4. Registers: Registers shall provide at least six-digit visual registration. The measuring units shall be printed on the face of the register. The register shall have a full test sweep hand or dial. All registers shall be removable without disassembly of the meter or depressurizing the service line. The register shall be free of openings to protect the internal electronics of the register. Lens covers shall be made of polycarbonate or other suitable engineering polymer for indoor installations and mineral glass for underground pit installations.
5. Plate Strainers: AWWA C702. All strainers provided shall have top access without blow down ports. Cases shall be bronze. Strainer plates shall be 18-8 stainless steel or bronze.
6. Remote Registration Requirements:
 - a. Meters shall have encoder-type remote-registration conforming to AWWA C707. Registers using generator pulses or low voltage conversions shall not be permitted. Power requirement for data transmission shall be supplied by an interrogation device. Registers shall be compatible with various brands of interrogation equipment. The register shall, in a digital format, simultaneously encode at least six significant digits of the meter reading for transmission through the remotely located receptacle. A meter identification number shall also be provided with each reading.

F. Strainers:

1. Strainers shall have blow off outlet with pipe nipple and gate valve or ball valve with discharge pipe nipple. Copper alloy or cast-iron body. Provide stainless steel strainer element with perforations of 0.047 inch (1.2 mm).

G. Pressure Gauges:

1. Pressure gauges shall be ASME B40.1, liquid filled, 1 percent accuracy or better, with bronze bourdon tube and steel or brass case, as manufactured by U.S. Gauge American, Mueller, Trerice, Ashcroft or acceptable equivalent product.

2. Gauges shall have a minimum 3 inch (80 mm) diameter face. Dial gradations reading in "PSIG" (kpag) shall be such that the normal operating pressure of the system installed shall be indicated in middle 1/3 of the scale range.
3. Gauges shall be equipped with a ball valve shutoff and snubber. An outlet, at least 1/4-inch (8 mm) size, plugged for the installation of the inspector's gauge shall be located between each valve and gauge.

H. Thermometers:

1. Bi-metal dial type thermometers with stainless steel case, stem, and fixed thread connection; minimum 3 inch (80 mm) diameter dial with glass face gasketed within the case; accuracy within 2 percent of scale range. Dial gradation reading in "Degrees Fahrenheit" shall be such that the normal operating temperature is in middle 1/3 of scale range.

I. Dielectric Connections:

1. Provide at connections between copper and ferrous metal piping materials. ASTM F441, Schedule 80, 4 inch (100 mm) minimum length, may be provided for dielectric connections in pipe sizes 2 inch (50 mm) and smaller.

J. Water Hammer Arresters:

1. PDI WH 201, hydropneumatic cushion with stainless steel bellows.

K. Valve Boxes:

1. For each buried valve provide cast-iron, ductile-iron, or plastic box of a suitable size. Provide cast-iron, ductile-iron, or plastic cover respectively for the box with the word "WATER" cast on the cover. Plastic boxes shall be constructed of ABS plastic or inorganic fiber-reinforced black polyolefin plastic. Coat cast-iron and ductile-iron boxes with bituminous paint.

L. Backflow Preventers:

1. Provide double check backflow preventer with gate or ball valve on both ends and inlet strainer. Backflow preventers shall have replaceable seats and discs, bronze body, rated for minimum 35 to 150 degrees F (2 to 66 degrees C) and 175 psig (1,207 kpag). Backflow prevention assemblies shall have current "Certificate of Approval from the Foundation for Cross-Connection Control and Hydraulic Research, FCCCHR List." Listing of the specific make, model, design, and size in the FCCCHR List shall be acceptable as the required documentation. Double check valve assembly shall be tested and certified under ASSE 1015. Each check valve shall have a drain.

M. Expansion Tanks:

1. NSF 61; diaphragm type expansion tanks designed for use in potable water systems; butyl diaphragm, polypropylene liner, welded steel shell; constructed, tested hydrostatically and certified in accordance with ASME BPVC SEC VIII D1. Tank shall be equipped with all necessary fittings including stainless steel system connection and welded air charge fitting with plastic cap. Tank and fittings shall have 125 psig (862 kpag) minimum working pressure and 180 degrees F (82 degrees C) minimum operating temperature.
2. Tanks shall be factory pre-charged and field-adjusted to match incoming water pressure.

N. Electric Trap Primer:

1. Trap primer valve and control all housed in moisture proof enclosure complete with UL listed electrical assembly consisting of circuit breaker, switch, and timer solenoid valve designed to operate on 120 VAC, single phase power. Unit shall be rated for minimum range of 32 to 120 degrees F (0 to 49 degrees C) and 20 to 125 psig (138 to 862 kpag), minimum 2 ounces (59 ml) water at 20 psig (138 kpag) per trap served. Inlet and outlet piping connections shall be 1/2-inch (15 mm) NPT.
 - a. Provide distribution unit to serve up to four (4) traps where required.

O. Hose:

1. Kink resistant reinforced rubber hose, corrosion resistant metal couplings, minimum 5 year warranty; size and length as indicated.

2.4 PIPE HANGERS AND SUPPORTS:

- A. See Section 22 05 29.

2.5 SUPPLEMENTARY STEEL AND CHANNELS:

- A. Unless otherwise indicated on the Structural Drawings, provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.
- B. Channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.
- C. All supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes. Channels shall be steel. Supplementary steel assemblies shall be hot dipped galvanized after fabrication and channels shall be hot dipped galvanized where located in the following rooms: 123-127.

2.6 PIPE SLEEVES AND PREFABRICATED FLASHING:

- A. Sleeves in Masonry and Concrete Walls, Floors, Ceilings, and Flat Roofs: Schedule 40 hot dipped galvanized, standard weight ductile-iron or cast-iron pipe sleeves. Sleeves available from the manufacturer of mechanically adjustable segmented elastomeric seals shall be permitted subject to acceptance by the Engineer. Provide minimum 2 inch high waterstop for sleeves in exterior walls and floors.
- B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness.
- C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have EPDM seal elements and steel hardware with corrosion inhibiting coating.
- D. Prefabricated flashing shall be manufactured from EPDM rubber or Silicone with square or round flexible aluminum base. Design shall form watertight, weatherproof seal around pipe and allow flashing to adjust to any roof pitch. Flashing shall be marked to allow accurate trimming for required pipe size.

2.7 PIPE ESCUTCHEONS:

- A. General: Provide pipe escutcheons at all pipe penetrations where penetration is exposed to view as specified herein with inside diameter closely fitting pipe outside diameter. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, wall, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be held in place by internal spring tension or set screws.
- B. Provide pipe escutcheons in finished spaces. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

2.8 DRIP PANS:

- A. Piping is not permitted in Electrical Rooms and stairwells.
- B. Provide drip pans fabricated from 14 gauge steel sheet and with edges turned up 2-1/2-inches. Reinforce top edge, either by structural angles or by rolling top over 1/4-inch rod made of same material as drip pan sheet metal. Provide hole and 1 inch threaded half coupling for low point drain. Provide hanging brackets of sufficient quantity made of same material as drip pan sheet metal for connecting threaded rods used for suspended drip pans. All joints shall be welded watertight and entire and welded assembly sandblasted, degreased and hot dipped galvanized after fabrication.
- C. Locate drip pans under piping passing over or within 3 feet horizontally of material and equipment defined above, and elsewhere as indicated. Hang from structure with rods and building attachments, fasten rods to brackets on sides of drip pan. Carefully pitch to the drip pan low point for drainage. Brace to prevent sagging or swaying. Drip pans shall be installed within 12 inches below piping.

- D. Provide 1 inch schedule 40 hot dipped galvanized steel drain line from each drip pan and terminate 6 inches above the floor at nearest floor drain.

2.9 ACCESS PANELS:

- A. Access panels shall give access to each valve and cleanout in concealed spaces above non removable (hard) suspended ceilings, and to all other concealed parts of the system. Access panels shall be located where indicated on the Drawings, or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.
- B. Access panels shall be Milcor Type M, 16 inch by 16 inch (400 mm by 400 mm) minimum, as manufactured by Inryco, Inc., or equal. Door shall be constructed of 18 gage (1.311 mm) galvanized steel with frame constructed of 16 gage (1.613 mm) galvanized steel. Casing bead shall be galvanized steel. Hinges shall be steel concealed spring type with steel pin. Locks shall be flush, screwdriver allen head operated, with metal cam. Prime coat shall be factory applied rust-inhibitive light grey paint.

2.10 PLUMBING FIXTURES:

- A. Provide control-stop valves in each supply to each fixture. The finish of fittings, accessories, and supplies exposed to view shall be chromium-plated per ASME A112.18.1M. Centerset faucets shall be top-mounted with inlets on not greater than 8 inch centers. Provide special roughing-in for wheelchair fixtures.
- B. (Accessible) Flush Valve Type Water Closets:
 - 1. ADA compliant, ASME A112.19.2M, flush valve type, white vitreous china, top spud inlet, wall-hung, wall outlet, siphon jet action, elongated bowl, white solid plastic elongated open-front seat, and ASME A112.19.5 trim. Height to top of seat shall be 17 inches (432 mm) to 19 inches (483 mm) above floor.
 - 2. Provide ADA compliant, diaphragm type, exposed solar powered sensor activated flush valve complete with battery back-up and override button to enable flushing during a power outage or at user's discretion. Flush valve shall be of polished chrome plated cast brass, including vacuum breaker and angle (control-stop) valve with back check. Unit shall be equipped with splashproof circuit control module, sensor range adjustment, trouble shooting indicator lights, and variable time-out settings. Mount approximately 30 inches (762 mm) above floor and arrange to avoid interference with grab bars. In addition, the flush valve shall be installed on the wide side of the enclosure.
 - 3. The water flushing volume of the flush valve and water closet combination shall not exceed 1.28 gallons (4.8 liters) per flush.
 - 4. Provide ASME A112.6.1M carrier with feet.
 - 5. Provide ASME A112.6.1M concealed chair carriers with feet.

C. (Accessible) Lavatories:

1. ASME A112.19.2M, white vitreous china, contoured front rim, front concealed overflow, single hole punch, ASME A112.6.1M concealed arm carrier support and chair carrier, minimum dimensions of 20 inches wide by 27 inches (508 mm wide by 686 mm) front to rear, 29 inch (737 mm) minimum clearance from bottom of front rim to floor, 34 inch (864 mm) front rim height above floor.
2. Provide ASME A112.18.1M, ADA-compliant, copper alloy, 24 VAC sensor-operated electronic hand washing faucet with vandal resistant pressure compensating flow control spray head 5 inches (127 mm) above rim. Flow shall not exceed 0.5 gpm (1.9 lpm) at 60 psi (414 kPa) flow pressure. Unit shall be equipped with splashproof circuit control module, sensor range adjustment, trouble shooting indicator lights, variable time-out settings, solenoid valve with wye strainer, metal jacketed protection for control wiring, modular quick release sensor and solenoid connections, and proper size trim plate at base of faucet. Provide plug-in 120/24 VAC transformer for operating up to 2 faucets. Faucet shall be designed for tempered or hot/cold water operation set-up as specified below.
 - a. Provide hot/cold water operation set-up. Set-up shall include back-check tee.
 - b. Provide tempered water operation set-up. Set-up shall include below deck thermostatic mixing valve.
2. Provide perforated grid strainer with offset tailpiece, and 1-1/4 inch (32 mm) adjustable P-trap.

D. Mop Sink Basins:

1. Precast terrazzo receptor, 24 inch (607 mm) by 24 inch (607 mm) by 12 inch high. Flanges shall be provided on all sides mating against wall, and protective caps shall be provided on all exposed sides. Flanges shall be galvanized, bonderized steel cast integral with receptor and extend at least one inch above shoulder for installation against stud wall. Protective caps shall be stainless steel cast integral with receptor. Drain body shall be copper alloy, 3 inch (80 mm) size, floor or wall outlet, cast integral with receptor and shall provide for a non-caulked connection. Terrazzo shall be made of marble chips cast in white portland cement to produce 3,000 psi (20.7 mpa) minimum compressive strength 7 days after casting. Terrazzo surface shall be ground and polished with all air holes and/or pits to be grouted and sealed to resist stains and moisture. Receptor will be reinforced with minimum 16 gage (1.0 square mm) wire.
 - a. Provide ASME A112.18.1M rough chrome-plated copper alloy back-mounted combination (double stop) faucet with vacuum breaker, bucket hook and 3/4-inch (20 mm) external hose threads.

E. Countertop Sinks:

1. ASME A112.19.3M 18 gage (1.27 mm) stainless steel with integral mounting rim, minimum dimensions of 16 inches wide by 20 inches front to rear, single compartment with ledge back and undersides coated with sound dampening material. Provide top-mounted ASME A112.18.1 copper alloy faucets, swing spout with aerator, and stainless steel drain outlets with cup strainers. Flow shall not exceed 2.2 gpm (8.3 lpm) at 60 psi (414 kPa) flow pressure. Provide 1.5 inch (38 mm) adjustable P-trap. Provide UL 430 waste disposer unit in right compartment.

F. (Accessible) Electric Water Cooler:

1. ARI 1010, wall-mounted, non-recessed, bubbler style with ASME A112.6.1M concealed chair carrier, air-cooled condensing unit, 4.75 gph (18 lph) minimum capacity, stainless steel splash receptor, and all stainless steel cabinet, with 27 inch (686 kPa) minimum knee clearance from front bottom of unit to floor and 36 inch (914 mm) maximum spout height above floor. Bubblers shall also be controlled by push levers, by push bars, or touch pads one on each side or one on front and both sides of the cabinet.

G. Combination Emergency Shower and Eyewash:

1. ADA compliant. ANSI Z358.1; factory assembled and water tested; column mounted shower and eye/face wash fixtures on floor flange. Fixtures shall be operated individually from a common fixture supply line. Provide a self-cleaning, non-clogging 10 inch (254 mm) diameter deluge shower head fixture with elbow and full flow stay-open ball valve having stainless steel pull rod and 8 inch (203 mm) diameter stainless steel ring or triangular handle. Shower head shall be fed by 1 inch (25 mm) branch line, be 7 feet (2,134 mm) above floor and extend 2 feet (610 mm) horizontally from the unit support column/standpipe. Shower shall deliver a minimum of 20 gpm (75.7 lpm) of water at an inlet supply of 30 psig (207 kpag). Provide a self-cleaning, non-clogging eye and face wash fixture with full-flow stay-open ball valve activated by flag handle, eye/face wash bowl, and four spray-type outlet nozzles. Each nozzle shall have "flip top" dust cover, internal flow control and filter. Eye/face wash shall deliver 3 gpm (11.4 lpm) of aerated water at 30 psig (207 kpag) flow pressure, with eye and face wash nozzles 33 to 45 inch (838 to 1,143 mm) above finished floor. Provide copper alloy control valve with stay-open feature such that fixture flow continues uninterrupted until handle is manually returned to closed position. Provide an air-gap with the lowest potable eye and face wash water outlet located above the overflow rim by not less than the Plumbing Code minimum. Pipe and fittings shall be Schedule 40 galvanized steel with support column/standpipe marked for high visibility. Water supply connection shall be 1-1/4 inch (32 mm) female NPT top or side inlet, and 1-1/4 inch (32 mm) female NPT waste outlet. Furnish unit with ANSI-compliant identification sign.
2. Provide the following accessories:

- a. shower head
- b. Powder coated finish on galvanized pipe and fittings
- c. 20 gpm min (75.7 lpm) flow control valve
- d. Privacy curtain for indoor use
- e. Stainless steel bowl cover for eye/face wash fixture cover shall automatically raise when unit is activated
- f. Stainless steel dust covers for each spray nozzle
- g. Thermostatic mixing valve

H. Hose Bibbs:

- 1. Provide angle type copper alloy hose bibb with lockshield and handwheel or tee-handle. Inlet shall have internal threads. Outlet shall have vacuum breaker with 0.75 inch (20 mm) external hose threads.

I. Nonfreeze Wall Hydrant:

- 1. ASSE 1019, cast bronze, with lockshield and removable handwheel or tee-handle, one inch external thread inlet, 0.75 inch (20 mm) external hose thread outlet with automatic draining vacuum breaker. Hydrant shall be of sufficient length to extend through walls and place the valve seat inside the building. Bonnet and valve stem shall be removable from outside of the building.

J. Trench Drains:

- 1. Modular type system designed for placement in cast concrete floors, width and length as indicated. Channel sections shall be made of HDPE plastic with interlocking ends and curved bottom. Channels shall be provided with 1 percent built-in slope. Minimum invert shall be 6 inches. Channel system shall have provisions for positioning and anchoring in concrete slab. System shall include acid resistant coated or stainless steel frame to distribute weight between grate and channel. Outlets shall be no-hub end, bottom, or side outlet type as indicated, 4, 6, or 8 inch size as indicated.
- 2. Grates shall be heavy duty, with material as indicated on drawings to match environment (ductile iron, acid resistant coated ductile iron, galvanized steel, galvanized ductile iron, stainless steel, fiberglass reinforced polyester (FRP), etc. with slotted or bar type pattern. Grates shall be Class C rated, unless otherwise indicated. Where metal covers are utilized, AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

2.11 GAS-FIRED DOMESTIC WATER HEATERS (SEALED COMBUSTION/DIRECT VENT):

- A. Domestic water heaters shall be UL listed, NSF certified, natural gas-fired of sealed combustion/direct vent design, UL listed, minimum 95 percent thermal efficiency condensing type, and certified for 150 psig (1,034 kpag) maximum working pressure. Water heaters shall have low NO_x emissions meeting SCAQMD Rule 1146.2 and designed for zero clearance to all combustible surfaces.
- B. Domestic water heaters shall be constructed of series 300 stainless steel requiring no anode rods. The primary condensing heat exchanger shall be constructed of 90/10 cupronickel. Tank insulation shall be non-CFC, polyurethane rigid foam minimum 2 inch thick (50 mm) enclosed in a high impact plastic shell. All components shall be located in the front of the water heater and accessible through a removable cover. All related hardware shall be constructed of stainless steel studs and brass nuts.
- C. The control panel shall be an integrated solid state temperature and ignition control device with integral diagnostics, LED fault display capability and a digital display of water temperature, set point and differential. Temperature set point range shall be from 70 to 160 degrees F (21 to 71 degrees C).
- D. Each water heater shall be supplied with an AGA/ASME rated combination pressure/temperature safety relief valve sized per the domestic water heater manufacturer's recommendations.
- E. Combustion system shall be complete with control board, control well and E.C.O., transformer, gas burner, gas valve, hot surface ignitor, flame probe, combustion blower, vent over-temperature sensor, reset switch, and pressure switch.
- F. All related intake air and exhaust gas piping shall be acceptable for zero clearance to any combustible surface. Intake air, exhaust gas, and condensate drain piping shall be installed in strict accordance with domestic water heater manufacturer instructions and local code.

2.12 GAS VENTS:

- A. NFPA 211, Type B, of the prefabricated multi-wall UL listed type. Vents shall be rigid, round vent pipe with aluminum alloy inner liner and galvanized steel outer casing. Provide fittings, thimbles, bird proof top (top of stack discharge), roof flashing, adapters, connectors and supports.

2.13 RECIRCULATION PUMPS:

- A. Select the pump so that the operating point on the characteristic performance curve for the impeller size to be furnished will be to the left (shut-off side) of and not more than 5 percent below the point of maximum efficiency for the impeller to be furnished. Provide lifting attachments on pumps larger than 2 horsepower (1.5 kW).

B. In Line Centrifugal Pumps:

1. In-line pumps shall be close coupled direct driven and have all-bronze construction, including bronze casings, alloy steel shafts with copper alloy shaft sleeves, and bronze impellers. Impeller shall be statically and dynamically balanced. Bearings shall be either sleeve type or sealed ball bearings. Shaft seals shall be mechanical seals. Provide casing wear rings, drain and vent connections with threaded plugs, suction and discharge pressure gage tapings with threaded plugs, and flexible coupling or direct drive connection between pump and motor. If the scheduled pump includes ball bearings and a direct drive motor to impeller connection, the submitted pump shall not have sleeve bearings or a flexible coupling between pump and motor.

C. Wet Rotor Pumps:

1. Pumps shall be single stage. Pumps shall have cast iron casing, ceramic shaft, carbon bearings, EPDM o-rings and gaskets, and non-metallic impellers. Pumps shall have replaceable bronze cartridge containing all moving parts of the pump. Pumps shall be self-lubricating with no mechanical seal. Pumps shall have thermally protected permanent split capacitor motor and stator housing. Provide anti-condensate baffle with ambient air flow to protect motor windings against condensate buildup.

D. Flexible Connectors:

1. Provide flexible connectors at pumps. All connectors shall be installed on the equipment side of shutoff valves, horizontal and parallel to shafts whenever possible. Connectors shall be manufactured of nylon tire cord and EPDM, both molded and cured in hydraulic presses and rated at 250 psig/170 degrees F (1,724 kpag/77 degrees C), dropping in a straight line to 170 psig/250 degrees F (1,172 kpag) for sizes 1-1/2 to 12 inch (40 to 300 mm). Neoprene in lieu of EPDM shall not be acceptable. Straight connectors to have two (2) spheres reinforced with a molded-in, external ductile iron ring between the spheres.
2. Connectors shall be pre-extended per manufacturer's recommendation to prevent elongation under pressure. Connectors bolted to gate, butterfly or check valves to have a minimum 5/8-inch (16 mm) flange spacer installed between the connector and the coupling flange. Minimum safety factor of 3.6:1 at a maximum pressure rating shall be certified by test reports. Submittals shall also include two test reports by independent consultants showing minimum reduction of 20 Db in vibration accelerations and 10 Db in sound pressure levels at typical blade passage frequencies.
3. Connectors shall be Mason Ind. Super-Flex type MFTNC or NTFU, or acceptable equivalent product.

2.14 FLUE GAS CONDENSATE PUMPS:

- A. UL listed, rated for high efficiency gas burning appliances producing acidic condensate and intermittent liquid temperatures up to 120 degrees F (49 degrees C). Units shall be equipped with vertical type pump, stainless steel motor shaft, high impact and corrosion resistant tank and motor cover, 3/8-inch (10 mm) OD barbed tubing adapter and check valve, and motor thermal overload protection.

2.15 SUMP PUMPS (SUBMERSIBLE TYPE):

- A. UL listed, factory assembled and tested submersible type pumps for operation under water up to maximum 120 degrees F (49 degrees C) or higher and capable of passing minimum 1/2-inch (13 mm) spherical solids. Pump shall be complete with cast-iron casing with corrosion resistant finish, cast iron or bronze impeller, stainless steel shaft, carbon/ceramic mechanical seals, sealed heavy-duty ball bearings, water-cooled hermetically-sealed motor, built-in automatic reset thermal protection, stainless steel lift handle, and waterproof three-conductor cables and grounded plugs. Pumps shall have single seal design.
- B. Provide adjustable/variable level float switch complete with waterproof three-conductor cable and grounded plug. Plug shall be designed for piggybacking into pump grounded plug. Float shall have plastic encased variable level switch designed for use in minimum 18 inch (457 mm) diameter sump. Variable level control switch shall be normally open when hanging down vertically above sump liquid level, and close when it reaches a few degrees above the horizontal position.
- C. Provide UL listed alarm panel complete with high water alarm light, high water alarm horn with alarm test and horn silence switch, 115 VAC auxiliary dry high level alarm contacts, and NEMA 4X thermoplastic enclosure. Alarm panel shall operate on 115 VAC circuit separate from pump.
- D. Select the pump so that the operating point is in the middle one half of the characteristic performance curve for the pump to be furnished.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Installation, workmanship, inspection, and testing shall be in accordance with the specified Plumbing Code, Energy Conservation Code, and Building Code with the additions specified herein. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other acceptable methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position. When fixtures require both hot

water and cold water supplies, provide the hot water supply to the left of the cold water supply.

- B. Copper tube extracted joints shall not be permitted.
- C. Piping shall not be permitted in Electrical Rooms and stairwells.
- D. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.
- E. Install aboveground pressurized piping to permit draining of all sections of each piping systems without traps. Pitch piping back to system low points. Provide drain valves at all piping low points.
- F. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.
- G. Buried Piping:
 - 1. Pipe bedding and compacted backfill to a point 12 inches (300 mm) above crown of buried pipe shall be provided under this Section of the Specifications in accordance with the requirements of Section 31 23 33.
 - 2. Pipe bedding shall be 6 inches (150 mm) deep. Bedding and compacted backfill shall be non-corrosive material such as cleaned washed sand, and contain no stones, metal, rubbish of any kind, frozen material, organic matter, or any other material capable of damaging piping or coating, and/or of settling.
 - 3. Where feasible, install buried lines in a single trench. Trenches shall be wide enough to permit at least 6 inches (150 mm) spacing between lines and the sides and floor of the trench.
 - 4. Terminate buried piping not more than 6 inches (150 mm) above finished ground surface or floor slab-on-grade, or from foundation wall inside surface.
 - 5. Make provisions in buried piping for differential settlement.
 - 6. Completely encase buried copper tubing, ductile-iron piping, and cast iron piping with polyethylene tube or sheet in accordance with AWWA C105.
- H. Threaded Connections:
 - 1. Jointing compound for pipe threads shall be polytetrafluoroethylene (PTFE) pipe thread paste, pipe cement and oil, or PTFE powder and oil; apply only on male threads. Provide exposed ferrous pipe threads with one coat of primer applied to a

minimum dry film thickness of 1.0 mil (0.03 mm). Do not thread metal pipe into plastic piping.

