manufacturer's grout installation training specified in paragraph 3.03, Manufacturer's Services.
6. Shop drawings for equipment pads, equipment anchors, and baseplate, soleplate or fabricated steel frame depict size and location of equipment pads and reinforcement; equipment drains; equipment anchor, size, location, and projection; expansion joint locations; grout formwork; elevation of top of grout and grout thickness; elevation of top of baseplate, soleplate, or mounting block; size and location of electrical conduits; and any other equipment mounting features embedded in equipment pads. Shop drawings for equipment pads, equipment anchors, and baseplate, soleplate, or fabricated steel frames to be numbered and marked (specification number and equipment number) for inclusion (filing) with the associated equipment submittal requirements.

B. Informational Submittals:
1. Procedures: Section 01 33 00
2. Submit equipment anchor calculations demonstrating compliance with paragraph 2.04, Equipment Anchor Design. Submit equipment anchor calculations with submittal information specified in the associated equipment specification.
3. Results of grout strength tests, as specified in paragraph 3.02, Grouting.
4. Completed Rigid Equipment Mount Installation Inspection Checklist Forms (43 05 13-A), as specified in paragraph 3.03, Manufacturer's Services.

1.07 QUALITY ASSURANCE

A. Quality Control By Contractor:
1. Except where union rules require installation by another trade, all machinery to be mounted and leveled by journeyman millwrights.
2. Epoxy grout installation performed by employees that have completed the epoxy grout manufacturer's grout installation training specified in this Section.
3. Provide the services of an independent testing laboratory that complies with the requirements of ASTM E329. Testing laboratory to sample and test materials installed as part of rigid equipment mounts specified in this Section. Testing laboratory services costs borne by the Contractor.
4. Where epoxy grout is specified for bedding mounting plates, furnish the services of a grout manufacturer's technical representative who has been factory trained by the grout manufacturer. The grout manufacturer's technical representative performs training and quality control for epoxy grout installation for rigid equipment mounts as specified in paragraph 3.03, Manufacturer's Services.

B. Special Inspection for Equipment Anchors:
1. Equipment anchors shall comply with special inspection requirements specified in Section 05 05 20.

PART 2 PRODUCTS

2.01 GENERAL

A. Configure rigid equipment mounts as specified in the Equipment Mounting Schedule (See Part 4 of this specification) or as specified in individual equipment specifications. Equipment mounting configuration requirements in individual equipment specifications govern over configuration requirements specified in the Equipment Mounting Schedule. In the absence of equipment mounting configuration requirements in either of these locations, mount equipment per the default requirements specified in paragraph 1.01.

B. Pumps installed in accordance with this Section, HI 14.3, and HI 14.4.

2.02 MATERIALS FOR EQUIPMENT MOUNTING

A. Equipment pads: Reinforced concrete as specified in Standard Details D01006, D01007, D01008, and D01009.

B. Mounting Plates: Cast iron, cast steel, plate steel, fabricated steel frame, polymer concrete, or FRP as specified in the equipment specification.

C. Grout type for equipment mounting as specified in the Equipment Mounting Schedule or in individual equipment specification.

1. Epoxy Grout for Equipment Mounting: Where epoxy grout is specified in the Equipment Mounting Schedule or in individual equipment specifications, provide Epoxy Grout for Equipment Mounting as specified in Section 03 60 00. Where the term epoxy grout is used in the context of details and specifications for equipment mounting it means Epoxy Grout for Equipment Mounting as specified in Section 03 60 00.
2. Cementitious Nonshrink Grout: Where non-shrink grout is specified in the Equipment Mounting Schedule or in individual equipment specifications, Cementitious Non-shrink Grout, specified in Section 03 60 00, may be used for setting bearing surfaces of baseplates, soleplates, or fabricated steel frames. Where the term non-shrink grout or cementitious grout is used in the context of details and specifications for equipment mounting it means Cementitious Non-shrink Grout as specified in Section 03 60 00.

D. Equipment anchors: Materials per the following table and per the area exposure condition where the equipment is installed. Section 01 61 45 specifies area exposure conditions.

Area Exposure	Equipment Anchor Materials
Indoor, Dry	Carbon Steel, ASTM F1554, Grade 36, weldable per S1 for threaded rod
Indoor, Wet	Galvanized Carbon Steel, ASTM F1554, Grade 36, weldable per S1 for threaded rod
Outdoor	304 Stainless, ASTM F593, Cond. CW
Submerged, Immersed	316 Stainless, ASTM F593, Cond. CW
Process Corrosive	316 Stainless, ASTM F593, Cond. CW
Chemical Corrosive	316 Stainless, ASTM F593, Cond. CW

E. Anchor sleeves: Flexible polyurethane foam, steel cylinder/tubes, or corrugated/ribbed plastic sleeves.

F. Epoxy Primer: High-strength, lead free, chrome free, rust inhibiting two-component epoxy primer specifically designed for use on metal substrates and in conjunction with epoxy grout. Bond strength to sandblasted metal not less than 1500 psi.
    a. ITW Performance Polymer MS-7CZ primer
    b. Approved equal.

G. Anti-seize/Anti-galling compound: Molybdenum disulfide and graphite combination in aluminum complex base grease conforming to MIL-PRF-907E.
    a. Jet Lube 550 by Jet Lube, Inc.
    b. E-Z Break by LA-CO
    c. or approved equal.

2.03 EQUIPMENT PADS

A. Minimum dimensions for equipment pads are shown on structural drawings where a minimum equipment pad mass is required for vibration dampening/control.

B. Equipment Pad Drainage:
    1. Furnish equipment pads with 2-inch drains.
    2. Locate equipment pad drains at drainage outlets from equipment or mounting plates
    3. Route equipment drainage outlets or mounting plate drainage outlets to equipment pad drains
    4. Route equipment pad drains to the floor drainage collection system.
    5. Drainage piping for equipment pads shall be routed below the finished floor elevation.
    6. Exposed drain lines mounted on the floor are not acceptable.

2.04 EQUIPMENT ANCHORS:

A. Equipment Anchors:
    1. All thread rod with heavy hex welded nuts, heavy hex bolts, post-installed anchors (wedge, sleeve, undercut, expansion, and adhesive anchors), or adjustable canister anchors as specified in the Equipment Mounting Schedule or in individual equipment specifications.
    2. Bolt length as required for the specified embedment and sleeve length. Reduce equipment anchor sleeve length as necessary to fit within finished height of equipment pad if equipment pad height is insufficient to provide specified equipment anchor sleeve length. Unified Coarse Thread Series per ASME B1.1.
    3. Post-installed anchors (wedge, sleeve, undercut, expansion, and adhesive anchors) conforming to the requirements of Section 05 05 20.
    4. Adjustable canister anchors consist of cast-in-place pre-manufactured adjustable anchor inserts. Provide a minimum of 6 inches of vertical bolt height adjustment and lateral adjustment of the anchor bolt while maintaining the anchor bolt in a true vertical orientation.
        a. Jakebolts as manufactured by Unisorb
        b. Heavy Duty Adjustable Anchors as manufactured by Deco
        c. Rowan Adjustable Canister Anchor Bolt
        d. or approved equal.

B. Equipment Anchor Design:
   1. Size (diameter) of anchors for clamping/fastening mounting plates to equipment pads determined by the equipment manufacturer.
   2. Comply with Utah Governing Building Code for equipment anchor size, embedment, and edge distance. Provide equipment anchors that are sufficient to resist the maximum lateral and vertical forces specified in Section 01 73 23.
   3. Resistance to lateral (horizontal) loads based on the static friction between the mounting plate and its supporting grout pad. Include the clamping force applied by equipment anchors and the weight of the equipment for calculating static friction resistance to lateral loads. Do not include lateral (shear) loading on equipment anchors or adhesion between mounting plates and supporting grout in lateral loading resistance calculations.
   4. Furnish equipment anchor calculation submittals for all rotating equipment including (but not limited to) pumps, flocculators, and generators.
   5. Equipment anchor calculations sealed by a registered structural or civil engineer licensed in the State of Utah.

C. Equipment Anchor Tension:
   1. Unless alternate bolt torque/tension requirements are specified by the equipment manufacturer, tighten equipment anchors to provide a final clamping force that produces a tensile stress of 15,000 psi in each equipment anchor. Tighten adjustable canister anchors to the manufacturer's maximum safe working load. Tighten post-installed anchors to manufacturer's recommendations.
   2. Bolt torque values required to produce the specified bolt tension based on well lubricated plain finish national coarse thread bolts are presented in the following table. Revise bolt torque values per equipment manufacturer's recommendations for alternate thread patterns, thread lubrication, bolt material, or bolt finish.

Bolt Diam. (in)	3/8	1/2	5/8	3/4	7/8	1	1-1/8	1-1/4	1-1/2
Final bolt torque for 15,000 psi bolt stress (ft*lbs)	8	15	30	50	80	125	180	250	400

   3. Prior to leveling and grouting mounting plates, pull test grouted equipment anchors (standard detail D01003) to the values specified in the following table.

Anchor Diam. (in)	3/8	1/2	5/8	3/4	7/8	1	1-1/8	1-1/4	1-1/2
Pull test load (kips)	2.1	3.8	6.1	9.1	13	17	22	28	43

D. Anchor Sleeves:
   1. Provide sleeves for equipment anchors as specified in the Equipment Mounting Schedule or in individual equipment specifications.
   2. Adjust equipment anchor length/embedment depth shown in Standard Detail D01002 and Standard Detail D01003 if sleeves are not required.
   3. Sleeves may be installed at the Contractor's option if not specified in the Equipment Mounting Schedule or in individual equipment specifications provided they do not interfere with specified embedment lengths.

4. Fill steel cylinders/tubes and ribbed plastic sleeves with a flexible room temperature vulcanizing (RTV) sealant prior to embedment/installation.

2.05 MOUNTING PLATES

A. General:

1. Round edges of surfaces of baseplates, soleplates, and fabricated steel frames that bear on grout to a radius of not less than 0.25 inch.
2. Round perimeter corners of baseplates, soleplates, or fabricated steel frames to a radius of not less than 2.0 inches to avoid producing stress risers on the grouted foundation.
3. Provide grout pouring holes (minimum 4 inches in diameter for epoxy grout, minimum 2.5 inches in diameter for cementitious non-shrink grout) and air release holes in all baseplates and soleplates.
4. Provide grout relief or vent holes (minimum 1 inch in diameter) in all baseplates and soleplates.
5. Drill mounting holes for equipment anchors through baseplates, soleplates, and fabricated steel frames. Open slots or burned out holes for equipment anchors are not permitted.
6. Provide acorn nuts welded to the underside of the baseplate or soleplate or nuts welded to the underside of the baseplate or soleplate and plugged with cork, plastic plugs or grease where terminations to baseplates and soleplates are required.
7. Where fasteners terminate only into the baseplate, soleplate, or fabricated steel frame, threaded lengths (tapped or embedded in mounting plates) shall be not less than the bolt diameter.
8. Where baseplates, soleplates, or fabricated steel frames are leveled using jackscrews, tap jackscrew threads in thickened pads or otherwise in sufficient metal to provide ease in adjusting level.
9. Mill mounting pads and/or mounting surfaces of baseplates, soleplates, and fabricated steel frames flat and coplanar within 0.0005 inch per foot in all directions after all welding and stress relieving.
10. Pre-grout baseplates prior to milling.
11. Baseplates, soleplates, and fabricated steel frames provide common support for the equipment and driver (and flywheel, if one is specified).
12. For equipment with drivers 20 horsepower and greater, provide transverse alignment (horizontal) positioning jackscrews for alignment of equipment drivers on horizontal surfaces of baseplates, soleplates, and fabricated steel frames.
13. Provide alignment/positioning jackscrews in perpendicular directions in a horizontal plane at the mounting position for each corner or foot of the equipment driver. (Additional jackscrews provided for transverse alignment of the flywheel, if flywheels are specified in the equipment specification.)
14. Where specified in individual equipment specifications; baseplates, soleplates, and fabricated steel frames fitted with RK Fixators as manufactured by Unisorb, or approved equal.
    a. Fixators installed at mounting surfaces for drivers.
    b. Fixators consist of a three-piece wedge leveling adjustment device incorporating a spherical washer assembly to provide true level height adjustment at each mounting surface for the equipment driver.

B. Fabricated Steel Frames:
   1. Fabricated steel frames consist of structural steel shapes welded to form mounting plates.
   2. Fabricated steel frames to be rectangular in shape, excepting fabricated steel frames for centrifugal refrigeration machines and pumps which may be T- or L-shaped to accommodate the equipment driver and accessories.
   3. Fabricated steel frames for split case pumps include supports for suction and discharge elbows, if required by the specified configuration.
   4. Perimeter members consist of I-beams or C-channel with a minimum depth equal to 1/10 of the longest dimension of the fabricated steel frame. Beam depth need not exceed 14 inches provided that the deflection and misalignment is kept within acceptable limits as determined by the manufacturer.
   5. Fabricated steel frames furnished with thickened steel mounting pads welded to the fabricated steel frame for bolting equipment to the mounting plate.
   6. Sandblast surfaces of fabricated steel frames in contact with grout to white metal per SSPC SP-5.
   7. Apply a high-strength epoxy primer as specified in paragraph 2.02 within 8 hours of sandblasting the fabricated steel frame.

C. Baseplates:
   1. Baseplates may be welded steel, cast steel, or cast iron with thickened mounting pads for bolting equipment to the baseplate.
   2. Provide internal stiffeners on all cast and fabricated baseplates. Stiffeners designed to allow free flow of grout from one section of the baseplate to another.
   3. Provide a minimum 2 inches high by 6 inches wide opening in cross bracing and stiffeners for grout flow between sections of the baseplate.
   4. All welds continuous and free from skips, blowholes, laps and pockets.
   5. Pre-grout baseplates at the factory after all welding has been completed and prior to machining the mounting pads on the baseplate. Pre-grout baseplates in the field if they have not been pre-grouted at the factory. Remove the equipment from the baseplate, invert the baseplate, and pre-grout as specified in this Section.
   6. Prior to pre-grouting, sandblast the underside of baseplates to white metal per SSPC SP-5.
   7. Complete pre-grouting within 8 hours of sandblasting.
   8. Fill the underside of the baseplate to the bottom edges of the baseplate.
   9. Seal cast iron baseplates to prevent surface bleeding prior to shipment to the project site.

D. Plate Steel Soleplates:
   1. Not less than 1.0 inch thick for equipment with drivers greater than 30 horsepower.
   2. Furnished with grout keys/lugs or stiffeners on the underside of the soleplate.
   3. Flat uniform horizontal surface on underside of plate steel soleplates, excepting grout keys, grout pour holes, vent holes, and attachment hardware (nuts, bolts, tapped holes, etc.).
   4. Prior to milling the mounting pads for equipment or mounting surfaces, scribe the words “THIS SIDE DOWN”, using welding rod material, on the underside of plate steel soleplates , .

5. Plate steel soleplates without grout pouring holes are acceptable provided that no dimension of the soleplate (width or length) exceeds 18 inches.
6. Sandblast surfaces of plate steel soleplates in contact with grout to white metal per SSPC-SP-5, prior to shipment to the project site.
7. Apply a high-strength epoxy primer as specified in paragraph 2.02 within 8 hours of sandblasting the underside of plate steel soleplates.
8. Where equipment is fabricated or cast with feet or mounting surfaces that are not fastened to a common baseplate or soleplate, as in dry-pit bottom-suction pumps, the equipment may be supported on individual concrete piers or equipment pads in lieu of mounting on a common equipment pad and soleplate. In such instances, support the equipment at the feet or mounting surfaces on individual plate steel soleplates. Level individual plate steel soleplates and grout into place on the individual piers or equipment pads as specified in this Section. Where multiple soleplates are installed to support one piece of equipment, soleplates shall be coplanar within 0.002 inch/foot.

E. Polymer Concrete Soleplates:
1. Pre-cast soleplates consisting of polymer concrete with stainless steel inserts for equipment mounting.
2. Mounting surfaces shall be coplanar within 0.002 inch/foot.
3. Furnished with a uniform horizontal surface over the entire underside of the mounting plate, excepting grout keys, grout pour holes and vent holes.
   a. PoxyBase as manufactured by Basetek
   b. Chembase as manufactured by Goulds
   c. Approved equal.

F. Corrosion Resistant FRP Baseplates:
1. Pre-formed fiber reinforced plastic fabrications.
2. Product of the manufacturer of the equipment that is mounted on the baseplate.

PART 3 EXECUTION

3.01 PREPARATION

A. Concrete Equipment Pad Preparation:
1. Roughen the top of the equipment pad after the concrete has reached its 28-day compressive strength.
2. Remove all laitance and defective or weak concrete.
3. Roughen surface profile to 0.25 inch amplitude, minimum.
4. Expose broken aggregate without dislodging unbroken aggregate from the cement matrix and without fracturing concrete and aggregate below the concrete surface.
5. Roughen using a light-duty (15 pounds or less), hand-held chipper with a chisel type tool.
6. Abrasive blast, bush-hammer, jack hammers with sharp chisels, heavy chipping tools, or needle gun preparation of concrete surfaces to be grouted are not acceptable.
7. Demonstrate removal of defective or weak concrete to the Construction Manager prior to leveling.

8. Chip the surface of the concrete such that the final elevation of the equipment pad provides the grout manufacturer's recommended thickness between the surface of the equipment pad and the lower baseplate flange, underside of the soleplate, or underside of the fabricated steel frame.
9. Remove all dust, dirt, chips, oil, water, and any other contaminants and protect the surface with plastic sheeting until grout is installed.
10. Protect concrete equipment pad surfaces that have been finished smooth and level for use as leveling positions. Protect from damage during chipping activities. Alternatively, leveling positions may be restored on chipped surfaces. Restore leveling positions by installing leveling blocks or leveling plates for jackscrews on a high compressive strength epoxy putty (Philadelphia Resins, Phillybond Blue 6A, or equal). Leveling blocks and leveling plates installed level on the epoxy putty.

B. Grout Form Construction:
1. Design forms for a minimum of 6 inches hydrostatic head above the final elevation of the grout and manufacturer's recommendations for form edge clearance for intended pour scheme, but not less than two inches.
2. Install grout expansion joints at 4 to 6 foot intervals, perpendicular to the centerline of baseplates. Design expansion joints in accordance with the grout manufacturer's written instructions.
3. Coat forms with three coats of paste wax on all areas of the forms that will be in contact with the grout.
4. Wax forms before assembly.
5. Prevent accidental application of wax to surfaces where the grout is to bond.
6. Remove any foreign material, such as oil, sand, water, wax, grease, etc., from concrete surfaces that will contact grout before forms are installed.
7. Forms must be liquid tight. Seal any open spaces or cracks in forms, or at the joint between forms and the foundation using sealant, putty, or caulking compound.
8. Chamfer vertical and horizontal edges of the grout with 45-degree chamfers as specified in equipment pad details. Locate 45-degree perimeter chamfer strips at the final elevation of the grout.
9. Match chamfers in concrete portions of the equipment pad.
10. Install block outs at all leveling positions to allow removal of leveling equipment and leveling nuts to be backed off after the grout has cured.
11. Coat jackscrews with a light oil or other acceptable bond-breaking compound prior to grouting.
12. Seal equipment anchor sleeves to protect the sleeved length of the anchor from contact with grout.
13. Wrap exposed portions of equipment anchors with duct tape to protect them from grout splatter and to prevent bonding to grout.

C. Mounting Plate Preparation:
1. Roughen the underside of soleplates and fabricated steel frames and wipe with a residue-free solvent as recommended by the epoxy primer manufacturer before placement of the baseplate, soleplate, or fabricated steel frames on the equipment pad for leveling. Roughen surfaces of mounting plates that will be in contact with grout by power tool cleaning. Cleaning performed by power wire brushing, power sanding, power grinding, power tool chipping or power tool descaling. Impart a minimum profile of 1.0 mil.

2. Prior to placement on the equipment pad for leveling, roughen exposed grout surfaces of pre-grouted baseplates and wipe with a residue-free solvent as recommended by the manufacturer of the epoxy grout used for pre-grouting.
3. Prepare the underside of corrosion-resistant FRP baseplates and polymer concrete baseplates per the baseplate manufacturer's recommendations and prior to placement of the baseplate on the equipment pad for leveling.
4. Grouting for installation of mounting plates on equipment pads completed prior to connecting any field piping or electrical and instrumentation systems.
5. Unless the Construction Manager accepts an alternate installation procedure in writing, baseplates, soleplates, and fabricated steel frames leveled and grouted with the equipment removed.

3.02 INSTALLATION

A. Leveling:
1. Except where union rules require installation by another trade, all equipment and machinery mounted and leveled by a Qualified Millwright.
2. Use precision surveying equipment for leveling.
3. Machinists' spirit levels will not be permitted for leveling purposes for any baseplate, soleplate, or fabricated steel frame with a plan dimension greater than 4 feet.
4. Baseplates, soleplates, and fabricated steel frames leveled to the tolerance specified in the Equipment Mounting Schedule, in the individual equipment specification, or as otherwise required by the equipment manufacturer, if more stringent.
5. Apply an anti-seize or anti-galling compound, specified in paragraph 2.02, to all equipment anchor threads prior to beginning baseplate, soleplate, or fabricated steel frame leveling.
6. Level all baseplates, soleplates, and fabricated steel frames against steel surfaces (jackscrew plates, leveling blocks, leveling nuts, support plates, or other steel surfaces). Use of other materials for leveling purposes is strictly and specifically prohibited.
7. Use stainless steel leveling blocks and shims, steel wedges, or jackscrews bearing on leveling plates.
8. Leveling nuts may be used for leveling baseplates, soleplates, and fabricated steel frames weighing less than 200 pounds (inclusive of the weight of the equipment if leveled with the equipment on the mounting plate).
9. Leveling blocks shall be stainless steel, 4 inches square and 1.5 inches thick with an open-ended slot terminating in the center for the equipment anchor.
10. Machine leveling blocks flat on all horizontal surfaces and place under the baseplate or soleplate at each equipment anchor.
11. Provide pre-cut stainless steel shims, slotted for removal after grouting. Coat leveling blocks and shims with a light oil just prior to beginning the leveling and grouting work. Place shims so the tabs on the shims are easily accessible.
12. Clamp baseplates, soleplates, or fabricated steel frames in position (after leveling) by installing the equipment anchor nuts and washers.
13. Apply bolt tension to fix the position of mounting plates during grouting (30 to 60 percent of the final clamping force applied to clamp the mounting plate to the equipment pad).
14. Prior to grouting, verify that the correct level and position of the baseplate, soleplate, or fabricated steel frame has been maintained after clamping it to the equipment pad.

B. Grouting:
   1. Adjust ambient temperature to maintain mounting plate, foundation, and grout temperatures to grout manufacturer's recommended temperature.
   2. Mix grout for equipment mounting in accordance with the grout manufacturer's written recommendations.
   3. Place epoxy grout using a method that avoids air entrapment.
   4. Place grout at one end of the baseplate or soleplate and work grout toward the opposite end to force the air out from beneath the baseplate or soleplate.
   5. Pour grout through a head box into grout pouring holes.
   6. When the head box is moved to the next grout hole, place a 6 inch standpipe over the grout hole and fill with grout.
   7. Pour grout to the top of the lower flange of the perimeter I-beams or C-channel of fabricated steel frames.
   8. Pour grout at least 0.125 inch but not more than 0.5 inch above the bottom or underside of the perimeter edge of a baseplate or soleplate.
   9. Use of vibrating tools and/or jarring (rapping or tapping) forms to facilitate grout flow is not permitted during placement of epoxy grout.
   10. Never allow the grout in the head box to fall below the top of the baseplate or soleplate once the grout has made contact with the baseplate or soleplate.
   11. Grout placement applied in one continuous pour, until all portions of the space beneath the baseplate, soleplate, or fabricated steel frame have been filled.
   12. Prepare subsequent batches of grout prior to depleting the preceding batch.
   13. Maintain grout height in standpipes after the space under the baseplate, soleplate, or fabricated steel frame has been filled.
   14. When the grout has started to take an initial set (typically this is determined by a noticeable increase in temperature and no flow of grout at the vent holes) remove the standpipes and clean excess grout from all surfaces.
   15. Check for leaks throughout grout pours. Repair leaks immediately to prevent formation of voids.
   16. Check baseplate, soleplate, or fabricated steel frame level and elevation before the grout sets.
   17. Cure grout in accordance with the grout manufacturer's written instructions.
   18. Collect at least one grout sample from each grout pour. Where specified in the individual equipment specifications, collect a grout sample from the grout pour for each equipment pad.
       a. Place samples in a cylinder of sufficient size to yield three 2-inch cubes as test samples.
       b. Label samples with project name, date, time, the equipment number, and ambient temperature at the time of placement.
       c. Place samples next to the foundation of the equipment being grouted and cure for 48 hours.
       d. Test grout samples in accordance with the grout manufacturer's recommendations.
       e. Grout samples tested by the independent testing laboratory specified in paragraph 1.07 Quality Control by Contractor.
       f. Report test results directly to the Construction Manager.

C. Completion:
   1. Upon acceptance by the Construction Manager and the equipment manufacturer's representative and after the grout has reached sufficient strength, remove grout forms and block outs at leveling positions. Remove leveling blocks and shims or wedges and support plates. Back off leveling nuts and jack screws to allow the grout to fully support the baseplate, mounting block, or soleplate. Take care not to damage the grout during removal of extended shimming material or leveling equipment and tools.
   2. Tighten equipment anchor nuts using calibrated indicating torque wrenches, to develop the full bolt tension specified in paragraph 2.04 Equipment Anchor Tension.
   3. Tighten equipment anchor nuts in increments of not more than 25 percent of the final torque value in an alternating pattern to avoid stress concentration on the grout surface. After tightening equipment anchor nuts to final values, apply additional wax, grease, or mastic to all exposed portions of the equipment anchor beneath the baseplate, soleplate, or mounting block.
   4. After applying additional wax or mastic to exposed portions of equipment anchors and tightening to final torque values, fill and point block outs (pockets) for access to leveling nuts, leveling blocks, shims, or wedges with the grout material installed under baseplates, soleplates, or fabricated steel frames. Remove jackscrews and fill holes in the baseplate, soleplate, or fabricated steel frame with a flexible sealant (silicone rubber) or a short cap screw.
   5. Check for baseplate, soleplate, or fabricated steel frame movement (soft foot) by individually loosening and re-tightening each equipment anchor. Measure and record vertical movement at each equipment anchor during loosening and retightening. Measure vertical movement using a magnetic-based dial indicator on the baseplate, soleplate, or fabricated steel frame referenced to the epoxy grout surface of the equipment pad, or other approved method. Vertical movement exceeding 25 micrometers (0.001 inch) indicates a soft foot condition. Soft foot conditions are sufficient cause for removal and reinstallation of grout and baseplates, soleplates, or fabricated steel frames.
   6. Check for grout voids by tapping along the upper surfaces of the baseplate, soleplate, or mounting block. Mark grout voids. A grout void is sufficient cause for removal and reinstallation of grout and baseplate, soleplate, or fabricated steel frame. At the discretion of the Construction Manager, grout voids may be repaired as specified in Chapter 5, Section 3.16 of API RP 686.

D. Piping Connections:
   1. Anchor piping connecting to flexible connections and/or expansion joints such that the intended function of these connections/joints is maintained in the piping system without imposing strain on the equipment connections.
   2. Where an equipment manufacturer's installation requirements include a rigid connection between the machine and connecting piping systems, delete any flexible coupling (including equipment connection fittings) shown on the drawings and install the equipment in the following manner, in lieu of installing the flexible coupling:
      a. Install equipment pad as shown in the detail specified in the Equipment Mounting Schedule or in the individual equipment specification.
      b. Install the baseplate, soleplate, or fabricated steel frame supporting the equipment and grouted in place as specified in this Section.
      c. Install and align the equipment in place as specified in Section 43 05 14.

d. Install and align piping between equipment connections and field piping without welding one of the joints for one section of pipe between the equipment connection and the field piping and all valving. All flanged joints bolted up and pressure-tested.

e. All piping must be fully supported by supports designed to accept their full weight and thrust forces.

f. Install the final section of piping. Align the final section of pipe with the equipment and field connections without the use of jacks, chain falls, or other devices to force it into alignment.

g. Do not weld the final piping joints until after the previous steps have been completed and accepted by the Construction Manager.

3.03 FIELD QUALITY CONTROL

A. Manufacturer's Services

1. Epoxy Grout Training: Prior to commencing rigid equipment mount installation work on equipment pads, furnish the services of a grout manufacturer's technical representative to conduct a training school for the workers who will be using epoxy grout for rigid equipment mount installations. Epoxy grout training school duration to be not less than 4 hours duration and covers all aspects of using the products, including form construction for each equipment installation, surface preparation, mixing, application, void prevention/elimination, and clean up. This requirement does not relieve the Contractor of overall responsibility for this portion of the work. Epoxy grout manufacturer to furnish a list of school attendees who have been satisfactorily trained to perform epoxy grout installation for equipment mounting.
2. Epoxy Grout Quality Control: The epoxy grout manufacturer's technical representative provides quality control services for equipment mounted with epoxy grout. The epoxy grout manufacturer's technical representative must be present (on site) to inspect and verify that the installation personnel have successfully performed surface preparation, epoxy grout application, and Quality Control Inspection in accordance with these specifications for a representative portion of the epoxy grout installation work.
3. Epoxy grout manufacturer's technical representative performs the following services for at least one rigid equipment mount installation for each equipment type and size installed with epoxy grout:
    a. Inspect ambient conditions during various phases of epoxy grouting installation for conformance with the epoxy grout manufacturer's requirements.
    b. Inspect the surface preparation of concrete substrates onto which epoxy grout materials are to be applied. Inspect surface for conformance to the specified application criteria, including but not limited to substrate profile, degree of cleanliness, and moisture.
    c. Inspect the surface preparation of the metallic substrates onto which the epoxy primer is to be applied.
    d. Inspect the epoxy-primed metallic substrate for coverage and adhesion.
    e. Inspect preparation and application of epoxy grout form work for conformance to the specifications and manufacturer's recommendations for form edge clearance.
    f. Inspect and record that the "pot life" of epoxy grout materials is not exceeded during installation.
    g. Inspect epoxy grout for cure.

h. Inspect and record that localized repairs made to grout voids conform to the specification requirements.

i. Conduct a final review of completed epoxy grout installation for conformance to these specifications.

j. Attest to conformance of the Contractor's work by signing appropriate entries in the "Rigid Equipment Mount Inspection Checklist," Form 43 05 13-A in Section 01 99 90.

B. Training and quality control by the grout manufacturer's technical representative is not required for rigid equipment mounts installed with cementitious non-shrink grout.

3.04 FINAL INSPECTION

A. The Construction Manager will conduct a final inspection with the Contractor for conformance to requirements of this Section.

PART 4 EQUIPMENT MOUNTING SCHEDULE

Equipment Mounting Schedule

Equipment Number	Specification Section	Specification Title	Equipment Pad Detail	Mounting Plate Leveling Tolerance (inch/foot)	Equipment Anchor Type	Equipment Anchor Sleeve Length	Grout Type	Application Notes
Default Config.	*Various*	*Various*	*D01007*	*0.005*	*D01002*	*10D*	*Non-shrink*	*Default equipment mounting configuration for all equipment not otherwise specified in this schedule*
Freestanding floor-mounted electrical panels and equipment	*Various*	*Various*	*D01006*	*Not applicable*	*D01004*	*Not required*	*Not required*	
TBD	*TBD*	*Vertical Turbine Pumps*	*D01007*	*0.0005*	*D01003*	*15D*	*Epoxy*	
TBD	*11325*	*Multistage Vertical Centrifugal Pumps*	*D01007*	*0.002*	*D01002*	*15D*	*Non-shrink*

SECTION 43 05 14

MACHINE ALIGNMENT

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies requirements for alignment of directly coupled mechanical equipment weighing 1000 pounds or more and/or greater than 5 horsepower furnished or modified under this contract.

B. Equipment direct coupled to the motor with drivers 5 horsepower and less and belt or chain driven machinery are specifically exempted from the requirements of this section.

C. Separately mounted equipment connected by offset universal joints are exempted from the offset and angularity requirements, but all units must be installed and leveled as specified in this section and referenced sections.

1.02 RELATED SECTIONS

A. Section 43 05 11 – General Requirements for Equpment

B. Section 43 05 13 – Rigid Equpment Mounts

C. Section 43 05 17 – Vibration and Critical Speed Limitations

D. Section 43 23 03 – General Requirements for Centrifugal and Axial Flow Pumps

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

ANSI/ASA S2.75 Part 1	Shaft Alignment Methodology, Part 1: General Principals, Methods, Practices, and Tolerances
ANSI/ASA S2.75 Part 2	Shaft Alignment Methodology, Part 2: Vocabulary

Reference	Title
ANSI/ASA S2.75 Part 3	Shaft Alignment Methodology, Part 3: Alignment of Vertically Oriented Rotating Machinery
Shaft Alignment Handbook	Shaft Alignment Handbook, Third edition, John Piotrowski, Marcel Dekker Inc.

1.04 DEFINITIONS

A. Follow definitions as defined in ANSI/ASA S2.75, Parts 1, 2, and 3.

1.05 QUALITY ASSURANCE

A. General:
   1. All equipment shall be aligned using laser alignment equipment to the tolerances specified by the subject equipment manufacturer or the criteria specified in this section, whichever is more stringent.

B. Alignment Criteria:
   1. Unless otherwise specified by more stringent manufacturer's requirements or the the detailed equipment specification:
      a. Meet the level, flatness, and coplanarity limits in ANSI/HI S2.75, Part 1, Table 1, for equipment bases and sole plates..
      b. Comply with shaft runout tolerances in ANSI/HI S2.75, Part 1, Table 2,
      c. Conduct a test for soft foot prior to aligning machines.
         1) Soft foot (machine frame distortion) shall be not more than 2.0 mils for any speed.
      d. Align all process equipment, including pumps, blowers, turbines, and similar machines to meet the Precision Tolerance Range in Tables 3 and 4 of ANSI/ASA S2.75, Part 1.

C. Qualifications:
   1. All alignment work shall be performed by millwrights trained in the use of the laser alignment equipment by the manufacturer.

1.06 SUBMITTALS

A. Provide in accordance with Section 01 33 00:
   1. Action Submittals:
      a. Prior to testing, provide a Testing Plan Report identifying, for each piece of equipment, testing location and passing measurement values for each location and test type.
      b. Summary report verifying compliance with the alignment criteria as set forth in paragraph 1.06.B. Include hard copy of all alignment records, signed and dated by the technician performing the work.
      c. Electronic files, including both a summary (pdf) file and files native to the alignment software used for completing the work specified in this section.
      d. Qualifications of the alignment technician.
         1) Millright training
         2) Training certification from the laser alignment equipment manufacturer

PART 2 PRODUCTS

2.01 EQUIPMENT

A. Laser alignment equipment shall be:
   1. Easy-Laser®
   2. PrufTechnik
   3. ACOEM,
   4. or approved equal.

B. Alignment equipment used to perform the work required under this section shall employ laser alignment techniques to achieve the required tolerances. The equipment shall be computer based and its software shall be compatible with current Windows® based spreadsheets and databases. The equipment shall employ a hand-held field computer using a graphic interface to determine actual alignment and necessary corrective action to bring equipment into required tolerance. The link between field measurement components and the computer shall be through cable, infrared, or wireless transmission.

PART 3 EXECUTION

3.01 GENERAL

A. After machine base grouting as specified in Section 43 05 13, align all machines mounted on baseplates or soleplates as specified in this section.

B. Alignment work shall be performed by journeyman millwrights skilled in this type of work under the supervision of a technician trained in the use of the laser alignment by the manufacturer or vendor of the alignment equipment. The use of untrained laborers, carpenters or apprentices for this work will not be acceptable.

C. Submit alignment report for each machine within 2-weeks of completing the alignment.

3.02 PROCEDURE

A. Sequence:
   1. Machines supported on integral feet or support pads shall be leveled, grouted and aligned in the following order: driven machine; intermediate bearings or machines; and driver. Under certain circumstances, such as a diesel engine driving a generator, it may be preferable to reverse this order and set the driver first. The Contractor shall submit a written request for a reversal of the alignment order to the Construction Manager and the Construction Manager must approve any change in alignment order in writing before it will be allowed.

B. Alignment:
   1. All machines shall be rough aligned without any connections to piping, electrical and instrumentation systems. Upon completion of all field connections, alignment shall be rechecked to demonstrate no change. If change has occurred, the Contractor shall eliminate any external forces affecting machine alignment.

2. Next, soft foot (machine frame distortion) shall be measured and brought to within the permissible tolerances. Thereafter, the alignment shall be rechecked and the alignment process repeated if necessary to bring all machinery to final alignment tolerances.

3.03 VERIFICATION

A. Factory Personnel:

1. Where required by other sections in this project manual, factory authorized installation technicians representing the equipment manufacturer shall witness final alignment work. After completion of all alignment work, acceptance of the work shall be documented in writing by factory authorized installation technicians.

END OF SECTION

SECTION 43 05 17

VIBRATION AND CRITICAL SPEED LIMITATIONS

PART 1 GENERAL

1.01 DESCRIPTION

A. This section specifies vibration and critical speed limitations for rotating mechanical equipment. Factory and/or field testing and vibration measurements shall be taken when specified in the individual equipment specification sections.

1.02 VIBRATION LIMITATIONS

A. General:
   1. Vibration frequencies shall span the range from 5.0 to 5000 Hz. Where specified, measurements shall be obtained while the installed equipment is operating within the specified speed range.

B. Centrifugal:
   1. Machines With Sleeve Bearings:
      a. Unless otherwise specified, centrifugal machines with sleeve bearing shafts shall not exhibit unfiltered RMS readings for vibration displacement in excess of the following:

Shaft speed range, rpm	Displacement, peak to peak, mils
Up to 900	3.5
901-1800	3.0
1801-3000	2.5
3001-4500	2.0
Above 4500	1.6

      b. Displacement measurements shall be taken radially on the shaft at two points at each bearing, except for well pumps which shall be measured at top of motor. Measuring points shall be 90 degrees apart.
   2. Machines with Antifriction Bearings:
      a. Unless otherwise specified, centrifugal machines with antifriction bearing shafts shall not exhibit unfiltered RMS readings for vibration velocity in excess of 0.12 inch per second. Velocity measurements shall be taken on one point of each bearing housing.

C. Positive Displacement Machines:
   1. Unless otherwise specified, positive displacement machines of the rotary, reciprocating and controlled volume types shall operate without any lateral or torsional vibration characteristics that may accelerate wear of the equipment. The Contractor shall provide manufacturer's certification that the manufacturer has inspected the machine under operating conditions and found it to comply with the requirements of this paragraph.

1.03 CRITICAL SPEED REQUIREMENTS

A. Unless otherwise specified, rotating mechanical equipment shall not exhibit critical speeds within the specified range of operating speeds. Critical speeds for equipment with rigid rotor systems shall be at least 20 percent greater than maximum operating speed. Critical speeds for equipment with flexible shaft-rotor systems shall be at least 15 percent below minimum operating speed and 20 percent above maximum operating speed.

PART 2 PRODUCTS

2.01 PRODUCT DATA

A. Manufacturer's certified data showing location of critical speeds in relation to operating speeds shall be provided as product data in accordance with Section 01 33 00.

PART 3 NOT USED

END OF SECTION

SECTION 43 05 18

VIBRATION ISOLATION SYSTEMS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies vibration isolation system requirements for mechanical equipment. Additional vibration isolation system requirements are provided in individual mechanical equipment specification sections. Mountings which are rigidly anchored to the supporting floor system are specified in Section 43 05 13.

B. Mounting Requirements:

1. Unless the equipment incorporates unit construction using an integral rigid frame or is specified otherwise, each item of mechanical equipment, along with its drive unit, shall be mounted on a rigid steel or steel and concrete base. Cast iron bases are not permitted when equipment is furnished with a vibration isolation system. Where specified, the equipment, including the base, shall be mounted on or suspended from vibration isolators to prevent the transmission of vibration and mechanically transmitted sound to the supporting structure. Vibration isolation available internally in the equipment will not be considered equivalent and shall not be provided when vibration isolation as specified herein is required. Normally provided internal vibration isolators shall be replaced with rigid supports in such cases. Vibration isolators shall be selected in accordance with unit weight distribution to produce reasonably uniform deflections at each support. Unless otherwise specified, bases, isolators, and deflections shall be as specified in the 2019 ASHRAE Handbook for HVAC Applications, Chapter 49, Noise and Vibration Control, Table 47.

C. Design Requirements:

1. The Contractor shall cause all vibration isolation systems, including the isolators, seismic restraints and flexible connectors between the isolated equipment and associated piping, ducting and/or electrical work, to be designed by a professional engineer qualified in this type of work. This provision, however, shall not be construed as relieving the Contractor of his overall responsibility for the work. The Contractor shall submit a copy of the engineer's calculations for design of the vibration isolation systems, stamped with the engineer's seal. Flexible connectors shall be provided by the manufacturer of the mechanical equipment item in accordance with the recommendations of the vibration isolation system engineer.

D. Seismic Restraints:

1. General:

a. Restraint devices shall be designed to resist seismic forces for the project location in accordance with the requirements of the IBC and ASCE-7. Design lateral forces shall be distributed in proportion to the mass distribution of the equipment.

2. Floor Mounted Equipment:
    a. Equipment and appurtenances resiliently floor mounted on spring or pad type vibration isolators, except for curb mounted equipment, shall be provided with seismic snubbers. Equipment shall receive four all-directional restraint/snubbers. The capacity of snubbers, at 3/8-inch deflection, shall be 3 to 4 times the load at the adjacent equipment mount.
        1) Restraint assembly for floor mounted equipment shall consist of welded steel interlocking assemblies welded or bolted securely to the equipment or the equipment bases and the supporting structure. Restraint assembly surfaces which engage under seismic motion shall be lined with a resilient elastomer, 3/4 inches thick. Restraints shall be field adjustable and be positioned for 1/4-inch clearance both vertically and horizontally or clearance as required to prevent interference during normal operation, stopping, or starting. Restraint assembly shall be designed in accordance with the requirements of the IBC and ASCE-7 for the project location.
3. Curb Mounted Equipment:
    a. Seismic restraints for equipment mounted on vibration isolation curbs shall consist of slack stainless steel cables designed to provide restraint in the four primary horizontal directions based on the requirements in the IBC and ASCE-7 for the project location.
4. Suspended Equipment:
    a. Restraint assembly for suspended equipment, piping, or ductwork shall consist of plow steel cable attached to steel thimbles with neoprene sleeve all specifically designed for cable service and securely fastened to the equipment, or the equipment base and the building structure. Cables shall be sized in accordance with the requirements of the IBC and ASCE-7 for the project location. Cables shall be installed to prevent excessive seismic motion and so arranged that they do not engage during normal operation, starting, or stopping.
5. Testing:
    a. Seismic restraint tests shall be conducted in an independent laboratory or under the supervision of an independent registered engineer. The snubber assemblies shall be bolted to the test machine as the snubber is normally installed. Test reports shall certify that neither the elastomeric nor the snubber body sustained any obvious deformation after release of load.

1.02 REFERENCES:

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.03 SUBMITTALS

A. Provide in accordance with Section 01 33 00:

B. Action Submittals:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
2. Scale drawing of Type D mounting hanger showing the 30-degree arc capability.
3. Manufacturer and manufacturer's type designation.
4. Manufacturer's catalog data.

C. Informational Submittals:

1. Seismic system design calculations as specified in paragraph 1.01 Design Requirements.
2. Seismic restraint test reports specified in paragraph 1.01 Seismic Restraint, Testing.
3. Installation report specified in paragraph 3.02.
4. Static and dynamic deflections, weights, isolator locations, and flexible connector designs.

5. Spring deflections and diameters, compressed spring heights and solid spring heights.
6. Curb mounted base seal and wind resistance details.
7. Seismic restraint load deflection curves up to 1/2-inch deflection along the three principal orthogonal axes.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Vibration isolation mountings and seismic restraints shall be as manufactured by Mason Industries, Inc., Korfund Dynamics, Kinetics Noise Control, or equal. Flexible connectors shall be provided by the manufacturer of the mechanical equipment item in accordance with the recommendations of the vibration isolation system engineer.

2.02 BASES

A. Curb Mounted Bases:
   1. Curb mounted equipment where vibration isolation is required, principally roof top heating, ventilating and air conditioning equipment, shall be mounted on vibration isolation bases that fit over the curb and under the isolated equipment. The extruded aluminum top and bottom members shall contain cadmium-plated springs having a 1-inch minimum deflection with 50 percent additional travel to solid. Spring diameters shall be no less than 0.8 times the spring height at rated load. Wind resistance shall be provided by means of resilient snubbers in the corners with a minimum clearance of 1/4 inch so as not to interfere with spring action except in high winds. The weather seal shall consist of continuous closed cell sponge materials both above and below the base and a waterproof flexible neoprene connection duct joining the outside perimeter of the aluminum members. Foam or other contact seals are unacceptable at the spring cavity closure. Caulking shall be kept to a minimum.

B. Type I Bases:
   1. Type I bases shall be structural steel bases. The bases shall be rectangular in shape for all equipment other than centrifugal refrigeration machines and pump bases, which may be "T" or "L" shaped. Pump bases for split case pumps shall include supports for suction and discharge base ells. All perimeter members shall be beams with a minimum depth equal to 1/10 of the longest dimension of the base. Beam depth need not exceed 14 inches provided that the deflection and misalignment is kept within acceptable limits as determined by the manufacturer. Height saving brackets shall be employed in all mounting locations to provide a base clearance of 1-inch.

C. Type II Bases:
   1. Type II bases shall be steel members used to cradle machines having legs or bases that do not require a complete supplementary base. All members shall be sufficiently rigid to prevent strains in the equipment. Height saving brackets shall be employed in all mounting locations to provide a clearance of 1-inch below the base.

D. Type III Bases:

1. Type III bases shall be rectangular foundations consisting of concrete filled structural steel beam or channel forms. Bases for split case pumps shall be of sufficient size to provide support for suction and discharge base ells. The base depth need not exceed 12 inches unless specifically recommended by the base manufacturer or required for mass or rigidity. In general, base depth shall be a minimum of 1/12 of the longest dimension of the base but not less than 6 inches. Forms shall include, as a minimum, concrete reinforcement consisting of 1/2-inch bars or angles welded in place on 6-inch centers each way in a layer 1 1/2 inches above the bottom or additional steel as required by structural conditions. Forms shall be provided with drilled steel members with sleeves welded below the holes to receive equipment anchor bolts where the anchor bolts fall in concrete locations. Height saving brackets shall be employed in all mounting locations to maintain a 1-inch clearance below the base.

E. Type IV Bases:

1. Type IV bases are cast iron bases as specified in Section 43 05 13 and are not permitted when equipment is furnished with vibration isolators.

2.03 VIBRATION ISOLATION MOUNTINGS

A. Type A Mountings:

1. Type A mountings shall be double deflection neoprene mountings having a minimum static deflection of 0.35 inches. All metal surfaces shall be neoprene covered to avoid corrosion and shall have friction pads both top and bottom so that they need not be bolted to the floor. Bolt holes and anchor bolts shall be provided where required to resist lateral migration. Resilient washers and bushings shall be provided to prevent contact between the bolts and the equipment support bases. On equipment such as small vent sets, steel rails shall be used above the mountings to compensate for the overhang.

B. Type B Mountings:

1. Type B mountings shall be free-standing spring type isolators laterally stable without any housing and complete with 1/4-inch neoprene acoustical friction pads between the base and the support. Mountings shall have leveling bolts that must be rigidly bolted to the equipment. Spring diameters shall be no less than 0.8 times the compressed height of the spring at rated load. Springs shall have a minimum additional travel to solid equal to 50 percent of the rated deflection. Mountings shall be hot-dip galvanized steel.

C. Type C Mountings:
   1. Type C mountings shall be Type B mountings with a housing having vertical limit stops to prevent spring extension when weight is removed. Type C mountings shall be provided for equipment with operating weight different from the installed weight, such as chillers, boilers, etc., and equipment exposed to the wind, such as cooling towers. The housing shall serve as blocking during erection and shall be located between the supporting steel and roof or the grillage and dunnage as shown on the drawings. The installed and operating heights shall be the same. a minimum clearance of 1/2 inch shall be maintained around restraining bolts and between the housing and the spring to prevent interference with the spring action. Limit stops shall be out of contact during normal operations. Mountings shall be hot-dip galvanized steel.

D. Type D Mountings:
   1. Type D mountings shall be steel hangers which contain a steel spring and a 0.3-inch deflection neoprene element in series. The neoprene element shall be molded with a rod isolation bushing which passes through the hanger box. Spring diameters and hanger box lower hole sizes shall be of sufficient size to permit the hanger rod to swing through a 30-degree arc before contacting the hole. Springs shall have a minimum additional travel to solid equal to 50 percent of the rated deflection.

E. Type E Mountings:
   1. Type E mountings shall be double deflection, cork and rubber sandwich pads consisting of a high-density cork layer permanently bonded to top and bottom layers of corrugated oil-resistant synthetic rubber. The corrugated design shall allow deflection to increase with load and shall form a nonskid surface to resist lateral migration of the equipment. Bolt holes and anchor bolts shall be provided where required to resist migration. Resilient washers and bushings shall be provided to prevent contact between the bolts and the equipment support bases.

PART 3 EXECUTION

3.01 GENERAL

A. Seismic restraints shall be securely anchored or fastened to the equipment and supporting structure in accordance with approved submittal data. Operating clearances shall be adjusted so that restraints do not interfere during normal operation of the equipment.

3.02 FIELD INSPECTION

A. The vibration isolation manufacturer, or his qualified representative, shall provide such supervision as is necessary to assure correct installation and adjustment of the isolators and seismic restraints. Upon completion of the installation and after the system is put into operation, the manufacturer, or his representative, shall make a final inspection and submit his report in writing certifying the correctness of installation and compliance with approved submittal data.

END OF SECTION

SECTION 43 05 21

COMMON MOTOR REQUIREMENTS FOR EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Squirrel cage type, AC induction motors, up to 500 HP, for up to 4 poles (3600 or 1800 rpm nominal), or up to 250 HP for over 6 poles (1200 rpm or slower) shall be per NEMA MG1, Small or Medium.
   2. Special purpose motors with features or ratings which are not specified herein, are specified in the particular equipment specifications.

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 26 29 23 Variable Frequency Motor Controllers

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ABMA 9	Load Ratings and Fatigue Life for Ball Bearings
ABMA 11	Load Ratings and Fatigue Life for Roller Bearings
IEEE 112	Standard Test Procedures for Polyphase Induction Motors and Generators
IEEE 841	Standard for Petroleum and Chemical Industry- Premium-Efficiency, Severe Duty Totally Enclosed Fan-Cooled (TEFC) Squirrel Cage Induction Motors - Up to and Including 500 HP
NEMA ICS 2	Industrial Control and Systems Controllers, Contactors and Overload Relays Rated Not More Than 2000 Volts AC or 750 Volts DC
NEMA 250	Enclosures for Electrical Equipment (1000 volts maximum)
NEMA MG 1	Motors and Generators
Department of Energy	Energy Policy and Conservation Act, Final Rules EERE-2010-BT-STD-0027-0117
UL 674	Electric Motors and Generators for Use in Division 1 Hazardous (Classified) Locations
UL 1004	Electric Motors

1.04 DEFINITIONS

A. Terminology used in this Section conforms with NEMA MG-1. Motors covered in this specification are those defined in NEMA MG1 as Small (Fractional) and Medium (Integral) AC induction motors.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Unit Responsibility: Where Unit Responsibility is specified in the driven equipment sections of these specifications, the motor supplier shall coordinate with the provider of the driven equipment to verify that the motor provided under this section is fully compatible with and meets the specified performance requirements for that equipment.

1.06 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
      a. Copy of this Section, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
      b. Check-marks (✓) to denote full compliance with a paragraph as a whole. Underline deviations and denote by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance. Include a detailed, written justification for each deviation.
      c. Failure to include a copy of the marked-up specification sections with justification(s) for any requested deviation will cause rejection of the entire submittal with no further consideration.
   2. Motor Data Sheets specified in this Section and Division 01.
      a. Motors in conformance with IEEE 841: Manufacturers to complete IEEE Standard 841 Data Sheet for AC Induction Motors.
      b. Motors not in conformance with IEEE 841: Motor supplier to complete Form 43 05 21-A in Section 01 99 90 with required factory data.
      c. Motor Speed-Torque curve, where specified.
   3. Routine Factory test data for polyphase motors.
      a. High-potential test.
   4. Factory test data, from required dynamometer tests, where specified.
   5. Vibration level when measured in accordance with NEMA MG 1, for all IEEE 841 motors, and where elsewhere specified.
   6. Motor heating curve, where specified,
   7. Motor mounting, outline, dimensions, and weight.
   8. Motor bearing and winding RTDs (resistance temperature detector), where specified.
   9. Motor winding thermostat or thermistor, where specified.
   10. Motor winding space heaters, where specified.
   11. Motor nameplate data.

B. Informational Submittals:
   1. Procedures: Section 01 33 00 and 01 78 23.
   2. Submittal requirements for operation and maintenance manuals as per requirements of Section 01 78 23.

1.07 QUALITY ASSURANCE

A. Factory Testing:
   1. All polyphase motors shall be factory tested in conformance with routine tests per NEMA MG1 and IEEE 112. Provide the following tests:
      a. Measurement of winding resistance.
      b. No-load readings of current and speed at normal voltage and frequency.
      c. Current input at rated frequency with rotor at standstill.
      d. High potential test.

B. Where specified for use in corrosive or hazardous locations, motor testing shall additionally be per IEEE 841. Test report shall be certified by the motor manufacturer's test personnel and submitted to the Engineer.
   1. For motors larger than 100 horsepower, test and submit results for the following:
      a. Routine tests per NEMA MG1 and IEEE 112. Provide tests as noted in paragraph 1.07 Factory Testing. Test report shall be certified by the motor manufacturer's test personnel and submitted to the Engineer.
      b. For motors larger than 200 horsepower, efficiency and power factor by Test Method B, IEEE 112. Submit Form B and B-2.

1.08 DELIVERY, STORAGE AND HANDLING

A. Procedures shall be in accordance with Section 01 66 00.

1.09 SPECIAL WARRANTY

A. Provide warranty in accordance with Section 01 77 00.

B. Submit warranties in writing to include 100 percent full payment coverage for parts and labor for repair or replacement of the motor (s) during the warranty period.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. The manufacturer's standard product may require modification to conform to specified requirements:
   1. Baldor
   2. General Electric
   3. Siemens
   4. US Motors
   5. WEG
   6. Approved Equal

2.02 PERFORMANCE/DESIGN CRITERIA

A. Service Conditions:
   1. Temperature: -25-degree C to +40 degree C.
   2. Altitude: 0 to 3300 feet above sea level minimum.
   3. Derate motors for higher ambient temperature and for higher altitude with motor size based on brake-horsepower.

B. Design Requirements:
   1. Operation: Continuous.
   2. Compliance: Energy Policy Act of 1992 (EPAct), Final Rule 2014.
   3. Tolerance: +/- 10-percent of rated voltage at rated frequency; +/- 5-percent of rated frequency at rated voltage.
   4. Standard design: NEMA Design B.

C. Service Factor (percent of additional horsepower):
   1. 1.15 for Sine-wave motors.
   2. Dual rating: 1.15 Sine-wave and 1.0 Inverter Duty for Inverter Duty motors.

D. Motor Efficiency:
   1. NEMA Premium™ efficiency electric motor, single-speed, polyphase, 1-500 horsepower, 3600-rpm 2-pole, 1800-rpm 4-pole, and 1200-rpm 6-pole (1-250 HP), squirrel cage induction motors, NEMA Design B, continuous rated. NEMA Standards Publication MG 1 2011, in Table 12-12.

2.03 MATERIALS

A. Motor frames:
   1. TEFC motors shall be cast iron.
   2. Aluminum frame motors are not permitted.

B. Stator windings:
   1. Shall be copper with Class F minimum insulation not to exceed Class B temperature rise of 80-degree C at rated load and with Design B torque /current characteristics for all Medium (Integral) motors.
   2. Small (fractional) motors shall be supplied with Class F insulation where available.

C. Rotor material shall be aluminum or copper.

D. Fans shall be non-sparking fan blades.

E. Motor leads shall be non-hygroscopic.

2.04 MOTOR TYPES

A. General Requirements for motors 1/2 horsepower through 500 horsepower:
   1. Three phase, squirrel cage, with copper windings.
   2. Rated for full voltage starting and continuous duty.
   3. Rating shall be:
      a. 460/ 230 volts, three-phase, 60-Hertz, as shown on the contract drawings.
   4. General Purpose Type motors, which may also be called Type 1 per the project equipment specifications shall be:
      a. Open Drip Proof Motors, shall be as defined per NEMA MG1, self-cooled by convection air.
      b. Weather-Protected Type I Motors (WP-I), shall be as defined per NEMA MG1, similar to ODP construction with addition of screens to prevent entry of rain, snow, and particles, or objects into the motor. Suitable for clean indoor and protected outdoor installations.
      c. Weather Protected Type II Motors (WP-II) shall be as defined per NEMA MG1, with maximum protection from entry of airborne particles, moisture and high velocity air. Suitable for unprotected outdoor installations.
   5. Severe Duty Type Motors, which may also be called Type 2 per the project equipment specifications, shall be in accordance with IEEE 841.
      a. Totally Enclosed Fan-Cooled Motors (TEFC) shall be defined per NEMA MG1.
      b. Enclosure: totally enclosed, fan cooled, with external fan blowing air to the motor frame cooling fins for cooling.
      c. Applications: severe duty and most outdoor installations.
   6. Explosion Proof Type Motors, which may also be called Type 3 per the project equipment specifications.
      a. Enclosures: UL listed explosion proof
      b. Applications: hazardous locations including Class I and Class II (Division 1 and 2), and Class III classified areas.

B. Motors Less Than 1/2 Horsepower:
   1. Type shall be:
      a. Squirrel cage, capacitor start with Class F insulation and copper windings.
      b. Fan motors rated 1/8 horsepower or less: split-phase or shaded-pole type.
   2. Rating shall be:
      a. 115Volts, single phase, 60 Hz.
      b. 208 Volts, single phase, 60 Hz.
      c. 230 Volts, single phase, 60 Hz..

2.05 COMPONENTS

A. Inverter-Fed Polyphase Motors per NEMA MG1 Part 31:
   1. Applications: variable torque or constant torque loads, for vertical or horizontal motors with variable frequency drive controllers (VFD).
   2. Features shall include:
      a. Insulation design to meet 2000-Volt peak at a minimum of 0.1 micro-second rise time.
      b. Built-in motor winding protection as specified.
      c. Electrically insulated bearings or,
      d. Provide Electro Static Technology's AEGIS Shaft Grounding Ring for Bearing Protection or equal. The shaft grounding ring shall be solidly bonded per manufacturer's recommendations.

B. Vertical Motors:
   1. Features: Inverter duty or non-inverter duty with solid shaft P-base and high thrust bearing compatible with loads imposed by the driven equipment.

C. Thermal Protection:
   1. Unless specified otherwise in the driven equipment specification, provide the following:
      a. Motors up to 200 horsepower:
         1) Thermal switches (thermostats), one per winding, encapsulated, normally closed and wired in series out to a terminal box).
         2) Motor Nameplate: Marked "OVER TEMP PROT 2" in accordance with NEMA MG 1 12.43.
   2. Motors larger than 250 horsepower:
      a. 100 ohm platinum RTDs, two per phase embedded in each winding phase and one for each motor bearing.
      b. RTDs shall be brought out to a separate control terminal box mounted on the motor.
      c. Motor Nameplate: Marked "OVER TEMP PROT 1" in accordance with NEMA MG 1 12.43.

D. Motor Nameplates:
   1. Materials: Engraved or stamped stainless steel.
   2. Features shall be as follows:
      a. NEMA Standard MG 1 motor data.
      b. Permanently fastened to the motor frame.
      c. ABMA bearing identification number for motors meeting IEEE 841.
      d. NEMA nominal efficiency for all motors.
      e. NEMA nominal and minimum efficiency for motors meeting IEEE 841.
      f. UL frame temperature limit code for explosion proof motors.
      g. Space heater data.
      h. Over Temperature Protection Type Number.

i. Temperature device rating and alarm and shutdown setpoint.

j. Provide motor nameplates for motors with space heaters located in Class I, Division 2, Groups C, and D areas in accordance with NEC 501.125(B).

E. Conduit Boxes:

1. Provide oversized boxes, with split construction with threaded hubs and petroleum-resistant gaskets.
2. Conduit boxes can be rotated in order to permit installation in any of four positions 90 degrees apart.
3. Provide grounding lug located within the conduit box for ground connection.
4. Provide separate conduit boxes for temperature devices and space heaters.
5. Separate terminal box for any signal leads (RTD, thermistor, vibration transmitter, etc.).

F. Bearings:

1. Provide oil or grease lubricated ball bearings, angle contact roller bearings for axial thrust loads, and cylindrical bearings for radial-only loads.
2. Rated for a minimum L-10 life of 50,000 hours for direct-connected loads.
3. Cartridge type bearings will not be accepted.
4. Fitted with lubricant fill and drain or relief fittings.
5. Belt loads not to exceed forces calculated from NEMA MG 1 Table 14-1 and 14-1A.

G. Bearing lubrication shall be either grease or oil as per the requirements in either 1 or 2:

1. Grease lubricated bearings:
   a. Shall be for electric motor use only.
   b. Grease shall be capable of higher temperatures associated with electric motors and shall be compatible with Polyurea-based greases.
   c. Provide grease fittings, similar to Alemite™ type (or equivalent).
   d. Shielded bearings with regreasable provisions are permissible.
2. Provide oil lubricated bearings with externally visible sight glass to view oil level.

H. Lifting Eyes:

1. Provide lifting eyes with a safety factor of 5.
2. Provide one lifting eye for motors more than 50 pounds.
3. Provide two lifting eyes for motors over 150 pounds.

I. Winding Space Heaters when specified or shown:

1. Provide winding space heaters to prevent condensation.
2. Rating: 120 volts, single phase, 60 Hertz.
3. Motor nameplate to show space heater rating in watts and volts.
4. Provide terminal block in motor conduit box for heater leads termination.

2.06 FINISHES

A. Paint Finish:

1. Provide standard manufacturer paint finish.

2. Provide motors with semi-gloss finish, scratch and heat resistance electric motor paint.

PART 3 EXECUTION

3.01 EXAMINATION

A. Delivery Inspection:
   1. Inspect driven equipment-motor assembly and components immediately upon delivery and unloading at the job site for damages.
   2. Take photos of damage(s) if any, to substantiate the delivery inspection report.

3.02 INSTALLATION

A. Grounding of Motors:
   1. Connect the motor feeder ground cable (green) to the grounding lug terminal in the conduit terminal box.

B. Supplemental Grounding of Motors: Provide for motors fed from VFDs, all motors above 100 horsepower, and all motors in classified areas, where feasible.
   1. Bond the motor frame to the grounding grid/electrode system to provide supplemental grounding.

C. Field Coating of Motors:
   1. Refer to the driven equipment specification section and Section 09 90 00 for coating requirements.

3.03 FIELD QUALITY CONTROL

A. Field Testing:
   1. Measure winding insulation resistance of motors to no less than 10-megohm with a 1000-Vac megohmmeter.
   2. Perform motor phases current imbalance testing for motors 20 horsepower and larger.
   3. Test motors for proper rotation prior to connection to the driven equipment.
   4. Perform thermographic survey per NETA ATS, for motors over 100 horsepower.

B. Field Inspection:
   1. Compare equipment nameplate data with drawings and specifications.
   2. Inspect physical and mechanical condition.
   3. Inspect anchorage, alignment, and grounding.
   4. Verify the installation of breather/drain fittings as specified herein.
   5. Check for proper connections of space heaters, winding and RTDs and or thermostats.
   6. Visually check for correct phase and ground connections:

C. Manufacturer Services: Provide where specified or shown on the drawings.
   1. Provide services to the driven equipment manufacturer for the inspection and certification of the installation of the motor driven equipment.
   2. Provide assistance in the start up and operational testing of the motor driven equipment.

3.04 SYSTEM START UP

A. Commissioning Test: Provide where specified or shown on the drawings.
   1. Provide assistance during the commissioning test of the motor driven equipment.

3.05 CLOSEOUT ACTIVITIES

A. Operation and Maintenance:
   1. Provide the operation and maintenance manual of the motor(s). Include testing result information in the O&M manual.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 43 11 17.16

HORIZONTALLY SPLIT MULTISTAGE CENTRIFUGAL BLOWERS, CONSTANT VOLUME

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies electric motor driven multistage centrifugal blowers with appurtenances for use in constant volume applications.