I. Soldered Connections:

1. Soldering shall be performed in accordance with best soldering practice. Before soldering copper tubing joints, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Provide suitable flux for use with solder. Surplus soldering material shall be removed at all joints. Piping shall be supported prior to soldering and not be sprung or forced.
2. For solder end valves, remove stems and washers and other items subject to damage by heat during installation. Reassemble valve after soldering is complete. Valves without heat sensitive parts do not require disassembly but shall be fully opened during soldering.

J. Brazed Connections:

1. Brazing of copper tubing joints shall be performed in accordance with AWS BRH, except as modified herein. During brazing, the pipe and fittings shall be continuously purged with a pressure regulated inert gas, such as nitrogen, to prevent the formation of scale. Before brazing, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Brazing flux shall not be used. Surplus brazing material shall be removed at all joints. Piping shall be supported prior to brazing and not be sprung or forced.

K. Flanged Connections:

1. Flanges shall be faced true and made square and tight.

L. Pipe Hangers and Supports:

1. See Section 22 05 48

M. Seismic Bracing Requirements:

1. Piping and equipment shall be supported and braced to resist seismic loads where required by the specified Building Code. Provide seismic restraints in accordance with the SMACNA Seismic Restraint Unit.
2. See Section 22 05 48

N. Pipe Through-Penetrations:

1. Furnish pipe sleeves where piping passes through walls, floors, ceilings, roofs, and partitions. Sleeves will be installed, and secured in proper position and location

during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, steel siding in the case of a steel building, and dry wall and/or plaster in the case of framed construction. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors, ceilings, roofs, and partitions.

2. Pipe Penetrations Through Building Interior Construction: Provide not less than 1/4-inch (8 mm) space between exterior of piping or pipe insulation and interior of sleeve. Firmly pack space with mineral wool insulation. For non-fire rated assemblies, seal at both ends of the sleeve with plastic waterproof cement which will dry to a firm but pliable mass or silicone. Seal both ends of penetrations through fire rated assemblies to maintain fire resistive integrity with UL listed fill, void, or cavity material.
3. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer.
4. Extend sleeves in floor slabs 2 inches (51 mm) above the finished floor, except sleeves are not required where drain, waste and vent piping passes through concrete floor slabs located on grade. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.

O. Cross Connection and Interconnections:

1. No equipment, devices or piping shall be installed which will provide a cross or interconnection between a domestic water supply and a drainage, soil or waste pipe which will permit or make possible the backflow of sewage, polluted water or waste into the domestic water supply system.

P. Connections to Existing Water Supply Systems:

1. Use tapping or drilling machine valve and mechanical joint type sleeves for connections to be made under pressure. Bolt sleeves around the main piping; bolt valve conforming to AWWA C500 to the branch connection. Open valve, attach drilling machine, make tap, close valve, and remove drilling machine, without interruption of service. Notify the Engineer and CM in writing at least 15 days prior to connection date and receive acceptance before any service is interrupted. Furnish materials required to make connections into the existing water supply systems and perform excavating, backfilling, surface restoration and other incidental labor.

3.02 FIELD QUALITY CONTROL:

- A. General: After system installation has been completed and prior to initial operation, inspect piping and control wiring systems for compliance with Drawings, Specifications, and accepted submittals. Perform flushing and tests in compliance with the specified

Plumbing Code with the additions specified herein. Have piping accepted by the Engineer and CM before insulating or otherwise concealing.

B. Test Procedures and Reports:

1. Prepare and submit procedures for all specified tests to the Engineer and CM for acceptance prior to the planned preliminary tests. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case.
2. Material and equipment used in testing shall be subject to inspection by the Engineer and/or CM. Provide water, electricity, instruments, appliances, equipment, connecting devices, and personnel for the tests.
3. When tests have been completed and corrections made, submit signed and dated test reports.
4. Test each new system to demonstrate compliance with the contract requirements. Tests shall be witnessed by the Engineer and/or CM. Correct defects in the Work and repeat tests until Work is in compliance with contract requirements.
5. Gages used in pressure tests shall have been calibrated within the 6-month period preceding the tests. Leaks found during tests shall be repaired by replacing pipe and/or fittings and the system retested. Caulking of joints shall not be permitted.

C. Tests:

1. Domestic Water Piping and Service Water Piping Pressure Tests: Before applying insulation, and before the installation of fixtures, cap ends of each system and hydrostatically test each piping system at not less than 125 psig (862 kpag) systems working pressure for a period of time sufficient for inspection of every joint in the system but in no case less than 2 hours. During the pressure test, there shall be no leakage or reduction in pressure.
2. Drain, Waste and Vent Piping Pressure Tests: Before the installation of fixtures, provide Drainage and Vent Water Test or Air Test in compliance with the specified Plumbing Code. Each test shall be for a period of time sufficient for inspection of every joint in the system but in no case less than 30 minutes. During the pressure test, there shall be no drop in water level or air pressure.
 - a. After plumbing fixtures have been set and their traps filled with water, subject the entire sanitary system to a Drainage and Vent Final Test in compliance with the specified Plumbing Code. The entire system shall be proven absolutely tight under such test.

3. Backflow Preventer Tests: Backflow preventers shall be tested by a locally approved and certified backflow assembly tester. A copy of the test report shall be provided to the Engineer, CM and Owner prior to placing the domestic water system into operation, or no later than 5 days after the test.
4. Functional Testing All control devices and signaling devices shall be tested individually to demonstrate proper operation. Test all control panel functions to demonstrate proper operation. Test all control system functions to demonstrate proper operation in accordance with the specified control sequences. Monitoring signals to the facility Supervisory Control and Data Acquisition (SCADA) system shall be verified.

D. Flushing:

1. After completion of testing and before placing in operation, flush all new piping including water feed mains of all foreign matter. Use the permanent water service at its maximum available pressure as the source of flushing water. Remove integral strainer screens, aerators, shower heads, hose end vacuum breakers, and other devices susceptible to clogging prior to flushing and re-install upon completion. Flush piping through each fixture outlet, strainer blowdown and equipment drain valve. Discharge used water to sanitary sewer. Remove and provide new screens in strainers after flushing is completed. System shall be drained prior to final filling.
2. The system shall be thoroughly flushed, in no case for less than 2 hours at the design flow rate, of all foreign matter until a white linen bag installed in a strainer basket shows no evidence of contamination. The white linen bag shall be in the strainer basket during the entire flushing operation prior to its being presented to the Engineer and/or CM for acceptance. The Engineer and/or CM will inspect the linen bag prior to completion of flushing and approve the flushing operation.

3.03 MANUFACTURERS INSTRUCTIONS AND SERVICES:

- A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project.
- B. Provide manufacturer's service in accordance with Section 01 78 23. Services shall be provided for the satisfactory completion of installation, start-up, testing and training for those equipment and systems described herein below.
 1. Domestic water heaters.
 2. Sump pumps.
- C. Field Training: For equipment and systems described herein above, provide separate field training course for designated operating and maintenance staff members. Training shall be provided for a minimum period of 5 hours of normal working time and shall

start after the subject equipment and systems are functionally complete but prior to final acceptance tests. The training shall include discussion of the system design and layout and demonstrations of routine operation and maintenance procedures. This training shall include: normal system operation and control; flow balancing; detection of a nonfunctioning system due to sensor, controller, and/or mechanical failure; filling, draining, and venting of the system; replacement of sensors, equipment, and equipment components; cleaning and inspection for leaks; and expansion tank charging if applicable.

- D. Upon completion of all Work, furnish, in duplicate, certificates of inspection from equipment manufacturers stating that authorized factory engineers have inspected and tested the operation of their respective equipment and systems and found same to be in satisfactory operating condition, and have trained operating and maintenance staff.

3.04 DISINFECTION:

- A. Disinfect the new water piping in accordance with the specified Plumbing Code with the additions specified herein or AWWA C651 whichever is more stringent. Fill piping systems with chlorine solution and allow solution to stand. Following the required standing time, flush solution from the systems with domestic water until maximum residual chlorine content is within the range of 0.2 to 0.5 ppm, or the residual chlorine content of domestic water supply. Obtain at least two consecutive satisfactory bacteriological samples from new water piping, analyzed by a certified laboratory, and submit results prior to the new water piping being placed into service.
- B. Where it is not possible to disinfect a potable water storage tank as specified above, the entire interior of the tank shall be swabbed with a solution which contains 200 parts per million of available chlorine; and the solution shall then be allowed to stand 3 hours before the tank is flushed and returned to service.
- C. For a potable water filter or similar device, the dosage shall be determined by the Utah Department of Environmental Protection.

3.05 PAINTING:

- A. Field painting of above ground plumbing piping shall be provided under this Section in accordance with Section 09 91 13.
- B. Field touch up all damaged factory or shop applied coatings for material and equipment furnished under this Section in accordance with the manufacturer's recommendation.
- C. Provide painting system, under this Section, of the following.
 - 1. Hangers and supports in exposed locations.
 - 2. Pipe, fittings and valves in exposed locations.
 - 3. Piping insulation jackets in exposed locations.

- D. Do not apply field painting and touch-up until after installation and testing is completed and system accepted.

3.06 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 05 19

METERS AND GAUGES FOR PLUMBING PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide meters and gages for plumbing piping as indicated and in compliance with Contract Documents.
 - 1. Thermometers
 - 2. Pressure Gages
 - 3. Test Plugs

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)
 - 2. B1.20.1: Pipe Threads, General Purpose (Inch)
 - 3. B40.100: Pressure Gauges and Gauge Attachments
 - 4. B40.200: Thermometers, Direct Reading and Remote Reading

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product. Submit manufacturer's technical product data, including installation instructions for each type of meter and gage. Include scale range, ratings, and calibrated performance curves, certified where indicated. Submit meter and gage schedule showing manufacturer's figure number, scale range, location, and accessories for each meter and gage.
- C. Product Certificates: For each type of meter and gage.
- D. Operation and Maintenance Data: For each type of meters and gages to include in operation and maintenance manuals.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Manufacturer's Qualifications: Firms regularly engaged in manufacture of meters and gages, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.
- C. Codes and Standards:
 - 1. UL Compliance: Comply with applicable UL standards pertaining to meters and gages.
 - 2. ANSI and ISA Compliance: Comply with applicable portions of ANSI and Instrument Society of America (ISA) standards pertaining to construction and installation of meters and gages.
- D. Certification: Provide meters and gages whose accuracies, under specified operating conditions, are certified by manufacturer.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 METAL-CASE, LIQUID-IN-GLASS THERMOMETERS:

- A. Manufacturers:
 - 1. Palmer - Wahl Instruments Inc.
 - 2. Miljoco Co.
 - 3. Terice, H. O. Co.
 - 4. Weiss Instruments, Inc.
 - 5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division.
- B. Case: Die-cast aluminum or brass, 7 inches to 9 inches long.
- C. Tube: Red or blue reading, organic-liquid filled, with magnifying lens.
- D. Tube Background: Satin-faced, nonreflective aluminum with permanently etched scale markings.
- E. Window: Glass.

- F. Connector: Adjustable type, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device.
- G. Stem: Copper-plated steel, aluminum, or brass for thermowell installation and of length to suit installation.
- H. Accuracy: Plus or minus 1 scale division.

2.02 DIRECT-MOUNTING, VAPOR-ACTUATED DIAL THERMOMETERS:

- A. Manufacturers:
 - 1. Miljoco Co
 - 2. Trerice, H. O. Co.
 - 3. Weiss Instruments, Inc.
 - 4. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division
- B. Type: Vapor Tension, Universal Angle Brass.
- C. Case: Liquid-filled type, metal, 4-1/2-inch diameter.
- D. Element: Bourdon tube.
- E. Movement: Brass precision geared.
- F. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings.
- G. Pointer: Red or other dark-color metal.
- H. Window: Glass.
- I. Ring: Brass or Stainless steel.
- J. Connector: Adjustable type, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device.
- K. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem for thermowell installation and of length to suit installation.
- L. Accuracy: Plus or minus 1 scale division.

2.03 BIMETALLIC-ACTUATED DIAL THERMOMETERS:

- A. Manufacturers:
 - 1. Ernst Gage Co.

2. Eugene Ernst Products Co.
3. Miljoco Co.
4. Terice, H. O. Co.
5. Weiss Instruments, Inc.
6. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division

B. Type: Bi-metal stainless steel case and stem.

C. Description: Direct-mounting, bimetallic-actuated dial thermometers complying with ASME B40.3.

D. Case: Liquid-filled type, stainless steel with 3-inch to 5-inch diameter

E. Element: Bimetal coil

F. Dial: 1 inch diameter, dust and leak proof

G. Pointer: Red or other dark-color metal

H. Window: Glass

I. Ring: Stainless steel

J. Connector: Adjustable angle type

K. Stem: 1/8 inch diameter with nominal length of 5 inches

L. Accuracy: 0.5 percent of dial range

2.04 DIGITAL THERMOMETERS:

A. Manufacturers:

1. Weksler Glass Thermometer Corporation
2. Weiss Instruments, Inc.

B. Case: High Impact ABS, black plastic

C. Range: -40 degrees to 300 degrees F

D. Display: LCD, 3/8 inches

E. Accuracy: 1 percent of reading

F. Lux Rating: 10 Lux (1 foot candle)

2.05 THERMOWELLS:

- A. Manufacturers: Same as manufacturer of thermometer being used.
- B. Description: Provide thermowells constructed of brass or stainless steel, pressure rated to match piping system design pressure. Provide 2: extension for insulated piping. Provide cap nut with chain fastened permanently to thermometer well.

2.06 PRESSURE GAGES:

- A. Manufacturers:
 - 1. AMETEK, Inc.; U.S. Gauge Division
 - 2. Miljoco Co
 - 3. Trerice, H. O. Co.
 - 4. Weiss Instruments, Inc.
 - 5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division
- B. General use type complying with ANSI B40, Grade A.
- C. Case: Liquid-filled type, drawn steel or Brass, 4-1/2-inch diameter.
- D. Pressure-Element Assembly: Phosphor bronze Bourdon tube.
- E. Pressure Connection: Brass, NPS 1/4, bottom-outlet type unless back-outlet type is indicated.
- F. Movement: Mechanical, with link to pressure element and connection to pointer.
- G. Dial: White coated aluminum with permanently etched scale markings.
- H. Pointer: Red or other dark-color metal.
- I. Window: Glass.
- J. Ring: Brass or Stainless steel.
- K. Accuracy: Grade A, 1 percent scale.
- L. Pressure Range:
 - 1. Vacuum: 30-in. Hg of vacuum to 15 psig of pressure
 - 2. Water: 0-100 psi

M. Pressure-Gage Fittings:

1. Valves: NPS 1/4 brass or stainless-steel needle type.
2. Snubbers: ASME B40.5, NPS 1/4 brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure.

2.07 TEST PLUGS:

A. Manufacturers:

1. MG Piping Products Co.
2. Miljoco Co.
3. Peterson Equipment Co., Inc.
4. Trerice, H. O. Co.
5. Watts Industries, Inc.; Water Products Division

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 degrees F.

D. Core Inserts: One or two self-sealing rubber valves.

1. Insert material for water service at 20 to 200 degrees F shall be CR.
2. Insert material for water service at minus 30 to plus 275 degrees F shall be EPDM.

2.08 SIGHT FLOW INDICATORS:

A. Description: Piping inline-installation device for visual verification of flow.

B. Construction: Bronze or stainless-steel body, with sight glass and paddle wheel indicator, and threaded or flanged ends.

C. Minimum Pressure Rating: 150 psig

D. Minimum Temperature Rating: 200 degrees F

E. End Connections for NPS 2 and Smaller: Threaded

F. End Connections for NPS 2-1/2 and Larger: Flanged

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install thermowells with socket extending to center of pipe and in vertical position in piping tees.
- B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.
- C. Install thermowells with extension on insulated piping.
- D. Fill thermowells with heat-transfer medium.
- E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.
- F. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.
- G. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.
- H. Install remote-mounted pressure gages on panel.
- I. Install valve and snubber in piping for each pressure gage for fluids.
- J. Install test plugs in piping tees.
- K. Install thermometers in the following locations:
 - 1. Inlet and outlet of each water heater.
 - 2. Inlets and outlets of each domestic water heat exchanger.
 - 3. Inlet and outlet of each domestic hot-water storage tank.
- L. Install pressure gages in the following locations:
 - 1. Building water service entrance into building.
 - 2. Inlet and outlet of each pressure-reducing valve.
 - 3. Suction and discharge of each domestic water pump.

3.02 CONNECTIONS:

- A. Install meters and gages adjacent to machines and equipment to allow service and maintenance of meters, gages, machines, and equipment.

3.03 ADJUSTING:

- A. Adjust faces of meters and gages to proper angle for best visibility.

3.04 APPLICATIONS:

A. Thermometer Applications:

1. Install thermometers in the outlet of each domestic water heater and each domestic, hot-water storage tank.
2. Install liquid-filled-case-type, bimetallic-actuated dial thermometers at suction and discharge of each pump.
3. Install thermometers at inlets and outlets of each domestic water heat exchanger.
4. Install thermometers at inlet and outlet of each remote domestic water chiller.
5. Thermometer stems shall be of length to match thermowell insertion length.
6. Provide the following temperature ranges for thermometers:
 - a. Domestic Hot Water: 30 to 180 degrees F, with 2-degree scale divisions
 - b. Domestic Cold Water: 0 to 100 degrees F, with 2-degree scale divisions

B. Gage Applications:

1. Install pressure gages at discharge of each water service into building.
2. Install pressure gages for discharge of each pressure-reducing valve.
3. Install pressure gages at suction and discharge of each pump.
4. Install pressure gages at suction and discharge of each domestic water pump shall.
5. Provide the following pressure ranges for thermometers:
 - a. Scale Range for Water Service Piping: 0 to 100 psi
 - b. Scale Range for Domestic Water Piping: 0 to 100 psi

3.05 INSTALLATIONS:

1. Install direct-mounting thermometers and adjust vertical and tilted positions.
2. Install remote-mounting dial thermometers on panel, with tubing connecting panel and thermometer bulb supported to prevent kinks. Use minimum tubing length.
3. Install thermowells with socket extending a minimum of 2 inches into fluid to center of pipe and in vertical position in piping tees where thermometers are indicated.
4. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.
5. Install remote-mounting pressure gages on panel.
6. Install needle-valve and snubber fitting in piping for each pressure gage.
7. Install test plugs in tees in piping.
8. Install permanent indicators on walls or brackets in accessible and readable positions.
9. Install connection fittings for attachment to portable indicators in accessible locations.
10. Install thermometers and gages adjacent to machines and equipment to allow service and maintenance for thermometers, gages, machines, and equipment.
11. Adjust faces of thermometers and gages to proper angle for best visibility.

3.06 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 05 29

HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide hangers and supports for plumbing piping and equipment as indicated and in compliance with Contract Documents.
 - 1. Metal pipe hangers and supports
 - 2. Trapeze pipe hangers
 - 3. Fiberglass pipe hangers
 - 4. Metal framing systems
 - 5. Fiberglass strut systems
 - 6. Thermal hanger-shield inserts
 - 7. Fastener systems
 - 8. Pipe stands
 - 9. Pipe-positioning systems
 - 10. Equipment supports

1.02 REFERENCES:

H. Underwriters' Laboratories, Inc. (UL):

1. 94: Standard for Safety Tests for Flammability of Plastic Materials for Parts in Devices and Appliances

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Shop Drawings: Show fabrication and installation details and include calculations for the following:
 - 1. Trapeze pipe hangers.
 - 2. Metal framing systems.
 - 3. Fiberglass strut systems.
 - 4. Pipe stands.
 - 5. Equipment supports.
- C. Delegated-Design Submittal: For trapeze hangers indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - 1. Detail fabrication and assembly of trapeze hangers.
 - 2. Include design calculations for designing trapeze hangers.
- D. Welding certificates.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Structural-Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1.
- C. Pipe Welding Qualifications: Qualify procedures and operators according to 2015 ASME Boiler and Pressure Vessel Code, Section IX.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

2.01 PERFORMANCE REQUIREMENTS:

- A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 43 00, to design trapeze pipe hangers and equipment supports.
- B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.
- C. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.
 - 1. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
 - 2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
 - 3. Design seismic-restraint hangers and supports for piping and equipment and obtain approval from authorities having jurisdiction.

A. Carbon-Steel Pipe Hangers and Supports:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.
2. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
3. Galvanized Metallic Coatings: Pre-galvanized, hot-dip galvanized, or electro-galvanized.
4. Nonmetallic Coatings: Plastic coated or epoxy powder coated.
5. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.

B. Stainless-Steel Pipe Hangers and Supports:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
3. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
4. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

C. Copper Pipe and Tube Hangers:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.
2. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.
3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

2.03 TRAPEZE PIPE HANGERS:

- A. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.
- B. Description: MSS SP-58, Type 59, shop- or field-fabricated pipe-support assembly, made from structural-carbon-steel shapes, with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.04 METAL FRAMING SYSTEMS:

A. MFMA Manufacturer Metal Framing Systems:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.
2. Manufacturers:
 - a. G-STRUT
 - b. Powerstrut Corp.
 - c. Unistrut Corp.
3. Description: Shop- or field-fabricated pipe-support assembly, made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.

- ## 2.05 THERMAL HANGER-SHIELD INSERTS:

- ## 2.06 FASTENER SYSTEMS:

- ## 2.07 PIPE STANDS:

- Hangers and Supports for Plumbing Piping and Equipment
Section No. 22 05 29-7

4. Accessories: Protection pads
- C. Low-Profile, Single-Base, Single-Pipe Stand:
 1. Description: Single base with vertical and horizontal members, and pipe support, for roof installation without membrane protection.
 2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate
 3. Vertical Members: Two galvanized-steel, continuous-thread, 1/2-inch rods
 4. Horizontal Member: Adjustable horizontal, galvanized-steel pipe support channels
 5. Pipe Supports: Roller
 6. Hardware: Galvanized steel
 7. Accessories: Protection pads
 8. Height: 12 inches above roof
- D. High-Profile, Single-Base, Single-Pipe Stand:
 1. Description: Single base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
 2. Base: Single vulcanized rubber or molded polypropylene
 3. Vertical Members: Two galvanized-steel, continuous-thread, 1/2-inch rods
 4. Horizontal Member: One adjustable-height, galvanized-steel, pipe-support slotted channel or plate
 5. Pipe Supports: Clevis hanger
 6. Hardware: Stainless steel
 7. Accessories: Protection 1/2-inch, continuous-thread, stainless-steel rod
 8. Height: 36 inches above roof
- E. High-Profile, Multiple-Pipe Stand:
 1. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
 2. Bases: Two or more; molded polypropylene
 3. Vertical Members: Two or more, galvanized-steel channels

4. Horizontal Members: One or more, adjustable-height, galvanized-steel pipe support
 5. Pipe Supports: Strut clamps
 6. Hardware: Galvanized steel
 7. Accessories: Protection pads, 1/2-inch, continuous-thread rod
 8. Height: 36 inches above roof
- F. Curb-Mounted-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.
- 2.08 PIPE-POSITIONING SYSTEMS:
- A. Description: IAPMO PS 42 positioning system composed of metal brackets, clips, and straps for positioning piping in pipe spaces; for plumbing fixtures in commercial applications.
- 2.09 EQUIPMENT SUPPORTS:
- A. Description: Welded, shop- or field-fabricated equipment support made from structural-carbon-steel shapes.
1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.
- 2.10 MATERIALS:
- A. Aluminum: ASTM B221
 - B. Carbon Steel: ASTM A1011
 - C. Structural Steel: ASTM A36 carbon-steel plates, shapes, and bars; black and galvanized
 - D. Stainless Steel: ASTM A240
 - E. Grout: ASTM C1107, factory-mixed and -packaged, dry, hydraulic-cement, non-shrink and nonmetallic grout; suitable for interior and exterior applications
1. Properties: Non-staining, noncorrosive, and nongaseous
 2. Design Mix: 5000-psi, 28-day compressive strength

PART 3 - EXECUTION

3.01 APPLICATION:

- A. Comply with requirements in Section 07 84 00 for firestopping materials and installation, for penetrations through fire-rated walls, ceilings, and assemblies.
- B. Strength of Support Assemblies: Where not indicated, select sizes of components, so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 pounds.

3.02 HANGER AND SUPPORT INSTALLATION:

- A. Metal Pipe-Hanger Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.
- B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-58. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
 - 1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size, or install intermediate supports for smaller-diameter pipes as specified for individual pipe hangers.
 - 2. Field fabricate from ASTM A36 carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1.
- C. Fiberglass Pipe-Hanger Installation: Comply with applicable portions of MSS SP-58. Install hangers and attachments as required to properly support piping from building structure.
- D. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.
- E. Thermal Hanger-Shield Installation: Install in pipe hanger or shield for insulated piping.
- F. Fastener System Installation:
 - 1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete, after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
 - 2. Install mechanical-expansion anchors in concrete, after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

- G. Pipe Stand Installation:
1. Pipe Stand Types, except Curb-Mounted Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.
 2. Curb-Mounted-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. See Section 07 72 00 for curbs.
- H. Pipe-Positioning-System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture.
- I. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- J. Equipment Support Installation: Fabricate from welded-structural-steel shapes.
- K. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- L. Install lateral bracing with pipe hangers and supports to prevent swaying.
- M. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms, and install reinforcing bars through openings at top of inserts.
- N. Load Distribution: Install hangers and supports, so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.
- O. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.
- P. Insulated Piping:
1. Attach clamps and spacers to piping.
 - a. Piping Operating Above Ambient Air Temperature: Clamp may project through insulation.
 - b. Piping Operating Below Ambient Air Temperature: Use thermal hanger-shield insert with clamp sized to match OD of insert.
 - c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
 2. Install MSS SP-58, Type 39 protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

- ## Hangers and Supports for Plumbing Piping and Equipment
- ### Section No. 22 05 29-14

13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
 14. Pipe Saddle Supports (MSS Type 36): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.
 15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.
 16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.
 17. Single-Pipe Rolls (MSS Type 41): For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction occurs.
 18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction occurs.
 19. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction occurs but vertical adjustment is unnecessary.
 20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction occurs and vertical adjustment is unnecessary.
 21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation, in addition to expansion and contraction, is required.
- K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.
 2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.
- L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment of up to 6 inches for heavy loads.

2. Steel Clevises (MSS Type 14): For 120 to 450 degrees F piping installations.
 3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11 split pipe rings.
 4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
 5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 degrees F piping installations.
- M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable-Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
 2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joint construction, to attach to top flange of structural shape.
 3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
 4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
 5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
 6. C-Clamps (MSS Type 23): For structural shapes.
 7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
 8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
 9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
 10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
 11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
 12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
 - a. Light (MSS Type 31): 750 pounds

- b. Medium (MSS Type 32): 1500 pounds
 - c. Heavy (MSS Type 33): 3000 pounds
- 13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
- 14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
- 15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.
- N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
 - 1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
 - 2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
 - 3. Thermal Hanger-Shield Inserts: For supporting insulated pipe.
- O. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
 - 1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
 - 2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
 - 3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.
 - 4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
 - 5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load, and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
 - 6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load, and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
 - 7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load, and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.

8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:

- a. Horizontal (MSS Type 54): Mounted horizontally.
- b. Vertical (MSS Type 55): Mounted vertically.
- c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

P. Comply with MSS SP-58 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.

Q. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

R. Use mechanical-expansion anchors instead of building attachments where required in concrete construction.

S. Use pipe-positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 05 48

VIBRATION AND SEISMIC CONTROLS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide vibration and seismic controls for plumbing piping and equipment as indicated and in compliance with Contract Documents.

1. Elastomeric isolation pads.
2. Elastomeric isolation mounts.
3. Restrained elastomeric isolation mounts.
4. Open-spring isolators.
5. Housed-spring isolators.
6. Restrained-spring isolators.
7. Housed-restrained-spring isolators.
8. Pipe-riser resilient supports.
9. Resilient pipe guides.
10. Elastomeric hangers.
11. Spring hangers.
12. Snubbers.
13. Restraint channel bracings.
14. Restraint cables.
15. Seismic-restraint accessories.
16. Mechanical anchor bolts.
17. Adhesive anchor bolts.

1.02 REFERENCES:

E. FM Global (FM):

1. Data Sheet 2-8: Earthquake Protection for Water-Based Fire Protection Systems.

1.03 DEFINITIONS:

A. IBC: International Building Code.

B. ICC-ES: ICC-Evaluation Service.

C. OSHPD: Office of Statewide Health Planning & Development (for the State of California).

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to requirements of indicated according to Section 1613 of the building codes of Utah, Salt lake City and ASCE/SEI 7 for post-disaster structures at time of shop drawing submittals.

B. Product Data: For each type of product.

1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.

2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of vibration isolation device and seismic-restraint component required.
 - a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.
 - b. Annotate to indicate application of each product submitted and compliance with requirements.
3. Interlocking Snubbers: Include ratings for horizontal, vertical, and combined loads.

C. Shop Drawings:

1. Submit manufacturer's assembly-type shop drawings indicating dimensions, weights, required clearances, and method of assembly of components. Detail bases, and show location of equipment anchoring points, coordinated with equipment manufacturer's shop drawings.
 - a. Shop drawings showing structural design and details of inertia bases, steel beam bases and other custom-fabricated work not covered by manufacturer's submitted data.
 - (1) Furnish templates, anchor bolts and sleeve for equipment bases, foundations and other support systems for coordination of vibration isolation units with other work.
2. Submit shop drawings indicating scope of vibration isolation work and locations of units and flexible connections. Include support isolation points for piping and ductwork including risers, air housings and inertia bases.
 - a. Include schedule of units, showing size or manufacturer's part number, and weight supported and resulting deflection of each unit.

D. Delegated-Design Submittal: For each vibration isolation and seismic-restraint device.

1. Include design calculations and details for selecting vibration isolators and seismic restraints complying with performance requirements, design criteria, and analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
2. Design Calculations: Calculate static and dynamic loading due to equipment weight and operation, due to seismic forces required to select vibration isolators, and due to seismic restraints. Provide calculations to Engineer and FM global representative at least two weeks prior to beginning of construction.

3. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system was examined for excessive stress and that none exists.
4. Seismic-Restraint Details:
 - a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.
 - b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.
 - c. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.
 - d. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).
 - e. Coordination Drawings: Show coordination of vibration isolation device installation and seismic bracing for plumbing piping and equipment with other systems and equipment in the vicinity, including other supports and restraints, if any.
 - f. Qualification Data: For professional engineer and testing agency.

E. Welding certificates.

F. Field quality-control reports.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

B. Sustainability Standards Certifications.

- C. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7 and that is acceptable to authorities having jurisdiction.
 - D. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.
 - E. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
 - F. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval OPA number from OSHPD, preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are unavailable, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.
- 1.08 DELIVERY STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS:

- A. Seismic-Restraint Loading:
 - 1. Site Class as Defined in the IBC: D
 - 2. Assigned Seismic Use Group or Building Category as Defined in the IBC: IV
 - 3. Design Spectral Response Acceleration at Short Periods (0.2 Second): .92
 - 4. Design Spectral Response Acceleration at 1.0-Second Period: .61
 - 5. Rated strengths, features, and applications shall be as defined in reports by an agency acceptable to authorities having jurisdiction.
- B. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least **four** times the maximum seismic forces to which they are subjected.

2.2 ELASTOMERIC ISOLATION PADS:

A. Elastomeric Isolation Pads:

1. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.
2. Size: Factory or field cut to match requirements of supported equipment.
3. Pad Material: Oil and water resistant with elastomeric properties.
4. Surface Pattern: Waffle pattern.
5. Load-bearing metal plates adhered to pads.

2.3 ELASTOMERIC ISOLATION MOUNTS:

A. Double-Deflection, Elastomeric Isolation Mounts:

1. Mounting Plates:
 - a. Top Plate: Encapsulated steel load transfer top plates, factory drilled and threaded
 - b. Baseplate: Encapsulated steel bottom plates with holes provided for anchoring to support structure.
2. Elastomeric Material: Molded, oil-resistant rubber, neoprene, or other elastomeric material.

2.4 RESTRAINED ELASTOMERIC ISOLATION MOUNTS:

A. Restrained Elastomeric Isolation Mounts:

1. Description: All-directional isolator with seismic restraints containing two separate and opposing elastomeric elements that prevent central threaded element and attachment hardware from contacting the housing during normal operation.
 - a. Housing: Cast-ductile iron or welded steel.
 - b. Elastomeric Material: Molded, oil-resistant rubber, neoprene, or other elastomeric material.

2.5 OPEN-SPRING ISOLATORS:

A. Freestanding, Laterally Stable, Open-Spring Isolators:

1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.

2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
5. Baseplates: Factory-drilled steel plate for bolting to structure with an elastomeric isolator pad attached to the underside. Baseplates shall limit floor load to 500 psig (3447 kPa).
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

2.6 HOUSED-SPRING ISOLATORS:

A. Freestanding, Laterally Stable, Open-Spring Isolators in Two-Part Telescoping Housing:

1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
5. Two-Part Telescoping Housing: A steel top and bottom frame separated by an elastomeric material and enclosing the spring isolators.
 - a. Drilled base housing for bolting to structure with an elastomeric isolator pad attached to the underside. Bases shall limit floor load to 500 psig (3447 kPa).
 - b. Top housing with attachment and leveling bolt

2.7 RESTRAINED-SPRING ISOLATORS:

A. Freestanding, Laterally Stable, Open-Spring Isolators with Vertical-Limit Stop Restraint:

1. Housing: Steel housing with vertical-limit stops to prevent spring extension due to weight being removed.
 - a. Base with holes for bolting to structure with an elastomeric isolator pad attached to the underside. Bases shall limit floor load to 500 psig (3447 kPa).
 - b. Top plate with Threaded mounting holes.
 - c. Internal leveling bolt that acts as blocking during installation.

2. Restraint: Limit stop as required for equipment and authorities having jurisdiction.
3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

2.8 HOUSED-RESTRAINED-SPRING ISOLATORS:

A. Freestanding, Steel, Open-Spring Isolators with Vertical-Limit Stop Restraint in Two-Part Telescoping Housing:

1. Two-Part Telescoping Housing: A steel top and bottom frame separated by an elastomeric material and enclosing the spring isolators. Housings are equipped with adjustable snubbers to limit vertical movement.
 - a. Drilled base housing for bolting to structure with an elastomeric isolator pad attached to the underside. Bases shall limit floor load to 500 psig (3447 kPa).
 - b. Threaded top housing with adjustment bolt and cap screw to fasten and level equipment.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

2.9 PIPE-RISER RESILIENT SUPPORT:

A. Description: All-directional, acoustical pipe anchor consisting of two steel tubes separated by a minimum 1/2-inch- (13-mm-) thick neoprene

1. Vertical-Limit Stops: Steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions.
2. Maximum Load Per Support: 500 psig (3.45 MPa) on isolation material providing equal isolation in all directions.

2.10 RESILIENT PIPE GUIDES:

- A. Description: Telescopic arrangement of two steel tubes or post and sleeve arrangement separated by a minimum 1/2-inch- (13-mm-) thick neoprene
 - 1. Factory-Set Height Guide with Shear Pin: Shear pin shall be removable and reinsertable to allow for selection of pipe movement. Guides shall be capable of motion to meet location requirements.

2.11 ELASTOMERIC HANGERS:

- A. Elastomeric Mount in a Steel Frame with Upper and Lower Steel Hanger Rods:
 - 1. Frame: Steel, fabricated with a connection for an upper threaded hanger rod and an opening on the underside to allow for a maximum of 30 degrees of angular lower hanger-rod misalignment without binding or reducing isolation efficiency.
 - 2. Dampening Element: Molded, oil-resistant rubber, neoprene, or other elastomeric material with a projecting bushing for the underside opening preventing steel to steel contact.

2.12 SPRING HANGERS:

- A. Combination Coil-Spring and Elastomeric-Insert Hanger with Spring and Insert in Compression:
 - 1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
 - 2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
 - 3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
 - 4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
 - 5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
 - 6. Elastomeric Element: Molded, oil-resistant rubber or neoprene. Steel-washer-reinforced cup to support spring and bushing projecting through bottom of frame.
 - 7. Adjustable Vertical Stop: Steel washer with neoprene washer "up-stop" on lower threaded rod.
 - 8. Self-centering hanger-rod cap to ensure concentricity between hanger rod and support spring coil.

2.13 SNUBBERS:

- A. Manufacturers:
- B. Description: Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
 - 1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
 - 2. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.
 - 3. Maximum 1/4-inch (6-mm) air gap, and minimum 1/4-inch- (6-mm-) thick resilient cushion.

2.14 RESTRAINT CHANNEL BRACINGS:

- A. Description: MFMA-4, shop- or field-fabricated bracing assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.15 RESTRAINT CABLES:

- A. Restraint Cables: ASTM A603 galvanized-steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; with a minimum of two clamping bolts for cable engagement.

2.16 SEISMIC-RESTRAINT ACCESSORIES:

- A. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod.
- B. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.
- C. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.
- D. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.
- E. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.17 MECHANICAL ANCHOR BOLTS:

- A. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

2.18 ADHESIVE ANCHOR BOLTS:

- A. Adhesive Anchor Bolts: Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS:

- A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.
- B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.
- C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.
- D. Hangers and Supports for Plumbing Piping and Equipment:
 - 1. Delegated Design: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

- a. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.
 - (1) Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
 - (2) Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
 - (3) Design seismic-restraint hangers and supports for piping and equipment.
 - 2. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- E. Sanitary Waste and Vent Piping:
- 1. Seismic Performance: Soil, waste, and vent piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 2. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - 3. Install seismic restraints on piping.
- F. Storm Drainage Piping:
- 1. Seismic Performance: Storm drainage piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - 2. Install seismic restraints on piping.
- G. Water Heaters:
- 1. Seismic Performance: Storm drainage piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

- a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - 2. Install commercial, electric, domestic-water heaters with seismic-restraint devices
- 3.03 VIBRATION CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION:
- A. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 03 30 00.
 - B. Installation of vibration isolators must not cause any change of position of equipment, piping, or ductwork resulting in stresses or misalignment.
 - C. Comply with requirements in Section 07 72 00 for installation of roof curbs, equipment supports, and roof penetrations.
 - D. Equipment Restraints:
 - 1. Install seismic snubbers on plumbing equipment mounted on vibration isolators. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.
 - 2. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).
 - 3. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.
 - E. Piping Restraints:
 - 1. Comply with requirements in MSS SP-127.
 - 2. Space lateral supports a maximum of 40 feet (12 m) o.c., and longitudinal supports a maximum of 80 feet (24 m) o.c.
 - 3. Brace a change of direction longer than 12 feet (3.7 m).
 - F. Install cables so they do not bend across edges of adjacent equipment or building structure.
 - G. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.
 - H. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.

- I. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.
- J. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.
- K. Drilled-in Anchors:
 - 1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
 - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
 - 3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
 - 4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
 - 5. Set anchors to manufacturer's recommended torque, using a torque wrench.
 - 6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.04 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION:

- A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment. Comply with requirements in Section 22 11 16 for piping flexible connections.

3.05 FIELD QUALITY CONTROL:

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.
- C. Tests and Inspections:

1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
 2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless post connection testing has been approved), and with at least seven days' advance notice.
 3. **Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.**
 4. **Test at least four of each type and size of installed anchors and fasteners selected by Architect.**
 5. **Test to 90 percent of rated proof load of device.**
 6. **Measure isolator restraint clearance.**
 7. **Measure isolator deflection.**
 8. Verify snubber minimum clearances.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Prepare test and inspection reports.
- 3.06 ADJUSTING:
- A. Adjust isolators after piping system is at operating weight.
 - B. Adjust limit stops on restrained-spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
- 3.07 CLOSEOUT ACTIVITIES:
- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 05 53

IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide equipment labels, warning signs and labels, pipe labels, valve tags, warning tags as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. A13.1: Scheme for the identification of Piping Systems

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. Sustainable Design Submittals.
- B. Product Data: For each type of product indicated.
- C. Samples: For color, letter style, and graphic representation required for each identification material and device.
- D. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.
- E. Valve numbering scheme.
- F. Valve Schedules: For each piping system to include in maintenance manuals.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Sustainability Standards Certifications.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 EQUIPMENT LABELS:

A. Metal Labels for Equipment:

1. Material and Thickness: Brass, 0.032-inch (0.8-mm), stainless steel, 0.025-inch (0.64-mm), aluminum, 0.032-inch (0.8-mm) or anodized aluminum, 0.032-inch (0.8-mm) minimum thickness, and having predrilled or stamped holes for attachment hardware.
2. Letter Color: Black
3. Background Color: White
4. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).
5. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
6. Fasteners: Stainless-steel rivets or self-tapping screws.
7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Plastic Labels for Equipment:

1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch (3.2 mm) thick, and having predrilled holes for attachment hardware.
2. Letter Color: Black
3. Background Color: White
4. Maximum Temperature: Able to withstand temperatures up to 160 degrees F (71 degrees C).
5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).

6. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
 7. Fasteners: Stainless-steel rivets or self-tapping screws.
 8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- C. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), and the Specification Section number and title where equipment is specified.
 - D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch (A4) bond paper. Tabulate equipment identification number, and identify Drawing numbers where equipment is indicated (plans, details, and schedules) and the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.02 WARNING SIGNS AND LABELS:

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch (3.2 mm) thick, and having predrilled holes for attachment hardware.
- B. Letter Color: Black
- C. Background Color: Yellow.
- D. Maximum Temperature: Able to withstand temperatures up to 160 degrees F (71 degrees C).
- E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).
- F. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
- G. Fasteners: Stainless-steel rivets or self-tapping screws.
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- I. Label Content: Include caution and warning information plus emergency notification instructions.

2.03 PIPE LABELS:

- A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.
- B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to partially cover or cover full circumference of pipe and to attach to pipe without fasteners or adhesive.
- C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.
- D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings; also include pipe size and an arrow indicating flow direction.
 - 1. Flow-Direction Arrows: Integral with piping-system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.
 - 2. Lettering Size: Size letters according to ASME A13.1 for piping. At least 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm) and proportionately larger lettering for greater viewing distances.

2.04 STENCILS:

- A. Stencils for Piping:
 - 1. Lettering Size: Size letters according to ASME A13.1 for piping. At least 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm) and proportionately larger lettering for greater viewing distances.
 - 2. Stencil Material: Fiberboard or metal
 - 3. Stencil Paint: Exterior, gloss, alkyd enamel or acrylic enamel in colors complying with recommendations in ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.
 - 4. Identification Paint: Exterior, alkyd enamel or acrylic enamel in colors according to ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

2.05 VALVE TAGS:

- A. Valve Tags: Stamped or engraved with 1/4-inch (6.4-mm) letters for piping system abbreviation and 1/2-inch (13-mm) numbers.
 - 1. Tag Material: Brass, 0.032-inch (0.8-mm), stainless steel, 0.025-inch (0.64-mm), aluminum, 0.032-inch (0.8-mm), or anodized aluminum, 0.032-inch (0.8-mm)

minimum thickness, and having predrilled or stamped holes for attachment hardware.

2. Fasteners: Brass wire-link chain or beaded chain or S-hook.

B. Valve Schedules: For each piping system, on 8-1/2-by-11-inch (A4) bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.

1. Valve-tag schedule shall be included in operation and maintenance data.

2.06 WARNING TAGS:

A. Description: Preprinted or partially preprinted accident-prevention tags of plasticized card stock with matte finish suitable for writing.

1. Size: Approximately 4 by 7 inches (100 by 178 mm).

2. Fasteners: Brass grommet and wire or Reinforced grommet and wire or string.

3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."

4. Color: Safety yellow background with black lettering.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.02 GENERAL INSTALLATION REQUIREMENTS:

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

3.03 EQUIPMENT LABEL INSTALLATION:

A. Install or permanently fasten labels on each major item of mechanical equipment.

B. Locate equipment labels where accessible and visible.

3.04 PIPE LABEL INSTALLATION:

- A. Piping Color Coding: Painting of piping is specified in Section 09 96 00.
- B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ASME A13.1,[with painted, color-coded bands or rectangles] on each piping system.
 - 1. Identification Paint: Use for contrasting background.
 - 2. Stencil Paint: Use for pipe marking.
- C. Pipe Label Locations: Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
 - 1. Near each valve and control device.
 - 2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
 - 3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
 - 4. At access doors, manholes, and similar access points that permit view of concealed piping.
 - 5. Near major equipment items and other points of origination and termination.
 - 6. Spaced at maximum intervals of 50 feet (15 m) along each run. Reduce intervals to 25 feet (7.6 m) in areas of congested piping and equipment.
 - 7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.
- D. Directional Flow Arrows: Arrows shall be used to indicate direction of flow in pipes, including pipes where flow is allowed in both directions.
- E. Pipe Label Color Schedule:
 - 1. Low-Pressure Compressed Air Piping:
 - a. Background: Safety blue
 - b. Letter Colors: White
 - 2. High-Pressure Compressed Air Piping:
 - a. Background: Safety blue
 - b. Letter Colors: White.

3. Domestic Water Piping
 - a. Background: Safety green
 - b. Letter Colors: White
4. Sanitary Waste and Storm Drainage Piping:
 - a. Background Color: Safety black
 - b. Letter Color: White.

3.05 VALVE-TAG INSTALLATION:

- A. Install tags on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, shutoff valves, faucets, convenience and lawn-watering hose connections, and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.
- B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
 1. Valve-Tag Size and Shape:
 - a. Cold Water: 2 inches (50 mm), round or square.
 - b. Hot Water: 2 inches (50 mm), round or square.
 - c. Low-Pressure Compressed Air: 2 inches (50 mm), round or square.
 - d. High-Pressure Compressed Air: 2 inches (50 mm), round or square.
 2. Valve-Tag Colors:
 - a. Cold Water: Natural
 - b. Hot Water: Natural
 - c. Low-Pressure Compressed Air: Natural
 - d. High-Pressure Compressed Air: Natural
 3. Letter Colors:
 - a. Cold Water: White
 - b. Hot Water: White
 - c. Low-Pressure Compressed Air: White

d. High-Pressure Compressed Air: White

3.06 WARNING-TAG INSTALLATION:

- A. Write required message on, and attach warning tags to, equipment and other items where required.

3.07 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 07 19

PLUMBING PIPING INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide the following plumbing piping services as indicated and in compliance with Contract Documents.
 - 1. Domestic cold-water piping
 - 2. Domestic hot-water piping
 - 3. Domestic recirculating hot-water piping
 - 4. Sanitary waste piping exposed to freezing conditions
 - 5. Storm-water piping exposed to freezing conditions
 - 6. Roof drains and rainwater leaders
 - 7. Supplies and drains for handicap-accessible lavatories and sinks

1.02 REFERENCES:

- A. ASTM International (ASTM):
 - 1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
 - 2. B209: Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
 - 3. C195: Standard Specification for Mineral Fiber Thermal Insulating Cement
 - 4. C196: Standard Specification for Expanded or Exfoliated Vermiculite Thermal Insulating Cement
 - 5. C449: Standard Specification for Mineral Fiber Hydraulic-Setting Thermal Insulating and Finishing Cement
 - 6. C450: Standard Practice for Fabrication of Thermal Insulating Fitting Covers for NPS Piping, and Vessel Lagging
 - 7. C534: Standard Specification for Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form

8. C547: Standard Specification for Mineral Fiber Pipe Insulation
 9. C552: Standard Specification for Cellular Glass Thermal Insulation.
 10. C585: Standard Practice for Inner and Outer Diameters of Thermal Insulation for Nominal Sizes of Pipe and Tubing
 11. C795: Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel
 12. C871: Standard Test Methods for Chemical Analysis of Thermal Insulation Materials for Leachable Chloride, Fluoride, Silicate, and Sodium Ions
 13. C1126: Standard Specification for Faced or Unfaced Rigid Cellular Phenolic Thermal Insulation
 14. C1136: Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation
 15. C1427: Standard Specification for Extruded Preformed Flexible Cellular Polyolefin Thermal Insulation in Sheet and Tubular Form

 19. F1249: Standard Test Method for Water Vapor Transmission Rate Through Plastic Film and Sheeting Using a Modulated Infrared Sensor
- B. ICC Evaluation Services (ICC-ES):
1. A117.1: Accessible and Usable Buildings and Facilities
- C. Military and Government Specs & Standards (Naval Publications and Form Center) (NFPC):
1. MIL-A-3316C: Adhesives, Fire-Resistant, Thermal Insulation
 2. MIL-C-20079H: Cloth, Glass; Tape, Textile Glass; and Thread, Glass and Wire-Reinforced Glass
 3. MIL-PRF-19565C: Coating Compounds, Thermal Insulation, Fire- and Water-Resistant, Vapor-Barrier

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied if any).
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 - 2. Detail attachment and covering of heat tracing inside insulation.
 - 3. Detail insulation application at pipe expansion joints for each type of insulation.
 - 4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
 - 5. Detail removable insulation at piping specialties, equipment connections, and access panels.
 - 6. Detail application of field-applied jackets.
 - 7. Detail application at linkages of control devices.
- D. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use. Sample sizes are as follows:
 - 1. Preformed Pipe Insulation Materials: 12 inches long by NPS 2.
 - 2. Jacket Materials for Pipe: 12 inches long by NPS 2.
 - 3. Sheet Jacket Materials: 12 inches square.
 - 4. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.
- E. Qualification Data: For qualified Installer.
- F. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.
- G. Field quality-control reports.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- C. Fire-Test Response Characteristics: For insulation and related materials, as determined by testing identical products in accordance with ASTM E84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less and smoke-developed index of 50 or less.
 - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less and smoke-developed index of 150 or less.
- D. Manufacturer's Qualifications: Firms regularly engaged in manufacturer of mechanical insulation products, of types and sizes required, whole products have been in satisfactory use in similar service for not less than 3 years.
- E. IECC Compliance: Insulation applied to plumbing services shall comply with International Energy Conservation Code (IECC) with regard to insulation performance, thickness, and sealing.
- F. Comply with the following applicable standards and other requirements specified for miscellaneous components:
 - 1. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.
- C. Deliver insulation, coverings, cements, adhesives, and coatings to site in containers with manufacturer's stamp or label, affixed showing fire hazard indexes of products.