B. Type:
   1. Motor driven blowers provided under this section shall be of the multistage centrifugal type with outboard shaft bearings. The blower shall be direct connected to an electric motor driver through a flexible coupling. Included with the blower shall be the drive motor, blower controls, base, vibration detection system, intake and discharge flexible couplings, valves, and other items as specified.

C. Definitions:
   1. Standard Cubic Feet Per Minute (SCFM):
      a. The volumetric flow rate in cubic feet per minute at 68 degrees F, 14.70 pounds per square inch absolute pressure and 36-percent relative humidity.
   2. Actual Cubic Feet Per Minute (ACFM):
      a. The volumetric flow rate in cubic feet per minute actually entering the blower at the site temperature, pressure, and relative humidity.
   3. Absolute Pressure (PSIA):
      a. The total pressure measured from an absolute vacuum is the absolute pressure. Units are pounds per square inch absolute (psia).
   4. Discharge Pressure (PSIG):
      a. The pressure at the compressor discharge at site conditions. Units are pounds per square inch gauge (psig).
   5. Inlet Cubic Feet Per Minute (ICFM):
      a. Same as actual cubic feet per minute.

D. Equipment List:

Item	Equipment Number
Blower 1	70-B-00010
Blower 1 Check Valve	00014
Blower 1 Control Valve	CV-00013
Blower 1 Silencer	70-SLR-00030
Blower 2	70-B-00020
Blower 2 Check Valve	00024
Blower 2 Control Valve	CV-00023

E. Performance and Design Requirements:

1. General: The multistage centrifugal blower provided under this section will be operated as a duty/standby system with similar equipment to produce scour air for filter backwashes. The blower will be operated at constant volume.
2. Operating Conditions: The blowers will be installed in reinforced concrete building which will be ventilated with filtered, tempered air. Ambient temperatures within the room are expected to range between 60 and 85 degrees F. The plant site is located at approximately 5320 feet above sea level. Blower supply air will be taken from medium efficiency viscous panel filters located on independent blower air intake ducts.
3. Operating Requirements:
   a. The blowers provided under this section shall meet the following operating requirements:

Condition A[1]	
Inlet pressure, psia	11.8
Inlet temperature, degrees F	-11°F
Relative humidity, percent	36
Discharge pressure, psia	15.6
Mass flow rate, scfm[a]	1,416
Shaft efficiency, min., percent[3]	70
Operating condition	Throttled

Condition B[2]	
Inlet pressure, psia	11.8
Inlet temperature, degrees F	108°F
Relative humidity, percent	36
Discharge pressure, psia	15.7
Mass flow rate, scfm[a]	1,416
Shaft efficiency, min., percent[3]	70
Operating condition	Throttled
Notes:	
[a]Standard conditions (68 deg F, 14.696 psia)	

Condition C[3]	
Inlet pressure, psia	11.8
Inlet temperature, degrees F	-11°F
Relative humidity, percent	36
Discharge pressure, psia	16.5
Mass flow rate, scfm[a]	1,416
Shaft efficiency, min., percent[3]	70
Operating condition	Throttled
Notes:	
[a]Standard conditions (68 deg F, 14.696 psia)	

Condition D[4]	
Inlet pressure, psia	11.8
Inlet temperature, degrees F	108°F

Condition D[4]	
Relative humidity, percent	36
Discharge pressure, psia	16.6
Mass flow rate, scfm[a]	1,416
Shaft efficiency, min., percent[3]	70
Operating condition	Throttled

Notes:

[a]Standard conditions (68 deg F, 14.696 psia)

b. In addition, the following limitations shall apply to the motor:

Motor speed, rpm	3600
Motor horsepower, maximum[2]	100
Motor full load power factor, minimum	89.0

Notes:

1. *Condition A shall be the blower's rated condition. Because the blower will be operated at constant volume, the blower shall be selected to position Condition A as close as practicable to the best efficiency point on the blower's output pressure-capacity curve. The blower's shaft efficiency at the rated condition shall be not less than that listed.*
2. *Condition B is the estimated operating requirement for the blower under conditions which will impose the greatest mass flow through the machine. The blower motor shall be selected to drive the unthrottled blower without overloading under this condition. Use of the motor's service factor rating to meet this requirement will not be accepted.*
3. *Shaft efficiency shall be defined as the ratio of the adiabatic power for compression of a perfect gas to the power driving the blower shaft. Shaft efficiency shall be calculated in accordance with ASME PTC-13 with k, the ratio of specific heats, taken as having a value of 1.40 for air. Standard atmospheric conditions shall be taken as 68 degrees F, 14.7 psia, and 36 percent relative humidity.*

c. The blower shall have, as a minimum, 0.75 psi pressure rise to surge from the rated discharge pressure. The surge point shall be not more than 50 percent of the volume produced at Condition A.

F. Controls:

1. Each blower shall be provided with a wall-mounted control cabinet to contain the machine's start/stop controls as well as monitoring and safety/shutdown systems.

1.02 QUALITY ASSURANCE

A. Factory Tests:

1. Each blower shall be subjected to a factory test. Factory tests shall be performed in accordance with ASME PTC-10, Class II. The test shall be conducted at constant speed and shall extend from the surge point to not less than 120 percent of design volume at design pressure. The test shall be sufficiently comprehensive to produce guaranteed performance characteristics.
2. The test data shall be employed to produce operating curves showing pressure-capacity, power-capacity, and efficiency-capacity curves and surge points for each operating condition specified. Capacity shall be in inlet cfm.
3. Test logs and guaranteed performance curves shall be provided and certified by an officer of the blower manufacturer's corporation under penalty of perjury.
4. The motor shall be subjected to a factory test which shall consist of:
   a. No load current and speed

b. Locked rotor current
c. Winding resistance
d. Four-hour heat run
e. Winding and bearing temperature at end of heat run
f. Hi-pot test in accordance with NEMA MG1-20.47
g. Bearing inspection

5. The specified tests shall be performed in accordance with NEMA MG1-12 or MG1-20, as applicable. Copies of the results, plus the computer design calculation printout for efficiency and power factor (at 100 percent, 75 percent and 50 percent of full load) and locked rotor current shall be provided and certified by an officer of the motor manufacturer's corporation under penalty of perjury.

B. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
AISI	Pocketbook of AISI Standard Steels
ANSI H35.1	Alloy and Temper Designation Systems
ANSI/IEEE 112	Polyphase Induction Motors and Generators
ASME PTC-10-65 (R1992)	Power Test Code for Exhausters Compressors
ASTM A36/A36M	Structural Steel
ASTM A48	Gray Iron Castings
NEMA MG1	Motors and Generators

C. Unit Responsibility:

1. The Contractor shall assign unit responsibility as specified in Section 43 05 11 to the blower manufacturer for the equipment specified in this section. A certificate of unit responsibility shall be provided.

1.03 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
2. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
3. Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
4. Manufacturer's catalog data and shop drawings confirming dimensions, weight, construction, and installation details of blower and all associated equipment.
5. Predicted performance curves for the specified operating requirements under both Conditions A and B showing pressure-capacity, power-capacity, and efficiency-capacity curves and surge points. Capacity shown in inlet cfm. All performance parameters are to reflect site conditions as listed in this Section for each operating condition. Sample actual test condition inlet/specified condition acfm conversion calculations shall also be provided.
6. Predicted power-capacity (inlet cfm) curves for blowers for inlet throttled operation under Conditions A and B at inlet valve positions from 70 degrees open to 20 degrees open in 10-degree increments.
7. Operating noise levels shall be provided for the motor and blower combination. Noise shall be expressed as sound pressure levels (SPL) in decibels as read on the "A" weighting network of a standard sound level meter (dbA); all measurements shall be made in relation to a reference pressure of 0.0002 microbar.
8. Drawing and catalog information detailing all control devices in the control cabinets as well as overall panel layout interconnection diagrams and construction.
9. Spatial requirements, showing clearances required for maintenance purposes.
10. Motor data, Section 43 05 21-Form A as required in Section 43 05 21.

1.04 ENVIRONMENTAL CONDITIONS

A. Blowers to be installed under this section shall be suitable for continuous service and installation indoors at an elevation of 5315. Temperatures are expected to range between 0 and 105 degrees F in the room. Relative humidity within the room is expected to range between 23 and 80 percent.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Blowers shall be multistage centrifugal compressors as manufactured by Gardner Denver, Continental Blower, Or approved equal modified to meet specified requirements.

2.02 MATERIALS

A. Materials of construction shall be as follows:

Component	Material
Casing and bearing housing	Cast iron, ASTM A48, Class 25
Impeller	Cast aluminum, ANSI H35.1 Type 443 or fabricated aluminum, ANSI 5052-H-34
Shaft	Steel, SAE 1045 or AISI 1045
Tie rods	Steel
Base	Structural steel, ASTM A36

B. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

2.03 EQUIPMENT FEATURES

A. Multistage Blower:

1. The multistage centrifugal blower shall utilize single piece, cast iron, volute sections which are assembled in sufficient number with the inlet and discharge sections to provide the number of compression stages required to achieve the specified discharge pressure. The complete assembly shall be held together with high strength steel tie rods which shall connect body flanges on the suction and discharge heads. Inlet and discharge connections shall be flanged and oriented and sized as specified. The interstage sealing diaphragm shall be cast as a part of each casing inlet to each stage to ensure proper approach conditions, reduce turbulence, and improve blower efficiency. Shaft end seals shall be the carbon ring or lead babbitted labyrinth type. Interstage seals shall be aluminum labyrinth type.

2. Bearings shall be oil lubricated, anti-friction type sized for an L-10 bearing life of 100,000 hours. Bearing lubrication shall be by constant-level oilers. Bearings shall be mounted in outboard cast iron housings which shall be designed to affect a complete separation between the bearing and the casing to isolate the bearing from the heat generated by the machine. Bearings shall be replaceable without disconnecting any piping or disassembling the machine. Each bearing assembly shall be provided with a thermo-well and replaceable switch type temperature detector.
3. Impellers shall be keyed to the shaft and held in place by abutting spacers and lock washer assemblies. The rotating assembly shall be statically and dynamically balanced to limit vibration to 1.25 mil (peak-to-peak) when measured on the outboard bearing housing at design speed. Maximum rotor tip speed shall not exceed 450 feet per second. The first critical speed of the rotating assembly shall be not less than 20 percent above the operating speed.

B. Motor:
1. Each blower drive motor shall be guarded, dripproof, 480 volts, 3 phase, 60 hertz, squirrel cage induction type. The motor shall be continuous time rated in accordance with NEMA MG1, paragraph 10.35. The motor shall have a service factor of 1.15. The driven load, including shaft connected power absorbing accessories, shall not exceed the motor's nameplate rating. Insulation shall be Class F, with Class B (80 degrees C) rise based upon a 60-degree C ambient temperature. Maximum locked rotor current shall be 650 percent of full-load current. Torque rating shall conform to NEMA MG1-20.41. The motor shall be a high-efficiency design. Minimum guaranteed full-load efficiency shall be tested in accordance with IEEE 112, Method B. Rotor and stator windings shall be copper, form wound type, sealed with vacuum impregnated epoxy resin. Windings shall pass the sealed winding conformance test in accordance with NEMA MG1-20.48. The windings shall be braced to permit across-the-line full voltage starting. Two temperature detectors, embedded in the windings and wired to the motor temperature detector junction box, shall be provided for each phase. Only one detector per phase shall be wired to the temperature monitor. The motor enclosure shall be guarded, drip-proof type of cast iron or fabricated steel not less than 0.125 inches thick. Washable air filters, differential air pressure gages, and stainless steel screens shall be provided over all enclosure openings. The enclosure shall be painted, inside and out, with a chemical resistant epoxy paint. Two lifting eyes shall be provided.
2. The motor enclosure shall be provided with an anticondensation heater designed for operation on 120 VAC, single-phase, 60 Hz. The heater rating and voltage shall be noted on the motor nameplate. Maximum surface temperature shall be 200 degrees F. Space heater terminals shall be wired to a separate terminal box.
3. Bearings shall be grease lubricated, anti-friction type, sized for an L-10 bearing life of 100,000 hours. Each bearing assembly shall be provided with a thermo-well and a replaceable switch type temperature detector.

C. Base and Isolation Pad:

1. The blower and motor shall be connected through a flexible coupling and shall be mounted on a common structural steel base, which shall be designed to keep the unit in proper alignment. The structural steel base shall rest upon a one-piece cork and rubber sandwich isolation pad consisting of a high-density cork layer permanently bonded to top and bottom layers of waffle embossed, oil-resistant, synthetic rubber. The structural base and its isolation pad shall in turn be mounted upon a concrete equipment pad.

D. Accessories:

1. Inlet Valve:
   a. The inlet valve shall be an actuated control valve as specified in Section 40 05 64. The operator shall be a manual chain wheel type as specified in Section 40 05 57.13.
2. Discharge Check Valve:
   a. The blower shall be supplied with a discharge check valve suitable for use in the service specified and capable of providing an airtight seal upon closure with minimum pressure loss when open. The check valve shall be of the double disc, center pivot, spring assisted type, specifically designed and suitable for installation in the orientation shown under the operating conditions and test pressures specified. When necessary because of piping configuration or valve orientation, special lightweight discs and/or special springs shall be provided to assure proper operation and sealing or to minimize pressure loss. All components shall be suitable for use with air temperatures as great as 300 degrees F. Valves shall be APCO series 9000, Stockham Duo-Chek II, Gulf Valve Model MB, or equal, modified to meet specified requirements.
3. Coupling and Guard:
   a. Each blower shall be directly coupled to the electric motor through a dry type spacer coupling. An OSHA approved coupling guard of heavy gauge steel shall be included, bolted solidly in place.
4. Expansion Joints:
   a. Single arch, flexible rubber expansion joints as specified in Section 40 05 06.23-2.01 Elastomer and Fabric Construction shall be provided by the blower manufacturer at the suction and discharge connections to the blower.
5. Blowoff Silencer:
   1) The blower shall be provided with a discharge blowoff silencer suitable for installation as specified. The silencer shall be selected to limit noise to not more than 96 dba 3 feet from the blowoff exhaust.
   2) The blow-off silencer shall be an inline absorption type, provided with flanged connections for installation in piping as shown on the drawings. Silencer shall be Stoddard, Universal, or equal.
   3) Blow-off silencer shall be constructed of carbon steel, with manufacturer's standard epoxy coating.
   4) The blowoff silencer shall be shipped loose for installation in the blowoff piping by the Contractor.

E. Instruments:
   1. General:
      a. Each blower shall be provided with a discharge pressure gauge and a motor current ammeter.
         1) The pressure gauge shall be mounted as recommended by the blower manufacturer and as specified in this section.
         2) All blower instruments shall be field calibrated and tested under actual operating conditions by the blower manufacturer.
   2. Pressure Gauge:
      a. The pressure gauge shall comply with Section 40 73 00.
   3. Ammeter:
      a. Ammeter shall display blower motor current and be calibrated to blower capacity in scfm. The ammeter shall show surge region, design point, and maximum blower capacity corresponding to nameplate motor capacity.

F. Controls and Electrical:
   1. General:
      a. Control and electrical devices and systems shall conform to Divisions 26 and 40 of this project manual. Where 24-VDC controls are provided, two power supply transformers shall be provided for each control cabinet.
   2. Control Cabinet:
      a. The control cabinet construction shall conform to the requirements of Divisions 26 and 40 of this project manual.
   3. Monitors:
      a. The control cabinet shall contain instruments to monitor the following:
         1) Blower discharge volume, scfm (from calibrated ammeter)
         2) Elapsed time meter, hours
   4. Safety Shutdown:
      a. Safety shutdown circuits shall be provided for the following:
         1) Surge
         2) Motor overcurrent. If motor current rises to 100-percent nameplate rating, the unit shall shutdown according to the emergency shutdown sequence.
   5. Indicating Lights:
      a. Indicating lights shall be provided to indicate blower status as follows:

Ready	Green
Running	Red

2.04 SPARE PARTS

A. Spare parts shall be provided for each blower as follows:
   1. 1 set--end seals and interstage seals
   2. 2 sets--all gaskets
   3. 1 set--main bearings

4. 1 set--special tools required for maintenance, if any

B. Spare parts shall be tagged and stored in accordance with Section 43 05 11-2.12.

2.05 PRODUCT DATA

A. The following information shall be provided.
   1. Certified results of factory blower and motor tests including test logs as specified in paragraph 1.02 Factory Tests.
   2. Certified performance curves for each unit based upon pressure-capacity, power-capacity, efficiency-capacity curves, and surge points.
   3. Certification that blowers operate under first critical speed in accordance with the requirements of paragraph 2.03 Multistage Blower.
   4. Motor product data as specified in Section 43 05 21-2.05.
   5. Certified balancing test logs.
   6. Operator and maintenance information as specified in Section 01 78 23.
   7. Installation Certification Section 43 05 11-Form A specified in paragraph 3.01.
   8. Training Certification Section 43 05 11-Form B specified in paragraph 3.03.

PART 3 EXECUTION

3.01 INSTALLATION

A. The blower shall be connected and installed in accordance with the manufacturer's recommendations. Installation and alignment shall be performed by millwrights. The installation shall be certified on Form 43 05 11-A as specified in Section 01 99 90.

3.02 START-UP AND TESTING

A. The equipment provided under this section shall be started and tested only under the direction of personnel provided by the equipment manufacturer. To that end, the Contractor shall cause the manufacturer to furnish start-up and testing specialists factory trained in the proper procedures for initial installation, initial testing, and commissioning of the equipment. All such activities shall be performed under the direction of these specialists. This provision, however, shall not be construed as relieving the Contractor of overall responsibility for this work.

B. Test procedures shall conform to the requirements of Section 01 45 20 and those specified in this Section 43 11 17.16. They shall contain the following features:
   1. Static tests of all control and protective circuits.
   2. Not less than 2 cold starts.
   3. Not less than 24 hours of continuous operation at full load.

C. Commissioning shall conform to the requirements of Section 01 91 00.

3.03 TRAINING

A. The Contractor shall cause the equipment manufacturer, as a part of the commissioning services, to provide not less than 16 hours of on-the-job training. Training shall include the requirements of Section 01 79 00 and the following:
   1. Centrifugal blower theory.
   2. General operational information for the specific equipment provided under this section.
   3. Operation of the equipment in automatic and manual modes.
   4. Troubleshooting.
   5. Routine maintenance.

B. Training shall be certified on Form 43 05 11-B as specified in Section 01 99 90.

END OF SECTION

SECTION 43 23 03

GENERAL REQUIREMENTS FOR CENTRIFUGAL AND AXIAL-FLOW PUMPING EQUIPMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section, when referenced in the detailed specification section, provides minimum requirements applicable to centrifugal and axial-flow pumping equipment furnished under this contract. More restrictive requirements and/or specific citation or requirement in conflict with a 43 23 03 provision, where found in individual pump specifications, supersede requirements of this section for each specific instance.
2. "Detailed pump specification," "detailed specification," "individual pump specification," "referencing section," or words of similar import in this section, mean the specification section where the requirements for specific pump performance are presented. "Pumping unit," whenever and wherever used, means the complete pumping assembly, including driver (whether engine, turbine, or motor) and includes accessories such as variable-speed drives required for motor operation, gear reducers, intermediate shafting and bearings, flywheels, and supports for equipment furnished with the pump.
3. For a subset of pumps, a number of provisions of this section are required. These requirements (refer to paragraphs 1.05 and 1.07 in this section) are in addition to requirements applicable to pumps. The subset of pumps is defined as pumping equipment meeting any of the following criteria:
    a. All pumping unit specifications where the words "custom-engineered" appear in the title of the specification section
    b. Where a particular Section 43 23 03 provision is cited in the detailed section

B. Definitions:

1. The following definitions apply for classifying pumps specified in this and referencing sections:
    a. General: Terminology and definitions in this section follow those established in American National Standards Institute (ANSI)/Hydraulic Institute (HI) 9.1 through 9.5, unless otherwise noted.
    b. Solids-bearing liquids: Liquids to be pumped containing, or assumed to contain, solids that require appropriate pump design considerations and/or materials of construction. Solids-bearing liquids are liquids with settleable solids exceeding 50 milligrams per liter (mg/L) and include wastewater, stormwater, primary effluent, return sludge, return activated sludge (RAS), trickling filter circulation, and similar services.
    c. Clear liquids: Liquids to be pumped mostly free of deleterious solids. Potable water, heat reservoir, raw water, secondary effluent pumping, and similar services are clear liquids.

d. Efficiency: For the purposes of this section and sections referencing this section, efficiency, as related to pumps, is the ratio of the pump output power (water horsepower [hp]) divided by the pump input power (brake horsepower) required to deliver the total head, with meanings as defined in ANSI/HI 14.2.6.6. For column-type pumps, efficiency is computed inclusive of inlet, bowl, column, and discharge head losses.

e. Net positive suction head, 3 percent reduction (NPSH3): For the purposes of this section and sections referencing this section, NPSH3 means the value of net positive suction head (NPSH) resulting in a reduction of 3 percent in the developed pump discharge head when the pump is tested in accordance with procedures established by ANSI/HI. NPSH3 is the successor designation to net positive suction head required (NPSHR). Where NPSHR is used in the contract documents it means NPSH3.

f. NPSH margin: For the purposes of this section and sections referencing this section, "NPSH margin," wherever used, means net positive suction head available (NPSHA) divided by the candidate pump's NPSH3 for the specific operating condition in question.

g. POR: preferred operating region as defined in ANSI/HI 9.6.3.

h. AOR: allowable operating region as defined in ANSI/HI 9.6.3.

1.02 TYPE

A. Provisions and requirements contained in this section apply specifically to centrifugal and axial-flow pumps, both vertical and horizontal, commonly falling into the generic types covered by ANSI/HI 14.1 through 14.3. This section does not apply, except by specific reference, to positive-displacement pumps of any type.

1.03 REFERENCES

A. This section (Section 43 23 03) contains references to the following documents. They are a part of this section and any referencing section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. The following order of precedence prevails in the event of conflict between the requirements of this section or any referencing section and those of the listed documents (in the order of primacy):

1. The referencing section
2. This section
3. The referenced document

B. Unless otherwise specified, references to documents mean the documents in effect at the time of advertisement for bids or invitation to bid (or on the effective date of the agreement if there were no bids). References to documents mean the replacement documents issued or otherwise identified by the organization if referenced documents have been discontinued, or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued, or replaced.

For the purposes of this specification, Annex A of ISO 10816, Part 7 forms a part of this specification and ISO 10816, Part 7.

1.04 DESIGN REQUIREMENTS, ALL PUMPS:

A. General:

1. Equipment furnished under sections referencing this section shall meet the longevity objective that the pumping equipment, motor, shafting, couplings and appurtenances are designed for at least a 20-year service life and 3 years of “uninterrupted operation.” Select all components associated with the rotating elements in the drive train, including equipment supports and supports for rotating elements, that are designed to function without damage or disassembly at reverse rotational speeds up to 130 percent of maximum operational speed during flow reversals through the pump. The complete pumping unit shall operate without overload on any component at any point along the pump’s entire full-speed operating curve. Furnish pumps required by virtue of the specified operating conditions to operate against a closed valve or throttled for any period of time exceeding 5 seconds with drivers sized to operate continuously at the power requirement for that condition even though the power requirements at the rated condition may be less.
2. Pump selections proposing maximum diameter impellers for the proposed pump model and casing size will not be accepted.
3. With the exception of submersible pumps and the inlet connection for pumps designed to operate in open forebays or wetwells, pump connection nozzles shall be designed for the loads and moments stipulated in ANSI/HI 9.6.2. Where ANSI/HI 9.6.2 does not cover a specific pump type or category, or where that document is silent on allowable nozzle loads or a particular type of nozzle load (e.g., thermal pipe strain), the contractor shall furnish documentation from the manufacturer attesting to the limitations on loads and moment forces that can be tolerated on each connection and recommended connection details to be used.

B. Pump Selection:
   1. Proven designs:
      a. Pumps furnished under sections referencing this section shall be proven designs that have been in similar conditions of service with no objectionable performance characteristics for a period of not less than 5 years. The contractor shall furnish a detailed list of installations with contact information supporting qualification under this requirement with the information required under paragraph 1.08. To satisfy this requirement, the listed pump shall be of the same size volute or bowl, discharge case and nozzle size, and impeller design (including number of vanes) and is operating under similar conditions of pumped fluid, head, capacity, speed, rotation, and NPSHA.
      b. The contractor may propose alternative equipment that cannot meet the requirement for a proven design under this paragraph, subject to additional documentation requirements and under the following conditions:
         1) The proposed design has been in successful operation under similar conditions of volute or bowl, discharge case and nozzle size, impeller design (including number of vanes), pumped fluid, head, capacity, rotation, and NPSHA, but at a higher speed for a period of not less than 3 years.
         2) The proposed design has been in operation in designs where both larger and smaller nozzle size pumps have been in service for a period of not less than 5 years, and impeller design (including number of vanes, plus or minus one vane in pumps with four or more vanes), pumped fluid, head, capacity, speed, and NPSHA are similar to that for the proposed installation and within one synchronous speed higher or lower than that indicated in the detailed specification.
         3) In addition to the installation list required under this paragraph, provide dimensional drawings, bill of materials, and historical (certified) shop test results for candidate pumps documenting performance including, but not limited to head, capacity, speed, and NPSHR, and limit of stable hydraulic operation based on the onset of suction recirculation, if available. Results should match or bracket the specified performance and two or more candidate pump results may be required.
      c. If the proposed pump is not a proven design under either of the above paragraphs, the contractor shall demonstrate, by operation of a test pump in a fully equipped hydraulic test facility, that the proposed pump in the size and at the speed proposed with the proposed impeller design will have acceptable operating characteristics under the conditions specified for the proposed installation. Set up the test pump and perform a witnessed demonstration prior to designing, fabrication, and testing of any of the equipment proposed for the specific installation.
   2. General performance criteria:
      a. Pumps furnished under this section and any referencing section shall operate without loss of head due to cavitation or vibration over the entire specified range of flow and head conditions and are specifically selected for NPSH margin requirements detailed in paragraph 1.04 NPSH margin limitations. Pump selections that do not provide the specified margin will be rejected.

3. General design criteria:
    a. Select pumps furnished under sections referencing this section that are designed in accordance with applicable portions of ANSI/HI 9.6.2, 9.6.3, 9.6.4, 9.6.6, 9.6.8 and 14.1-14.3 and the requirements of this section. Select pumps that are specifically designed to pump the fluid described in the detailed specification and to operate without clogging or fouling caused by material in the pumped fluid at any operating condition within the range of service specified. Clogging or fouling conditions may be of any cause, demonstrated by a 5 percent or greater capacity drift within 2 hours of sustained operation.
    b. Unless otherwise noted or specified, slope pump head capacity curves in one continuous curve within the specified operating conditions. Do not permit points of reverse slope inflection capable of causing unstable operation within the specified zone of continuous-duty operation. Pumps with head/capacity curves with a reverse inflection are specifically prohibited if these characteristics will cause unstable operation within the specified range of operating conditions and where startup/shutdown conditions entail operation against a slow opening/closing valve.
    c. Column-type (vertical-turbine, vertical-column solids-handling, and axial-flow propeller and mixed-flow) pumps shall have bells selected to provide intake velocity of not less than 3.5 feet per second (ft/s) or more than 4.0 ft/s when operating at the maximum specified flow or the flow resulting from the lowest specified operating head at maximum speed, whichever is greatest (“peak flow”). Pump discharge column sizes shall limit the calculated average velocity at peak flow to no more than 12 ft/s.
    d. Pumps specified to operate at constant-speed shall function without loss of head or capacity due to cavitation or excessive vibration over the entire specified range of flow and head conditions defined by the region bounded by Condition Points A, B, and C and any other continuous-duty operating condition specified in the detailed specification referencing this section. In addition, constant-speed pumps shall be selected to place Condition Point C in the detailed specification within the POR, or a modified POR if stipulated in the detailed pump specification.
    e. Pumps specified to operate at variable-speed shall function without loss of head or capacity due to cavitation or excessive vibration over the entire specified range of flow and head conditions defined by the region bounded by Condition Points A, B, and C and any other continuous-duty operating condition specified in the detailed specification referencing this section. Unless otherwise specified in the section referencing this section, acceptance criteria shall include the following:
        1) Operating Condition Point C and any other continuous-duty operating point specifically required in the detailed specification shall reside within the region defined by the POR, or in a modified POR if stipulated in the detailed pump specification.
        2) Unless otherwise noted in the detailed specification referencing this section, Operating Condition Point A may reside in the AOR outside the POR; Condition Point C will be located within the POR, or in a modified POR if stipulated in the detailed pump specification; and Condition B will preferably be located within the POR, or within 5 BEPQ percentage points (in terms of flow) outside the POR so long as Condition Point C resides in the POR or the stipulated modified range.

4. POR:
    a. Unless otherwise specified, the POR for a given pump is as defined in ANSI/HI 9.6.3.
    b. The detailed specifications may stipulate a narrower POR than indicated in ANSI/HI 9.6.3.
    c. The suction-specific speed (S) shall not exceed 8,500, unless otherwise indicated in the detailed specifications.
    d. For high- S pumps (greater than 8,500) and other conditions as determined by the engineer, a narrower stable operating region may be defined in the detailed specifications and then identified in ANSI/HI 9.6.3 for the POR. The detailed specifications take precedence over this section.
    e. The detailed specification sections identify the duty points that must be within a pump's POR and those that may be within the AOR and take precedence over this section.

C. Critical Speeds and Natural Frequencies:
    1. General:
        a. The criteria of this paragraph applies to pumps, provided that the foundation and support details provided at the time of pump design are accurate. Repair or replace pumps exhibiting adverse behavior after installation from resonance, vibration, or fatigue at no cost to the owner. The criteria apply to the equipment in "like-new" condition as well as the "as-worn" condition (i.e., when parts, individually and as a composite, reach the manufacturers' maximum tolerances). Critical speed and natural frequency data submittal requirements depend upon the pump:
            1) For the more critical pumps that are covered under paragraph 1.05, and other pumps covered under paragraph 1.04 Alternate mass elastic design, where specified in the detailed specification section, the contractor is required to submit analytical reports confirming requirements on critical speeds and natural frequencies prior to pump fabrication, as specified
            2) Unless otherwise specified, for constant-speed pumps and variable-speed pumps with suction size less than 6 inches diameter, no critical speed submittal is required
            3) Except as modified in paragraph 1.04 Alternate mass elastic design, the requirements of 1.05 Critical Speed Analysis and System Design apply to other pumps, where specified in the detailed specification section.

    2. Alternate mass elastic design:
        a. Subject the complete pumping unit (including rotating elements, frames, and supports) and related structural elements (including pump, motor, and bearing supports) to structural, lateral, and torsional dynamic analyses, per ANSI/HI 9.6.8 Level 2 and as follows:
            1) Select the complete pumping unit rotating group including pump, motor, intermediate shafting and flywheel rotors (if specified), and other elements in the power train (or powered via the power train) that are designed and manufactured to limit torsional stresses.

2) Additionally, for vertically suspended (VS) and vertically mounted overhung (OH) and between bearing (BB) types provide pump structural natural frequency analysis by modal finite element analysis (FEA)

3) Motors for vertical pumps, subjected to Level 2 analyses shall be subjected to bump test requirements under paragraph 1.04 Motors for custom-engineered pumps.

b. Professional qualifications:

1) The contractor shall require the manufacturer of the pumping equipment to provide the required analyses either with a qualified design professional employed by the manufacturer or a person employed by an independent firm that may have other contract relationships with the pump manufacturer.

2) Aside from allowing the qualified design professional to be employed by the manufacturer or an independent firm that may be contracted to manufacturer, all other qualifications requirements of paragraph 1.05B.2 Professional qualifications apply. Provide a letter, signed by an officer of the manufacturer, describing the role of design professional and relationship to the manufacturer, in lieu of notarized certification.

c. Reports, calculations and recommendations:

1) All documentation shall be provided as specified in paragraph 1.05.

2) A field torsional vibration test is required.

d. Methodology:

1) Conduct analyses in accordance with paragraph 1.05 Lateral rotor and structural dynamic analyses, except as noted:

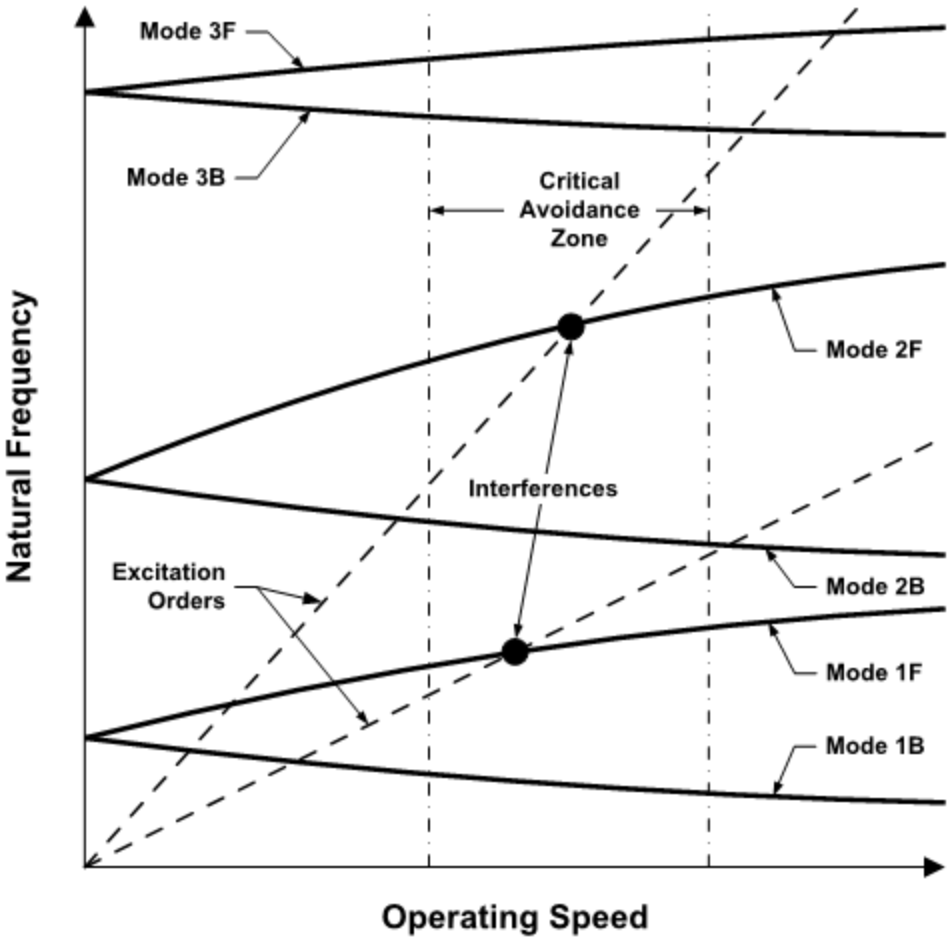
a) Analyses based on a Level 2 analysis prescribed in ANSI/HI 9.6.8:

b) Mathematical calculation tools in compliance with ANSI/HI 9.6.8, as selected by the design professional.

2) In case of conflict between these specifications and ANSI/HI 9.6.8, these specifications shall prevail (e.g., Campbell diagrams shall be provided), unless an exception is requested by the Contractor and approved by the Construction Manager.

3. Lateral rotor and structural dynamics:

a. The complete pumping unit, composed of the entire rotating group and related frames, supports, enclosures, housings, and casings, shall be free from critical speeds from 15 percent below to 25 percent above the operating speeds required to achieve the specified performance characteristics (critical avoidance zone). A critical speed is defined as any damped natural frequency with a logarithmic decrement less than +0.3 that has an interference with a primary excitation order in the critical avoidance zone. Analyze backward rotation for rubber-bearing vertical-column pumps. The critical avoidance zone, interferences, and possible critical speeds can be illustrated on a natural frequency map as presented in the figure below. In the figure, three natural frequencies are shown with forward and backward modes. Only two of those modes, 1F and 2F, have interferences with primary excitation orders. Whether these are critical speeds is determined by the value of log decrement at the intersection. Note that higher order modes, such as 2F, have the same log decrement criterion as the first mode.



b. Process sensitivities are such that operation at infinitely variable speed within the specified operational conditions is an absolute requirement. Any remedy imposing a locked-out speed interval or intervals will not be considered an acceptable remedy for identified critical speeds. Acceptable remedies include combinations of adjustments in rotor geometry or materials, and the substitution of energy-absorbing couplings. Other remedies may be considered so long as they are justified in writing and the proposal is sealed and signed by the design professional retained by the manufacturer to perform the system mass elastic system analyses.

4. Torsional rotordynamics and combined shaft stress:

a. The complete rotating group shall be free from critical speeds from 10 percent below to 20 percent above the operating speeds required to achieve the specified performance characteristics (critical avoidance zone). A critical speed is defined as any damped natural frequency with a logarithmic decrement less than plus 0.3 that has an interference with a primary excitation order in the critical avoidance zone.

b. If efforts to remove torsional critical speeds are unsuccessful, perform a combined shaft stress analysis to demonstrate that the response does not adversely affect the entire rotating group fatigue life. The combined shaft stress analysis shall consider any speed in the critical avoidance zone and during startup, shutdown, or motor control transients if synchronous motors are specified.

c. For constant-torque applications, the pump-rotating group shall be free from torsional response that produces combined (steady plus alternating torque induced) stresses exceeding 50 percent of the material's fatigue limit or 30 percent of the material's elastic limit (but no more than 18 percent of the material's ultimate tensile strength) if relevant fatigue data for the selected material are not available.

d. For variable-torque applications (including variable-speed pumps, vertical pumps, and pumps with large overhung loads) the pump rotating group shall be free from torsional response that produces combined (torsional steady and alternating) peak shear stresses at points of stress concentration (calculated in accordance with the requirements of paragraph 1.04E.3 Torsional Shaft Stresses) that exceed 50 percent of the material's fatigue limit or 4 percent of the material's ultimate tensile strength, based upon ASME or other recognized standard, if relevant fatigue data for the selected material are not available.

e. Document the source of fatigue data used in lieu of elastic or ultimate strength ratios in the analysis report submittal.

D. Impeller clearances, vane-passing frequency, and impeller keyways:

1. The radial clearance between the tip of the impeller vane and diffuser or volute vanes shall be not less than 3 percent and 6 percent, respectively, of impeller diameter. Select a pump that is designed so that internal geometry does not cause uneven flow distribution at impeller vane inlets.

2. Impeller vane combinations shall not be an even multiple of diffuser vanes in column-type pumps.

3. Cut impeller keyways for multistage column-type pumps at differing positions and provide equal angular spacing on the impeller shaft to avoid multiple simultaneous vane-passing pulses.

E. Component design criteria:

1. General:

a. Unless otherwise specified, ensure that combined stresses in steel frames and supports does not exceed those permitted by the American Institute of Steel Construction (AISC) Manual of Practice. Combined stresses in cast, forged, rolled, or fabricated pressure-retaining components, frames, and supports shall not exceed that allowed for the given material in Section VIII, Division 1 of the American Society of Mechanical Engineers (ASME) Code. Design pressures for pressure-retaining parts shall be not less than 50 percent greater than the pump's shutoff head at the manufacturer's listed maximum operating speed. The pump casing strain at any head on the full-speed operating curve (including allowances for increases caused by specified multistage applications) shall not result in distortions at the bearing housings greater than the maximum allowable by the bearing manufacturer to provide the specified bearing life.

b. The term “combined stresses” in this section means the sum of operating stresses, including stresses induced by dynamic and static forces as developed via the analysis procedures stipulated in this section. Static forces (x, y, z, and moments in planes) include the relevant maximum nozzle loads specified in ANSI/HI 9.6.2 or as stipulated by the pump manufacturer. Dynamic forces include both steady-state and transient stresses induced by operating conditions within the zone of operation established by the specified operating conditions.

2. Anchorage and equipment mounts:
   a. The contractor shall hold the pump manufacturer responsible for the design of the anchor-bolting system and equipment supports for each separately mounted component furnished under the detailed specification. Conform anchorage and equipment support requirements for pumps to the requirements of Section 43 05 13.
   b. Select anchor bolts and connecting bolts for pumps and assemblies supported by other assemblies furnished under this section, or sections referencing this section, that are designed in accordance with Section 01 73 24. All operation and maintenance (O&M) manuals for pumps and assemblies shall contain criteria for anchor and baseplate bolt torque values.
   c. Equipment mounts for vertical (column- and volute-type) pumps weighing more than 1,000 pounds, with discharge nozzles 6 inches in diameter and greater, shall employ soleplates conforming to the requirements of Section 43 05 13. Provide soleplate mounting conforming to Section 43 05 13 for separately supported components in the pump drive system. Fabricated steel supports regardless of design, and the nature of the structural shapes used for such proposed supports, will not be accepted.
   d. Soleplates shall be designed to span openings for equipment connections and provide access to maintenance points. Soleplates shall be of sufficient section to key, not less than 1 inch, into the supporting grout provided for bonding the soleplate to the structure. Provide soleplates of sufficient size to bolt the pump base to the soleplate without encumbering the anchor bolts required for clamping the soleplate to the structure.
   e. Equipment mounts for horizontal pumps shall be designed in accordance with Section 43 05 13 and ANSI/HI 14.3, and shall provide common support for the pump and motor (and flywheel, if one is specified). Conform baseplate bolting to assumptions contained in ANSI/HI 9.6.2
   f. Use tapered dowel pins when required in the detailed specification to record the final position of machine bases on soleplates or pump baseplates. Where specified, harden and machine-ground dowel pins, conforming to the requirements of ANSI/ASME B18.8.2. Conform holes for tapered dowels to the requirements set forth in Appendix A of ANSI/HI B18.8.2.

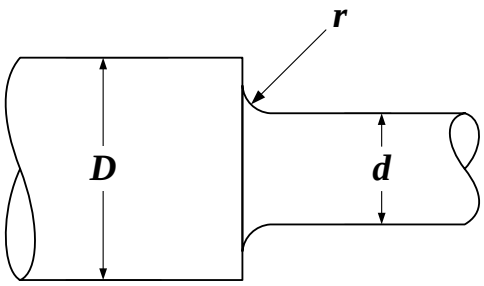
3. Torsional shaft stresses:
   a. Calculate shaft stresses using the following equation and the stress concentration factors in the tables below:

$$S = S_{cf} \times \frac{G \times D \times \Delta_{\Theta}}{2 \times L}$$

where:

S	=	stress, pounds per square inch (psi)
S_{cf}	=	stress concentration factor, dimensionless
D	=	minimum shaft diameter at point of concentration, inches
Δ_Θ	=	twist in shaft between adjacent masses, radians
L	=	effective length between masses, inches
G	=	shear modulus of shaft material, psi

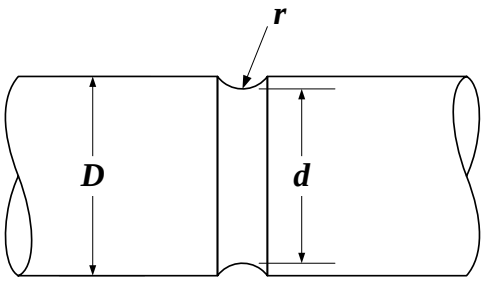
b. S_{cf} shall be applied at changes in shaft diameter is as follows:



Shaft diameter ratio D/d = 1.05	
r/d	S_{cf} [a]
0.0025	2.67
0.0100	1.84
0.0200	1.58
0.0300	1.47
0.0400	1.39
0.0500	1.34
0.1000 and greater	1.22

Shaft diameter ratio D/d = 1.50	
r/d	S_{cf} [a]
0.0025	4.05
0.0100	2.54
0.0200	2.07
0.0300	1.85
0.0400	1.72
0.0500	1.62
0.1000 and greater	1.40

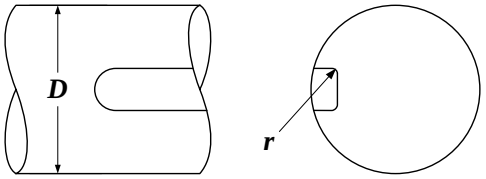
c. Ensure that the S_{cf} to be applied at circumferential shaft grooves is as follows:



Shaft diameter ratio D/d = 1.05	
r/d	S_{cf} [a]
0.0025	3.73
0.0100	2.34
0.0200	1.92
0.0300	1.74
0.0400	1.64
0.0500	1.57
0.1000 and greater	1.39

Shaft diameter ratio D/d = 1.30	
r/d	S_{cf} [a]
0.0025	5.04
0.0100	2.82
0.0200	2.24
0.0300	1.99
0.0400	1.84
0.0500	1.73
0.1000 and greater	1.49

d. Ensure that the S_{cf} to be applied at the roots of keyways is as follows:



r/D	S_{cf} *
0.0025	4.35
0.0100	3.20
0.0200	2.64
0.0300	2.43
0.0400	2.32
0.05 00	2.25
0.1000 and greater	2.12

** Base values of S_{cf} between data points in the tables above upon a straight-line interpolation.*

4. Shaft deflection:
   a. Select pump shafts installed on volute-type pumps to provide sufficient stiffness to operate without distortion or damaging vibration throughout the range of service specified. Limit shaft deflection at the face (impeller side) of the shaft seal to no more than 2 mils at any operating condition within the zone described by the specified continuous-duty operating conditions. Calculate deflection at the shaft seal as required by provisions set forth in ANSI/HI 14.3.

5. Bearings:
    a. Unless otherwise specified, select anti-friction bearings for pumps for a minimum L–10 life of 50,000 hours in accordance with ABMA 9 or 11. Ensure that anti-friction bearings for custom-engineered pumps have bearings selected for an L–10 life of 100,000 hours in accordance with ABMA 9 or 11. Select bearings for other elements in the rotating system such as motors, intermediate shaft bearings, and flywheel bearings using the same criteria as specified for the pump. Base bearing selection upon the worst combination of continuous-duty operating conditions specified and include both steady-state and transient loads. Provide calculations supporting the selection of bearing sizes as and informational submittal.
6. Bearing isolators:
    a. Unless otherwise specified, fit pump and motor bearings with bearing isolators, specifically selected for the size and type of bearing. Provide bearing isolators that are the labyrinth, non-fretting type designed to expel contaminants by centrifugal force and prevent the escape of lubricants. Provide vapor-block capability. Bearing seals shall be Inpro/Seal, or an approved equal.
7. Pump shaft seals:
    a. Unless otherwise specified in the detailed specification, pump shaft seals must be mechanical seals as specified in Section 43 05 11.

F. NPSH margin limitations:
1. General:
    a. Pumps furnished under this section and sections referencing this section shall be selected for NPSH margin limitations using the criteria set forth in this section. Base NPSH3 characteristics for the candidate pump upon documented test data not more than 5 years old. Perform testing on a pump not more than two nominal pump diameters larger or smaller than the proposed pump with an impeller of the same geometry as that proposed for the pump to be used for the subject application, and operating at either the same speed as the pump for the proposed application or a speed that provides plus or minus 10 percent of the impeller inlet velocity if reduced-speed testing is used. For very large pumps that cannot be accommodated in the manufacturer's test pit, the use of a model pump, sized in accordance with ANSI/HI 14.6, Appendix K, is acceptable. The contractor shall document the basis for pump selection based upon NPSH margin limitations as set forth in this paragraph.

b. The detailed specification sections provide NPSHA information for anticipated operating conditions for each application. This information is generally referenced to a specific elevation, stated in terms of project datum. The contractor is responsible for requiring the pump manufacturer to adjust the NPSHA information in the specification section to the elevation of the pump impeller eye for the specific pump model and size proposed for the application. NPSH3, as used in the following paragraphs, means the NPSH3 at the impeller eye, determined in accordance with ANSI/HI 11.6 or 14.6, as applicable for the proposed pump. The contractor shall require the pump manufacturer to document the method used to determine NPSH3 for the proposed pump and justifying compliance with the NPSH margin limitations established under this paragraph for each specified operating condition in material submitted under paragraph 1.08. Include in the documentation justification of the NPSH3 tests used to develop NPSH3 characteristics, including the following:
   1) Date, test procedure, and test logs of original NPSH3 information used to project requirements for the pump selected for the application
   2) Test pump size, impeller diameter, impeller model, eye diameter, and speed
   3) Calculations projecting NPSH3 test information to NPSH3 curve information for the pump proposed for the application
   4) Calculations demonstrating compliance with the NPSH margin requirements established in this paragraph

c. The contractor shall submit the manufacturer's margin calculations justifying the proposed pump selection with the material required under paragraph 1.08. The NPSH margin ratios specified in this paragraph are the minimum acceptable margin ratios. If the proposed pump requires greater margin ratios to operate within the specified operating conditions without loss of head due to cavitation, then it is the responsibility of the contractor to bear costs associated with achieving the required margin ratio by lowering the elevation of the pump setting, lowering the elevation of the structure, or through other means. Subject any such adjustments to review and acceptance by the construction manager if necessary.

d. Individual restrictions are applicable to NPSH margin depending upon the type of pumping equipment and the fluid to be pumped as set forth in ANSI/HI 9.6.1, Table 9.6.1.5.5. Under no circumstances may the absolute value of the NPSH3 margin be less than 3.5 feet.

G. Electric Motors:

1. General:

   a. Pumps shall be electric-motor driven unless otherwise specified. Select all motors to be non-overloading at any operating point along the pump's full-speed operating curve, including points located beyond specified operating conditions. Motors shall be capable of carrying the axial/radial load applied to the motor shaft with motor bearing life equivalent to the pump bearing life.

   b. All vertical motors shall be solid-shaft construction. Hollow-shaft motors will not be accepted.

   c. Motors furnished with pumps specified for operation at variable-speed shall be inverter-duty types conforming to the requirements of Section 43 05 21 and shall be compatible with the variable-speed equipment furnished with the pump.

   d. Protect motor bearings with bearing isolators as specified in paragraph 1.04.

2. Motors for custom-engineered pumps:
    a. In addition to the information submitted under the requirements of Section 43 05 21, the contractor shall provide certified reed-frequency calculations for both the motor rotor and frame for vertical motors driving custom-engineered pumps with the data to be submitted under paragraph 1.08. Upon completion of construction of motors for custom-engineered pumps, give each rotor and frame and the completed assembly a bump test to confirm reed-frequency calculations in the dynamic analysis modeling work performed under paragraph 1.05. Provide the results of the bump test, certified by the chief engineer or individual in responsible charge of the test facility, as an informational submittal under paragraph 1.08.
    b. All vertical motors shall meet motor face dimension tolerances as follows:

Motor face bolt circle diameter, inches	Motor face runout, inches
12	0.002
16.5–24.5	0.002
30–42	0.003
42 and larger	0.005

    c. The motor face register concentricity, referenced to the shaft centerline, shall be not greater than 0.002 inch if the motor is furnished without jack screws. The motor shaft total indicated runout (TIR) shall not exceed 0.002 inch.
3. Balance:
    a. Motors rated 50 hp or greater and motors driving custom-engineered pumps shall be precision-balanced, conforming to a balance grade of G2.5 per International Organization for Standardization (ISO) 1940-1.
    b. The contractor shall provide certified balance logs attesting to achieving these requirements and submitted as required by paragraph 1.08. The chief engineer or person in charge of the test facility shall sign the balance logs.

1.05 ADDITIONAL DESIGN REQUIREMENTS

A. Scope:

The following paragraphs present requirements that apply to only some pumps on the project. In each of the paragraphs, the first sub-paragraph titled “General” explains when the paragraph applies.

B. Critical Speed Analysis and System Design:
1. General:
    a. The requirements of this paragraph apply to pumping equipment in detailed specifications where the words “custom-engineered” appear in the title of the specification section, and elsewhere when the referencing specification section stipulates. Apply the analyses to the equipment in “like-new” condition, as well as the “as-worn” condition (i.e., when parts, individually and as a composite, reach the manufacturers’ maximum tolerances). For the purpose of these analyses, define worn conditions as two times the new condition clearance unless specified less by the manufacturer and specifically accepted by the construction manager.

2. Requirements:
    a. Subject the complete pumping unit (including rotating elements, frames, and supports) and related structural elements (including pump, motor, and bearing supports) to structural, lateral, and torsional dynamic analyses to identify and eliminate critical speeds as defined in paragraphs 1.04C.3.a Lateral rotor and structural dynamics and 1.04C.4.aTorsional rotordynamics and combined shaft stress.
    b. Select the complete pumping unit rotating group including pump, motor, intermediate shafting and flywheel rotors (if specified), and other elements in the power train (or powered via the power train) that are designed and manufactured to limit torsional stresses.
    c. Overhung shaft pumps and between bearings pumps operating in single-volute casings shall be subject to analysis for shaft deflection in accordance with the terms of this section.
    d. The structural, lateral, and torsional dynamic analyses together are termed the pumping equipment's "mass elastic design." No fabrication work on any component for the equipment specified under this section and any referencing section shall be started until the mass elastic design has been completed and has been reviewed by the construction manager.
    e. If the contractor proposes the use of alternative methods for the required analyses, submit documentation justifying the substitution. Include in the documentation justification that product results will be equivalent to that specified and with an equivalent level of accuracy. Also include the location and description of projects of an equivalent size where the procedure has been employed and the length of time these projects have been in actual service.
3. Professional qualifications:
    a. The contractor shall require the manufacturer of the pumping equipment to retain the services of an independent professional engineering firm, employing a qualified design professional who has been engaged in performance of the required mass elastic design analyses for not less than 10 years on equipment of similar size and complexity. The design professional shall have not been in the employ of any pump manufacturer for a period of not less than 10 years from the date of the request for proposals for the project. The design professional's firm shall submit a notarized certification attesting to having no contractual arrangements (other than for similar critical speed analysis) with the proposed pump manufacturer. The pump manufacturer's internal engineering organizations, regardless of qualifications, are specifically prohibited from doing this work. This provision, however, is not to be construed as relieving the contractor of overall responsibility for this portion of the work.
    b. The mass elastic design shall be the product of a design professional, registered to practice mechanical engineering in at least one of the states composing the United States, who has been responsible for the design of not less than five systems similar to that specified in the detailed specification section. The design professional shall have been engaged in this type of analysis for not less than 10 years, and directly supervise the performance of the work and be responsible for analysis of results and recommendations for any corrections to the specific rotating system and the associated frames and supports. The contractor shall submit the design professional's qualifications as a part of the initial submittal information required under this section.

c. The owner and construction manager believe that the following firms are capable of providing services that will satisfy the requirements of this paragraph. This statement, however, is not to be construed as an endorsement of a particular firm; do not assume that a named firm's standard service will comply with the requirements of this section. Candidate firms performing these analyses satisfactorily in the past include:
   1) DynaTech Engineering Incorporated, Auburn, California
   2) Engineering Dynamics Incorporated, Houston, Texas
   3) Xdot Engineering and Analysis, Charlottesville, Virginia
   4) Mechanical Solutions, Inc., Whippany, New Jersey

d. The contractor may propose a firm other than those listed. However, before a substitute firm can perform the analyses, submit the proposed firm's qualifications, the qualifications of personnel proposed for assignment to this project, along with examples of analyses performed on similar pumping equipment using procedures similar to those specified in this section, for review by the construction manager. Examples include the types of graphical displays required under this section as well as a complete report describing the analyses performed and the recommendations arising out of the analysis results. The construction manager retains the right to reject any proposed firm with justification.

4. Reports, calculations, and recommendations: All reports, calculations, and recommendations resulting from the required analyses shall bear the design professional's original signature and professional registration seal. Submit all reports, recommendations, and calculations produced under this paragraph under the requirements of this section, as follows:
   a. Following completion of the pumping equipment's mass elastic design, the contractor shall require the design professional to prepare a plain-English "Executive Summary" report with a narrative including a description and assumptions about the proposed operating system, detailed description of the analysis process, results of analyses and findings, detailed recommendations for modification of the pumping unit (defined in paragraph 1.01A Scope), if any, and sufficient graphical depictions to describe the information to a lay reader. Detailed calculations and extensive data reports are not to be submitted at this time and will cause the entire report to be rejected, if included. Submit this Executive Summary for review and acceptance prior to pump or component fabrication. The Executive Summary report shall state that analysis procedures have complied fully with the requirements of this section and that the proposed system will meet of the requirements set forth herein for limitations in stresses, deflection, and fatigue limits. The design professional shall affirm in writing that requirements of this section have been achieved or specifically state where exceptions have been taken, with justification citing recognized authorities for taking such exceptions. The reports shall be signed and sealed by the design professional, as specified.

b. Following review and approval of the Executive Summary report, the contractor shall require the design professional to review and address any comments from the construction manager and incorporate changes that may be required. Subsequently, the contractor shall direct the design professional to issue a complete “Final Report” with a revised Executive Summary report, recommendations binding on the manufacturer, calculations, data, and other supporting information. The format and documentation for this report shall follow the requirements of ANSI/HI 9.6.8 Appendix G Level 3 as indicated in the detailed specifications. The contractor shall submit this report as an informational submittal.

c. Upon completion and receipt of certified results of the bump tests required for the motor rotor, frame, and assembly specified under paragraph 1.04G.2, the design professional shall review the data and submit a “Supplemental Report,” as an informational submittal, either accepting the test results or recommending alterations to assembly structures to adjust for differences between calculated values used for the original analyses and actual values determined subsequent to motor fabrication.

d. Upon completion of installation and as a part of the initial test procedures specified under Section 01 45 20, the design professional responsible for the mass elastic design shall visit the site and inspect the installed equipment. Prior to the initiation of any field tests, the design professional shall issue a report attesting that the equipment, as installed, conforms to the recommendations contained in the report setting forth the results of the mass elastic system design or recommendations for remedies should the supplied equipment contain features or characteristics deviating from the original recommendations and calculations.

e. During initial testing of the equipment, the design professional shall be prepared with necessary monitors, instruments, and recorders, and shall conduct an in situ torsional vibration test on one of the installed pumping units, to be selected by the construction manager, to confirm the torsional natural frequency results of the original mass elastic system design. Conduct the torsional vibration test with transducers suitable for narrow-band spectrum analysis, including strain gauges, magnetic or optical pulse demodulation, or shaft position encoders. If the torsional vibration test should reveal any anomalies that cause the equipment to be out of compliance with the requirements of this section, the design professional shall conduct torsional vibration tests on other like pumping units and submit a comprehensive report, sealed and signed as specified above, detailing the reasons for failure to comply with these specifications and recommendations for attaining compliance. The design professional shall consider feasible options for compliance and provide detailed descriptions of the modifications required to achieve the required performance. The contractor shall implement those recommendations accepted by the Construction Manager at no cost to the Owner.

5. Methodology:
    a. Lateral rotor and structural dynamic analyses:
        1) Include in the analyses procedure the following features based on an ANSI/HI 9.6.8 Level 2 analysis and ANSI/HI 9.6.8 Level 3, with exceptions as specified in 1.04 Critical Speeds and Natural Frequencies, as prescribed in ANSI/HI 9.6.8:
            a) The procedure considers speeds required to operate the equipment within the envelope of continuous-duty operating conditions specified in paragraph 1.04C.3.a Lateral rotor and structural dynamics.
            b) The procedure includes liquid influences (wet conditions) including Lomakin effects, impeller-diffuser destabilizing forces, and added mass due to entrained fluid in the calculation of natural frequencies and forced response for pump types.
            c) The procedure produces Campbell diagrams for the proposed operating conditions depicting potential sources of excitation to check interference with relevant natural frequencies from both lateral and structural analyses. Primary excitation orders to be considered during the analysis include 1- and 2-times running speed, vane-passing frequencies for the pump impeller/cutwater-diffuser vane combinations, and any unique harmonic of running speed produced by the pumping system, up to, and including, not less than 6 times operating speed.
            d) For pump types except column pumps, the procedure considers the effect of support stiffness on natural frequencies. The range of stiffness to be considered is not to be less than 4 orders of magnitude. Results are provided in a critical-speed map (graph of natural frequencies versus stiffness similar to Figure 9.6.8.6.2.1.3 in ANSI/HI 9.6.8) and indicate the expected values of stiffness.
            e) For column-type pumps only, the procedure considers the effect on critical speeds subject to variations in assumed coefficients from new values for seal and wearing ring clearances, bearing clearances, and impeller destabilizing forces. Unless specifically accepted by the construction manager, the range in variation of component characteristics (either clearances or forces) is 2 times as-new values. Forced response is also calculated at new and 2 times as-new values (or approved deviation) using rotor unbalance (10 percent of weight at each impeller position) and hydraulic unbalance at not less than five operating conditions within the envelope of continuous-duty operating conditions specified in (a). Response to unbalance is assessed by the design professional relative to acceptable bearing loads and deflections of the rotating group.

f) The mathematical calculation tools to be employed for the analyses and the procedures to be used are as follows:

(1) Build the mathematical model of the rotating group on a dedicated rotordynamics code employing finite-element beam theory. Do not use general-purpose finite-element, transfer matrix, or lumped-parameter program for this purpose. Construct the model specifically to contain axisymmetric models of the rotor and, with column-type pumps only, the casing. Use this model to determine the damped natural frequencies and, if required, the forced response of the rotating group.

(2) Use a general-purpose finite-element code such as NASTRAN or ANSYS to construct three-dimensional models of the casing and housing structures supporting the rotating group. Use this model to determine the natural frequencies of the support structures and casing as well as the pump-bearing frames. Include representative sections of piping and structural supports such as piers and baseplates in the model.

(3) Adjust the rotating group axisymmetric model, preferably by changing component materials or sizes, or by changing component type, until the output frequencies or static deflections agree with the models constructed under (2).

(4) Use the three-dimensional models constructed under (2) to determine if the foundation of the pumping unit is rigid or flexible as per Figures 9.6.8.3.1a, 9.6.8.3.1b, and 9.6.8.3.1c in ANSI/HI 9.6.8-2014.

2) Include in the Final Report graphic presentations, preferably in three dimensions, of frame and shaft distortion and rotor group performance at any identified critical speeds within the pump's operating range.

b. Torsional dynamic analysis:

1) The methodology used for the torsional rotordynamic analysis of the rotating group and evaluation of shaft combined stresses is based on a Level 2/3 analysis in ANSI/HI 9.6.8 and includes the following features:

a) The procedure considers speeds required to operate the equipment within the envelope of continuous-duty operating conditions specified in paragraph 1.04C.4.aTorsional rotordynamics and combined shaft stress.

b) The mathematical model of the rotating group is built on a dedicated rotordynamics code employing finite-element beam theory or a general-purpose finite-element program. Do not use a transfer matrix or lumped-parameter code for this purpose. The computer program used for the torsional analysis must be field calibrated at not less than five similar installations.

c) Verify the computer analysis results by hand calculations for the fundamental frequency and mode shape.

d) Primary excitation orders to be considered in the analysis are 1- and 2-times running speed, vane-passing frequencies for the pump impeller/cutwater-diffuser vane combinations, line- and twice-line frequency, motor-pole frequency, torsional harmonics from reciprocating engine drivers (up to, and including, 6 times operating speed), and harmonics as defined in (f) if variable-frequency drives (VFDs) are specified.

e) Produce a Campbell-type interference diagram showing the relationship between operating range, natural frequencies, and primary excitation orders, with any critical speeds clearly identified.

f) If critical speeds are predicted to occur in the critical avoidance zone specified in paragraph 1.04C.4.aTorsional rotordynamics and combined shaft stress, perform a damped, steady-state forced-response analysis to demonstrate satisfactory fatigue life as defined further in that paragraph, as applicable. Forcing function magnitudes used for the analysis shall be not less than 1 percent of the maximum transmitted torque at the speed of intersection. Justification of the source and magnitude of any damping incorporated in the analysis is required. Include in the analysis evaluation of control pulse frequencies induced by VFDs or engine power-stroke frequencies, if provided as part of the specified system. Include in the analysis report a statement produced by the VFD manufacturer detailing control-pulse frequencies generated by the equipment between 1- and 24-times motor running speed. Consider any torque harmonic greater than 1 percent of steady torque a primary excitation order.

2) Physical adjustments to obtain the required characteristics should preferably be implemented through changes in component dimensions, and alternatively through providing torsionally-resilient dampening devices such as fluid-damped couplings or metallic couplings such as manufactured by Bibby and Holset. Do not use couplings or dampeners using rubber or similar elastic materials.

3) If synchronous drives are specified in the mass-elastic design, include in the analysis a time-integration study showing transient peak stresses resulting from startup, shutdown, and motor control transients. Provide tomographic diagrams, colorimetrically displaying stresses at positions in the rotating group shafting, including roots at changes in section and keyways or other stress concentrating locations, with the analysis report. Indicate in the diagrams the operating speeds identified that produce the peak stresses, specific for speeds inducing identified peak stresses at keyways, changes in section, and at connections to other components. Combine the reported stresses incorporating identified loads from torsional, lateral, and hydraulic sources.

C. Cans for Column Pumps:

1. General:

a. This paragraph applies where the detailed specification requires a column-type pump to be installed in a can-type intake.

2. Requirements:
    a. Where the detailed specification requires that a column-type pump be installed in a can, the contractor shall require the pump manufacturer to design and provide the can. Include in the design an arrangement that results in no deceleration down the suction well and into the cone. These provisions, however, are not to be construed as relieving the contractor of responsibility for this portion of the work. Design the cans in accordance with the requirements of ANSI/HI 9.8, and provide design documentation as a part of the information to be submitted under paragraph 1.08.
3. Model testing:
    a. The contractor shall require the pump manufacturer to verify the design of cans for column pumps specified in detailed sections with "custom-engineered" in the section title by physical model tests conducted in accordance with ANSI/HI 9.8.
    b. The acceptance criteria for design confirmation and final report of the model study are as set forth in ANSI/HI 9.8.
    c. The physical model shall include the pump, can, upstream inlet piping, and any valves or piping appurtenances within the 10 pipe diameters upstream reach preceding the can.
    d. The physical modeling effort will be the product of a commercial hydraulics laboratory specializing in physical model studies of this type. Hydraulics laboratories associated with colleges or universities and pump manufacturer's hydraulics laboratories are specifically prohibited from providing this service. All development work required to the conduct of the study shall be under the direct supervision of an engineer licensed to practice in at least one of the states composing the United States, hereinafter called "the design professional" for the purposes of this paragraph. The design professional shall have not less than 10 years' experience in hydraulic modeling of pump intake designs of at least the magnitude required by these specifications, using physical modeling techniques. Computational fluid dynamics (CFD) modeling techniques are not an acceptable substitute for the requirements of this paragraph. The Final Report, describing the work performed and the results and recommendations arising out of the study, shall bear the original seal and signature of the design professional.

1.06 QUALITY ASSURANCE: ALL PUMPS

A. Quality Certification:
    1. All manufacturers and manufacturing sites proposed by the contractor for supply of equipment furnished under this section and sections referencing this section shall hold current certification under ISO 9001. Application for certification under ISO 9001 is not deemed as an acceptable substitute for current certification. Provide documentation of the manufacturer's ISO 9001 certification and the manufacturer's written quality assurance/quality control (QA/QC) program.

B. Unit Responsibility:
   1. The contractor shall assign unit responsibility to the pump manufacturer in conformance with the requirements of Section 43 05 11.

C. Performance Confirmation:
   1. Hydrostatic tests:
      a. Subject all pressure-sustaining parts to factory hydrostatic tests. Unless otherwise specified, conform hydrostatic tests to the requirements of ANSI/HI 11.6 for submersible pumps and ANSI/HI 14.6 for dry pit pumps. Unless otherwise indicated in the detailed specifications, hold castings at the test pressure for the duration indicated in ANSI/HI 11.6 and 14.6. For process pumps designed in accordance with ANSI/API 610, hydrostatic testing must comply with the requirements of paragraph 8.3.2 of ANSI/ ANSI/API 610. Test results shall be certified correct by the chief engineer or individual in responsible charge of the manufacturing facility.
   2. Performance guarantee:
      a. Unless specified otherwise in the detailed specification, pump performance (flow and head, efficiency, and NPSH3) shall be guaranteed by the pump manufacturer to the criteria specified under this paragraph.
      b. Equipment performance documentation, including test data, where tests are specified, shall include sufficient test points (not less than eight) to document hydraulic performance along the complete head/capacity curve from shutoff to maximum capacity, and covers full-speed operating points specified in the detailed specification section referencing this section. Tests conducted at specified operating conditions shall be with the inlet throttled to produce the NPSHA indicated for that specific condition in the detailed specification. Perform NPSH3 tests for not less than four full-speed operating conditions, but not less than specified operating conditions and at the best efficiency point (BEPQ).
      c. Test procedures shall be as set forth in ANSI/HI 14.6, and as specifically detailed in these specifications. However, any increase in flow or head permitted under specified acceptance grade[s] cannot result in overload (nameplate basis, S. F. = 1.0) of the specified motor power rating at any location on the pump's head/capacity curve. Conduct performance tests at the specified maximum speed. Affinity relationship-predicted test results will not be accepted. For column-type pumps, include in the performance documentation curves showing both bowl efficiency and overall efficiency (including inlet, bowl, column, and discharge head losses) at maximum operating speed for the application.
      d. The acceptance criteria for head and capacity test results shall be based upon the rated condition specified in the detailed specification and as required in ANSI/HI 11.6 and 14.6 for acceptance Grade 1U, with the above-stated limitation with respect to motor power overload.
      e. Where there are none stipulated, the acceptance criteria for head and capacity test results for the other specified duty conditions in the detailed specification shall be as required in ANSI/HI 11.6 and 14.6 for acceptance grade 3B, with the above-stated limitation with respect to motor power overload.

f. The acceptance criteria for NPSH3 at any specified operating condition shall be the values proposed by the contractor in the curves submitted under paragraph 1.08, and duly accepted by the construction manager, with a tolerance of plus 0, minus unlimited, with the exception that S, as calculated for the specific pump, does not exceed the limitation established under paragraph 1.04B. If the NPSH3 data result in an increase in S, the manufacturer shall confirm that the stable operating region for the pump corresponds to the POR as defined in ANSI/HI 9.6.3, and that the operating conditions specified to be within the POR are within the stable operating region for the pump. In addition, the manufacturer shall identify the onset of suction recirculation and confirm that the onset of suction recirculation is outside of the specified operating range.

g. Include in the guarantee a statement to the effect that the pump will operate within the operating regions specified in the detailed specification. The guarantee shall be in writing and signed by the chief engineer or individual in responsible charge of the test facility. Under no circumstances should deviations from specified operating conditions result in overload of the driver furnished with the equipment, nor should such deviations result in power requirements greater than the driver's nameplate (1.0 service factor) rating.

3. Non-witnessed tests:

a. Unless specified otherwise, performance-test pumps in accordance with ANSI/HI 14.6, with the above restrictions on motor power overload. Include in the factory tests test data for each full-speed performance requirement and any other points stipulated for this test procedure in the detailed specification. Conduct these tests with the pump inlet throttled to provide the specified NPSHA. For large-column pumps, model performance testing with reduced NPSHA, pursuant to paragraph 1.07B.4, may be used. If specified in the detailed specification, include shaft vibration and case noise in the test data at the full-speed operating conditions.

b. Duplicate the test setup in the manufacturer's test facility as closely as possible to the inlet conditions in the proposed installation, using temporary baffles and other means, within the limitations of the test facility. Where centrifugal pumps are furnished with inlet elbows, inlet adapters or inlet reducers as a part of the manufacturer's scope of supply, test the pumps with the elbow, adapter, or reducer fitted to the pump and apply specified performance criteria to the complete pump assembly, including losses through any elbow, adapter, or reducer. Where submersible pumps are to be furnished with inlet nozzles and/or discharge elbows or adapters, test the pumps with these components fitted to the pumps. Apply the specified performance requirements to the complete pumping assembly including any inlet nozzles, and discharge elbows or adapters. Include in the certified test data separate readings for inlet and discharge head for each data point.

c. Take not less than eight test points, including not less than three within plus or minus 8 percent (in terms of rated flow) of the rated condition (Condition Point A) and not less than two test points within plus or minus 4 percent of the pump's BEP at the test speed. In addition, one test point is sufficient to define head and power requirements at shutoff head.

d. Perform NPSH3 tests in accordance with ANSI/HI 14.6, paragraph 14.6.5.8.2.1, Type 1 Test except that not less than four tests should be performed at the test motor speed to completely cover the range of operating conditions specified in the detailed specification. One of the test points shall be at the BEP flow to confirm the test pump's S. The translation of test results to specified operating conditions shall be in accordance with ANSI/HI 14.6, paragraph 14.6.6.1.1 so long as the exponent used can be supported by certified test data performed on a pump of the same type, size, speed, and specific speed as that of the proposed pump. Include NPSH3 tests at both the proposed and test speeds in test data justifying the exponent, test points at BEP, and at least three other points on the test pump head/capacity curve at least 15 percentage points removed from the BEP. Use the results of the NPSH3 tests to confirm the NPSH margins for each specified operating condition as specified in paragraph 1.04F. Perform NPSH3 tests for column type (axial, mixed-flow, and vertical-turbine) pumps using the open sump/water level or closed tank/tank pressure methods described in ANSI/HI 14.6, Table 14.6.5.8.2.1. Perform NPSH3 tests for submersible wastewater pumps using the method described in Figure 11.6.8 in ANSI/HI 11.6. Extend all NPSH3 tests from 50 percent to 140 percent of best efficiency flow at full speed, or to not less than 10 percent (in terms of flow) past the flow at Operating Condition B, whichever is greater. For a given pump, if the manufacturer can provide documentation that the upper flow limit of the AOR on the right side of the pump curve is less than 140 percent of best efficiency flow, the AOR may be used as the limit for the NPSH3 test. Cause for rejection is failure to achieve specified performance or performance proposed in accepted submittal documents (capacity and head, efficiency, or NPSH3), whichever is more restrictive. Acceptance tolerances are as set forth in paragraph 1.06C.2 Performance Confirmation; Performance guarantee.

e. All test procedures shall be in strict conformance with the referenced standards. However, prediction of performance of a trimmed impeller from test data of the larger impeller will not be permitted. If trimming is required, re-test the pump. Do not allow deviations from specified operating conditions, though allowed by the referenced standards, to result in overload of the driver furnished with the equipment, nor allow such deviations to result in power requirements greater than the driver's nameplate (1.0 service factor) rating.

f. The contractor shall furnish the construction manager with not less than 2 weeks' advance written notice of the date and place of the non-witnessed tests.

g. All test results, including test logs and generated curves, shall be certified correct by the chief engineer or individual in responsible charge of the manufacturer's test facility, and shall be submitted in accordance with paragraph 1.08.

1.07 QUALITY ASSURANCE: ADDITIONAL REQUIREMENTS

A. Scope:

1. In addition to the requirements under paragraph 1.06 applicable to pumps, the following are required for the subset of larger and custom-engineered pumps defined in paragraph 1.01A Scope. Contractor is advised that the results of NPSH3 will be used by the construction manager to determine if the tested pumps conform to the POR requirements set forth in paragraph 1.04. Failure to meet these requirements will likely require remanufacture of the pumps or rework of one or more of the pump components to achieve the required and necessary pump stability characteristics. All costs associated with such remanufacture or rework and retesting shall be borne by the contractor.

2. The performance curves submitted under paragraph 1.08, once accepted by the construction manager, shall become a warranty on the part of the contractor to provide equipment that will provide performance characteristics that accurately duplicate the characteristics presented in the submitted and accepted curves. The factory test results shall confirm performance within the tolerances set forth in ANSI/HI 14.6.3 and paragraph 1.06.C.2, NPSH3, as determined by certified factory test results, shall not cause the pump's S to exceed the limit specified in this section or the detailed specification. The manufacturer may propose a pump with a higher S, provided that documentation showing that the onset of suction recirculation is to the left of the pumps specified operating region. Submit documentation of the procedures used to determine the onset of suction recirculation.

B. Performance Testing:

1. Witnessed tests:

   a. Subject all custom-engineered pumps, and other pumps where required by the detailed specification, to a witnessed factory performance test and NPSH3 tests in accordance with the provisions of this portion of the specifications.

   b. The contractor shall furnish the construction manager with not less than 2 weeks' advance written notice of the date and place of the witnessed tests.

2. Performance tests:

   a. Factory performance tests shall comply with the requirements of ANSI/HI 14.6. Include in the factory tests test data for each full-speed performance requirement and any other points stipulated for this test procedure in the detailed specification. Conduct these tests with the pump inlet throttled to provide the specified NPSHA or as otherwise detailed in the accepted test plan. For large-column pumps, model performance testing with reduced NPSHA, pursuant to paragraph 1.07B.4 Performance Testing; Model tests, may be used. Include shaft vibration and case noise at full speed in the test data.

b. Duplicate the test setup in the manufacturer's test facility as closely as possible the inlet conditions in the proposed installation, using temporary baffles and other means. Where centrifugal pumps are furnished with inlet elbows, inlet adapters, or inlet reducers as a part of the manufacturer's scope of supply, test the pumps with the elbow, adapter, or reducer fitted to the pump. Specified performance criteria shall apply to the complete pump assembly, including losses through any elbow, adapter, or reducer. Where submersible pumps are to be furnished with inlet nozzles and/or discharge elbows or adapters, test the pumps with the inlet nozzles or adapters. The specified performance requirements shall apply to the complete pumping assembly, including any inlet nozzles, discharge elbows, or adapters. NPSHA shall not exceed that specified in the detailed specification during any performance test. Include separate readings for inlet and discharge head for each data point in certified test data.

c. Take not less than eight test points, including not less than four within plus or minus 8 percent (on the basis of rated flow) of the rated condition (Condition Point A) and not less than two test points within plus or minus 4 percent of the pump's BEP at the test speed. In addition, one test point is sufficient to define head and power requirements at shutoff head, and one test point is sufficient to define flow at Condition Point B.

3. NPSH3 tests:
   a. Perform NPSH3 tests to confirm the data used to establish NPSHA margin for each specified operating condition as specified in paragraph 1.04F. Perform NPSH3 tests for submersible wastewater pumps using the method described in Figure 11.6.8 in ANSI/HI 11.6. Extend all NPSH3 tests from 30 percent to 140 percent of best efficiency flow at full speed, or to the upper limit of the AOR as defined by the manufacturer, whichever is less. Cause for rejection is failure to achieve guaranteed performance or performance proposed in accepted submittal documents, whichever is the more restrictive (capacity and head, efficiency or NPSH3). Tolerances and restrictions are as set forth in paragraph 1.06C.3 Performance Confirmation; Non-witnessed tests, above, for non-witnessed tests.
4. Model tests:
   a. Where allowed in the detailed specification or upon specific application with adequate justification by the manufacturer, confirmation of performance of large pumps may be demonstrated by testing the prototype at reduced speed or by testing a model of the prototype pump. Perform NPSH3 tests to confirm the data used to establish NPSHA margin for each specified operating condition as specified in paragraph 1.04F. Cause for rejection is failure to achieve guaranteed performance (capacity and head, efficiency or NPSH3). Perform physical model testing at qualified, commercial facilities, with at least 10 years of continuous-duty operation. Conduct all tests in accordance with ANSI/HI 1.6 or 2.6. with the following restrictions:
      1) If the prototype is tested at reduced speed, the ratio of test speed to prototype speed shall be not less than 0.66:1.
      2) Model test ratios shall be not less than 0.33:1, model to prototype.
      3) Impellers for model tests shall be a minimum of 12 inches in diameter.

4) Subject impellers for prototype pumps to a model-to-prototype profile comparison using templates ratioed from the impeller used for the completed and accepted model test. Compare impeller profiles for the x, y, and z planes. If model testing is proposed for any or of the specified tests, the contractor shall include the proposed methodology for profile confirmation as a part of the submittal material required under paragraph 1.08. Perform impeller profile comparison with a representative of the construction manager present. All costs associated with travel and subsistence of the construction manager's representative shall be borne by the contractor.

5) Acceptance criteria, based upon projected prototype performance from model test results using ANSI/HI-approved affinity relationships, are as set forth above under paragraph 1.06C.3 Performance Confirmation; Non-witnessed tests.

6) Apply the restrictions set forth above for witnessed tests.

b. The contractor shall furnish the construction manager with not less than 2 weeks' advance written notice of the date and place of the model tests.

5. Test certification and reporting:

a. An officer of the pump manufacturer or chief engineer of the test facility shall certify correct all test results, including test logs and generated curves. The contractor shall submit test results as an informational submittal.

C. Confirmation of passage geometry:

1. For solids-handling pumps, subject the design waterway passages and mating passages between rotating and stationary portions of such passages to confirmation that no mismatch of exiting and entering angles or angular discontinuities exist in pumps furnished under specification sections containing the words "custom-engineered" in the title, and that are not proven designs in accordance with paragraph 1.04B. The confirmation process shall employ CFD modeling techniques in which mesh generation is optimized and mesh size is reduced in the regions of flow attachment, detachment, and separation regions of the impeller and cutwater to detect angular mismatches of 0.25 degree or greater.

2. Use a number of different convergence criteria to assess whether a solution is converged. These criteria may include the residuals given by the software; global imbalances in momentum, energy, etc.; whether key global quantities have reached an equilibrium value; and whether information from various solution monitoring points have stabilized. Note that these monitoring points should be in areas where the flow could be much weaker, and not where the flow could be converged easily. Use high-convergence criteria, and repeat runs with different monitoring points to ensure proper convergence.

3. Provide modeling software that is professionally customized and optimized for the determination of pump fluid dynamics, especially flow attachment, detachment, and separation. Verify the mathematical model and software accuracy by experimental data from test cases including similar dynamics. The individual conducting the modeling effort shall be a CFD specialist with graduate-level education in the subject and over 5 years of relevant experience. Submit the model graphic outputs, signed and notarized by the pump manufacturer's officer in charge of engineering, as a part of the documentation required under paragraph 1.08.

1.08 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. In addition to the material listed in the detailed specification, provide the following submittals:
      a. Documentation of successful pump designs or proposed alternatives as specified under paragraph 1.04B.1 Pump Selection. If included as part of the design, include in the documentation applications where pump cans of a similar size have been provided as part of the design.
      b. A Certificate of Unit Responsibility attesting that the contractor has assigned unit responsibility in accordance with the requirements of this section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
      c. A copy of this specification section and the specification sections listed for submittal in the detailed specification sections. Ensure that the specification copies are complete with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore, requested by the contractor, underline each deviation and denote by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the contractor with the specifications. Accompany the submittal with a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal is sufficient cause for rejection of the entire submittal with no further consideration.
      d. A copy of the contract document control diagrams and process and instrumentation diagrams (P&IDs) relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, mark the drawing or drawings as “no changes required.” Failure to include copies of the relevant drawings with the submittal is cause for rejection of the entire submittal with no further review.
      e. Documentation of certification in accordance with ISO 9001 as specified under paragraph 1.06A.

f. Predicted pump performance curves for each condition point specified showing head, power, efficiency, and NPSH3 on the vertical axis plotted against capacity on the horizontal axis, along with the manufacturer's warranty to meet the requirements specified in paragraph 1.07 Scope. Provide curves for variable-speed pumps to demonstrate operation at speeds required to achieve the specified reduced-speed operating conditions. All curves shall clearly display the specified operating conditions and conformance with POR and AOR limits in the individual specification sections. Provide variable-speed plots showing specified operating conditions and POR limits. Plot curves at increments of not more than 5 percent speed or 50 rpm increments, whichever is less, from full speed to the lowest speed required to meet specified operating conditions. Curves for column-type pumps shall show bowl efficiency and allowances for inlet, column, and discharge head losses separately.

g. NPSH margin calculations performed for each specified operating condition in accordance with paragraph 1.04 as applicable and including the information required under paragraph 1.04F.

h. Motor submittal information as specified in Section 43 05 21. In addition, include in this information certified calculations for motor rotor and frame reed frequencies, as specified under paragraph 1.04G.

i. Complete description and sketch of proposed test setup for factory test if a factory test has been required under the detailed specification section or as required by the provisions of this section. Include in submittal material sample calculations and proposed test log format. If the contractor proposes a model test for a part or all of the specified performance tests, include in the submittal information the proposed model details and a complete description of the proposed method for comparing the model impeller profiles with the impeller profiles for the prototype pumps.

j. Drawings showing general dimensions and confirming the size of pumps, motors, drives, and specified appurtenances; piping connections; construction details of equipment (including bearings and bearing isolators); wiring diagrams; and weight of equipment.

k. Variable-speed drive information as required under Section 26 29 23 if the equipment specified includes variable-speed capability.

l. Driver unit support calculations and data if the driver is separately supported and if the analysis under the requirements of paragraph 1.05B have been required by the terms of these specifications.

m. Shaft deflection calculations for volute-type pumps: provide calculations to demonstrate compliance with paragraph 1.04E, per the methodology set forth as required by paragraph 1.05B.

n. Detail drawings of the pump and driver unit foundation demonstrating conformance to this section and Section 43 05 13. Include in the submittal drawings depicting type, size, number, projection, and arrangement of anchor bolts; dimensional drawings of the sole and baseplates; and dimensional drawings for the concrete supports for both the pump and motor, if applicable. Drawings shall also depict other pertinent information, including location of equipment pads and reinforcement; equipment drains; expansion joint locations; elevation of top of grout and grout thickness; elevation of top of baseplate, soleplate, or mounting block; size and location of electrical conduits; and any other equipment-mounting features embedded in equipment pads.

o. Limiting nozzle loading criteria, if different from that established by ANSI/HI 9.6.2.

p. The qualifications of the personnel proposed by the contractor to perform field alignment procedures in accordance with the requirements of paragraph 3.04.

3. The following are applicable to all vibration testing of pumps, in accordance with the requirements of paragraph 3.06 Field Vibration Tests and, paragraph 3.07 Torsional Vibration Testing, where required:

   a. The qualifications of the independent testing laboratory and individual personnel proposed by the contractor to perform field vibration testing, analysis, and reporting.

   b. Proposed vibration testing plan. including accelerometers mounting and presentation formats.

4. The following are applicable for pumps specified to meet ANSI/HI 9.6.8 Analysis Level 2 or 3:

   a. Qualifications of the design professional, and firm name, proposed to perform the mass elastic design analyses specified under paragraph 1.05B, or the manufacturer's qualified design professional conducting Alternate mass elastic design analyses under paragraph 1.04C Critical Speeds and Natural Frequencies, where required by the detailed specification section, if the subject analyses are required by the terms of these specifications.

   b. Descriptive material outlining the methodology and software to be used in the analyses required under paragraph 1.05B and paragraph 1.04 Critical Speeds and Natural Frequencies, as applicable.

   c. "Executive Summary" report of the mass elastic design analyses for pumps as specified in paragraph 1.05B, for custom-engineered pumps, and for Alternate mass elastic design specified under paragraph 1.04 Critical Speeds and Natural Frequencies, where required by the detailed specification section.

   d. The proposed instrumentation setup for the in situ torsional vibration test specified under paragraph 1.05B.

   e. Can design documentation specified under paragraph 1.05C, including bolt patterns for the pump base and soleplate on can.

   f. "Final Report" of the model study specified under paragraph 1.05C.

   g. Model graphic outputs specified in paragraph1.07C.

B. Informational Submittals

1. Procedures: Section 01 33 00:

   a. Performance guarantee as specified in paragraph 1.06C.

   b. Equipment anchor calculations specified in paragraph 1.04E.

   c. O&M information specified in Section 01 78 23.

   d. Motor information submittals as specified in Section 43 05 21.

   e. Bearing L-10 life calculations.

   f. Critical speed calculations demonstrating compliance with paragraph 1.05B if a lateral rotordynamic analysis is required. Otherwise, provide critical speed calculations demonstrating compliance with paragraph 1.04C.

   g. Nozzle loading information required under paragraph 3.01.

h. Motor balance logs, certified and notarized as specified in paragraph 1.04G.
i. Certified balance logs and worksheets, as specified in paragraph 2.05.
j. Installation certification Section 43 05 11-Form A as specified in paragraph 3.01.
k. Training certification Section 43 05 11-Form B as specified in paragraph 3.08.
l. If factory tests are specified in the detail specification section, certification of satisfactory testing of each unit as specified. Include in the certified material copies of test logs and resulting performance curves.
m. Documentation of field alignment data in accordance with Section 43 05 14.
n. Field vibration test reports in accordance with paragraph 3.06.

2. The following are applicable for pumps specified to meet ANSI/HI 9.6.8 Analysis Level 2 or 3:

a. Results of model tests for pump cans if model tests are required by the provisions for paragraph 1.05C.
b. "Final Report" of mass elastic systems analyses for pumps as specified in paragraph 1.05B, for custom-engineered pumps, and for Alternate mass elastic design specified under paragraph 1.04 Critical Speeds and Natural Frequencies, where required by the detailed specification section.
c. Results of motor rotor, frame, and assembly bump tests, certified as specified under paragraph 1.04G Electric Motors, along with the design professional's "Supplemental Report" as specified under paragraph 1.05B.
d. Pump can installation acceptance certification, as specified in paragraph 3.03, if applicable.
e. Results of field vibration tests as specified under paragraph 3.06.

PART 2 PRODUCTS

2.01 MATERIALS

A. General:

1. Where this section and sections referencing this section are silent with respect to materials of construction on any component, material selection shall follow the requirements of Table H.1, ANSI/API 610, Materials Class I-1, with the exception that shafts for vertical column-type pumps be 12 percent chromium stainless steel. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

B. Pumps:

1. Finish for surfaces in contact with pumped fluid:
   a. Conform all pump components in contact with the pumped fluid to the following requirements.
   b. Indicate surfaces to be machine-finished on the shop drawings by symbols that conform to ANSI B46.1, Surface Texture, Surface Roughness, Waviness, and Lay. Machine surfaces shall be finished to at least the following tolerances:
   c. Nominal roughness:

Surface	Grade, Ref: ANSI B46.1 (SI units microns) (Ra: micro inches)
General machine work	3.2 or better (125 Ra)
Flange faces	3.2 or better (125 Ra)
Journal surfaces at sleeve bearings	0.4 or better (16 Ra)
Hydraulic surfaces	
Impeller	4.5 or better (177 Ra)
Impeller bowl and diffuser	6.3 or better (250 Ra)
All other wetted surfaces	6.3 or better (250 Ra)

d. Flaws such as scratches, ridges, holes, peaks, cracks, or checks that will make the part unsuitable will be cause for rejection. Machine-finished surfaces shall be thoroughly cleaned and coated with a protective layer of rust preventive. Oil and wrap small pieces, unassembled pipe, or finished bolts with moisture-resistant paper.

2. Materials:
   a. Unless otherwise specified, wetted cast-iron parts for pumps for solids-bearing liquid services shall have 2 to 3 percent nickel added to the cast iron.
   b. Provide stainless-steel impellers for the first stage of custom-engineered pumps, pumps intended for pumping screened or unscreened wastewater, and elsewhere when specified. Stainless-steel impellers shall be ASTM A743, Grade CA6NM. Where cast-nickel aluminum bronze impellers are specified, the materials shall conform to ASTM B148, Alloy C95500.
   c. Materials for shaft sleeves for packed boxes, fretting seals, and interstage seals shall conform to ANSI/API 610, Annex H 12 percent chromium-hardened or hard-faced 316 austenitic stainless steel. Materials for seal glands for packed boxes and shaft sleeves shall be AISI 316 stainless steel. Fastener parts of all types in wetted areas shall conform to ANSI/API 610, Materials Class S-5 requirements. Regardless of the seal construction, adequately size seal chambers to accommodate specified mechanical seals.

C. Flywheels: [Not Used]:

2.02 GENERAL QUALITY

A. The details of manufacture and assembly of equipment furnished under this section and referencing sections shall follow the requirements of ANSI/API 610 with respect to the following features (paragraph references, ANSI/API 610):
   1. Alignment aids (paragraph 6.1.24)
   2. Removal of rotating element (paragraph 6.1.25)
   3. Jackscrews for assistance in alignment on baseplates and equipment supports (paragraph 9.3.8.3.2)
   4. Castings (paragraph 6.12.2)

B. Provide all components or subassemblies weighing 50 pounds or more with at least one lifting eye or a provision for threading in a lifting eye. Provide components 250 pounds or greater with lifting eyes or provisions for at least two lifting eyes. Provide components 1,000 pounds or greater with at least three lifting eyes or provisions for inserting lifting eyes.

2.03 BASEPLATES AND SOLEPLATES

A. Unless otherwise noted in the detailed specification, the pump manufacturer shall furnish pumps with baseplates or soleplates conforming to the requirements of Section 43 05 13. Design baseplates and soleplates to be installed in the housekeeping curb shown and machine flat and co-planar to within 0.002 inch per foot in all directions on the face mating with the pump and motor or driver support. Soleplates shall have the words “THIS SIDE DOWN” permanently affixed to the underside using a welding rod material or stamped prior to milling. Alternative marking methods, using heavy scribing or machining, are acceptable provided that they may be observed following blasting in preparation for coating.

2.04 WEARING RINGS

A. Where specified, fit pumps with both stationary and rotating wearing rings. Except for the difference in hardness between stationary and rotating rings, wearing rings shall be stainless steel and conform to the requirements of ANSI/API 610, paragraph 6.7 and material class S-8 (Table H.1, Annex H). The maximum wearing ring clearances shall not exceed 150 percent of the values stated in Table 6, ANSI/API 610. The minimum wearing ring hardness on the rotating ring is 350 Brinell Hardness Number (BHN), with the stationary ring not less than 100 hardness points greater.

2.05 BALANCE

A. The balancing for pumps with suction nozzle sizes 6 inches in diameter and greater and associated components shall conform to the requirements set forth in ANSI/API 610, paragraph 6.9.4.1 (equivalent to ISO 1940 or ANSI 2.19 Grade 2.5), unless other portions of this project manual impose more restrictive requirements. It is the intent that the components be balanced as an assembly (“rotor”) in accordance with ANSI/API 610 definitions. For extended-shaft pumps, balance impeller(s) and shaft up to the first coupling with the line-shaft.

B. For separately balanced components, perform a residual unbalance inspection after rotor assembly per ANSI/API 610 requirements, as described in Annex J of that document. Provide copies of worksheets and demonstrate that tolerances are in compliance (i.e., rotor has passed) in addition to other reporting requirements of this paragraph.

C. Furnish all balance logs, certified correct and signed by the chief engineer or individual in responsible charge of the manufacturing facility, in accordance with paragraph 1.08.

2.06 DRIVE UNIT SUPPORTS FOR SEPARATELY SUPPORTED MACHINES AND INTERMEDIATE SHAFT SUPPORTS

A. Supports for separately mounted vertical pump drivers and intermediate shaft bearings shall be composite structures of fabricated steel, ASTM A36. Unless otherwise specified, design the supports to span an opening in the floor sufficient to allow removal for the complete pump. Provide rolled steel beams to stiffen the support and mount a fabricated steel driver unit support pedestal on the support plate. The support pedestal top plate and portions of the support plate assembly intended to join with surfaces in the installation structure shall be milled flat and parallel to 0.002 inch per foot. Provide pedestals with access provisions to adjust or assemble/disassemble couplings. Select a support that is designed to be supported on a soleplate or soleplates embedded in a housekeeping pad at the edges of the floor opening or as indicated. Other details for the driver unit support shall be as indicated.

2.07 FLYWHEEL ASSEMBLIES [NOT USED]

2.08 CANS FOR COLUMN-TYPE PUMPS

A. Unless specified otherwise, fabricate cans for column-type pumps from ASTM A36 steel with internal baffles fillet-welded to the interior surface of the can. Provide seal welds at welded joints and ensure that welds are ground smooth. Prepare and coat all internal surfaces after welding with fusion-bonded epoxy conforming to the requirements of AWWA C213 using NSF/ANSI 61-compliant materials (3M Scotchkote 134, or approved equal). The minimum coating thickness is 12 mils. The external epoxy coating shall be in accordance with Section 09 90 00 requirements.

B. Where the detailed specification requires a can suitable for service with an upstream hydraulic gradient in excess of the elevation required for the pump discharge head, gasket or fit the flanged connection to the pump discharge head with a double O-ring seal designed to withstand not less than twice the pressure specified in the detailed specification

2.09 MACHINING

A. Unless otherwise specified, provide machined surfaces with a 125 Ra (micro-inch) finish without any grooves, surface imperfections, or machining marks. Mating surfaces shall be coplanar within a maximum of 0.002 inch. Bearing housings and seals shall have collinear centerlines within less than 0.001-inch total difference. Provide shafts with a 63 Ra (1.6-micron) finish at fit areas (coupling, sleeves, impeller) and 125 Ra (3.2-micron) finish at the clear spans.

PART 3 EXECUTION

3.01 GENERAL

A. With the exception of submersible pumps and the inlet connection for column-type pumps installed in open forebays or wetwells, connect pump inlet and discharge nozzles to field piping using equipment connection fittings conforming to the requirements of Section 40 05 06.16. Select restraining rods on equipment connection fittings that is designed specifically to restrain the unbalanced hydraulic thrust developed by the pump when operating at full speed against a closed valve. Torque all restraining rod nuts to ensure that any moment or shear transmitted to the pump nozzles is within the values permitted under ANSI/HI 9.6.2, or that permitted by the equipment manufacturer, whichever is greatest. Where ANSI/HI 9.6.2 is silent with respect to any particular aspect of allowable nozzle loads, the contractor shall follow the written requirements provided by the equipment manufacturer. Install all pumps furnished under specification sections containing the words “custom-engineered” in the title under the presence of a factory-authorized installation specialist or specialists. Under no circumstances shall any installation procedure take place without the installation specialists present. Equipment installation procedures shall conform to the requirements of Section 43 05 13. Upon completion of installation work, the contractor shall submit a complete, properly signed certification Form 43 05 11-A as specified in Section 01 99 90.

3.02 SOLEPLATES

A. Level soleplates, if provided pursuant to this section or any section referencing this section, or where required by the equipment manufacturer’s recommendation, in the presence of a factory-authorized installation specialist to a maximum tolerance of 0.002 inch per foot in all directions. Where the equipment manufacturer requires more stringent tolerances, those tolerances prevail.

3.03 PUMP CANS

A. When specified, install pump cans as indicated to the following tolerances:

Horizontal position	±0.125 inch in all directions
Vertical axis	within 0.5 degree from vertical
Level	0.02 inch per foot of diameter at the pump baseplate bolt circle
Elevation	±0.125 inch from planned elevation

B. Where the equipment manufacturer requires more stringent tolerances, those tolerances prevail.

C. Equipment shall not be installed in pump cans until the pump manufacturer’s factory-trained and authorized installation specialist has furnished the construction manager with written and signed certification that the can has been installed satisfactorily and is acceptable for installation of the equipment.

3.04 ALIGNMENT

A. Journeymen millwrights shall perform alignment of equipment furnished under this section and any referencing section. Carpenters, laborers, or any other trades are specifically excluded from performing this work. In locations where such trades are not available, the contractor shall retain the services of a firm specializing in this type of work to perform the setting and alignment work. The contractor shall submit the qualifications of the proposed firm to the construction manager for acceptance prior to performing the work. The construction manager shall personally witness the final alignment procedures for each item of equipment as a condition precedent to beginning any work required under Section 01 45 20. Alignment techniques shall conform to the requirements of Section 43 05 14.

3.05 FIELD TESTING

A. Field testing shall conform to the requirements of Section 01 45 20 and the detailed specification sections.

B. For pumps furnished under specification sections containing the words “custom-engineered” in the title, and where the manufacturer’s qualified design professional has conducted the Alternate mass elastic design analyses specified under paragraph 1.04 Critical Speeds and Natural Frequencies, the testing procedure is a plan developed jointly by the contractor and equipment manufacturer to demonstrate performance of each item of equipment at specified operating conditions.

C. Unless otherwise specified in the detailed specifications, field-test centrifugal pumps for lateral vibration in accordance with paragraph 3.06B. In addition, “custom-engineered” pumps, and pumps subjected to Alternate mass elastic design analyses under paragraph 1.04 Critical Speeds and Natural Frequencies, shall undergo field torsional vibration testing (paragraph 3.07A).

3.06 FIELD VIBRATION TESTS

A. Qualifications:
   1. The contractor shall retain the services of an independent testing laboratory to conduct the testing work specified under this paragraph. The work shall be directed by a professional mechanical engineer, registered to practice in any one of the 50 states composing the United States.
      a. The engineer (hereinafter termed “professional vibration analysis specialist”) shall be a graduate of a college holding Accreditation Board for Engineering and Technology Inc. (ABET) accreditation in mechanical engineering and has been engaged in the practice of providing the type of monitoring services required under this paragraph for rotating machinery for a period of not less than 10 years.
      b. As an alternate qualification, the professional vibration analysis specialist shall have an ISO/ANSI Vibration Analyst Category IV and been engaged in the practice of providing the type of monitoring services required under this paragraph for rotating machinery for a period of not less than 10 years.

2. Submit the professional vibration analyst specialist's qualifications and references, certified and notarized, for review and acceptance by the construction manager not less than 6 weeks prior to the date scheduled for the field vibration test work specified herein. The construction manager shall review the required documentation and references and indicate acceptance or rejection of the proposed analyst's qualifications within 14 days of submission. If the analyst proposed by the contractor is rejected, the contractor shall propose an alternative choice with appropriate documentation.
3. The independent testing laboratory's testing team (comprising the professional vibration analysis specialist and any technicians required to complete the specified tasks) shall be fully equipped to provide continuous pressure, velocity, and displacement values for rotating equipment installed under the requirements of this section. Vibration testing equipment shall include sufficient calibrated pressure and flow monitoring devices to determine pump operating conditions as well as vibration levels.

B. Vibration Tests:
1. Submit vibration testing plan, prepared by the professional vibration analysis specialist, for review and acceptance by the construction manager not less than 3 weeks prior to the date scheduled for the field vibration test work specified herein.
   a. Proposed vibration testing plan, incorporating corresponding pump performance testing, shall be developed to demonstrate absence of natural frequency excitation (resonance) and compliance with specified vibration limits within the pump operating range.
   b. The professional vibration analysis specialist shall consider identified standards and others consistent with practice standards of care in preparing the plan and directing the work.
   c. As part of the plan, professional vibration analysis specialist shall specify and justify selection and mounting of the vibration sensors (fully adhered or magnet-mounted) in accordance with accepted practice and specified requirements. Hand-held probe accelerometers shall not be used.
   d. Plan shall also stipulate the data collection and processing method including frequency response averaging of spectra and waveform points for each discrete measurement.
   e. Include example presentation formats consistent with specifications and accepted practice.
2. Unless otherwise specified in the detailed specification, the RMS vibration velocity shall not exceed the limits established in the appropriate standards indicated in the Table below. The measurement locations shall correspond to the guidelines provided in the specific standards given in the Table below.

Component	Standard
All Pumps	ANSI/HI 9.6.4 or ANSI/HI 11.6
Electric Motors of Any type	ISO 10816-3 Table A.1 or A.2, Zone Boundary A/B
Reciprocating engines	ISO 10816-6 Table A.1, Class 3
Support bearings, flywheels	ISO 20816-1

3. Testing:

a. Perform ramp (sweep) test of pump vibrations (at average or higher head conditions) – minimum 10 minutes (mins) start-up run, slow ramp from minimum to maximum speeds (20 mins). 20 mins at maximum speed, 10 mins at reduced (A operating speed), 10 mins to confirm largest peak; then through coast down.

b. The professional vibration analysis specialist shall collect vibration readings during the sweep test, make notes about peaks and then proceed to testing with steady state operation at the design and other targeted points. Prepare report of Overall Velocity Trends including pump speed and flow.

c. Conduct discrete performance and vibration testing of all design points (4), when performance is stable but not less than 10 minutes each. It is not necessary to conduct vibration testing at shut-off.

d. Conduct similar discrete performance and vibration testing at each discrete peak observed during the sweep test.

4. Reporting:

a. Provide vibration test reports as an information submittal in accordance with paragraph 1.08, and provide the signature of the responsible professional vibration analysis specialist.

b. The vibration spectra shall be of sufficient resolution for legibility of magnitude and frequency data to be properly reviewed by the construction manager. Cascade diagrams are not sufficient for variable-speed drive application unless supported by the required data in a format suitable for more detailed analyses. Provide separate spectra at the maximum and minimum operating speeds and any potential resonant frequencies.

c. Depict RMS velocity by axis on same plot and zoom in on 10 highest peaks for each separate axis. Report should clearly address multiples of operating speed and twice vane pass at operating speed, typically associated with pump phenomena.

d. Interpret data, identify anomalies and resonant frequencies (if any), provide discussion of probable sources/causes in test report. Provide interpretation as to why there may be peaks beyond typical phenomena.

e. If deemed necessary by the professional vibration analysis specialist, to determine the potential problem and risk with any identified peaks, further resolve and analyze critical peaks by frequency.

C. Remedial Measures:

a. If required, professional vibration analysis specialist shall provide written recommendations for remedy of problems identified.

b. Contractor shall undertake appropriate remedial action, in conjunction with the pump manufacturer, and provide professional vibration analysis specialist services, and pump manufacturer services throughout the process required to resolve identified problems.

c. Conduct additional testing after modifications or replacements to confirm effectiveness of remedy.

3.07 FIELD TORSIONAL VIBRATION TESTING

A. As required in paragraph 1.05 for custom-engineered pumps, and pumps subjected to Alternate mass elastic design analyses under paragraph 1.04 Critical Speeds and Natural Frequencies, perform field torsional vibration tests.

B. Qualifications:
   1. Work shall be conducted under the direct supervision of the design professional responsible for the mass elastic system design on an installed pumping unit selected by the construction manager.
   2. Submit qualifications of the firm and analyst demonstrating training and competency in the required testing, consistent with the requirements of paragraph 3.06 Field Vibration Tests.

C. Submit testing plan and reporting documentation consistent with the requirements of paragraph 3.06 Field Vibration Tests.

D. Provide remedial measures consistent with the requirements of paragraph 3.06 Field Vibration Tests.

3.08 TRAINING

A. Training shall conform to the requirements of Section 01 79 00 and include separate training sessions for each operator shift maintained by the Owner and a separate session for maintenance personnel.

B. Unless otherwise specified in the referencing section, the training requirement is waived for constant-speed pumping equipment with suction nozzle sizes 6 inches in diameter and smaller and for pumps with connected power requirements 10 hp and less.

C. The training session for maintenance personnel shall include a comprehensive presentation, employing cut-away models or comparable graphics, and documentation on the step-by-step disassembly and subsequent reassembly of a pumping unit.

D. Upon completion of training requirements, the contractor shall submit certified Form 43 05 11-B as specified in Section 01 99 90.

SECTION 43 23 61

CONSTANT SPEED VERTICAL TURBINE PUMPS, OPEN LINESHAFT

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Constant speed single or multi-stage vertical turbine diffuser pumps for pumping fluids that may contain mildly abrasive small diameter solids.
   2. Provide pumps complete with intake bell, discharge column, discharge head and electric motor.
   3. Select equipment furnished under this section that will comply with the requirements of this section and Section 43 23 03.

B. Equipment list:

Item	Equipment Number
Plant Water Pump 1	73-P-00010
Plant Water Pump 2	73-P-00020

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below:
   1. Section 43 05 11: General Requirements for Equipment
   2. Section 43 05 13: Rigid Equipment Mounts
   3. Section 43 05 14: Machine Alignment
   4. Section 43 05 21: Common Motor Requirements for Equipment
   5. Section 43 23 03: General Requirements for Centrifugal and Axial Flow Pumping

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

Reference	Title
ABMA 9	Load Ratings and Fatigue Life for Ball Bearings
ABMA 11	Load Ratings and Fatigue Life for Roller Bearings
AISC	American Institute of Steel Construction—Manual of Practice
ANSI/API 610	Standard for Centrifugal Pumps for Petroleum, Petrochemical and Natural Gas Industries
ANSI/ASME B46.1	Surface Texture, Surface Roughness, Waviness and Lay
HI Standards	Hydraulic Institute Standards

1.04 DEFINITIONS

A. Terminology used in this section conforms to the following definitions:
   1. Equipment Pad: Concrete foundation (block or slab) supporting and elevating equipment mounts above the supporting structural floor slab or local grade.
   2. Mounting Pads: Thickened or raised areas of baseplates and soleplates where the feet or mounting surfaces of mounted equipment and drivers rest on the baseplate or soleplate.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination
   1. See Section 01 12 16 Work Sequence.

B. Pre-installation meetings

C. Sequencing

D. Scheduling

E. Unit responsibility: Assign unit responsibility, as specified in Section 43 05 11, to the pump manufacturer for the pumps, seal water control unit assemblies, and motors specified in this section. Provide a completed and signed Unit Responsibility Certification Form (Form 43 05 11-C, Section 01 99 90).

1.06 SUBMITTALS

A. Action submittals:
   1. Procedures: Section 01 33 00.
   2. Conform submittals to the requirements of Section 43 23 03. Sections to be marked-up and submitted in accordance with Section 43 23 03 requirements include:
      a. Section 43 05 11: General Requirements for Equipment
      b. Section 43 05 13: Rigid Equipment Mounts
      c. Section 43 05 14: Machine Alignment
      d. Section 43 23 03: General Requirements for Centrifugal and Axial Flow Pumping Equipment
      e. Section 43 05 21: Common Motor Requirements for Equipment

B. Informational submittals:
   1. Procedures: Section 01 33 00.
   2. Conform submittals to the requirements of Section 43 23 03.

C. Closeout submittals:
   1. Procedures: Section 01 78 23.
   2. Conform submittals to the requirements of Section 43 23 03.
   3. Spare parts:
      a. Procedures: Section 01 33 00.

b. For each unit consisting of one or two pumps of like size and service furnished under this section, one set of the following spare parts shall be furnished. Two sets shall be furnished for each unit consisting of more than two pumps of like size and service.

c. Provide the following spare parts:

1) One set bowl bearings

2) One lineshaft bearing assembly

3) One set wear rings

4) One shaft seal, complete

d. Tag and store spare parts in accordance with provisions of Section 43 05 11.

1.07 QUALITY ASSURANCE

A. Certifications:

1. Manufacturers proposing to furnish equipment specified under this section shall hold current certification under ISO 9001-2001.

2. Application for certification under ISO 9001 shall not be deemed as an acceptable substitute for current certification. Documentation attesting to current certification shall be signed by an officer of the manufacturer's corporation and shall be notarized.

3. Welder Certification

a. ASME Section IX and/or AWS

B. Critical speeds: Critical speeds shall be in accordance with Section 43 23 03-1.04 except when the title of the detailed section includes "Custom Engineered" in which case Section 43 23 03-1.05 applies.

C. Vibration limits: Vibration limits shall be in accordance with Section 43 23 03-3.06 and subject to field testing in accordance with paragraph 3.04 of this section.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

1.09 SPECIAL WARRANTY [NOT USED]

PART 2 PRODUCTS

2.01 OWNER-FURNISHED EQUIPMENT [NOT USED]

2.02 MANUFACTURERS

A. Manufacturers: Candidate manufacturers are listed below. The manufacturer's standard product may require modification to conform to specified requirements:

1. Fairbanks-Morse
2. Floway
3. Flowserve
4. Goulds

2.03 PERFORMANCE/DESIGN CRITERIA

A. Service conditions:

Description	Value
Equipment number	73-P-00010 73-P-00020
Area exposure	Indoors, No Area Classification
Fluid type	Potable Water
Maximum operating pressure	100 psi

B. Operation Conditions:

Operating Condition	
Condition A [a,b]	
• Capacity, gpm	120
• Total head, psi	85
• NPSHA, feet	TBD
Condition B [b,d]	
• Capacity, mgd	From pump H/Q curve
• Total head, psi	60
• NPSHA, feet	TBD
Condition C [c,d]	
• Capacity, mgd	From pump H/Q curve
• Total head, feet	90
• NPSHA, feet	TBD

Notes:

a. *Take Condition A as the rated, continuous-duty operating condition. Guarantee performance at the rated condition in accordance with Section 43 23 03. Condition A has been selected to obtain the rated pumping capacity for the installation. It is not intended that the pumps be selected for maximum efficiency at Condition A. Select pumps furnished under this section to achieve Condition A performance, and also operate continuously without objectionable vibration or cavitation at the head specified under Condition B. Condition A may be located in the Allowable Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3 and published in the manufacturer's published application data for the specific model proposed for this application.*

b. *Condition B head is presented to indicate operating conditions when the pump is operating against minimum anticipated system head, assuming a hypothetical head-capacity curve. Use Condition B for pump selection. Condition B shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and list in the manufacturer's published application data for the specific model proposed for this application. Condition B shall be located to the right of BEPQ and shall not be less than 10 percent of BEPQ. Pumps with head-capacity curves steeper than that assumed will produce somewhat less flow at somewhat lower head. The reverse will occur with pumps having a shallower head-capacity curve. Net positive suction head available (NPSHA), as listed for Condition B is calculated on a pumped flow of 130 mgd.*

c. *Condition C is the anticipated continuous duty maximum head condition. Provide pumps furnished under this specification that are capable of sustained (24 hours per day) operation at this condition within the requirements set forth in Section 43 23 03. Condition C shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and list in the manufacturer's published application data for the specific model proposed for this application.*

d. *Total head in the above tabulation is the algebraic difference between the discharge head and suction head as defined in ANSI/HI 2.1–2.6 and are exclusive of pump intake, bowl, discharge column, discharge head and lineshaft losses. A curve showing these losses separately shall be provided as a part of the submittal information required under Section 43 23 03. NPSHA in the above tabulation is referenced to project elevation 5211' and is calculated in accordance with ANSI/HI 2.3 for average barometric pressure and maximum temperature conditions. Calculated NPSHA has been reduced by 2 feet as an allowance for uncertainties associated with the pumped fluid and sump conditions, and no reduction in NPSH margin limitations specified in Section 43 23 03 will be permissible because of the inclusion of this allowance. NPSHA at the pump impeller eye can be determined by adjusting the given value in the above tabulation by proposed pump dimensions and the indicated requirements for pump installation details.*

C. Design requirements:

1. Provide equipment provided under this section that conforms to the following:

Item	Value
Pump	73-P-00010 73-P-00020
Maximum efficiency, minimum, percent [a]	
Bowl	TBD
Pump	TBD
Impeller type	TBD
Piping connection size, inches, minimum	
Discharge	TBD
Minimum bell diameter, inches [b]	TBD
Discharge arrangement	Above Grade
Operating speed, rpm, maximum	TBD
Motor (See Section 43 05 21)	
Horsepower	15
Type (See Section 43 05 21)	Project defined TEFC – (Corrosion) Severe Duty, Enclosed
Inverter duty	No
Space heater	Yes
Thermal protection	Yes
Ambient duty rating	+40
Operating speed, rpm, maximum	TBD
Voltage rating	460 volt, 3 Phase
Hazardous rating	None
Reversing motor	No
Multi-speed motor	No
Motor starting type	Full Voltage
Voltage rating	460 volt, 3 Phase

Notes:

a. *The maximum efficiency is the minimum acceptable peak efficiency and is not required to coincide with any specified operating condition in paragraph 1.01 Performance Requirements. Pump efficiency shall be as defined in Section 43 23 03. Ensure that pump efficiency is within 2 percent of bowl efficiency when calculated at the point of peak bowl efficiency on the pump's head/capacity curve.*

b. *Select inlet bells in accordance with the requirements of Section 43 23 03.*

2. The pumps will be installed in an intake structure designed in accordance with ANSI/HI 9.8, assuming a pump bell velocity of 4.0 feet per second when the pump is operating at the flow produced at the head specified in Operating Condition B. Pumps with inlet velocities less than this value at Operating Condition B are acceptable. If the Contractor proposes a pump with an inlet velocity greater than 4.0 feet per second at the head listed for Operating Condition B, a bell extension fitting, or "umbrella" shall be fitted to the pump to achieve this limitation.

2.04 SYSTEM OPERATION

A. The pumps will be installed in a heated and/or ventilated room at an elevation of 5211' feet above sea level. One pump is a standby pump, while the remainder are duty pumps. The pumps will be controlled by the central plant control system.

2.05 MATERIALS

A. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

Component	Material
Impeller, first stage	Cast nickel aluminum bronze, ASTM B148, C95500
Impeller, all other stages	Cast nickel aluminum bronze, ASTM B148, C95500
Bowls	Close-grained cast Iron ASTM A48 CL30 NSF 61 approved epoxy coating System E-5 per coating specification Section 09 90 00 for potable water application
Hydrocones	Type 316L stainless steel

2.06 COMPONENTS

A. Bell:
   1. Must provide a smooth transition from the diameter specified above under the PERFORMANCE/DESIGN CRITERIA - Design Requirements to the suction case. Provide bolted connections between the bell casting and the suction case. At the manufacturer's option, a bell extension fitting or "umbrella" shall be provided to achieve the specified inlet velocity.

B. Suction case:
   1. Design the suction case to provide conservative entrance velocities and evenly distribute the flow to the impeller. Ensure that the inner surface of the case is smooth and free from projections or cavities. House the pump shaft lower bearing in a streamlined casing, and center and hold in place by means of rigid cast vanes. Design the bearing housing and vanes to conduct the flow efficiently into the impeller eye.

C. Pump bowl:
   1. Flange the pump bowl for registered fit. Provide bolted connections between the suction case and the bowl and between the bowl and adjacent stages or the discharge case. Diffuser vanes shall not be a multiple of impeller vanes. Flow passages through the bowl, and ensure that diffuser vanes are polished or porcelain-lined. If required on multi-stage installations, the first-stage bowl may be designed to facilitate a low NPSH impeller arrangement.
   2. If enclosed impellers are specified, provide replaceable wearing rings on the pump bowl at the impeller inlet connection.

D. Impeller:
   1. Construct impellers free from projections, cavities, or abrupt transitions. Polish the impeller surfaces.
   2. Provide impellers of the type as specified in above in the PERFORMANCE/DESIGN CRITERIA - Design Requirements. If of the enclosed type, fit the shroud with wearing rings. Secure impellers to the pump shaft using tapered collets or keyways.

E. Shafts:
   1. Size shafts to prevent excessive elongation, and to transmit the required torque without distortion in both the forward and reverse direction. Provide shafts with a first critical speed not less than 10 percent below and 20 percent above maximum operating speed. The pumping units shall use a two-piece headshaft, solid intermediate lineshafts supplied in maximum 10-foot lengths, and provide a single pump shaft extending from the suction case through a discharge case or upper bowl case containing an upper pump shaft bearing.
   2. Provide an open line shaft that is lubricated by the product fluid.

F. Bearings:
   1. Provide a suction case, bowl, and lower tube bearings that are close tolerance, spiral grooved, sleeve type. Grease lubricate the suction case bearing. Lubricate bowl sleeve bearings by the pumped fluid. Bearing spacing shall not exceed 5 feet.
   2. Provide bearings that are extra length spiral grooved sleeve type, spaced at not more than 5 feet apart. Lubricate the lineshaft bearings by the pumped fluid.

G. Discharge column:
   1. Fabricate discharge columns with interchangeable pipe sections with flanged joints. Ensure that the column interior is free from offsets, burrs, discontinuities, or irregularities. Supply the column in sections not exceeding 5 feet in length. Provide intermediate spider bushings that align and support the lineshaft enclosure. Provide flanged connections at all column, bowl and discharge head connections.

H. Discharge head and drive unit support:
   1. Provide a discharge elbow that is of the above ground type as specified, mitered or formed to provide a smooth transition from the discharge column to the discharge nozzle. Fit the pump discharge nozzle for connection with a grooved-end pipe coupling or flanged as specified. Fit the discharge head with the specified shaft seal, located to afford convenient access for maintenance. Support the elbow with a fabricated steel baseplate reinforced with ribs designed to carry the weight of the complete pump and drive unit without distortion when spanning an opening sufficient to permit withdrawal of the complete pump without removing the bowl or inlet bell. Cast or fabricate the drive unit support of steel, and design to accommodate the equipment specified. Provide brackets, cartridges and drilled ports as required for all monitoring devices specified in Division 40. The support shall be designed in accordance with Section 43 23 03 and for seismic zone in accordance with Section 01 73 24.
   2. Provide the pump head with a soleplate conforming to Section 43 05 13, manufactured expressly for the discharge head provided.

I. Seal:
   1. Provide a mechanical seal conforming to the requirements of Section 43 05 11-2.04 Mechanical Seals. Provide drilled and tapped connections for connection to an external source of lubricating fluid if specified.

J. Couplings:
   1. Provide a four-piece coupling to connect the motor shaft and headshaft between the motor and the tension nut assembly. Select a four-piece coupling that will provide for impeller adjustment, and include a spacer to permit servicing the seal.
   2. Select lineshaft couplings that are a perfect butt-fit. Design with a safety factor of 1-1/2 times the shaft safety factor and shall have a left-hand thread to tighten during pump operation.

K. Corrosion protection:
   1. Protect the interior of the discharge column, discharge head, and all exterior below grade surfaces of the pump with coating system TBD as specified in Section 09 90 00.

L. Drive unit:
   1. Drive the pump by a vertical solid-shaft motor conforming to PERFORMANCE/DESIGN CRITERIA - Design Requirements specified above, Section 43 05 21, and the requirements of Section 43 23 03. Non-reverse ratchet-equipped motors will not be accepted.

M. Equipment mounts:
   1. Mounting plates: Fabricated steel (stress relieved after fabrication) or cast iron per Section 43 05 13 with provisions for bolting each machine and sufficient thickness to permit dowelling.

2.07 CONTROLS

A. Refer to Division 40 specifications for further control information.

2.08 CONTROL PANELS

A. Refer to Divisions 26 and 40 Sections for further information.

2.09 FINISHES

A. Procedures: Section 09 90 00.

B. Prime coat: Shop applied, coating material per NSF 61.

C. Finish coat: Field applied, coating material per NSF 61.

2.10 SOURCE QUALITY CONTROL

A. Factory testing shall be non-witnessed in accordance with Section 43 23 03.

B. Hydrostatic tests:
   1. Factory test all pressure sustaining parts in accordance with Section 43 23 03.

C. Performance tests:
   1. Subject each pump to non-witnessed performance test in accordance with Section 43 23 03 to verify the full range of operating condition

PART 3 EXECUTION

3.01 EQUIPMENT MOUNTING

A. Procedure: Section 43 05 13.

B. Position equipment pad and equipment anchors for final placement of equipment.

C. Use a bolting template to position equipment anchors.

D. Level baseplate.

E. Pour grout bed supporting baseplate.

F. Eliminate grout voids below baseplate as applicable.

G. Tension equipment anchors.

H. Provide completed Form 43 05 13-A, Section 01 99 00, for each equipment installation.

3.02 ALIGNMENT

A. Procedures: Section 43 05 14.

3.03 FIELD QUALITY CONTROL

A. Field testing:
   1. Lateral vibration testing in accordance with Section 43 23 03.

2. Include in the bid all costs for services of Testing Firms and Design Professionals performing these services.

B. Manufacturer services:
   1. On-site inspections and training: Provide a factory-trained manufacturer's representative at the site for the following activities. Specified durations do not include travel time to or from the site.
      a. Installation inspections: Assist, supervise, and inspect the Contractor's activities during installation. Provide 16 inspection hours. Provide a completed Form 43 05 11-A, Section 01 99 90.
      b. Component test phase inspections: Assist, supervise, and inspect the Contractor's activities during the system test phase specified in Section 01 45 20 and this section. Provide 16 inspection hours.
      c. Operational test phase inspections: Assist, supervise, and inspect the Contractor's activities during the operational test phase specified in Section 01 45 20 Provide 16 inspection hours.
      d. Training sessions: Procedures Section 01 79 00. Provide a minimum of 4 hours classroom training for each training session. Conduct one training session to accommodate the shift schedules of operation and maintenance staff. Certify completion of training on Form 43 05 11-B, Section 01 99 90.

3.04 SYSTEMS STARTUP

A. Procedures: Section 01 45 20.

B. Preoperational (factory) testing; See paragraphs 1.07 and 2.11.

C. Component testing: Perform the following tests:
   1. During initial pump installation, verify on one pump that the crane system has the clearance and capacity to lift the wetted-end from the field mounted pump volute to accommodate routine pump maintenance. Provide or modify spreader bar or lifting assemblies as necessary to accomplish this task.
   2. During initial pumping system installation, verify with clean water that the common pump discharge header, and the individual pump suction elbows can be readily drained to the pump room sump for maintenance or pump de-ragging without spilling on to the pump room floor.
   3. Complete lateral vibration testing of all pumps in accordance with Section 43 23 03.

END OF SECTION

SECTION 43 23 62

VARIABLE SPEED VERTICAL TURBINE PUMPS, OPEN LINESHAFT

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Variable speed single or multi-stage vertical turbine diffuser pumps for pumping fluids that may contain mildly abrasive small diameter solids.
   2. Provide pumps complete with intake bell, discharge column, discharge head, electric motor, and variable frequency drive (VFD).
   3. Select equipment furnished under this section that will comply with the requirements of this section and Section 43 23 03.

B. Equipment list:

Item	Equipment Number
Backwash Pump 1	70-P-00010
Backwash Pump 2	70-P-00020
Backwash Pump 3	70-P-00030

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below:
   1. Section 43 05 11: General Requirements for Equipment
   2. Section 43 05 13: Rigid Equipment Mounts
   3. Section 43 05 14: Machine Alignment
   4. Section 43 05 21: Common Motor Requirements for Equipment
   5. Section 43 23 03: General Requirements for Centrifugal and Axial Flow Pumping
   6. Section 26 29 23: Variable Frequency Motor Controllers

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

1.04 DEFINITIONS

A. Terminology used in this section conforms to the following definitions:
   1. Equipment pad: Concrete foundation (block or slab) supporting and elevating equipment mounts above the supporting structural floor slab or local grade.
   2. Mounting pads: Thickened or raised areas of baseplates and soleplates where the feet or mounting surfaces of mounted equipment and drivers rest on the baseplate or soleplate.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination
   1. See Section 01 12 16: Work Sequence.

B. Pre-installation meetings

C. Sequencing

D. Scheduling

E. Unit responsibility: Assign unit responsibility, as specified in Section 43 05 11, to the pump manufacturer for the pumps, seal water control unit assemblies, motors and VFDs specified in this section. Provide a completed and signed Unit Responsibility Certification Form (Form 43 05 11-C, Section 01 99 90).

1.06 SUBMITTALS

A. Action submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section, and those listed below with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements:
      a. Section 43 05 11: General Requirements for Equipment
      b. Section 43 05 13: Rigid Equipment Mounts
      c. Section 43 05 14: Machine Alignment
      d. Section 43 23 03: General Requirements for Centrifugal and Axial Flow Pumping Equipment
      e. Section 43 05 21: Common Motor Requirements for Equipment
      f. Section 26 29 23: Variable Frequency Motor Controllers

B. Informational submittals:
   1. Procedures: Section 01 33 00
   2. Conform submittals to the requirements of Section 43 23 03.

C. Closeout submittals:
   1. Procedures: Section 01 78 23.
   2. Conform submittals to the requirements of Section 43 23 03.

3. Spare parts:
    a. Procedures: Section 01 33 00.
    b. For each unit consisting of one or two pumps of like size and service furnished under this section, furnish one set of the following spare parts. Furnish two sets for each unit consisting of more than two pumps of like size and service.
    c. Provide the following spare parts:
        1) One suction bell bearing assembly
        2) One set bowl bearings
        3) One lineshaft bearing assembly
        4) One set wear rings
        5) One shaft seal, complete
    d. Tag and store spare parts in accordance with provisions of Section 43 05 11.

1.07 QUALITY ASSURANCE

A. Qualifications
    1. Design Professional for rotordynamic analysis and mass elastic design: Section 43 23 03-1.05.
    2. Independent testing laboratory for vibration testing: Section 43 23 03.

B. Certifications:
    1. Manufacturers proposing to furnish equipment specified under this section shall hold current certification under ISO 9001-2001.
    2. Application for certification under ISO 9001 shall not be deemed as an acceptable substitute for current certification. Documentation attesting to current certification shall be signed by an officer of the manufacturer's corporation and shall be notarized.
    3. Welder Certification
        a. ASME Section IX and/or AWS

C. Critical speeds: Critical speeds shall be in accordance with Section 43 23 03-1.04 except when the title of the detailed section includes "Custom Engineered" in which case Section 43 23 03-1.05 applies.