- D. Protect insulation against dirt, water, and chemical and mechanical damage. Do not install damaged or wet insulation; remove from project site.

1.07 COORDINATION:

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 22 05 29.
- B. Coordinate clearance requirements with piping Installer for piping insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.
- C. Coordinate installation and testing of heat tracing.

1.08 SCHEDULING:

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 INSULATION MATERIALS:

- A. Comply with requirements in "Piping Insulation Schedule, General," "Indoor Piping Insulation Schedule," "Outdoor, Aboveground Piping Insulation Schedule," and "Outdoor, Underground Piping Insulation Schedule" articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come into contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested in accordance with ASTM C871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable in accordance with ASTM C795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Calcium Silicate:

1. Manufacturers:

- a. Industrial Insulation Group (The); Thermo-12 Gold
2. Preformed Pipe Sections: Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C533, Type I.
3. Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C533, Type I.
4. Prefabricated Fitting Covers: Comply with ASTM C450 and ASTM C585 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.

G. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Comply with ASTM C552.

1. Manufacturers:

- a. Cell-U-Foam Corporation; Ultra-CUF
- b. Pittsburgh Corning Corporation; Foamglas Super K
2. Block Insulation: ASTM C552, Type I.
3. Special-Shaped Insulation: ASTM C552, Type III.
4. Board Insulation: ASTM C552, Type IV.
5. Preformed Pipe Insulation without jacket: Comply with ASTM C552, Type II, Class 1
6. Preformed Pipe Insulation with Factory-Applied ASJ jacket: Comply with ASTM C552, Type II, Class 2.
7. Factory fabricate shapes in accordance with ASTM C450 and ASTM C585.
8. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

- H. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C534, Type I for tubular materials.
1. Manufacturers:
 - a. Aeroflex USA Inc.; Aerocel
 - b. Armacell LLC; AP Armaflex
 - c. RBX Corporation; Insul-Sheet 1800 and Insul-Tube 180
- I. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C612, Type IA or Type IB. For equipment applications, provide insulation with factory applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
1. Manufacturers:
 - a. Schuller (formerly Manville Corp.)
 - b. Owens-Corning Fiberglas Corp.
 - c. Certain Teed Corp.
 - d. Knauf Fiber Glass
 - e. Manson
 - f. Armstrong World Industries, Inc.
 - g. Pittsburgh Corning Corp.
 - h. Rubatex Corp.
- J. Mineral-Fiber, Preformed Pipe: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C547.
1. Manufacturers:
 - a. Schuller (formerly Manville Corp.)
 - b. Owens-Corning Fiberglas Corp.
 - c. Certain Teed Corp.
 - d. Knauf Fiber Glass
 - e. Manson

- f. Armstrong World Industries, Inc.
 - g. Pittsburgh Corning Corp.
 - h. Rubatex Corp.
- 2. Type I, 850 degrees F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C547, Type I, Grade A, with factory-applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- K. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ complying with ASTM C1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 degrees F is 0.29 Btu x in./h x sq. ft. x degrees F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Manufacturers:
 - a. Schuller (formerly Manville Corp.)
 - b. Owens-Corning Fiberglas Corp.
 - c. Certain Teed Corp
 - d. Knauf Fiber Glass
 - e. Manson
 - f. Armstrong World Industries, Inc.
 - g. Pittsburgh Corning Corp.
 - h. Rubatex Corp.
- L. Phenolic: Preformed pipe insulation of rigid, expanded, closed-cell structure. Comply with ASTM C1126.
 - 1. Manufacturers:
 - a. Owens-Corning
 - b. Knauf North America
 - 2. Preformed Pipe Insulation: Type III, with factory-applied ASJ.
 - 3. Factory fabricate shapes in accordance with ASTM C450 and ASTM C585.

4. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- M. Polyolefin: Unicellular, polyethylene thermal plastic insulation. Comply with ASTM C534 or ASTM C1427, Type I, Grade 1, for tubular materials.
1. Manufacturers:
 - a. Owens-Corning
- N. Polyurethane Foam (BNR Demonstration Facility Only):
1. 90 percent minimum close cell content; initial thermal conductivity of 0.16 Btu in./hour.Ft² F; minimum density of 2.0 lbs/cubic foot and minimum thickness of 1 inch. Jacket to be minimum of 0.125 inches HDPE meeting requirements of ASTM D1248, Type 3, Class C.
 2. Manufacturer:
 - a. Permapipe; model XTru-Therm.
 3. Install in accordance with manufacturer's instructions.
- 2.02 INSULATING CEMENTS:
- A. Mineral-Fiber Insulating Cement: Comply with ASTM C195.
 - B. Expanded or Exfoliated Vermiculite Insulating Cement: Comply with ASTM C196.
 - C. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C449.
- 2.03 ADHESIVES:
- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
 - B. Calcium Silicate Adhesive: Fibrous, sodium-silicate-based adhesive with a service temperature range of 50 to 800 degrees F.
 1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-97
 - b. Foster Products Corporation, H. B. Fuller Company; 81-27/81-93
 - c. Marathon Industries, Inc.; 290
 - d. Mon-Eco Industries, Inc.; 22-30

- e. Vimasco Corporation; 760
- C. Cellular-Glass, Adhesive: Solvent-based resin adhesive, with a service temperature range of minus 75 to plus 300 degrees F.
 - 1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-96
 - b. Foster Products Corporation, H. B. Fuller Company; 81-33
- D. Flexible Elastomeric Adhesive: Comply with MIL-A-24179A, Type II, Class I.
 - 1. Manufacturers:
 - a. Aeroflex USA Inc.; Aeroseal
 - b. Armacell LCC; 520 Adhesive
 - c. Foster Products Corporation, H. B. Fuller Company; 85-75
 - d. RBX Corporation; Rubatex Contact Adhesive
- E. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
 - 1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-82
 - b. Foster Products Corporation, H. B. Fuller Company; 85-20
 - c. ITW TACC, Division of Illinois Tool Works; S-90/80
 - d. Marathon Industries, Inc.; 225
 - e. Mon-Eco Industries, Inc.; 22-25
- F. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
 - 1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-82
 - b. Foster Products Corporation, H. B. Fuller Company; 85-20
 - c. ITW TACC, Division of Illinois Tool Works; S-90/80
 - d. Marathon Industries, Inc.; 225

- e. Mon-Eco Industries, Inc.; 22-25
- G. PVC Jacket Adhesive: Compatible with PVC jacket.
 - 1. Manufacturers:
 - a. Dow Chemical Company (The); 739, Dow Silicone
 - b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive
 - c. P.I.C. Plastics, Inc.; Welding Adhesive
 - d. Red Devil, Inc.; Celulon Ultra Clear
 - e. Speedline Corporation; Speedline Vinyl Adhesive
- 2.04 MASTICS AND COATINGS:
 - A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.
 - B. Vapor-Barrier Mastic: Solvent based; suitable for indoor use on below ambient services.
 - 1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-30
 - b. Foster Products Corporation, H. B. Fuller Company; 30-35
 - c. ITW TACC, Division of Illinois Tool Works; CB-25
 - d. Marathon Industries, Inc.; 501
 - e. Mon-Eco Industries, Inc.; 55-10
 - 2. Water-Vapor Permeance: ASTM F1249, 0.05 perm at 35-mil dry film thickness.
 - a. Service Temperature Range: 0 to 180 degrees F.
 - b. Solids Content: ASTM D1644, 44 percent by volume and 62 percent by weight.
 - c. Color: White.

C. Vapor-Barrier Mastic: Solvent based; suitable for outdoor use on below ambient services.

1. Manufacturers:

- a. Childers Products, Division of ITW; Encacel
- b. Foster Products Corporation, H. B. Fuller Company; 60-95/60-96
- c. Marathon Industries, Inc.; 570
- d. Mon-Eco Industries, Inc.; 55-70

2. Water-Vapor Permeance: ASTM F1249, 0.05 perm at 30-mil dry film thickness.

3. Service Temperature Range: Minus 50 to plus 220 degrees F.

4. Solids Content: ASTM D1644, 33 percent by volume and 46 percent by weight.

5. Color: White.

2.05 LAGGING ADHESIVES:

A. Description: Comply with MIL-A-3316C Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.

1. Manufacturers:

- a. Childers Products, Division of ITW; CP-52
- b. Foster Products Corporation, H. B. Fuller Company; 81-42
- c. Marathon Industries, Inc.; 130
- d. Mon-Eco Industries, Inc.; 11-30
- e. Vimasco Corporation; 136

2. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over equipment and pipe insulation.

3. Service Temperature Range: Minus 50 to plus 180 degrees F.

4. Color: White.

2.06 SEALANTS

A. Joint Sealants:

1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-76
 - b. Foster Products Corporation, H. B. Fuller Company; 30-45
 - c. Marathon Industries, Inc.; 405
 - d. Mon-Eco Industries, Inc.; 44-05
 - e. Pittsburgh Corning Corporation; Pittseal 444
 - f. Vimasco Corporation; 750
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Permanently flexible, elastomeric sealant.
4. Service Temperature Range: Minus 100 to plus 300 degrees F.
5. Color: White or gray.

B. FSK and Metal Jacket Flashing Sealants:

1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-76-8
 - b. Foster Products Corporation, H. B. Fuller Company; 95-44
 - c. Marathon Industries, Inc.; 405
 - d. Mon-Eco Industries, Inc.; 44-05
 - e. Vimasco Corporation; 750
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 degrees F.
5. Color: Aluminum.

C. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:

1. Manufacturers:
 - a. Childers Products, Division of ITW; CP-76
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 degrees F.
5. Color: White.

2.07 REMOVABLE INSULATION JACKETS

A. Manufacturers:

1. Childers
2. Ceel-Co

- B. Jackets for Piping Insulation: ASTM C921, Type I for piping with temperatures below ambient, Type II for piping with temperatures above ambient. Type I may be used for all piping at Installers option.
- C. Encase pipe fittings insulation with one-piece premolded PVC fitting covers, fastened as per manufacturer's recommendations.
- D. Where piping is specified to be exposed in finished area all insulated piping shall have PVC jacketing and fitting covers as manufactured by Ceel-Co 550Z with a 25/50 flame/smoke rating not less than 15 mil thick, suitable and ready to accept a final painted finish.
- E. Jacketing Material for Equipment Insulation: Provide pre-sized glass cloth jacketing material, not less than 7.8 ounces per square yard, or metal jacket at Installer's option, except as otherwise indicated.

2.08 FACTORY-APPLIED JACKETS:

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
1. ASJ: White, Kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C1136, Type I.
 2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.

3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with Kraft-paper backing; complying with ASTM C1136, Type II.
- 2.09 FIELD-APPLIED FABRIC-REINFORCING MESH:
- A. Woven Glass-Fiber Fabric: Approximately 2 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in. for covering pipe and pipe fittings.
 - B. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for pipe.
- 2.10 FIELD-APPLIED CLOTHS:
- A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and pre-sized a minimum of 8 oz./sq. yd.
- 2.11 FIELD-APPLIED JACKETS:
- A. Field-applied jackets shall comply with ASTM C921, Type I, unless otherwise indicated.
 1. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
 - a. Manufacturers:
 - (1) Johns Manville; Zeston
 - (2) P.I.C. Plastics, Inc.; FG Series
 - (3) Proto PVC Corporation; LoSmoke
 - (4) Speedline Corporation; SmokeSafe
 - b. Adhesive: As recommended by jacket material manufacturer.
 - c. Color: White.
 - d. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
 - (1) Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.
 - e. Factory-fabricated tank heads and tank side panels.

2. Metal Jacket:

a. Manufacturers:

- (1) Childers Products, Division of ITW; Metal Jacketing Systems
- (2) PABCO Metals Corporation; Surefit (Dewatering only)
- (3) RPR Products, Inc.; Insul-Mate (Special order required)

b. Aluminum Jacket: Comply with ASTM B209, Alloy 3003, 3005, 3105 or 5005, Temper H-14.

- (1) Factory cut and rolled to size.
- (2) Finish and thickness are indicated in field-applied jacket schedules.
- (3) Moisture Barrier for Indoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper.
- (4) Moisture Barrier for Outdoor Applications: 2.5-mil-thick Polysurlyn.
- (5) Factory-Fabricated Fitting Covers:
 - (a) Same material, finish, and thickness as jacket.
 - (b) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - (c) Tee covers.
 - (d) Flange and union covers.
 - (e) End caps.
 - (f) Beveled collars.
 - (g) Valve covers.
 - (h) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

c. Stainless-Steel Jacket: ASTM A167 or ASTM A240.

- (1) Factory cut and rolled to size.
- (2) Material, finish, and thickness are indicated in field-applied jacket schedules.

- (3) Moisture Barrier for Indoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper.
- (4) Moisture Barrier for Outdoor Applications: 2.5-mil-thick Polysurlyn.
- (5) Factory-Fabricated Fitting Covers:
 - (a) Same material, finish, and thickness as jacket.
 - (b) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - (c) Tee covers.
 - (d) Flange and union covers.
 - (e) End caps.
 - (f) Beveled collars.
 - (g) Valve covers.
 - (h) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
- 3. Underground Direct-Buried Jacket: 125-mil-thick vapor barrier and waterproofing membrane consisting of a rubberized bituminous resin reinforced with a woven-glass fiber or polyester scrim and laminated aluminum foil.
 - a. Manufacturers:
 - (1) Pittsburgh Corning Corporation; Pittwrap
 - (2) Polyguard; Insulrap No Torch 125

2.12 TAPES:

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C1136.
 - 1. Manufacturers:
 - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835
 - b. Compac Corp.; 104 and 105
 - c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ
 - d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ

2. Width: 3 inches.
 3. Thickness: 11.5 mils.
 4. Adhesion: 90 ounces force/inch in width.
 5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.
1. Manufacturers:
 - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827
 - b. Compac Corp.; 110 and 111
 - c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK
 - d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ
 2. Width: 3 inches.
 3. Thickness: 6.5 mils.
 4. Adhesion: 90 ounces force/inch in width.
 5. Elongation: 2 percent.
 6. Tensile Strength: 40 lbf/inch in width.
 7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
- C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
1. Manufacturers:
 - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555
 - b. Compac Corp.; 130
 - c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape
 - d. Venture Tape; 1506 CW NS

2. Width: 2 inches.
3. Thickness: 6 mils.
4. Adhesion: 64 ounces force/inch in width.
5. Elongation: 500 percent.
6. Tensile Strength: 18 lbf/inch in width.

D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.

1. Manufacturers:
 - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800
 - b. Compac Corp.; 120
 - c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF
 - d. Venture Tape; 3520 CW
2. Width: 2 inches.
3. Thickness: 3.7 mils.
4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

2.13 SECUREMENTS:

A. Bands:

1. Manufacturers:
 - a. Childers Products; Bands
 - b. PABCO Metals Corporation; Bands (Dewatering only)
 - c. RPR Products, Inc.; Bands (Special order required)
2. Stainless Steel: ASTM A240, Type 304; 0.015 inch thick, 3/4 inch wide with wing seal.
3. Aluminum: ASTM B209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated.
 - a. Manufacturers:
 - (1) AGM Industries, Inc.; CWP-1
 - (2) GEMCO; CD
 - (3) Midwest Fasteners, Inc.; CD
 - (4) Nelson Stud Welding; TPA, TPC, and TPS
2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
 - a. Manufacturers:
 - (1) AGM Industries, Inc.; CWP-1
 - (2) GEMCO; Cupped Head Weld Pin
 - (3) Midwest Fasteners, Inc.; Cupped Head
 - (4) Nelson Stud Welding; CHP
3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Manufacturers:
 - (1) AGM Industries, Inc.; Tactoo Insul-Hangers, Series T
 - (2) GEMCO; Perforated Base
 - (3) Midwest Fasteners, Inc.; Spindle
 - b. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.

- c. Spindle: Copper- or zinc-coated, low carbon steel, aluminum, or stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.
 - d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
- 4. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Manufacturers:
 - (1) GEMCO; Nylon Hangers
 - (2) Midwest Fasteners, Inc.; Nylon Insulation Hangers
 - b. Baseplate: Perforated, nylon sheet, 0.030 inch thick by 1-1/2 inches in diameter.
 - c. Spindle: Nylon, 0.106-inch-diameter shank, length to suit depth of insulation indicated, up to 2-1/2 inches.
 - d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
- 5. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Manufacturers:
 - (1) AGM Industries, Inc.; Tactoo Insul-Hangers, Series TSA
 - (2) GEMCO; Press and Peel
 - (3) Midwest Fasteners, Inc.; Self Stick
 - b. Baseplate: Galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
 - c. Spindle: Copper- or zinc-coated, low carbon steel, aluminum, or stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.

- d. Adhesive-backed base with a peel-off protective cover.
- 6. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick, aluminum or stainless-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
 - a. Manufacturers:
 - (1) AGM Industries, Inc.; RC-150
 - (2) GEMCO; R-150
 - (3) Midwest Fasteners, Inc.; WA-150
 - (4) Nelson Stud Welding; Speed Clips
 - b. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
- 7. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
 - a. Products: Subject to compliance with requirements, provide one of the following:
 - (1) GEMCO
 - (2) Midwest Fasteners, Inc.
- C. Staples: Outward-clinching insulation staples, nominal 3/4-inch-wide, stainless steel or Monel.
 - 1. Manufacturers:
 - a. C & F Wire
 - b. Childers Products
 - c. PABCO Metals Corporation
 - d. RPR Products, Inc.
- D. Wire: 0.062-inch soft-annealed, stainless steel.

2.14 PROTECTIVE SHIELDING GUARDS:

A. Protective Shielding Pipe Covers,:

1. Description: Manufactured plastic wraps for covering plumbing fixture hot-water supply and trap and drain piping. Comply with Americans with Disabilities Act (ADA) requirements.

B. Protective Shielding Piping Enclosures,:

1. Description: Manufactured plastic enclosure for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with ADA requirements.

2.15 CORNER ANGLES:

- A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D1784, Class 16354-C. White or color-coded to match adjacent surface.
- B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B209, Alloy 3003, 3005, 3105 or 5005; Temper H-14.
- C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A167 or ASTM A240, Type 304 or 316.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
 1. Verify that systems to be insulated have been tested and are free of defects.
 2. Verify that surfaces to be insulated are clean and dry.
 3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:
 1. Stainless Steel: Coat 300 series stainless steel with an epoxy primer 5 mils thick and an epoxy finish 5 mils thick if operating in a temperature range of between 140

and 300 degrees F. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

2. Carbon Steel: Coat carbon steel operating at a service temperature of between 32 and 300 degrees F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.
- C. Coordinate insulation installation with the tradesman installing heat tracing. Comply with requirements for heat tracing that apply to insulation.
- D. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless steel surfaces, use demineralized water.

3.03 GENERAL INSTALLATION REQUIREMENTS:

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.
 - B. Install insulation materials, forms, vapor barriers or retarders, jackets, and of thicknesses required for each item of pipe system, as specified in insulation system schedules.
 - C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
 - D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
 - E. Install multiple layers of insulation with longitudinal and end seams staggered.
 - F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
 - G. Keep insulation materials dry during storage, application, and finishing. Replace insulation materials that get wet.
 - H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
 - I. Install insulation with least number of joints practical.
 - J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
1. Install insulation continuously through hangers and around anchor attachments.

2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends attached to structure with vapor-barrier mastic.
 3. Install insert materials and insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- L. Install insulation with factory-applied jackets as follows:
1. Draw jacket tight and smooth.
 2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward-clinching staples along both edges of strip, spaced 4 inches o.c.
 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward-clinching staples along edge at 4 inches o.c.
 - a. For below-ambient services, apply vapor-barrier mastic over staples.
 4. Cover joints and seams with tape, in accordance with insulation material manufacturer's written instructions, to maintain vapor seal.
 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.
- M. Cut insulation in a manner to avoid compressing insulation more than 25 percent of its nominal thickness.
- N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches in similar fashion to butt joints.
- P. For above-ambient services, do not install insulation to the following:
1. Vibration-control devices

2. Testing agency labels and stamps
3. Nameplates and data plates
4. Cleanouts

3.04 PENETRATIONS:

- A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
 1. Seal penetrations with flashing sealant.
 2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
 4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.
- C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
 1. Seal penetrations with flashing sealant.
 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
 4. Seal jacket to wall flashing with flashing sealant.
- D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

- E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
 - 1. Comply with requirements in Section 07 84 00 for firestopping and fire-resistive joint sealers.
 - F. Insulation Installation at Floor Penetrations:
 - 1. Pipe: Install insulation continuously through floor penetrations.
 - 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 00.
- 3.05 EQUIPMENT, TANK, AND VESSEL INSULATION INSTALLATION:
- A. Mineral Fiber, Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.
 - 1. Apply adhesives according to manufacturer's recommended coverage rates per unit area of tank and vessel surfaces.
 - 2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
 - 3. Protect exposed corners with secured corner angles.
 - 4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
 - a. Do not weld anchor pins to ASME-labeled pressure vessels.
 - b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
 - c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
 - d. Do not overcompress insulation during installation.
 - e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
 - f. Impale insulation over anchor pins and attach speed washers.
 - g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

- h. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.
 - i. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
 - j. Stagger joints between insulation layers at least 3 inches.
 - k. Install insulation in removable segments on equipment access doors, maintenance holes, handholes, and other elements that require frequent removal for service and inspection.
 - l. Bevel and seal insulation ends around maintenance holes, handholes, ASME stamps, and nameplates.
 - m. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.
5. Flexible Elastomeric Thermal Insulation Installation for Tanks and Vessels: Install insulation over entire surface of tanks and vessels.
- a. Apply 100 percent coverage of adhesive to surface with manufacturer's recommended adhesive.
 - b. Seal longitudinal seams and end joints.
6. Insulation Installation on Pumps:
- a. Fabricate metal boxes lined with insulation. Fit boxes around pumps and coincide box joints with splits in pump casings. Fabricate joints with outward bolted flanges. Bolt flanges on 6-inch centers, starting at corners. Install 3/8-inch-diameter fasteners with wing nuts. Alternatively, secure the box sections together using a latching mechanism.
 - b. Fabricate boxes from galvanized steel or aluminum, at least 0.040 inch thick.

- c. For below ambient services, install a vapor barrier at seams, joints, and penetrations. Seal between flanges with replaceable gasket material to form a vapor barrier.
- 7. Install insulation materials with smooth and even surfaces and on clean and dry surfaces. Redo poorly fitted joints. Do not use mastic or joint sealer as filler for gapping joints and excessive voids resulting from poor workmanship.
- 8. Maintain integrity of vapor-barrier on equipment insulation and protect it to prevent puncture and other damage.
- 9. Do not apply insulation to equipment while hot.
- 10. Apply insulation using staggered joint method and double layer construction. Apply each layer of insulation separately.
- 11. Provide removable insulation sections with aluminum jacket and stainless steel bands to cover parts of equipment which must be opened for maintenance; include metal vessel covers, fasteners, flanged, frames and accessories.

3.06 GENERAL PIPE INSULATION INSTALLATION:

- A. Requirements in this article generally apply to all insulation materials, except where more specific requirements are specified in various pipe insulation material installation articles.
- B. Insulation Installation on Fittings, Valves, Strainers, Flanges, Mechanical Couplings, and Unions:
 - 1. Install insulation over fittings, valves, strainers, flanges, mechanical couplings, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
 - 2. Insulate pipe elbows using preformed fitting insulation made from same material and density as that of adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
 - 3. Insulate tee fittings with preformed fitting insulation of same material and thickness as that used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
 - 4. Insulate valves using preformed fitting insulation of same material, density, and thickness as that used for adjacent pipe. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.

5. Insulate strainers using preformed fitting insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers, so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.
 6. Insulate flanges, mechanical couplings, and unions, using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Stencil or label the outside insulation jacket of each union with the word "union" matching size and color of pipe labels.
 7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
 8. For services not specified to receive a field-applied jacket, except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing, using PVC tape.
- C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.
- D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as that of adjoining pipe insulation.
 2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union at least 2 times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless steel or aluminum bands. Select band material compatible with insulation and jacket.
 3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.

4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.07 CALCIUM SILICATE INSULATION INSTALLATION:

A. Insulation Installation on Domestic Water Boiler Breechings:

1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation material.
2. Install 2-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
3. On exposed applications without metal jacket, finish insulation surface with a skim coat of mineral-fiber, hydraulic-setting cement. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth. Thin finish coat to achieve smooth, uniform finish.

B. Insulation Installation on Straight Pipes and Tubes:

1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation materials.
2. Install 2-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
3. Apply a skim coat of mineral-fiber, hydraulic-setting cement to insulation surface. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth or tape. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth or tape. Thin finish coat to achieve smooth, uniform finish.

C. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.

2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of same material and thickness as pipe insulation.
4. Finish flange insulation same as pipe insulation.

D. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed insulation sections of insulation are not available, install mitered sections of calcium silicate insulation. Secure insulation materials with wire or bands.
3. Finish fittings insulation same as pipe insulation.