D. Vibration limits: Vibration limits shall be in accordance with Section 43 23 03-3.06 and subject to field testing in accordance with paragraph 3.04 of this section.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

1.09 SPECIAL WARRANTY [NOT USED]

PART 2 PRODUCTS

2.01 OWNER-FURNISHED EQUIPMENT [NOT USED]

2.02 MANUFACTURERS

A. Manufacturers: Candidate manufacturers are listed below. The manufacturer's standard product may require modification to conform to specified requirements:

1. Fairbanks-Morse
2. Floway
3. Flowserve
4. Goulds
5. Approved Equal

2.03 PERFORMANCE/DESIGN CRITERIA

A. Service conditions:

Description	Value
Equipment number	70-P-00010 70-P-00020 70-P-00030
Area exposure	Indoor, No Area Classification
Fluid type	Finished Water
Maximum operating pressure	TBD

B. Operating conditions:

Equipment number	70-P-00010 70-P-00020 70-P-00030
Full Speed Operation	
Condition A [a,f]	
Capacity, gpm	4250
Total head, feet	32.46
NPSHA, feet	31.94
Condition B [b,f]	
Capacity, mgd	from pump H/Q curve
Total head, feet	27.15
NPSHA, feet	39.61
Condition B [c,f]	
Capacity, mgd	from pump H/Q curve
Total head, feet	68.15
NPSHA, feet	30.43
Reduced Speed Operation	
Condition D-1 [d,f]	

Capacity, mgd	2250
Total head, feet	20.84
Pump speed	Reduced
NPSHA, feet	40.43
Condition D-2 [d,f]	
Capacity, mgd	2250
Total head, feet	28.93
Pump speed	Reduced
NPSHA, feet	30.43
Condition E [e,f]	Condition E [e,f]
Capacity, mgd	TBD
Total head, feet	TBD
Pump speed	Minimum
NPSHA, feet	TBD

a. *Take Condition A as the rated operating condition. Guarantee performance at the rated condition in accordance with Section 43 23 03. Condition A has been selected to obtain the rated pumping capacity for the installation. It is not intended that the pumps be selected for maximum efficiency at Condition A. Select pumps furnished under this section to achieve Condition A performance, and also operate continuously without objectionable vibration or cavitation at the head specified under Condition B. Condition A may be located in the Allowable Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and published in the manufacturer's published application data for the specific model proposed for this application.*

b. *Condition B head is presented to indicate operating conditions when the pump is operating at maximum speed against minimum anticipated system head, assuming a hypothetical head-capacity curve. Use Condition B for pump selection. Condition B shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and list in the manufacturer's published application data for the specific model proposed for this application. Condition B shall be located to the right of BEPQ, and shall not be less than 10 percent of BEPQ. Pumps with head-capacity curves steeper than that assumed will produce somewhat less flow at somewhat lower head. The reverse will occur with pumps having a shallower head-capacity curve. Proposed pump selections meeting this discharge head requirement by operating the equipment at less than full speed will be rejected. Net positive suction head available (NPSHA), as listed for Condition B is calculated on a pumped flow of [TBD] mgd.*

c. *Condition C represents the pump operating against the backwash tank at maximum flow. The pumps shall operate within the POR if possible.*

d. *Condition D is the anticipated continuous duty minimum speed condition. Provide pumps furnished under this specification capable of sustained (24 hours per day) operation at this condition within the requirements set forth in Section 43 23 03. Condition C shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and list in the manufacturer's published application data for the specific model proposed for this application.*

e. *Condition e represents the expected momentary (startup/shutdown) condition. Pumps furnished under this specification will operate for no more than 30 seconds at this condition when initiating or terminating a service cycle. The maximum anticipated number of service cycles is 12 per day.*

f. *Total head in the above tabulation is the algebraic difference between the discharge head and suction head as defined in ANSI/HI 1.1–1.6. NPSHA in the above tabulation is referred to the pump inlet piping at centerline elevation as shown and is calculated in accordance with ANSI/HI 1.3 for average barometric pressure and maximum temperature conditions. NPSHA at the pump impeller eye can be determined by adjusting the given value by proposed pump dimensions and the indicated requirements for pump installation details. An allowance of 5 feet has been included for the presence of volatile constituents in the pumped fluid. Required NPSHA margin shall be as specified in Section 43 23 03.*

C. Design requirements:

1. Conform equipment provided under this section to the following:

Item	Value
Pump	70-P-00010 70-P-00020 70-P-00030
Maximum efficiency, minimum, percent [a]	
Bowl	TBD
Pump	TBD
Impeller type	TBD
Piping connection size, inches, minimum	
Discharge	TBD
Minimum bell diameter, inches [b]	TBD
Discharge arrangement	Above
Operating speed, rpm, maximum	TBD
Motor (See Section 43 05 21)	
Horsepower	100
Type (See Section 43 05 21)	Project defined TEFC – (Corrosion) Severe Duty, Enclosed
Inverter duty	Yes
Space heater	Yes
Thermal protection	Yes
Ambient duty rating	+40
Operating speed, rpm, maximum	TBD
Voltage rating	460 volt, 3 Phase
Hazardous rating	None
Reversing motor	No
Multi-speed motor	Yes
Motor starting type	VFD
Voltage rating	460 volt, 3 Phase

Notes:

a. The maximum efficiency is the minimum acceptable peak efficiency and is not required to coincide with any specified operating condition in paragraph 1.01 Performance Requirements. Ensure pump efficiency is as defined in Section 43 23 03. Ensure pump efficiency is within 2 percent of bowl efficiency when calculated at the point of peak bowl efficiency on the pump's head/capacity curve.

b. Select inlet bells in accordance with the requirements of Section 43 23 03.

2. The pumps will be installed in an intake structure designed in accordance with ANSI/HI 9.8, assuming a pump bell velocity of 4.0 feet per second when the pump is operating at the flow produced at the head specified in Operating Condition B. Pumps with inlet velocities less than this value at Operating Condition B are acceptable. If the Contractor proposes a pump with an inlet velocity greater than 4.0 feet per second at the head listed for Operating Condition B, fit a bell extension fitting, or "umbrella" to the pump to achieve this limitation.

2.04 SYSTEM OPERATION

A. Install the pumps in a heated and/or ventilated room at an elevation of 5211' feet above sea level. One pump is a standby pump, while the remainder are duty pumps. Control the pumps by the central plant control system

2.05 MATERIALS

A. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

Component	Material
Impeller, first stage	Nickel aluminum bronze, ASTM B148, C95500
Impeller, all other stages	Nickel aluminum bronze, ASTM B148, C95500
Bowls	NSF 61 approved epoxy coating System E-5 per coating specification Section 09 90 00 for potable water application
Hydrocones	Type 316L stainless steel

2.06 COMPONENTS

A. Bell:
   1. Select a bell that will provide a smooth transition from the diameter specified above under the PERFORMANCE/DESIGN CRITERIA: Design Requirements to the suction case. Provide bolted connections between the bell casting and the suction case. At the manufacturer's option, provide a bell extension fitting or "umbrella" to achieve the specified inlet velocity.

B. Suction case:
   1. Design the suction case to provide conservative entrance velocities and evenly distribute the flow to the impeller. Ensure the inner surface of the case is smooth and free from projections or cavities. House the pump shaft lower bearing in a streamlined casing. Center and hold in place by means of rigid cast vanes. Design the bearing housing and vanes to conduct the flow efficiently into the impeller eye.

C. Pump bowl:
   1. Flange the pump bowl for registered fit. Provide bolted connections between the suction case and the bowl and between the bowl and adjacent stages or the discharge case. Provide diffuser vanes that are not a multiple of impeller vanes. Polish or porcelain-line flow passages through the bowl and diffuser vanes. If required on multi-stage installations, the first-stage bowl may be designed to facilitate a low NPSH impeller arrangement.
   2. If enclosed impellers are specified, provide replaceable wearing rings on the pump bowl at the impeller inlet connection.

D. Impeller:
   1. Construct impellers free from projections, cavities, or abrupt transitions. Polish the impeller surfaces.

2. Select impellers of the enclosed or semi-open type as specified in above under the PERFORMANCE/DESIGN CRITERIA - Design Requirements. If of the enclosed type, fit the shroud with wearing rings. Secure impellers to the pump shaft using tapered collets or keyways.

E. Shafts:
   1. Size shafts to prevent excessive elongation, and to transmit the required torque without distortion in both the forward and reverse direction. Provide shafts with a first critical speed not less than10 percent below and 20 percent above maximum operating speed. Provide pumping units that use a two-piece headshaft, solid intermediate lineshafts supplied in maximum 10-foot lengths, and provide a single pump shaft extending from the suction case through a discharge case or upper bowl case containing an upper pump shaft bearing.
   2. Provide a open lineshaft assembly that is lubricated by the product fluid.

F. Bearings:
   1. Select a suction case, bowl, and lower tube bearings that are close tolerance, spiral-grooved, and sleeve-type. Grease lubricate the suction case bearing. Lubricate bowl sleeve bearings by the pumped fluid. Ensure that bearing spacing does not exceed 5 feet.
   2. Provide bearings that are extra length spiral-grooved sleeve-type, spaced at not more than 5 feet apart. Lubricate the lineshaft bearings using the product fluid.

G. Discharge column:
   1. Fabricate discharge columns with interchangeable pipe sections with flanged joints. Ensure that the column interior is free from offsets, burrs, discontinuities, or irregularities. Supply the column in sections not exceeding 5 feet in length. Provide intermediate spider bushings that align and support the lineshaft enclosure. Provide flanged connections at all column, bowl, and discharge head connections.

H. Discharge head and drive unit support:
   1. Select a discharge elbow of the above-ground type as specified, mitered, or formed to provide a smooth transition from the discharge column to the discharge nozzle. Fit the pump discharge nozzle for connection with a grooved-end pipe coupling or flanged as specified. Fit the discharge head with the specified shaft seal, located to afford convenient access for maintenance. Support the elbow by a fabricated steel baseplate reinforced with ribs designed to carry the weight of the complete pump and drive unit without distortion when spanning an opening sufficient to permit withdrawal of the complete pump without removing the bowl or inlet bell. Cast or fabricate the drive unit support out of steel, and design to accommodate the equipment specified. Provide brackets, cartridges, and drilled ports as required for all monitoring devices specified in Division 40. Design the support in accordance with Section 43 23 03 and for seismic zone in accordance with Section 01 73 24.
   2. Provide the pump head with a soleplate conforming to Section 43 05 13, manufactured expressly for the discharge head provided.

I. Seal:
   1. Provide a mechanical seal conforming to the requirements of Section 43 05 11-2.04 Mechanical Seals. Provide drilled and tapped connections for connection to an external source of lubricating fluid, if required.

J. Couplings:
   1. Provide a four-piece coupling to connect the motor shaft and headshaft between the motor and the tension nut assembly. Design the four-piece coupling to provide for impeller adjustment, and include a spacer to permit servicing the seal.
   2. Provide lineshaft couplings that are a perfect butt-fit. Design with a safety factor of 1-1/2 times the shaft safety factor and shall have a left-hand thread to tighten during pump operation.

K. Corrosion protection:
   1. Protect the interior of the discharge column, discharge head, and all exterior below grade surfaces of the pump with coating system TBD as specified in Section 09 90 00.

L. Drive unit:
   1. Drive the pump by a vertical solid-shaft motor conforming to PERFORMANCE/DESIGN CRITERIA: Design Requirements specified above, Section 43 05 21, and the requirements of Section 43 23 03. Non-reverse ratchet-equipped motors will not be accepted.

M. Variable frequency drive:
   1. Furnish the pump with a VFD as specified in Section 26 29 23.

N. Equipment mounts:
   1. Mounting plates: Fabricated steel (stress relieved after fabrication) or cast iron per Section 43 05 13 with provisions for bolting each machine and sufficient thickness to permit dowelling.

2.07 CONTROLS

A. Refer to Division 40 specifications for further control information.

2.08 CONTROL PANELS

A. Refer to Division 26 Sections for further information.

2.09 FINISHES

A. Procedures: Section 09 90 00.

B. Prime coat: Shop applied, coating material per NSF 61.

C. Finish coat: Field applied, coating material per NSF 61.

2.10 SOURCE QUALITY CONTROL

A. Factory testing shall be non-witnessed in accordance with Section 43 23 03.

B. Hydrostatic tests:
   1. Factory test all pressure sustaining parts in accordance with Section 43 23 03.

C. Performance tests:
   1. Subject each pump to non-witnessed performance test in accordance with Section 43 23 03 to verify the full range of operating condition

PART 3 EXECUTION

3.01 EQUIPMENT MOUNTING

A. Procedure: Section 43 05 13.

B. Position equipment pad and equipment anchors for final placement of equipment.

C. Use a bolting template to position equipment anchors.

D. Level baseplate.

E. Pour grout bed supporting baseplate.

F. Eliminate grout voids below baseplate as applicable.

G. Tension equipment anchors.

H. Provide completed Form 43 05 13-A, Section 01 99 00, for each equipment installation.

3.02 ALIGNMENT

A. Procedures: Section 43 05 14.

3.03 FIELD QUALITY CONTROL

A. Field testing:
   1. Lateral vibration testing in accordance with Section 43 23 03.
   2. Torsional vibration testing in accordance with Section 43 23 03. Torsional testing performed by Design Professional.
   3. Include in the bid all costs for services of Testing Firms and Design Professionals performing these services.

B. Manufacturer services:
   1. On-site inspections and training: Provide a factory-trained manufacturer's representative at the site for the following activities. Specified durations do not include travel time to or from the site.
      a. Installation inspections: Assist, supervise, and inspect the Contractor's activities during installation. Provide 16 inspection hours. Provide a completed Form 43 05 11-A, Section 01 99 90.
      b. Component test phase inspections: Assist, supervise, and inspect the Contractor's activities during the system test phase specified in Section 01 45 20 and this section. Provide 16 inspection hours.
      c. Operational test phase inspections: Assist, supervise, and inspect the Contractor's activities during the operational test phase specified in Section 01 45 20 Provide 16 inspection hours.

d. Training sessions: Procedures Section 01 79 00. Provide a minimum of 4 hours classroom training for each training session. Conduct one training session to accommodate the shift schedules of operation and maintenance staff. Certify completion of training on Form 43 05 11-B, Section 01 99 90.

3.04 SYSTEMS STARTUP

A. Procedures: Section 01 45 20.

B. Preoperational (factory) testing; See paragraphs 1.07 and 2.11.

C. Component testing: Perform the following tests:
   1. During initial pump installation, verify on one pump that the crane system has the clearance and capacity to lift the wetted-end from the field mounted pump volute to accommodate routine pump maintenance. Provide or modify spreader bar or lifting assemblies as necessary to accomplish this task.
   2. During initial pumping system installation, verify with clean water that the common pump discharge header, and the individual pump suction elbows can be readily drained to the pump room sump for maintenance or pump de-ragging without spilling on to the pump room floor.
   3. Complete lateral vibration testing of all pumps in accordance with Section 43 23 03.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 43 23 80.12

SUBMERSIBLE WATER PUMPS – CONSTANT SPEED SUMP PUMPS

PART 1 GENERAL

1.01 SUMMARY

A. Scope:

1. This section specifies submersible pumps installed in a wet pit configuration suitable for pumping fluids containing water treatment residual solids at constant speed. Pumps furnished under this specification shall have discharge nozzles 4 inches in diameter and smaller, motors less than 7.5 horsepower.

   .

2. Pump units shall be complete with motor, discharge fitting, guide bar and brackets, chain and cable hooks and other accessories as specified. Each submersible pump will have a sump access frame, hatch and fall protection system as provided under Section 08 31 20.
3. Manufacturers proposing to furnish equipment specified under this section shall hold current certification under ISO 9001-2001. Application for certification under ISO 9001 shall not be deemed as an acceptable substitute for current certification. Documentation attesting to current certification shall be signed by an officer of the manufacturer's corporation and shall be notarized.

B. Type:

1. Pumps shall be of the submersible, vertical shaft, centrifugal nonclog type, suitable for pumping fluids containing water treatment residual solids. The pumps shall be designed for continuous or cyclic operation under submerged, or partially submerged without damage to the pump and motor. Special attention shall be devoted to the shaft design to limit deflection under all operating conditions, as specified in this section.

C. Equipment List:

Item	Equipment Number
INFILTRATION GALLERY PUMP 1	01-P-00010
INFILTRATION GALLERY PUMP 2	01-P-00020
TREATMENT BUILDING RECYCLE PUMP 1	35-P-00050
TREATMENT BUILDING RECYCLE PUMP 2	35-P-00060
TREATMENT BUILDING DRAINAGE PUMP 1	35-P-00100
TREATMENT BUILDING DRAINAGE PUMP 2	35-P-00110
STRUCTURAL UNDERDRAIN PUMP 1	70-P-00020
STRUCTURAL UNDERDRAIN PUMP 2	70-P-00030

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.

1. Section 01 78 23 Operation and Maintenance Data
2. Section 01 79 00 Demonstration and Training

3. Section 01 91 00 Commissioning, Testing and Startup
4. Section 01 99 90 Reference Forms
5. Section 08 31 20 Floor Access Doors.
6. Section 43 05 11 General Requirements for Equipment.
7. Section 43 05 13 Rigid Equipment Mounts.
8. Section 43 05 21 Common Motor Requirements for Equipment.

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect on the effective date of the Agreement. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued.

Reference	Title
ASTM A48	Gray Iron Castings
ASTM A276	Stainless and Heat-Resisting Steel Bars and Shapes
UL 674	Motors and Generators, Electric, for Use in Hazardous Locations, Class I, Groups C and D, Class II, Groups E, F, and G

1.04 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. See Section 01 12 16: Work Sequence.

B. Unit Responsibility:
   1. Assign unit responsibility, as specified in Section 43 05 11, to the manufacturer of the vertical, nonclog submersible pumps provided for all equipment and accessories under this section. Have all mechanical equipment components, at least, of this entire equipment assembly furnished by the pump's manufacturer. Provide a completed, signed, and notarized Certificate of Unit Responsibility (Form 43 05 11-C, Section 01 99 90).

1.05 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.

2. A copy of this Section, addendum updates included, along with the sections listed below shall be submitted with each paragraph check-marked to indicate compliance or marked to indicate requested deviations.
    a. This Section (43 23 80.12)
    b. Section 43 05 11 – General Requirements for Equipment
    c. Section 43 05 13 – Rigid Equipment Mounts
    d. Section 43 05 21 – Common Motor Requirements for Equipment
3. The specification copies shall be complete with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check-marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
5. Unit Responsibility Certification form (Form 43 05 11-C) attesting that unit responsibility has been assigned in accordance with the requirements of this Section and Section 43 05 11. No other submittal material will be reviewed until the certificate has been found in conformance with this requirement.
6. Predicted pump performance curves for each condition point specified showing head, power, efficiency, and NPSH3 on the ordinate plotted against capacity on the abscissa. All curves shall clearly display the specified operating conditions, POR and the manufacturer's limits for the AOR.
7. Drawings showing general dimensions and confirming the size of pumps, motors, drives and specified appurtenances; piping connections; construction details of equipment (including bearings and bearing isolators); wiring diagrams; and weight of equipment.
8. Manufacturer's data including materials of construction and equipment weight.
9. Motor Data Form 43 05 21 -A.
10. Manufacturer's operation and maintenance information in accordance with Section 01 78 23.
11. Installation Forms in accordance with Section 43 05 11.
12. Testing Forms in accordance with Section 01 99 90.

B. Informational Submittals:
    1. NOT USED

C. Closeout Submittals:
   1. Operating and maintenance submittals:
      a. Procedures: Section 01 78 23.
   2. Spare parts:
      a. Procedures: Section 43 05 11. Provide the following spare parts for each model and size of pump furnished for this Section:
         1) One complete set of all gaskets and seals.
         2) One complete sets of all bearings.
         3) One complete set of mechanical seals.
         4) One complete set of discharge connection sealing devices.
         5) One complete spare pump.

1.06 QUALITY ASSURANCE

A. Vibration Limits: Vibration limits for submersible pumps shall be in accordance with ANSI/HI 11.6.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00.

B. Block shaft and prevent damage to bearings during shipment.

1.08 MANUFACTURER'S REPRESENTATIVE

A. Field services shall be performed by qualified personnel with at least five (5) years experience providing field services for similar equipment installation for System Supplier.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. The manufacturer's standard product may require modification to conform to specified requirements:
   1. Xylem – Flygt
   2. Sulzer – ABS
   3. Or Approved Equal

2.02 TYPE

A. Submersible, vertical shaft, centrifugal nonclog type, suitable for pumping fluids containing water treatment residual solids.

2.03 PERFORMANCE/DESIGN CRITERIA

A. Service Conditions:

Description	
Equipment number	05-P-00010 05-P-00020 35-P-00050 35-P-00060 35-P-00100 35-P-00110 70-P-00020 70-P-00030
Area exposure	Per Section 01 61 45
Fluid type	Water treatment residual solids containing up 600 mg per liter of suspended solids consisting of organic and inorganic materials, and grit (sand, activated carbon).
Fluid temperature	40 to 75 degrees F

B. Operating Conditions:

1. The performance requirements presented in tabular form below are intended to describe the results of hydraulic calculations developed using a mathematical modeling program specifically developed for the purpose. The model was intentionally used to develop the limits of expected extremes in variation of static head, coefficients for pipeline resistance and turbulence losses through fittings and valves.
2. Equipment furnished under this section shall be fully suitable for continuous operation at any specified condition or any condition lying between the extremes of the operating conditions specified in the following table. The total head in the information below is the total system head at the operating capacity, essentially a summation of the head of the two pumps at that capacity. The notes presented at the end of the table are intended to be complimentary to the information presented in the table.

C. Table of Operating Conditions:

Operating Condition	Value	Value	Value	Value
Equipment number	05-P-00010 05-P-00020	35-P-00050 35-P-00060	35-P-00100 35-P-00110	70-P-00020 70-P-00030
Condition A [1,3]				
Capacity, gpm	206.5	50	25	200
Total head, feet	45.9	20.0	10.0	31.0
NPSHA, feet	6.76	-	-	-
Condition B [2,3]		50	25	200
Capacity, gpm	207.6	From pump H/Q curve (300 gpm max)	From pump H/Q curve (300 gpm max)	From pump H/Q curve (300 gpm max)

Operating Condition	Value	Value	Value	Value
Equipment number	05-P-00010 05-P-00020	35-P-00050 35-P-00060	35-P-00100 35-P-00110	70-P-00020 70-P-00030
Total head, feet	29.1	20.0	10.0	31.0
NPSHA, feet [4]	6.78	N/A	N/A	N/A

Notes:

1. *Condition A shall be taken as the rated, continuous-duty operating condition. Performance at the rated condition shall be guaranteed in accordance with Section 43 23 03. Condition A has been selected to obtain the rated pumping capacity for the installation. It is not intended that the pumps be selected for maximum efficiency at Condition A. Pumps furnished under this section shall be selected to achieve Condition A performance, and also shall operate continuously without objectionable vibration or cavitation at the head specified under Condition B. Condition A may be located in the Allowable Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3 and published in the manufacturer's published application data for the specific model proposed for this application.*
2. *Condition B head is presented to indicate operating conditions when the pump is operating against minimum anticipated system head, assuming a hypothetical head-capacity curve. Condition B shall be used for pump selection. Condition B shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3 and listed in the manufacturer's published application data for the specific model proposed for this application. Condition B shall be located to the right of BEPQ and shall be not less than 60 percent of BEPQ. Pumps with head-capacity curves steeper than that assumed will produce somewhat less flow at somewhat lower head. The reverse will occur with pumps having a shallower head-capacity curve. NPSHA, as listed for Condition B is calculated on a pumped flow as listed in the table.*
3. *Total head in the above tabulation is the algebraic difference between the discharge head and suction head as defined in ANSI/HI 1.1 through 1.6. Net positive suction head available (NPSHA) in the above*
4. *Flow rate provided in parentheses for Condition B represents the flow rate at which NPSHA is calculated. Also refer to Note 3.*

D. Design Requirements:

Item	Value	Value	Value	Value
Equipment number	01-P-00010 01-P-00020	35-P-00050 35-P-00060	35-P-00100 35-P-00110	70-P-00020 70-P-00030
Pump				
Rigid sphere, inches diameter (min.), capable of passing through the pump from inlet to discharge (Impeller Alternate 1/Alternate 2)	2/1.5	2/1.5	2/1.5	2/1.5
Minimum efficiency at best efficiency point (BEP) at maximum speed, percent[1]	60	30	30	60
Piping connection size, inches, minimum				
Pump discharge	3.0	2.0	1.0	1.0
Operating speed, rpm, maximum	1,779	-	-	-
Operating speed, constant or variable	constant	constant	constant	constant

Item	Value	Value	Value	Value
Equipment number	01-P-00010 01-P-00020	35-P-00050 35-P-00060	35-P-00100 35-P-00110	70-P-00020 70-P-00030
Suction specific speed, dimensionless, maximum[2]	9,000	9,000	9,000	9,000
Motor				
Horsepower	6.0	1.0	1.0	6.0
Type	Submersible	Submersible	Submersible	Submersible
Over temperature protection	Yes	Yes	Yes	Yes
Moisture sensors	Yes	Yes	Yes	Yes
Operating speed, rpm, maximum	1,779	-	-	-
Voltage/Phase	460 VAC, 3 Phase	460 VAC, 3 Phase	460 VAC, 3 Phase	460 VAC, 3 Phase

Notes:

1. *The minimum acceptable efficiency at best efficiency point (BEP) at the speed required to achieve the performance specified under Condition Points A and B. The minimum acceptable efficiency is not necessarily required to be associated with any operating condition specified in paragraph 2.03 Operating Conditions.*
2. *The suction specific speed limitation listed applies only to pump selections where both Operating Conditions A and B reside within the proposed pump selection's POR. Proposed selections with Operating Condition A residing in the AOR shall be limited to designs with suction specific speed less than 8500. Suction specific speed shall be calculated for the maximum pump design speed and impeller diameter, using the capacity in gallons per minute and NPSH3 at Best Efficiency in accordance with the procedures set for in the standards of the Hydraulic Institute.*

2.04 SYSTEM OPERATION

A. The pumps will be operated automatically by the control panel specified in this section in a Lead/Lag configuration to empty the sump based on level switches in the sump.

B. The pumps will be operated by a control system that will start and stop the pumps at constant speed to control wet well liquid surface elevation. Periodically, the control system will be overridden permitting the wet well level to be drawn down until the pumps break suction.

C. The pumps will be installed in a ventilated reinforced concrete structure designed to provide sufficient space for access to install and remove the equipment.

2.05 MATERIALS

A. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

B. Provide materials of construction in accordance with the following table:

Component	Material
Pump and motor casing	
Rated head < 100 feet	Cast iron, ASTM A48, Class 30 or 35
Rated head > 100 feet	Cast ductile iron, ASTM A 536, Class 65-45-12
Discharge elbow	Cast iron, ASTM A48, Class 30 or 35
Impeller	Cast iron, ASTM A48, Class 30 or 35 or ASTM A532-IIIA
Motor and pump shaft	Stainless steel, ASTM A276 Type 329, 403, 416, 420 or ASTM A479 Type 403, 431
Wearing rings	Stainless steel, ASTM A276 Series 440B or Cast duplex stainless steel, ASTM A890 Grade 1B or 5A
External bolts and nuts	Stainless steel, ASTM A276 Type 316
Guide bar brackets	Stainless steel, ASTM A276 Type 316
Anchor bolts	Stainless steel, ASTM A276 Type 316
Guide rails, lifting assemblies	Stainless steel, ASTM A276 Type 316

2.06 COMPONENTS

A. Pumps and Motor Casing:

1. Casings shall be constructed of corrosion resistant cast iron and shall be designed to allow removal of all rotating parts from the motor end of the pumps. All mating surfaces where watertight sealing is required shall be machined and fitted with nitrile O-rings. Casing shall be fitted with moisture sensor specifically designed to detect the presence of water in the seal chamber.

B. Impellers:

1. Alternate 1: The impeller shall be dynamically balanced with a non-clogging design capable of passing solids, fibrous materials, coarse solids, and other matter found in normal water applications through to the discharge nozzle. Impellers for pumps with discharge nozzles 4 inches in diameter and greater shall be not less than two-vane design. Fit between the impeller and the shaft shall be a sliding fit with a taper-lock bushing pressed by a screw that is threaded into the end of the shaft, or a slip fit onto the shaft and drive key and fastened to the shaft by an impeller nut having cover for protection from pumped fluid. A wearing ring system designed for abrasion resistance shall provide efficient sealing between the volute and impeller.
2. Alternate 2: The impeller shall be dynamically balanced, semi-open, multi- vane, back-swept, non-clog design. The impeller vane leading edges shall be mechanically self-cleaned upon each rotation as they pass across a spiral groove located on the volute suction which shall keep them clear of debris, maintaining an unobstructed leading edge. The impeller(s) vanes shall have screw-shaped leading edges that are hardened to Rc 45 and shall be capable of handling solids, fibrous materials, coarse solids and other matter found in water and potable water. The screw shape of the impeller inlet shall provide an inducing effect for the handling of water treatment residual solids ladened water. Impellers shall be locked to the shaft and shall be coated with alkyd resin primer.

C. Bearings:
   1. Bearings shall be heavy-duty permanently lubricated ball type. Bearings shall be designed for an L-10 life of 50,000 hours heavy-duty service without requiring additional lubrication.

D. Shaft:
   1. The pump shaft shall be turned, ground and polished, of proportions suitable for use in the specified application. The shaft shall be of sufficient section to limit deflection at the shaft seal to not more than 4.0 mils when the pump is operating at any continuous-duty point defined by the envelope of conditions specified in this Section.

E. Mechanical Seals:
   1. Provide tandem or dual mechanical seals per the following requirements:
      a. Dual cartridge
      b. High-capacity barrier fluid ports
      c. Self-centering, non-fretting
      d. Springs isolated from both process and barrier fluids
      e. Pressure Rating: 250 psig
      f. Stationary Face: silicon carbide
      g. Rotary Face: silicon carbide
      h. Metal Parts: Type 316 stainless steel
      i. Springs: Hastelloy C
      j. O-Rings: fluorocarbon
      k. Candidate Product: Chesterton 255 or approved substitute

F. Motor:
   1. The motor shall be designed to be non-overloading over the entire pump curve. The motor housing shall be of submersible construction with the windings operating in a sealed environment. Motors shall be either air or dielectric oil filled with built-in automatic reset overload protection. Motors in hazardous locations shall be UL listed in accordance with UL 674 for Class I, Group D hazardous atmosphere. The motor shall be provided with motor windings thermostats, one in each winding, to protect the motor from overheating.

G. Cable:
   1. Pump motor and detector cables shall be suitable for submersible pump applications. Pump motor and detector cables may be combined into one assembly or separate as standard for the pump manufacturer. Each cable shall be a heavy-duty, flexible, water-resistant portable, UL listed cable, sealed at the motor bell and of sufficient length to connect to the associated sump pump control panel. The cable entry into the motor shall be comprised of a singles cylinder elastomer grommet and shall prevent water from leaking into the motor due to capillary action even if cable is cut or damaged. Cables shall be watertight to a minimum depth of 65 feet.

H. Guide Rail Lifting System and Discharge Elbow:

1. The pump shall be provided with a dual guide rail system to allow easy removal of the pump without entering the wet well. The discharge connection shall be bolted to the structure as required by the pump manufacturer and shall serve as a lower attachment for the guide rails. The discharge connection shall be an elbow discharge type.
2. The pump and guide rail system shall be designed to automatically connect the pump to the discharge piping when lowered into place on the discharge connection. The design shall be non-sparking and shall conform to UL requirements for installation in a location classified in accordance with NFPA 70, Article 500 for Class 1, Group D, Division 1 locations. When in place, the connection shall form a watertight seal with the discharge fitting. The pump shall be easily removable for inspection or service, requiring no bolts, nuts, or other fastenings to be removed for this purpose. Sealing of the pumping unit to the discharge connection shall be accomplished by a simple linear downward motion of the pump with the entire weight of the pumping unit guided to and pressing tightly against the discharge connections. No portion of the pump shall bear directly on the floor of the sump and no rotary motion of the pump shall be required for sealing. Once the pump has been positioned on its support fitting at the discharge fitting, the guide bar system shall not be required for pump support.
3. The pump shall be provided with a lifting chain, guide bars, upper guide bar brackets, intermediate guide bar brackets, cable holder assemblies, safety chain hook assemblies, discharge elbow connections, anchor bolts, and all other accessories necessary to complete the installation as specified. The lifting chain length shall equal the depth of the sump.

I. Level Instruments:

1. Provide level instruments to meet the pump control operation requirements defined in this section. Level instruments shall meet the requirements of Section 40 72 00. Provide cable of sufficient length to reach the control panel from the sump.

2.07 CONTROL PANEL

A. General:

1. Panels shall be provided with instruments used for control, monitoring, and alarming. The control panel for the sump pumps shall be designed in accordance with Section 40 67 00, the contract P&ID drawings, and to support the specified operation.

B. Sump pump control panels shall be rated NEMA 4X for non-hazardous locations and NEMA 7 for use in hazardous locations.

C. Features:

1. Panels shall be provided with instruments used for control, monitoring, and alarming.
2. Control shall include HAND/OFF/AUTO mode selection, pump **LEAD/LAG**, motor protection, and reset button to clear motor protection alarms.
3. Panels shall contain distribution components, power supplies, and transformers, as required, to derive power for all instruments and equipment provided as part of the pump package.
4. Separate pump and control circuit breaker with intrinsically safe module for floats.

5. Dry contact and panel lights for pump running, pump fail, moisture sensor, motor over temperature, and high-level alarm.
6. Suitable for service from a single 480V ac, three-phase service.
7. Provide intrinsically safe relays for use with the level switches to meet hazardous ratings.
8. Pump protection relay for each pump for connecting the motor leak and temperature detectors.
9. Internal enclosure heater.
10. Terminal strip for connection of external devices.
11. Motor starter per Division 26.
12. External Signal Interface: Provide dry contact closures for connection to the Plant Control System rated 0.5 amps at 12 or 24 Vdc for the following conditions:
    a. Each pump's running status.
    b. Pump fault signal
    c. Low, Mid and High level signals
    d. Each pump ready status. Ready status is panel has power and pumps set to AUTO mode with no active alarms present.
    e. Moisture alarm
    f. Motor winding alarm

D. Pump Control Operation:
1. Provide controls for the following pump Operation.
    a. Start the selected lead pump at the LSL level setting.
    b. Start the selected lag pump at the LSH level setting.
    c. Alarm and start both pumps at the LSHH level setting.
    d. Shut down both pumps at the LSL level setting.
2. Pump Protection Controls:
    a. Moisture sensor shall be wired to activate an indicator in the local control panel and to send an alarm to the Plant Control System. Upon detection of moisture the alarm shall be activated, but the pump shall be allowed to run.
    b. Temperature switch shall be wired to disable the pump if excessive heat is detected and send an alarm to the Plant Control System. The thermostats shall reset automatically after the motor windings have cooled down. Provide provision for manual reset of the motor.

2.08 FINISHES

A. Procedures: Section 09 90 00

B. Prime Coat: Shop applied, manufacturer's standard coating system.

C. Finish Coat: Shop applied, manufacturer's standard coating system

2.09 SOURCE QUALITY CONTROL

A. Factory Tests:

1. Factory tests will not be required. However, the manufacturer shall guarantee the performance specified under paragraph 43 23 80.12-2.03, Condition A.

PART 3 EXECUTION

3.01 FIELD QUALITY CONTROL

A. Procedures: Section 01 45 00 and Section 01 91 00.

B. Perform the following test:
   1. Performance Test
      a. Using clean water, measure pump flow and discharge pressure. Verify pump flow and discharge pressure is within the range of specified operating conditions.
      b. Temporary flow meters and pressure gauges will be required.
      c. Throttle valve on pump discharge as necessary to achieve specified pump pressure within specified operating range.
      d. Test level controls to verify pump control system operates as specified in this Section.

3.02 MANUFACTURER'S SERVICES

A. On-Site Inspections and Training: Provide a factory-trained manufacturer's representative at the Site for the following activities. Specified durations do not include travel time to or from the Site.
   1. Installation Inspections: Assist, supervise, and inspect the Contractor's activities during installation of submersible sump pumps. Provide 4 hours of installation inspection during installation of each submersible sump pumps.
   2. Training Sessions: Procedures Section 01 79 00. Provide 2 hours of classroom training. Complete Form 43 05 11-B, Section 01 99 90.

END OF SECTION

SECTION 43 23 80.14

SUBMERSIBLE WATER PUMPS - VARIABLE SPEED

PART 1 GENERAL

1.01 SUMMARY

A. Scope:
   1. This section specifies submersible pumps installed in a wet-pit configuration suitable for pumping fluids containing potable water treatment residual solids at infinitely variable speed.
   2. Pump units shall be complete with motor, discharge fitting, guide bar and brackets, chain and cable hooks and other accessories as specified. Each submersible pump will have a sump access frame, hatch and fall protection system as provided under Section 08 31 20.
   3. Manufacturers proposing to furnish equipment specified under this section shall hold current certification under ISO 9001-2001. Application for certification under ISO 9001 shall not be deemed as an acceptable substitute for current certification. Documentation attesting to current certification shall be signed by an officer of the manufacturer's corporation and shall be notarized.
   4. Equipment shall additionally conform to the requirements of Section 43 23 03 with the exception that provisions of Section 43 23 03-1.05 and Section 43 23 03-1.07 do not apply unless of specifically called out in this project specification.
   5. Control panel shall comply with Division 40 specifications.
   6. Backwash Transfer pumps shall have been certified to meet the following requirements for potable drinking water applications:
      a. NSF/ANSI/CAN 61 for drinking water system components.
      b. NSF/ANSI/CAN 372 for lead content.

B. Type:
   1. Pumps shall be of the heavy-duty, submersible, vertical shaft, centrifugal nonclog type, suitable for pumping fluids containing potable water treatment residual solids. The pumps shall be designed for continuous or cyclic operation under submerged, partially submerged or totally dry condition without damage to the pump and motor. Special attention shall be devoted to the shaft design to limit deflection under all operating conditions, as specified in this section.

C. Equipment List:

Item	Equipment Number
RECYCLED WATER PUMP 1	60-P-00010
RECYCLED WATER PUMP 2	60-P-00020

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 08 31 20 Floor Access Doors

2. Section 26 29 23 Variable Frequency Motor Controllers
3. Section 43 23 03 General Requirements for Centrifugal and Axial Flow Pumping
4. Section 43 05 11 General Requirements for Equipment
5. Section 43 05 13 Rigid Equipment Mounts
6. Section 43 05 21 Common Motor Requirements for Equipment

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. References shall be as listed in Section 43 23 03.

C. Additional references shall be as follows:

Reference	Title
NSF/ANSI/CAN 61	Requirements for drinking water system components
NSF/ANSI/CAN 372	Requirements for lead content

1.04 DEFINITIONS

A. Terminology used in this section conforms to the following definitions:
   1. Equipment Pad: concrete foundation (block or slab) supporting and elevating equipment mounts above the supporting structural floor slab or local grade
   2. Mounting Pads: thickened or raised areas of baseplates and soleplates where the feet or mounting surfaces of mounted equipment and drivers rest on the baseplate or soleplate]

1.05 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. See Section 01 12 16: Work Sequence.
   2. Coordinate pump and motor operational and starting characteristics with adjustable-frequency drive settings used for control of this equipment. A system curve is available upon request from the Construction Manager. Include the following:
      a. Motor minimum operational speed
      b. Motor maximum operational speed
      c. Motor ramp-up and ramp-down speed, voltage, and hertz requirements
      d. Other operating limits that are imposed by the driven equipment for operation and warranty

B. Unit Responsibility:

1. Assign unit responsibility, as specified in Section 43 05 11, to the manufacturer of the vertical, nonclog submersible pumps provided for all equipment and accessories under this section. Have all mechanical equipment components, at least, of this entire equipment assembly furnished by the pump's manufacturer. Provide a completed, signed, and notarized Certificate of Unit Responsibility (Form 43 05 11-C, Section 43 05 11). Additionally, the manufacturer shall review submittal data for the variable speed drive units that are proposed by the Contractor under Section 26 29 23. The manufacturer shall submit a letter indicating whether the proposed units are satisfactory or not for use with the pumps in this section.

1.06 SUBMITTALS

A. Action Submittals:

1. Procedures: Section 01 33 00.
2. Submittals shall conform to the requirements of Section 43 23 03. A copy of this Section, addendum updates included, along with the sections listed below shall be submitted with each paragraph check-marked to indicate compliance or marked to indicate requested deviations.
   a. This Section (43 23 80.14)
   b. Section 43 05 11 – General Requirements for Equipment
   c. Section 43 05 13 – Rigid Equipment Mounts
   d. Section 43 05 21 – Common Motor Requirements for Equipment
   e. Section 43 23 03 – General Requirements for Centrifugal and Axial Flow Pumping Equipment
3. The specification copies shall be complete with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check-marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
5. Unit Responsibility Certification form (Form 43 05 11-C) attesting that unit responsibility has been assigned in accordance with the requirements of this Section and Section 43 05 11. No other submittal material will be reviewed until the certificate has been found in conformance with this requirement.

6. Predicted pump performance curves for each condition point specified showing head, power, efficiency, and NPSH3 on the ordinate plotted against capacity on the abscissa. Curves shall be provided to demonstrate operation at all speeds required to achieve the specified reduced speed operating conditions. All curves shall clearly display the specified operating conditions, POR and the manufacturer's limits for the AOR.
7. Drawings showing general dimensions and confirming the size of pumps, motors, drives and specified appurtenances; piping connections; construction details of equipment (including bearings and bearing isolators); wiring diagrams; and weight of equipment.
8. Manufacturer's data including materials of construction and equipment weight.
9. Motor Data Form 43 05 21 -A.
10. Proof of service of previously installed units of similar size and configuration in wet wells of the type specified in this Section.
11. Written factory tests report, as specified in paragraph 2.09.
12. Shaft deflection calculations.
13. Anchorage calculations and required documentation.
14. Cooling system calculations.
15. Manufacturer's operation and maintenance information in accordance with Section 01 78 23.
16. Installation Forms in accordance with Section 43 05 11.
17. 5-Year warrantee in accordance with paragraph 1.09.
18. Testing Forms in accordance with Section 01 99 90.
19. Field vibration test protocol as specified in ANSI/HI 11.6.
20. Field discharge connection leakage test video files in accordance with paragraph 3.03.

B. Informational Submittals:
   1. Procedures: Section 01 33 00
   2. Submittals shall conform to the requirements of Section 43 23 03.
   3. Letter of confirmation of suitability of variable frequency drives being provided by the Contractor for this equipment in accordance with Section 26 29 23.
   4. Coordination items required for proper setup of the variable frequency driver as specified in paragraph 1.05.A. Coordination.
   5. Letter of confirmation of listed NSF/ANSI/CAN certification of equipment for potable water use and operation.

C. Closeout Submittals:
   1. Operating and maintenance submittals:
      a. Procedures: Section 01 78 23.
   2. Spare parts:
      a. Procedures: Section 43 05 11. Provide the following spare parts for each model and size of pump furnished for this Section:
      b. One complete set of all gaskets and seals
      c. Two complete sets of all bearings

d. Two complete sets of mechanical seals
e. Two complete sets of discharge connection sealing devices
f. One removable cable seal chamber cap with cable length as required in this Section.
g. If oil-filled motor is furnished, provide spare oil in sufficient quantity to allow for one-time flushing and replacement of coolant for all installed pumps.

1.07 QUALITY ASSURANCE

A. Qualifications:
   1. Independent testing agent hired by the Contractor for field vibration testing: Section 43 23 03.

B. Critical Speeds: Critical Speeds shall be in accordance with Section 43 23 03-1.04.

C. Vibration Limits: Vibration limits for submersible pumps shall be in accordance with ANSI/HI 11.6. Field testing shall be in accordance with paragraph 3.03 of this section.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00

B. Block shaft and prevent damage to bearings during shipment.

1.09 SPECIAL WARRANTY

A. Provide a Special 5-Year Warranty. The manufacturer shall warrantee the pumps provided under this section against defects in materials and workmanship for 5 years.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. The manufacturer's standard product may require modification to conform to specified requirements:
   1. Xylem - Flygt
   2. KSB
   3. Sulzer – ABS
   4. Pentair
   5. Approved Equal

2.02 TYPE

A. Heavy-duty, submersible, vertical shaft, centrifugal nonclog type, suitable for pumping fluids containing potable water treatment residual solids.

2.03 PERFORMANCE/DESIGN CRITERIA

A. Service Conditions:

Description	
Equipment number	60-P-00010 60-P-00020
Area exposure	Per Section 01 61 45
Fluid type	Potable water treatment residual solids containing up 600 mg per liter of suspended solids consisting of organic and inorganic materials, and grit (sand, activated carbon).
Fluid temperature	40 to 75 degrees F

B. Operating Conditions:

1. The performance requirements presented in tabular form below are intended to describe the results of hydraulic calculations developed using a mathematical modeling program specifically developed for the purpose. The model was intentionally used to develop the limits of expected extremes in variation of static head, coefficients for pipeline resistance and turbulence losses through fittings and valves.
2. Equipment furnished under this section shall be fully suitable for continuous operation at any specified condition or any condition lying between the extremes of the operating conditions specified in the following table. The total head in the information below is the total system head at the operating capacity, essentially a summation of the head of the two pumps at that capacity. The notes presented at the end of the table are intended to be complimentary to the information presented in the table.

C. Table of Operating Conditions:

Operating Condition	Value	Value
Equipment number	60-P-00010	60-P-00020
Full-speed or reduced speed operation, Condition A [1,5]		
Capacity, gpm	550	550
Total head, feet	39.4	39.4
NPSHA, feet	Ample	Ample
Full-speed operation, Condition B [2,5]		
Capacity, gpm	1275	1275
Total head, feet	47.8	47.8
NPSHA, feet (flow basis, gpm)	Ample	Ample
Reduced-speed operation, Condition C [3,5]		
Capacity, gpm	233	233
Total head, feet	34.4	34.4
NPSHA, feet	Ample	Ample

1. *Condition A shall be taken as the rated operating condition. Performance at the rated condition shall be guaranteed in accordance with Section 43 23 03. Condition A has been selected to obtain the rated pumping capacity for the installation. It is not intended that the pumps be selected for maximum efficiency at Condition A. Pumps furnished under this section shall be selected to achieve Condition A performance, and also shall operate continuously without objectionable vibration or cavitation at the head specified under Condition B. Condition A may be located in the Allowable Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3 and published in the manufacturer's published application data for the specific model proposed for this application.*
2. *Condition B head is presented to indicate operating conditions when the pump is operating at maximum speed against minimum anticipated system head, assuming a hypothetical head-capacity curve. Condition B shall be used for pump selection. Condition B shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3 and listed in the manufacturer's published application data for the specific model proposed for this application. Condition B shall be located to the right of BEPQ and shall be not less than 60 percent of BEPQ. Pumps with head-capacity curves steeper than that assumed will produce somewhat less flow at somewhat lower head. The reverse will occur with pumps having a shallower head-capacity curve. Proposed pump selections meeting this discharge head requirement by operating the equipment at less than full speed will be rejected. NPSHA, as listed for Condition B is calculated on a pumped flow of as listed for each pump.*
3. *Condition C is the anticipated continuous duty minimum speed condition. Pumps furnished under this specification shall be capable of sustained (24 hours per day) operation at this condition within the requirements set forth in Section 43 23 03. Condition C shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3 and listed in the manufacturer's published application data for the specific model proposed for this application.*
4. *Total head in the above tabulation is the algebraic difference between the discharge head and suction head as defined in ANSI/HI 1.1 – 1.6. Net positive suction head available (NPSHA) in the above tabulation is referred to the pump inlet centerline elevation as shown and is calculated in accordance with ANSI/HI 1.3 for average barometric pressure and maximum temperature conditions. NPSHA at the pump impeller eye can be determined by adjusting the given value by proposed pump dimensions and the indicated requirements for pump installation details. An allowance of five feet has been included for the presence of volatile constituents in the pumped fluid. Required NPSHA margin shall be as specified in Section 43 23 03.*

D. Design Requirements:

Item	Value	Value
Equipment number	60-P-00010	60-P-00020
Pump	Recycled Water Pump 1	Recycled Water Pump 2
Rigid sphere, inches diameter (min.), capable of passing through the pump from inlet to discharge (Impeller Alternate 1/Alternate 2)	3.25	3.25
Minimum efficiency at best efficiency point (BEP) at maximum speed, percent [1]	69.02	69.02
Piping connection size, inches, minimum		
Pump discharge	8.0	8.0
Operating speed, rpm, maximum	1731	1731
Operating speed, constant or variable	Variable	Variable
Approximate pump suction centerline elevation, feet, NAVD 88	5295.1	5295.1
Maximum expected surge pressure, ft	N/A	N/A
Suction specific speed, dimensionless, maximum[2]	-	-
Motor		
Horsepower	25.0	25.0
Type	Submersible	Submersible
Inverter duty	-	-
Space heater	No	No
Over temperature protection	Yes	Yes
Moisture sensors	Yes	Yes
Operating speed, rpm, maximum	1750	1750
Voltage/Phase	460 VAC, 3 Phase	460 VAC, 3 Phase

Notes:

1. *The minimum acceptable efficiency at best efficiency point (BEP) at the speed required to achieve the performance specified under Condition Points A and B. The minimum acceptable efficiency is not necessarily required to be associated with any operating condition specified in paragraph 2.03 Operating Conditions.*
2. *The suction specific speed limitation listed applies only to pump selections where both Operating Conditions A and B reside within the proposed pump selection's POR. Proposed selections with Operating Condition A residing in the AOR shall be limited to designs with suction specific speed less than 8500. Suction specific speed shall be calculated for the maximum pump design speed and impeller diameter, using the capacity in gallons per minute and NPSH3 at Best Efficiency in accordance with the procedures set for in the standards of the Hydraulic Institute.*

   Surge pressure estimated at 10 second valve closure.

2.04 SYSTEM OPERATION

A. The pumps will be installed in a ventilated reinforced concrete structure designed to provide sufficient space for access to install and remove the equipment. The pumps will be operated at variable speed, responding to a control system that will cycle and vary the speed of the pumps in accordance with the specified program. Under normal operation, there will be no cascade into the wet well and the wet well level will vary between the levels indicated.

B. The pumps will be operated by a control system configured to control wet well liquid surface elevation. This objective will be achieved by adjusting pump speed to match the pumping rate to the rate of inflow into the wet well. The pump drives will be adjusted to establish minimum speed when the wet well is at preset low elevation. Pump speed control increments and sequenced starts of additional pumps will be initiated based on rising wet well level. Pumps will be at maximum speed when the liquid level is at the preset maximum level. (I&C: Very difficult to maintain a surface elevation on level switches alone as it's shown now.)

C. System controls allow for wet well cleaning. At intervals estimated to be nominally one week in length, but possibly as little as three days, operating staff will manipulate station wet well level controls to lower the wet well level to clean the wet well of accumulated solids. Solids will be removed from the wet well by operating the pumps until they break suction. Equipment furnished under this section shall be specifically certified by the pump manufacturer as suitable for operation in trench type wet wells where the wet well will be cleaned using the pumping equipment. (I&C: Confirm that wet well cleaning is going to be performed on a regular basis or at all.)

2.05 MATERIALS

A. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion and providing compliance with NSF Lead-Free requirements. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

B. Provide materials of construction in accordance with the following table:

Component	Material
Pump and motor casing	
Rated head < 100 feet	Cast iron, ASTM A48, Class 30 or 35
Rated head > 100 feet	Cast ductile iron, ASTM A 536, Class 65-45-12
Discharge elbow	Cast iron, ASTM A48, Class 30 or 35
Impeller	Cast duplex stainless steel, ASTM A744 or European standard 1.4474, or Cast duplex stainless steel, ASTM A890 Grade 1B, or Hard Chrome Iron ASTM A532-IIIA
Motor and pump shaft	Stainless steel, ASTM A276 Type 329, 403, 416, 420 or ASTM A479 Type 403, 431
Wearing rings	Stainless steel, ASTM A276 Series 440B or Cast duplex stainless steel, ASTM A890 Grade 1B or 5A
External bolts and nuts	Stainless steel, ASTM A276 Type 316
Guide bar brackets	Stainless steel, ASTM A276 Type 316
Anchor bolts	Stainless steel, ASTM A276 Type 316
Guide rails, lifting assemblies	Stainless steel, ASTM A276 Type 316

2.06 COMPONENTS

A. General:

1. The motor and rotating parts shall be removable from the motor end of the pump. All motor mating surfaces where watertight sealing is required shall be machined and fitted with nitrile O-rings. The pump shall be fitted with a dynamically balanced nonclog impeller designed to pass coarse solids and stringy materials. The pump shall be listed by Factory Mutual or Underwriters Laboratory as conforming in all respects to the requirements in UL 1207.

B. Casing:
   1. The volute casing shall be a one-piece casting with a tangential or center discharge nozzle. The volute shall be designed for efficient conversion of kinetic to potential energy and shall have clear passageways designed to pass the solid sphere specified in this Section. The solids passing capability of the furnished equipment will be subjected to a field test in accordance with this Section. The solids passing capability of the furnished equipment will be subjected to a field test in accordance with paragraph 3.03.
   2. The cutwater shall be specifically designed for use in fluids with stringy materials. The volute casting shall be specifically designed to bear the loads associated with removal and placement of the pump when submerged or exposed and to withstand the loads imposed by the operations specified in this Section. The discharge nozzle shall be not less than the diameter specified in this Section and shall be reinforced for the loads imposed by the specified conditions of service. The nozzle flange face shall be designed to mate with the discharge fitting specified in this Section.

C. Shaft:
   1. The pump shaft shall be turned, ground and polished, of proportions suitable for use in the specified application. The shaft shall be of sufficient section to limit deflection at the shaft seal to not more than 4.0 mils when the pump is operating at any continuous-duty point defined by the envelope of conditions specified in this Section. The method for calculating shaft deflection shall be as established in Section 43 23 03. Additionally, under no circumstances shall the distance from the lower bearing and the hub of the impeller exceed two times the diameter of the shaft. The documentation required under Section 43 23 03 shall be included as a submittal.

D. Bearings:
   1. Bearings shall be heavy-duty, oil lubricated or permanently greased lubricated anti-friction type double shielded and factory sealed. Bearings shall be designed for an L-10 rating life of at least 50,000 hours at any operating condition specified in this Section. Loads for radial bearing calculations shall be calculated in accordance with this Section. Bearings isolators in accordance with 43 23 03 are not required for submersible pumps.

E. Impeller:

1. Alternate 1: The impeller shall be dynamically balanced with a non-clogging design capable of passing solids, fibrous materials, coarse solids, and other matter found in normal water applications through to the discharge nozzle. Impellers for pumps with discharge nozzles 4 inches in diameter and greater shall be not less than two-vane design. Fit between the impeller and the shaft shall be a sliding fit with a taper-lock bushing pressed by a screw that is threaded into the end of the shaft, or a slip fit onto the shaft and drive key and fastened to the shaft by an impeller nut having cover for protection from pumped fluid. A wearing ring system designed for abrasion resistance shall provide efficient sealing between the volute and impeller.
2. Alternate 2: The impeller shall be statically balanced, semi-open, multi- vane, back-swept, non-clog design. The impeller vane leading edges shall be mechanically self-cleaned upon each rotation as they pass across a spiral groove located on the volute suction which shall keep them clear of debris, maintaining an unobstructed leading edge. The impeller(s) vanes shall have screw-shaped leading edges capable of handling solids, fibrous materials, coarse solids and other matter. The screw shape of the impeller inlet shall provide an inducing effect for the handling of potable water treatment residual solids ladened water. Impellers shall be locked to the shaft and shall be coated with alkyd resin primer.

F. Mechanical Seals:

1. The pump shall be provided with a tandem double mechanical seal running in an oil reservoir, composed of two separate lapped face seals. The lower seal unit, between the pump and oil chamber, shall consist of one stationary and one positively driven, rotating tungsten-carbide or silicon-carbide ring, with each pair of rings held in contact by a separate spring. The upper seal unit, between the oil sump and the motor housing, shall consist of one stationary tungsten-carbide or silicon-carbide ring and one positively driven tungsten carbide, or silicon-carbide ring. Ceramic seals will not be acceptable. The seals shall require neither maintenance nor adjustment and shall be easily replaceable. Conventional double mechanical seals with a single or a double spring between the rotating faces, or that require constant differential pressure to effect sealing and are subject to opening and penetration by pumping forces, will not be acceptable. The pump shall be capable of continuous submergence without loss of watertight integrity to a depth of 65 feet. The mechanical seal shall accommodate the manufacturer's shaft deflection at the seal face and shaft angularity with a safety factor of 3.
2. Each pump shall be provided with a seal lubricant chamber for the shaft sealing system. The seal lubricant chamber shall be designed to assure that an air pocket is provided in the seal lubricant chamber, to absorb the expansion of the seal lubricant due to temperature variations. The drain and inspection plug with positive anti-leak seal shall be easily accessible from the outside.
3. Oil shall be ANSI/NSF/CAN 61/600 certified.

G. MOTOR:

1. The pump motor shall be a squirrel-cage induction, shell type design, housed in an air-filled or an oil-filled, watertight chamber, NEMA B type Inverter Duty with a service factor of 1.15 based upon nameplate rating. Oil shall be ANSI/NSF/CAN 61/600 certified.

2. Motor shall be rated for operation with VFD. The manufacturer shall furnish an unqualified warranty guaranteeing (full replacement at no cost to the City) the performance of the motors furnished under this project for a period of five years when operating under the specified conditions.
3. The stator winding and stator leads shall be insulated with moisture resistant Class H insulation, which shall be rated at a temperature of 180 degrees C. Motor shall be provided with thermal sensors to protect the motor from excessive heating. Thermal sensors shall be as specified in this Section. The temperature rise of the motor shall not be in excess of that specified in NEMA MG-1 for class B insulating materials when operating continuously under load.
4. Motors shall be Factory Mutual or UL listed in accordance with UL 674 and 1207 for Class I, Group D hazardous atmospheres.
5. The motor shall be designed for continuous duty in air and in 95 degree Fahrenheit water, capable of sustaining a minimum of 20 starts per hour when operated with variable frequency motor controllers.
6. The junction chamber, containing the terminal board, shall be hermetically sealed from the motor. Connection between the cable conductors and stator leads shall be made with threaded compressed type binding post permanently affixed to a terminal board.

H. COOLING SYSTEM:
1. The cooling system may rely on radiation of excess heat energy to the fluid in the wet well or, alternatively, shall be provided a closed-circuit circulating system utilizing glycol or heat transfer oil, which shall in turn circulate to a heat exchanger incorporated into the cavity behind the pump impeller. It is specifically required that the cooling system be compatible with the contemplated control schedule, which may require that the motor case to be exposed continuously or intermittently.
2. The cooling jacket shall encircle the stator housing to provide cooling for the motor under all conditions (i.e., submerged or non- submerged).
3. The cooling system shall not employ the pumped fluid to directly cool the motor through water passageways incorporated into the motor shell.
4. The system shall be designed to prevent clogging by virtue of dimensions and configuration and shall be specifically configured to maintain motor temperatures within conservative limits.

I. Temperature Sensors:
1. The stator shall be equipped with three thermal sensors, embedded in the end coils of the stator winding (one sensor in each stator phase). These shall be wired to the specified motor protection relay for motor protection.

J. Moisture Detection:
1. Provide motors with a moisture detection system.
   a. A primary moisture detector shall be provided in the stator housing leakage chamber.
   b. A second moisture detector shall be located in the motor junction box or inspection chamber.
2. All moisture detectors shall be wired to the motor junction box for connection to the specified motor protection relay.

3. Moisture detectors shall be either mechanical float switch or capacitance probe type as recommended by the manufacturer.

K. Motor Protection Relay:
   1. Provide motor protection relay to protect motor from high temperature and moisture.
   2. During normal pump operation, the temperature switch shall be closed and the leakage switch shall be normally open. Sensor circuit shall operate on 12 or 24 VDC feed from the main relay body. The relay shall be provided with LEDs to indicate status of relay on face for leakage, temperature, and supply voltage.
   3. Latch detection of open temperature switch. An external reset shall be required to clear alarm. Retain relay state during power failures for temperature.
   4. Moisture detection shall auto reset.
   5. Power supply shall be 120 VAC.
   6. Provide one SPDT contact for remote over-temperature alarming. Provide one SPDT contact for remote moisture detection alarming.
   7. Relay shall be UL or UR approved, suited for panel installation.
   8. Relay shall be mounted inside the associated pump's motor controller panel. Mounting shall be DIN rail mount mount. Coordinate to provide relay for installation at the shop where the associated motor controller is being fabricated. Coordinate size, wiring, and mounting of the relay into the motor controller.
   9. Relay manufacturer shall be Xylem-Flygt, ATC Diversified Electronics, Dwyer, or approved substitute.

L. Variable Frequency Drives:
   1. The variable frequency drive will be provided by the Contractor conforming to the requirements of Section 26 29 23, the Contract electrical one-line diagrams, and the Contract wiring diagrams.

M. Cables:
   1. Cable:
      a. The pump shall have two cables. One cable shall be for power, and one cable shall be for control (the motor thermal sensors and moisture detector). The cable design shall be suitable for installation in a municipal water pumping station. The cable length shall not exceed the product manufacturer's recommended length. The Contractor shall be responsible for determining the length of cable required to wire the motors and sensors from the wet well to the terminal boxes. The Contractor shall provide additional cable length for slack to allow the pumps to be removed from the wet well. The length of cable for slack shall be based on the pump manufacturer's recommendation.

2. Cable Seal:
    a. The cable entry water seal design shall preclude specific torque requirements to insure a watertight and submersible seal. The cable entry shall be comprised of individual cylindrical elastomer clamps having a close tolerance fit against the cable conductor insulation and the entry inside diameter and compressed by the entry body containing a strain relief function, separate from the function of sealing the cable. The cable entry junction chamber and motor shall be separated by a stator lead sealing gland, potting chamber or terminal board, which shall isolate the motor interior from foreign material gaining access through the pump top. If a potting chamber is used, the potting procedure shall employ an epoxy-potting compound combined with a procedure that insures penetration of the compound into the individual cable conductor strands to prevent development of wicking pathways for entrance of water into the motor.
3. Cable Disconnection:
    a. The pump shall be designed such that power/ control cable can be removed from the pump motor without breaking the cable seal. The power/ control cable shall be sealed to a removable motor chamber cap that shall be universally mateable to the same manufacturer's pump series. The pump shall be able to be removed from the wet well and disconnected from the cable by removing the motor chamber cap. A spare removable chamber cap with 15 feet of cable shall be provided.

N. TERMINAL BOXES: A terminal box shall be provided for each submersible pump. Cords from the pumps shall be connected to the terminal boxes with plugs. The contractor shall terminate submersible cables into plugs to mate up with receptacles located in the terminal boxes per this section.
1. Boxes, Plugs, and Receptacles:
    a. Class I, Division 1, Group D.
    b. Water tight.
    c. The receptacle/plug shells shall be machined from Stainless Steel type 316.
    d. See the drawings for information about boxes, conduits, and cords.
    e. Terminals per specification Section 26 05 33.
2. Pump terminal box:
    a. Contain a ground stud bonded to the enclosure and support four #8 AWG crimped one hole standard barrel terminal lugs.
    b. Box shall have two receptacles/plugs on the bottom. One receptacle/plug for motor power and one receptacle/plug for motor sensors.
3. Acceptable plug/receptacle manufacturers:
    a. Vantage Technologies
    b. Or approved substitute

O. NOT USED:

P. Pump Discharge Connection Seal:

1. The connection between the pump discharge connection shall be fitted with a means of sealing. The seal may be either a replaceable dynamic seal or a metal-to-metal seal to effect a complete closure between the pump discharge flange and the mating connection on the anchor fitting described in this Section. Leakage through the seal shall not exceed 1.5 percent of the flow specified for Condition Point A when operating at pump shutoff head and not more than 1 percent of total pump flow at Condition Point B. The seal shall be subject to field test for acceptance in accordance with the requirements of this Section.
2. The dynamic type of seal shall affect a seal meeting the requirements of this paragraph using the head developed by the pump when in operation to expand the sealing device, which may be of metallic or elastomeric construction, against the inner contours of the discharge fitting. The design of the seal shall incorporate features to protect the integrity of the seal during the pump removal/setting process.

Q. Pump Anchorage, Guide System and Access Cover:

1. The pump shall be provided with a guide system to allow easy removal of the pump without entering the wet well. The guide rail system may be of either the single or dual rail type. The discharge connection shall be bolted to the structure as indicated and shall serve as a lower attachment for the guide rails. The discharge connection shall be either horizontal or elbow discharge type, as indicated. The anchorage system shall be designed to transmit the forces specified in this Section safely to the structure. Calculations and supporting documentation justifying the support design shall be provided with the submittals required under Section 43 23 03.
2. The pump and guide rail system shall be designed to automatically connect the pump to the discharge piping when lowered into place on the discharge connection. The design shall be non-sparking and shall conform to UL requirements for installation in a location classified in accordance with NFPA 70, Article 500 for Class 1, Group D, Division 1 locations. The pump shall be easily removable for inspection or service, requiring no bolts, nuts, or other fastenings to be removed for this purpose, and no need for personnel to enter the pump wet well or sump. Sealing of the pumping unit to the discharge connection shall be accomplished by a simple linear downward motion of the pump with the entire weight of the pumping unit guided to and pressing tightly against the discharge connections. No portion of the pump shall bear directly on the floor of the sump and no rotary motion of the pump shall be required for sealing. Guide bars provided for directing the pump into position or for removing the pump for maintenance shall steer the pump into proper contact with the discharge elbow. Once the pump has been positioned on its support fitting at the discharge fitting, the guide bar system shall not be required for pump support.
3. Access frames and covers furnished by the Contractor shall be as specified in Section 08 31 20 and as shown on drawings. Hardware and miscellaneous attachments shall all be constructed out of ASTM A276, Type 316 stainless steel. Dielectric isolation shall be provided for dissimilar metals.

R. Accessories
   1. Pumps shall be provided with lifting chains, guide bars, upper guide bar brackets, intermediate guide bar brackets, cable holder assemblies, safety chain hook assemblies, discharge elbow connections, metric to english pipe increaser, anchor bolts, and all other accessories necessary to complete the installation as specified. All connecting hardware and miscellaneous attachments shall be constructed out of ASTM A276, Type 316 stainless steel. Dielectric isolation shall be provided for dissimilar metals.

2.07 EQUIPMENT AND SYSTEM CONTROLS

A. Section 40 61 13 specifies control system requirements. (I&C: May want to include process control narrative here.)

2.08 FINISHES

A. Procedures: Section 09 90 00

B. Prime Coat: Shop applied, manufacturer's standard coating system.

C. Finish Coat: Shop applied, manufacturer's standard coating system.

2.09 SOURCE QUALITY CONTROL

A. Provide non-witnessed factory testing at a location in the Continental United States and in accordance with Section 43 23 03-1.06

B. Submit factory testing results report in accordance with Section 43 23 03.

C. Hydrostatic tests:
   1. Factory-test all pressure-sustaining parts in accordance with Section 43 23 03.

D. Performance and NPSH tests:
   1. Subject each pump to performance and NPSH testing in accordance with Section 43 23 03 to verify the full range of operating condition

E. Motor tests:
   1. First check impeller, motor rating, and electrical connections for compliance with the specifications
   2. Subject all motor circuits to electrical resistance tests to confirm functionality

PART 3 EXECUTION

3.01 EQUIPMENT MOUNTING

A. Procedure: Section 43 05 13

B. Position equipment pad and equipment anchors for final placement of equipment

C. Use a bolting template to position equipment anchors

D. Level mounting plates

E. Pour grout bed supporting each mounting plate

F. Eliminate grout voids below mounting plate

G. Tension equipment anchors

H. Provide a completed Form 43 05 13-A, Section 01 99 90, for each equipment installation

3.02 FIELD QUALITY CONTROL

A. Field Testing
   1. Procedures: Section 01 45 00 and Section 01 91 00.
   2. Vibration Test:
      a. Vibration levels shall be determined by affixing suitable sensors to the top of the motor housing in both the x-x (parallel to the nozzle) and y-y (perpendicular to the nozzle) directions. The Contractor or his designated testing agent shall provide all sensors and monitoring equipment.
      b. As a condition precedent to final acceptance of the equipment, the pumps shall be individually operated at all specified operating conditions. The Contractor shall provide the means to recirculate pumped fluid or alternatively throttle the pumps to achieve the specified head at specified flow.
      c. Vibration levels shall not exceed that specified in paragraph 1.07 when the pump is operating within the manufacturer's listed POR as determined in accordance with Section 43 23 03. When operating at conditions outside the POR, vibration levels shall be no more than 125 percent of that specified in paragraph 1.07.
   3. Leakage Test:

      Leakage testing for each wet-pit pumps shall include five sets of tests, each set consisting of two tests, one with the pump operating against a closed discharge valve and one with the pump operating at Condition B, as specified in paragraph 2.03. Testing shall be scheduled with and witnessed by the Construction Manager. For each test the wet well shall be drawn down such that the pump discharge elbow is clearly visible prior to the test. Additional lighting shall be provided if necessary to clearly see leakage discharge, if any, from the discharge elbow connection. Each test shall be not less than 30 seconds in duration. Between each test set, the pump shall be lifted clear of its support bracket and re-lowered to connect again. The tests results shall be video recorded. The apparent average rate of leakage shall not exceed that specified in paragraph 2.06 Pump Discharge Connection Seal. If the discharge connection leakage rate at either against a closed valve or at Condition Point B exceeds the specified allowance, the Contractor shall cause the pump manufacturer to correct the defect and the pump shall be tested again as described in this paragraph. If the pump should fail the second test, the pump shall be removed from the site and the Contractor shall furnish a replacement which in turn shall be tested for acceptance in accordance with this paragraph. Video files shall be submitted.

B. Manufacturer Services:
   1. Procedures: Section 01 45 23 and Section 01 91 00.

2. On-Site Inspections and Training: Provide a factory-trained manufacturer's representative at the Site for the following activities. Specified durations do not include travel time to or from the Site.
    a. Installation Inspections: Assist, supervise, and inspect the Contractor's activities during installation. Provide 6 inspection hours. Provide a completed Form 43 05 11-A, Section 01 99 90.
    b. Component Test Phase Inspections: Assist, supervise, and inspect the Contractor's activities during the system test phase specified in Section 01 91 00 and this Section. Provide 8 inspection hours.
    c. Training Sessions: Procedures Section 01 79 00. Provide a minimum of [8] hours classroom training for each training session. Conduct [two] training sessions, [one] training session per week on [two] consecutive weeks to accommodate the shift schedules of operation and maintenance staff. Certify completion of training on Form 43 05 11-B, Section 01 99 90.

3.03 SYSTEMS START UP

A. Procedures: Section 01 45 00.

B. Preoperational (factory) testing; See paragraph 2.09.

C. Component testing: Perform the following tests.
    1. During initial pump installation, verify on one pump that the davit crane has the clearance and capacity to lift out the pump on rail system to accommodate routine pump maintenance.
    2. Complete field testing in accordance with paragraph 3.02.

END OF SECTION

SECTION 43 23 92

MULTI-STAGE VERTICAL CENTRIFUGAL PUMPS

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies vertical multi-stage, constant speed, end suction, centrifugal pumps for [flash mixing].
   1. Each pumping unit shall be complete with pump, drive unit, variable speed drive, base, and all appurtenances to provide a complete pumping system.
   2. Except as specifically referenced in this section, Section 43 23 03 provisions will not apply to equipment furnished under this section.

B. Equipment List

Item	Equipment Number
Flash Mix Pump 1	20-P-10010
Flash Mix Pump 2	20-P-20010

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections not specifically listed below may apply.
   1. Section 26 29 23: Variable Frequency Motor Controllers
   2. Section 43 05 11: General Requirements for Equipment
   3. Section 43 05 17: Vibration and Critical Speed Limitations
   4. Section 43 05 21: Common Motor Requirements for Equipment

1.03 REFERENCES

A. References
   1. This section contains references to the following documents. These references are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. If requirements of this section conflict with those of the listed documents, requirements of this section prevail.
   2. Unless otherwise specified, reference documents refer to documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if no Bids). If referenced documents have been discontinued by the issuing organization, refer to replacement documents issued or otherwise identified by that organization. If there are no replacement documents, refer to the last version of the document before it was discontinued. Where document dates are given in the following listing, those documents refer to the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued, or replaced.

Reference	Title
ABMA 9	Load Ratings and Fatigue Life for Ball Bearings

Reference	Title
ABMA 11	Load Ratings and Fatigue Life for Roller Bearings
ASTMA A48	Gray Iron Castings
ASTM A108	Steel Bars, Carbon, Cold Finished, Standard Quality
ASTM A276	Stainless and Heat-Resisting Steel Bars and Shapes
ASTM A278	Gray Iron Castings for Pressure Containing Parts for Temperatures of up to 650 Degrees F
ASTM A322	Steel Bars, Alloy, Standard Grades
ASTM A576	Steel Bars, Carbon, Hot Wrought, Special Quality
ASTM A743/A743M	Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion-Resistance for General Application

1.04 DEFINITIONS

A. Terminology used in this section conforms to the following definitions:
   1. Equipment pad: concrete foundation (block or slab) supporting and elevating equipment mounts above the supporting structural floor slab or local grade.
   2. Mounting pads: thickened or raised areas of baseplates and soleplates where the feet or mounting surfaces of mounted equipment and drivers rest on the baseplate or soleplate.

1.05 ADMINISTRATIVE REQUIREMENTS

A. Unit Responsibility
   1. Assign unit responsibility, as specified in Section 43 05 11, to the pump manufacturer for the pumps and motors as specified in this section and Section 43 05 21 and the variable speed drive equipment specified in Section 26 29 23.
   2. Provide a completed and signed Unit Responsibility Certification Form (Form 43 05 11-C, Section 01 99 90).

1.06 SUBMITTALS

A. Action Submittals
   1. Comply with procedures described in Section 01 33 00:
      a. Submit a copy of this specification section (with addendum updates included) and all referenced and applicable sections (with addendum updates included).
         1) Mark each paragraph with a check-mark (✓) to indicate specification compliance or mark to indicate requested deviations from specification requirements.
         2) Use check-marks (✓) to denote full compliance with a paragraph as a whole.
         3) If deviations from the specifications are indicated, underline and denote each deviation with a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations.

4) Remaining portions of the paragraph not underlined signify the Contractor's compliance with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

b. Submit a copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment. Include addendum updates applying to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, mark the drawing or drawings with *"no changes required"*. Failure to include copies of relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.

c. Show predicted pump performance curves. Show head, capacity, speed, power, efficiency, and net positive suction head (NPSH) required on the ordinate plotted against capacity on the abscissa.

d. Provide motor submittal information as specified in paragraph 43 05 21-1.03.

e. Provide drawings showing general dimensions and confirming pump piping connections, with construction details including dimensions and materials of construction, and wiring diagrams.

f. Provide manufacturer's catalog data, showing materials of construction and including a list of spare parts to be provided.

B. Informational Submittals

1. Comply with procedures described in Section 01 33 00:
   a. Show guaranteed pump performance curves.
   b. Provide applicable operation and maintenance information as specified in Section 01 78 23.
   c. Provide certification that pumping units meet vibration and critical speed limitations as specified in Section 43 05 17.
   d. Submit Installation Certification Form 43 05 11-A as specified in paragraph 43 23 92-3.01.
   e. Provide motor product data as specified in paragraph 43 05 21-2.05.
   f. Submit Training Certification Form 43 05 11-B as specified in paragraph 43 23 92-3.03.

C. Closeout Submittals

1. Comply with procedures described in Section 01 78 23.
   a. Provide field vibration test reports in accordance with paragraph 43 23 03-3.06.
   b. Provide operating and maintenance submittals as specified in Section 01 78 23.
   c. Submit Installation Certification Form 43 05 11-A as specified in paragraph 43 23 88.13-3.01.
   d. Submit Training Certification Form 43 05 11-B as specified in paragraph 43 23 88.13-3.02.

e. Spare Parts
    1) The following spare parts shall be provided if one pump is furnished under this section. If more than one pump is furnished, the following shall be provided for each pair of pumps. Spare parts shall be tagged and stored as specified in paragraph 43 05 11-2.12.
        a) Three sets of all gaskets
        b) One set of pump bearings
        c) One set of wearing rings
        d) One set of seals, including shaft seal

1.07 QUALITY ASSURANCE

A. Certifications
    1. Manufacturers proposing to furnish equipment specified under this section shall hold current certification under ISO 9001-2001.
    2. Application for certification under ISO 9001 is not an acceptable substitute for current certification. Documentation attesting to current certification shall be signed by an officer of the manufacturer's corporation and notarized.

B. Critical Speeds
    1. Critical speeds shall be in accordance with Section 43 23 03-1.04 except when the title of the detailed section includes "Custom Engineered" in which case Section 43 23 03-1.05 applies.

C. Vibration Limits
    1. Vibration limits shall be in accordance with Section 43 23 03-3.06 and subject to field testing in accordance with paragraph 3.04 of this section.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following candidate manufacturers are capable of producing equipment and/or products satisfying the requirements of this section. The manufacturer's standard product may require modification to conform to specified requirements.
    1. Grundfos
    2. Aurora
    3. Taco
    4. Approved equal

2.02 PERFORMANCE/DESIGN CRITERIA

A. Service Conditions
    1. The pump shall be designed to pump raw water from city creek that has been screen upstream by a coanda screen.
    2. The fluid to be pumped is anticipated to range between 2 degrees C and 35 degrees C and may be expected to contain small amounts of grit and other particulates.
    3. The pumps will be operated at a variable speed.

B. Operating Conditions

1. The pump shall perform in accordance with the following:

Full Speed Operation	
Condition A [a,e]	
Capacity, gpm	250
Total head, feet	139
NPSHA, feet	16
Condition B [b,e]	
Capacity, mgd	from pump H/Q curve
Total head, feet	130
NPSHA, feet	16
Reduced Speed Operation	
Condition C [c,e]	
Capacity, mgd	139
Total head, feet	30
Pump speed	Reduced
NPSHA, feet	17
Condition D [d,e]	
Capacity, mgd	TBD
Total head, feet	TBD
Pump speed	Minimum
NPSHA, feet	TBD

a. *Take Condition A as the rated operating condition. Guarantee performance at the rated condition in accordance with Section 43 23 03. Condition A has been selected to obtain the rated pumping capacity for the installation. It is not intended that the pumps be selected for maximum efficiency at Condition A. Select pumps furnished under this section to achieve Condition A performance, and also operate continuously without objectionable vibration or cavitation at the head specified under Condition B. Condition A may be located in the Allowable Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and published in the manufacturer's published application data for the specific model proposed for this application.*

b. *Condition B head is presented to indicate operating conditions when the pump is operating at maximum speed against minimum anticipated system head, assuming a hypothetical head-capacity curve. Use Condition B for pump selection. Condition B shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and list in the manufacturer's published application data for the specific model proposed for this application. Condition B shall be located to the right of BEPQ, and shall not be less than 10 percent of BEPQ. Pumps with head-capacity curves steeper than that assumed will produce somewhat less flow at somewhat lower head. The reverse will occur with pumps having a shallower head-capacity curve. Proposed pump selections meeting this discharge head requirement by operating the equipment at less than full speed will be rejected. Net positive suction head available (NPSHA), as listed for Condition B is calculated on a pumped flow of 230 gpm.*

c. *Condition C is the anticipated continuous duty minimum speed condition. Provide pumps furnished under this specification capable of sustained (24 hours per day) operation at this condition within the requirements set forth in Section 43 23 03. Condition C shall be located within the Preferred Operating Region as established by the pump manufacturer in accordance with ANSI/HI 9.6.3, and list in the manufacturer's published application data for the specific model proposed for this application.*

d. *Condition D represents the expected momentary (startup/shutdown) condition. Pumps furnished under this specification will operate for no more than 30 seconds at this condition when initiating or terminating a service cycle. The maximum anticipated number of service cycles is 12 per day.*

e. Total head in the above tabulation is the algebraic difference between the discharge head and suction head as defined in ANSI/HI 1.1–1.6. NPSHA in the above tabulation is referred to the pump inlet piping at centerline elevation as shown and is calculated in accordance with ANSI/HI 1.3 for average barometric pressure and maximum temperature conditions. NPSHA at the pump impeller eye can be determined by adjusting the given value by proposed pump dimensions and the indicated requirements for pump installation details. An allowance of 5 feet has been included for the presence of volatile constituents in the pumped fluid. Required NPSHA margin shall be as specified in Section 43 23 03.

C. Design Requirements

1. The pump shall be designed to operate without damaging cavitation, and the motor and pump combination shall operate without vibration over the specified range of conditions. The pump head capacity curve shall slope in one continuous curve with no point of reverse slope inflection.
2. All components shall be designed to safely withstand forces resulting from flow reversals, up to 125 percent of maximum speed, within the pump during shutdowns caused by power failure.
3. The complete pumping unit shall be designed to operate without overload on any component at any point along the pump's entire operating curve without using the motor's service factor.
4. Equipment furnished under this section shall conform to the following characteristics:

Pump	**Equipment No.**
Minimum sphere, inches diameter, capable of passing through the pump from inlet to discharge	1 mm
Efficiency at Condition A, minimum, percent [a]	TBD
Piping connection size, inches, minimum	
Inlet	4"
Discharge	4"
Motor	
Horsepower	15 hp
Type (See Section 43 05 21)	TEFC – (Corrosion) Severe Duty, Enclosed]
Inverter duty	Yes
Space heater	Yes
Thermal protection	Yes
Ambient duty rating	+40 C
Operating speed, rpm, maximum	TBD
Voltage rating	460 volt, 3 Phase
Reversing motor	No
Multispeed motor	No
Motor starting type	VFD
Voltage rating	460 volt, 3 Phase

Notes:

a. Because the pumps are to operate at constant speed, the pump shall be selected so that the rated condition lies within 5 percent (based upon capacity) of the best efficiency point (BEP) on the pump's head-capacity curve.

b. The motor shall be nonoverloading within the selection criteria set forth in Section 43 05 21. Pump selections which do not conform to this requirement without requiring a motor with a nameplate rating greater than that listed are not acceptable.

D. Vibration and Critical Speeds
   1. The pump shall comply with the requirements of Section 43 05 17.

2.03 MATERIALS

A. Materials of construction shall be as follows:

Component	Material
Suction/discharge base, pump head, flanges and couplings	316 Stainless Steel
Motor stool	TBD
Shaft	Stainless steel, Type 316
Impellers 1	316 Stainless Steel
Wearing rings	Teflon or Equal
Intermediate bearings	Aluminum Oxide Ceramic or Graflon
Bottom bearing rings, shaft journal	Tungsten carbide, replaceable
Cartridge shaft seal	Per manufacturer, corrosion resistant, replaceable without disassembling pump (EPDM [std], Viton, or Buna O-rings)
Motor seal	Per manufacturer, replaceable without removing motor

Notes:

a. Impellers shall be balanced at the factory. Balancing of the impeller in the field is not permitted.

b. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials to provide greater strength or meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

B. Variable Frequency Drive:
   1. The variable frequency drive shall conform to the requirements of Section 26 29 23.

2.04 EQUIPMENT MOUNTS

A. Mounting Plates
   1. Use [Fabricated Steel Frame, Baseplate, Plate Steel Soleplate, Polymer Concrete Soleplate, or Corrosion Resistant FRP Baseplate].
   2. Install mounting plates per Section 43 05 13.
   3. Mount plate leveled to TBD inch/foot or less.
   4. Mount pump and motor on a common baseplate. Baseplate collects, contains, and directs seal water leakage to a single outlet.

B. Grout Type
   1. Use Epoxy Grout or Cementitious Non-Shrink Grout per Section 03 60 00.

C. Equipment Anchors
   1. Install per Standard Detail D01002.

D. Equipment Anchor Sleeves
   1. Install per Section 43 05 13.
   2. Length shall not be less than 15D (D = nominal bolt diameter; bolt diameter determined by mounting plate manufacturer).

E. Equipment Pad
   1. Install per Standard Detail D01007

2.05 SOURCE QUALITY CONTROL

A. Factory Tests
   1. Factory tests are not be required. However, the manufacturer shall guarantee the performance specified under paragraph 2.02 Operating Conditions, Condition A.

PART 3 EXECUTION

3.01 INSTALLATION

A. Each pumping unit shall be aligned, connected, and installed in accordance with the manufacturer's recommendations.

B. The installation shall be certified on Form 43 05 11-A as specified in Section 01 99 90.

3.02 FIELD QUALITY CONTROL

A. After completion of installation, each pumping unit shall be field tested to demonstrate compliance with the performance requirements as specified.
   1. A minimum of 4 hours of training shall be provided by the pump manufacturer’s service representative.
   2. Training shall conform to Section 01 79 00.
   3. Certify completion of training on Form 43 05 11-B as specified in Section 01 99 90.

END OF SECTION

SECTION 43 41 43.13

HIGH DENSITY CROSSLINKED POLYETHYLENE TANKS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies crosslinked high-density polyethylene tanks for chemical storage.

B. Type:

1. Unless otherwise specified, tanks shall be circular cross-section, vertical, complete with piping outlets, drains, overflows, and anchoring system. Covered tanks shall be vented, and where specified, tanks shall be provided with entrance manways, level indicators, electrical heat tracing, spray-on urethane foam insulation, and exterior coating.

C. Equipment List:

Item	Equipment No.
PEA BATCH DAY TANK	84-T-00020
SODIUM HYPOCHLORITE DAY TANK 1	89-T-00010
SODIUM HYPOCHLORITE DAY TANK 2	89-T-00020

D. Design Requirements:

1. Physical Characteristics: Chemical storage tanks provided under this section shall have the following characteristics:

Equipment number[1,2]	84-T-00020	89-T-00010	89-T-00020
Type[3]	CB	CD	CD
Nominal diameter, ft	4	4	4
Nominal height,[4] ft	6.25	7	7
Liquid depth, ft	9	5	5
Nominal capacity, gallons	335	545	545
Manway:[5]	N/A	Yes	Yes
• Mounting[6]	N/A	TM	TM
• Diameter, inches	N/A	17	17
• Exposure	Inside	Inside	Inside
Color	White	White	White

Notes:

1. *All Tanks shall be provided with level indicator.*
2. *Tanks shall not use molded flange full drain fittings. (IMFO)*
3. *CD = closed, domed top; CB = closed, cone bottom; CF = closed, flat top; OIF = open, internal flange; OEF = open, external flange; FLR = flat lid removable; FLH = flat lid hinged.*
4. *Nominal height of domed top tanks is the dimension measured along the straight cylindrical portion of the tank and does not include the rounded end.*
5. *Unless otherwise specified, manways shall be integrally molded with the tank.*
6. *TM = top mount; TSM = top and side mount.*

2. Operating Conditions: Chemical storage tanks provided under this section shall be suitable for the following operating conditions:

Equipment number	84-T-00020	89-T-00010	89-T-00020
Chemical stored	Anionic Polymer	Sodium Hypochlorite	Sodium Hypochlorite
Concentration, percent	100	5.37	5.37
Unit weight, lb/gal	9.17	0.48	0.48
Design specific gravity	1.10	1.08	1.08
Solution pH	TBD	11	11
Solution viscosity, centipoise at 20 deg. F	500-	TBD	TBD
Maximum fluid temperature, deg. F	100	TBD	TBD
Minimum fluid temperature, deg. F	7	TBD	TBD
Minimum ambient air temperature, deg. F	TBD	TBD	TBD

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM C177	Steady-State Thermal Transmission Properties by Means of the Guarded Hot Plate Apparatus
ASTM D638	Tensile Properties of Plastics
ASTM D746	Brittleness Temperature of Plastics and Elastomers by Impact
ASTM C273	Shear Properties in Flatwise Plane of Flat Sandwich Constructions or Sandwich Cores
ASTM D1505	Density of Plastics by the Density Gradient Technique
ASTM D1525	Vicat Softening Temperature of Plastics
ASTM D1621	Compressive Properties of Rigid Cellular Plastics
ASTM D1622	Apparent Density of Rigid Cellular Plastics
ASTM D1623	Tensile and Tensile Adhesion Properties of Rigid Cellular Plastics
ASTM D1693	Environmental Stress-Cracking of Ethylene Plastics
ASTM D2126	Response of Rigid Cellular Plastics to Thermal and Humid Aging
ASTM D2842	Water absorption of Rigid Cellular Plastics
ASTM D2856	Open Cell Content of Rigid Cellular Plastics by the Air Pycnometer
ASTM E84	Surface Burning Characteristics of Building Materials
NEMA ICS 6	Enclosures for Industrial Control and Systems
Phillips Chemical Technical Bulletin SSL-193	Impact and Gel Testing
UBC	Uniform Building Code

B. Factory Test:
   1. Following fabrication the tanks, including factory applied pipe outlet fittings, shall be hydraulically tested with water. Test methods may include adding a 2.5 psig air pad to filled tanks or filling the tanks with standpipes, raising the maximum water surface approximately 6 feet higher than the normal maximum tank level. The test duration shall be 24 hours with proof of acceptance being an affidavit signed by the factory inspector. Following successful testing, the tank shall be emptied and dried prior to shipment.

C. Manufacturer's Warranty:
   1. The tank shall be warranted for 7 years to be free of defects in material and workmanship. Warranty shall be prorated over the last 5 years.

D. Manufacturer's Experience:
   1. The tank manufacturer shall have a record of at least ten installations during the previous 5 years for the tank sizes specified. The manufacturer must be capable of providing names of users and specific locations which can be visibly inspected.

E. Unit Responsibility:
   1. The Contractor shall assign unit responsibility as specified in Section 43 05 11-1.02 Unit Responsibility to the tank manufacturer for all equipment specified in this section.

1.03 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00:
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
   2. Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
   3. Tank manufacturer's data and dimensions showing locations of all openings, location of level sensors, seismic support structure and anchoring system details, and location of tank accessories.
   4. Details on outlet fittings, flexible connections, and vent and level indicator.

5. Manufacturer's experience required in paragraph 1.02 Manufacturer's Experience.
6. Electrical heat tracing installation details, sizing calculations, wattage–amperage (120 volt) and thermostat details.
7. Insulation data, name of insulation contractor, and insulation contractor credentials.

1.04 ENVIRONMENTAL CONDITIONS

A. The bulk storage tanks shall be suitable for indoor installation.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. The tanks specified in this section shall be manufactured by Poly Cal Plastics, Inc., Poly Processing, Nalgene, or equal, modified to provide the specified features.

2.02 TANKS

A. The tanks provided under this specification shall be constructed of high-density crosslinked polyethylene using a rotationally molded fabrication process. Resin used in the tank shall be equal to Phillips Chemical crosslinked polyethylene Marlex CL 200 or equal and shall contain 1/2 to 1 percent ultraviolet stabilizer. Where black tanks are specified, the black resin shall contain 3 percent carbon black blended into the resin. The tank material shall meet or exceed the following test properties:

ASTM Test	Parameter	Value
ASTM D1505	Density, gms/cc	0.930-0.933
ASTM D1693	Environmental stress cracking, F50, hrs	>1,000
ASTM D638	Tensile strength, ultimate, psi, 2-inch minimum	2,600
ASTM D638	Elongation at break, percent, 2-inch minimum	450
ASTM D746	Brittleness temperature, degrees F	<-180
ASTM D1525	Vicat softening point, degrees F	255
Phillips SSL-193	Impact resistance at -40 degrees F, ft/lb	>120
Phillips SSL-193	Percent gel, innermost 1/32 inch of inner wall	>65
--	Percent gel, outermost 1/32 inch of outer wall	>90
--	Percent gel, entire wall thickness	>80

B. Wall thickness of the tank shall be designed by the manufacturer with a hoop stress no greater than 500 psi and a safety factor of no less than 2 using the Barlow formula. Calculations shall be based on design specific gravity specified in paragraph 1.01 Operating Conditions.

C. The tank manufacturer shall provide a certificate attesting that the tank materials meet or exceed the test properties specified above. Such certificates shall be signed by an officer of the manufacturer's corporation and shall be notarized.

2.03 TANK FITTINGS

A. Tank fittings shall be according to the fitting schedule below. Gasket material shall be closed cell, crosslinked polyethylene material equal to the material specified in paragraph 2.02. PVC fittings shall be compression type Schedule 80 long shank high-torque design with minimum of 85 percent threaded contact. No metals shall be exposed to tank contents.

Equipment No.	Fitting type[1]		
	84-T-00020	89-T-00010	89-T-00020
1. Fill line	DB-H	DB-H	DB-H
2. Overflow	DB-H	DB-H	DB-H
3. Tank drain	DB-H	DB-H	DB-H
4. Vent	PVC	PVC	PVC
5. Outlet to pump	DB-H	DB-H	DB-H
6. Pipe supports	PVC	PVC	PVC

Notes

[1]Refer to drawings for fitting size and location. Legend for abbreviations:

DB-H: Double bolt with Hastelloy-C studs and polyethylene encapsulated heads.

DB-SS: Double bolt with 316 SS studs and polyethylene encapsulated heads.

IMFO: Integrally molded flange.

PVC: Double-nut PVC fitting.

2.04 LEVEL INDICATORS

A. Level indicators shall be provided for tanks 84-T-00020, 89-T-00010 and 89-T-00020. Graduations shall be provided at every 200-gallon interval with 1,000-gallon intervals clearly labeled for bulk storage tanks. Unless otherwise specified, graduations shall be marked on the tank exterior. The level indicator shall be completely assembled to the tank and shall consist of PVC float, indicator, polypropylene rope, perforated interior pipe, PVC roller guides, clear sun and chemical resistant sight tube, and necessary pipe supports. The level indicator shall act inversely to the tank contents and shall not allow entrance of tank contents into the sight tube at any time.

2.05 TANK INSULATION – NOT USED

2.06 HEAT TRACING – NOT USED

2.07 SEISMIC RESTRAINT SYSTEM

A. The tanks shall be provided with seismic restraint systems manufactured in conformance with plans and instructions prepared and stamped by a registered structural engineer in the State of Utah. The lateral restraint assembly shall be designed for the seismic loads in Section 01 73 24, Design Requirements For Non-Structural Components and Non-Building Structures.

2.08 SAFETY SIGNS

A. Each tank inlet and tank outlet shall be clearly marked with hazardous material warning signs, 10 inches by 14 inches in size. Each sign shall have the words "DANGER" and the name of the chemical stored, printed in large block letters and mounted directly adjacent to the tank outlet and tank inlet. Each entry manway shall be provided with a sign ("DANGER--CONFINED SPACE--HAZARDOUS ATMOSPHERE"). Signs shall comply with Section 10 14 00, modified as specified herein.

2.09 FLEXIBLE CONNECTION

A. Tank connections shall include a flexible spool type flanged connector. Spool casing and liner must be suitable for chemical involved.

2.10 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Applicable operation and maintenance information as specified in Section 01 78 23.
   2. Signed affidavit by the tank manufacturer indicating that the tank was successfully factory tested as specified in paragraph 1.02 Factory Test.
   3. Copy of manufacturer's warranty specified in paragraph 1.02 Manufacturer's Warranty.
   4. Certification of tank material test data as specified in paragraph 2.02.
   5. Manufacturer's recommendations for installation.
   6. Seismic restraint plans and instructions specified in paragraph 2.07.
   7. Installation Certification Section 43 05 11-Form A specified in paragraph 3.01 Tanks.
   8. A complete set of structural calculations shall be provided for the tank structure, including certifications by the tank Manufacturer that the tanks conform to seismic zone design requirements. All such submissions shall be stamped by a Registered Professional Engineer licensed in Utah.

PART 3 EXECUTION

3.01 INSTALLATION

A. Tanks:
   1. The tanks shall be installed as specified and in accordance with the manufacturer's written instructions. Prior to being placed in service, tank installations shall be checked by a factory-trained representative of the manufacturer, who shall fill out and submit the Installation Certificate Form 43 05 11-A specified in Section 01 99 90.

B. Tank Insulation:
   1. Tank insulation shall be applied only by the tank manufacturer. Proper adhesion of the foam to all surfaces shall be the responsibility of the manufacturer. The final foam surface shall be free from bumps, rings, pinholes, voids, and depressions. Mating surfaces of piping flange connections and other items noted by the Construction Manager shall be kept clear of insulation.

3.02 FIELD TESTING

A. Field testing shall be in accordance with requirements in Section 01 45 20 and as specified herein. Each tank shall be field tested by filling entire contents with water and monitoring the tank as well as all fitting connections for at least 24 hours. Any leaks shall be corrected by the manufacturer's representative prior to acceptance. Following successful field tank testing, the tank shall be completely emptied and dried.

3.03 SAFETY

A. Appropriate sections of the safety precautions outlined by Cellular Plastics Division of the SPI, the NFPA, OSHA, and the material manufacturers shall be followed. All personnel shall be familiar with the hazards involved in the use of equipment and materials on the project and the proper techniques and procedures to safely handle and apply the materials.

END OF SECTION

SECTION 46 07 10

CHEMICAL SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies the supply, installation, testing, and commissioning of chemical systems. The chemical systems shall be suitable for storage, metering, and injection of the respective chemicals.

B. The following chemical systems are covered by this specification:
   1. Sodium hypochlorite systems
      a. SH Transfer Pump
      b. SH RAW Water Pipe Feed
      c. SH Filter Inlet Channel Feed
      d. SH Combined Filter Outlet Pipe Feed
      e. SH Backwash Pipe Feed

C. Limitations: The chemiacal storage tanks, equipment, pump skids, and other accessories of the chemical systems shall be suitable for installation within the space allocated for each system. Where systems are delineated herein to be the responsibility of a particular Subcontractor/Supplier, that Subcontractor/Supplier is responsible for confirming design criteria, selection, and arrangement of appurtenances such that the system functions as needed to support the process equipment provided by the Subcontractor/Supplier.

1.02 REFERENCES

A. Comply with applicable provisions and recommendations of the latest edition of the following, except as otherwise shown or specified:

Reference	Title

   17. Section 40 05 72.82 Degassing Valve, CPVC

1.04 UNIT RESPONSIBILITY:

A. The Subcontractor/Supplier(s) of the Packaged Chemical Systems provided under this section shall assume unit responsibility, as specified in section 43 05 11. This supplier has unit responsibility for both the equipment assembly specified in this section and all other equipment assembly components specified elsewhere but referenced in this section. A completed, signed certificate of unit responsibility (Section 01 99 90-form 43 05 11-C) shall be provided.

1.05 SUBMITTALS

A. The following information shall be provided in accordance with Section 01 33 00.
   1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (√) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and therefore requested by the Subcontractor, underline each deviation and denote by a number in the margin to the right of the identified paragraph. The ENGINEER OF RECORD shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance with the specifications. Provide a detailed, written justification for each deviation.

B. A copy of the contract document process and instrumentation drawings (P&ID) relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal.

   If no changes are required, the drawing or drawings shall be marked “no changes required.”

C. Shop Drawings:
   1. Illustration, specification, and engineering data on all components of the system.
   2. Drawings showing assembly, accessories, and installation details.
   3. Setting drawings, templates, and direction for the installation of anchor bolts and other anchorages.
   4. Deviations from Contract Documents.
   5. Drawings and design calculations, as applicable.

D. Calculations:
   1. The pump skid supplier shall submit structural calculations (including anchorage) for the pump skid sealed and signed by an Utah registered Professional Engineer.

E. The chemical system supplier shall submit a certificate of compatibility for all materials that will come in contact with the chemicals being handled.

F. Provide report on all shop testing performed prior to shipment.

G. Field Test Results:
   1. Written report giving the results of the field tests required herein or as part of the installation and start-up.

H. Certifications:
   1. Supplier’s Instructions Certification Form 43 05 11-A.
   2. Supplier’s Installation Certification Form 43 05 11-B.

I. Operation and Maintenance Manuals:
   1. Submit complete installation, operation and maintenance manuals, maintenance data and schedule, descriptions of operations, and spare parts information in accordance with Section 01 78 23.

J. Installation Procedures:
   1. General installation procedures. Include weights of all major assemblies and sub-assemblies.

1.06 QUALITY CONTROL

A. Subcontractor/Supplier's Qualifications:
   1. The suppliers shall be qualified and experienced in the design, construction, installation, and operation of equipment for the purpose required and shall regularly produce such systems. Subcontractor shall have experience in the production of substantially similar equipment and shall show evidence of satisfactory operation in at least five installations.

1.07 SHIPMENT AND STORAGE

A. The equipment shall be protected during shipment as specified in Section 01 66 00.

B. Ship equipment, material, and spare parts (where specified or required) complete except where partial disassembly is required by transportation regulations or for protection of components.

C. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

D. Provide short-term and long-term storage requirements to the Contractor.

1.08 ENVIRONMENTAL CONDITIONS

A. The units specified in this section shall be designed for installation under a canopy. Environmental conditions will be as described in Section 01 11 80.

PART 2 PRODUCTS

2.01 GENERAL CONFIGURATION

A. General:
   1. Each of the chemical systems will consist of the following:
      a. Fill lines from chemical transfer pump(s) to the day storage tanks(s) or tote(s)
      b. Day storage tank(s)
      c. Metering pump skids
      d. Chemical injectors
      e. All piping, valves, instruments, and other accessories such as pressure relief valves, back pressure valves, calibration columns, pressure gauges, and pressure switches.
      f. Storage tanks and metering pumps are specified separately and referenced herein. The metering pumps complete with the interconnecting piping, valves, instruments, and accessories shall be supplied as a complete skid as shown on the Drawings for each chemical system.

B. Metering Pump Skid Requirements:

1. Provide single, duplex, or triplex pump systems for the systems described below. Each system shall be constructed of lightweight, permanently welded 6060 T6 aluminum with acidic liquid iron phosphate three stage clean and coat pre-treatment and exterior grade corrosion resistant polyester polyurethane powder coat. Alternately skids may be fabricated of HDPE or FRP structural and molded shapes.
2. Each skid shall have the dimensions to provide access to each metering pump and specified accessories on each skid.
3. The skids shall be mechanically and electrically complete, requiring only the connection of electrical power, signal wiring, and inlet and outlet process chemical connections.
4. There shall be two side walls, a pump mounting base, and two rear back plates. Each of the two side walls shall be provided with nine service access cutouts and two accessory mounting slots.
5. Four 316 stainless steel skid mounting pads shall be provided which can be positioned to enable either floor mounting or wall mounting the skid. Each mounting pad shall be secured to two mounting holes in the skid structure by 18-8 stainless steel hardware.
6. Two 316 stainless steel pump mounting brackets with four mounting slots shall be provided. Pump mounting brackets shall be secured to the skid structure by 18-8 stainless steel hardware.
7. Custom engineered universal mounting brackets shall secure each of the valves to the skid structure. Valve mounting brackets shall be PVC. Valve mounting brackets shall be secured to pre-cut slots in the skid structure by 18-8 stainless steel hardware.
8. A polypropylene drip tray shall be provided for each pump.
9. Piping shall be as specified by system below.
10. Valves shall be as specified by system below.
11. Unions shall match piping system.
12. Seals shall match piping system or as specified by system below.
13. Two chemical interface ports shall be provided one suction and one discharge. The configuration of connections shall be as specified by system below.
14. System shall have a two-year manufacturer's warranty.
15. The skid systems may be the product of the chemical pump manufacturer or manufacturer's approved representative.
16. Skid shall have built-in containment with sloped deck and drain fitting connection to allow any maintenance fluids or spills to gravity drain out of skid containment.
17. Skid shall be provided with removable spray shield. The spray shield shall be constructed of polycarbonate material to allow for clear view of skid components from 3 sides.

2.02 SODIUM HYPOCHLORITE SYSTEM

A. Sodium hypochlorite system consists of the following:

Item	Details	Remarks
Chemical detail	5.37% sodium hypochlorite (NAOCL)	
Day Tanks	2 x 545 gallons XLPE Tank	See Section 43 41 66 for details
SH Transfer Pump	1 pump complete with accessories installed	Magnetic Drive Gear Pumps for Chemical Service, See Section 46 33 33 for pump details
SH Recirculation Pumps	4 pumps complete with accessories installed	Magnetic Drive Gear Pumps for Chemical Service, See Section 46 33 33 for pump details.
SH Raw Water Pipe Feed Pumps	2 pumps complete with accessories installed on a skid	Peristaltic Tube Pumps, See Section 46 33 44 for pump details
SH Filter Inlet Channel Feed Pump	1 pumps complete with accessories installed on a skid	Peristaltic Tube Pumps, See Section 46 33 44 for pump details
SH Combine Filter Outlet Pipe Feed Pumps	2 pumps complete with accessories installed on a skid	Peristaltic Tube Pumps, See Section 46 33 44 for pump details
SH Backwash Pipe Feed Pump	1 pumps complete with accessories installed on a skid	Peristaltic Tube Pumps, See Section 46 33 44 for pump details
Pump skid material	FRP or HDPE	
Piping material	CPVC single wall, CPVC double containment pipe	CPVC Double Containment, See Section 40 05 31.19
Valves	CPVC vented ball valves and ball check valves	
Accessories	Calibration column, pressure relief valves, flow metering, pressure switches, tube failure/leak detection sensors,	
Wetted Materials	CPVC, FPM/Viton, PTFE, Hastelloy C-276	
Connection Details	Suction: Flanged, ASME 150 Discharge: Socket	

PART 3 EXECUTION

3.01 INSTALLATION

A. Installation shall be in strict accordance with the Manufacturer's instructions and recommendations. Installation shall be certified by the Subcontractor on Form 43 05 11-A as provided in Section 01 99 90.

B. Anchor bolts and other hardware required for the installation shall be provided by the Contractor.

C. The equipment must be balanced and leveled to ensure proper operation.

3.02 SPARE PARTS AND SPECIAL TOOLS

A. Provide the Manufacturer's recommended spare parts for the initial two years of operation.

B. Provide special tools required for maintenance of the system.

3.03 STARTUP AND TESTING

A. Start-up and commissioning shall be performed in accordance with 01 45 20. The Supplier shall provide a factory representative, knowledgeable of the system and components, to inspect the final installation, supervise the initial operation, and train necessary personnel in the proper operation and maintenance for the system.

3.04 TRAINING

A. The Subcontractor shall provide the services of a factory-trained Manufacturer's representative to provide training for a minimum of 4 hours for each system. Prior to final acceptance, the Manufacturer's representative shall complete and provide supplier's Certification of Training on Form 43 05 11-B as provided in Section 01 99 90.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 46 33 33

POLYMER BLENDING AND FEED EQUIPMENT

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies a packaged polymer blending units suitable for metering and diluting of liquid polymers. The units shall be suitable for the feed of all types of liquid polymers specified in this Section.

B. Type:

1. The polymer blending units shall be capable of pumping the required amount of liquid polymer from a bulk storage tank, mixing the polymer with the correct amount of dilution water in the mixing chamber, and feeding the blended polymer solution to the batch day tank. The blending unit shall automatically adjust the amount of polymer and dilution water to maintain the required diluted neat concentration. The polymer blending feed equipment shall consist of the following components:
   a. Non-mechanical liquid polymer activation chamber
   b. Neat polymer metering pump
   c. Water booster pump
   d. Polymer check valve
   e. Clear solution discharge piping
   f. Local control panel with metering pump SCR controller
   g. Stainless steel frame
   h. Polymer flow meter
   i. Dilution water flow meter
   j. Clear calibration column
   k. Associated pressure gauges, pressure switches, transmitters, valves and solenoid valves required for operation detailed in this Section.

C. Equipment List:

Item	Equipment No.
Polymer Blending Unit 1	84 -BLND-10010
Polymer Blending Unit 2	84-BLND-20010

D. Operating Conditions:

1. Each polymer blending unit shall be provided with its own dedicated local control panel to allow for manual and fully automatic control as described in this specification section.

E. Performance Requirements:

1. Each packaged aqueous polymer blending unit shall be designed for continuous duty under the following operating conditions:

Item	Value
Neat polymer feed rate, gallons per hour	
Maximum	1.5
Minimum	1.5
Diluted neat polymer feed rate, gallons per hour	
Maximum[c]	596.7
Minimum[c]	4.9
Required Discharge Pressure, psig	
Maximum	2
Minimum	1
Dilution water supply pressure, psig	
Maximum	60
Minimum	40

[c] *Based on a solution output concentration of 0.25 percent.*

F. Design Requirements:

1. The polymer blending unit shall be designed to handle the following types of neat polymer:

Item	Value
Neat polymer specific gravity	
[Emulsion]	1.10
Neat polymer active concentration range, percent	
[Emulsion]	20-45
Neat polymer viscosity range, centipoise	
[Emulsion]	20.5

G. Environmental Conditions:

1. Ambient conditions are specified in Section 01 11 80.

H. Seismic:

1. Equipment, skid, and supports shall be braced per Section 01 73 24.

1.02 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A276	Stainless Steel Bars and Shapes
ASTM A320/A320M	Alloy/Steel Bolting Materials for Low-Temperature Service
NEMA 250	Enclosures for Electrical Equipment (1,000 Volts Maximum)
NFPA 70	National Electrical Code (NEC)

B. Unit Responsibility:
   1. This manufacturer is the unit responsibility manufacturer and has unit responsibility, as specified in Section 43 05 11-1.02 Unit Responsibility, for both the equipment assembly specified in this section and for the Local Control Panel specified in this section and in Section 40 67 00. A completed, signed, and notarized Certificate of Unit Responsibility (Section 01 99 90-Form 43 05 11-C) shall be provided.

C. Factory Tests:
   1. The specified equipment with all mechanical and electrical components shall be completely assembled as a skid at the manufacturer's facility. Pump casings shall be hydrostatically tested to twice the discharge head. The skid shall be non-witnessed tested for desired functionality and operation at the manufacturer's facility prior to the shipment.

D. Shipment, Protection, and Storage:
   1. Equipment shipment, protection, and storage shall conform to the requirements specified in Section 01 66 00.

E. Manufacturer's Experience:

F. Equipment furnished under this section shall be of a design and manufacture that has been successfully used in similar applications. The manufacturer shall have furnished equipment for a minimum of five similar applications that have been in successful operation for at least five years. A list of these installations complete with installation description, contact names, addresses, and telephone numbers shall be provided. Warranty And Performance Affidavit:
   1. The packaged aqueous polymer blending unit shall be warranted against defects in materials and workmanship of a period of 5 years.

1.03 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:

1. Shop Drawings:

a. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. A check mark (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. *Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.*

b. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked *"no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review*.

c. Completed Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and Section 43 05 11-1.02 Unit Responsibility. *No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.*

d. Motor Data Sheets specified in Section 43 05 21.

e. Marked copies of specification Sections 26 29 13, 26 09 16 and 40 67 00, with addendum updates included.

f. Manufacturer's specifications verifying the equipment performance. Motor data sheet.

g. Dimensional drawings, showing required access and clearances, including any layout requirements of the equipment.

h. Equipment mounting information as specified in Section 43 05 13.

i. Manufacturer's catalog data and shop drawings confirming dimensions, weight, construction, materials, and installation details.

j. Equipment control panels:

1) Schematic diagrams, including connections to remote equipment.

2) Drawings showing scaled front and interior views.

3) Bill of materials of components.

4) Marked product literature for all components.

k. Marked product literature for all instruments and controls.

l. Installation reference list including contact information as specified in this section.

m. Manufacturer's written certification that the polymer blending unit is suitable for the required polymer. The certification shall state that no additional equipment, such as aging tanks, are necessary.

n. Predicted performance curves developed for the specific application. Performance curves shall plot speed, capacity, head, horsepower, efficiency, and NPSH required for the specified operating range for the pumps provided on the skid.

o. Shop drawings including location of all piping, electrical, instrumentation, and structural connections.

p. Descriptive control sequences of the polymer blending unit's manual and automatic operation.

q. PLC program listing printout and SCADA Input/Output List per paragraph 2.04 Local Alarms. to support development of Plant Control System interface. If submittal is electronic, entire submittal electronic file shall be compressed to reduce file size.

r. HMI screen printouts.

2. Operation And Maintenance:

a. Applicable operation and maintenance information as specified in Section 01 78 23, including:

1) Final reviewed shop drawing submittal.

2) As-built drawings, PLC program listing, HMI screen printouts, and SCADA Input/Output list.

3) Range and setting of indicators, instruments, timers, and other related devices.

4) Equipment Warranty.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Engineer believe the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this section. Candidate manufacturers include:

1. Velodyne, Veloblend VM Series
2. UGSI, Polyblend
3. Or approved equal

B. Candidate neat polymer metering pump include Moyno, or equal.

2.02 MATERIALS

A. Materials of components shall be as follows:

Component	Material
Mixing chamber	304 Stainless Steel Steel with PVC internal components
Polymer pump suction and bearing housing	Type 316 Stainless Steel
Polymer pump rotor	Type 316 Stainless Steel
Polymer pump drive shaft	Type 316 Stainless Steel
Neat polymer flow meter wetted parts	Type 316L Stainless Steel
Skid	Type 304 Stainless Steel

2.03 EQUIPMENT

A. General:

1. Each polymer blending unit shall be a complete package that automatically dilutes, activates and pumps liquid polymer and water. Blenders shall instantaneously invert neat polymer into solution, producing a thoroughly diluted and completed activated homogeneous blend, free of “fish-eyes” and unblended polymer. Units shall be capable of delivering a consistent dilute polymer solution at an adjustable rate of flow and concentration. Each unit shall be an integrated package, prepiped and prewired.

B. Liquid Polymer Mixing Chamber:

1. Provide a multi-staged, non-mechanical hydrodynamic blending device specifically designed to dilute and activate the specified solution type polymer with viscosity up to 75,000 cps and active contents up to 75 percent.
2. The liquid polymer mixing activation chamber’s mixing energy shall be staged such that it provides for high, non-damaging mixing energy over the full operating range of the system which then dissipates through a series of concentric chambers. The system shall be designed for use with potable dilution water. The type of dilution water used shall not affect the specified warranty in any way. A mixing chamber drain valve with ½-inch fitting shall be provided and routed to the nearest floor drain. The mixing chamber shall have a maximum rated pressure of 150 psi.
3. Provide neat polymer check valve designed to isolate neat polymer from dilution water. The valve construction shall be PVC or Teflon, stainless steel and/or Viton. The valve shall be readily accessible for cleaning and shall be easily disassembled. Valve shall be located outside of the mixing chamber and shall not require mixing chamber disassembly for servicing.
4. The maximum pressure drop across the mixing chamber shall be 50 psi.
5. Equip the mixing chamber with an adjustable pressure relief valve plumbed to the nearest drain.

C. Neat Polymer Metering Pump:

1. The stator shall be a one-piece molding of Viton with a minimum durometer hardness of 65. Bond the stator securely to the housing.
2. Pumps shall be provided with packing. Packings shall have stainless steel parts, Viton elastomers and carbon to tungsten carbide seal faces.
3. Drive shaft shall be solid and sized with ample safety factors to give a long operating life.

4. The rotor shall be joined to the drive shaft by means of a connecting rod with high strength, shock resistant universal joints. Universal joints shall be pin type, sealed and greased to prevent entrance of pumped fluid.
5. Stainless steel nameplates with raised lettering, indicating the manufacturer's model and serial number, rated capacity, head, speed and all other pertinent data, shall be attached to the pump.
6. The pump shall have a continuous output that includes the range indicated in this section. The pump shall have a minimum turndown range of 10:1. The pump shall contain a minimum of four stages to minimize slip. The pump shall be mounted to the frame with a stainless steel bracket which positions the pump suction no more than 18-inches off the base to maintain ideal pump suction conditions.
7. The pump shall be driven by a DC motor directly connected to the gear reducer. The pump speed shall not exceed 585 rpm. The speed of the pump shall be controlled by an SCR motor controller mounted in the control panel.
8. The SCR motor controller shall be controlled manually and automatically at the local control panel.

D. Calibration Assembly:
   1. The blending unit shall be provided with a calibration assembly for the neat polymer metering pump. The calibration assembly shall be rigidly mounted onto the blending unit's frame. Supporting the calibration column using the polymer piping is not acceptable. The calibration assembly shall have both mL calibrations and direct reading flow in gallons per hour. Size the calibration assembly based on a 30 second draw down at 100 percent pump capacity.

E. Dilution Water Booster Pump (I&C: Confirm if this pump is to be supplied.):
   1. Provide an integrally mounted dilution water booster pump with the blending unit. The pump shall be designed to increase the dilution water pressure to satisfy the performance requirements specified in paragraph 1.01 Performance Requirements without cavitation or excessive vibration. All wetted parts shall be stainless steel.
   2. Manual and automatic controls shall be provided for the dilution water booster pump. The operator shall be allowed to start and stop the dilution water booster pump in manual mode. The dilution water booster pump shall be programmed to operate when the polymer pump is running and stop when the polymer pump is stopped in automatic mode. The dilution water booster pump shall also be programmed to automatically run on an operator entered system flush setpoint time prior to the blending unit shutting down.
   3. The dilution water booster pump shall automatically shutdown on low suction pressure or loss of dilution water flow.

F. Dilution Water Flow Control (I&C: Confirm if this control valve is to be supplied.):
   1. Dilution water flow control shall be accomplished using a motor actuated flow control valve. The flow control valve shall be an integral part of the blending unit. Flow control valves shall be constructed of stainless steel and brass designed to allow repair without disassembly of any other part of the blending unit.

2. The blending unit shall automatically adjust the flow control valve position to maintain the operator entered setpoint neat polymer concentration in manual and automatic mode of operation. The blending unit shall also control the flow control valve's position based on an operator entered dilution water setpoint flow rate to flush the system prior to shutdown.
3. The flow control valve shall be accompanied by a motor controlled ball valve for on/off control of the dilution water supply and the dilution water booster pump.

G. Other Instruments:
1. Instruments shall meet the requirements of Division 40.
2. Mixing chamber shall be provided with a differential pressure switch. Polymer pump shall be provided with a discharge pressure gauge and pressure switch. Dilution water shall be provided with a solenoid valve and flow indicator

H. Stainless Steel Skid:
1. Polymer blending unit components shall be integrally mounted on a frame. All pipe supports shall be stainless steel. No mild steel shall be used. The frame shall be constructed of 3/16-inch angle or structural stainless steel tubing. The panel supporting the control panel shall be a minimum 12 gauge thickness.
2. Secure piping, valves and other components with rigid clamps. The frame shall be designed for lifting and shall have holes for mounting on concrete pads.

I. Suction Assemblies:
1. Provide all necessary couplings and adapters to connect the polymer blending unit to the polymer storage unit.

J. Motors:
1. Motors shall conform to the requirements of Section 43 05 21. Motor enclosures shall be TEFC and corrosive/washdown rated.
2. Motors shall operate on 90 or 180 Vdc.

2.04 CONTROLS

A. Control Description:
1. Operator shall be allowed to start and stop the blending unit, set the polymer flow and dilution water flow using the local control panel's HMI when the HOA is in the Hand position.
2. Operator shall be allowed to enter the following operating parameters through the HMI when the HOA is in the Auto position:
   a. Polymer percent active concentration
   b. Average sludge concentration, percent
   c. Pound of polymer per ton of dry solids,
   d. Neat polymer specific gravity,
   e. Diluted neat polymer concentration, percent.
   f. Pre and post flushing times, seconds and
   g. Pre and post flush flow rates, gph.
   h. Polymer pump maximum capacity, gph

3. The blending unit PLC shall also be programmed to accept an external 4-20 mAdc sludge flow rate pacing signal and a remote start/stop signal (dry contact) signal The PLC shall perform all required calculations to determine the required polymer flow rate and dilution water flow rate based on the entered operating parameters and sludge flow pacing signal. The PLC shall automatically control the polymer metering pump and dilution water flow control valve to maintain the calculated neat polymer flow rate and setpoint diluted neat polymer concentration.
4. Prior to starting and stopping the polymer feed pump at the initiation of the remote start/stop signal, the blending unit shall initiate a start-up and shutdown flush in accordance with the operator entered setpoints.

B. Control Panels:
   1. Provide each unit with a control panel integral to the system's frame rated NEMA 4X and constructed of fiberglass reinforced plastic (FRP). The control panel shall consist of all switches, relays, indicator lights, digital displays, transformers, and controllers as required herein. The blender components shall be factory wired to the control panel for power supply and control in accordance with the Section 40 67 00.
   2. An external lockout/disconnect for 480 Vac, 3 phase electric power source shall be provided for each blending unit control panel.
   3. Control Panel Lights:
      a. Power ON indicator light.
      b. Common alarm light.
      c. Panel light colors shall meet the requirements of Section 40 67 00.

C. Control Devices: Provide the following control devices:
   1. Programmable Logic Controller (PLC) to control the operation of the blending unit in any mode of operation. PLC shall be Square D Modicon Momentum or approved equal.
   2. A liquid crystal display (LCD) touchscreen human machine interface (HMI) shall be provided for input of operating setpoints, alarm setpoints, monitoring of blending unit operation, and to acknowledge or clear alarm conditions. The polymer dilution and feed unit control panel shall have, as a minimum, the following displays and lights or be integrated into the HMI system:
      a. Actual polymer flow rate,
      b. Actual dilution water flow rate,
      c. Actual diluted neat polymer (solution) concentration,
      d. Hand-Auto status,
      e. Alarm setpoints and time delays,
      f. Alarm status, and
      g. Diluted neat polymer pressure.
   3. Hand–Off–Auto (HOA) switch.
   4. Heavy-duty emergency stop push button with red knob.

D. Interlocks:
   1. The polymer pump shall be interlocked to shutdown in any mode of operation on the following alarm conditions:
      a. Low neat polymer flow

b. High neat polymer discharge pressure
c. High mixing chamber differential pressure
d. Low dilution water flow
e. Low dilution water suction pressure

E. Local Alarms:
1. Polymer blending unit shall be capable of generating the following alarms with adjustable time delays:
a. Low mixing chamber differential pressure
b. High neat polymer discharge pressure
c. Low neat polymer flow (operator adjustable)
d. High neat polymer flow (operator adjustable)
e. Polymer blending unit failure when unit is unable to maintain the setpoint polymer flow rate and setpoint diluted neat polymer (solution) concentration.
f. Low dilution water flow (operator adjustable)

F. Remote Input And Outputs:
1. The polymer blending unit control panel shall provide the following alarms, control signals, and status signals to/from Plant Control System. Analog signals shall be 4 to 20 mADC, discrete inputs and outputs shall be dry contacts.
a. Control Inputs:
1) Remote start/stop
2) Neat polymer flow
3) Diluted neat polymer (solution) concentration
4) Neat polymer specific gravity
b. Control Outputs:
1) Metering pump speed.
2) Neat polymer flow rate
3) Dilution water flow rate
4) Diluted neat polymer (solution) flow rate
5) Diluted neat polymer (solution) concentration. The solution concentration is generated by the blending unit's PLC based on actual neat polymer flow, dilution water flow and polymer specific gravity entered at the HMI.
c. Status Outputs:
1) Neat polymer pump status (running or stopped)
2) Dilution water pump status (running or stopped)
3) Polymer blending unit control status (HAND or AUTO)
d. Alarm Outputs:
1) Common alarm

2.05 COATINGS

A. Equipment shall be shop primed prior to shipment from the factory with a primer compatible with the field applied coating specified in Section 09 90 00.

2.06 SPARE PARTS

A. Mechanical: The following spare parts shall be provided for each polymer blending unit of each size:
   1. Special tools required for operation and maintenance.
   2. One complete set of gaskets and o-rings for all gasketed covers and connections
   3. One neat polymer ball check valve assembly.
   4. One neat polymer pump rotor
   5. One neat polymer pump stator
   6. One neat polymer pump packing kit.
   7. One water booster pump packing
   8. One set of bearings for water booster pump
   9. One dilution water needle valve
      a. Spare parts shall be tagged and stored as specified in Section 43 05 11.

B. PLC Program:
   1. Provide two separate copies of PLC and HMI programs on CD-ROM. Label with Owner's name, facility name, project name, Owner's project number, LCP name, date, and PLC or HMI manufacturer's programming software used name; model; and revision/version. Programs shall be provided after completion of testing.

2.07 PRODUCT DATA

A. The following product data shall be provided in accordance with Section 01 33 00:
   1. Manufacturer's Installation Certification Section 43 05 11-Form A
   2. Manufacturer's Instruction Certification Section 43 05 11-Form B.
   3. Operating and maintenance information specified in Section 01 78 23.
   4. Motor data specified in Section 43 05 21.
   5. Manufacturer's Warranty specified in paragraph 1.02-F.1

PART 3 EXECUTION

3.01 INSTALLATION

A. The polymer blending unit shall be installed in accordance with the manufacturer's written recommendations, and] the requirements of Sections 43 05 13, 43 05 14. The installation and initial operation shall be certified on Form 43 05 11-A specified in Section 01 99 90.

3.02 FIELD TESTING

A. Each polymer blending unit shall be field tested in accordance with the requirements of Section 01 45 20.

3.03 TRAINING

A. A minimum of 2 hours of training conforming to the requirements of Section 01 79 00 Training shall be certified on Form 43 05 11-B specified in Section 01 99 90.

END OF SECTION

MAGNETIC DRIVE CENTRIFUGAL PUMPS FOR CHEMICAL SERVICE

PART 1 GENERAL

1.01 SUMMARY

A. Scope

1. This Section specifies the furnishing of the self-priming magnetically driven centrifugal pumps for chemical service including centrifugal pumps, drive motors, pump control and all piping and appurtenances required for a complete operating installation as specified herein.
2. The Manufacturer shall review the mechanical layout and instrumentation drawings within the Contract Documents, which relate to the equipment specified in this Section to familiarize themselves with the location and the set-up of the equipment specified and shall assure themselves that the equipment specified is appropriate for and coordinated with that which is shown on the Drawings.

B. Equipment List

1. Numbered equipment, components, ancillaries and panels which are in the scope of supply of this Section are as follows.

Item	Equipment Number
Sodium Hypochlorite Transfer Pump	89-P-00010
Sodium Hypochlorite Recirculation Pumps	89-P-00020, 89-P-00030, 89-P-00040, 89-P-0050
Pressure Gauges and Switches	
Backpressure Valve	

C. Performance Requirements

1. The equipment described in this Section shall meet the following design minimum operating requirements.

Item	Required value
SH Transfer Pump (Equipment Tag: 89-P-00010) SH Recirculation Pump 1 & 2 (Equipment Tag: 89-P-00020 & 89-P-00030) SH Recirculation Pump 3 & 3 (Equipment Tag: 89-P-00040 & 89-P-00050)	
Service	Sodium Hypochlorite
Maximum Flow, gpm	60
Minimum Flow, gpm	20
Maximum Pressure, feet	41

Item	Required value
Average Pressure, feet	55
Maximum Speed, rpm	3450
Horsepower, hp	2
Pump Model Number	SP15
Back Pressure Valves	
Inlet Pressure (psig)	10
Outlet Pressure (psig)	2
Drive Motor	
Drive type	Self-priming, magnetic drive, constant speed provided by the Manufacturer of the driven equipment.
Voltage, V/Phase	480/3
Hertz, Hz	60

2. Fluid Characteristics: The pumping system shall be suitable for pumping the chemicals described below:
   a. Sodium Hypochlorite
      1) Formula: NaOCl
      2) Solution Concentration: 5.37% percent by weight
      3) Solution Temperature: 35 to 100 degrees Fahrenheit
      4) Solution pH: 11
      5) Solution Specific Gravity: 1.08 at 68 degrees Fahrenheit
3. Pumps: Dry self-priming, capable of being run dry for up to 5 minutes without damaging effects to pump, with a maximum suction lift capability and pressure rating as schedule.

1.02 QUALITY ASSURANCE

A. Reference Codes and Standards

1. This Section contains references to the following documents. Those documents are a part of this Section as specified and modified. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference Title	Specific Section and Paragraph, if applicable	Version, if other than latest as of February 2016
ASTM A743/A743M-88 Castings, Iron-Chromium, Iron-Chromium-Nickel, and Nickel-Base Corrosion-Resistant for General Application	Entire Document	-
California Building Code (CBC)	Entire Document	-
NEMA MG 1 Motors and Generators	Entire Document	-
NEMA ICS 1 Industrial Control and Systems General Requirements	Entire Document	-

B. Unit Responsibility

1. Unit Responsibility in accordance with Section 43 05 11 – General Requirements for Equipment to warrant, design, manufacture, Factory Test, provide proof of seismic requirement compliance as required by this Section, ship, provide coordination of installation, provide all specified Field Testing and Facility Startup, Training, and Operations and Maintenance Manuals for all the equipment specified in this Section. A Certificate of Unit Responsibility Form shall be furnished for the equipment specified in this Section.

C. Factory Testing

1. Factory Testing shall be performed by the Manufacturer prior to delivery in order to verify the accuracy and performance of the systems as specified. Factory Testing need not be witnessed by the Engineer unless a special Witness Testing paragraph is included in this Section. However, the Manufacturer shall certify and provide copies of the tests and guarantee the equipment's performance as specified in this Section. All certifications of Factory Testing shall be submitted and approved by the Engineer prior to shipping equipment.
    a. Provide one (1) month advanced notice of factory testing schedule
2. All factory wiring shall be tested.
3. Factory Testing shall include at the minimum all standard tests recommended by the Manufacturer and the following:
    a. Flow at 100 percent of stroke speed and 100 percent stroke length at maximum pressure
    b. Flow at 50 percent stroke speed and 50 percent stroke length at maximum pressure

D. Warranty

1. A warranty for the equipment specified under this Section shall be provided in accordance with the General Conditions. The Warranty shall be for one (1) year from the date of the Notice of Substantial Completion certificate issued by the Owner for the Work. If extended warranties are required, a special paragraph calling for an extended warranty will be included in this Section.

1.03 AREA EXPOSURE DESIGNATIONS AND ENVIRONMENTAL CONDITIONS

A. Refer to Section 01 61 45 – Area Exposure Designations for site-wide area exposure designations and environmental conditions.

B. Refer to Section 01 11 80 – Environmental Conditions for site environmental conditions.
   1. Exposure: Indoor
   2. Environmental: Chemical Sodium Hypochlorite

1.04 SUBMITTALS

A. Action Submittals-Preconstruction: The following minimum submittals shall be submitted prior to construction of this element of the Work in accordance with Section 01 33 00 - Submittals.
   1. A copy of this Section, with addendum updates included, and all referenced and applicable Sections, with addendum updates included, with each paragraph check-marked to indicate Specification compliance or marked to indicate requested deviations from Specification requirements or those parts which are to be provided by the Contractor or others shall be provided. Check marks (✓) shall denote full compliance with a paragraph as a whole.
   2. If deviations from the Specifications are indicated, and therefore requested, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Engineer shall be the final authority for determining acceptability of requested deviations.
   3. The remaining portions of the paragraph not underlined shall signify compliance with the Specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the requirements of the Specification shall be cause for rejection of the entire submittal and no further submittal material will be reviewed.
   4. For all equipment specifications, a copy from the Drawings of the control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this Section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the diagrams shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
   5. Certificate of Unit Responsibility attesting that the Contractor has assigned unit responsibility in accordance with the requirements of this Section. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
   6. Equipment literature, cut-sheets and data-sheets for all equipment supplied under this Section, including specifications, size, weight, performance data, pump performance curve, Manufacturer startup required inlet pressure, flow rate, motor horsepower and speed. This shall include accessories including pressure valves, pulsation dampers, and calibration column.
   7. Performance calculations.