E. Insulation Installation on Valves and Pipe Specialties:

1. Install mitered segments of calcium silicate insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
2. Install insulation to flanges as specified for flange insulation application.
3. Finish valve and specialty insulation same as pipe insulation.

3.08 INSTALLATION OF CELLULAR-GLASS INSULATION:

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands, and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward-clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive, as recommended by insulation material manufacturer, and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as that of pipe insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of cellular-glass insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.09 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION:

A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:

1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as that of pipe insulation.

4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- C. Insulation Installation on Pipe Fittings and Elbows:
1. Install mitered sections of pipe insulation.
 2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed valve covers manufactured of same material as that of pipe insulation when available.
 2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
 3. Install insulation to flanges as specified for flange insulation application.
 4. Secure insulation to valves and specialties, and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- 3.10 INSTALLATION OF MINERAL-FIBER INSULATION:
- A. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of preformed pipe insulation to pipe with wire or bands, and tighten bands without deforming insulation materials.
 2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
 3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward-clinched staples at 6 inches o.c.
 4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive, as recommended by insulation material manufacturer, and seal with vapor-barrier mastic and flashing sealant.
- B. Insulation Installation on Pipe Flanges:
1. Install preformed pipe insulation to outer diameter of pipe flange.

2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available.
2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

3.11 INSTALLATION OF PHENOLIC INSULATION:

A. General Installation Requirements:

1. Secure single-layer insulation with stainless steel bands at 12-inch intervals, and tighten bands without deforming insulation materials.
2. Install two-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with 0.062-inch wire spaced at 12-inch intervals. Secure outer layer with stainless steel bands at 12-inch intervals.

B. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands, and tighten bands without deforming insulation materials.

2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward-clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets with vapor retarders on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive, as recommended by insulation material manufacturer, and seal with vapor-barrier mastic and flashing sealant.

C. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of same material and thickness as that of pipe insulation.

D. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed insulation sections of same material as that of straight segments of pipe insulation. Secure according to manufacturer's written instructions.

E. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed insulation sections of same material as that of straight segments of pipe insulation. Secure according to manufacturer's written instructions.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.12 INSTALLATION OF POLYOLEFIN INSULATION:

A. Insulation Installation on Straight Pipes and Tubes:

1. Seal split-tube longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:

1. Install pipe insulation to outer diameter of pipe flange.

2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polyolefin sheet insulation of same thickness as that of pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install mitered sections of polyolefin pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install cut sections of polyolefin pipe and sheet insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties, and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.13 FIELD-APPLIED JACKET INSTALLATION:

A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
2. Embed glass cloth between two 0.062-inch-thick coats of lagging adhesive.
3. Completely encapsulate insulation with coating, leaving no exposed insulation.

B. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.
2. Install lap or joint strips with same material as jacket.

3. Secure jacket to insulation with manufacturer's recommended adhesive.
 4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch-wide joint strips at end joints.
 5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.
- C. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints. Seal with manufacturer's recommended adhesive.
1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.
- D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless steel bands 12 inches o.c. and at end joints.
- 3.14 FINISHES:
- A. Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 99 00.
1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.
- C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
- D. Do not field paint aluminum or stainless steel jackets.
- 3.15 FIELD QUALITY CONTROL:
- A. Owner will engage a qualified testing agency to perform tests and inspections.
- B. Engage a qualified testing agency to perform tests and inspections.
- C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- D. Perform tests and inspections.

- E. Tests and Inspections: Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, two locations of threaded strainers, two locations of welded strainers, three locations of threaded valves, and three locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.
- F. All insulation applications will be considered defective if they do not pass tests and inspections.
- G. Prepare test and inspection reports.

3.16 EQUIPMENT INSULATION SCHEDULE:

- A. Insulation materials and thicknesses are identified below. If more than one material is listed for a type of equipment, selection from materials listed is Contractor's option.
- B. Insulate indoor and outdoor equipment in paragraphs below that is not factory insulated.
- C. Provide equipment insulation as follows:

Equipment	Material	Thickness (inches)
Water-To-Water Domestic Hot Water Generator	Rigid Cellular Glass	2-1/2
	Mineral-Fiber Board	2
Steam-To-Water Domestic Hot Water Generator	Rigid Cellular Glass	3
	Mineral-Fiber Board	2
Domestic Water Pump	Rigid Cellular Glass	3
	Mineral-Fiber Board	2
Domestic Hot Water Pump	Rigid Cellular Glass	2
	Mineral-Fiber Board	1
Domestic Hot Water Storage Tank	Rigid Cellular Glass	4
	Mineral-Fiber Board	3
Filter Housing	Rigid Cellular Glass	3
	Mineral-Fiber Board	2

3.17 PIPING INSULATION SCHEDULE, GENERAL:

- A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.
- B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
 - 1. Drainage piping located in crawl spaces.

2. Underground piping.
3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

3.18 INDOOR PIPING INSULATION SCHEDULE:

- A. Provide indoor piping insulation as follows:

Piping Service	Pipe Size	Thickness (inches)	Material
Domestic Cold Water	All	1	Mineral Fiber
Domestic Hot Water & Circulation	1-1/2 inches and Smaller	1	Mineral Fiber
Domestic Hot Water & Circulation	2 inches and Larger	1-1/2	Mineral Fiber
Roof Drain & Overflow	All	1	Mineral Fiber
Roof Drain & Overflow Drain Bodies	All	1-1/2	Mineral Fiber
Exposed Piping for Fixtures for People with Disabilities (Provide Flexible Elastometric)	All	1/2	Mineral Fiber
Sanitary Waste Piping Where Heat Tracing is Installed	All	1-1/2	Mineral Fiber
Condensate	All	1	Mineral Fiber
Hot Service Vents	All	1	Mineral Fiber

3.19 OUTDOOR, ABOVEGROUND PIPING INSULATION SCHEDULE:

- A. Provide outdoor, above ground piping insulation as follows:

Piping Service	Pipe Size	Cellular Glass Thickness
Domestic Cold Water	All	2 inches
Domestic Hot Water & Circulation	All	2 inches
Sanitary Waste & Vent	All	1-1/2 inches

3.20 OUTDOOR, UNDERGROUND PIPING INSULATION SCHEDULE

- A. Loose-fill insulation, for belowground piping, is specified in Division 33 piping distribution Sections.
- B. Sanitary Waste Piping, All Sizes, Where Heat Tracing Is Installed: Cellular glass, 2 inches thick.
- C. Chilled Water, All Sizes: Cellular glass, 2 inches thick.

3.21 INDOOR, FIELD-APPLIED JACKET SCHEDULE:

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Equipment, Concealed:
 - 1. None.
- D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:
 - 1. PVC: 20 mils thick.
 - 2. Painted Aluminum, Smooth: 0.020 inch thick.
 - 3. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.
- E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger than 72 Inches:
 - 1. Painted Aluminum, Smooth: 0.032 inch thick.
 - 2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.020 inch thick.
- F. Piping, Concealed:
 - 1. None.
- G. Piping, Exposed:
 - 1. PVC: 30 mils thick.

3.22 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE:

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Equipment, Concealed:
 - 1. PVC: 20 mils thick.
 - 2. Painted Aluminum, Smooth: 0.020 inch thick.

3. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.
- D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:
 1. Painted Aluminum, Smooth: 0.020 inch thick.
 2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.
- E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger than 72 Inches:
 1. Painted Aluminum, Smooth: 0.032 inch thick.
 2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.020 inch thick.
- F. Piping, Concealed:
 1. PVC: 20 mils thick.
 2. Painted Aluminum, Smooth: 0.020 inch thick.
 3. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.
- G. Piping, Exposed:
 1. Painted Aluminum, Smooth: 0.032 inch thick.
 2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.020 inch thick.
- 3.23 UNDERGROUND, FIELD-APPLIED INSULATION JACKET:
 - A. For underground direct-buried piping applications, install underground direct-buried jacket over insulation material.
- 3.24 CLOSEOUT ACTIVITIES:
 - A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 14 13

STORM DRAINAGE PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide storm drainage piping as indicated and in compliance with Contract Documents.
 - 1. Metal roof drain piping
 - 2. Miscellaneous storm drainage piping specialties
 - 3. Cleanouts
 - 4. Groundwater underdrain piping

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. A112.6.4: Roof, Deck and Balcony Drains
 - 2. A112.36.2M: Cleanouts
- B. ASTM International (ASTM):
 - 1. A48: Specification for Gray Iron Castings
 - 2. A74: Standard Specification for Cast Iron Soil Pipe and Fittings
 - 3. A888: Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications
- C. Cast Iron Soil Pipe Institute (CISPI):
 - 1. 301: Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS:

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.
- B. Comply with requirements in Table 22 14 13-1 for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 METAL ROOF DRAIN PIPING:

- A. Hubless, Cast-Iron Soil Pipe and Fittings:
 - 1. See Division 40 for pipe and fitting specifications.
 - 2. Pipe and Fittings: ASTM A888 or CISPI 301.
 - 3. Heavy-Duty, Hubless-Piping Couplings:
 - a. Standards: ASTM C1277 and ASTM C1540
 - b. Description: Stainless-steel shield with stainless-steel bands and tightening devices; and ASTM C564, rubber sleeve with integral, center pipe stop.
 - c. Manufacturers:
 - (1) ANACO-Husky
 - (2) Dallas Specialty
 - (3) Fernco Inc.
 - (4) MIFAB, Inc. (Dewatering only)

2.03 CLEANOUTS:

- A. Cast-Iron Exposed Cleanouts:

1. Provide threaded pipe cap
2. Size: Same as connected branch

2.04 SPECIALTY PIPE FITTINGS:

A. Transition Couplings:

1. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
2. Shielded, Non-pressure Transition Couplings:
 - a. Manufacturers:
 - (1) ANACO-Husky
 - (2) Dallas Specialty
 - (3) Fernco Inc.
 - (4) MIFAB, Inc. (Dewatering only)
 - b. Standard: ASTM C1460
 - c. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
 - d. End Connections: Same size as and compatible with pipes to be joined.
3. Pressure Transition Couplings:
 - a. Manufacturers:
 - (1) ANACO-Husky
 - (2) Dallas Specialty
 - (3) Fernco Inc.
 - (4) MIFAB, Inc. (Dewatering only)
 - b. Standard: AWWA C219
 - c. Description: Metal, sleeve-type same size as, with pressure rating at least equal to, and ends compatible with, pipes to be joined.
 - d. Center-Sleeve Material: Manufacturer's standard.

- e. Gasket Material: Natural or synthetic rubber.
- f. Metal Component Finish: Corrosion-resistant coating or material.

PART 3 - EXECUTION

3.01 EARTHWORK:

- A. Excavating, trenching, and backfilling are specified in Section 31 23 00.

3.02 INSTALLATION:

- A. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions.
 - 1. Install flashing collar or flange of roof drain to prevent leakage between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
 - 2. Install expansion joints, if indicated, in roof drain outlets.
 - 3. Position roof drains for easy access and maintenance.
- B. Install downspout adapters on outlet of back-outlet parapet roof drains and connect to sheet metal downspouts.
- C. Install downspout boots at grade with top 12 inches above grade. Secure to building wall.
- D. Install conductor nozzles at exposed bottom of conductors where they spill onto grade.
- E. Install cleanouts in aboveground piping and building drain piping according to the following instructions unless otherwise indicated:
 - 1. Use cleanouts the same size as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
 - 2. Locate cleanouts at each change in direction of piping greater than 45 degrees.
 - 3. Locate cleanouts at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
 - 4. Locate cleanouts at base of each vertical storm piping conductor.
- F. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.
- G. Install test tees in vertical conductors and near floor.

- H. Install wall cleanouts in vertical conductors. Install access door in wall if indicated.
- I. Install trench drains at low points of surface areas to be drained. Set grates of drains flush with finished surface unless otherwise indicated.
- J. Assemble channel drainage system components according to manufacturer's written instructions. Install on support devices so that top will be flush with adjacent surface.
- K. Install through-penetration firestop assemblies for penetrations of fire- and smoke-rated assemblies.
 - 1. Comply with requirements in Section 07 84 00.

3.03 CONNECTIONS:

- A. Comply with requirements for piping specified in Section 22 14 13. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Join perforated PE pipe and fittings with couplings according to ASTM D3212 with loose banded, coupled, or push-on joints.
- C. Special Pipe Couplings: Join piping made of different materials and dimensions with special couplings made for this application. Use couplings that are compatible with and fit materials and dimensions of both pipes.
- D. Connect low elevations of underslab subdrainage to stormwater sump pumps in maintenance holes. Comply with requirements for sump pumps specified in Section 22 11 23.

3.04 CLEANOUT INSTALLATION:

- A. Cleanouts for Underslab Subdrainage:
 - 1. Install cleanouts and riser extensions from piping to top of grade. Locate cleanouts at beginning of piping run as indicated on plans. Install fittings so cleanouts open in direction of flow in piping.
 - 2. Use NPS 12 cast-iron soil pipe and fittings for piping branch fittings and riser extensions to cleanout flush with top of slab.

3.05 FLASHING INSTALLATION:

- A. Fabricate flashing from single piece of metal unless large pans, sumps, or other drainage shapes are required.
- B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
- C. Set flashing on floors and roofs in solid coating of bituminous cement.

- D. Secure flashing into sleeve and specialty clamping ring or device.

3.06 PROTECTION:

- A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.
- B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

3.07 FIELD QUALITY CONTROL:

A. Tests and Inspections:

1. After installing drainage course to top of piping, test drain piping with water to ensure free flow before backfilling.
2. Remove obstructions, replace damaged components, and repeat test until results are satisfactory.
3. Drain piping will be considered defective if it does not pass tests and inspections.
4. Prepare test and inspection reports.

3.08 CLEANING:

1. Clear interior of installed piping and structures of dirt and other superfluous material as work progresses. Maintain swab or drag in piping and pull past each joint as it is completed. Place plugs in ends of uncompleted pipe at end of each day or when work stops.

3.09 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

Table 22 14 13-1 Plumbing Storm Drainage Piping Schedule							
Service	Size (in)	Pipe Matl	Fittings	Gasket	Joint Type	Location	Remarks
Storm Drain	All	CAST IRON, CISPI 301	Cast-Iron	Neoprene rubber with stainless clamp/shield	No-Hub CISPI 310	All	For process areas typically use 3" and greater Class 53 DIP ceramic epoxy lined or less than 3" 316 SS sched 40
Storm Drain	All	CAST IRON, CISPI 301	Cast-Iron	Neoprene rubber with stainless clamp/shield	No-Hub CISPI 310	Inside Exposed, Encased, Buried within building footprint

SECTION 22 14 23

STORM DRAINAGE PIPING SPECIALTIES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide storm drainage piping specialties as indicated and in compliance with Contract Documents.
 - 1. Metal roof drains
 - 2. Miscellaneous storm drainage piping specialties
 - 3. Backwater valves

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. A112.6.4: Roof, Deck and Balcony Drains
 - 2. A112.14.1: Backwater Valves
 - 3. A112.36.2M: Cleanouts
- B. ASTM International (ASTM):
 - 1. A48: Specification for Gray Iron Castings.
 - 2. A74: Standard Specification for Cast Iron Soil Pipe and Fittings
 - 3. A888: Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications
- C. Cast Iron Soil Pipe Institute (CISPI):
 - 1. 301: Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 METAL ROOF DRAINS:

- A. American Iron and Steel (AIS) Complaint - Cast-Iron, Combination Main and Overflow, General-Purpose Roof Drains:

- 1. Manufacturers:

- a. Josam Company; Josam Division (Special order required)
 - b. Approved AIS Compliant equal

- 2. Standard: ASME A112.6.4.

- 3. Body Material: Cast iron.

- 4. Dimension of Body: Nominal 12 inch diameter.

- 5. Combination Flashing Ring and Gravel Stop: Required.

- 6. Flow-Control Weirs: Required.

- 7. Outlet: Bottom.

- 8. Outlet Type: No hub.

- 9. Extension Collars: Required.

- 10. Underdeck Clamp: Required.

11. Expansion Joint: Not required.
12. Sump Receiver Plate: Required.
13. Dome Material: Cast iron.
14. Perforated Gravel Guard: Stainless steel.
15. Vandal-Proof Dome: Required.
16. Water Dam: 2 inches high.

2.02 MISCELLANEOUS STORM DRAINAGE PIPING SPECIALTIES:

A. Downspout Adaptors :

1. Description: Manufactured, gray-iron casting, for attaching to horizontal-outlet, parapet roof drain and to exterior, sheet metal downspout.
2. Size: Inlet size to match parapet drain outlet.

B. Cleanouts:

1. Floor Cleanouts:

a. Manufacturers:

- (1) Josam Company; Josam Division (Special order required)
- (2) Oatey (Dewatering only)
- (3) Sioux Chief Manufacturing Company, Inc.
- (4) Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
- (5) Watts Drainage Products Inc.
- (6) Zurn Plumbing Products Group; Light Commercial Operation (Dewatering only)

b. Standard: ASME A112.36.2M for adjustable housing; cast-iron soil pipe with cast-iron ferrule; heavy-duty, adjustable housing; threaded, adjustable housing cleanout.

c. Size: Same as connected branch.

d. Type: Heavy-duty, adjustable housing.

- (1) Body or Ferrule: Cast iron, unless otherwise noted on drawings.

- (2) Clamping Device: Not required.
- (3) Outlet Connection: Threaded.
- (4) Closure: Cast-iron plug.
- (5) Adjustable Housing Material: Cast iron with threads, set-screws or other device.
- (6) Frame and Cover Material and Finish: cast iron
- (7) Top Loading Classification: Heavy Duty.
- (8) Riser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.

2. Wall Cleanouts:

a. Manufacturers:

- (1) Josam Company; Josam Division (Special order required)
- (2) MIFAB, Inc.
- (3) Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
- (4) Watts Drainage Products Inc.
- (5) Zurn Plumbing Products Group; Specification Drainage Operation (Dewatering only)

b. Standard: ASME A112.36.2M. Include wall access.

c. Size: Same as connected drainage piping.

d. Body: Hubless, cast-iron soil pipe test tee as required to match connected piping.

- (1) Closure: Countersunk or raised-head, drilled-and-threaded cast-iron plug.
- (2) Closure Plug Size: Same as or not more than one size smaller than cleanout size.
- (3) Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.
- (4) Wall Access: Round, stainless-steel wall-installation frame and cover.

3. Flashing Materials

- a. Refer to Section 07 60 00 for material specification.

2.03 BACKWATER VALVES:

A. Cast-Iron, Horizontal Backwater Valves:

1. Manufacturers:

- a. MIFAB (Dewatering only)
- b. Zurn (Dewatering only)
- c. Josam Company; Josam Division (Special order required)
- d. Smith, Jay R. Mfr. Co.; Division of Smith Industries, Inc.
- e. Watts Drainage Products Inc.

2. Standard: ASME A112.14.1.

3. Size: Same as connected piping.

4. Body Material: Cast iron.

5. Cover: Cast iron with bolted access check valve.

6. End Connections: Hub and spigot or hubless.

7. Check Valve: Removable, bronze, swing check, factory assembled or field modified to hang open for airflow unless subject to backflow condition.

8. Extension: ASTM A74, Service class; full-size, cast-iron soil-pipe extension to field-installed cleanout at floor; replaces backwater valve cover.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions.

- 1. Install flashing collar or flange of roof drain to prevent leakage between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
- 2. Install expansion joints, if indicated, in roof drain outlets.

3. Position roof drains for easy access and maintenance.

B. Install downspout adapters on outlet of back-outlet parapet roof drains and connect to sheet metal downspouts.

C. Install conductor nozzles at exposed bottom of conductors where they spill onto grade.

D. Install cleanouts in aboveground piping and building drain piping according to the following instructions unless otherwise indicated:

1. Use cleanouts the same size as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.

2. Locate cleanouts at each change in direction of piping greater than 45 degrees.

3. Locate cleanouts at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.

4. Locate cleanouts at base of each vertical storm piping conductor.

E. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

F. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

G. Install horizontal backwater valves in floor with cover flush with floor.

H. Install drain-outlet backwater valves in outlet of drains.

I. Install test tees in vertical conductors and near floor.

J. Install wall cleanouts in vertical conductors. Install access door in wall if indicated.

K. Install through-penetration firestop assemblies for penetrations of fire- and smoke-rated assemblies.

1. Comply with requirements in Section 07 84 00.

3.02 CONNECTIONS:

A. Comply with requirements for piping specified in Section 22 14 13. Drawings indicate general arrangement of piping, fittings, and specialties.

3.03 FLASHING INSTALLATION:

A. Fabricate flashing from single piece of metal unless large pans, sumps, or other drainage shapes are required.

- B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
- C. Set flashing on floors and roofs in solid coating of bituminous cement.
- D. Secure flashing into sleeve and specialty clamping ring or device.

3.04 PROTECTION:

- A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.
- B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

3.05 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 13

COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on alternating-current power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. The Institute of Electrical and Electronics Engineers, Inc. (IEEE):
 - 1. 841: Motors
- B. National Electrical Manufacturers Association (NEMA):
 - 1. MG-1: Motors and Generators.

1.03 COORDINATION:

- A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
 - 1. Motor controllers.
 - 2. Torque, speed, and horsepower requirements of the load.
 - 3. Ratings and characteristics of supply circuit and required control sequence.
 - 4. Ambient and environmental conditions of installation location.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 GENERAL MOTOR REQUIREMENTS:

- A. Comply with NEMA MG 1 unless otherwise indicated.
- B. Comply with IEEE 841 for severe-duty motors.

2.02 MOTOR CHARACTERISTICS:

- A. Duty: Continuous duty at ambient temperature of 40 degrees C and at altitude of 4500 feet above sea level.
- B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.03 POLYPHASE MOTORS:

- A. Description: NEMA MG 1, Design B, medium induction motor.
- B. Efficiency: Premium efficient, as defined in NEMA MG 1.
- C. Service Factor: 1.15.
- D. Multispeed Motors: Separate winding for each speed.
- E. Rotor: Random-wound, squirrel cage.
- F. Bearings: Regreaseable, shielded, antifriction ball bearings suitable for radial and thrust loading.
- G. Temperature Rise: Match insulation rating.
- H. Insulation: Class F.
- I. Code Letter Designation:
 - 1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
 - 2. Motors Smaller Than 15 HP: Manufacturer's standard starting characteristic.
- J. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.04 ADDITIONAL REQUIREMENTS FOR POLYPHASE MOTORS:

- A. Motors Used with Reduced-Voltage and Multispeed Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.
- B. Motors Used with Variable-Frequency Controllers
 - 1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width-modulated inverters.
 - 2. Premium-Efficient Motors: Class B temperature rise; Class F insulation.
 - 3. Inverter-Duty Motors: Class F temperature rise; Class H insulation.
 - 4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.
- C. Severe-Duty Motors: Comply with IEEE 841, with 1.15 minimum service factor.

2.05 SINGLE-PHASE MOTORS:

- A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:
 - 1. Permanent-split capacitor.
 - 2. Split phase.
 - 3. Capacitor start, inductor run.
 - 4. Capacitor start, capacitor run.
- B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.
- C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.
- D. Motors 1/20 HP and Smaller: Shaded-pole type.
- E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION

3.01 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 16

EXPANSION FITTINGS AND LOOPS FOR HVAC PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Flexible-hose packless expansion joints.
 - 2. Alignment guides and anchors.

1.03 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Anchor Details: Detail fabrication of each anchor indicated. Show dimensions and methods of assembly and attachment to building structure.
 - 2. Alignment Guide Details: Detail field assembly and attachment to building structure.
 - 3. Schedule: Indicate type, manufacturer's number, size, material, pressure rating, end connections, and location for each expansion joint.
 - 4. Maintenance Data: For expansion joints to include in maintenance manuals.
- B. Quality Assurance
 - 1. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
 - 2. Pipe and Pressure-Vessel Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Compatibility: Products shall be suitable for piping service fluids, materials, working pressures, and temperatures.
- B. Capability: Products to absorb 200 percent of maximum axial movement between anchors.

2.02 PACKLESS EXPANSION JOINTS

- A. Flexible-Hose Packless Expansion Joint:
 - 1. Description: Manufactured assembly with inlet and outlet elbow fittings and two flexible-metal-hose legs joined by long-radius, 180-degree return bend or center section of flexible hose.
 - 2. Flexible Hose: Corrugated-metal inner hoses and braided outer sheaths.
 - 3. Expansion Joints for Steel Piping NPS 2 and Smaller: Carbon-steel fittings with threaded end connections.
 - a. Stainless-steel hoses and single-braid, stainless-steel sheaths with 450 psig at 70 deg F and 325 psig at 600 deg F ratings.
 - b. Stainless-steel hoses and double-braid, stainless-steel sheaths with 700 psig at 70 deg F and 515 psig at 600 deg F ratings.
 - 4. Expansion Joints for Steel Piping NPS 2-1/2 to NPS 6: Carbon-steel fittings with flanged end connections.
 - a. Stainless-steel hoses and single-braid, stainless-steel sheaths with 200 psig at 70 deg F and 145 psig at 600 deg F ratings.
 - b. Stainless-steel hoses and double-braid, stainless-steel sheaths with 275 psig at 70 deg F and 200 psig at 600 deg F ratings.