8. Dimensional drawings for the equipment supplied under this Section. In addition to dimensional information for the equipment specified, these drawings shall dimensionally show the connection points and sizes for piping, electrical, instrumentation, water supply, and structural connections. Dimensional drawings to include location of piping connections, fitting sizes, and minimum clearance requirements for operation and maintenance.
9. Weights for the provided equipment and major components.
10. Information and chemical compatibility regarding the materials of construction for all equipment supplied under this Section.
11. Shop painting systems, including descriptive technical catalog literature and specifications.
12. Section 43 05 13 – Rigid Equipment Mounts
13. Complete list of recommended spare parts, irrespective of what spare parts are required to be supplied under this scope of supply.
14. Warranty information.
15. Operation and maintenance information in accordance with Section 01 78 23 - Operations and Maintenance Data.
16. Special shipping, storage and protection, and handling instructions.
17. Installation Instructions.
18. Submit calibration charts and tables relating flow rate to speed control.
19. Electrical elementary diagrams, internal connection diagrams, and external interconnection diagrams. Connection diagrams shall be the conventional type with lines showing point-to-point wiring and must show terminals and devices as viewed by the electrician; wireless or wire schedule types are not acceptable.
20. Catalog data on all ancillary electrical components, including limit switches and instruments.
21. Motor Data in accordance with Section 26 05 84 – Electric Motor.

B. Action Submittals-Construction: The following additional submittals shall be submitted in accordance with Section 01 33 00 - Submittal Procedures through the construction of this element of the Work.
   1. Factory Test Report
   2. Field Testing Plan
   3. Field Test Reports

C. Closeout Submittals: The following minimum closeout submittals shall be submitted in accordance with the timing requirements specified in these Contract Documents, prior to Substantial Completion and in accordance with Section 01 33 00 - Submittal Procedures.
   1. Operations and Maintenance Manuals (including Warranty) in accordance with Section 01 78 23 - Operations and Maintenance Data
   2. Certificate of Proper Installation
   3. Certificate of Field Testing and Commissioning
   4. Certificate of Training Completion

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. Manufacturers: Candidate manufacturers are listed below. The manufacturer's standard product may require modification to conform to specified requirements:
   1. Magnetically Driven Centrifugal Pump:
      1) SP by Finish Thompson
      2) TE Series by March Pumps
   b. Back Pressure Valves:
      1) Plast-O-Matic, Series RVDT;
      2) Asahi/America, or
      3) Approved Equal.

2.02 STRUCTURAL DESIGN REQUIREMENTS FOR EQUIPMENT

A. Equipment shall be provided in accordance with Section 01 73 24 - Design Requirements for Non-Structural Components and Non-Building Structures.

2.03 MATERIALS

A. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose. If alternatives are proposed, the proposals shall be accompanied with documentation supporting the claimed superiority of the proposed substitutions. The Engineer shall be the sole decider in the equivalency of alternative materials of construction.

B. Magnetically Driven Centrifugal Pump
   1. Chemical Resistance: All equipment and materials utilized in the chemical system shall be resistant to the chemical being fed and shall be so certified by the Manufacturers. The pumps and appurtenances shall be certified corrosion resistant materials and construction suitable for the chemical being pumped at the pressures specified in the pump schedule and at a maximum temperature of 125 degrees Fahrenheit. Wetted parts of all pumps and appurtenances shall be selected by the Manufacturer to ensure optimum corrosion and erosion-free operations. The Contractor shall verify the chemical resistance and compatibility of materials before installation.
   2. All surfaces that come into direct contact with the fluid being pumped must be either alumina ceramic, graphite impregnated silicon carbide, Viton, Hastelloy C or peek, as scheduled depending on service.
   3. All pump housings are to be constructed of PVDF.
   4. The gear set (driver and idler) must be non-metallic. Non-metallic gear material shall be carbon reinforced ETFE or as scheduled. All gear materials shall be non-sparking for use with hazardous fluids.

5. Shafts shall be made of alumina ceramic material. Metallic shafts are not acceptable.
6. Driven and drive magnets shall be made from rare earth Neodymium Iron suitable for temperatures up to 300 degrees Fahrenheit without degradation of magnetic strength. Other materials such as ceramics or rare earth Samarium Cobalt are not acceptable.
7. Driven magnet assemblies shall be fully encapsulated in carbon-reinforced ETFE
8. Drive magnet assemblies must be nickel plated on all exterior surfaces to minimize atmospheric corrosion.
9. Pump containment shell is to be 100 percent carbon-reinforced ETFE material. Any metallic components, linings and/or outer shell reinforcements are not acceptable.
10. Pump must be designed for close-coupled mounting to both standard NEMA and IEC motor configurations through the use of a non-metallic motor adapter.
11. All external hardware shall be 300 series stainless steel.
12. When applicable, each pump shall have a single, corrosion resistant baseplate that is structurally adequate to prevent misalignment or vibration.
13. All pump casings connections shall have either American Standard taper pipe threads or ANSI 150 number raised face flanges.

C. Motor and Drive
1. Valve Body: CPVC or PVC.
2. U-Cup Seals:
   a. Hypochlorite Service: Viton.
3. Adjusting bolt, locknut, control spring and fasteners: Stainless steel.

2.04 EQUIPMENT

A. Magnetically Driven Centrifugal Pump
1. Pumps shall be designed to isolate the pump body from the motor by driving a magnet and impeller assembly with a magnet attached drive to the motor shaft.
2. Pump shall be seal-less and ensures leak-free operation.
3. Pump shall be capable of withstanding a temporary upset condition of up to 5 minutes in which the pump is left to run dry without sustaining any damage to pump internals. Pumps without run dry capability are not acceptable.
4. Pump Construction:
   a. All gears shall be molded integral to the associated shaft. Gear mounting hardware such as retaining rings or gear keys are not acceptable.
   b. Pump bearings are to be of the internal sleeve type design and shall include spiral grooves so that they are properly cooled and lubricated by the pumped fluid. Pumps relying in external bearing lubrication systems shall not be acceptable.
   c. Bearings and wearplates shall be of the one-piece integral design. Separate bearings and wear plates are not acceptable.

d. Driven magnet assemblies shall be fully encapsulated in carbon-reinforced ETFE. Design must include spline drive geometry to allow for ease of alignment and assembly. Mechanical locking of the driven magnet to the drive shaft by any other means is not acceptable.

e. Drive magnet assemblies must be nickel plated on all exterior surfaces to minimize atmospheric corrosion. Drive magnet carrier must include a removable motor mounting hub for use with multiple motor frame sizes. Integral (one piece) drive magnet carriers and hubs are not acceptable.

f. Pump containment shell is to be 100 percent carbon-reinforced ETFE material. Any metallic components, linings and/or outer shell reinforcements are not acceptable. Containment shell must be sealed from the environment by use of an elastomeric o-ring. Gaskets or other sealing devices are not acceptable.

g. Pump must be designed for close-coupled mounting to both standard NEMA and IEC motor configurations through the use of a non-metallic motor adapter.

h. NPSH required for pump operating conditions shall not exceed 2 feet.

i. Pumps shall be self-priming

j. Open loop flow repeatability shall be within plus or minus 5 percent.

k. All external hardware shall be 300 series stainless steel.

l. All typically wearing parts of the pump shall be replaceable without disturbing the process piping.

m. When applicable, each pump shall have a single, corrosion resistant baseplate that is structurally adequate to prevent misalignment or vibration.

n. All pump casings connections shall have either American Standard taper pipe threads or ANSI 150 number raised face flanges.

B. Motor and Drive

1. Refer to this Section, Paragraph 2.05 Electrical Components and Accessories for additional motor and drive requirements.
2. Motors shall be provided by the Manufacturer of the driven equipment in accordance with this Section and Section 26 05 84 – Electric Motors.
3. Motors and drives shall be mounted as specified in this Section and as shown on the Drawings. Alternative configurations will not be considered.
4. Gearbox: Output shaft and face shall accept the direct coupling of the pump head
5. Gearing: Manufactured in accordance with AGMA Class 11-12 requirements with an overall gearbox rating of AGMA class II under continuous operation.

C. Pressure Gauges and Switches

1. Provide pressure gauges and switches as specified in Section 40 73 00.

D. Backpressure Valve

1. The equipment Manufacturer shall furnish corrosion-resistant backpressure valves on the discharge of each chemical pump (near discharge return to day tank). Backpressure valves shall be the diaphragm type with a pre-set pressure spring and be of CPVC construction with a PTFE-coated diaphragm. Backpressure valves shall be sized for the following maximum flows.

2.05 ELECTRICAL COMPONENTS AND ACCERSORIES

A. Electrical components shall be listed for the purpose for which they are to be used by an independent testing laboratory acceptable to the inspection authority having jurisdiction per specification section 26 05 00 Common Work Results for Electrical

B. Electrical components shall be tested per the requirements specified in specification sections 01 45 20 Equipment and System Performance and Operational Testing and 26 08 00 Commissioning of Electrical Systems.

C. Where a motor is specified, unless otherwise indicated, the motor shall be provided in accordance with Section 26 05 84 – Electric Motors.

D. Electrical equipment shall include arc flash hazard labels as specified in specification section 26 05 00 3.01 C Common Work Results for Electrical– Electrical Equipment Labeling.

E. All factory wiring required for equipment specified under this section shall be included and shall have been tested for installation integrity as part of factory testing specified in this section.

F. Field installed raceway and wiring required for the functional operation of the equipment specified in this section is defined on the electrical drawings and schedules based on the first named equipment Manufacturer specified in this section. Any additions or modifications to field wiring, raceway requirements, upstream overcurrent protection, related motor controllers or variable frequency drives being provided for the operation of driven equipment included in this specification shall be included under the work of this section and shall be installed per the specified requirements of the Division 26 electrical specifications.

G. Provide nameplates on electrical equipment and control panels (where included under this section) as specified in specification section 26 05 00 - Common Work Results for Electrical.

2.06 INSTRUMENTATION

A. Instrumentation and control devices shall be provided in accordance with the provisions of Division 40.

2.07 SAFETY ENCLOSURES AND MEASURES

A. Equipment shall have adequate removable enclosures to protect personnel against accidental contact with moving parts and prevent dripping in multilevel installations in accordance with the guards and caution sign requirements in Section 43 05 11 – General Requirements for Equipment.

2.08 NAMEPLATES

A. Equipment nameplates shall be provided on each item of equipment, including the primary equipment supplied, valves, operators and all other major appurtenances that are part of the scope of supply of this Section. Unless otherwise specified, equipment nameplates shall be provided in accordance with technical requirements described in Section 43 05 11 - General Requirements for Equipment.

B. Electrical nameplates shall be provided on each electrical item supplied including control panels and variable frequency drives which are part of the scope of supply of this Section. Unless otherwise specified, electrical nameplates shall be provided in accordance with the technical requirements of Section 26 05 00 - Common Work Results for Electrical.

C. Motor nameplates shall be provided on each motor supplied which are part of the scope of supply of this Section. Unless otherwise specified, motor nameplates shall be provided in accordance with the technical requirements of Section 26 05 84 - Electric Motors.

2.09 ANCHOR BOLTS

A. Furnish all anchor bolts in accordance with Section 05 05 20 – Anchor Bolts of ample size and strength required to securely anchor each item of equipment.

2.10 COATINGS

A. Coatings shall be factory-applied and provided in accordance to Section 09 90 00 – Painting and Coating.

2.11 SPARE PARTS

A. The following spare parts and special tools shall be provided in accordance with Section 01 60 00 – Product Requirements.

Spare Parts	Quantity
Complete spare pump and motor	1

B. One (1) set of any special tools required to perform operation and maintenance activities and perform installation.

C. Manufacturer shall provide a one (1) year supply of lubrication greases required for maintaining all screen components.

PART 3 EXECUTION

3.01 MANUFACTURERS FIELD SERVICES

A. Manufacturer shall provide field services in accordance with Section 01 60 00 – Product Requirements and as further required within this Section.

B. Manufacturer shall provide assistance during equipment installation as required by the Contractor.

C. The equipment provided under this Section shall be started and tested only under the direction of personnel provided by the Manufacturer.

D. The Contractor shall furnish the services of competent factory representatives familiar with the installation of their respective equipment to supervise the installation of the equipment and their appurtenances. The Manufacturer's factory representative shall be present at frequent enough intervals to ensure proper installation testing and initial operation of equipment.

3.02 SHIPMENT AND STORAGE

A. Equipment shall be shipped and stored in accordance with Section 01 60 00 – Product Requirements.

B. Manufacturer shall provide Contractor with detailed recommendations and instructions for equipment storage.

C. Packing and Shipping:
   1. Pack as required for shipping and outdoor storage at the project Site for up to 12 months. Apply temporary corrosion protective coatings to all unpainted components and pack components to protect the elements.

D. Storage and Protection: Protect the pump system and components at the Site and during installation prior to project completion. Apply protective coatings and manually rotate shaft regularly as recommended by the Manufacturer:
   1. Inspect and inventory items upon delivery to Site.
   2. Store and guard equipment, material, instructions, and spare parts in accordance with Manufacturer's written instructions.

3.03 INSTALLATION

A. Equipment shall be installed in accordance with Section 43 05 11 – General Requirements for Equipment.

B. Manufacturer's services: On-site inspection and training: Provide a factory-trained manufacturer's representative at the site for the following activities. Specified durations do not include travel time to or from the site.
   1. Installation inspections: Assist, supervise, and inspect the Contractor's activities during installation. Provide 8 inspection hours. Provide a completed Form 43 05 11-A, Section 01 99 90.
   2. Training sessions: Procedures Section 01 79 00. Provide a minimum of 2 hours classroom training for each training session. Conduct one training session to accommodate the shift schedules of operation and maintenance staff. Certify completion of training on Form 43 05 11-B, Section 01 99 90.

C. The equipment shall be aligned, connected, and installed at the locations shown and in accordance with the recommendations of the Manufacturer.

D. All material and equipment shall be clean and free of oil, grease, or chemical contamination on process surfaces prior to installation.

3.04 FIELD TESTING

A. Field Testing shall be in accordance with the requirements of Section 01 45 20 – Equipment and System Performance and Operational Testing.

B. The Manufacturer shall provide detailed procedures for the Field Testing of the equipment specified in this Section.

C. Field Testing shall be performed under the direction of experienced and qualified personnel provided by the Manufacturer.

D. Operational test phase inspections: Assist, supervise, and inspect the Contractor's activities during the operational test phase specified in Section 01 45 20 Provide 8 inspection hours.

3.05 TRAINING

A. Training shall be provided as specified in Section 01 79 00 – Demonstration and Training.

B. Training sessions: Procedures Section 01 79 00. Provide a minimum of 4 hours classroom training for each training session. Conduct one training session to accommodate the shift schedules of operation and maintenance staff. Certify completion of training on Form 43 05 11-B, Section 01 99 90

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 46 33 44

PERISTALTIC METERING PUMPS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies pumps and accessories for feeding anionic polymer (PEA) and fluoride for the purpose of flocculation aid, filtration aid, waste backwash water aid, sedimentation basin solids settling aid, and fluoride addition.

B. Type:

1. The metering pumps shall be of positive displacement, peristaltic type utilizing a flexible tube and spring-loaded roller or track. The pump shall be suitable for metering service with adjustable speed drives to control the dosage with accuracy of one percent variation from the pump setting. Each pumping unit shall be complete with pump, drive unit, base, and all appurtenances to provide a complete pumping system for the specific process fluids and design characteristics as specified herein.

C. Equipment List:

Equipment Description	Equipment Number
PEA Feed Pump 1	84-P-00020
PEA Feed Pump 2	84-P-00030
PEA Feed Pump 3	84-P-00040
PEA Feed Pump 4	84-P-00050
PEA Feed Pump 5	84-P-00060
Sodium Hypochlorite Feed Pump 1	89-P-00060
Sodium Hypochlorite Feed Pump 2	89-P-00070
Sodium Hypochlorite Feed Pump 3	89-P-00080
Sodium Hypochlorite Feed Pump 4	89-P-00090
Sodium Hypochlorite Feed Pump 5	89-P-00100
Sodium Hypochlorite Feed Pump 6	89-P-00110

D. Performance and Design Requirements:

1. General:

a. The metering pumps and equipment shall be designed and selected for pumping the following chemical solutions:

Chemical	Solution Density[1]	Concentration (wt/wt)
Anionic Polymer	9.17	100%
Sodium Hypochlorite	1.08	5.37%

[1] Solution density, lb per gal @ 68 degrees F

b. Pump operation shall be automatic mode. Adjustable speed drives shall be controlled by a 4-20 mA signal from SCADA.

2. Design Requirements:
   a. The metering pumps shall be designed for continuous duty under the following operating conditions:
      1) Size pumps so the average chemical feed rate is only 30% of the pump's maximum feed rate.

Equipment Numbers	84-P-00020, 84-P-00030 (Filter Inlet)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	0.3	gph
Average chemical feed rate	6.2	gph
Maximum chemical feed rate	26.7	gph
Operating pressure	10	psi
Maximum discharge pressure	20	psi
Maximum power consumption	135 VA	hp or VA
Maximum rotor speed	220	rpm
Power supply	120/60/1	V/Hz/phase

Equipment Number	84-P-00040 (Flocculation)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	1.6	gph
Average chemical feed rate	12.4	gph
Maximum chemical feed rate	53.4	gph
Operating pressure	10	psi
Maximum discharge pressure	20	psi
Maximum power consumption	135 VA	hp or VA
Maximum rotor speed	220	rpm
Power supply	120/60/1	V/Hz/phase]

Equipment Number	84-P-00050 (Waste Backwash Collection Box)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	0.4	gph
Average chemical feed rate	4.3	gph
Maximum chemical feed rate	17.3	gph
Operating pressure	10	psi
Maximum discharge pressure	20	psi
Maximum power consumption	135 VA	hp or VA
Maximum rotor speed	220	rpm
Power supply	120/60/1	V/Hz/phase]

Equipment Number	84-P-00060 (Solids Collection Box)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	0.0	gph
Average chemical feed rate	0.1	gph
Maximum chemical feed rate	12.0	gph
Operating pressure	10	psi
Maximum Discharge Pressure	20	psi
Maximum power consumption	135 VA	hp or VA
Maximum rotor speed	220	rpm
Power supply	120/60/1	V/Hz/phase]

Equipment Number	89-P-00060, 89-P-00070 (Raw Water)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	6.4	gph
Average chemical feed rate	12.7	gph
Maximum chemical feed rate	38.0	gph
Operating pressure	3.0	psi
Maximum Discharge Pressure	TBD	psi
Maximum power consumption	TBD	hp or VA
Maximum rotor speed	TBD	rpm
Power supply	120/60/1	V/Hz/phase]

Equipment Number	89-P-00080 (Filter Inlet)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	6.3	gph
Average chemical feed rate	12.7	gph
Maximum chemical feed rate	25.4	gph
Operating pressure	3.0	psi
Maximum Discharge Pressure	TBD	psi
Maximum power consumption	TBD	hp or VA
Maximum rotor speed	TBD	rpm
Power supply	120/60/1	V/Hz/phase]

Equipment Number	89-P-00090, 89-P-00100 (Filter Effluent)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	6.3	gph
Average chemical feed rate	12.7	gph
Maximum chemical feed rate	25.4	gph
Operating pressure	6.0	psi
Maximum Discharge Pressure	TBD	psi
Maximum power consumption	TBD	hp or VA
Maximum rotor speed	TBD	rpm
Power supply	120/60/1	V/Hz/phase]

Equipment Number	89-P-00110 (Backwash)	
Parameter	**Design Value**	**Units**
Minimum chemical feed rate	9.9	gph
Average chemical feed rate	19.9	gph
Maximum chemical feed rate	44.7	gph
Operating pressure	6.0	psi
Maximum Discharge Pressure	5.5	psi
Maximum power consumption	TBD	hp or VA
Maximum rotor speed	TBD	rpm
Power supply	120/60/1	V/Hz/phase]

1.02 QUALITY ASSURANCE

A. References:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ASTM A743/A743M-88	Castings, Iron-Chromium, Iron-Chromium-Nickel, and Nickel-Base Corrosion-Resistant for General Application
NEMA MG 1	Motors and Generators
NEMA ICS 1	Industrial Control and Systems General Requirements

1.03 ENVIRONMENTAL CONDITIONS:

A. The equipment shall be located indoors in heated and ventilated areas. Environmental conditions are as described in Section 01 11 80.

1.04 SUBMITTALS

A. The following submittals shall be provided as specified in Section 01 33 00:
   1. Shop drawings with complete dimensions and mounting details for the pumps.
   2. Catalog data and information including:
      a. Maximum and minimum capacity using adjustable speed drive, gpm; maximum and minimum operating speed, rpm; and discharge pressure.

b. Motor and adjustable speed drive type.

3. Materials of construction.
4. Net positive suction head required.
5. Manufacturer's wiring diagram.
6. Manufacturer's catalog data on all accessories including pressure regulating valves, pressure relief valves, flow calibration chambers, and suction assemblies.
7. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
8. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
9. A copy of all related contract schematic, structural, and mechanical drawings with all piping, foundations, supports, and layout sizes and dimensions requiring Contractor confirmation marked.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturer is capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer’s product, nor shall it be construed that a named manufacturer’s standard product will comply with the requirements of this Section. Candidate manufacturers include Watson Marlow or approved equal.

2.02 GENERAL

A. The manufacturer shall furnish all meter pump system equipment to complete a properly functioning, integrated package as intended by these specifications. The system shall be factory-assembled to the maximum extent practical. Factory assembly shall include all pumps, motors, bases, drives, and appurtenant valves and fittings. Any component parts not pre-assembled due to packaging and shipping concerns shall be identified and clearly labeled. No field welding will be allowed.

B. All materials used for the metering pumps and accessories shall be designed by the manufacturer to have the necessary strength, stability and stiffness for the intended service. All connections, foundation bolts, plates, nuts, washers and clamps shall be corrosion resistant to the conditions of use.

2.03 MATERIALS

A. The peristaltic metering pumps shall be manufactured of the following materials:

Equipment Number	84-P-00020 to 84-P-00060
Case	Die-cast aluminum
Track	Polyphenylene sulfide
Rollers	316 stainless steel
Bearings	316 stainless steel with PTFE seals
Drive shaft	Nickel plated steel

Equipment Number	87-P-00040, 87-P-00050
Case	Die-cast aluminum
Track	Powder coated aluminum
Rollers	303 stainless steel with Nylatron guide
Bearings	Carbon steel
Drive shaft	440C stainless steel

B. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

2.04 EQUIPMENT

A. Pump and Drive Mechanism:

1. Pump shall be of the positive displacement peristaltic type utilizing a flexible tube. The tubing shall be in contact with the inside diameter of the track (housing) and be held in place on the suction and discharge by a hand adjustable clamp mechanism. Tube clamps requiring tools are not acceptable. Suction and discharge shall be on the same side of the pump head. The tubing shall be replaceable with no disassembly of the pump head and without the use of tools. Each pump shall consist of track/pump head cover with safety lock-out switch, screw down retainer mechanism, roller rotor assembly with integral adjustable speed drive. The lock-out switch shall render the drive inoperable when opened. The pump head shall be easily secured to the drive and be self locating.
2. Each pump shall be capable of self priming when completely dry with a suction lift capability of up to 30 feet of water. The pump shall be capable of running dry without damaging effects to the pump or tubing. The pump shall require no check valves or diaphragms and shall not require any dynamic seals in contact with the process fluid. The process fluid shall only be in contact with the inside of the pump tubing.
3. Pumps shall be configured to conform with space constraints as shown in the Contract Drawings.

B. Tubing:
   1. The manufacturer shall furnish the appropriate hose material for the conditions of use (e.g., extruded Marprene, Neoprene, Silicone, PVC, or Viton). The tubing shall be of 64 shore A durometer.
   2. Pump tubing diameter may vary for different drive sizes. For drive speeds ranging from 10 to 360 rpm, the pump must accept tubing with a wall thickness of 3/16 inch and an inside diameter ranging from of 3/4 inch to 1 inch. For drive speeds ranging from 5 to 265 rpm, the pump must accept a wall thickness of 1/8 inch and a variation in inside diameter ranging from 1/2 inch to 5/8 inch. For drive speeds ranging from 10 to 220 rpm, the pump must accept tubing with an inside diameter of 1/8 inch.

C. Rotor Assembly and Track:
   1. The rotor assembly shall be equipped with two or four self lubricating geared compression rollers mounted on spring loaded arms. Rotor material of construction shall be as specified in paragraph 2.03 Materials. Compression rollers shall be symmetrical about the rotor for compression of the hose against the track. The track material shall be as specified in paragraph 2.03 Materials, and if cast aluminum; shall be factory coated with trimite polyurethane. One roller shall at all times be fully engaged with the tubing providing complete compression to prevent back flow or siphoning. The pumping action shall be created by the occlusion of the pump hose and its subsequent restitution causing a vacuum effect to draw the fluid into the suction side of the hose. Hose occlusion shall be adjustable with a lead screw, which limits the travel of the spring, loaded roller.

D. Piping Connection:
   1. Adapters and connective fittings between the flexible tubing and the fixed piping shown on the Contract Drawings shall be provided by the manufacturer for each size tubing that is compatible with each pump.

E. Valves
   1. Adjustable diaphragm backpressure regulating type valves shall be installed on pump discharge as shown on the drawings. Pressure shall be set according to the table below. Valve shall be suitable for the chemical solution service specified. The valve body shall be PVC, and the diaphragm shall be PTFE faced EPDM.

Valve number	Service	Valve size, inches	Maximum flow, gpm	Inlet pressure range, psig	Outlet pressure, psig
TBD					
TBD					
TBD					
TBD					
TBD					

   2. Adjustable pressure relief type valves shall be installed on pump discharge as shown the drawings. Pressure shall be set according to the table below. The valves shall be sized to handle a maximum flow through the valves of not less than 1.5 times the maximum flow supplied by the associated pump. The valve shall be suitable for the chemical solution service specified. The valve body shall be [PVC], and the diaphragm shall be [PTFE faced EPDM].

Valve number	Service	Valve size, inches	Pressure Relief, psig

2.05 DRIVE UNITS AND CONTROLS

A. Adjustable Speed Drive:

1. Pumps shall be provided with an integrally mounted adjustable speed drive. The speed setting of the drive shall be continuously adjustable over a minimum 110:1 operating range. The adjustable speed drive shall be for use with brush motors, and be located in a NEMA 4X cabinet. Drive shall be supplied with one 120 VAC input. Drive motor shall be servo permanent magnet DC with integral gear box.

B. Motors:

1. Drive shall be rated for continuous 24-hour operation. Pumps shall have non-maintained maximum speed switches for purpose of priming. Pump drives shall be close coupled and self aligning, requiring no flexible couplings. Each pump shall be capable of operating with a range of hose/tubing diameters and thicknesses which may vary depending on the drive size of the pump.
2. The drive enclosure shall be NEMA 4X rated and be factory coated with a corrosion resistant non-reactive (e.g. polyester and/or polyurethane) coating. Drive motors shall be integrally mounted in drive enclosure.

C. Local Controls:

1. Local controls (confirm these are on the pump) shall consist of a speed adjusting potentiometer, a START pushbutton, a STOP pushbutton, and an AUTO/MANUAL switch. Control shall be such that when the drive is running in the MANUAL mode, speed shall be adjusted with the local potentiometer. In the AUTO mode, the drive shall operate in response to an external run command and 4-20 mA external speed reference signal as shown on drawings.
2. NEMA 4X rated controls shall be provided on the pumps. The controls shall provide as a minimum the following features:
    a. Accept a 4-20 mA speed reference input signal
    b. Accept dry REMOTE-RUN contact
    c. Provide a 4-20 mA drive speed output signal
    d. Provide dry contacts rated for 1 amp at 120 VAC for the following status:
        1) Running
        2) In AUTO mode
        3) In MANUAL mode
        4) Pump leaking (Confirm this signal is required to PLC)
    e. Leak Detection

1) If a pump leak is detected, the pump will be disabled and a standby pump will be enabled.

3. Provide the following instruments and appurtenances which comply with the respective Division 40 specifications:
   a. Pressure transmitters
   b. Pressure gauges
   c. Magnetic flow meters

2.06 EQUIPMENT MOUNTING

A. Pumps shall be suitable for installation on a wall-mounted structural support.

2.07 ACCESSORIES

A. Flow Calibration Columns:
   1. Pumps shall be provided with flow calibration columns on the pump suction lines. Calibration columns shall be manufactured of clear PVC, and shall be labeled in standard divisions and milliliters. Calibration columns shall have a volume of 1/2 liter and shall have 1/2-inch female NPT connections at the top and bottom. Calibration chambers shall be provided by the same manufacturer as is furnishing the pumps.

B. Leak Detection:
   1. Pumps shall be provided with leak detection located on the tube which shall interconnect to the pump control panel. The control panel shall provide a dry contact alarm for remote indication of leak detection.

C. Flow Measurement:
   1. Pumps shall be provided with a magnetic flow meters on the pump discharges. The flow meters shall be configured to signal both flow and no flow conditions.

2.08 COATINGS

A. Except as otherwise specified in this Section 46 33 44, equipment shall be shop primed in accordance with the requirements of Section 09 90 00.

2.09 SPARE PARTS

A. The following spare parts components shall be provided:
   1. Ten lengths of tubing in each size (diameter) as necessary to satisfy the requirements of paragraph 1.01 Design Requirements.
   2. One pump head for each size pump.

B. Spare parts shall be tagged and stored as specified in Section 43 05 11.

2.10 PRODUCT DATA

A. The following product data shall be provided in accordance with Section 01 33 00:
   1. Operation and maintenance data, as specified in Section 01 78 23, on the pumps, adjustable speed drives and accessories.

2. Manufacturer's certification (Form 43 05 11-A per Section 01 99 90) that the equipment has been properly installed, aligned and tested and meets all requirements for satisfactory performance under the conditions specified.
3. Manufacturer's instruction certification (Form 43 05 11-B per Section 01 99 90) that instructions to operators have been completed.
4. Motor data as specified in Section 43 05 21.
5. Pump Test Log as specified in paragraph 3.03.

PART 3 EXECUTION

3.01 GENERAL

A. Pumps shall be aligned, connected, and installed in strict accordance with the manufacturer's instructions.

3.02 INSTALLATION

A. The equipment shall be installed and tested under the direction of factory trained personnel as specified in Section 43 05 11. The installation shall be certified on Form 43 05 11-A specified in Section 01 99 90.

3.03 TESTING

A. After installation, the equipment specified in this section shall be completely tested to ensure compliance with operating requirements, varying pumps speeds with speeds and flows recorded in a test log. Field testing shall be in accordance with the testing procedures in Section 01 45 20. Testing shall verify the control strategies specified in Division 40.

B. Following successful testing and commissioning of associated control loops, and prior to pumping chemical solution, the pump and chemical piping shall be emptied and dried. See Section 40 05 01 for additional requirements.

3.04 TRAINING

A. A minimum of 6 hours of training, as specified in Section 01 79 00, shall be provided. Training shall be certified on Form 43 05 11-B specified in Section 01 99 90.

END OF SECTION

SECTION 46 41 17

CHEMICAL INJECTORS

PART 1 GENERAL

1.01 SUMMARY

A. This section specifies the general requirements for design, selection, and supply of chemical injectors. Installation, inspection, and testing are also specified in this Section.

B. Equipment List

Item	Equipment Number	Supplied by
SH Raw Water Pipe Feed Injector	IQXXXXX	CONTRACTOR
SH Combine Filter Outlet Feed Injector	IQXXXXX	CONTRACTOR
SH Backwash Pipe Feed Injector	IQXXXXX	CONTRACTOR

C. The Contractor shall be responsible for providing injectors injected in line as shown in the Drawings.

D. Chemical Service:

1. The equipment shall be designed and selected for handling the following chemical solution[s]:

Chemical	Abbreviation	Concentration (wt/wt)
Sodium Hypochlorite	NaOCl	5.37%

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.

1. Section 01 33 00 – Submittal Procedures
2. Section 01 45 23 – Testing and Inspection Services
3. Section 01 78 23 – Operation and Maintenace Data
4. Section 01 78 39 – Project Record Documents
5. Section 40 05 02 – Piping System Schedules
6. Section 40 05 45 – Piping System Identification

1.03 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section prevail.

Reference	Title
ASME B16.21	Nonmetallic Flat Gaskets for Pipe Flanges

Reference	Title
ASME B31.1	Power Piping
ASME B31.3	Process Piping
NSF 61	Drinking Water Components – Health Effects

1.04 SUBMITTALS

A. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The City shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

B. Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has ben received and found to be in conformance with these requirements.

C. Manufacturer's data confirming piping connections, locations, and sizes.

D. Injector sizing curves and information confirming size and selection of injectors.

1.05 QUALITY ASSURANCE

A. Review the drawings prior to installation of equipment. Coordinate the length of the mixers with available space for installation.

B. See Section 01 45 23 for additional inspection requirements.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Procedures: Section 01 66 00 for shipment and storage.

PART 2 PRODUCTS

2.01 INJECTION ASSEMBLIES:

A. Provide injection assemblies where shown on the Drawings and specified herein.

B. Requirements:

1. Injection quills shall be threaded into the side of the process pipe or mixer at the locations specified with 1/2-in or 3/4-in NPT fitting.
2. Components shall include a spring-loaded ball check valve, retractable solution tube (injector), solution tube body, compression gland, ball valve, dual limit chains and dual bolt restraints.
3. Tip profile of the injection tube shall be standard/flat except for sodium hydroxide quills which shall include elastomeric duckbill tips.
4. Coordinate injector tube insertion length with the static mixer manufacturer where applicable to insure against interferences with the mixer port and/or mixing plate and to insure the chemical is injected in the centerline of the process pipe.
5. Injection quills shall be installed at each location identified in the table below and shall be constructed with materials compatible with each chemical. Injection quills shall be able to withstand maximum pump discharge line pressure and water main pressure as specified in applicable pipe schedules under Section 40.
6. Injection assemblies shall be as manufactured by Saf-T-Flo or equal.

Equipment Number	Process Pipe Diameter, inches	Chemical Inlet Size, inches	Process Tap Size, inches	Water Flowrate, MGD		Chemical Details			Wetted Materials
				Maximum	Minimum	Chemical	Maximum Flowrate, gph	Minimum Flowrate, gph	
IQXXXXX	36	1/2	1	17.6	2	Sodium Hypochlorite	37.9	0.7	CPVC or Hastelloy C276
IQXXXXX	36	1/2	1	17.6	2	Sodium Hypochlorite	37.9	0.7	CPVC or Hastelloy C276
IQXXXXX	24	1/2	1	17.6	2	Sodium Hypochlorite	28.5	0.7	CPVC or Hastelloy C276

PART 3 EXECUTION

3.01 GENERAL

A. The equipment shall be installed in strict accordance with the applicable sections of Division 1 and the respective manufacturer's instructions and recommendations.

3.02 INSTALLATION

A. The equipment shall be installed and tested under the direction of factory trained personnel as specified in Section 43 05 11. The installation shall be certified on Form 43 05 11-A specified in Section 01999.

3.03 TESTING

A. After installation, the equipment specified in this section shall be completely tested to ensure compliance with operating requirements and flows recorded in a test log.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 46 41 42

FLOCCULATOR MIXERS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:

1. This section specifies mixing equipment for the City Creek Water Treatment Plant flocculation tanks. The mixers shall be a complete assembly with electric motor, gear reducer, mechanical seal, shafts, impeller, and all specified appurtenances, mounted on a common pedestal base. The Contractor shall assign unit responsibility as specified in Section 43 05 11-1.02 Unit Responsibility to the mixer manufacturer for the equipment specified in this Section.
2. Each mixer will be driven by a variable speed drive provided under Section 26 29 23 and supplied by the Contractor. The mixer manufacturer shall submit a letter of confirmation on the suitability for use of the Contractor's proposed VFD selection.
3. Flocculation tanks are configured with 2 basins, each having 3 stages, for a total of 12 flocculators for the project. The flow enters the first stage near the bottom and passes from the first stage over a baffle to the second stage, then under a baffle from the second to third stage, and ultimately over a baffle from the third stage flows into a common flocculated water distribution channel.

B. Equipment List:

1. The following is the list of equipment which is specified in this section. The location of each piece of equipment is shown on the drawings.

Equipment Name	Mixer Number
Flocculator 1A	30-MX-11010
Flocculator 2A	30-MX-12010
Flocculator 3A	30-MX-13010
Flocculator 1B	30-MX-11020
Flocculator 2B	30-MX-12020
Flocculator 3B	30-MX-13020
Flocculator 4A	30-MX-21010
Flocculator 5A	30-MX-22010
Flocculator 6A	30-MX-23010
Flocculator 4B	30-MX-21020
Flocculator 5B	30-MX-22020
Flocculator 6B	30-MX-23020

1.02 RELATED SECTIONS

A. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.

1. Section 26 29 23 Variable Frequency Motor Controllers
2. Section 43 05 11 General Requirements for Equipment
3. Section 43 05 13 Rigid Equipment Mounts
4. Section 43 05 21 Common Motor Requirements for Equipment

1.03 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. They are a part of this section, as specified and modified. In case of a conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, whether or not the document has been superseded by a version with a later date, discontinued or replaced.

B. Manufacturer's Experience:
   1. The mixers shall be a product of a manufacturer experienced in the design and fabrication of equipment of this type. Manufacturer shall have experience with design and supply of vertical mixers of the type specified and demonstrate a minimum of 10 installations in the US in similar applications in successful operation for a minimum of 5 years.
   2. Mixer manufacturer must have in-house CFD modeling capabilities with a CFD model that has been verified by physical modeling.

C. Factory Testing:
   1. Manufacturer shall provide the following factory testing:
      a. A visual inspection of the unit to confirm project requirements.
      b. The unit shall be run partially loaded at maximum speed for at least 2 hours after its oil temperature has stabilized. During this period, sound levels shall be measured at a distance of 3 feet away from the unit and recorded in accordance with AGMA 297.02. Regardless of gear speed, sound level shall not exceed 85 dBA. During the test period, the unit shall be monitored for oil leaks, excessive lubricant temperature, and excessive vibration. Any causes for leaks, excessive sound, vibration, or lubricant temperature shall be corrected before shipment. Near the end of the test, a suitable gear marking compound shall be added to the oil. Following the test run, oil shall be drained, inspection covers removed, and gear teeth shall be inspected for proper contact.
      c. Measurement of the no load amp draw of the motor.
      d. Measurement of the output speed to verify gear ratios.
   2. The manufacturer shall provide a brief letter report certifying that the unit has passed the specified test and inspection requirements. The entire assembly shall be prepared for shipment in accordance with the manufacturer's recommendations.

D. Unit Responsibility:
   1. The Contractor assigns unit responsibility as specified in Section 43 05 11 to the manufacturer of the mixers provided under this section. This manufacturer is the unit responsibility manufacturer and has unit responsibility, as specified in Section 43 05 11 for both the equipment assembly specified in this section and for the motors as specified in Section 43 05 21 and all other equipment assembly components specified elsewhere but referenced in this section. A completed, signed, and notarized Certificate of Unit Responsibility (Section 01 99 90-Form 43 05 11-C) shall be provided.

E. Shipment and Storage:
   1. The equipment shall be protected during shipment and storage as specified in Section 01 66 00 and in accordance with manufacturer’s instruction. No sudden temperature fluctuations, aggressive vapors, or shocks shall be allowed.

1.04 ENVIRONMENTAL CONDITIONS

A. Mixers specified in this section will be installed indoors.

1.05 SUBMITTALS

A. Action Submittals:

1. Procedures: Section 01 33 00.
2. A copy of this Section, addendum updates included, along with the sections listed below shall be submitted with each paragraph check-marked to indicate compliance or marked to indicate requested deviations.
    a. Section 43 05 11 – General Requirements for Equipment
    b. Section 43 05 13 – Rigid Equipment Mounts
    c. Section 43 05 21 – Common Motor Requirements for Equipment
3. The specification copies shall be complete with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check-marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Supplier/Subcontractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Supplier/Subcontractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
4. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
5. Unit Responsibility Certification form (Form 43 05 11-C) attesting that unit responsibility has been assigned in accordance with the requirements of this Section and Section 43 05 11. No other submittal material will be reviewed until the certificate has been found in conformance with this requirement.
6. Manufacturer's product literature and shop drawings, including submergence requirements for the impeller, dimensioned drawings of mixer layout, anchorage and base details, blade diameter and details, shaft diameter and speed, and materials of construction.
7. Flocculator performance data to include relationship between speed (rpm) and mixing intensity (G-value, sec-1) at a minimum of ten points including maximum and minimum speed.
8. Mixer weights and loads transmitted to the supporting structure.
9. Manufacturer's experience statement as specified in paragraph 1.03 B.1.
10. Statement by the manufacturer indicating that gears comply with AGMA standards, and bearings comply with AFBMA standards specified in this section.
11. Motor product data as specified in Section 43 05 21.
12. Manufacturer’s operation and maintenance information in accordance with Section 01 78 23.

B. Informational Submittals:
   1. Procedures: Section 01 33 00
   2. Equipment anchor calculations.
   3. O&M information specified in Section 01 78 23.
   4. Bearing L-10 life calculations.
   5. Letter of confirmation of suitability of variable frequency drives being provided by the Contractor for this equipment in accordance with Section 26 29 23. Letter shall be on manufacturer's letterhead.
   6. Calculations of the mean velocity gradient during operation and the operating speed to first critical speed ratio. Calculations shall be stamped by a professional engineer registered in one of the fifty (50) United States.
   7. Installation instructions.
   8. Testing and adjusting instructions.
   9. Installation certifications per Part 3.01 and 3.02, certifying equipment is installed and tested properly and ready for service.
   10. Testing Forms in accordance with Section 01 99 90 and including shop test report per Part 1.03.C.2.
   11. Installation Forms in accordance with Section 43 05 11.
   12. Operation and maintenance information per Section 01 78 23.
   13. Training plan.

C. Closeout Submittals:
   1. Operating and maintenance submittals:
      a. Procedures: Section 01 78 23.
   2. Provide the following Spare parts: Provide a breakdown of replacement cost along with a listing of spare parts within the shop drawing submittal.
      a. One set of bearings, shims, and seals for each size of gear reducer,
      b. One flexible coupling,
      c. Any additional spare parts as recommended by the manufacturer.
   3. Spare parts shall be tagged and stored in compliance with Section 43 05 11.

1.06 WARRANTY

A. Warranty shall be for a period of 1 year from date of substantial completion, unless standard warranty is for a longer term. Provide the longer of 1 year, or standard warranty.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Equipment shall be protected during shipping and storage prior to installation in accordance with Section 01 66 00.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The mixers shall be by SPX Flow/Lightnin , Philadelphia Mixers, or approved equal.

2.02 TYPE

A. Mixers shall consist of an electric motor, high-speed flexible coupling, bearing housing, impeller shaft, mechanical seal, and impellers. Impeller shafts shall be of the overhung design. Underwater guides or bearings will not be accepted.

2.03 PERFORMANCE/DESIGN CRITERIA

A. Service Conditions:

1. The equipment shall be designed and selected for continuous mixing of the rapid mix effluent to provide flocculation. The maximum flow through each basin is expected to 8.8 mgd through each basin, with range in temperatures between 55 degrees F and 85 degrees F, and the pH may vary between approximately 6 and 8.

B. Operating Conditions:

1. The mixers shall be suitable for operation in the flocculator tanks and designed for continuous duty under the specified conditions. The mixer shall provide gentle mixing to encourage particle collisions and floc development while minimizing the floc breakup through over-mixing.
2. The mixers shall be designed for the tank dimensions and water surface elevations as shown in the table below. Each mixer shall operate independently and shall be controlled from the local control panel or PLC provided by others. The mixers shall be variable speed.
3. The nominal flocculation detention time with all trains in service is 41 minutes.
4. Required performance shall be met with one train out of service or with all in service across the range of flows specified above.

Schedule of Service Conditions

Design Parameter	Flocculator Mixers Stage 1 30-MX-11010 30-MX-11020 30-MX-21010 30-MX-21020	Flocculator Mixers Stage 2 30-MX-12010 30-MX-12020 30-MX-22010 30-MX-22020	Flocculator Mixers Stage 3 30-MX-13010 30-MX-13020 30-MX-23010 30-MX-23020
Area Dimensions for Flocculator: Length x Width, ft	18.5 x 20	18.5 x 20	18.5 x 20
Average Side Water Depth, ft	15	15	15
Top of Platform Elevation	5336.67	5336.67	5336.67
Impeller Diameter, inches	104	104	104
Min. Impeller Shaft Diameter, inches	2.0	2.0	2.0
Direction of Pumping	Down | Clockwise	Down | Clockwise	Down | Clockwise
Min. mean velocity gradient, s^{-1}	35	25	25
Max. mean velocity gradient, s^{-1}	70	40	40
Maximum rated motor power, HP	3	2	2

Notes:

1. Velocity gradient values at minimum water temperature of 2 deg C.
2. Concrete base, grout, and mounting design may increase the actual mixer elevation. Confirm exact elevations with the manufacturer prior to shaft fabrication.

2.04 MATERIALS

A. Materials of construction shall be as follows:

Component	Material
Shaft	Type 316 Stainless Steel
Impeller	Type 316 Stainless Steel
Miscellaneous wetted parts	Type 316 Stainless Steel
Anchor Bolts, Nuts, Washers, Fasteners	Type 316 Stainless Steel

B. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Supplier/Subcontractor may propose alternate materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

2.05 EQUIPMENT FEATURES

A. General

1. The mixer shall consist of a heavy-duty gear speed reducer, drive motor, support members, shaft, and hydrofoil turbine impeller. Each drive shall have a horizontal input shaft and vertically downward output shaft. Outline dimensions and anchor bolt pattern shall be compatible with the installation conditions specified.
2. Drive motor will be controlled by an electrical variable frequency drive (VFD). VFDs are to be supplied by the Contractor and be as specified in Section 26 29 23, Variable Frequency Motor Controllers.

3. All motor and gearbox assemblies shall have lifting lugs.
4. Sound level shall not exceed 85 dBA at a distance of three feet from the drive assembly at any operating speed.
5. Design equipment for 365-day, 24-hours per day continuous operation.
6. Gear reducer assemblies and devices mounted on, at or near the assemblies shall be suitable for an outdoor environment at the location of the facility.
7. Design flocculator assemblies to run at any operating speed at any liquid level in the basin, including empty, without mechanical damage.

B. Gear reducers
1. Construction: Provide right angle gear reducer in accordance with AGMA Standards.
2. Nameplate: Provide stainless steel nameplate with AGMA calculated drive horsepower rating.
3. Efficiency: Gear drive train efficiency shall not be less than 95 percent.
4. Cooling: External cooling coils or devices to dissipate heat will not be acceptable.
5. Openings: Provide water and dust proof covers.
6. Internal Output Shaft Diameter: Equal to or greater than the impeller shaft diameter.
7. Gear reducer configuration shall be selected to provide the smallest footprint available above deck.
8. Rating:
   a. Gear reducers which include separate shaft bearings, located above and below the main drive bearings and a torsionally resilient coupling at the impeller shaft, shall have a minimum rating of 1.5 times the rated horsepower of the drive motor.
   b. Gear reducers which incorporate bearing arrangements other than that described above, shall have a minimum rating of 2.0 times the rated horsepower of the drive motor.
9. Lubrication:
   a. Provide easy filling and draining without spills.
   b. Provide dry well construction designed to eliminate lubricant leakage at the output shaft.
   c. Provide splash or immersion lubrication from a common sump for all gearing.
   d. Provide a dip stick to observe lubricant level.
   e. Output shaft bearings may be grease lubricated. All other bearings shall be submerged in the lubricant. Inlet and outlet grease fittings shall be accessible from outside the gear reducer housing. Provide neoprene covers over fittings.
   f. Each gearbox shall be supplied with a food grade lubricant meeting NSF 60 certification. The lubricant shall be as specified by the manufacturer for compatibility and warranty specifications.
10. Bearings:
   a. All bearings within the reducer shall be of the antifriction ball or roller type.

b. All bearings other than those in the impeller shaft system shall have a minimum AFBMA L-10 life of 100,000 hours when operating continuously at the full rated load motor horsepower and speed. Output impeller-shaft bearings shall each have a minimum AFBMA L-10 life of 300,000 hours under the same full-load conditions. Bearings shall be splash oil lubricated or grease lubricated. All grease lubricated bearings shall have seals to prevent leakage.

11. Gears and Gearing:
    a. General: Gear reducer assembly shall incorporate a double or triple reduction gear drive system.
    b. Type: Gearing shall be a combination of helical and spiral bevel. Worm gearing is not acceptable.
    c. Gear Quality: gearing shall be AGMA Quality No. 10 or better in accordance with AGMA 390.03, with bevels being AGMA Quality No. 8 or better.
    d. Arrangement: Output shaft shall pass through a hollow shaft driven by the gear train.
    e. Gear Ratios: Not to exceed 7 to 1.
12. Gear Reducer Housing:
    a. Materials: Close grained cast-iron, ductile iron or stress relieved fabricated steel.
    b. Accessories: Provide lifting lugs.
    c. Openings: Provide water and dustproof covers and seals over all openings.

C. Impeller shaft
1. Provide overhung solid shaft design. The shaft shall be centerless ground and finished for straightness and cleanliness. The material of construction shall be as specified herein.
2. Bearings located outside of the gear reducer are not permitted.
3. Connect impeller shaft to the output shaft of the gear reducer by means of a rigid coupling located above the mounting platform. The rigid coupling halves shall be machined with a rabbet for concentricity. Safety guards for rigid couplings shall be provided. Provide for removal (dropping) of the shaft without disturbing the gear reducer housing or any internal components.
4. The shaft-impeller system shall be safe for operation when: the liquid level rises through the impeller while the mixer is operating; during deceleration and acceleration associated with a momentary power outage; and with unbalanced process flows that may be perpendicular to the shaft-impeller system. The entire system shall be hydraulically and dynamically stable during fluctuations in water levels commonly associated with turbulent mixing and with variations in process flow.
5. Combined Tensile and Shear Stress: Not to exceed 8,000 psi at maximum load.
6. Runout: Not to exceed 1/4-inch for every ten feet of overhang as measured when turning by hand.
7. Couplings: Use rigid flanged bolted type couplings connected to the shafts by welding. Mating faces shall utilize a rabbeted male and female connection and shall not require match marks for alignment. Use same materials as specified for the shafts. Mixer shaft shall attach to reducer by split removable coupling located above mounting surface.
8. Critical Speed: Maximum output shaft speed shall not exceed 70 percent of the first lateral critical speed.

9. Length: Not to exceed 20 feet per section. Provide an additional impeller shaft coupling located below the mounting platform and above the water level, if necessary to limit the length of shaft.
10. Keyway: Provide for field adjustment of the impeller setting of not less than 9-inches above and below the setting in 3-inch or less increments.

D. Impeller:
1. Provide a single, low-speed, field removable, hydrofoil type impeller specially designed to minimize shear and turbulence while maximizing fluid motion. Provide up or down pumping impellers as required in the Schedule of Service Conditions. Key the impeller to the shaft.
2. Tip speed: Provide as required for optimum performance, but not to exceed 8 ft/s at a G-value of 80 s^{-1}.
3. Setting: Locate the centerline of the impeller from the basin bottom as shown in the Contract Drawings.
4. Combined Tensile and Shear Stress: Not to exceed 11,000 psi under maximum loading conditions.

E. Mounting:
1. General: Provide as required to mount the gear reducer frame with pedestal to the support pad to elevate the low speed coupling and oil drain above the mounting floor elevation.
2. Type:
   a. Adhesive anchors for mounting in accordance with the details shown and sufficient to withstand the torque and other loadings transmitted by the gear reducer. Conform to the requirements of Section 05 05 20.
3. The anchor bolts shall be sized by the manufacturer.

F. Motor
1. Suitability: Suitable for the torque load, variations in torque and other loading conditions imposed by the gear reducer and also suitable for the variable speed drive controller. Gear motors are unacceptable.
2. Ratings:
   a. Nameplate horsepower rating and allowable temperature rise shall not be exceeded under any specified loading condition at any operating speed.
   b. Motors shall not be rated at less than 1.0 horsepower, nor less than the rating shown in the Schedule of Service Conditions.
3. Speed:
   a. Maximum: 1,800 rpm.
   b. Minimum: 900 rpm.
4. Enclosure: Type 2 per Section 43 05 21, TEFC with finned cast housing.
5. Applicable Standards: IEEE, NEMA, ABMA and ANSI.
6. Gear Reducer Connection: Provide an easily accessible torsionally resilient flexible coupling between the motor and the gear reducer. Provide a coupling guard.
7. Insulation: Class F or better.
8. Temperature Rise: Limit to Class B temperature rise at 40°C ambient at full load.

9. Nameplate: Provide a stainless steel nameplate describing motor characteristics and required lubricants.
10. Motors shall conform to the requirements of Section 43 05 21.

2.06 TOOLS AND SPARE PARTS

A. Special tools:
   1. Special tools, if required for normal operation and maintenance, shall be furnished with the equipment.

B. Spare parts:
   1. The following spare parts shall be provided for each size mixer:
      a. One set of bearings, shims, and seals
      b. One flexible coupling
      c. Any additional spare parts as recommended by the manufacturer
   2. Spare parts shall be tagged and stored as specified in Section 43 05 11.

2.07 COATINGS

A. Stainless steel components shall be provided with an ASTM A480, No. 2B finish. Ferrous or steel components shall be factory coated per Section 09 90 00.

PART 3 EXECUTION

3.01 INSTALLATION

A. The mixers shall be installed as specified and in accordance with the manufacturer's written recommendations. The installation and initial operation shall be certified in writing by the Supplier/Subcontractor. Installation shall be carried out by mechanics skilled in work of this kind, under the general supervision of a factory-trained representative of the manufacturer. Total shaft runout and deflection shall be checked by hand turning the shaft. Maximum shaft runout or deflection shall not exceed 1/4-inch per 10 feet of shaft length at any point along the shaft. The equipment shall be checked, aligned, tested, and placed in operation by a factory-trained manufacturer's representative.

3.02 FIELD QUALITY CONTROL AND TESTING

A. After installation and prior to being placed in operation, each unit shall be inspected and checked by a qualified representative of the equipment manufacturer, as required.

B. The Contractor shall make all adjustments to each unit as directed by Supplier/Subcontractor prior to placing the unit in operation. Each mixer shall be checked by the manufacturer for lubrication, alignment, rotation and the representative shall notify the Contractor of anything in the installation which affects the manufacturer's warranty. The manufacturer's representative shall provide certification that each mixer is rotating in the right direction and is ready for testing.

C. After completion of the installation, the equipment shall be field tested as specified in Section 01 45 20 to demonstrate compliance with the specified performance requirements. Equipment supplier to provide within their price all labor and effort to support Pre-operational check out, Functional Testing, and Start-Up Testing as specified in Section 01 45 20.

D. As part of the Functional Test, a factory trained representative shall test the installed equipment at full load and full speed for a minimum of 4 hours after oil temperature has stabilized. The test runs of the mixers shall be undertaken with water in the tanks filled up to the peak water elevations. The test runs on the mixers shall determine acceptable running noise, speed and rotational direction. The reducer housing and shaft seals shall be checked for leaks during the test. Any leaks shall be corrected and the test repeated at the Supplier/Subcontractor 's expense. Oil temperature shall be recorded at intervals of no greater than 15 minutes and shall not exceed the manufacturer's recommended maximum. Sound level shall be recorded and shall not exceed 85 dBA at a distance of 3 feet from the equipment. Provide a written certification from the equipment manufacturer that the equipment has been properly installed according to the plans, specifications and manufacturer's specifications, and that the equipment is operating normally. In the event of improper installation, correction of the work and subsequent test runs will be provided until the defects are corrected at no additional cost to the Contractor. Manufacturer shall provide certification that the improper installation has been corrected.

3.03 TRAINING

A. Training shall be provided as specified in 01 79 00. A minimum of eight (8) hours of total training shall be provided and comprised of the following:
   1. Operations Training: Two (2) sessions, two (2) hours per session.
   2. Maintenance Training: Two (2) sessions, two (2) hours per session.

B. Upon completion of the training activities, the Manufacturer shall provide an executed Instruction Certification Form 43 05 11-B.

C. The Supplier/Subcontractor's representative shall provide one additional (4-hour) day on-site as part of a separate trip at the time of start-up to provide startup support and furnish additional training of the Owner's personnel in the operation and maintenance of the equipment.

END OF SECTION

SECTION 46 43 21

CIRCULAR CLARIFIER EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. This Section specifies sludge collection equipment for circular clarifiers in the use of gravity separation of solids from flocculator basin effluent.

B. Scope: This section specifies clarifier equipment as follows:
   1. Sludge collection equipment
   2. Drive equipment
   3. Walkways and access bridges with guardrails and grating to the drive equipment
   4. Miscellaneous appurtenances as shown and specified herein

C. Type: Equipment furnished under this Section shall be suitable for installation in circular tanks. The equipment shall be specifically design for the conditions described and shown.

D. Equipment List:

Item	Equipment Number
Primary Clarifier 1 Mechanism	60-CL-0013

1.02 DEFINITIONS

A. Terminology used in this Section conforms to the following definitions:
   1. Continuous operating torque: The continuous operating torque is defined as the 100% AGMA design torque which is the torque load that is assumed to be continuously applied on the drive system through a 24-hour operating period, 365 days per year for a 20-year life. Bearing life, gear strength, gear durability, gear rating, mechanism structural design, and alarm and shutdown setpoints are specified as a percentage of the continuous operating torque.
   2. Alarm Torque: The torque at which an alarm sounds to serve as a warning of increased torque loading. The alarm torque is defined to be equal to 110 percent of the continuous operating torque.
   3. Cutout Torque: The torque load at which a motor cutout switch is activated to shut down the unit. The cutout torque is defined to be not less than 120 percent of the continuous operating design torque.
   4. Momentary Peak Torque: The maximum or peak torque of the drive unit assumed to be equal to twice the calculated AGMA torque rating of the spur gear set or 3 times the calculated AGMA torque rating of the worm gear set, whichever is lower.

1.03 QUALITY ASSURANCE

A. Reference Standards:

1. This section contains references to the following documents. They are part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ABMA-9	Load Ratings and Fatigue Life for Ball Bearings
AGMA 2001-B	Fundamental Rating Factors and Calculation Methods for Involute Spur and Helical Gear Teeth
AGMA 6013	Standard for Industrial Enclosed Drives
AGMA 6010-E	Standard for Spur, Herringbone, and Bevel Enclosed Drives
AGMA 6019-E	Gearmotors Using Spur, Helical, Herringbone, Straight Bevel or Spiral Bevel Gears
AGMA 6034-B	Enclosed Cylindrical Worm Gear Speed Reducers and Gear Motors
AISC	American Institute of Steel Construction, Steel Construction Manual, 16th Ed.
AISI	Pocketbook of AISI Standard Steels
ASTM A36/A36M	Structural Steel
ASTM A48-REV A	Gray Iron Castings
ASTM A536	Ductile Iron Castings
ASTM A666	Austenitic stainless steel, sheet, strip, plate and flat bar for structural application
ASTM B247	Aluminum-Alloy Die Forgings, Hand Forgings and Rolled Ring Forgings
ASTM E18	Rockwell Hardness and Rockwell Superficial Hardness of Metallic Materials
AWS D1.1	Structural Welding Code—Steel
AWS D1.6	Structural Welding Code—Stainless Steel
NEMA 250	Enclosures for Electrical Equipment

B. Standards:

1. Structural Steel and Welds:
   a. All structural steel used for equipment fabrication shall conform to the requirements of the Standard Specifications for Steel for Bridges and Buildings. All welding shall conform to the latest standards of the American Welding Society (AWS). Continuous seal welds shall be provided at all welded joints. Skip welds will not be permitted.

2. Structural Design:
    a. All steel structural components shall be so designed that the stresses developed under the specified conditions will not exceed the allowable stresses defined by the AISC standards and the aforementioned standards. Except where specifically indicated otherwise, all plate and structural members designed for submerged service shall be steel with a minimum thickness of 1/4 inch. AISC recommended limits for slenderness shall not be exceeded on any steel member.

C. Unit Responsibility:
    1. The Contractor shall assign unit responsibility as specified in Section 43 05 11-1.02 Unit Responsibility to the circular clarifier equipment manufacturer for the equipment specified in this section, the drive motors, and all other appurtenances required to operate the equipment. Provide a completed and signed Unit Responsibility Certification Form (Form 43 05 11-C, Section 01 99 90).

1.04 SUBMITTALS

A. Procedures: Section 01 33 00

B. Action Submittals:
    1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance of the part of the Contractor with the specifications. Failure to include a copy of the marked up specification sections, along with justification(s) of any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
    2. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
    3. Certificate of Unit Responsibility attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
    4. General arrangement drawings showing the entire assembly. This shall include a materials list and descriptions of all major components such as all gears, structural members, and sludge collection members (sizes, piping, connections, ASTM designations where appropriate, thicknesses, and construction).

5. Rating, AGMA and ASTM designations, construction, and detailed descriptions of all gears, reducers, and drives.
6. Calculations substantiating the torque rating of the gear assembly as specified herein.
7. Bearing manufacturer, bearing model, and ABMA L-10 life data.
8. Concrete anchors for clarifier mechanism, bridge, and other necessary equipment.
9. Proposed on-site testing and start-up procedures, including sketches and calculations for torque test as specified herein.
10. Motor submittal requirements of Section 43 05 21.

C. Informational Submittals:
1. Calculations, stamped by an engineer registered in the State of Utah, that demonstrate support and anchor bolt (i.e. number, diameter, length) design complies with the requirements of this Section.
2. Calculations showing stresses in the drive cage, sludge collection arms and walkways as specified in paragraph 2.03 Drive Cage, paragraph 2.03 Sludge Collector Mechanism and paragraph 2.03 Walkway and Operating Platform
3. Calculations sizing the sludge scraper blades for uniform sludge withdrawal and other data specified in paragraph 1.05.
4. Manufacturer's operation and maintenance information in accordance with Section 01 78 23 including:
   a. Copy of final reviewed submittal.
5. Testing Form in accordance with Section 01 45 20.
6. Installation Certification Form 43 05 11-A as specified in paragraph 3.01.
7. Training Certification Form 43 05 11-B as specified in paragraph 3.02.
8. Form 43 05 13-A, Rigid Equipment Mount Installation Checklist in Section 01 99 90.

1.05 PERFORMANCE AND DESIGN REQUIREMENTS:

A. All structural members shall be designed in accordance with AISC standards and shall be capable of transmitting the momentary peak torque without undue or permanent deflection. AISC recommended slenderness limits shall not be exceeded for the design of all members. In addition to the specified operating loads, each member shall be designed to withstand a point load of 200 pounds applied perpendicular to its weak axis at the midpoint between its support areas.

B. The sludge collector mechanism includes a central driving mechanism mounted on a center support pier, to support and rotate a center cage with 2 truss arms.

C. Sludge accumulated in the clarifier is scraped to a center well for intermittent/continuous removal. Sludge is transported in a single revolution toward a center sludge hopper. Sludge removal is accomplished by operation of the drain valve.

D. The central pier and column assembly shall be designed to support the drive mechanism, the sludge collection mechanism, utility piping, access bridge beams and walkway. No vertical thrust load shall be placed on any underwater bearing. All drive gears shall be located above water level and all gearing shall be completely enclosed and oil-lubricated. The drive cage, each sludge collector arm, and associated supports and connecting members shall be designed to withstand application of 200 percent of the continuous operating torque at the AISC allowable stresses. The drive cages shall be designed to withstand these forces resulting from operation in the clockwise and counter-clockwise directions.

E. The access bridge and operating platform shall be design for a live load of 100 pounds per square foot. Deflection under full live load and dead load shall not exceed 1/360 of the span.