2.03 ALIGNMENT GUIDES AND ANCHORS

- A. Alignment Guides:
 - 1. Description: Steel, factory-fabricated alignment guide, with bolted two-section outer cylinder and base for attaching to structure; with two-section guiding slider for bolting to pipe.
- B. Anchor Materials:
 - 1. Steel Shapes and Plates: ASTM A36/A36M.

2. Bolts and Nuts: ASME B18.10 or ASTM A183, steel hex head.
3. Washers: ASTM F844, steel, plain, flat washers.
4. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened portland cement concrete, with tension and shear capacities appropriate for application.
 - a. Stud: Threaded, zinc-coated carbon steel.
 - b. Expansion Plug: Zinc-coated steel.
 - c. Washer and Nut: Zinc-coated steel.
5. Chemical Fasteners: Insert-type stud, bonding-system anchor for use with hardened portland cement concrete, with tension and shear capacities appropriate for application.
 - a. Bonding Material: ASTM C881/C881M, Type IV, Grade 3, two-component epoxy resin suitable for surface temperature of hardened concrete where fastener is to be installed.
 - b. Stud: ASTM A307, zinc-coated carbon steel with continuous thread on stud, unless otherwise indicated.
 - c. Washer and Nut: Zinc-coated steel.

PART 3 - EXECUTION

3.01 EXPANSION JOINT INSTALLATION

- A. Install expansion joints of sizes matching sizes of piping in which they are installed.
- B. Install packed-type expansion joints with packing suitable for fluid service.
- C. Install metal-bellows expansion joints according to EJMA's "Standards of the Expansion Joint Manufacturers Association, Inc."
- D. Install rubber packless expansion joints according to FSA-PSJ-703.
- E. Install grooved-joint expansion joints to grooved-end steel piping.

3.02 ALIGNMENT-GUIDE AND ANCHOR INSTALLATION

- A. Install alignment guides to guide expansion and to avoid end-loading and torsional stress.
- B. Install two guides on each side of pipe expansion fittings and loops. Install guides nearest to expansion joint not more than four pipe diameters from expansion joint.

- C. Attach guides to pipe, and secure guides to building structure.
- D. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.
- E. Anchor Attachments:
 - 1. Anchor Attachment to Steel Pipe: Attach by welding. Comply with ASME B31.9 and ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
 - 2. Anchor Attachment to Copper Tubing: Attach with pipe hangers. Use MSS SP-69, Type 24; U bolts bolted to anchor.
- F. Fabricate and install steel anchors by welding steel shapes, plates, and bars. Comply with ASME B31.9 and AWS D1.1/D1.1M.
 - 1. Anchor Attachment to Steel Structural Members: Attach by welding.
 - 2. Anchor Attachment to Concrete Structural Members: Attach by fasteners. Follow fastener manufacturer's written instructions.
- G. Use grout to form flat bearing surfaces for guides and anchors attached to concrete.

END OF SECTION

SECTION 23 05 17

SLEEVES AND SLEEVE SEALS FOR HVAC PIPING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

- 1. Sleeves.
- 2. Stack-sleeve fittings.
- 3. Sleeve-seal systems.
- 4. Sleeve-seal fittings.
- 5. Grout.
- 6. Silicone sealants.

- B. Related Requirements:

- 1. Section 07 84 13 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.03 SUBMITTALS

- A. Product Data: For each type of product.
- B. Sustainable Design Submittals:
- C. Informational Submittals
 - 1. Field quality-control reports.

PART 2 - PRODUCTS

2.01 SLEEVES

- A. Cast-Iron Pipe Sleeves: Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop collar.
- B. Steel Pipe Sleeves: ASTM A53/A53M, Type E, Grade B, Schedule 40, anti-corrosion coated or zinc coated, with plain ends and integral welded waterstop collar.
- C. Galvanized-Steel Sheet Sleeves: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.
- D. PVC Pipe Sleeves: ASTM D1785, Schedule 40.
- E. Molded-PVC Sleeves: With nailing flange for attaching to wooden forms.
- F. Molded-PE or -PP Sleeves: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

2.02 STACK-SLEEVE FITTINGS

- A. Description: Manufactured, Dura-coated or galvanized cast-iron sleeve with integral cast flashing flange for use in waterproof floors and roofs. Include clamping ring, bolts, and nuts for membrane flashing.
 - 1. Underdeck Clamp: Clamping ring with setscrews.

2.03 SLEEVE-SEALING SYSTEMS

- A. Description:
 - 1. Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.
 - 2. Designed to form a hydrostatic seal of 20-psig minimum.
 - 3. Sealing Elements: High-temperature-silicone interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size.
 - 4. Pressure Plates: Stainless steel.
 - 5. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.04 SLEEVE-SEAL FITTINGS

A. Description:

1. Manufactured plastic, sleeve-type, waterstop assembly, made for imbedding in concrete slab or wall.
2. Plastic or rubber waterstop collar with center opening to match piping OD.

2.05 GROUT

- A. Description: Nonshrink, recommended for interior and exterior sealing openings in nonfire-rated walls or floors.
- B. Standard: ASTM C1107/C1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- C. Design Mix: 5000-psi, 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

2.06 SILICONE SEALANTS

- A. Silicone, S, NS, 25, NT: Single-component, nonsag, plus 25 percent and minus 25 percent movement capability, nontraffic-use, neutral-curing silicone joint sealant, ASTM C920, Type S, Grade NS, Class 25, use NT.
- B. Silicone, S, P, 25, T, NT: Single-component, pourable, plus 25 percent and minus 25 percent movement capability, traffic- and nontraffic-use, neutral-curing silicone joint sealant; ASTM C920, Type S, Grade P, Class 25, Uses T and NT. Grade P Pourable (self-leveling) formulation is for opening in floors and other horizontal surfaces that are not fire rated.
- C. Silicone Foam: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

PART 3 - EXECUTION

3.01 SLEEVE INSTALLATION

- A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.
- B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls.
 1. Sleeves are not required for core-drilled holes.

- C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
 - 1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.
 - 2. Cut sleeves to length for mounting flush with both surfaces.
 - a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.
 - 3. Using grout or silicone sealant, seal space outside of sleeves in slabs and walls without sleeve-seal system.
- D. Install sleeves for pipes passing through interior partitions.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - 2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
 - 3. Seal annular space between sleeve and piping or piping insulation; use sealants appropriate for size, depth, and location of joint.
- E. Fire-Resistance-Rated Penetrations, Horizontal Assembly Penetrations, and Smoke-Barrier Penetrations: Maintain indicated fire or smoke rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with fire- and smoke-stop materials. Comply with requirements for firestopping and fill materials specified in Section 07 84 13 "Penetration Firestopping."

3.02 STACK-SLEEVE-FITTING INSTALLATION

- A. Install stack-sleeve fittings in new slabs as slabs are constructed.
 - 1. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
 - 2. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing. Comply with requirements for flashing specified in Section 07 62 00 "Sheet Metal Flashing and Trim."
 - 3. Install section of cast-iron soil pipe to extend sleeve to 3 inches above finished floor level.
 - 4. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
 - 5. Using waterproof silicone sealant, seal space between top hub of stack-sleeve fitting and pipe.

- B. Fire-Resistance-Rated, Horizontal Assembly, and Smoke Barrier Penetrations: Maintain indicated fire or smoke rating of floors at pipe penetrations. Seal pipe penetrations with fire- and smoke-stop materials. Comply with requirements for firestopping specified in Section 07 84 13 "Penetration Firestopping."

3.03 SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.
- B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal-system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

3.04 SLEEVE-SEAL-FITTING INSTALLATION

- A. Install sleeve-seal fittings as new walls and slabs are constructed.
- B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.
- C. Secure nailing flanges to concrete forms.
- D. Using grout or silicone sealant, seal space around outside of sleeve-seal fittings.

3.05 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 - 1. Leak Test: After allowing for a full cure, test sleeves and sleeve seals for leaks. Repair leaks and retest until no leaks exist.
- B. Sleeves and sleeve seals will be considered defective if they do not pass tests and inspections.

3.06 SLEEVE AND SLEEVE-SEAL SCHEDULE

- A. Use sleeves and sleeve seals for the following piping-penetration applications:
 - 1. Exterior Concrete Walls Above Grade:
 - a. Piping Smaller Than NPS 6: Steel pipe sleeves.
 - 2. Concrete Slabs Above Grade:
 - a. Piping Smaller Than NPS 6: Steel pipe sleeves.

3. Interior Partitions:
 - a. Piping Smaller Than NPS 6: Steel pipe sleeves.

END OF SECTION

SECTION 23 05 18
ESCUTCHEONS FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide escutcheons and floor plates as indicated and in compliance with Contract Documents.

1.02 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.

1.03 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 ESCUTCHEONS:

- A. One-Piece, Stainless-Steel Type: With polished stainless-steel finish.
- B. One-Piece, Cast-Brass Type: With chrome-plated finish and setscrew fastener.
- C. One-Piece, Stamped-Steel Type: With polished, chrome-plated finish and spring-clip fasteners.
- D. Split-Plate, Stamped-Steel Type: With polished, chrome-plated finish; hinge; and spring-clip fasteners.

2.02 FLOOR PLATES:

- A. Split Floor Plates: Steel with concealed hinge.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.
- B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.

1. Escutcheons for New Piping:

- a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep pattern.
 - b. Insulated Piping: One-piece stainless steel with polished stainless-steel finish.
 - c. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece stainless steel with polished stainless-steel finish.
 - d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece stamped steel or split-plate, stamped steel with hinge with polished, chrome-plated finish.
 - e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece stainless steel with polished stainless-steel finish.
 - f. Bare Piping in Unfinished Service Spaces: One-piece stainless steel with polished stainless-steel finish.
 - g. Bare Piping in Equipment Rooms: One-piece stainless steel with polished stainless-steel finish.
- C. Install floor plates for piping penetrations of equipment-room floors.
 - D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
 - 1. New Piping: Split floor plate.

3.02 FIELD QUALITY CONTROL:

- A. Using new materials, replace broken and damaged escutcheons and floor plates.

3.03 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 19

METERS AND GAUGES FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide meters and gauges for HVAC piping as indicated and in compliance with Contract Documents.
 - 1. Bimetallic-actuated thermometers
 - 2. Liquid-in-glass thermometers
 - 3. Duct-thermometer mounting brackets
 - 4. Thermowells
 - 5. Dial-type pressure gauges
 - 6. Gauge attachments
 - 7. Flowmeters

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. B1.1: Unified Inch Screw Threads
 - 2. B1.20.1: Pipe Threads, General Purpose (Inch)
 - 3. B40.100: Pressure Gauges and Gauge Attachments
 - 4. B40.200: Thermometers, Direct Reading and Remote Reading

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.
- C. Shop Drawings:
 - 1. Include diagrams for power, signal, and control wiring.
- D. Product Certificates: For each type of meter and gauge.

- E. Operation and Maintenance Data: For meters and gauges to include in operation and maintenance manuals.
- 1.04 SUSTAINABLE DESIGN:
 - A. Comply with the requirements specified in Section 01 81 13.01.
- 1.05 SPARE PARTS:
 - A. Comply with the requirements specified in Section 01 61 00.
- 1.06 QUALITY ASSURANCE:
 - A. Comply with the requirements specified in Section 01 43 00.
- 1.07 DELIVERY STORAGE AND HANDLING:
 - A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

- 2.01 BIMETALLIC-ACTUATED THERMOMETERS:
 - A. Manufacturers:
 - 1. Terice
 - 2. Ashcroft
 - 3. Winters
 - 4. Marsh
 - B. Standard: ASME B40.200.
 - C. Case: Liquid-filled and sealed type(s); stainless steel with 3-inch nominal diameter.
 - D. Dial: Nonreflective aluminum with permanently etched scale markings and scales in degrees F.
 - E. Connector Type(s): Union joint, adjustable angle, with unified-inch screw threads.
 - F. Connector Size: 1/2 inch, with ASME B1.1 screw threads.
 - G. Stem: 0.25 or 0.375 inch in diameter; stainless steel.
 - H. Window: Plain glass or plastic.
 - I. Ring: Stainless steel.

- J. Element: Bimetal coil.
- K. Pointer: Dark-colored metal.
- L. Accuracy: Plus or minus 1 percent of scale range.

2.02 LIQUID-IN-GLASS THERMOMETERS:

- A. Metal-Case, Compact-Style, Liquid-in-Glass Thermometers:
 - 1. Terrice
 - 2. Ashcroft
 - 3. Winters
 - 4. Marsh
- B. Standard: ASME B40.200.
- C. Case: Cast aluminum; 6-inch nominal size.
- D. Case Form: Straight unless otherwise indicated.
- E. Tube: Glass with magnifying lens and blue or red organic liquid.
- F. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in degrees F.
- G. Window: Glass or plastic.
- H. Stem: Aluminum or brass and of length to suit installation.
 - 1. Design for Air-Duct Installation: With ventilated shroud.
 - 2. Design for Thermowell Installation: Bare stem.
- I. Connector: 3/4 inch, with ASME B1.1 screw threads.
- J. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.

2.03 DUCT-THERMOMETER MOUNTING BRACKETS:

- A. Description: Flanged bracket with screw holes, for attachment to air duct and made to hold thermometer stem.

2.04 THERMOWELLS:

A. Thermowells:

1. Standard: ASME B40.200.
2. Description: Pressure-tight, socket-type fitting made for insertion in piping tee fitting.
3. Material for Use with Copper Tubing: CNR or CUNI.
4. Material for Use with Steel Piping: CRES.
5. Type: Stepped shank unless straight or tapered shank is indicated.
6. External Threads: NPS 1/2, NPS 3/4, or NPS 1, ASME B1.20.1 pipe threads.
7. Internal Threads: 1/2, 3/4, and 1 inch, with ASME B1.1 screw threads.
8. Bore: Diameter required to match thermometer bulb or stem.
9. Insertion Length: Length required to match thermometer bulb or stem.
10. Lagging Extension: Include on thermowells for insulated piping and tubing.
11. Bushings: For converting size of thermowell's internal screw thread to size of thermometer connection.

B. Heat-Transfer Medium: Mixture of graphite and glycerin.

2.05 DIAL-TYPE PRESSURE GAUGES:

A. Direct-Mounted, Metal-Case, Dial-Type Pressure Gauges:

1. Manufacturers:
 - a. Trerice
 - b. Ashcroft
 - c. Weiss
 - d. Marsh
2. Standard: ASME B40.100.
3. Case: Sealed type(s); cast aluminum or drawn steel; 4-1/2-inch nominal diameter.
4. Gasketed pressure relief back with solid front.

5. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
6. Diaphragm assembly for corrosive service.
7. Snubber for pulsating operation.
8. Oil filled for high vibration applications.
9. Pressure Connection: Brass, with ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
10. Movement: Mechanical, with link to pressure element and connection to pointer.
11. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi.
12. Pointer: Dark-colored metal.
13. Window: Glass.
14. Ring: Brass or Stainless steel.
15. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.

2.06 GAUGE ATTACHMENTS:

- A. Snubbers: ASME B40.100, brass; ASME B1.20.1 pipe threads and piston surge-dampening device. Include extension for use on insulated piping.
- B. Siphons: Loop-shaped section of stainless-steel pipe.
- C. Valves: Brass ball, with ASME B1.20.1 pipe threads.

2.07 FLOWMETERS

- A. Turbine Flowmeters:
 1. Manufacturers:
 - a. Terice
 - b. Ashcroft
 - c. Weiss
 - d. Marsh
 2. Standard: ASME B40.100.

3. Flow Range: Sensor and indicator shall cover operating range of equipment or system served.
4. Sensor: Impeller turbine; for inserting in pipe fitting or for installing in piping and measuring flow directly in gallons per minute.
5. Design: Device or pipe fitting with inline turbine and integral direct-reading scale for water.
6. Construction: Bronze or stainless-steel body, with plastic turbine or impeller.
7. Minimum Pressure Rating: 150 psig.
8. Minimum Temperature Rating: 180 deg F.
9. Indicator: Hand-held meter; either an integral part of sensor or a separate meter.
10. Accuracy: Plus or minus 1-1/2 percent.
11. Display: Shows rate of flow, with register to indicate total volume in gallons.
12. Operating Instructions: Include complete instructions with each flowmeter.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install thermowells with socket extending a minimum of one-third of pipe diameter and in vertical position in piping tees.
- B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.
- C. Install thermowells with extension on insulated piping.
- D. Fill thermowells with heat-transfer medium.
- E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.
- F. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.
- G. Install duct-thermometer mounting brackets in walls of ducts. Attach to duct with screws.

- H. Install direct-mounted pressure gauges in piping tees with pressure gauge located on pipe at the most readable position.
 - I. Install remote-mounted pressure gauges on panel.
 - J. Install valve and snubber in piping for each pressure gauge for fluids.
 - K. Assemble and install connections, tubing, and accessories between flow-measuring elements and flowmeters according to manufacturer's written instructions.
 - L. Install permanent indicators on walls or brackets in accessible and readable positions.
 - M. Install connection fittings in accessible locations for attachment to portable indicators.
 - N. Install thermometers in the following locations:
 - 1. Inlet and outlet of each hydronic zone.
 - 2. Inlet and outlet of each hydronic boiler.
 - 3. Two inlets and two outlets of each chiller.
 - 4. Inlet and outlet of each hydronic coil in air-handling units.
 - 5. Inlet and outlet of each thermal-storage tank.
 - 6. Other locations as indicated.
 - O. Install pressure gauges in the following locations:
 - 1. Discharge of each pressure-reducing valve.
 - 2. Inlet and outlet of each chiller chilled-water and condenser-water connection.
 - 3. Suction and discharge of each pump.
- 3.02 CONNECTIONS:
- A. Install meters and gauges adjacent to machines and equipment to allow space for service and maintenance of meters, gauges, machines, and equipment.
- 3.03 ADJUSTING:
- A. After installation, calibrate meters according to manufacturer's written instructions.
 - B. Adjust faces of meters and gauges to proper angle for best visibility.

3.04 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 23.12

BALL VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide ball valves for HVAC piping as indicated and in compliance with Contract Documents.

- 1. Brass ball valves

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):

- 1. B1.20.1: Pipe Threads, General Purpose (Inch)
 - 2. B16.1: Pipe Flanges and Fittings
 - 3. B16.5: Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24 Metric/Inch Standard
 - 4. B16.10: Face-to-Face and End-to-End Dimensions of Valves
 - 5. B16.18: Cast Copper Alloy Solder Joint Pressure Fittings
 - 6. B16.34: Valves – Flanged, Threaded, and Welding End
 - 7. B31.1: Power Piping
 - 8. B31.9: Building Services Piping

- B. ASTM International (ASTM):

- 1. A126: Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings

- C. Manufacturers' Standardization Society (MSS):

- 1. SP-45: Bypass and Drain Connections
 - 2. SP-72: Ball Valves with Flanged for Butt-Welding Ends for General Service
 - 3. SP-110: Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends

1.03 DEFINITIONS:

- A. CWP: Cold working pressure
- B. SWP: Steam working pressure

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of valve.

1.05 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.08 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Prepare valves for shipping as follows:
 - 1. Protect internal parts against rust and corrosion.
 - 2. Protect threads, flange faces, and weld ends.
 - 3. Set ball valves open to minimize exposure of functional surfaces.
- C. Use the following precautions during storage:
 - 1. Maintain valve end protection.
 - 2. Store valves indoors and maintain at higher-than-ambient-dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
- D. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use operating handles or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR VALVES:

- A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.
- B. ASME Compliance:
 - 1. ASME B1.20.1 for threads for threaded-end valves.
 - 2. ASME B16.1 for flanges on iron valves.
 - 3. ASME B16.5 for flanges on steel valves.
 - 4. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
 - 5. ASME B31.1 for power piping valves.
 - 6. ASME B31.9 for building services piping valves.
- C. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.
- D. Refer to HVAC valve schedule articles for applications of valves.
- E. Valve Pressure-Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- F. Valve Sizes: Same as upstream piping unless otherwise indicated.
- G. Valve Actuator Types:
 - 1. Hand lever: Zinc plated carbon steel with vinyl insulator.
- H. Valves in Insulated Piping:
 - 1. Include 2-inch stem extensions.
 - 2. Extended operating handle of nonthermal-conductive material, and protective sleeves that allow operation of valves without breaking the vapor seals or disturbing insulation.
 - 3. Memory stops that are fully adjustable after insulation is applied.
- I. Valve Bypass and Drain Connections: MSS SP-45.

2.02 BRASS BALL VALVES:

A. Brass Ball Valves, Two-Piece with Full Port and Brass Trim, Threaded Ends:

1. Manufacturers:
 - a. Kitz Corporation
 - b. Toyo
 - c. MAS
 - d. Nibco
 - e. Watts
2. Description:
 - a. Standard: MSS SP-110
 - b. SWP Rating: 150 psig
 - c. CWP Rating: 600 psig
 - d. Body Design: Two piece
 - e. Body Material: Forged brass
 - f. Ends: Threaded
 - g. Seats: PTFE
 - h. Stem: Brass
 - i. Ball: Chrome-plated brass
 - j. Port: Full

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
- B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

- C. Examine threads on valve and mating pipe for form and cleanliness.
- D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- E. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE INSTALLATION:

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install valve tags. Comply with requirements in Section 23 05 53 for valve tags and schedules.

3.03 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS:

- A. If valves with specified SWP classes or CWP ratings are unavailable, the same types of valves with higher SWP classes or CWP ratings may be substituted.
- B. Select valves with the following end connections:
 - 1. For Copper Tubing, NPS 2 and Smaller: Threaded ends.
 - 2. For Copper Tubing, NPS 2-1/2 to NPS 4: Threaded.
 - 3. For Steel Piping, NPS 2 and Smaller: Threaded ends.
 - 4. For Steel Piping, NPS 2-1/2 to NPS 4: Threaded ends.
 - 5. For Steel Piping, NPS 5 and Larger: Flanged ends.

3.04 CHILLED-WATER VALVE SCHEDULE:

- A. Brass ball valves, two piece, with brass trim, full port, threaded ends.

3.05 HEATING-WATER VALVE SCHEDULE:

- A. Brass ball valves, two piece, with brass trim, full port, threaded ends.

3.06 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 23.13

BUTTERFLY VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide butterfly valves for HVAC piping as indicated and in compliance with Contract Documents. The document includes building HVAC butterfly valves.
 - 1. Iron, single-flange butterfly valves
 - 2. Iron, grooved-end butterfly valves
 - 3. Chainwheels

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. B16.1: Pipe Flanges and Fittings
 - 2. B16.5: Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24 Metric/Inch Standard
 - 3. B16.10: Face-to-Face and End-to-End Dimensions of Valves
 - 4. B16.34: Valves – Flanged, Threaded, and Welding End
 - 5. B31.1: Power Piping
 - 6. B31.9: Building Services Piping
- B. ASTM International (ASTM):
 - 1. A126: Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
 - 2. A536: Standard Specification for Ductile Iron Castings
- C. American Water Works Association (AWWA):
 - 1. C606: Grooved and Shouldered Joints
- D. Manufacturers' Standardization Society (MSS):
 - 1. SP-67: Butterfly Valves

2. SP-68: High Pressure Butterfly Valves with Offset Design

1.03 DEFINITIONS:

- A. CWP: Cold working pressure
- B. EPDM: Ethylene propylene copolymer rubber

1.04 SUBMITTALS:

- A. Submit the shop drawings in accordance with Section 01 33 00.
- B. Detailed Product Data: For each type of valve.

1.05 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.08 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Prepare valves for shipping as follows:
 - 1. Protect internal parts against rust and corrosion.
 - 2. Protect threads, flange faces, grooves, and weld ends.
 - 3. Set butterfly valves closed or slightly open.
- C. Use the following precautions during storage:
 - 1. Maintain valve end protection.
 - 2. Store valves indoors and maintain at higher-than-ambient-dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
- D. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR VALVES:

- A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.
- B. ASME Compliance:
 - 1. ASME B16.1 for flanges on iron valves
 - 2. ASME B16.5 for pipe flanges and flanged fittings, NPS 1/2 through NPS 24
 - 3. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria
 - 4. ASME B31.1 for power piping valves
 - 5. ASME B31.9 for building services piping valves
- C. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.
- D. Valve Pressure-Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- E. Valve Sizes: Same as upstream piping unless otherwise indicated.
- F. Valve Actuator Types:
 - 1. Gear Actuator: For valves NPS 8 and larger (Manual override)
 - 2. Hand-lever: For valves NPS 6 and smaller (Manual override)
 - 3. Chainwheel: Device for attachment to gear, stem, or other actuator of size and with chain for mounting height. Attached to all valves located higher than 7 feet.
- G. Valves in Insulated Piping: With 2-inch stem extensions with extended necks.

2.02 IRON, SINGLE-FLANGE BUTTERFLY VALVES:

- A. Building Systems: Iron, Single-Flange Butterfly Valves with Aluminum-Bronze Disc:
 - 1. Manufacturers:
 - a. Kitz Corporation
 - b. Apollo
 - c. NIBCO, Inc.