F. Operating Conditions: The equipment shall be designed and operable for the following conditions for each clarifier:

Parameter	Minimum	Maximum
Influent Flow, mgd	1.5	15.2
Liquid Depth, ft	0	15.0

G. Design Requirements: Tank configuration is specified as follows:

Item	Clarifier
Internal tank diameter, feet	60'-0"
Sidewater depth, feet	+/- 15
Depth at center column, feet	17 ft, 6 inch
Floor Slope	1: 12
Center column minimum diameter, inches	18
Sludge collection arms, number	2
Collector mechanism rotating speed, ft/min	11.8
Continuous operating torque, ft • lbs, applied at the output of drive unit	13,500
Nominal bearing race diameter, inches	35
Maximum Motor output, horsepower	1.0

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Candidate manufacturers and models are listed below. To conform with specified requirements, the manufacturer's standard product may require modification.
   1. Ovivo Clarifier Mechanism
   2. WesTech Engineering, Inc.
   3. Evoqua
   4. Walker Process
   5. ClearStream

B. Candidate manufacturers shall have a minimum of 20 years' experience designing clarifier equipment.

2.02 MATERIALS

A. Materials of construction:

Component	Material
Center column	ASTM A36 carbon steel ANSI,
Steel plate	ASTM A36 carbon steel
Structural steel shapes	ASTM A36 carbon steel
Drive cage	ASTM A36 carbon steel
Main spur gear	
Ductile iron	ASTM A536, 100-70-03
Forged steel	AISI 4140, 4150 or 4340
Worm	Through hardened AISI 41L50 or 8620 alloy steel
Worm gear	ASTM B247, gear bronze alloy casting
Pinion	AISI 4140, 4142, 4150 or 4340
Main bearings	SAE 52100, Rockwell C64 or AISI E4140 43-46 RC
Spur Gear housing	Cast Iron ASTM A-48 Class 40A or Ductile Iron ASTM 536, Grade 65-45-12
Other gear cases	Cast or Ductile Iron
Turntable base	Cast or Ductile Iron
Submerged fastening hardware including anchor bolts	ANSI, Type 316 stainless steel
Truss arms and other misc. structural components	ASTM A36 carbon steel
Plow scraper blades, rear blade	ASTM A36 carbon steel
Seals	Neoprene
Bridge beams	ASTM A36 or ANSI, Stainless Steel (Type 304)
Walkway grating	Per Section 05 53 10 requirements
Guardrails and toeplates	Per Section 05 52 10 requirements
Guardrail Bolts, nuts and washers	Per Section 05 52 10 requirements

B. Materials specified herein are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

C. All carbon steel equipment shall be fully prepared with shop-applied NSF 61 certified typeE-5 coating with SSPC-SP5 surface preparation in accordance with the requirements of Section 09 90 00.

2.03 COMPONENTS

A. Drive Cage:

1. Torque shall be transmitted from the drive unit to the sludge collection arms by a drive cage. The drive cage shall encompass the center column and shall be of sufficient strength to transmit and/or carry all loads and stresses associated with 200 percent of the continuous operating torque. Drive cages shall be capable of accepting the specified design loads resulting from operation in both the clockwise and counter-clockwise directions. Calculations shall be provided showing the related stresses developed in the drive cage at the torque value specified.

B. Sludge Collector Mechanism:

1. Plow Scraper Blades:

a. General: Manufacturer shall be solely responsible for the design of the adjustable scraper blades (including quantity and dimensions). Sludge blades shown on the Drawings are for illustration purposes only and shall not be construed as design intent. Additional blades to transport sludge away from center column to withdrawal point shall be provided, if required by Manufacturer's design configuration.

b. Blades:

1) Thickness and stiffeners as required to limit blade deflections. Taper blades as required to match floor slope.

2. Sludge Collector Support:

a. The collectors shall be supported from the drive cage by steel truss arms to hold the collectors in alignment in a vertical and horizontal plane. The sludge collector arms shall be designed to withstand 200 percent of the continuous operating torque developed from uniform loads applied to all arms. In addition, each arm shall be designed to withstand a point load applied at its extreme end that produces cutout torque. Uniform loads and the point loading shall be applied separately. Calculations shall be provided showing the related stresses developed in the sludge collection arms under both conditions. Turnbuckles, guy cables, tie rods, and similar arrangements will not be allowed for support of the collector arms. The truss arms shall be of box or triangle truss construction, fabricated from rolled angles or sections having a minimum thickness of 1/4 inch. Maintain the width of the truss arm the same as the width of the center drive cage to ensure alignment and proper connection and rigidly connect the truss arm to the center drive cage. The truss arms shall conform to the slope of the clarifier floor and the truss arms shall support the segmented sludge scraper blades and all other affiliated components.

C. Drive Mechanism:

1. General:

a. The drive assembly shall include an electric gear motor with planetary or helical bevel gear reducer, pinion gear, turntable type main spur gear, drive base, shear pin hub coupling or sprocket, and mechanical torque overload protection system. The spur gear set shall be designed in accordance with AGMA 2001-B.

b. The drive mechanism shall be mounted on the center column with the top of the spur gear housing capable of supporting the total access bridge load by means of equally loaded, removable bridge supports. Drive mechanism components shall be designed for the rated torque specified herein. Calculations shall be provided that substantiate the torque rating (including momentary peak torque) of the gear assembly. Numerical values shall be shown for all terms used in the AGMA rating equations.

c. Drive mechanism shall be designed to inhibit reverse rotation.

2. Gear Reducer:

a. The gear reducer shall be of a Planetary/Helical or Helical Bevel modular design construction. It shall be capable of accepting high overloads and high ratios in a very compact package, while maintaining a high degree of efficiency. A cycloidal speed reducing unit, of drive manufacturer's standard offering and comparable features, performance and materials, may be provided. Cycloidal drive design shall not have less than 10 years' service in comparable applications.

b. If a planetary/helical gear reduction is provided, then the Planetary portion shall have two stages of reduction in a single piece housing made of Kymmenite ADI. The output stage shall have 4 planet wheels and the intermediate stage shall have 3 planet wheels made from case hardened steel (17CrNiMo6 or 16MnCr5). The output shaft and planet gears shall be mounted on a full complement of roller bearings. The tooth quality for the sun wheel and planet gears shall meet ISO 6 (AGMA 11) and the internal gearing must meet or exceed ISO 8 (AGMA 9) quality standard. The output planet carrier shall be a double flange design for high stiffness, large diameters of parts, and a short distance between input and output shaft. The intermediate planetary carrier shall have a single flange design for compact construction. The connection between the Sun Wheel and planetary carrier shall be gear teeth for optimized torque balance and full tooth contact. Dual Lip oil seals on the output shaft shall be standard.

c. The Helical gear reducer portion shall have gearing in compliance with ANSI/AGMA Standard 2001-B88, Bevel gearing in compliance with ANSI/AGMA Standard 2003-A86. Gears are to be carburized to a Hardness of 58–62 Rc for durability. The gearcase and flanges are to be made of high strength gray cast iron SAE Class 30. Double Lip oil seals on output shaft with additional inner seal made of Viton. Captured keys on input and output shafts. The efficiency of the gear unit is primarily determined by the gearing and bearing friction, and should range from approximately 95% for three stages of gear reduction to 98% for single stage reduction.

d. The Helical or Helical Bevel input housing shall be fabricated steel or cast iron and compact. While maintaining high efficiency, it must be modular in construction and totally adaptable to accept and Integral motor or NEMAC-Face Input. The reducer should be capable of running in horizonal or vertical positions.

e. The gear reducer must be capable of operating with mineral oil or synthetic oil and capable of operating under adverse environmental conditions.

f. The gear reducer shall be provided with an oil level sight glass.

3. Drive Motor:

a. The drive motor shall be 1,800 rpm conforming to Section 43 05 21. The motor shall be designed for continuous duty, Class II applications in accordance with AGMA 6019-E. The motor shall be Type 2 as specified in Section 43 05 21.

b. Motor bearings shall be rated for a minimum L-10 life of 100,000.

c. Power transmission between the gear motor and the pinion gear shall be via a direct shaft connection.

4. Pinion Gear:
   a. The pinion and pinion shaft which drive the internal spur gear shall be made from heat treated forged alloy steel and designed in accordance with AGMA 6010-E. The pinion shall be rigidly supported by bearings located above and below the pinion gear. Overhung pinions shall not be acceptable.
5. Spur Gear Assembly:
   a. The spur gear shall be AGMA Quality 5 and shall be designed and rated in accordance with 2001-B.
   b. The spur gear housing shall be made of cast iron. A felt or neoprene seal and dust shield shall be included with each spur gear housing in two locations; a lower seal located between the stationary drive base and main gear and an upper seal located between the main gear and stationary drive cover. The spur gear housing shall be designed to allow submergence of the gear face in the oil bath sufficient to provide complete lubrication of the gear assembly. When the main spur gear is manufactured from forged steel, a minimum of 75 percent of the gear face shall be submerged in oil. The gear case shall be complete with an oil fill and drain components. Drain piping shall tap the lowest point in the oil reservoir for removal of oil and condensate, shall be valved, and shall be conveniently accessible. An extension operator shall be provided for operation of the drain valve from the walkway level above. A dipstick extending from the walkway level to the bottom of the drain shall be provided to indicate oil level and the presence of condensate.
   c. The drive assembly shall be firmly mounted to a cast iron turntable base with a minimum wall thickness of 1/2-inch. The drive base shall be mounted on the center column and be provided with a positive leveling feature. The drive base shall be suitable for supporting the entire load the drive mechanism and access bridge. To permit inspection and maintenance of components in the interior of the drive unit housing, each assembly shall have an access opening of not less than 24 inches in diameter. Cover plate with lifting eyes securely attached shall be provided for the opening. The base shall be formed to provide a sump with a valved drain and sight glass not less than 1-5/16 inches deep to allow for the collection and disposal of condensate. The sump shall be designed to trap condensate before it comes in contact with bearing housings.
6. Main Bearing:
   a. The entire sludge collector mechanism shall be suspended from the turntable which in turn shall be supported on a ball bearing assembly that uses hardened carbon corrected, vacuum degassed alloy steel bearing balls, with nylon spacers. Bearings shall run in a hardened raceway (43-46 Rc), in a cross-contact or four-point angle contact bearing arrangement. The bearing balls shall run in an oil bath and be protected by dust and moisture seals. Minimum L-10 bearing life shall be 175,000 hours. The use of precision bearings is also acceptable.

7. Torque Overload Protection:
    a. The drive mechanism for the sludge collector shall be provided with a torque overload protection system. The overload protection system shall be designed to measure thrust of the worm or pinion gear shaft and be provided with an indicator showing the load on the mechanism. The indicator shall be visible from the access bridge, shall read in ft-lbs torque or percent continuous operating torque and shall cover the range of torques specified up to 200 percent of the continuous operating torque. The torque overload protection system shall be fully functional in the forward rotation of the mechanism.
    b. The overload protection system shall include two switches, the first to activate local and remote warnings, and the second to shut down the unit. The overload devices and switches shall be enclosed in a NEMA 4X watertight cast aluminum housing. The switches shall be DPDT, rated at 10 amps and 250 volts AC. The device shall be factory calibrated to activate the warning switch such that its contacts open when the torque load on the mechanism reaches 110 percent of the continuous operating torque and activate the cutout switch (normally closed) at 120 percent of the continuous operating torque.
    c. A backup shear pin shall be provided in a shear pin hub mounted on the output shaft of the gear motor. The shear pin shall be selected to break when the load on the mechanism achieves 140 percent of the continuous operating torque specified. A DPDT limit switch rated at 10 amps and 250 volts AC shall be provided to activate when the shear pin breaks. The shear pin device shall be capable of protecting the collector mechanism during forward collector rotation.
    d. Protective devices and switches must be suitable for installation in a Class I, Division 2 environment. Provide an intrinsically safe system in a NEMA 4X stainless steel enclosure to be mounted outside the hazardous envelope for interfacing with the switches for the overload protection system and shear pin device.

D. Walkway and Operating Platform:
    1. Access bridges shall be provided as shown for the sludge collector mechanism and shall consist of structural steel beam sections interlaced for rigidly. All walkway surfaces shall be at the same elevation. The access bridge shall be at the same elevation. The access bridge shall be supported on the main spur gear housing which in turn shall be supported by the center column support structure. The access bridge shall span the entire tank diameter. Calculations shall be provided showing the related stresses developed in the bridge for all load combinations.
    2. The bridge shall include a 36-inch wide aluminum grating walkway for the full span complete with 3/16-inch by 4-inch high toe plates. The operating platform shall include a similarly constructed walkway encircling the exposed portion of the drive unit. Clearance of 36 inches shall be provided around the drive.
    3. Removable sections of grating shall be provided to cover all wells or depressed areas in the walkway and access platform to provide a single plane for all walking surfaces.
    4. Walkway and operating platform grating shall be as specified in Section 05 53 10 and on the Drawings. The walkway and operating platform shall be provided with handrailing conforming to the requirements of Section 05 52 10.
    5. Provide supports from the access bridge for piping and electrical conduits.

E. Local Control Panel:
   1. Provide a NEMA 4X-rated, 316 stainless steel, local control station to be mounted at the center of the clarifier near the drive.
   2. The local control station shall be assembled and tested in accordance with the applicable specifications noted in Divisions 26 and 40.
   3. The panel shall have a HAND/OFF/AUTO selector switch whereby in HAND mode, the drive shall run without input from the PLC. In AUTO mode, the clarifier drive shall run with a discrete signal from the PLC. In OFF mode, the clarifier shall not run.
   4. A fault pilot shall be provided to signal a general fault with the clarifier.

F. Shop Finishing Requirements:
   1. Shop prime and finish drive mechanism.
   2. All steel or ferrous metal drive equipment, with the exception of stainless steel, shall be fully prepared with shop-applied prime and finish coats in accordance with the requirements of Section 09 90 00. Submit colors for Owner selection. One (1) gallon of touch up paint shall be provided for each mechanism.

2.04 SPARE PARTS

A. Procedures: Section 01 66 00.

B. Provide the following spare parts:
   1. Two complete sets of shear pins.
   2. One complete set of any special tools required to assemble, disassemble or maintain equipment.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Equipment furnished under this section shall be installed, checked, and adjusted as recommended by the manufacturer. The installation shall be certified on Form 43 05 11-A as specified in Section 01 99 90.

B. Floor Clearance:
   1. The mechanism shall be used to screed the finish grout topping layer of the floor of the clarifier basin to a clearance tolerance of not less than 0.25-inch and not more than 0.50 inches between the collector squeegee and the finished floor surface.

3.02 FIELD TESTING AND START-UP

A. Procedures: Section 01 45 20

B. Perform the following tests:
   1. Performance Test:
      a. General:

1) All performance tests shall be performed under the on-site supervision of personnel trained by the manufacturer. All equipment and instrumentation necessary to complete the testing procedures outlined below shall be provided by the Contractor. Failure to complete the testing program, outlined in the following paragraphs, shall be sufficient cause for rejection. In addition, a factory representative shall start up the equipment and train plant personnel in operating and maintenance procedures.

b. Torque Test:

1) Load test the entire collector mechanism by anchoring collector arms individually. Each arm of the collector mechanism shall be tested individually by using a single attachment point at the end of the arm to achieve a point load condition during the test. In successive tests, demonstrate the sludge collection mechanism's (including drive unit, cage, gears and structures) capability to withstand all loads and stresses associated with the cutout torque. Prior to initiating the test, furnish the Engineer with sketches and calculations illustrating the test procedure and demonstrating how the specified torque will be applied to satisfy the requirement.

2. System Test:

a. Operating Tests:

1) The sedimentation basins shall be filled with water to their operating level and the clarifier mechanisms shall be operated continuously at their maximum speed for a period of not less than 48 hours. At no time during the operating test shall the equipment fail on torque overload or exhibit indications of binding or uneven operation. Record torque values as registered on the drive mechanism torque indicator and motor amperage (all three phases) at three-hour intervals.

2) If the mechanism should fail on torque overload or, in the opinion of the Engineer, the mechanism should exhibit indications of binding or improper adjustment, immediately halt the tests and remedy the problem. After completion of necessary repairs or adjustments, the tests shall be repeated. Failure to successfully complete the test in six attempts shall be considered sufficient cause for rejection.

3.03 MANUFACTURER'S SERVICES

A. On-Site Inspections and Training:

1. Provide a factory-trained manufacturer's representative at the Site for the following activities. Specified durations do not include travel time to or from the Site.

a. Operational Test Phase Testing Inspections:

1) Assist, supervise and inspect the Contractor's activities during the operational test phase specified in Section 01 42 20 and this Section. Provide 8 hours per visit (one visit per clarifier for a total of four visits) for inspection of operational test phase testing for the clarifier equipment. Complete Form 43 05 11-A, Section 01 99 90.

b. Training Session:

1) Procedures: Section 01 79 00

2) Provide a minimum of 8 hours of classroom training for one session. Certify completion of training on Form 43 05 11-B, Section 01 99 90.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 46 43 76

INCLINED PLATE SETTLERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Inclined plate settlers and all appurtenant work, complete and operable, in accordance with Contract Documents for:
   1. Inclined Plate Settler Equipment in two (2) new sedimentation basins.

B. Requirements include furnishing individual inclined plate pack assemblies for installation in concrete basins as shown on the drawings and specified herein. Supplier shall also provide layout for future plate installation, if shown on drawings, including support spacing.

C. Plate pack assemblies shall include the following Manufacturer supplied items: plates; frames; troughs; flow control baffles; embedment pieces; anchor assemblies; and bolts for attachment to concrete supports.

1.02 RELATED SECTIONS

A. The Contract Documents are complementary; what is called for by one is as binding as if called for by all.

B. This section contains specific references to the following related sections. Additional related sections may apply that are not specifically listed below.
   1. Section 01 11 80: Environmental Conditions
   2. Section 01 33 00: Submittal Procedures
   3. Section 01 73 24: Non-structural Components and Non-building Structures
   4. Section 01 78 23: Operation and Maintenance Data
   5. Section 01 79 00: Demonstration and Testing
   6. Section 05 05 20: Anchor Bolts
   7. Section 05 50 00: Metal Fabrications
   8. Section 43 05 11: General Requirements for Equipment

1.03 REFERENCES

A. The references listed below are a part of this section. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

1.04 SYSTEM DESCRIPTION

A. One Inclined Plate Settler Manufacturer shall supply all equipment specified in this Section.

B. Plate settler equipment, including place modules (or packs), frames, effluent troughs, and support system shall be installed in two new sedimentation basins at the City Creek Water Treatment Plant located in Salt Lake City, Utah.
   1. Each plate settler system shall be installed in a sedimentation basin for the purpose of removing solids from water.

C. Basis of Design
   1. The structural and mechanical design for the inclined plate settlers are based on information provided by the listed Inclined Plate Settler Manufacturers. Layouts and drawings show orientations for the first listed manufacturer. Fundamental changes in the configuration of the plate settler system will not be allowed. The Supplier shall submit drawings and supporting documents, identifying all proposed changes, to the Engineer for approval. Supporting documents shall delineate all proposed changes including complete structural calculations stamped and signed by a Structural Engineer registered in the state of Utah.
   2. Process Design:
      a. Plate packs shall be protected by a curb or apron to prevent the water surface from submerging the plates at maximum hydraulic flow rate.
      b. Troughs shall be designed to allow a maximum of 5 inches of headloss as flow passes from plate settlers into effluent troughs over a weir at the design flow rate.
      c. The maximum feed velocity into the plate pack shall be 0.5 ft/sec to prevent floc destruction and hydraulic disturbances.
      d. Feed through the bottom end of the plate shall be minimized to prevent solids re-entrainment.
      e. Effluent troughs are to be located on each side of plate packs to prevent maldistribution. After exiting the plates, water shall travel no more than ½ of a plate width to reach an effluent trough. Effluent troughs shall be of the dual side-loaded design and be located on both sides of the plate settler frame assembly.

3. Structural Design:
    a. The structural design of the plate settler system shall be in accordance with the requirements of the International Building Code (IBC).
    b. Plate settlers, frame, supports, troughs, and anchorage system shall be designed per the environmental conditions specified in Section 01 11 80.
    c. Inclined Plate Settler support frames shall be designed for the worst-case load condition of an empty basin and full effluent troughs. The effluent troughs shall be designed such that maintenance personnel can walk on the troughs when the troughs are empty.
    d. Plate settler shall be designed to allow maintenance personnel to walk on top of the plate packs.
    e. Plate settlers, frame, supports, troughs, and anchorage system shall be designed per seismic criteria, specified in Section 01 73 24 including effects of water slosh during a seismic event.

D. Inclined Plate Settlers:

1.	Total Sedimentation Basin Design Capacity (Basin 3 through 6):	17.6 mgd
2.	Number of Basins	2
3.	Maximum Design Flow Rate per Basin:	8.8 mgd
4.	Minimum Design Flow Rate per Basin:	2 mgd
5.	Maximum Hydraulic Flow Rate per Basin:	10 mgd
	a. plate settlers must pass this flow without submerging the weirs or troughs; this is not the design process flow	
6.	Maximum Design Effective Hydraulic Loading Rate:	0.30 gpm/ft^2
7.	Total Effective Projected Settling Area Percentage (efficiency):	80%
8.	Minimum Effective Projected Settling Area per Basin:	20,370 sq ft
9.	Water Temperature Range:	33 to 80 °F
10.	pH Range (standard units):	6.0 to 9.0
11.	Angle of inclination between the plates and the horizontal:	55 degrees
12.	Maximum Dose of Primary Coagulant	TBD
	a. System shall be compatible with all ferric- and aluminum-based coagulants	

E. Basin Geometry:
    1. Each sedimentation basin is approximately 40-feet wide and 61-feet long with a side water depth of TBD ft.

F. Weirs
    1. Straight Weirs
        a. Each trough shall be equipped with adjustable bolt-on flat-crested or straight weirs for leveling during initial installation and to provide an even flow distribution during operation.
        b. The weir shall be designed so each plate pack has a continuous weir for even flow distribution.
        c. The flat crested weirs shall be securely fastened by continuous pressure clamp.
        d. Flat crested weirs shall be designed to set top deck flow depth to less than 2 inches.

e. Adjustable weirs shall be gasketed with 1/8" thick EPDM or appropriately sealed with an NSF-61 compliant sealant.

2. V-notch Weirs
   a. Each trough shall be equipped with adjustable bolt on v-notch weirs for leveling during initial installation and to provide an even flow distribution during operation.
   b. The v-notch weir shall be designed so each plate has two individual v-notches for even flow distribution.
   c. The v-notch weirs shall be securely bolted to the effluent troughs with 3/8" Type 316 SS through bolt connection a minimum of every 12 inches.
   d. V-notch weirs shall operate at a minimum water elevation of 4 inches above the top flow control angle at design flow.
   e. Adjustable weirs shall be gasketed with 1/8" thick EPDM or appropriately sealed with an NSF-61 compliant sealant.
   f. V-notch weir design shall be such that top edge of plate is continuous rather than "serrated" for the purpose of protecting wash water hoses from damage when routed over weir and trough. Design shall not expose operator to sharp edges or corners.

G. Responsibilities:
   1. Plate Settler Manufacturer is responsible for delivery of equipment and supplies required under these specifications.
      a. Plate settlers shall be constructed of materials, certified or classified by NSF or underwriters laboratories as meeting ANSI/NSF Standard 61.
      b. Proper coordination and integration of all equipment required for supply in the basins, including plate pack assemblies, support beams and columns, and all other associated work shown on the drawings and specified in the Contract Documents.
      c. Ensuring that the plate settler system shall be properly coordinated and will function as a unit in accordance with these specifications.
      d. Ultimate responsibility for equipment coordination, installation, operation, and guarantees.
   2. The Contractor will be responsible for:
      a. Proper coordination with Suppler and installation of all equipment in the basins including plate pack assemblies, support beams and columns, piping, and all other associated work shown on the drawings and specified in the Contract Documents.
      b. Ultimate responsibility for equipment installation.

1.05 PERFORMANCE REQUIREMENTS

A. The inclined plate settlers shall operate to meet the following performance conditions. In the event of noncompliance, the Inclined Plate Settler Manufacturer shall make all necessary adjustments, repairs and/or modifications necessary to meet the requirements before the Work will be accepted.
   1. Maximum Design Flow Rate per Sedimentation Basin = 8.8 mgd
   2. Minimum Design Flow Rate per Sedimentation Basin = 2 mgd

3. Minimum Freeboard within Effluent Trough = 5 inches @ Maximum Hydraulic Flow Rate
4. Maximum Headloss Induced by the Plate Settlers = 1.5 inches @ 8.8 mgd (Measured from the weir elevation to the basin water surface upstream of and outside of the first plate pack).
5. Maximum Flow Maldistribution along a Plate Pack Row = less than 10% (Measured between the first and last plate pack in a given row of plate packs at 8.8 mgd per basin).
6. Maximum acceptable daily average turbidity in the plate settler effluent trough shall be no greater than 1.0 NTU 95% of the time with influent turbidity at 1-30 NTU at 8.8 mgd as measured over a 2-week test period.

1.06 SUBMITTALS

A. All submittals shall be as specified in Section 01 33 00. Note that the Supplier will need an approved submittal early in the project to meet interim project milestones.

B. Product Data and Calculations
   1. Design calculations to substantiate the proposed plate settler design. Calculations shall include at least the following:
      a. Plate area calculations.
      b. Detailed hydraulic calculations, including a hydraulic profile, at maximum design sedimentation basin and plant flow rates, across the inclined plate settlers showing the water surface elevations in the sedimentation basins upstream of the plate packs, through the effluent troughs, and into the settled water channel at the point of connection with the effluent troughs. Hydraulic calculations shall also include effective hydraulic loading rates of the units and flow velocities between plates and between rows of plate packs; flow velocities throughout the unit (feed box velocities, plate influent velocities, and plate velocities).
      c. Headloss through unit.
      d. Water surface elevations upstream of the effluent weir, in the effluent trough and in the sedimentation basin. Show these elevations on the submittal drawings.
      e. Effective hydraulic loading rates of unit.
      f. Maldistribution testing results.
      g. Weight of the equipment and its distribution on the supports for worst- case design conditions.
   2. Structural Calculations
      a. The Supplier shall submit complete structural calculations stamped and signed by a Structural Engineer registered in the state of Utah, in accordance with Section 01 33 00. The calculations shall demonstrate full compliance with the structural requirements specified for this Project on the Drawings and in Section 01 73 24.

C. Shop Drawings: Submit drawings and descriptive data of inclined plate settlers for review. Sufficient information is to be provided to show equipment conforms to specification requirements and allows for proper installation of equipment by Contractor. This includes, but is not limited to the following:
   1. Complete dimensional, and installation drawings and details.
      a. Elevations of weirs, flumes, troughs, and other controls;
      b. Materials and details of construction;
      c. Pertinent manufacturer's data and details of special features;
      d. Load distributions for the plate packs onto the supports (for the worst case design condition)
      e. Certified dimensional drawings for plate settlers and support system. Include support anchor bolt and anchorage details.
      f. Fabrication drawings, including weld types
   2. Diagram of the system that details which part of the equipment is completely submerged during normal operation and at the air/water interface.
   3. Flow diagrams of system showing location of equipment and devices;
   4. Parts list and other materials,
   5. Recommended shipping and storage procedures.
   6. Installation details and procedures identifying acceptable methods of lifting, lateral movement, leveling, and anchoring.
   7. Material data sheets.
   8. Conformance with ANSI/NSF 61 classification.
   9. Cross sections and details, as required, to satisfy Engineer and Contractor for the detailed design and location of all connecting or adjacent structural and mechanical items such as foundation, anchor bolts, steel and concrete supports, piping, conduit, etc.
   10. Any recommended or required deviations from the dimensions and locations of connecting or adjacent items as shown in the Drawings shall be described completely in the submittal.
   11. Operation and maintenance data per Section 01 33 00 required prior to submittal of Owners manuals.

D. Experience and References:
   1. Provide documentation indicating manufacturers qualifications as outlined in Section 1.06 of this specification.
   2. Provide contact name and phone number for reference on previous projects.

E. Welder certifications from a recognized testing laboratory demonstrating that the plate pack welders are qualified and experienced in welding stainless steel; and will demonstrate testing of welders using different types of welds, welding positions, etc.

F. Installation Manuals: The Inclined Plate Settler Manufacturer shall provide electronic copies of written Installation Manuals. The installation manuals shall provide complete and clear field erection instructions as well as recommended storage procedures prior to installation. The installation manuals shall be submitted at least two (2) weeks prior to shipping the first set of plate packs to the Project Site.
   1. Installation procedures identifying acceptable methods of lifting, lateral movement, leveling, and anchoring. Also include procedures for connecting the plate pack units to one another and to the settled water channel.

G. Owner's Manuals: The Supplier shall submit Owners Manuals in accordance with Section 01 78 23. The manuals shall address the following areas:
   1. Brief description of inclined settling plate components;
   2. Routine maintenance and cleaning procedures;
   3. Operation and maintenance instructions, parts list, illustrations and diagrams.

1.07 QUALITY ASSURANCE

A. Manufacturers Qualifications:
   1. Experienced in the production and manufacture of substantially similar equipment during the 5 years prior to the issuance of this contact, and able to submit evidence of satisfactory operation in at least 5 different installations.
   2. Plate settler manufacturer to provide support system troughs, plate settler modules, and all other components required providing a complete and operational plate settler system. All components shall be provided by a single manufacturer. The support system shall include all frames, columns, and beams required for a complete installation.
   3. The manufacturer shall be solely and fully responsible for the warranty and mechanical design adequacy of all the provided components under this section.

B. Shop Inspection:
   1. Shop inspection may be required by the Owner at its own expense. The Supplier shall give at least three (3) weeks notice to the Construction Manager prior to beginning of any fabrication work so that inspection may be provided. The Supplier shall furnish all facilities for the inspection of materials and workmanship in the shop and inspectors shall be allowed free access to the necessary parts of the works. Inspectors shall have the authority to reject any materials or work which does not meet the requirements of these Specifications. Inspection at the shop is intended as a means of ensuring high quality workmanship and of facilitating the work, but it is expressly understood that it will in no way relieve the Supplier from responsibility for furnishing proper materials or workmanship under this Specification.
   2. Plate pack units shall be completely assembled in the shop to assure accurate plate spacing.

C. Workmanship

1. Workmanship in the fabrication of the inclined plate settlers shall be first-class, including the following requirements. The assembled plate packs shall have members that are straight and true. Structural distortions, warps, and other defects shall not be present in the plate pack assemblies before or after installation in the sedimentation basins. All exterior surfaces and edges of the plate packs shall be smooth. Sharp corners shall be ground round and smooth.
2. All welding shall be done in accordance with the latest applicable code and other pertinent standards of the American Welding Society (AWS). Qualification of welders shall be in accordance with AWS standards. Welding of stainless steel shall be performed by welders experienced in stainless steel welding. In assembly and during welding, the component parts shall be adequately clamped, supported, and restrained to minimize distortion and for control of dimensions. Weld reinforcement shall be as specified by the AWS Code. Upon completion of welding, all weld spatter, flux, slag, and burrs left by attachments shall be removed. Welds shall be repaired to produce a workman- like appearance, with uniform weld contours and dimensions. Finished welds shall be neat in appearance.

1.08 DELIVERY, STORAGE AND HANDLING

A. Packing and Shipping: Pack as required for shipping and outdoor storage at the project site for up to 6 months. Provide lifting lugs or other means for unloading and/or installation. Include special handling instructions and provide picking spreader as needed. Plate settlers shall be shipped with cardboard end caps and corner pads to protect plates from damage during shipping and storage.

B. Storage and Protection: The Contractor will prepare the staging area for storing plate packs. The area shall be as designated on the Drawings. The storage area shall be graded with aggregate rock to form a firm, well-draining storage area. Plate packs shall be covered and kept clean at all times.

C. Protect finished surfaces which may be damaged during installation with removable tape or suitable alternate.

1.09 SPARE PARTS

A. Special tools as required for assembly or disassembly of the plate settlers and support system.

B. Spare parts as recommended by the manufacturer packed in containers which are clearly identified as to their contents. Pack all items for long periods of storage.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturer: Provide equipment as manufactured by the following:

1. Meurer Research, Inc. (MRI).
2. Jim Myer and Sons (JMS).

2.02 GENERAL

A. All equipment shall be designed for continuous, 24-hour operation. All parts of the product shall be amply proportioned for all stresses, which may occur during fabrication, installation, and operation.

B. Stainless steel nameplates giving the name of the manufacturer, model number, the rated capacity, shipping and operating weights, and any other pertinent data shall be attached to each unit.

C. The plate settler manufacturer shall coordinate the design and installation of the plate packs and support system with the hydraulic solids scraper manufacturer.

D. Fabrication:
   1. All welding shall be performed by qualified personnel in strict accordance with manufacturer recommendations and in accordance with the latest requirements of AWS.
      a. Sharp corners of all cut or sheared edges shall be ground smooth where practical.
      b. Welds shall be rough ground to remove heavy weld ripple or unusual roughness per the latest recommended practices of AWS.
      c. Acceptable welding methods shall include MIG, TIG, stick-electrode, or as per the manufacturer's recommendations.
   2. All welds shall be fully cleaned and passivated after completion of welding operations. All pastes and solutions shall be disposed of in accordance with all applicable laws and regulations.

E. The components of the Inclined Plate Settlers shall be made from the following material:
   1. Plates: Type 304 SST (Type 304L SST if welded)
   2. Frames: Type 304L SST
   3. Columns: Type 304 SST (Type 304L SST if welded)
   4. Beams: Type 304 SST (Type 304L SST if welded)
   5. Trough/Flume Assembly: Type 316 SST (Type 316L SST if welded)
   6. Ladder Assembly: Type 316L SST
   7. Slide Gate: Type 316 SST (Type 316L SST if welded)
   8. Baffles Type: 316 SST (Type 316L SST if welded)
   9. Adjustable Weirs: Type 316 SST (Type 316L SST if welded)
   10. Gaskets: EPDM Rubber
   11. Nuts, bolts, fasteners: 316 SST (in accordance with Section 05 50 20)

F. All components of the Inclined Plate Settlers that are not completely submersed under normal operation or at the air-water interface shall be constructed out of Type 316 stainless steel (Type 316L SST if welded).

2.03 PLATE PACKS

A. Plate settler modules consisting of metal sheets stacked and assembled in a pack or module.

B. The channels shall have a sufficient cross-sectional area, and shall be oriented on an angle of 55° from the horizontal, to promote gravity drainage of solids collected on the plate bottoms.

C. Minimum perpendicular plate spacing shall be 2 inches, nominal.

D. Plate settler modules shall fit in the corresponding sedimentation basin as indicated on the Drawings.

E. The plates shall be proven to support a 30 lb. solids loading.
   1. The plate shall be designed to handle a 30 lb. solids loading evenly distributed over the plate without failing, buckling, yielding, or creating a permanent deformation. The plate shall not exceed a maximum deflection of L/140 anywhere along the plate width and shall have center stiffeners as needed to prevent deflection of plates.
   2. The manufacturer shall provide a stamped report from a third-party testing laboratory in compliance with ASTM E330 and proving that the L/140 testing criteria is met.

F. Connectors
   1. Flexible connections shall be provided between each plate pack. Connectors shall be Neoprene sleeves with Type 304 stainless steel clamps.
   2. All gaskets and sleeves shall be neoprene.

2.04 EFFLUENT ASSEMBLY

A. The effluent assembly shall consist of side-mounted effluent troughs for each row of plate packs, and protected by perimeter aprons or separation walls that prevents flow in the basin from bypassing the plate packs. Both shall be constructed with a minimum thickness of 14 gauge.
   1. Troughs shall be of the dual side load arrangement, meaning one effluent trough per frame assembly shall not be allowed.
   2. The effluent trough shall be sized by Supplier. Flow into the trough will be controlled by continuous weirs.

B. The effluent trough shall be of continuous construction, or have a sealed connection, by use of SST and NSF 61 approved gaskets, between adjacent plate packs.

C. Minimum Number of Troughs and Minimum Trough Depth per Basin:
   1. Minimum Number of Troughs: TBD
   2. Minimum Trough Depth of Inclined Settler Plate:
      a. Exterior to Plates: 8 inches

D. The effluent trough/ flume assembly shall be reinforced as necessary to handle the loads transmitted from the effluent trough to the effluent flume, and the loads due to maintenance activities. Lateral stiffness and rigidity shall be provided if necessary through the use of spreaders placed at strategic points along the length of the flume and fastened with Type 316 stainless steel hardware. The stiffeners shall be above the design operating water level in the flumes. To satisfy horizontal and vertical deflection requirements, angle stiffeners shall be used to reinforce the sides of the trough.

E. Each trough shall be equipped with adjustable weirs for leveling during initial installation and to provide an even flow distribution during operation. Troughs located above the plate settlers obstructing access to the tops of the plates shall not be accepted.

2.05 TOP FLOW CONTROL DEVICE

A. Each plate shall be equipped with an integral Type 304 stainless steel top flow control device (angle or perforated tube) to ensure that there is an even flow distribution across the entire surface area of the plate.

B. Top flow control device shall provide a suitable walking surface for routine cleaning and maintenance without the use of a temporary walking surface, such as plywood. No part of the plate settler system shall deform or fail due to walking on top of the plates.

1. The manufacturer shall provide a P.E. stamped report from a third-party in compliance with ASCE 7-10 (Minimum Design Loads for Buildings and Other Structures) referencing catwalks for maintenance access. Specifically the flow control deck shall be designed using a minimum uniformly distributed live load of 40 psf and a minimum concentrated live load of 300 pounds. The top flow control device shall not experience any buckling, permanent deformation, or yielding.

2.06 ACCESSORIES

A. All brackets, fasteners, anchor bolts and similar items necessary to secure and support the furnished equipment on concrete beams within the basin shall be furnished by the equipment manufacturer and installed by the Contractor in accordance with the manufacturer's instructions.

B. Plate settler manufacturer shall equip the center most effluent trough per basin with a 1-inch stainless steel threaded nipple located below the water surface elevation within the effluent trough for sampling purposes as indicated by the Drawings. The location of the nipple shall be at the end of the trough and shall be coordinated with the Contractor.

2.07 SURFACE FINISH/CLEANING

A. All Stainless Steel components shall be protected, cleaned and tested as follows:

1. Stainless steel components shall be protected from carbon steel contamination during fabrication and assembly as defined in Paragraph 8 of ASTM A380. Surfaces surrounding joints shall be cleaned as discussed in Paragraph 6.3 prior to welding. Careful adherence to good stainless-steel practices may minimize descaling and cleaning requirements.
2. Welding temperatures shall be carefully monitored as to not sensitize the material and thereby increase the risk of intergranular corrosion.
3. After completion of welding, all surfaces shall be descaled as necessary using methods described in Paragraph 5 of ASTM A380. Welded surfaces (including surfaces within the heat affected zone of the weld) shall be descaled using a pickling solution as discussed in Paragraph 5.2. Surfaces shall be thoroughly rinsed in accordance with Paragraph 5.2.5.
4. Following descaling, all surfaces shall be cleaned as necessary using methods described in Paragraph 6 of ASTM A380. Final cleaning of all surfaces shall be in accordance with Paragraph 6.4 of ASTM A380.

5. Upon completion of cleaning, all surfaces shall be visually inspected in accordance with Paragraph 7.2.1 prior to testing. Any gross indications of Iron as defined in Paragraph 7.2.1.1 shall be cleaned as necessary.
6. Testing to ensure proper passivation and cleaning has occurred shall be as defined in Paragraph 7.2.5 of ASTM A380. First, perform a water-wetting and drying test on all stainless-steel surfaces in accordance with Paragraph 7.2.5.1 of ASTM A380 or a Practice A – Water Immersion Test as defined in Paragraph 14.1 of ASTM A967. Failed areas shall be re-cleaned and retested using a Copper Sulfate Test in accordance with Paragraph 7.2.5.3 of ASTM A380 or Practice D – Copper Sulfate Test found in Paragraph 14.4 of ASTM A967 . Any remaining failed areas shall be cleaned using a nitric acid solution in accordance with Table A2.1 Part II of ASTM A380 followed by retesting of all affected areas using a Copper Sulfate Test.
7. Manufacturer shall notify Engineer of any failed tests. No equipment shall be shipped without certification that all surfaces have passed inspection and testing. Manufacturer shall remove test chemical in accordance with the testing manufacturers recommendations. No visible indications of Iron may exist prior to shipment. Any evidence of rust or blooming upon arrival on site shall be the responsibility of the manufacturer to address.

PART 3 EXECUTION

3.01 EXAMINATION

A. Inspect all components, upon delivery, for shipping damage and conformance to specifications prior to installation. Repair or replace damaged items as directed by Construction Manager, including visible corrosion, at no additional cost to the Owner. Only factory-trained manufacturer's representative shall perform repair work.

3.02 INSTALLATION

A. Plate settler modules shall be provided in such configurations to minimize, if not eliminate, field modification.

B. Contractor will install Supplier’s products in accordance with manufacturer’s instructions.
   1. In general, installation shall include:
      a. Install bolts, nuts, and washers at all mounting locations for each plate pack.
      b. Install shims under anchor plates where necessary to meet the installation tolerances.
      c. Install flume connections to the collector trough and between plate packs.
      d. Install gaskets, bolts, nuts, and washers.
      e. Adjust weir plate to required elevation.
      f. Apply sealant around all gaskets after plate pack connections have been made and around all weir plates after elevations have been verified.
      g. Level plate pack supports with non-shrink, nonmetallic grout.

h. Install and level the plate pack units and troughs in accordance with the Manufacturer's recommendations and the Drawings. All plate settler support anchor locations shall be leveled to within +/- 1/8 of an inch. Contractor shall exercise care in erecting and leveling the plate settlers, troughs, and weir plates so that the units are at the elevations shown on the Drawings or specified herein and have deflections within the manufacturer's specified limits.

C. After installation, all weirs shall be leveled to within 1/16 of an inch of target elevation as shown on the Manufacturer's drawings. All brackets, fasteners, and similar items necessary to secure the furnished equipment in the basin shall be furnished by the Manufacturer.

3.03 FIELD TESTING

A. Contractor will perform all testing under the supervision of the Manufacturer's representative. The Contractor will conduct all specified tests and furnish all labor, equipment, materials, and supplies to conduct these tests. The Contractor will be responsible for sample collection, shipping, and analyses of all test samples. The Contractor will provide the Construction Manager with sufficient advance notice of the testing to enable the Supplier and Construction Manager to witness the tests.

B. Supplier shall provide the Contractor with protocols for all tests describing the type of test, test procedures, instrumentation used, proposed flow rates, and other information necessary to describe the proposed testing plan.

C. The effluent quality of the settled water must meet the performance requirements specified herein.

D. The inclined plate settlers shall demonstrate compliance with the specified hydraulic requirements. The inclined plate settlers shall be demonstrated to have the hydraulic capacity specified without maldistribution of flow or requiring more than the specified maximum headloss.

E. If a basin or individual plate pack assembly fails to meet specified performance requirements, the Supplier shall direct the Contractor to make necessary corrections and retest the settling basin or plate pack until the performance test is satisfactorily completed. No additional payments will be made for retesting.

F. Functional Testing
   1. Complete Functional Testing in accordance with Section 01 79 00.

G. Installation Tolerance:
   1. For the weirs on the plate pack trough, the maximum allowable variation shall be ±1/8-inch to achieve the water surface elevation indicated on the Drawings at maximum flow.

H. Tolerance shall be verified prior to filling with water. The Contractor will provide equipment to verify tolerances. Operational Testing: As specified in Section 01 79 00.
   1. Upon completion of testing, the Supplier shall submit to the Construction Manager a copy of the completed test reports. Reports shall include description of the units tested, test procedures, test flow rates, pressures, levels, and all other data and results required to demonstrate that the equipment meets specified requirements.

3.04 MANUFACTURER'S FIELD SERVICES

A. The CONTRACTOR shall coordinate field service work with the Manufacturer's representative, Owner, and Construction Manager prior to initiating such work.

B. The manufacturer shall provide a qualified field technician to perform the following:
   1. Inspect the system before initial start-up and verify that system has been correctly installed, as specified herein and in Section 01 79 00, prior to filling with water.

C. The Manufacturer shall provide the services of a factory field service technician or Engineer as follows:
   1. To include, but not limited to, four (4) trips to the site, totaling 20 days of on- site work. A day on-site shall be considered to be 8 hours in duration.
   2. Observe/advise the Contractor on the installation of the settler equipment.
   3. Check and verify that installation of the plate pack assemblies is in accordance with the Drawings and Manufacturer's installation instructions.
   4. Should chemical addition be required to meet performance requirements, settler Manufacturer shall recommend adjustments in coagulant chemical dosages.
   5. Assist in start-up and testing of the settler system as required.
   6. Instruct the Owner's personnel on operation and maintenance of the settlers. Personnel instruction shall consist of not less than one (1) day of classroom and field training. Subjects shall include the following:
      a. Troubleshooting.
      b. Operating adjustments for performance optimization.
      c. Preventive maintenance.
      d. Maintenance procedures.

END OF SECTION

SECTION 46 43 80

HOSELESS SOLIDS COLLECTION SYSTEM

PART 1 GENERAL

1.01 DESCRIPTION

A. SCOPE:

1. This Section specifies the solids collection system equipment for use in separation of solids in the flocculation/sedimentation process as shown on the Drawings.
2. Provide and install solids collector systems which include tandem collector assemblies, electric drive assemblies and controllers, drive cables, sensors, rigid solids conduit, cable pulleys, control system for a fully automatic or manual operation, and all other miscellaneous accessories and hardware as required for a complete and functional installation.
3. The solids collector equipment shall be provided as an integral package by a single manufacturer regularly engaged in the production of this equipment. The solids collector system shall be assembled in full conformity with drawings, specifications, and instructions furnished by the equipment manufacturer.
4. The solids collectors shall remove the settled solids from the basin floor. Flow shall be gravity driven. The solids shall be discharged through rigid solids conduits which are connected to the fixed piping to exit the basin.
5. The solids collectors shall be designed to fit the configuration of existing sedimentation basins without the need for structural modifications other than those included in the Contract Drawings.

B. EQUIPMENT LIST:

Item	Equipment Number
Solids Collector 1 A	40-COL-10010
Solids Collector 1 B	40-COL-10020
Solids Collector 2 A	40-COL-20010
Solids Collector 2 B	40-COL-20020
Solids Collector Drive 1 A	-
Solids Collector Drive 1 B	-
Solids Collector Drive 2 A	-
Solids Collector Drive 2 B	-

C. OPERATING REQUIREMENTS:

Component	Value
Number of Basins, quantity	2
Dimensions of each basin, ft x ft	61 x 40
Number of Units per Basin	2
Design Flow Rate per unit, gpm	100-150
Design cycles per day per basin	TBD
Collector Speed, ft/min	TBD
Maximum headloss through orifices, ft	TBD
Sidewater depth, feet	14.6
Maximum Motor, horsepower	1/4, (Conform to Section 43 05 21)
Motor Voltage/Phase	480V/3 Phase

1.02 QUALITY ASSURANCE

A. REFERENCES:

1. This Section contains references to the following documents. They are a part of this Section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this Section as if referenced directly. In the event of conflict between the requirements of this Section and those of the listed documents, the requirements of this Section shall prevail.

Reference	Title
ABMA-9	Load Ratings and Fatigue Life for Ball Bearings
AGMA 2001-B	Fundamental Rating Factors and Calculation Methods for Involute Spur and Helical Gear Teeth

ASTM A48	Gray Iron Castings
ASTM A536	Ductile Iron Castings
ASTM A666	Austenitic stainless steel, sheet, strip, plate and flat bar for structural application
ASTM B247	Aluminum-Alloy Die Forgings, Hand Forgings and Rolled Ring Forgings
ASTM E18	Rockwell Hardness and Rockwell Superficial Hardness of Metallic Materials
AWS D1.1	Structural Welding Code—Steel
NEMA 250	Enclosures for Electrical Equipment

B. UNIT RESPONSIBILITY:

1. The Contractor shall assign unit responsibility to the manufacturer of the Solids Collection Equipment provided under this section. This manufacturer is the unit responsibility manufacturer and has unit responsibility, for both the equipment assembly specified in this section, motors specified in Section 43 05 21, and VFD and all other equipment assembly components specified elsewhere but referenced in this section. A completed, signed, and notarized Certificate of Unit Responsibility (Form 43 05 11-C, Section 01 99 90) shall be provided.

C. FACTORY TESTS:

1. Perform factory tests of all equipment and controls associated appurtenances of the solids collection equipment prior to delivery onsite.

D. MANUFACTURER'S EXPERIENCE

1. Manufacturer shall have at least 10 installations of the proposed design. Solids collectors sold under other names, corporate identities or ownership; or not directly fabricated and supplied by the manufacturer will not be considered as meeting the experience qualifications.

E. SHIPMENT, PROTECTION AND STORAGE:

1. The equipment shall be protected during shipment and storage as specified in Section 01 66 00.

1.03 SUBMITTALS

A. The following information shall be submitted in accordance with Section 01 33 00:

1. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. A check mark shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
2. Certificate of Unit Responsibility (Form 43 05 11-C) attesting that the Contractor has assigned, and that the manufacturer accepts, unit responsibility in accordance with the requirements of this Section specified in 1.02B. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.

3. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this Section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required".
4. Documentation of experience specified in 1.02D. Provide a list of 10 hoseless solids collector installations of the design complying with these specifications and proposed for this project. All applications shall be municipal applications. Provide names and phone numbers of at least five references in operation for at least five years.
5. General arrangement drawings showing the entire assembly. This shall include a materials list and descriptions of all major components such as all gears, structural members, solids collection members, and the scum removal system (sizes, piping connections, ASTM designations where appropriate, thicknesses, and construction).
6. Rating, AGMA and ASTM designations, construction, and detailed descriptions of all gears, reducers, and drives.
7. Complete shop drawings of all equipment furnished.
8. Design and layout of equipment indicating all dimensions.
9. Head loss calculations through the solids collector.
10. Bearing manufacturer, bearing model, and ABMA L-10 life data.
11. Shop and field painting systems. Include the manufacturer's descriptive technical catalog and specifications. Submit drive finish coat colors for Owner selection.
12. Manufacturer's data including product literature, materials of construction, construction details of equipment, wiring diagrams, and weight of equipment.
13. Connection locations and attachment details.
14. Motor submittal data as specified in Section 43 05 21.
15. Control panel interconnection diagrams including field connections and connections to the plant control system. Boiler plate diagrams are not acceptable.
16. Drawings of the control panel including elevation of both exterior and interior including dimension.
17. Seismic design calculations per the requirements of Section 01 73 24

1.04 ENVIRONMENTAL CONDITIONS

A. Environmental conditions will be as described in Section 01 11 80.

1.05 SEISMIC ANCHORAGE AND STRUCTURAL DATA

A. Mechanical, instrumentation and control, electrical, nonstructural systems, components, and elements permanently attached to the structure shall be anchored and braced to resist seismic forces. Contractor shall design the structural components, seismic attachment, braces, and anchors to the structure for all parts or elements of the mechanical and electrical systems in accordance with Section 01 73 24.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The Owner and Construction Manager believe the following candidate manufacturer is capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's product, nor shall it be construed that a named manufacturer's standard product will comply with the requirements of this Section. Candidate manufacturers include Meurer Research Inc., JMS, or approved equal. The Owner and Construction Manager are not aware of an equal manufacturer.

2.02 MATERIALS

Component	Material
Header Assembly and Pipe	304, 316 Stainless Steel
Casters	Polyurethane, Solid Urethane
Drive Cable	304 Stainless Steel

A. All fabricated stainless steel components shall be passivated to prevent future corrosion. All welds shall be passivated by mechanical cleaning per ASTM A-380 and cleaning with an NSF approved acid solution. Nitric acid or other hazardous chemicals shall not be allowed for cleaning. Non-welded parts shall be supplied with standard mill finish.

B. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

2.03 FEATURES

A. General:
   1. Motor bearing are factory lubricated and sealed for life.
   2. Motors shall be inverter duty rated and comply with the requirements of Section 43 05 21.

B. Reel Drive Assembly
   1. Each drive assembly shall consist of a motor, which shall be coupled to a single rotating drum for manipulation of the cable that is attached to the tandem collector assembly.
   2. The cable shall be firmly attached to the rotating drum to prevent slippage. Tensioning the cable between multiple pulleys to prevent slippage will not be allowed.
   3. The cable shall store on the reel in a single layer, the placement of which shall be organized by the drive mechanism.
   4. The complete drive mechanism shall be packaged on a single base and provided with a powder coated aluminum or stainless steel safety enclosure.
   5. The drive cable shall be of a minimum diameter of 1/4". Pneumatic or steel tape drive systems are not acceptable.

6. The drive assembly shall be capable of ceasing operation on an excessive load without physical damage to the drive unit. During an overload, protection built into the VFD will cease operation and activate an alarm locally at the control panel. Operation will continue after alarm is reset. Back up protection in the form of a shear pin is required.
7. The drive assembly shall have integral position sensors which determine when the collector is at the end of the basin, the beginning of the basin and points in-between. No external or under-water position sensors shall be required or allowed.
8. The drive shall have an emergency disconnect button pre-wired to the assembly.

C. Hoseless Collector Assembly

1. The hoseless solids collector assembly shall be manufactured entirely of stainless steel, with the exception of non-metallic parts such as casters, bushings, orifices, etc. which will be manufactured of plastic, non-metallic materials.
2. Each Hoseless collector assembly shall consist of four solids collection header pipes each equal to half the width of the basin. Each header pipe shall have helical flow orifice blocks spaced by the manufacturer to insure proper distribution across the length of the header. Each header pipe shall have removable end caps for easy clean out.
3. The helical flow orifice blocks shall be designed to cause flow to enter tangentially into the header pipe for more efficient solids removal. Orifices shall cause a spiral flow inside the header pipe to prevent solids from settling and shall point forward to remove the settled solids ahead of the pipe as it travels down the basin. Holes drilled in the bottom of the header pipe shall not be allowed.
4. The collection chamber shall “telescope” over the smaller fixed solids conduit. Articulating pipes, flexible solids hoses, flexible hose joints, or swivel joints are not allowed.
5. The collection chamber shall be isolated against the horizontal telescoping pipe solids conduit by means of a UHMW bushing.
6. The horizontal telescoping pipe solids conduit shall include a UHMW flow balancing ring designed by CFD analysis to assure equal flow from the front and back solids collection headers.
7. Each header pipe shall be equipped with a plow blade which is triangular in shape and is equal in length to the header pipe, as shown on the Drawings. These plows will remove the settled solids that have accumulated at the ends of the basins.
8. The Hoseless collector assembly shall be guided by means of horizontal casters on the ends of the header pipes. Guide rails are not allowed.
9. Flow through the hoseless solids collector shall be controlled by a solids valve as directed by the collector control panel.
10. Stainless curbs shall be provided by the manufacturer as required between multiple units. Include all floor supports, mounting hardware and properly sized anchors.
11. Provide stainless steel end stops to be anchored to the basin floor at the header assembly’s end of travel

2.04 CONTROLS

A. Each sludge collector shall have its own control panel. The Collector Control Panels shall comply with the respective specifications in Division 26 and Division 40.

B. The motorized flow control valves associated with the solids collectors as shown on the Drawings shall be controlled from the Collector Control Panel. The Collector Control Panel shall provide solids valve open and close commands and shall receive an open and close signal from the valve actuator as well as a signal to indicate that the valve is in "remote" operation.

C. Collector Local Control Panel:
   1. Each Collector Control Panel shall include a programmable logic controller based on the Modicon M340 platform, with provisions for Modbus TCP connection.
   2. The Collector Control Panel shall arrive to the jobsite internally pre-wired ready to connect to each drive unit.
   3. The Collector Control Panel shall be powered by a three phase, 480 VAC circuit.
   4. Associated control equipment shall be rated 120 VAC and powered from the control panel. Provide 120 VAC control transformer for all 120 VAC controls.
   5. Control Panel shall include Schneider Electric Harmony HIM touch panel screen, model HMIST0735 series, or approved equal.
   6. In addition to that already listed herein the Collector Control Panel shall include the following:
      a. Real time clock for programmable run initiation.
      b. PLC with associated communication cables.
      c. Variable frequency drive (VFD) with Local/Off/Remote and manual speed control when in Local mode. The VFD's shall be sized based on constant torque and the full load amp rating of the drive motors. VFD's shall be per specification 26 29 23 and be compatible with motors specified in 43 05 21.
      d. Panel face with the features specified herein.
      e. Pilot devices as specified herein.
      f. Properly sized protective circuit breakers, surge suppression devices, terminal blocks, wireways, control relays, space heater and enclosure light.
   7. Provide the following connections for each solids collector to the Plant SCADA system:
      a. In Remote (dry contact in LCP for monitoring by remote PLC)
      b. Running (dry contact in LCP for monitoring by remote PLC)
      c. Solids Collector Alarm Remote Start or Call to Operate (dry contact in remote PLC to activate LCP)
      d. Medium speed indication (dry contact in LCP for monitoring by remote PLC)
      e. High speed indication (dry contact in LCP for monitoring by remote PLC)
      f. Common fault (dry contact in LCP for monitoring by remote PLC)

      Control devices shall be housed in an enclosure constructed per the requirements of Section 26 29 13 –Enclosed Controllers. It shall be the responsibility of the solids collector manufacturer to provide all of the necessary control hardware and components as required for a complete and functional control system.
   8. The Collector Control Panel shall include environmental controls to maintain the internal temperature of the control panel to the ambient temperature rating of the components installed within the control panel. This includes the VFD's.

2.05 SPARE PARTS

A. Provide the following spare parts:
   1. Two (2) Drive cable, See manufactures recommended lengths
   2. One (1) 1-pole relay
   3. One (1) 2-pole relay
   4. Two (2) 5/16-inch cable thimbles
   5. Four (4) 5/16- inch wire rope clips
   6. Five (5) shear pins
   7. One (1) spanner
   8. One (1) pulley
   9. Two (2) Delrin bushing

B. Spare parts shall be tagged and stored as specified in Section 01 66 00.

2.06 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00:
   1. Certification of factory acceptance testing.
   2. Motor Data Form 43 05 21-A
   3. Manufacturer's Installation Certification Form 43 05 11-A specified in paragraph 3.01
   4. Manufacturer's Instruction Certification Form 43 05 11-B specified in paragraph 3.03.
   5. Equipment Test Report Form in accordance with Section 01 99 90.

PART 3 EXECUTION

3.01 INSTALLATION

A. The solids collectors shall be installed as specified and in accordance with manufacturer's written recommendations. The manufacturer shall provide a factory-trained service technician to supervise installation and testing of all components. The installation and initial operation shall be certified on Form 43 05 11-A specified in Section 01 99 90.

3.02 TESTING

A. After completion of installation, the collectors shall be completely tested to ensure compliance with operating requirements as specified and in accordance with the testing procedures in Section 01 45 20.

B. In addition to the requirements of 01 45 20, fill each floc/sed basin with water and operate the collector continuously at maximum speed for 48 hours. At no point in the operation shall the solids collectors cease to operate. If the mechanisms fail or cease to operate, or in the opinion of the Owner, the solids collectors should exhibit evidence of improper installation, immediately halt the test and remedy the problem. After completion of necessary repairs or adjustments, the tests shall be repeated. Failure to successfully complete the test in six attempts shall be considered sufficient cause for rejection.

3.03 TRAINING

A. minimum of 8 hours of training conforming to the requirements of Section 01 79 00 and the following shall be provided. Training shall be certified on Form 43 05 11-B specified in Section 01 99 90. Training shall include instruction on field adjustments and shall include complete disassembly and subsequent reassembly of one mechanism.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 46 61 11

FILTER UNDERDRAIN SYSTEM

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies an underdrain (air/water) drinking water filter system. The underdrain system consists of the collection of filtered water and uniform distribution of backwash water and air supply for backwash events.
   2. The Supplier/Contractor shall provide all labor, materials, equipment and incidentals required to furnish and install the filter underdrain system with nozzle systems and air distribution manifold as shown on the Drawings and as specified.
   3. The filter underdrain system shall include the filter underdrain nozzles, nozzle sleeves, forming panels, panel support columns, and air distribution manifold.
   4. This section includes computational fluid dynamics (CFD) modeling for the plenum and waterways as shown on the Drawings. The Supplier shall include a final report with recommendations for plenum opening dimensions for backwash hydraulics optimization.

B. Equipment List:

Item	Equipment No.
Dual Media Filters	Filters 1-6

1.02 RELATED SECTIONS

A. The specification sections listed below are an integral part of this equipment specification.
   1. Section 03 60 00 - Grouting
   2. Section 05 05 20 – Anchor Bolts
   3. Section 40 05 02.01 – Piping System Schedule, Process Air (Stainless Steel)
   4. Section 40 05 07– Hangers and Supports for Process Piping
   5. Section 40 05 23 – Stainless Steel Process Pipe and Tubing
   6. Section 46 61 13 – Filter Media (Sand and Anthracite)
   7. Section 46 61 19 – Wash Water Troughs

B. NSF International:
   1. Standard 61- Drinking Water System Components – Health Effects.

C. ASTM international (ASTM)
   1. A790-Standard Specification for seamless and welded Ferritic/Austenitic Stainless-Steel Pipe

1.03 SYSTEM DESCRIPTION

A. Physical Requirements:
   1. There are a total of 6 single cell filters with nominal internal dimensions of 29.50 ft long by 12.00 ft wide.
   2. The plenum height shall be 2.00 ft. A total of nine (9) rectangular waterway orifices (plenum openings) shall be cast into the wall from the plenum to the lower gullet as shown on the Drawings. Final orifice heights shall vary and be determined by the manufacture using CFD modeling to optimize hydraulic distribution of backwash water.
   3. Each filter shall be equipped with an air distribution manifold located in the plenum. The Supplier shall design and supply the air distribution manifold from the connection point as shown on the Drawings. The air distribution manifold shall be structurally and seismically supported per the project specifications.
   4. The filter underdrain and air distribution manifold shall be constructed to avoid blocking the waterways and flow from the backwash supply and the filtered effluent.

B. Design Requirements
   1. General:
      a. The filter underdrains shall be resistant to changes in head loss, flow uniformity, corrosion, and any other effects which would in time cause loss of efficiency or effectiveness of its operation.
      b. Design the filter underdrains to meet all requirements for delivery, storage, handling, installation, and operation.
   2. Flow Design Requirements
      a. Design filter nozzles to produce uniform air and water flows throughout the filter cell over the full range of backwash and air scour flow rates specified on the Drawings.
      b. The installed filter underdrain systems shall satisfy both of the following criteria for acceptable flow uniformity:
         1) Maldistribution of air and water flows during backwash, for specified flow conditions, shall not exceed:
            a) Plus or minus 5 percent of average gallons per minute per square foot (cubic meter per hour per square meter) of filter area.
            b) Plus or minus 10 percent of average standard cubic feet or air per minute per square foot (Normal cubic meter per hour per square meter) of filter area.
         2) Visual test shall reveal no evidence of maldistribution or disturbance of filter media.
         3) CFD modeling provided by the Supplier shall reveal no evidence of maldistribution of air and water flows during backwash. Modeling shall include analysis through the plenum openings and underdrain nozzles.
      c. In addition to the uniformity requirements specified above, the head loss through the nozzle systems for the backwash water shall be 21 to 25 inches of water when backwashing at 23.0 GPM/ft^2 of filter area, no exceptions.

d. The filter underdrain systems shall be furnished and installed to perform satisfactorily and as specified when operated under the following flow conditions:
   1) Down flow of filtered water at 3.9 to 6.9 gpm/ft^2.
   2) Upflow of backwash water 6 to 23 gpm/ft^2
   3) Upflow of scour air up to 5 scfm/ft^2.
   4) Upflow of combined scour air and backwash water at 4 scfm/ft^2 and 8 gpm/ft^2, respectively.
e. Design the air backwash header to distribute air across the risers to the plenum over the full range of normal air backwash flow rates plus or minus 10% of average standard cubic feet of air per minute.

3. Structural Design Requirements
   a. The filter underdrain systems, including the concrete false floors and related appurtenances, anchorage, and supports, shall be designed in accordance with ACI Standard 318 to safely withstand the specified loadings.
   b. The nozzle underdrain systems, when installed, shall be designed for an uplift force of 1,600 pounds per square foot.
   c. There shall be no leakage from the seals, joints, or gaskets at the design pressure at maximum backwash rates.
   d. The filter underdrain systems shall be designed to withstand a net downward loading of not less than 1,400 pounds per square foot to account for the weight of the media, and the in-service hydraulic loading, plus its own dead weight and the force of vertical seismic accelerations as specified in Section 01 73 24.
   e. Adequate safety factors to account for dynamic loading (such as during the initiation and termination of backwash) and seismic loads as specified in Section 01 73 24, shall be included in the design to account for any dynamic loading above and beyond that described above.
   f. The design shall adequately provide for all loads incurred during shipment, handling, and installation.

C. The filter underdrain system shall be designed and installed to ensure long term stability in its operating characteristics. It shall be resistant to changes in head loss, flow uniformity, and any other effects which would in time cause loss of efficiency or effectiveness in its operation.

1.04 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. The equipment provided under this section shall be the product of a firm regularly engaged in the design and manufacture of filter underdrain systems for water treatment plants. The Supplier/Subcontractor shall be prepared to document the manufacturer's technical competence, skill, resources, and ability to complete the work specified herein. All documentation shall be submitted and reviewed prior to design, fabrication, and shipment of any component specified herein.
   2. Manufacturer shall utilize a quality control program in manufacturing of the equipment specified herein. If requested, provide letter or certificate documenting and detailing quality control program.