- d. Keystone
 - e. Toyo
 - f. Tyco Grinnell
 - g. MAS
 - h. DeZURIK
 - i. Watts
2. Description:
- a. Standard: MSS SP-67, Type I
 - b. CWP Rating: 200 psig
 - c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.
 - d. Body Material: ASTM A126, cast iron or ASTM A536, ductile iron
 - e. Seat: EPDM
 - f. Stem: One- or two-piece stainless steel
 - g. Disc: Aluminum bronze

2.03 IRON, GROOVED-END BUTTERFLY VALVES,

A. Description:

- 1. Standard: MSS SP-67, Type I.
- 2. CWP Rating: 175 psig.
- 3. Body Material: Coated, ductile iron.
- 4. Stem: Two-piece stainless steel.
- 5. Disc: Coated, ductile iron.
- 6. Seal: EPDM.

2.04 CHAINWHEELS:

- A. Description: Valve actuation assembly with sprocket rim, chain guides, chain, and attachment brackets for mounting chainwheels directly to hand wheels.
 - 1. Sprocket Rim with Chain Guides: Ductile or cast iron, of type and size required for valve. Include zinc or epoxy coating.
 - 2. Chain: Hot-dip, galvanized steel, of size required to fit sprocket rim.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
- B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.
- C. Examine mating flange faces for damage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- D. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE INSTALLATION:

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install chainwheels on operators for butterfly valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor.
- F. Install valve tags. Comply with requirements in Section 23 05 53 for valve tags and schedules.

3.03 ADJUSTING:

- A. Adjust if required.

- B. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.04 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 23.14

CHECK VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide check valves for HVAC piping as indicated and in compliance with Contract Documents.
- B. Section Includes:
 - 1. Bronze lift check valves
 - 2. Bronze swing check valves
 - 3. Iron swing check valves

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. B1.20.1: Pipe Threads, General Purpose
 - 2. B16.1: Pipe Flanges and Fittings
 - 3. B16.10: Face-to-Face and End-to-End Dimensions of Valves
 - 4. B16.18: Cast Copper Alloy Solder Joint Pressure Fittings
 - 5. B16.34: Valves – Flanged, Threaded, and Welding End
- B. ASTM International (ASTM):
 - 1. A126: Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
 - 2. A395: Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures
 - 3. A536: Standard Specification for Ductile Iron Castings
 - 4. B61: Standard Specification for Steam or Valve Bronze Castings
 - 5. B62: Standard Specification for Composition Bronze or Ounce Metal Castings

C. American Water Works Association (AWWA):

1. C606: Grooved and Shouldered Joints

D. Manufacturers' Standardization Society (MSS):

1. SP-45: Bypass and Drain Connections

2. SP-71: Gray Iron Swing Check Valves, Flanged and Threaded Ends

3. SP-80: Bronze Gate, Globe, Angle, and Check Valves

4. SP-125: Check Valves: Gray Iron and Ductile Iron, In-Line, Spring-Loaded, Center-Guided

1.03 DEFINITIONS:

A. CWP: Cold working pressure.

B. EPDM: Ethylene propylene copolymer rubber.

C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of valve.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in Section 01 66 10.

B. Prepare valves for shipping as follows:

1. Protect internal parts against rust and corrosion.

2. Protect threads, flange faces, grooves, and weld ends.

3. Block check valves in either closed or open position.
- C. Use the following precautions during storage:
1. Maintain valve end protection.
 2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
- D. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR VALVES:

- A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.
- B. ASME Compliance:
1. ASME B1.20.1 for threads for threaded-end valves
 2. ASME B16.1 for flanges on iron valves
 3. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria
- C. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.
- D. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.
- E. Valve Pressure-Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- F. Valve Sizes: Same as upstream piping unless otherwise indicated.
- G. Valve Bypass and Drain Connections: MSS SP-45.

2.02 BRONZE LIFT CHECK VALVES:

- A. Bronze Lift Check Valves with Bronze Disc, Class 125:
1. Manufacturers:
 - a. Toyo
 - b. Jenkins Valves

- c. Crane
 - d. Kitz Corporation
 - e. Milwaukee Valve Company
 - f. Watts
 - g. NIBCO
2. Description:
- a. Standard: MSS SP-80, Type 1
 - b. CWP Rating: 200 psig
 - c. Body Design: Vertical flow
 - d. Body Material: ASTM B61 or ASTM B62, bronze
 - e. Ends: Threaded
 - f. Disc: Bronze

2.03 BRONZE SWING CHECK VALVES:

A. Bronze Swing Check Valves with Bronze Disc, Class 125:

1. Manufacturers:
- a. Toyo
 - b. Jenkins Valves
 - c. Crane
 - d. Kitz Corporation
 - e. Milwaukee Valve Company
 - f. Watts
 - g. NIBCO
2. Description:
- a. Standard: MSS SP-80, Type 3
 - b. CWP Rating: 200 psig

- c. Body Design: Horizontal flow
- d. Body Material: ASTM B62, bronze
- e. Ends: Threaded
- f. Disc: Bronze

2.04 IRON SWING CHECK VALVES:

A. Iron Swing Check Valves with Metal Seats, Class 125:

1. Manufacturers:

- a. Toyo
- b. Jenkins Valves
- c. Crane
- d. Kitz Corporation
- e. Milwaukee Valve Company
- f. Watts
- g. NIBCO

2. Description:

- a. Standard: MSS SP-71, Type I
- b. NPS 2-1/2 to NPS 12, CWP Rating: 200 psig
- c. NPS 14 to NPS 24, CWP Rating: 150 psig
- d. Body Design: Clear or full waterway
- e. Body Material: ASTM A126, gray iron with bolted bonnet
- f. Ends: Flanged
- g. Trim: Bronze
- h. Gasket: Asbestos free

B. Iron Swing Check Valves with Nonmetallic-to-Metal Seats, Class 125:

1. Manufacturers:

- a. Toyo
- b. Jenkins Valves
- c. Crane
- d. Kitz Corporation
- e. Milwaukee Valve Company
- f. Watts
- g. NIBCO

2. Description:

- a. Standard: MSS SP-71, Type I
- b. NPS 2-1/2 to NPS 12, CWP Rating: 200 psig
- c. NPS 14 to NPS 24, CWP Rating: 150 psig
- d. Body Design: Clear or full waterway
- e. Body Material: ASTM A126, gray iron with bolted bonnet
- f. Ends: Flanged
- g. Trim: Composition
- h. Seat Ring: Bronze
- i. Disc Holder: Bronze
- j. Disc: PTFE
- k. Gasket: Asbestos free

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

- B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.
- C. Examine threads on valve and mating pipe for form and cleanliness.
- D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- E. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE INSTALLATION:

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install check valves for proper direction of flow and as follows:
 - 1. Swing Check Valves: In horizontal position with hinge pin level.
 - 2. Center-Guided Check Valves: In horizontal or vertical position, between flanges.
 - 3. Lift Check Valves: With stem upright and plumb.
- F. Install valve tags. Comply with requirements for valve tags and schedules in Section 23 05 53.

3.03 ADJUSTING:

- A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.04 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS:

- A. If valve applications are not indicated, use the following:
 - 1. Pump-Discharge Check Valves:
 - a. NPS 2 and Smaller: Bronze swing check valves with bronze disc.
 - b. NPS 2-1/2 and Larger: Iron swing check valves with lever and weight or with spring or iron, center-guided, metal-seat check valves.

B. Select valves, with the following end connections:

1. For Copper Tubing, NPS 2 and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules.
2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules.
3. For Copper Tubing, NPS 5 and Larger: Flanged ends.
4. For Steel Piping, NPS 2 and Smaller: Threaded ends.
5. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules.
6. For Steel Piping, NPS 5 and Larger: Flanged ends.
7. For Grooved-End Copper Tubing and Steel Piping: Valve ends may be grooved.

3.05 CHILLED-WATER VALVE SCHEDULE:

A. Pipe NPS 2 and Smaller:

1. Bronze Valves: Threaded ends.
2. Bronze swing check valves with bronze disc, Class 125.

B. Pipe NPS 2-1/2 and Larger:

1. Iron swing check valves with metal seats, Class 125.
2. Iron, center-guided check valves metal seat, Class 125.

3.06 HEATING-WATER VALVE SCHEDULE:

A. Pipe NPS 2 and Smaller:

1. Bronze Valves: Threaded ends.
2. Bronze swing check valves with bronze disc, Class 125.

B. Pipe NPS 2-1/2 and Larger:

1. Iron swing check valves with metal seats, Class 125.
2. Iron, center-guided check valves metal seat, Class 125.

3.07 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 23.15

GATE VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide bronze gate valves, iron gate valves and chainwheels as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. B1.20.1: Pipe Threads, General Purpose
 - 2. B16.1: Pipe Flanges and Fittings
 - 3. B16.10: Face-to-Face and End-to-End Dimensions of Valves
 - 4. B16.18: Cast Copper Alloy Solder Joint Pressure Fittings
 - 5. B16.34: Valves – Flanged, Threaded, and Welding End
- B. ASTM International (ASTM):
 - 1. A126: Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
 - 2. B62: Standard Specification for Composition Bronze or Ounce Metal Castings
- C. American Water Works Association (AWWA):
 - 1. C606: Grooved and Shouldered Joints
- D. Manufacturers' Standardization Society (MSS):
 - 1. SP-45: Bypass and Drain Connections
 - 2. SP-70: Gray Iron Gate Valves, Flanged and Threaded Ends
 - 3. SP-80: Bronze Gate, Globe, Angle, and Check Valves

1.03 DEFINITIONS:

- A. CWP: Cold working pressure.

- B. NRS: Non-rising stem.
- C. OS&Y: Outside screw and yoke.
- D. RS: Rising stem.

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of valve.

1.05 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.08 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Prepare valves for shipping as follows:
 - 1. Protect internal parts against rust and corrosion.
 - 2. Protect threads, flange faces, grooves, and weld ends.
 - 3. Set gate valves closed to prevent rattling.
- C. Use the following precautions during storage:
 - 1. Maintain valve end protection.
 - 2. Store valves indoors and maintain at higher-than-ambient-dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
- D. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR VALVES:

- A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.
- B. ASME Compliance:
 - 1. ASME B1.20.1 for threads for threaded-end valves
 - 2. ASME B16.1 for flanges on iron valves
 - 3. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria
- C. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.
- D. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.
- E. Valve Pressure-Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- F. Valve Sizes: Same as upstream piping unless otherwise indicated.
- G. RS Valves in Insulated Piping: With 2-inch stem extensions.
- H. Valve Bypass and Drain Connections: MSS SP-45.

2.02 BRONZE GATE VALVES:

- A. Bronze Gate Valves, NRS, Class 125:
 - 1. Manufacturers:
 - a. Kitz Corporation
 - b. Toyo
 - c. Jenkins Valves
 - d. Crane
 - e. Milwaukee Valve Company
 - f. Watts
 - g. NIBCO

2. Description:
 - a. Standard: MSS SP-80, Type 1
 - b. CWP Rating: 200 psig
 - c. Body Material: ASTM B62, bronze with integral seat and screw-in bonnet
 - d. Ends: Threaded
 - e. Stem: Bronze
 - f. Disc: Solid wedge; bronze
 - g. Packing: Asbestos free
 - h. Handwheel: Malleable iron, bronze, or aluminum

B. Bronze Gate Valves, RS, Class 125:

1. Manufacturers:
 - a. Kitz Corporation
 - b. Toyo
 - c. Jenkins Valves
 - d. Crane
 - e. Milwaukee Valve Company
 - f. Watts
 - g. NIBCO
2. Description:
 - a. Standard: MSS SP-80, Type 1
 - b. CWP Rating: 200 psig
 - c. Body Material: ASTM B62, bronze with integral seat and screw-in bonnet
 - d. Ends: Threaded
 - e. Stem: Bronze
 - f. Disc: Solid wedge; bronze

- g. Packing: Asbestos free
- h. Handwheel: Malleable iron, bronze, or aluminum

2.03 IRON GATE VALVES:

A. Iron Gate Valves, NRS, Class 125:

1. Manufacturers:

- a. Kitz Corporation
- b. Toyo
- c. Jenkins Valves
- d. Crane
- e. Milwaukee Valve Company
- f. Watts
- g. NIBCO

2. Description:

- a. Standard: MSS SP-70, Type I
- b. NPS 2-1/2 to NPS 12, CWP Rating: 200 psig
- c. NPS 14 to NPS 24, CWP Rating: 150 psig
- d. Body Material: ASTM A126, gray iron with bolted bonnet
- e. Ends: Flanged
- f. Trim: Bronze
- g. Disc: Solid wedge
- h. Packing and Gasket: Asbestos free

2.04 CHAINWHEELS:

A. Description: Valve actuation assembly with sprocket rim, chain guides, chain, and attachment brackets for mounting chainwheels directly to hand wheels.

- 1. Sprocket Rim with Chain Guides: Ductile or cast iron, of type and size required for valve. Include zinc or epoxy coating.

2. Chain: Hot-dip-galvanized steel, of size required to fit sprocket rim.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
- B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.
- C. Examine threads on valve and mating pipe for form and cleanliness.
- D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- E. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE INSTALLATION:

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install chainwheels on operators for gate valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor.
- F. Install valve tags. Comply with requirements in Section 23 05 53 for valve tags and schedules.

3.03 ADJUSTING:

- A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.04 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS:

- A. If valve applications are not indicated, use the following:
 1. Shutoff Service: Gate valves.

- B. If valves with specified SWP classes or CWP ratings are unavailable, the same types of valves with higher SWP classes or CWP ratings may be substituted.
- C. Select valves with the following end connections:
 - 1. For Copper Tubing, NPS 2 and Smaller: Threaded ends, except where solder-joint valve-end option is indicated in valve schedules below.
 - 2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged ends, except where threaded valve-end option is indicated in valve schedules below.
 - 3. For Copper Tubing, NPS 5 and Larger: Flanged ends.
 - 4. For Steel Piping, NPS 2 and Smaller: Threaded ends.
 - 5. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends, except where threaded valve-end option is indicated in valve schedules below.
 - 6. For Steel Piping, NPS 5 and Larger: Flanged ends.
 - 7. For Grooved-End Copper Tubing and Steel Piping: Valve ends may be grooved.

3.05 CHILLED-WATER VALVE SCHEDULE:

- A. Pipe NPS 2 and Smaller: Bronze valves, RS, Class 125, with threaded ends.
- B. Pipe NPS 2-1/2 and Larger: Iron gate valves, OS&Y, Class 125.

3.06 HEATING-WATER VALVE SCHEDULE:

- A. Pipe NPS 2 and Smaller: Bronze valves, RS, Class 125, with threaded ends.
- B. Pipe NPS 2-1/2 and Larger: Iron gate valves, OS&Y, Class 125.

3.07 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 29

HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide hangers and supports for HVAC piping and equipment as indicated and in compliance with Contract Documents.
- B. Section Includes:
 - 1. Metal pipe hangers and supports
 - 2. Trapeze pipe hangers
 - 3. Metal framing systems
 - 4. Thermal-hanger shield inserts
 - 5. Fastener systems
 - 6. Pipe stands
 - 7. Equipment supports

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. ASME Boiler and Pressure Vessel Code, Section IX
 - 2. B31.9: Building Services Piping
- B. ASTM International (ASTM):
 - 1. A36: Standard Specification for Structural Steel
 - 2. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
 - 3. A780: Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings

4. A1011: Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability
5. B221: Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes
6. C552: Standard Specification for Cellular Glass Thermal Insulation
7. C591: Standard Specification for Unfaced Preformed Rigid Cellular Polyisocyanurate Thermal Insulation
8. C1107: Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Non-shrink)
9. D635: Standard Test Method for Rate of Burning and/or Extent of Burning of Plastics in a Horizontal Position
10. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

C. American Welding Society (AWS):

1. D1.1: Structural Welding Code

D. Metal Framing Manufacturer's Association (MFMA):

1. 4: Metal Framing Standards
2. 103: Guidelines for the Use of Metal Framing

E. Manufacturers' Standardization Society (MSS):

1. SP-58: Pipe Hangers and Supports - Materials and Design

F. Underwriters' Laboratories, Inc. (UL):

1. 94: Standard for Safety Tests for Flammability of Plastic Materials for Parts in Devices and Appliances

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.

- C. Shop Drawings: Signed and sealed by a qualified Professional Engineer. Show fabrication and installation details and include calculations for the following; include Product Data for components:
 - 1. Trapeze pipe hangers
 - 2. Metal framing systems
 - 3. Pipe stands
 - 4. Equipment supports
 - D. Delegated-Design Submittal: For trapeze hangers indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - 1. Detail fabrication and assembly of trapeze hangers.
 - 2. Include design calculations for designing trapeze hangers.
 - E. Welding certificates.
- 1.04 SUSTAINABLE DESIGN:
- A. Comply with the requirements specified in Section 01 81 13.01.
- 1.05 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
- 1.06 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
 - B. Structural-Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."
 - C. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code, Section IX.
- 1.07 DELIVERY STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 43 00, to design trapeze pipe hangers and equipment supports.
- B. Structural Performance: Hangers and supports for HVAC piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.
 - 1. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
 - 2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
 - 3. Design seismic-restraint hangers and supports for piping and equipment and obtain approval from authorities having jurisdiction.

2.02 METAL PIPE HANGERS AND SUPPORTS:

- A. Carbon-Steel Pipe Hangers and Supports:
 - 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 - 2. Galvanized Metallic Coatings: Pre-galvanized, hot-dip galvanized, or electro-galvanized.
 - 3. Nonmetallic Coatings: Plastic coated, or epoxy powder-coated.
 - 4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 - 5. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
- B. Stainless-Steel Pipe Hangers and Supports:
 - 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 - 2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 - 3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.
- C. Copper Pipe and Tube Hangers:
 - 1. Description: MSS SP-58, Types 1 through 58, copper-plated steel, factory-fabricated components.

2. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

2.03 TRAPEZE PIPE HANGERS:

- A. Description: MSS SP-58, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.04 METAL FRAMING SYSTEMS:

- A. MFMA Manufacturer Metal Framing Systems:

1. Description: Shop- or field-fabricated, pipe-support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.
2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
3. Channels: Continuous slotted carbon-steel channel with inturred lips.
4. Channel Width: Selected for applicable load criteria.
5. Channel Nuts: Formed or stamped nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
7. Metallic Coating: Hot-dip galvanized.

2.05 THERMAL-HANGER SHIELD INSERTS:

- A. Insulation-Insert Material for Cold Piping: ASTM C552, Type II cellular glass with 100-psi or ASTM C591, Type VI, Grade 1 polyisocyanurate with 125-psi minimum compressive strength and vapor barrier.
- B. Insulation-Insert Material for Hot Piping: ASTM C552, Type II cellular glass with 100-psi or ASTM C591, Type VI, Grade 1 polyisocyanurate with 125-psi minimum compressive strength.
- C. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.
- D. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.
- E. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.06 FASTENER SYSTEMS:

- A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
- B. Mechanical-Expansion Anchors: Insert-wedge-type anchors for use in hardened Portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
 - 1. Indoor Applications: Stainless steel
 - 2. Outdoor Applications: Stainless steel

2.07 PIPE STANDS:

- A. General Requirements for Pipe Stands: Shop- or field-fabricated assemblies made of manufactured corrosion-resistant components.
- B. Compact Pipe Stand:
 - 1. Description: Single base unit with integral-rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
 - 2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate
 - 3. Hardware: Galvanized steel or polycarbonate
 - 4. Accessories: Protection pads
- C. Low-Profile, Single Base, Single-Pipe Stand:
 - 1. Description: Single base with vertical and horizontal members, and pipe support, for roof installation without membrane protection.
 - 2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate
 - 3. Vertical Members: Two, galvanized steel, continuous-thread 1/2-inch rods
 - 4. Horizontal Member: Adjustable horizontal, galvanized steel pipe support channels
 - 5. Pipe Supports: Strut clamps
 - 6. Hardware: Galvanized steel
 - 7. Accessories: Protection pads
 - 8. Height: 12 inches

D. High-Profile, Multiple-Pipe Stand:

1. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
2. Bases: Two or more; vulcanized rubber
3. Vertical Members: Two or more, galvanized steel channels
4. Horizontal Members: One or more, adjustable height, galvanized steel pipe support
5. Pipe Supports: Strut clamps
6. Hardware: Galvanized steel
7. Height: 36 inches

E. Curb-Mounted-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.

2.08 EQUIPMENT SUPPORTS:

- A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.

2.09 MATERIALS:

- A. Aluminum: ASTM B221
- B. Carbon Steel: ASTM A1011
- C. Structural Steel: ASTM A36, carbon-steel plates, shapes, and bars; galvanized
- D. Stainless Steel: ASTM A240
- E. Threaded Rods: Continuously threaded. Zinc-plated or galvanized steel for indoor applications and stainless steel for outdoor applications. Mating nuts and washers of similar materials as rods.
- F. Grout: ASTM C1107, factory-mixed and -packaged, dry, hydraulic-cement, non-shrink and non-metallic grout; suitable for interior and exterior applications.
1. Properties: Non-staining, non-corrosive, and non-gaseous
 2. Design Mix: 5000-psi, 28-day compressive strength

PART 3 - EXECUTION

3.01 APPLICATION:

- A. Comply with requirements in Section 07 84 for firestopping materials and installation for penetrations through fire-rated walls, ceilings, and assemblies.
- B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 pounds.

3.02 HANGER AND SUPPORT INSTALLATION:

- A. Metal Pipe-Hanger Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.
- B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-58. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
 - 1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
 - 2. Field fabricate from ASTM A36, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1.
- C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled strut systems.
- D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.
- E. Fastener System Installation:
 - 1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
 - 2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.
- F. Pipe Stand Installation:
 - 1. Pipe Stand Types except Curb-Mounted Type: Assemble components and mount on smooth surface.

2. Curb-Mounted-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. See Section 07 72 00 for curbs.
- G. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- H. Equipment Support Installation: Fabricate from welded-structural-steel shapes.
- I. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- J. Install lateral bracing with pipe hangers and supports to prevent swaying.
- K. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
- L. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.
- M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.
- N. Insulated Piping:
 1. Attach clamps and spacers to piping.
 - a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
 - b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
 - c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
 2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
 - a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
 - a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
 - a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick
 - b. NPS 4: 12 inches long and 0.06 inch thick
 - c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick
 - d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick
 - e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick
5. Pipes NPS 8 and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.
6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.03 EQUIPMENT SUPPORTS:

- A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.
- B. Grouting: Place grout under supports for equipment and make bearing surface smooth.
- C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.04 METAL FABRICATIONS:

- A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.
- B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
- C. Field Welding: Comply with AWS D1.1 procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:
 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.

3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.05 ADJUSTING:

- A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
- B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.06 PAINTING:

- A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
 1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.
- B. Touchup: Comply with requirements in Section 099600 Coatings for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.
- C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

3.07 HANGER AND SUPPORT SCHEDULE:

- A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Comply with MSS SP-58 for pipe-hanger selections and applications that are not specified in piping system Sections.
- C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.
- D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.
- E. Use carbon-steel pipe hangers and supports metal trapeze pipe hangers and metal framing systems and attachments for general service applications.
- F. Use stainless-steel pipe hangers and stainless-steel attachments for hostile environment applications:
 1. Chemical Storage

- G. Use copper-plated pipe hangers and stainless-steel attachments for copper piping and tubing.
- H. Use padded hangers for piping that is subject to scratching.
- I. Use thermal-hanger shield inserts for insulated piping and tubing.
- J. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
 - 1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated or insulated, stationary pipes NPS 1/2 to NPS 30.
 - 2. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes NPS 3/4 to NPS 36, requiring clamp flexibility and up to 4 inches of insulation.
 - 3. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.
 - 4. Pipe Hangers (MSS Type 5): For suspension of pipes NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.
 - 5. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of non-insulated, stationary pipes NPS 3/4 to NPS 8.
 - 6. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.
 - 7. Adjustable Band Hangers (MSS Type 9): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.
 - 8. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.
 - 9. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of non-insulated, stationary pipes NPS 3/8 to NPS 8.
 - 10. Extension Hinged or Two-Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated, stationary pipes NPS 3/8 to NPS 3.
 - 11. U-Bolts (MSS Type 24): For support of heavy pipes NPS 1/2 to NPS 30.
 - 12. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
 - 13. Pipe Saddle Supports (MSS Type 36): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.

14. Pipe Stanchion Saddles (MSS Type 37): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.
 15. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.
 16. Single-Pipe Rolls (MSS Type 41): For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction might occur.
 17. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction might occur.
 18. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is unnecessary.
 19. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is unnecessary.
 20. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.
- K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.
 2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.
- L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
 2. Steel Clevises (MSS Type 14): For 120 to 450 degrees F piping installations.
 3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
 4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.

5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 degrees F piping installations.
- M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
 2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.
 3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
 4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
 5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
 6. C-Clamps (MSS Type 23): For structural shapes.
 7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
 8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
 9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
 10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
 11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
 12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
 - a. Light (MSS Type 31): 750 pounds
 - b. Medium (MSS Type 32): 1500 pounds
 - c. Heavy (MSS Type 33): 3000 pounds
 13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.