B. Unit Responsibility:
   1. The underdrain manufacturer shall be responsible for designing and furnishing a ready-to-install filter underdrain system which meets all flow and structural design requirements specified herein, including items covered in article 1.02.A. All filter underdrain system items specified herein shall be obtained from a single filter underdrain manufacturer, who shall be the source of the information for all equipment furnished pertaining to the filter underdrain system, regardless of the manufacturing source of that equipment. A completed, signed, and notarized Certificate of Unit Responsibility (Section 01 99 90-Form 43 05 11-C) shall be provided that covers the Underdrain System and the ancillary systems mentioned in Article 1.02.A

C. Installation and Testing Certification:
   1. All installation activities including grouting, joining, and otherwise installing the underdrain system shall be performed by personnel properly trained by a representative of the filter underdrain manufacturer. Supplier/Contractor shall provide certification from filter underdrain manufacturer stating that the entire filter underdrain system has been properly installed, properly aligned, successfully tested, meets all requirements for the specified performance under the conditions herein, and that the equipment is ready to be put into continuous service.
   2. Support column forms, nozzle inserts, nozzles, and any specialties required for installation such as special anchorage, leveling shims, temporary sealing caps, air scour header, shall be the products of a single Supplier.

1.05 SUBMITTALS

A. The following submittals shall be provided in accordance with Section 01 33 00:
   1. Certificate of Unit Responsibility 43 05 11-Form C, attesting that the Supplier/Contractor has assigned unit responsibility in accordance with the requirements of this section and Section 43 05 11. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
   2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Supplier/Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Supplier/Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

3. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
4. Complete shop drawings showing details of fabrication, materials of construction, dimensions, weights, performance, and installation and leveling data of all items furnished under this section. This includes the grout mix design for grout below and between units, the stainless steel anchors and adhesive anchor system, pipe supports, and all materials related to the underdrain assembly.
5. Submit detailed drawings showing installation and assembly details including setting drawings, cast-in-place items, templates, and details for the installation of the anchorages. This shall include all requirements to interface the underdrain system with the filter box including grouting keys and pockets, dowels, support ledges and piers, and other anchorages.
6. Provide head loss data covering the range of design air and water flowrates specified, including air scour alone, water wash alone, combined air/water washing, and flow distribution calculations or modeling to substantiate compliance with the specified maldistribution limits. Head loss data shall indicate individual losses including gullet losses, primary orifice losses, and secondary orifice losses.
7. Provide structural design calculations, including the hold down system and pipe supports. Grout mix design, along with the full structural design calculations, shall be stamped by a Professional Engineer registered in the State of Utah.
8. Provide certification of compatibility of the underdrain system with the filter media specified in Sections 46 61 13.
9. Provide certification that all wetted parts and sealants in contact with the process water are NSF-61 certified for contact with drinking water.
10. Filter underdrain manufacturer certification for each filter per requirements of Part 1.04.C.
11. Manufacturer’s Warranty. Warranty shall be for a period of 1 year from date of substantial completion, unless standard warranty is for a longer term.
12. Proposed field-testing procedures and testing report.
13. Manufacturer’s detailed recommendations for installation, start-up, and proposed field testing procedures, to include a detailed, step-by-step plan with checklists for start-up, hydraulic, and air scour testing of each underdrain installation prior to installation of media including procedures prepared by the underdrain manufacturer.
14. Recommendations for short and long-term storage.
15. List of required spare parts and special tools along with unit pricing for each part.
16. All operation and maintenance information.

1.06 SHIPMENT, PROTECTION AND STORAGE

A. All materials and equipment shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability or appearance. The equipment shall be stored in a clean, dry location, free from construction dust, precipitation and excess moisture. Stainless steel materials shall be handled and stored to avoid potential damage or contamination with carbon steel. If stored for more than two weeks, the equipment shall receive all maintenance considerations required by the manufacturer for proper storage of the equipment.

B. The Supplier/Contractor shall be responsible for coordinating the shipment of supplies of materials and equipment specified herein. Coordination will be required during construction and startup and/or testing.

C. Store underdrains and specialties off the ground, under ultraviolet-resistant tarps or indoors from time of delivery on-site until final installation in the filters.

D. Replace underdrains and specialties damaged during storage and delivery.

E. Underdrains and specialties are subject to inspection at the Owner's request if visual evidence of damage is observed.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. The Engineer believes the following candidate manufacturers are capable of producing equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section.
   1. Orthos Liquid Systems, Inc.
   2. Or approved equal

B. The manufacturer of the filter underdrain system shall be ISO 9001 certified.

2.02 MATERIALS

A. General:
   1. Materials used in the filter underdrain system shall conform to specified requirements unless more stringent requirements are specified by the underdrain supplier.

B. Grout:
   1. Non-shrink grout conforming to the applicable requirements of Section 03 60 00.
   2. All grout associated with the installation of the underdrains shall be non-shrink grout.
   3. Underdrain manufacturer shall certify compatibility between the underdrain material and the non-shrink grout.

C. Structural concrete:
   1. As specified in Section 03 30 00 – Cast-in-Place Concrete, except that coarse aggregate shall not be larger than ½-inch diameter and shall have a minimum strength of 5000 psi at 28 days.
   2. Concrete Reinforcement: As specified in Section 03 20 00 – Concrete Reinforcing

D. Metals:
   1. As specified in Section 05 50 00 – Metal Fabrications.
   2. All exposed (not embedded in concrete) or partially exposed metals, including but not limited to anchor bolts and anchorage, fasteners, washers, etc., shall be Type 316 stainless steel.

E. Grout Stops, Cover Plates, and Concrete Retaining Strips:
   1. Shall be high impact plastic, or polyvinyl chloride, properly keyed or mechanically restrained to prevent the strips from working loose with time.
   2. Shall also be completely sealed with caulking to prevent water, air, or grout from leaking around them.
   3. Plastics shall be high strength, completely inert, resistant to erosion, corrosion, and degradation from chlorine up to 150 mg/l, and suitable for use with backwash temperatures from 40 to 140 degrees Fahrenheit.

2.03 NOZZLE UNDERDRAIN SYSTEM

A. Support System:
   1. The false floor shall be made up of reinforced concrete cast in place over prefabricated reinforced concrete forming panels.
   2. The forms remain in place as the underside of the floor slab and provide preformed holes for locating and supporting the cast-in-place flow element sleeves.
   3. The false floor forms shall be installed onto support columns inside the filter cell, and onto support ledges along the perimeter walls of the filter cell. The ledges and columns shall be leveled to within plus or minus 1/8 inch before installing the false floor forms.
   4. Leveling shims shall be provided by the underdrain manufacturer.
   5. The support system shall adequately provide for both longitudinal and transverse flow under the false floor to ensure uniformity of flow distribution.
   6. The false floor and support columns shall be designed to the criteria specified under Structural Design Requirements.

B. Forming Panels:
   1. The forming panels shall be constructed of high impact polystyrene or Glass Reinforced Concrete (GRC).
   2. The forms shall become a permanent part of the finished false floor.
   3. Forms shall be designed to carry stresses due to the placement of concrete with a maximum deflection of 1/8-inch.
   4. The manufacturer shall provide pre-cut filler forms, as required, to close the area along the perimeter walls where a full form cannot fit.

C. Flow Nozzles and Sleeves:
   1. Nozzle Sleeves
      a. The false floor shall contain an array of plastic nozzle sleeves cast in the concrete, uniformly spaced as required to prevent maldistribution of flow, and designed to accept a nozzle sleeve which shall lock into place at each nozzle location.
      b. The nozzle shall contain a disposable seal which shall prevent concrete from passing through or fouling the threaded portion.
   2. Nozzle:
      a. Each media retaining underdrain nozzle shall be molded of NSF-certified polypropylene or plastic.
      b. Nozzles shall screw into the nozzle sleeves and shall have narrow, vertical slot openings in a screen section suitably sized for compatibility with the filter media and no larger than 0.40 mm.
      c. Nozzle slots shall be designed to prevent clogging from small particles.
      d. Nozzles shall be designed to collect filtered water during the filtration cycle, and uniformly distribute air scour and wash water during the backwash cycle without permitting media to enter the plenum.
      e. Nozzles shall be easily installed (screwed into) and removed from the top side of the underdrain.
      f. Nozzles shall not require epoxy or metal fasteners for installation.
      g. Nozzles shall be designed to allow the direct placement of filter media (as specified) on top of the nozzle.
      h. Each nozzle shall be designed to withstand the same loadings as the monolithic pour.
      i. Nozzle Tail Pipe:
         1) Each nozzle shall have a tail pipe to provide for the uniform distribution of air scour and backwash water.
         2) Each tail pipe shall include one air metering orifice for proper distribution of scour air at the rates specified herein.
         3) Each nozzle shall have a hole in the tail pipe so placed to bleed off trapped air in the plenum.
      j. The manufacturer shall supply torque and other installation instructions and requirements to account for the variation in temperature from installation to service and other effects that may cause the nozzles to loosen in service.

D. Air Header:
   1. The filter underdrain system manufacturer shall have the responsibility to design and provide the air distribution header.
   2. The air distribution system shall be generally comprised of a minimum Schedule 10 316 stainless steel header specially calibrated to evenly distribute air flow via properly located riser pipes to each underdrain lateral. Sufficient relative velocities shall be maintained in both the header and riser pipes to insure proper distribution of air. Air piping shall conform to requirements of Sections 40 05 02.01 and 40 05 23.
   3. The filter underdrain system manufacturer shall supply pipe supports in accordance with Section 40 05 07. All pipe supports shall be Type 316 stainless steel.

2.04 AIR DISTRIBUTION MANIFOLD

A. In each filter underdrain plenum, an air distribution manifold shall be provided and installed with main header and riser pipes sized by the manufacturer to deliver an evenly distributed air flow to the respective underdrain plenum.

B. The main header shall be 316 Stainless Steel, Schedule 10, and riser pipes shall be 316 Stainless Steel, Schedule 40, in accordance with the requirements of ASTM A790.

C. The manufacturer shall design the air distribution manifold to provide a uniform distribution of airflow through each underdrain system to meet the air flow design requirements specified.

D. The manufacturer shall design the air distribution manifold to clear the manifold of water at the beginning of the air scour operation to result in an evenly distributed air flow to the respective underdrain plenum at the air rates specified herein.

E. Air metering tubes shall extend vertically upward between nozzle tailpipes, terminating above the nozzle tailpipes, terminating above the nozzle air metering hole without creating an air knife (less than 67 feet per second) to the plenum ceiling. Air velocity in the metering tubes shall not exceed 130 feet per second.

F. The manufacturer shall design the air distribution manifold from the connection point, as indicated on the Drawings.

2.05 PLENUM OPENINGS

A. The plenum and gullet heights shall be as shown on the Drawings. Plenum openings width shall be as shown on the drawings. Plenum opening heights shall be as shown on the drawings ±2 inches. Underdrain Supplier shall provide a final report that includes recommendations for plenum opening height dimensions to meet the Design Requirements of Article 1.03.B
   1. The final report shall include CFD modeling of the waterways, plenum and nozzles for the following flow scenarios:
      a. water backwash as the maximum rate shown on the Drawings
      b. water backwash at the minimum rate shown on the Drawings
      c. air/water combined backwash at 4 gpm/ft^2 and 8 gpm/ft^2, respectively
      d. air/water combined backwash at 3 gpm/ft^2 and 10 gpm/ft^2, respectively
   2. Modeling shall include at a minimum three separate plenum opening scenarios:
      a. Baseline – all opening heights are equal
      b. Modified – opening heights vary with only 3 sequential openings the same height (e.g., openings 1,2 and 3 are 9”; openings 4,5, and 6 are 8”, etc.)
      c. Optimized – plenum openings optimized based on results from the first two scenarios.

2.06 SPARE PARTS

A. Spare parts shall be provided for each unit as follows:
   1. A complete set of spare nozzles (quantity sufficient for one complete filter).

PART 3 EXECUTION

3.01 INSTALLATION

A. General

1. Install the filter underdrain systems in strict accordance with the manufacturer's installation drawings and printed recommendations, and as manufactured and indicated on the Drawings.
2. Provide an underdrain manufacturer's field representative to inspect and supervise the installation and testing of the underdrain system. All costs of such inspection and supervision shall be borne by the Supplier/Subcontractor. Installation work shall comply fully with the underdrain manufacturer's installation details and recommendations to acceptably interface the filter underdrain system with all surrounding structures, including requirements for grouting keys and pockets, dowels, support ledges and piers, anchorage and the like.

B. Cleaning and Placement:

1. During installation, take all necessary precautions recommended by the underdrain manufacturer and as specified herein to ensure that the underdrain system and piping connected thereto is completely clean and free of any debris, dirt, or other foreign materials which could clog the underdrain system or interfere with flow. Backwash air and water piping shall be thoroughly flushed clean. Air piping shall be flushed with air only. All loose debris and dirt within the filter and gullet shall be removed by brooming down, vacuuming and water flushing. Care shall be taken as necessary to prevent grout, concrete or debris from intruding into any flow passages or ports and all such grout, concrete or debris shall be removed. As installation progresses, underdrain sections partially completed shall be protected with heavy building paper, masking tape, or other means to maintain cleanliness. Cleanliness shall be maintained until final placement of filter media.

C. Nozzle Underdrain System Installation:

1. The reinforced concrete false floor underdrain system shall be a monolithic, cast-in-place, concrete structural slab that shall be finished to a true level plane within the lesser of plus or minus 1/8 inch or the tolerance specified by the manufacturer of the filter underdrain.
2. Failure of the filter underdrain system to meet the level tolerance shall require removal of the failed sections and replacement with new underdrain sections to within level tolerances.
3. Should any underdrain materials, including the false floor forms, nozzle sleeves, and nozzles become chipped, plugged, bent, or damaged in any way, they shall be removed and replaced before the false floor is poured.

3.02 START-UP AND TESTING

A. General:
   1. The equipment provided under this section shall be started up and tested only under the direction of the underdrain supplier. To that end, the underdrain equipment manufacturer shall furnish start-up and testing specialist(s) that has been factory trained in the proper procedures for initial installation, testing, and commissioning of the equipment. All such activities shall be performed under the direction of these specialist(s).
   2. The underdrain system manufacturer shall provide a technical representative to assist with the startup for not less than 16 working days (8 hours per day) in a minimum of 4 trips. Travel time shall not be included within the 8 hours per day.
      a. The factory service technician shall have a minimum of five (5) years' experience in the startup of air/water filter backwash systems.

B. Preliminary Structural Integrity Test:
   1. Perform this test after sufficient curing time of 28 days has elapsed to permit the installation to develop adequate strength for dynamic testing and before the placement of any media.
   2. Flood filter cell with approximately one foot of clean water above the underdrain.
   3. Backwash each underdrain installation increasing the backwash rate in stages as follows:
      a) 6 gpm/ft^2
      b) 15 gpm/ft^2
      c) 23 gpm/ft^2 (maximum backwash rate)
      d) Hold rate at each stage for a sufficient observation period as determined by the Owner's Representative.
   4. During this test, flow from each nozzle as well as any sign of dead spots or boils shall be visually observed. Any evidence of flow maldistribution such as a water "mound" or "boil" in any area of the filter will constitute a failed test.
   5. After this initial test, the filter shall be drained, and the underdrain system shall be inspected for any damage or leaks.
   6. Correct any damage or deficiencies revealed by these tests.
   7. Repeat test after damages are repaired and until deficiencies are corrected at no additional cost to the Owner.

C. Underdrain Flow Distribution Test:
   1. This test shall be performed after the Preliminary Structural Integrity Test and before the media is placed.
   2. Flood filter cells with clean water approximately 6 inches above the underdrain at the beginning of each test. Sustain test flow rates for approximately 3 minutes while making visual observations.
   3. Extend or repeat test when additional time is needed to make observations, as directed by the Engineer.

4. Tests shall be as follows:
    a. Test 1 – 4 scfm/ft^2 of scour air with no backwash water
    b. Test 2 – 4 scfm/ft^2 of scour air with 6 gpm/ft^2 of backwash water
5. During each test, the water surface shall present a uniformly turbulent appearance without dead spots or boils. Any evidence of flow maldistribution will constitute a failed test.
6. Correct and retest underdrain systems that fail to meet the test criteria.
7. Repeat tests after damages are repaired and until deficiencies are corrected at no additional cost to the Owner.

D. Equal Distribution Test of Backwash Water (Manometer Test)
1. The demonstration must be completed before the installation of media.
2. Since pressure is directly related to flow in a flooded filter, this test measures the pressure in the plenum during a backwash. To measure the pressure, the Contractor shall install seven (7) Supplier-provided piezometric adapters in the false floor as indicated on the plans. Four adapters shall be placed near each corner of the filter and three across the centerline of the filter from the backwash entrance(s).
3. From the piezometric adapters on the nozzle sleeves, the Contractor shall route Supplier-provided transparent vinyl tubing of equal length from the installed piezometric adapters to a Supplier-provided piezometer panel that contains a scale for each sample tube. Contractor to adjust the panel and the scales with the water level during backwashing and assist with measurements as directed by the Supplier.
4. The panel shall be installed in a place far from the troughs. Figure 3.24 of "Filter Troubleshooting and Design Handbook" by R.P. Beverly of the AWWA shall serve as a reference for performing this test.
5. Pressure readings representing the pressure drop of the underdrain are measured as the height of the water in each tube above the wash water level during a backwash.
6. Testing shall be performed at 23 gpm/ft^2 of backwash water.
7. The test shall demonstrate equal distribution of the backwash water. A maldistribution variation of up to ± 5% between different measurement points is acceptable. If the variation is found to be greater than ± 5%, the CONTRACTOR must make all corrections required to meet the maximum prescribed variation. No work will be allowed in any subsequent filters until the problem is corrected.
8. The measurements shall be recorded by the Supplier, and a report shall be submitted to the Owner Representative for review.

E. Sand Flow Distribution Test:
1. After the underdrain systems have been installed and have passed the Equal Distribution Test of Backwash Water, the filter sand media may be placed.
2. The Sand Flow Distribution Test for each filter may occur in conjunction with the sand washing and skimming procedure as described in the Filter Media Section, but before placement of Anthracite filter media.
3. Sand Flow Distribution Tests shall consist of at least 3 backwash cycles and shall be as follows:
    a. Prior to testing, to measure the levelness of the sand surface, measure the distance from an elevation above the media down to the sand surface for a minimum of (7) locations.

b. Flood filter cell approximately 6 inches above the sand media with clean water.
c. Air scour at 4 scfm/ft^2 for 4 minutes.
d. Simultaneous air and water backwash at 4 scfm/ft^2 and 6 gpm/ft^2, respectively, for 4 minutes.
e. Water backwash at 23 gpm/ft^2 for 4 minutes.
f. Water backwash at 6 gpm/ft^2 for 4 minutes.
g. Drain down to initial level and repeat.
h. At the conclusions of the 3 backwash cycles, inspect the sand surface.

4. Results:
a. Variation more than plus or minus 1/2 inch from the average level plane indicates failure.
b. Media boiling shall constitute a failed test.
c. Media movement from one area of the filter to the other shall constitute a failed test.
d. Follow underdrain manufacturer's specific instructions necessary to correct any deficiencies revealed by these tests
e. Repeat tests until deficiencies are corrected at no additional cost to the Owner.

F. Anthracite Flow Distribution Tests:
1. After the Sand Flow Distribution Test and removal of all sand fines, the Anthracite media may be placed.
2. The Anthracite Flow Distribution Test for each filter may occur in conjunction with the Anthracite washing and skimming procedure as described in the Filter Media Section.
3. Anthracite Flow Distribution Tests shall consist of at least 3 backwash cycles and shall be as follows:
a. Prior to testing, to measure the levelness of the sand surface, measure the distance from an elevation above the media down to the Anthracite surface in (7) different locations.
b. Flood filter cell approximately 6 inches above the Anthracite media with clean water.
c. Air backwash at 4 scfm/ft^2 for 4 minutes.
d. Simultaneous air and water backwash at 4 scfm/ft^2 and 6 gpm/ft^2 respectively, for 4 minutes.
e. Water backwash at 23 gpm/ft^2 for 4 minutes.
f. Water backwash at 6 gpm/ft^2 for 4 minutes to re-stratify the media.
g. Drain down to initial level and repeat.
h. At the conclusions of the 3 backwash cycles, inspect the Anthracite surface.
4. Results:
a. Variation more than plus or minus 1/2 inch from the average level plane indicates failure.
b. Media boiling shall constitute a failed test.
c. Media movement from one area of the filter to the other shall constitute a failed test.

5. Follow underdrain manufacturer's specific instructions necessary to correct any deficiencies revealed by these tests.
6. Repeat tests until deficiencies are corrected at no additional cost to the Owner.

G. Final Underdrain Inspection:
1. After the Flow Distribution Test(s), the filter shall be completely drained, and the underdrain system shall be inspected for indication of media passage through the underdrain system or media deposition inside/below the underdrain. Such indication of media shall constitute a failed inspection.
2. Follow underdrain manufacturer's specific instructions necessary to correct any deficiencies revealed by this test.
3. Repeat tests until deficiencies are corrected at no additional cost to the Owner

H. Notify the Engineer at least 2 days in advance of planned testing to enable Engineer to witness the tests.

3.03 TRAINING

A. Furnish services of qualified factory trained specialists from underdrain manufacturer to instruct Owner’s operations and maintenance personnel in recommended operation and maintenance of the products. Training requirements, duration of instruction, and other qualifications shall be per Section 01 79 00.

3.04 SYSTEM WARRANTY

A. Guarantee/Warranty: Warranty shall be for a period of 1 year from date of substantial completion, unless standard warranty is for a longer term. Provide the longer of 1 year, or standard warranty.

END OF SECTION

SECTION 46 61 13

FILTER MEDIA

PART 1 GENERAL

1.01 SUMMARY

A. Supply and installation of filter media in each of six filters as specified herein. Each filter consists of one cell (6 cells total). Each cell is approximately 29.5 feet long by 12 feet wide. The finished media depth after skimming consists of 54 inches of anthracite above 12 inches of sand. Contractor shall verify all required dimensions prior to purchasing and installation.

B. Media Responsibility: The Media Supplier has sole responsibility for furnishing granular filter media meeting the requirements of the specification.

C. Work Restrictions: The contract documents contain limitations on work schedules, media removal, and backwash limitations.

D. Related sections:
   1. Section 01 75 70 – Disinfection.
   2. Section 46 61 11 – Filter Underdrain Equipment

1.02 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

FCC	Food Chemical Codex
NSF 61	Standard 61 - Drinking Water System Components - Health Effects.

1.03 DEFINITIONS

A. Particle size distribution:
   1. The particle size distribution shall be determined by screening through standard sieves, Tyler fourth root of two series or equivalent U.S. series.
   2. The percent sizes shall be determined from a plot, on semi-log or probability paper, of the percentages of the material passing each sieve against the calibrated opening of the sieve or the equivalent diameter of the grains. Sieve dimensions shall conform to ASTM E11 and Table B.1 of the Appendix to AWWA B100.

B. Percent Size: The size of the theoretical opening of a sieve through which that percentage of the filter media, by weight, will pass.

C. Effective Size: The size opening that will just pass 10 percent (by dry weight) of a representative sample of the filter material. For example, if the size distribution of the filter media particles is such that 10 percent of the sample is finer than 0.50 millimeters, the filter media shall be said to have a 10 percent size of 0.50 millimeters, which is the effective size in millimeters.

D. Uniformity Coefficient: A ratio calculated as the size opening that will just pass 60 percent (by dry weight) of a representative sample of the filter material, divided by the size opening that will just pass 10 percent (by dry weight) of the same sample.

E. Media Supplier: The Media Supplier is the company or firm having sole responsibility for all granular media furnished and is either the manufacturer of the sand media or the anthracite media. The Media Supplier is responsible to furnish sand and anthracite media that are compatible with each other under backwash conditions.

1.04 SUBMITTALS

A. Action Submittals:
   1. Procedures: Section 01 33 00.
   2. A copy of this specification section, and those listed within this section with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements.
   3. Check-marks (✓) denote full compliance with a paragraph as a whole. Underline deviations and denote them with a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined signify compliance on the part of the Contractor with the specifications. Include a detailed, written justification for each deviation. Sufficient cause for rejection of the entire submittal with no further consideration is failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal.
   4. Completed Certificate of Unit Responsibility attesting that the Contractor has been assigned, and that the manufacturer accepts unit responsibility in accordance with the requirements of this section. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.

5. Complete Media Analysis.
    a. Sand quality information:
        1) Sieve analysis (particle size distribution), effective size, and uniformity coefficient.
        2) Acid solubility.
        3) Apparent specific gravity.
        4) Hardness based on the Mohs scale.
    b. Anthracite quality information:
        1) Sieve analysis (particle size distribution), effective size, and uniformity coefficient.
        2) Acid solubility.
        3) Apparent specific gravity.
        4) Hardness based on the Mohs scale.
        5) Ash content (ASTM D3174).
        6) Volatiles content (ASTM D3175).
        7) Grindability Index (ASTM D409).
6. Any other information as requested by the OWNER.
7. Submit qualifications of the independent testing laboratory for approval.
8. Media Submittal: For each type of media submit the following.
    a. Media Benchmark.
        1) Purpose: To establish the agreed upon benchmarks for the material that is to be manufactured.
        2) Schedule: Submittal approval is required prior to beginning manufacturing.
        3) Requirement:
            a) Certified test results of complete media analysis (1.04.B), from an approved independent testing lab employed by the Media Supplier, for the proposed media.
            b) Media Samples:
                (1) Submit one sample of each type of media.
                (2) Shipped in durable, non-glass containers of not less than 5 lb capacity, clearly labeled with Project name, media source, effective size, uniformity coefficient and specific gravity.
                (3) OWNER reserves the right to retest (at OWNER's expense) the samples to confirm that the samples reasonably match certified test results submitted.
    b. Manufactured Media Testing and Samples.
        1) Purpose: To demonstrate that media produced during the manufacturing process is reasonably similar to the approved benchmark submittal.
            a) It is anticipated that there may be a reasonable variation in the effective size and uniformity coefficient between different media lots produced during the manufacturing process for the Project.
                (1) A media lot is defined as media continually produced during a work day. Media produced on different days or after changes to the production equipment shall be considered separate lots.

b) Although such variation may be acceptable, the OWNER reserves the right to use the test results to direct the CONTRACTOR to install individual production lots of sand and anthracite media in different filters to provide the best possible media compatibility matches at no additional cost to the OWNER.

c) OWNER may reject any or all individual media lots produced during the manufacturing process that do not meet the requirements of the specification. Rejected lots will not be shipped to the Project site without additional remanufacturing or reprocessing and subsequent approval of test results by the OWNER.

2) Schedule:

a) Media samples and test result approval is required prior to shipping.

b) Separate submittals for individual production lots are required for large media quantities involving production runs over an extended duration. It is anticipated that individual lot test results will be submitted to the OWNER as soon as they are available during the production of media.

3) Requirement:

a) Filter media lots shall be sampled and tested for effective size and uniformity coefficient. The media producer may use in-house testing capabilities or an independent laboratory for the manufactured testing, but only after laboratory acceptance and approval by the OWNER.

b) Sample collection and frequency for individual production lots shall be in accordance with AWWA B100 and as modified herein. All test results shall be identified by traceable production lot identification clearly marked on each bag.

c) Manufactured Media Samples:

(1) Submit one sample of each production lot and type of media.

(2) Sample collection in accordance with AWWA B100.

(3) Shipped in durable, non-glass containers of not less than 5 lb capacity, clearly labeled with Project name, media source, effective size, uniformity coefficient and specific gravity.

(4) OWNER reserves the right to retest (at OWNER's expense) the samples to confirm that the samples reasonably match certified test results submitted.

c. Delivered Media Testing.

1) Purpose: To demonstrate that media delivered to the Project site matches the manufactured media.

a) The OWNER reserves the right to test the media received at the Project site at the OWNER'S expense.

b) Media that does not comply with the specified requirements, certified test results, or acceptance criteria may be rejected at the sole discretion of the OWNER and shall be replaced with approved media at no additional cost to the OWNER.

c) If the delivered media is rejected by the OWNER, an independent laboratory, acceptable to the OWNER, may be employed by the CONTRACTOR to sample and test disputed material. For material that is not in compliance with the specified requirements, the CONTRACTOR shall bear the cost of testing the delivered media and any retesting required by the OWNER to demonstrate compliance. Otherwise, the OWNER is responsible for costs of testing the delivered media.

2) Schedule: After delivery to the Project site and before installation.

3) Requirement:

a) Sample collection in accordance with AWWA B100.

b) Test results provided by an independent lab, acceptable to the OWNER.

d. Installed Media Testing.

1) Purpose: To document the characteristics of the installed media in each filter for the use of the OWNER in tracking changes in media characteristics over time and to assess the impacts of the backwash/skimmer procedure. It is understood that the effective size and uniformity coefficient of the installed media, after washing and skimming, may differ from values prior to installation.

2) Schedule:

a) Sand media shall be sampled after complete installation, washing and skimming of all sand layers to the required depth and prior to the installation of anthracite media.

b) Anthracite media shall be sampled after complete installation, washing and skimming of all anthracite layers to the required depth.

3) Requirement:

a) Collect media samples using a clean trowel or sampling tube to provide a representative sample from the entire media depth.

b) Store samples in clean clear plastic bags, securely sealed and labeled with location, media type and collection date using indelible marker.

c) Provide test results of effective size, uniformity coefficient and specific gravity for each sample.

d) Sampling Locations:

(1) One representative, composite sample collected from five locations including one in the center and one from each quarter quadrant of the cell.

(2) Sampling and testing is the responsibility of the CONTRACTOR using a laboratory approved by the OWNER.

9. Submit media installation instructions from the Media Supplier.

1.05 QUALITY ASSURANCE

A. Certified test results shall cover all physical, gradation, size, and chemical characteristics specified herein. All tests shall be made in accordance with test procedures as described in AWWA B100.

B. After approval, all shipments delivered to site shall meet the specifications. Approved samples shall meet the requirements of AWWA B100 including any addenda.

C. As bags are being filled at the production site, sampling across the cross section of material being loaded for each lot is required. Each package and container shall be legibly marked per AWWA B100.

D. Sampling and testing shall be performed in accordance with the requirements of AWWA B100.

E. The sand media and anthracite media manufacturing plants are to provide documentation that their respective site-specific manufacturing facilities are independently certified to be in compliance with the NSF/ANSI 61 Standard

1.06 PRODUCT HANDLING, STORAGE, AND DELIVERY

A. Packaging: Package filter media in 1 to 2 ton capacity, ultraviolet-resistant polyethylene bags (super sacks with bottom pour spout) on pallets. Clearly mark each bag of material with the following information:
   1. Effective size.
   2. Uniformity coefficient.
   3. Source.
   4. Date of bagging.
   5. Production lot or stockpile identification.

B. Place or store all filter media only in designated staging areas approved by the OWNER.

C. All filter media at the jobsite shall be stored off the ground, protected from weather, and covered with a suitable membrane to prevent contamination of the media from windblown debris and soil.

D. Conveying of the new filter media by compressed air through ducts, pipes, or hose is not permitted. Placement of filter media in the filters shall comply in all respects with AWWA B100, except as modified or supplemented herein.

PART 2 PRODUCTS

2.01 FILTER SAND

A. Quality:
   1. The filter sand shall be silica sand composed of hard, durable, uncoated grains. The filter sand shall be thoroughly washed, screened, and free of clay, loam, dust, dirt, organic matter, and other foreign material.
   2. The acid solubility of the filter sand shall not exceed 1.0 percent.
   3. The specific gravity of the filter sand shall not be less than 2.60.

B. B. Size:
   1. The silica sand shall meet the following requirements:
      a. Effective size (millimeters): 0.65 (±0.05).
      b. Uniformity coefficient: less than 1.40
      c. Final depth (inches): 12
      d. A maximum of 1% retained on a U.S. #14 Sieve (1.40 mm)

e. A maximum of 1% passing a U.S. #40 Sieve (0.425 mm)

2. Provide sufficient excess sand media to anticipate the skimming requirement, such that after skimming is completed to the specified criteria, the media is at the depth indicated in this specification.

2.02 FILTER ANTHRACITE

A. Quality:

1. The anthracite shall be composed of hard durable grains and shall be processed from anthracite coal. The anthracite shall be free from any significant amounts of iron sulfides, clay, shale, dust, dirt, or other foreign matter.
2. The solubility of the filter anthracite in a 1:1 mixture of concentrated hydrochloric acid (approximately 37 percent) shall be less than 1 percent. The solubility of the filter anthracite shall be less than 1 percent by weight in 1 percent hot (190 degrees Fahrenheit) sodium hydroxide solution.
3. The filter anthracite shall have a hardness of not less than 3.0 on the Mohs scale.
4. Average apparent specific gravity shall be determined by the procedure set forth in ASTM C128, which provides for soaking the sample in water for 24 hours. The filter anthracite shall have a specific gravity of not less than 1.60, nor more than 1.70.
5. The filter anthracite shall have an ash (dry) content of less than or equal to 15 percent as determined by ASTM D3174.
6. The filter anthracite shall have a volatiles (dry ash free) content of less than or equal to 7 percent as determined by ASTM D3175.
7. The filter anthracite shall have a Hardgrove grindability index of less than or equal to 38 as determined by ASTM D409.

B. Size:

1. The anthracite shall meet the following requirements:
   a. Effective size (millimeters): 1.2 (±0.05).
   b. Uniformity coefficient: less than 1.35.
   c. Final depth (inches): 54
   d. A maximum of 1% retained on a U.S. #10 Sieve (2.00 mm)
   e. A maximum of 1% passing a U.S. #25 Sieve (0.71 mm)
2. Provide sufficient excess anthracite media to anticipate the skimming requirement, such that after skimming is completed to the specified criteria, the media is at the depth indicated in this specification.

2.03 MEDIA COMPATIBILITY

A. The Media Supplier shall provide filter sand media and anthracite media that are compatible when backwashed. Media compatibility between sand and anthracite shall be determined from the following formula:

$Q_{BW}=17.67 \times d_{60} (S.G.-1.0)^{2/3}$

Where:

Q_{BW} = media backwash rate in gpm/ft^2

D_{60} = effective size in millimeters multiplied by uniformity coefficient

S.G. = apparent specific gravity

B. The Q_{BW} calculated for the sand media shall be greater than or equal to the Q_{BW} calculated for the anthracite media, but not more than 2.0 gpm/ft^2 greater.

C. Due to the variability and physical nature of media size, uniformity coefficient, and apparent specific gravity, and as necessary to improve results for media compatibility, the Media Supplier shall produce either the sand or anthracite media first to establish the backwash characteristics of that media and shall then produce the second media to match the backwash compatibility of the first.

F. Approved equal.
   1. In order to be approved as an equal, a prospective Media Supplier shall submit the following:
      a. Documentation demonstrating that the supplier has been continuously engaged in the business of manufacturing either sand or anthracite filter media for potable water treatment plants for a period not less than five years.
      b. References for a minimum of five similar projects for which the supplier has successfully furnished either sand or anthracite filter media within the last 10 years. Similar projects are defined as potable water treatment plant filters of equal or greater size to those of the Project.
      c. A letter signed by an authorized officer of the company certifying that the supplier will comply with all requirements of the specification including the requirement to accept sole responsibility for all filter media and to provide compatible sand and anthracite media as specified.
      d. Documentation that the site-specific manufacturing facilities are in compliance with the latest version of the ANSI/AWWA B100 Standard and are independently certified with the NSF/ANSI 61 Standard
   2. Approval of a prospective Media Supplier is at the sole discretion of the OWNER.

PART 3 EXECUTION

3.01 FILTER MEDIA INSTALLATION

A. Before placing filter media:
   1. Verify that all openings of the filter underdrain media retaining devices are clean and free of obstructions, and that the area around the filter underdrains is swept clean and vacuumed.
   2. Remove all debris from filters.
   3. Thoroughly wash down all parts of the filter units with clean water.
   4. Maintain the cleanliness of the filters throughout the media placement operation.
   5. The underdrain system shall pass a flow distribution test before any media is placed. The underdrain is considered to have passed this test upon the OWNER's acceptance of the test results.
      a. Place six inches of water over the filter underdrain. Observe water entering the filter and check for maldistribution indicating either a plugged or broken cap/nozzle.
      b. Perform an air scour at the normal plant air scour rate. Observe the air scour and check for maldistribution indicating either a plugged or broken cap/nozzle.
   6. Perform backwash at the normal plant backwash rate. Observe the backwash and check for maldistribution indicating either a plugged or broken nozzle.

B. Media Placement - General
   1. Prevent contamination during transporting and placing the filter media. Any filter media which has become contaminated, either before or after placement in the filters, shall be removed and replaced with new or washed and cleaned material in a manner approved by the OWNER.
   2. Based upon submitted test results of manufactured media and media matching parameters, the OWNER reserves the right to use the test results to direct the CONTRACTOR to install individual production lots of sand and anthracite media in different filters to provide the best possible media matching compatibility at no additional cost to the OWNER.
   3. Each layer of filter media shall be brought up to the required elevation and made level over the entire filter bed area. Provide sufficient excess media to anticipate the skimming requirement, such that after skimming is completed the media is at the depth indicated in this specification.
   4. The placement of each media layer shall be accepted by the OWNER before the next layer is placed.
   5. Do not damage any equipment or piping in the filter units. Bring any damage to the attention of the OWNER and repair said damage in a fashion acceptable to the OWNER.
   6. Workers shall not stand or walk directly on the filter materials. The workers shall walk on plywood mats that will sustain their weight without displacing the material (minimum dimensions 2 feet by 2 feet by 1/2 inch thickness).
   7. The filter may be flooded with water to use as a leveling gauge for each layer of material.
   8. Each media level shall be thoroughly washed and skimmed (by scraping) for removal of fine grain-sized particles before the next layer is placed.
   9. Place each layer evenly throughout the filter. Do not place in one area and then spread to the rest of the filter. Initial placement shall include sufficient depth to account for skimming and removal of media and fine particles.

C. Media Washing - General:
   1. The CONTRACTOR is responsible for coordinating the scheduling of filter media washing with the OWNER and ENGINEER to avoid delays to the schedule.
   2. Filter media washing will be conducted with clean water using backwash supply, auxiliary wash facilities, and waste washwater facilities as designed and configured as part of the existing plant or new plant construction.
   3. At no time shall the plant's wash water handling facility overflow from the media washing operations. Filter media washing shall be terminated before reaching a water level that would affect plant operations regardless of the status of the media washing operation.
   4. Make certain that water from the media washing operation is directed to the washwater handling facilities and does not flow to the storm drain or to discharge off-site.
   5. Verify separation of the media washing residuals from the backwash water sufficient for returning the water to the treatment plant. Remove and dispose of the residuals from the media washing operation.

D. Filter Sand:

1. Before placing the sand, remove all plywood panels used by the construction personnel to walk on the media support system or on the filter media. Fill the filters to a water depth 12 to 15 inches above the surface of the filter media support system. The sand shall then be placed into the water in a uniform manner over the entire surface area of the filter. This may require hand placement of the initial layer of filter sand.
    a. Transport and place the sand carefully to prevent contamination of any sort, and replace sand made dirty before or after placing with clean sand.
    b. Any indication during sand placement that the underdrain has been displaced or damaged shall require the sand to be removed and the underdrain repaired or replaced in accordance with the underdrain manufacturer's specific instructions for repairing damage.
2. After placing the filter sand, backwash the filter at an initial rate of not more than 2 gallons per minute per square foot (gpm/ft^2) of filter area and increase the rate gradually over a period of 3 minutes to a maximum rate of 20 gpm/ft^2, or as directed by the OWNER. Maintain this maximum rate for a minimum of 5 minutes, and until waste washwater appears clear. Close the filter backwash rate valve slowly to allow for hydraulic media segregation. This backwash sequence, or similar sequence as directed by the OWNER, shall be conducted before each skimming.
3. Using hand trowels and laser level, skim the top surface of the media to remove all fine-grained sized materials. Dispose of the sand particles removed by skimming.
4. At the discretion of the OWNER, skimming that is not of uniform depth shall be redone.
5. Conduct filter sand washing and skimming operations described above three separate times as follows:
    a. Wash and Skim No. 1: Depth of skimming and removal shall be a minimum of ½".
    b. Wash and Skim No. 2: Depth of skimming and removal shall be a minimum of ½".
    c. Wash and Skim No. 3: Skim and remove media to final depth. (Remove approximately 1/4" of media.)
6. After final skimming operation is finished, wash the media a final time as described above, drain the filter and measure final depth. Measured final depth shall not be less than 1/4" nor greater than 1/2" from the requirement. Otherwise, add or remove media and repeat washing and skimming as directed by the OWNER.
7. Upon approved completion, collect and test representative sand media sample from the filter in accordance with Paragraph 1.04 of these specifications. Test results shall be submitted to the OWNER. If OWNER determines additional skimming is required, CONTRACTOR shall repeat the entire backwash/skimming procedure described in this section one additional time at no additional cost to OWNER. Contractor shall initially purchase enough material to accomplish all six rounds of skimming.

E. Filter anthracite:

1. Remove all plywood panels used by the construction personnel to walk on the media before placing any anthracite. Transport and place the anthracite carefully to prevent contamination of any sort, and replace anthracite made dirty before or after placing with clean anthracite. Do not place anthracite filter media in any filter cell until the filter sand in that cell has been skimmed to final depth and accepted.
2. After placing the filter anthracite and soaking it in clean water in the filter box for 24 hours, backwash the filter media at an initial rate of not more than 2 gpm/ft^2 of filter area and increase the rate gradually over a period of 3 minutes to a maximum rate of 20 gpm/ft^2, or as directed by the OWNER. Maintain this maximum rate for a minimum of 5 minutes and until the waste washwater becomes clear. Close the filter backwash rate valve slowly to allow for hydraulic media segregation. This backwash sequence, or similar sequence as directed by the OWNER, shall be conducted before each skimming.
3. Using hand trowels and laser level, skim the top surface of the media to remove all fine-grained sized materials. Dispose of the anthracite particles removed by skimming.
4. At the discretion of the OWNER, skimming that is not is not of uniform depth shall be redone.
5. Conduct anthracite media washing and skimming operations described above three separate times as follows:
    a. Wash and Skim No. 1: Depth of skimming shall be approximately 3/4".
    b. Wash and Skim No. 2: Depth of skimming shall be approximately 1/2".
    c. Wash and Skim No. 3: Skim and remove media to final depth (Remove approximately 1/4" of media.).
6. After final skimming operation is finished, wash the media a final time as described above, drain the filter and measure final depth. Measured final depth shall not be less than 1/4" nor greater than 1/2" from the requirement. Otherwise, add or remove media and repeat washing and skimming as directed by the OWNER.
7. Upon approved completion, collect and test representative anthracite media sample from the filter in accordance with Paragraph 1.04 of these specifications. Test results shall be submitted to the OWNER. If OWNER determines additional skimming is required, CONTRACTOR shall repeat the entire backwash/skimming procedure described in this section one additional time at no additional cost to OWNER. Contractor shall initially purchase enough material to accomplish all six rounds of skimming.

3.02 DISINFECTION

A. Before the filter is placed in service, the entire filter shall be disinfected by chlorination as specified in Section 01 75 70.

B. Allow at least 24 hours for disinfection of a filter.

3.03 CLEANING

A. Filter structure cleaning: Once all filter testing and skimming operations are completed, remove all debris and media from all backwash drain conduits, troughs, pipelines and structures. General

SECTION 46 61 15

FILTER WASHWATER TROUGHS

PART 1 GENERAL

1.01 DESCRIPTION

A. Scope:
   1. This section specifies the fiberglass-reinforced plastic (FRP) washwater troughs for the filters. FRP troughs shall be designed, furnished, and installed complete and serviceable as shown and specified herein to make the work complete and operable. All supports, anchors, fasteners, and accessories shall be included.

1.02 RELATED SECTIONS

A. The specification sections listed below are an integral part of this equipment specification.
   1. Section 05 05 20 – Anchor Bolts

1.03 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Manufacturer shall maintain a continuous quality control program in the manufacturer of materials specified herein.
   2. Manufacturer shall have experience in manufacturing troughs of the same material, and the same or larger size to the items specified.
   3. Manufacturer shall provide evidence of filter washwater troughs in a similar service and of the same type specified for a minimum of ten installations, each in satisfactory operation for a minimum of five years.

B. All items specified under this Section shall be obtained from a single manufacturer who, with the Supplier/Subcontractor, shall assume full responsibility for the completeness of the system. The manufacturer shall be the source of information on all equipment furnished regardless of the manufacturing source of that equipment.

C. Reference Standards:
   1. This section contains references to the following documents. They are a part of this section as specified and modified. In case of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.
   2. Unless otherwise specified, references to the documents in this section shall mean the documents in effect at the time of Bid. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, whether or not the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
AWWA F101	Contact-Molded, Fiberglass-Reinforced Plastic Wash Water Troughs and Launders
AWWA F102	Matched-Die-Molded, Fiberglass-Reinforced Plastic Weir Plates, Scum Baffles, and Mounting Brackets
ASCE 8	Specification for the Design of Cold-Formed Stainless Steel Structural Members
ASTM D 256	Standard Test Methods for Determining Izod Pendulum Impact Resistance of Plastics
ASTM D 570	Standard Test Method for Water Absorption of Plastics

ASTM D 2583	Standard Test Method of Indentation Hardness of Rigid Plastics by Means of Barcol Impresser
ANSI/NSF-61	Drinking Water System Components – Health Effects

D. Source Quality Control:
   1. Finish of trough and weir plates and appearance shall meet requirements of AWWA F101.
      a. Provide inspection reports for finish and appearance for fabricated trough and weir laminates.
   2. Furnish affidavit that material was manufactured, sampled, inspected, and conformed to requirements in accordance with AWWA F101.

1.04 SUBMITTALS

A. General Requirements
   1. Furnish submittals in accordance with Section 01 33 00 - Contractor Submittals.
   2. A copy of this specification section, with addendum updates included, and all referenced and applicable sections, with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (✓) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and therefore requested by the Supplier/Subcontractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Supplier/Subcontractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

B. Action Submittals
   1. Manufacturer's literature, illustrations, specifications, and engineering data including critical dimensions, weights, jointing and connections, fasteners, and anchors; materials of construction; sizes, spacing and locations of structural members, connections, attachments, openings, fasteners, and loads.

2. Drawings showing the general arrangement of the equipment and methods of installation with detailed mounting information. Indicate provisions for thermal expansion and contraction and the capability to sustain all external and internal loads that may be applied during construction and operation.
3. Calculations confirming compliance with the requirements of this section and AWWA F101 including trough stress, deflection under loadings, and expansion/contraction.
4. Trough manufacturer shall provide concrete anchor bolt sizing and installation details (anchor bolts to be provided and installed by Contractor).

C. Information Submittals:

1. Manufacturer's installation procedures and method of shipping, along with recommendations for short and long-term storage
2. List of recommended spare parts and special tools along with description of each part, quantity recommended, and unit pricing for each part.
3. Samples
   a. Samples: Submit 4-inch by 6-inch sample of the trough material furnished in color specified. Samples shall be taken from plant production and shall be representative of actual construction, workmanship, appearance, and surface hardness.
   b. Copies of laminate glass content test results from representative laminate samples including glass content and tensile/flexural test results.
   c. Inspection reports for finish and appearance for fabricated trough and weir laminates
4. Certifications
   a. Affidavit of compliance stating that material was manufactured, sampled, and inspected, and conformed to requirements in accordance with AWWA F101.
   b. Provide certification that all wetted parts and sealants in contact with the process water are NSF certified for contact with drinking water.
   c. In support of Part 1.03.A.3, provide list of ten similar projects within the last 10 years that the manufacturer has designed and fabricated and in successful service for at least 5 years, including trough size and length, client name, facility name and contact, location, and year installed.

C. Closeout Submittals

1. Completed form 43 05 11-A Manufacturer's certificate of proper installation each filter.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Deliver materials to the site to insure uninterrupted progress of the Work.

B. Handle all materials and appurtenances carefully and in accordance with manufacturer recommendations. Package troughs to avoid damage during handling and shipment. Place fiberboard or plastic corners at edges of fabrications to prevent damage from bands. Items which are damaged will not be acceptable. Protect all bolt threads from damage and corrosion.

1.06 MANUFACTURER'S WARRANTY

A. Warranty: Warranty shall be for a period of 1 year from date of substantial completion unless standard warranty is for a longer term. Provide the longer of 1 year, or standard warranty.

PART 2 PRODUCTS

2.01 ACCEPTABLE PRODUCTS

A. The Engineer believes the following candidate manufacturers can produce equipment and/or products that will satisfy the requirements of this Section. This statement, however, shall not be construed as an endorsement of a particular manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this Section. Candidate manufacturers include.

1. Leopold (Xylem), Zelienople, PA
2. Fiberglass Fabricators, Inc., Smithfield, RI
3. Warminster Fiberglass, Southamption, PA
4. or approved equal.

2.02 DESIGN

A. General:

1. Construct troughs of fiberglass-reinforced polyester resin laminates and to the dimensions and shapes shown on the drawings. Troughs shall be a minimum of 1' 9" deep and 1' 6" wide.
2. The washwater troughs shall be designed in accordance with the provisions of AWWA F101 and this section, whichever is more stringent. Troughs shall span across the filter basin with intermediate supports as required by the manufacturer to meet the maximum tolerances shown. Each trough shall be closed on one end for connection to the filter wall. It shall be attached by means of a bolted connection and shall be supported in a manner that will resist downward and uplift forces but allow for thermal expansion. The open end will pass through the gullet wall and spill directly into the waste gullet allowing an unobstructed discharge pattern. An integrally molded water stop shall be provided on the discharge end of the trough to create seal with concrete encasement. The completed troughs shall be dimensionally stable and vibration free during operation. Stiffeners, if required, shall be designed to prevent the troughs from vibrating during all stages of operation. Design loads shall be as indicated in AWWA F101 and this section, whichever is more stringent.
3. Prior to fabrication of washwater troughs and support systems, Supplier/ Subcontractor shall provide measurements for installation of troughs and verify dimensions indicated on the Drawings. Manufacturer shall ensure troughs and ancillary appurtenances fit within the available space.
4. Maintain a minimum of 2 inches freeboard below the weir edge in the trough under maximum flow conditions.
5. Filter troughs shall be designed for intermittent exposure to chlorinated water up to 50 parts per million free chlorine for filter cleaning/disinfection.

6. Trough manufacturer shall be responsible to design and provide the entire support system for the troughs including structural support members, connections from troughs to supports, connections from troughs to concrete filter structure, and all other support system accessories and connections required for a complete installation. Troughs shall be designed to meet specified requirements without the need of external bracing. No part of the support system shall contact the filter media. Support systems shall be designed to not trap or hold water when the filter is drained.

B. Service Requirements:
   1. Service: washwater troughs
   2. Capacity per trough during backwash: 1460 gpm
   3. Backwash type: hydraulic, air scour, combined air/water
   4. pH range of liquid: 6 to 8
   5. Water temperature: 1 deg C to 10 deg C
   6. Minimum width: 18-inches
   7. Minimum height: 21-inches
   8. Trough length: 12-feet 0-inches (inside filter box dimension, not including portion through wall)
   9. Number required: 4 per filter, 24 total.

C. Troughs shall be capable of supporting, within stress and deflection limitations, the following loads, and related considerations:
   1. Gravity load shall be all downward loads including the weight of the trough and associated attachments together with the weight of water filling the trough completely.
   2. Uplift load shall be the buoyant load acting vertically upward if the filter cell is filled from below with the trough empty - the load which acts vertically upward and which is equal in magnitude to the weight of the water displaced by the trough, with trough weight neglected. Consider the line of action of this force to pass through the centroid of the submerged cross-sectional area.
   3. Lateral load shall be the load induced by differential water levels on either side of the trough walls. The maximum possible differential exists when the trough is empty, and the tank is full or when the trough is full, and the tank is empty.
   4. Backwashing load shall be the vertical load down during cell backwash and shall include the weight of the trough and any attachments, such as weirs and spreaders (ignoring buoyancy due to 2" lower inside water depth).
   5. Point load of 300 lbs. at any part of the trough.
   6. Design end flanges and blind ends to be a minimum of 1.5 times the nominal thickness of the trough, conforming to the fiber stress limitations as specified, and designed for anchorage loadings.
   7. When calculating deflection, fiber stress and other critical properties, use the maximum possible differential existing when the trough is empty and the tank full, or when the trough is full, and the tank is empty.

D. Design troughs to meet the deflection limits specified below:
   1. Vertical Deflection: Maximum vertical deflection under full buoyant or gravity load measured at the mid-point between supports shall not exceed 3/16-inch or L/1000, whichever is less, where L is the unsupported length in inches.
   2. Side Wall Deflection: Maximum trough sidewall horizontal deflection under full lateral load shall not exceed 3/16-inch or D/100, whichever is less, where D is the trough depth, in inches.
   3. Maximum bottom deflection under full buoyant or gravity load shall not exceed 3/16-inch or W/100, whichever is less, where W is the trough width in inches.

E. Design trough systems to resist torsional oscillations induced by the flow of water over the trough edges. Maximum allowable torsional oscillation sideways or torsionally during normal operating conditions shall be 3/8-inch. Provide torsional stabilization by methods described in Section 3.2.3.3 of AWWA F101 when torsional oscillation exceeds the maximum allowable limit. Provide wall-to-wall lateral stabilizers for backwash troughs installed in air-scour backwash systems as specified in Sections 3.2.3.1 and 3.2.3.2 of AWWA F101, respectively. Design of stabilizers and appurtenant mounting hardware shall be the responsibility of the trough manufacturer.

F. Design troughs to accommodate a thermally induced expansion or contraction in length of at least 1/8" per 20' length of trough over a temperature range of 10 °F to 100 °F without exceeding the deflection or strain limitations herein.

G. Supplemental to the deflection criteria above, the troughs shall also be designed such that the maximum wall stress under the most severe loading conditions is less than or equal to 1500 psi. This stress criterion is equivalent to 7:1 safety factor (approximate) as applied to the tensile and flexural properties of contact molded troughs and launders.

H. The maximum bending stress and shear stress under the most severe load conditions shall not be greater than 11,400 psi and 14,000 psi respectively. The troughs shall be designed to accommodate temperature-induced stresses resulting from differences in thermal expansion between trough and supports.

2.03 DETAILS OF CONSTRUCTION

A. Troughs shall be Type I fabrications as defined in Section 2 of AWWA F101.

B. Materials of Construction
   1. Reinforcing materials:
      a. Glass Fiber: Materials used shall be Type E (electrical borosilicate), or equivalent, glass with a chrome or silane finish, and a binder compatible with the resin. Surfacing veil, if used, shall be 0.010-inch Type C (chemical) or equivalent, veil with a binder containing silane and compatible with the lay-up resin.
      b. Synthetic Fibers: Use synthetic surfacing mat for chemical environment when Type C veil is not compatible with the intended chemical environment.
      c. Metallic: Metal reinforcements shall be free of rust, oil, and foreign matter. Completely encapsulate reinforcement with 1/8-inch laminate to ensure against pinhole bleeding and subsequent rust streaking. Galvanizing or rust inhibitive priming does not preclude requirement for encapsulation.

d. Composites: Use liquid-resistant materials such as end-grain balsa wood or closed-cell polyurethane foam for core materials. Standard wood products are not acceptable.

2. Plastic resin:
   a. Resin shall be a commercial-grade polyester thermosetting resin, which has either been evaluated in a laminate or which has been determined to be acceptable for the service conditions intended.
   b. Resin shall contain no fillers or additives except as follows:
      1) A thixotropic agent, which does not interfere with laminate quality or with the required chemical resistance of the laminate, may be added for viscosity control.
      2) Pigments, dyes, or colorants used shall be suitable for contact with potable water and which have been determined by at least 5 years previous service to be acceptable for the service condition without fading or chalking from original color standard. Pigments shall be light stable, not soluble in water and compatible with the resin. Color shall be translucent blue green.
      3) Ultraviolet Stabilization: Provide ultraviolet stabilizers in all laminates. The laminate shall exhibit not greater than 2 percent deterioration of flexural and tensile properties after 1000 hours of exposure in a Type E, single open-flame, sunshine carbon-arc lamp apparatus as detailed in ASTM G 23.
      4) Additives: Add catalysts, accelerators and/or promoters to provide a complete cure of the laminate and to meet the physical properties specified herein.

C. Laminate Construction
   1. General: Laminate comprising the fabrications shall consist of a molded or inner surface, a structural layer, and an exterior or outer surface with integral metallic structural elements as required.
   2. Inner Surface: The molded or inner surface shall be one of the following systems:
      a. A resin-rich layer, 0.010 to 0.020-inch thick, reinforced with a C veil surfacing mat or an organic fiber surface material in accordance with Paragraph 2.03.B.1. This resin-rich layer shall contain less than 20 percent by weight of the reinforcement material.
      b. A gelcoat consisting of a resin-rich layer 0.015 to 0.020-inch thick may be used in place of that specified above. Acceptable commercial gel-coat resins shall have been tested and proven in fabrications manufactured for use in potable water service. The gelcoat shall be compatible with the resins and shall not show delamination from the substrate when subjected to the tests described in Section 5 of AWWA F101. Gelcoat used for surfacing shall be a commercially manufactured gelcoat, shall be crack and craze resistant, and exhibit the following properties:

Property	Test Method	Value of Property
Minimum Tensile Strength	ASTM D 638	12 x 10^3 psi
Flexural Strength	ASTM D 790	19 x 10^3 psi
Minimum Modulus of Elasticity	ASTM D 638	9 x 10^5 psi
Minimum Barcol Hardness	ASTM D 2583	35
Maximum Water Absorption	ASTM D 570	0.2%

Property	Test Method	Value of Property
Porosity, Blisters, Wrinkles	None	

3. Structural Layer:
   a. Reinforcement placed subsequent to that installed in the inner surface shall consist of plies of chopped strand mat or spray-up passes to provide a laminate structure in accordance with the requirements herein.
   b. In all structural designs, each successive ply or pass of reinforcement shall be thoroughly wetted with resin and shall be well rolled to exclude all air pockets and bubbles prior to the application of additional reinforcement.
4. Exterior Surface: Exterior or outer surface shall consist of a resin-rich layer not less than 0.020-inch thick of resin paraffinated to prevent air inhibition. Apply exterior surface after gelation or cure of the structural layer suitably embeds all reinforcing fibers.

D. Integral Metallic Elements: Encapsulate integral metallic structural elements, where required, in accordance with Paragraph 2.03.B.1.c. Extend overlay laminate or encapsulate, where feasible, a minimum of 2-inches beyond the metal members.

E. Composite Structural Elements: Encapsulate core elements of composite structural fabrications with a minimum of 1/8-inch structural laminate layer. Extend overlay, where feasible, not less than 2-inches beyond the core member.

F. Reinforce troughs with integrally shaped longitudinal stiffener sections. Additional horizontal stiffness and rigidity may be provided using spreaders placed at appropriate points and fastened to the troughs with stainless steel hardware.

G. Laminate Cuts, Slots, and Holes: Sand smooth and seal with resin solution all cut edges, drilled holes, machined slots and similar work and laminate structures. Paraffinate resin solution to prevent air inhibition and to ensure complete sealing of edges to prevent water from penetrating or wicking into the laminate.

H. Tolerances:
1. Top edges of troughs shall be level and parallel with a tolerance of 1/8-inch, measured when the fabrications are empty.
2. Length of troughs shall have a tolerance of 1/8-inch per 10 feet.
3. Thickness of fabrications shall be in accordance with requirements specified in Article 2.02 but not less than 3/16-inch. Thickness tolerance shall be plus 1/8-inch minus zero, and in no event shall thickness be less than 3/16-inch.
4. At locations of supports such as saddles, thickness shall be at least 1.5 times the nominal thickness of the fabrication and shall be in accordance with the fiber stress limitations specified in Paragraph 2.02.G.
5. End flanges and blind ends shall be not less than 1.5 times the nominal thickness of the fabrication and shall be in accordance with the fiber stress limitations specified in Paragraph 2.02.G.

I. Finish and Appearance:

1. Check finished laminate visually. Defects in excess of limitations stipulated in Table 3 of AWWA F101 may be cause for rejection. Defects in excess of those listed in Table 3 of AWWA F101 may be repaired except where such repairs may affect the serviceability of the fabrication.
2. Repair defects by sanding or grinding to remove defective areas. Follow by coating with an overlay of paraffinated resin, used for manufacture, and reinforcement consisting of a minimum of one layer of 1.5 oz/sf chopped strand glass, plus a surfacing mat 0.015-inch of gelcoat. Buildup all repaired areas until the surface is flush and the original thickness is restored. Fill pits or other small deep defects with resin putty. All such remedial work shall be subject to the approval of Engineer.
3. There shall be no areas of the laminate that are excessively resin rich or poorly wetted out. The laminate shall be dense without dry spots or cracked or crazed surfaces. Minimum ratio of resin to glass shall be 70 to 30.

J. Minimum Physical Requirements: All laminates shall meet the minimum physical properties listed below:

Property	Test Method	Value of Property
Tensile Strength	ASTM D 638	12.0 x 10^3 psi
Flexural Strength	ASTM D 790	19 x 10^3 psi
Flexural Modulus	ASTM D 790	9 x 10^5 psi
Barcol Hardness	ASTM D 2583	35 min.
Izod Notched Impact	ASTM D 256	13 ft-lb/in.
Water Absorption (24 hr.)	ASTM D 570	0.2% max.

K. Trough Details

1. Provide an integrally molded water stop on the discharge end of each trough for installation in oversized wall openings.
2. Trough Leveling Adjustment and End Supports:
   a. Provide assembly at the closed end of the trough to allow minimum vertical leveling adjustment of 1-1/2 inches. Provide space between mounting walls and trough for expansion per manufacturer's recommendation. Troughs shall be watertight. Supports shall be 316 stainless steel.
3. Adjustable Weir Plate
   a. Adjustable straight edge weir plates shall be provided for each trough.
   b. The weir plates shall be constructed of fiberglass that meet the fabrication standards established for Type I per AWWA F102.
   c. Size: 1/4-inch x 6-inch x length of trough.
   d. Weir plates shall be installed by manufacturer and field adjusted.
   e. All mounting hardware shall be 316 stainless steel.
4. Spacer Rods
   a. Sufficient plastic spacer rods shall be included to maintain a uniform width over the length of trough.
   b. Spacer rods shall be spaced to prevent buckling and to provide maximum resistance to water loading on the sidewall of the trough.

c. Spacer rods shall be spaced per manufacturers design and no greater than 30-inches on center.

2.04 IDENTIFICATION

A. Provide each trough furnished under this Specification with product identification as described in Section 6.1.1 of AWWA F101.

2.05 ACCESSORIES

A. Provide all mounting brackets, supports, stabilizing bars, angles or rods, fasteners and similar accessories required for installation of the equipment furnished. All accessories shall be Type 316 stainless steel and meet requirements of Division 05.

B. Manufacturer shall size anchor bolts for provision and installation by Contractor.

PART 3 EXECUTION

3.01 INSTALLATION

A. Inspect and verify that structures or surfaces on which the equipment will be installed have no defects, which would adversely affect the installation. Promptly report, in writing, defects which may affect the Work to the Engineer.

B. Type 316 stainless steel trough supports, and hardware shall be installed in accordance with the provisions of Division 05 and the trough manufacturer's written instructions.

C. The troughs shall be installed in full accordance with the manufacturer's instructions by mechanics skilled in the installation of this type of work, under the supervision of the manufacturer's representative.

D. Troughs shall be aligned and leveled, free of warp or twist, with no greater than 1/8-inch variation between any 2 points on the weir edge. Across individual filter/contactor basins, align trough weirs to within plus or minus 1/8 inch of each other.

E. Gasket sealing material between the trough and the wall shall be ¼" neoprene sheet.

F. All joints shall be sealed with 1/8" neoprene gasket material, full width of flange, providing a seal between sections.

G. After the troughs have been leveled and aligned to the required accuracy, the troughs, stabilizer assemblies, and support assemblies shall be field drilled and bolted.

H. Install plastic spacing washers between the closed ends of troughs and the walls of filter boxes.

I. All holes, superficial damage, and other cut surfaces shall be sanded smooth and properly resin sealed according to manufacturer instructions.

3.02 COMMISSIONING, TESTING AND START-UP

A. Commissioning, testing and Startup shall conform to the requirements of Section 01 91 00

B. Filter boxes shall be individually filled with water to check trough elevation tolerances. For any not meeting tolerances, adjust weir plates to maintain level tolerances.

C. During backwashing including at the maximum design rate, observe and inspect troughs for deflection, oscillation, cracks, blisters, surface porosity, chips, delamination, or other defects. Correct any deficiencies found.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK.