14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
 15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.
- N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
 2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
 3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.
- O. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
 2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
 3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
 4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
 5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
 6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
 7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.
 8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected

equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:

- a. Horizontal (MSS Type 54): Mounted horizontally
 - b. Vertical (MSS Type 55): Mounted vertically
 - c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member
- P. Comply with MSS SP-58 for trapeze pipe-hanger selections and applications that are not specified in piping system sections.
- Q. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system sections.
- R. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.
- 3.08 CLOSEOUT ACTIVITIES:
- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 48

VIBRATION ISOLATION AND SEISMIC CONTROL

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide vibration isolation and seismic control as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. ASTM International (ASTM):
 - 1. A36: Standard Specification for Carbon Structural Steel
 - 2. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements
- B. Conform to latest edition of CSA W59 for welding.
- C. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):
 - 1. Seismic Restraint Manual; Guidelines for Mechanical Systems
 - 2. HVAC Duct Construction Standards Metal and Flexible
- D. Vibration Isolation and Seismic Control Manufacturers Association (VISCMA).

1.03 DEFINITIONS:

- A. AHJ: Authority Having Jurisdiction
- B. EPDM: Ethylene-Propylene-Diene Monomer
- C. Withstand: Unit will remain in place without separation of any parts from the device when subjected to seismic forces specified.

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and

ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1. Seismic-Restraint Details:

- a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.
- b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.
- c. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.
- d. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

2. Seismic Qualification Certificates:

- a. For pumps, accessories, and components, from manufacturer.
 - (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- b. For steel water storage tanks, accessories, and components, from manufacturer.
 - (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

- c. For hydronic piping, accessories, and components, from manufacturer.
 - (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - (2) Detailed description of piping anchorage devices on which the certification is based and their installation requirements.
- d. For air handling units and energy recovery units, accessories, and components, from manufacturer.
 - (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- e. Hot water heaters, accessories, and components, from manufacturer.
 - (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- f. For chillers, accessories, and components, from manufacturer.
 - (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Shop Drawings, Vibration Isolators:

- 1. Complete set of approved shop drawings of mechanical equipment, piping, and ductwork equipment which is to be isolated.

2. Include, as a minimum, basic equipment layout, length and width, installed operating weights of equipment to be isolated and distribution of weight at isolation points.
3. Product Data:
 - a. Manufacturer's product data including details of materials, construction, dimensions of individual components, installation details, and finishes.
 - b. Schedule of vibration isolator type with location and static and dynamic load on each.
 - c. Vibration Isolation Base Details:
 - (1) Detail fabrication, including anchorages and attachments to structure and to supported equipment.
 - (2) Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment, and cantilever loads.

D. Shop Drawings, Seismic Control Components:

1. Complete set of approved shop drawings of mechanical equipment, piping, and ductwork equipment that is to be seismically restrained.
2. Include, as a minimum, basic equipment layout, length and width, installed operating weights of equipment to be isolated and distribution of weight at isolation points.
3. Signed and sealed by a licensed Professional Engineer licensed registered in the State of Utah.
4. Calculations (including combining shear and tensile loads) to support seismic restraint designs shall be signed and sealed by a qualified registered Professional Engineer.
5. Include, as a minimum, a tabulation of design data for each snubber, including specific anchorage details.
6. Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.
7. Product Data:
 - a. Manufacturer's product data including details of materials, construction, dimensions of individual components, installation details, and finishes.

- b. Schedule of seismic control component type with location and static and dynamic load on each.
 - c. Interlocking Snubbers: Include load deflection curves up to 1/2-inch deflection in x, y, and z planes.
- E. Manufacturer's Installation Instructions: Indicate special procedures and setting dimensions.
- F. Certifications:
 - 1. Manufacturer's Certificate of Compliance, in accordance with Section 01 33 00.
 - 2. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 33 00.
 - 3. Welding Certificates: Copies of certificates for welding procedures and personnel.
 - 4. Manufacturer's Seismic Certification: Certification that specified equipment will withstand earthquake forces. Include the following:
 - a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.
 - b. Dimensioned Outline Drawing of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - c. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.
- 1.05 SUSTAINABLE DESIGN:
 - A. Comply with the requirements specified in Section 01 81 13.01.
- 1.06 EXTRA MATERIALS:
 - A. Furnish extra materials described below which match products installed and that are packaged with protective covering for storage and identified with labels describing content.
 - 1. Seismic Snubber Units: Furnish replacement neoprene inserts for snubbers.
- 1.07 QUALITY ASSURANCE:
 - A. Comply with the requirements specified in Section 01 43 00.
 - B. Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."

- C. Isolation materials, flexible connectors, and seismic restraints shall be same manufacturer. Select and certify using published or factory certified data.
- D. Vibration isolation and seismic restraint manufacturer shall be a member of the Vibration Isolation and Seismic Control Manufacturer's Association (VISCMA).
- E. Seismic Control:
 - 1. Designer Qualifications:
 - a. Professional Engineer registered in the State of Utah.
 - b. Minimum of 5 years' work experience certifying seismic snubber and anchorage details.
 - c. Components shall bear anchorage pre-approval "R" number, from OSHPD or other agency acceptable to AHJ, showing maximum seismic restraint ratings.

1.08 DESIGN REQUIREMENTS:

- A. Seismic Control:
 - 1. Design equipment, anchorage and support systems for vertical and lateral loading in accordance with Section 1613 of the building codes of Utah, Provo and ASCE/SEI 7.
 - 2. Provide seismic control as required to maintain integrity of mechanical piping, ductwork, and equipment installed in this project, so they will "withstand" earthquake forces.
 - 3. Design shall comply with requirements of this Specification, applicable codes, and requirements of Section 01 41 20.
 - 4. Design, size and install for equipment throughout facility, whether shown or not.
 - 5. Designed by a licensed Professional Engineer in the State of Utah.
 - 6. Seismic restraints shall conform to requirements of latest edition of SMACNA Seismic Restraint Manual.

1.09 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

- A. Mason Industries, Inc.
- B. Vibro-Acoustics
- C. Kinetics Noise Control Inc.

2.02 EQUIPMENT SCHEDULES:

- A. Refer to Drawings and/or Shop Drawings for product type and capacities.

2.03 VIBRATION ISOLATION:

A. General:

- 1. Provide for mechanical piping, ductwork, and equipment as identified by this Specification.
- 2. Select in accordance with equipment, pipe, or duct weight distribution to produce reasonably uniform deflections.
- 3. Springs: Minimum horizontal stiffness equal to 75 percent vertical stiffness, with working deflection between 30 percent and 60 percent of maximum deflection.

B. Elastomeric Pad:

- 1. Oil-resistant and water-resistant elastomer or natural rubber waffle pads, arranged in single or multiple layers, molded with a nonslip pattern.
- 2. Waffle pads bonded each side of minimum 0.24 inch thick galvanized steel separator plate.
- 3. Height of waffle ribs shall not exceed 0.7 times width.
- 4. Maximum Loading: 60 psi.
- 5. Minimum Single Layer Thickness: 0.24 inches.
- 6. Separator plate of sufficient stiffness for uniform loading over pad area.
- 7. Factory cut to size that matches requirements of supported equipment.
- 8. Waffle Pad Material: Standard neoprene.
- 9. Number of Layers: As required to support equipment load; refer to manufacturer's data for load capacities.

C. Elastomeric Mount:

1. Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements.
2. Factory-drilled, encapsulated top plate for bolting to equipment.
3. Baseplate for bolting to structure.

D. Open Spring Isolator:

1. Freestanding, laterally stable, open-spring isolators.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of required deflection at rated load.
4. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Baseplate:
 - a. Factory drilled for bolting to structure and bonded to 0.24 inches thick rubber isolator pad attached to baseplate underside.
 - b. Limit floor load to 100 psig.
 - c. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

E. Restrained Spring Isolator:

1. Freestanding, steel, open-spring isolators with seismic restraint.
2. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 0.24 inch thick elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and levelling bolt that acts as blocking during installation.
3. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.
4. Minimum Additional Travel: 50 percent of required deflection at rated load.
5. Lateral Stiffness: 80 percent minimum of the rated vertical stiffness.

6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
- F. Elastomeric Hanger:
1. Double-deflection type.
 2. Molded, oil-resistant rubber or neoprene isolator elements bonded to steel housing.
 3. Threaded connections for hanger rods.
- G. Spring Hanger:
1. Combination coil-spring and elastomeric-insert hanger with spring and insert in compression.
 2. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
 3. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.
 4. Minimum Additional Travel: 50 percent of required deflection at rated load.
 5. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.
 6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
 7. Elastomeric Element:
 - a. Molded, oil-resistant rubber or neoprene.
 - b. Steel washer-reinforced cup to support spring and bushing projecting through bottom of frame.
- H. Thrust Limit:
1. Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop.
 2. Rod and angle-iron brackets for attaching to equipment.
 3. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.

4. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.
5. Minimum Additional Travel: 50 percent of required deflection at rated load.
6. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.
7. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
8. Elastomeric Element: Molded, oil-resistant rubber or neoprene.
9. Coil Spring: Factory set and field adjustable.

2.04 EQUIPMENT BASES:

A. Structural Steel Base:

1. Factory-fabricated, welded, structural steel base and rail.
2. Design Requirements:
 - a. Lowest possible mounting height with not less than 1 inch clearance above floor.
 - b. Provide equipment anchor bolts and auxiliary motor slide bases or rails.
 - c. Provide supports for suction and discharge elbows for pumps.
3. Structural Steel:
 - a. Steel shapes, plates, and bars complying with ASTM A36.
 - b. Bases shall have shape to accommodate supported equipment.
4. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.

B. Concrete Inertia Base:

1. Factory-fabricated, welded, structural steel base and rail ready for cast-in-place concrete.
2. Design Requirements:
 - a. Lowest possible mounting height with not less than 1 inch clearance above floor.
 - b. Provide equipment anchor bolts and auxiliary motor slide bases or rails.

- c. Provide supports for suction and discharge elbows for pumps.
- 3. Structural Steel:
 - a. Steel shapes, plates, and bars complying with ASTM A36.
 - b. Bases shall have shape to accommodate supported equipment.
- 4. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.
- 5. Fabrication:
 - a. Fabricate steel templates to hold equipment anchor-bolt sleeves and anchors in place during placement of concrete.
 - b. Obtain anchor-bolt templates from supported equipment manufacturer.
- 6. Concrete: 4600 psi
- C. Rooftop Isolation Rails:
 - 1. Factory-assembled, fully enclosed, insulated, airtight, and watertight curb rail designed to resiliently support equipment.
 - 2. Lower Support Assembly:
 - a. Sheet metal “Z” section containing adjustable and removable steel springs that support upper floating frame.
 - b. Upper frame shall provide continuous support for equipment and shall be captive to resiliently resist wind and seismic forces.
 - c. Provide means for attaching to building structure and a wood nailer for attaching roof materials.
 - d. Insulated with a minimum of 2 inches of rigid, glass-fiber insulation on inside of assembly.
 - 3. Isolators:
 - a. Adjustable, restrained spring type, mounted on elastomeric vibration isolation pads.
 - b. Provide access ports, for level adjustment, with removable waterproof covers at isolator locations.
 - c. Locate so they are accessible for adjustment during the life of the installation without interfering with the integrity of the roof.

- d. Restrained Spring Isolators:
 - (1) Freestanding, steel, open-spring isolators with seismic restraint.
 - (2) Housing: Steel with resilient vertical-limit stops and adjustable equipment mounting and levelling bolt.
 - (3) Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.
 - (4) Minimum Additional Travel: 50 percent of required deflection at rated load.
 - (5) Lateral Stiffness: 80 percent minimum of rated vertical stiffness.
 - (6) Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
- e. Elastomeric Isolator Pads:
 - (1) Oil-resistant and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern.
 - (2) Single Layer Thickness: Minimum 0.24 inches
 - (3) Galvanized steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to size that match requirements of supported equipment.
 - (4) Material: Standard neoprene
 - (5) Number of Layers: As required to support equipment load; refer to manufacturer's data for load capacities.
- f. Snubber Bushings: All-directional, elastomeric snubber bushings at least 0.24 inches thick.
- g. Water Seal: Galvanized sheet metal with EPDM seals at corners, attached to upper support frame, extending down past wood nailer of lower support assembly, and counter-flashed over roof materials.

2.05 FLEXIBLE CONNECTORS:

A. Flexible Pipe Connectors:

- 1. Braided Nonferrous: For nonferrous piping systems, provide bronze hose covered with bronze wire braid with copper tube ends or bronze flanged ends, braze-welded to hose.

2. Braided Stainless Steel: For ferrous piping, provide stainless steel hose covered with Type 304 stainless steel wire braid with NPT steel nipples or 150 psi ANSI flanges, welded to hose.
3. Rubber:
 - a. Neoprene or EDPM construction consisting of multiple piles of nylon tire cord fabric and elastomer, molded and cured in hydraulic rubber presses.
 - b. Straight or elbow connector as indicated on the Drawings, rated at 120 psi at 219.2 degrees F.

B. Flexible Duct Connectors: Refer to Section 23 33 00.

2.06 SEISMIC RESTRAINTS:

- A. Resilient Isolation Washers and Bushings: One-piece, molded neoprene, having a durometer 50, plus or minus 5, with a flat washer face.
- B. Seismic Snubbers: Factory fabricated using welded structural steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
- C. Restraining Cables: Galvanized steel aircraft cables with end connections made of steel assemblies that swivel to final installation angle and utilize two clamping bolts for cable engagement.
- D. Anchor Bolts:
 1. Seismic-rated, drill-in, and stud-wedge or female-wedge type.
 2. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

2.07 SHOP/FACTORY FINISHING:

- A. Manufacturer's standard paint applied to factory-assembled and factory-tested equipment, before shipping.
- B. Powder coating on springs and housings.
- C. Electro-galvanize hardware.
- D. Hot-dip galvanize metal components for exterior use.
- E. Baked enamel coat metal components for interior use.
- F. Color-code or otherwise mark vibration isolation and seismic control devices to indicate capacity range.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas and equipment to receive vibration isolation and seismic control devices for compliance with requirements, installation tolerances, and other conditions affecting performance.
- B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. General:

- 1. Install products in accordance with manufacturers' written instructions.
- 2. Connect wiring to isolated equipment with flexible hanging loop.
- 3. Install roof curbs, equipment supports, and roof penetrations as specified in Section 07 72 00.
- 4. Install thrust limits at centerline of thrust, symmetrical on either side of equipment.
- 5. Locate isolation hangers as near overhead support structure as possible.

B. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by agency acceptable to authorities having jurisdiction.

C. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.

D. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.

E. Hangers and Supports for HVAC Piping and Equipment: Comply with requirements in Section 23 05 29 and those indicated below:

- 1. Delegated Design: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
 - a. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

- (1) Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
 - (2) Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
 - (3) Design seismic-restraint hangers and supports for piping and equipment.
 2. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- F. Hydronic Pumps: Comply with requirements in Section 23 21 23 and those indicated below:
1. Seismic Performance: Plumbing pumps shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - a. The term "withstand" means "the pump will remain in place without separation of any parts from the pump when subjected to the seismic forces specified."
- G. Hydronic Tanks: Comply with requirements in Section 23 21 16 and those indicated below:
1. Elevated Tanks, Ground-Mounted tanks, and Indoor Storage Tanks:
 - a. Seismic Performance: Elevated water-storage tank, ground-mounts tanks, and indoor storage tanks, including tank shell, structural reinforcement, supports, and foundations, shall be capable of withstanding the effects of earthquake motions determined according to ASCE/SEI 7.
 - (1) The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - b. Fabricate supports and attachments to tank with reinforcement strong enough to resist tank movement during seismic event when tank supports are anchored to building structure.
 - c. Install tank seismic restraints on all tanks.

H. Hydronic Piping: Comply with requirements in Section 23 21 13 and those indicated below:

1. Seismic Performance: Hydronic piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
2. Install seismic restraints on piping.

I. Metals Ducts: Comply with requirements in Section 23 31 13 and those indicated below:

1. Seismic Performance: Metal ductwork and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
2. Install seismic restraints on ductwork.

J. Mechanical Equipment

1. In the sections below, seismic performance seismic for the mechanical equipment indicated shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - a. In each case, the term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
2. Fans and Accessories: Comply with requirements in Section 23 34 00 and those indicated below:
 - a. Isolation Curb Support: Install centrifugal fans on isolation curbs, and install flexible duct connectors and vibration isolation and seismic-control devices.
 - b. Comply with requirements in Section 23 33 00 for flexible duct connectors.
3. Industrial Air Curtains: Comply with requirements in Section 23 34 33.16 and those indicated below:
 - a. Equipment Installation: Install air curtains with seismic-restraint devices.
 - b. Comply with requirements for hangers and supports specified in Section 23 05 29.

4. Hot Water Heating Boilers: Comply with requirements in Section 23 52 16 and those indicated below:
 - a. Equipment Installation: Mounting base to secure boiler to concrete base.
 - (1) Seismic Fabrication Requirements: Fabricate mounting base and attachment to boiler pressure vessel, accessories, and components with reinforcement strong enough to withstand seismic forces.
5. Air-Cooled Scroll Water Chillers: Comply with requirements in Section 23 64 23 and those indicated below:
 - a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
 - b. Equipment Installation: Install chiller units with seismic-restraint devices.
 - c. Fabricate chiller mounting base with reinforcement strong enough to resist chiller movement during a seismic event when chiller is anchored to field support structure.
 - d. Install roof-mounted units on manufactured curb (unless noted otherwise on drawings) base designed to withstand, without damage to equipment, seismic force required by code.
6. Air Conditioning Equipment: Comply with requirements in Section 23 70 00 and those indicated below:
 - a. Equipment Installation: Install air conditioning equipment with seismic-restraint devices.
 - b. Comply with requirements for hangers and supports specified in Section 23 05 29.
7. Indoor, Semi-Custom Air-Handling Units: Comply with requirements in Section 23 73 13 and those indicated below:
 - a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
 - b. Equipment Installation: Install air-handling units with seismic-restraint devices.
 - c. Install floor-mounted units on 4-inch (unless noted otherwise on drawings) high concrete base designed to withstand, without damage to equipment, seismic force required by code.

8. Unit Heaters: Comply with requirements in Section 23 82 39 and those indicated below:

- a. Equipment Installation: Install unit heaters with seismic-restraint devices.
- b. Comply with requirements for hangers and supports specified in Section 23 05 29.

K. Vibration Isolations:

1. Install spring hangers without binding.
2. On closed spring isolators, adjust so side stabilizers are clear under normal operating conditions.

L. Equipment Bases:

1. Adjust equipment level.
2. Bases with seismic snubbers shall have snubbers located close to isolators.
3. Structural Steel Bases: Set steel bases for 1 inch clearance between housekeeping pad and base.
4. Concrete Inertial Bases:
 - a. Set concrete inertia bases for 2 inch clearance between housekeeping pad and base.
 - b. Fill concrete inertia bases, after installing base frame, with concrete; trowel to a smooth finish.

M. Flexible Connectors: Prior to making piping connections to equipment with operating weights substantially different from installed weights, block up equipment with temporary shims to final height. When full load is applied, adjust isolators to load to allow shim removal.

N. Seismic Restraint Devices:

1. Notify local representative of seismic restraint materials manufacturer prior to installing seismic restraint devices.
2. Representative of seismic restraint materials manufacturer shall provide a written report of compliance with installed equipment.
3. No rigid connections between equipment and building structure shall be made which degrades seismic restraint system herein specified.

4. Electrical conduit to restrained equipment shall be looped to allow free motion of equipment without damage to electrical wiring.
5. Install seismic snubbers on isolated equipment.
6. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.
7. Install restraining cables at each trapeze and individual pipe hanger. At trapeze anchor locations, shackle piping to trapeze. Install cables so they do not bend across sharp edges of adjacent equipment or building structure.
8. Install steel angles or channel, sized to prevent buckling, clamped with ductile-iron clamps to hanger rods for trapeze and individual pipe hangers.
9. At trapeze anchor locations, shackle piping and equipment to trapeze.
10. Install resilient bolt isolation washers on equipment anchor bolts.
11. Upon completion of seismic restraint material installation and before startup of restrained equipment, all debris shall be cleaned from beneath all protected equipment, leaving equipment free to contact snubbers.

3.03 FIELD QUALITY CONTROL:

A. Testing: Conduct the following field quality-control testing:

1. Isolator deflection
2. Isolator seismic-restraint clearance
3. Snubber minimum clearances

B. Seismic Control Component Inspection:

1. Conduct periodic inspections of material installation with assistance of manufacturer's representative. Report in writing deviations from good installation practice.
2. Upon completion of seismic restraint device installation inspect completed system with assistance of manufacturer's representative. Report in writing installation errors, improperly selected snubber devices, or other fault in the system that could affect performance of the system.

C. Manufacturer's Services:

1. Provide manufacturer's representative at Site in accordance with Section 01 33 00 for installation assistance, inspection and certification of proper installation, equipment testing, and startup assistance.

2. Manufacturer's representative present at Site for minimum person-days listed below, travel time excluded:
 - a. 3 person-days for installation assistance and inspection
 - b. 1 person-day for completion of Manufacturer's Certification of Proper Installation
3. Inspection and Report:
 - a. Inspect isolated equipment after installation
 - b. Include static deflections
 - c. Submit report

3.04 ADJUSTING:

A. Vibration Isolation Devices:

1. Adjust isolators after piping systems have been filled and equipment is at operating weight.
2. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height.
3. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
4. Attach thrust limits at centerline of thrust and adjust to a maximum of 6 mm movement during start and stop.
5. Adjust isolators to ensure units do not exceed rated operating deflections or bottom out under loading, and are not short circuited by other contacts or bearing points.
6. Adjust levelling devices as required to distribute loading uniformly on isolators. Shim units as required where levelling devices cannot be used to distribute loading properly.

B. Seismic Control Components:

1. Adjust snubbers according to manufacturer's written recommendations and additional corrections as required by the manufacturers' representative site visit per Paragraph 3.03.B.
2. Adjust seismic restraints to permit free movement of equipment within normal mode of operation.

3. Torque anchor bolts according to equipment manufacture's written recommendations to resist earthquake forces.

C. Cleaning:

1. After completing equipment installation, inspect vibration isolation and seismic-control devices. Remove paint splatters and other spots, dirt, and debris.

3.05 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 53

IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide equipment labels, warning signs and labels, pipe labels, duct labels, stencils, valve tags, warning tags as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. A13.1: Scheme for the Identification of Piping Systems

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.
- C. Samples: For color, letter style, and graphic representation required for each identification material and device.
- D. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.
- E. Valve numbering scheme.
- F. Valve Schedules: For each piping system to include in maintenance manuals.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 EQUIPMENT LABELS:

A. Metal Labels for Equipment:

1. Material and Thickness: Brass, 0.032-inch or aluminum, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
2. Letter Color: Black
3. Background Color: White
4. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
5. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
6. Fasteners: Stainless-steel rivets or self-tapping screws.
7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Plastic Labels for Equipment:

1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
2. Letter Color: Black
3. Background Color: White
4. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.
5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
7. Fasteners: Stainless-steel rivets or self-tapping screws.
8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

- C. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), and the Specification Section number and title where equipment is specified.
- D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2 by 11-inch bond paper. Tabulate equipment identification number, and identify Drawing numbers where equipment is indicated (plans, details, and schedules) and the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.02 WARNING SIGNS AND LABELS:

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
- B. Letter Color: Black
- C. Background Color: Yellow
- D. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.
- E. Minimum Label Size: Length and width vary for required label content, but not less than 3-1/2 by 1 inch.
- F. Minimum Letter Size: 1/2 inch for viewing distances up to 48 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
- G. Fasteners: Stainless-steel rivets
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- I. Label Content: Include caution and warning information plus emergency notification instructions.

2.03 PIPE LABELS:

- A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction according to ASME A13.1.
- B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to partially cover or cover full circumference of pipe and to attach to pipe without fasteners or adhesive.
- C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings; also include pipe size and an arrow indicating flow direction.

1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.
2. Lettering Size: Size letters according to ASME A13.1 for piping.

2.04 STENCILS:

A. Stencils for Piping:

1. Lettering Size: Size letters according to ASME A13.1 for piping
2. Stencil Material: Aluminum
3. Stencil Paint: Exterior, gloss, in colors complying with recommendations in ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.
4. Identification Paint: Exterior, in colors according to ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

B. Stencils for Ducts:

1. Lettering Size: Minimum letter height of 1-1/4 inches for viewing distances up to 15 feet and proportionately larger lettering for greater viewing distances
2. Stencil Material: Aluminum
3. Stencil Paint: Exterior, gloss, acrylic enamel. Paint may be in pressurized spray-can form
4. Identification Paint: Exterior, acrylic enamel. Paint may be in pressurized spray-can form

C. Stencils for Access Panels and Door Labels, Equipment Labels, and Similar Operational Instructions:

1. Lettering Size: Minimum letter height of 1 inch for viewing distances up to 72 inches and proportionately larger lettering for greater viewing distances
2. Stencil Material: Aluminum
3. Stencil Paint: Exterior, gloss, acrylic enamel. Paint may be in pressurized spray-can form

4. Identification Paint: Exterior, acrylic enamel. Paint may be in pressurized spray-can form

2.05 VALVE TAGS:

- A. Description: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
 1. Tag Material: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware
 2. Fasteners: Brass beaded chain
- B. Valve Schedules: For each piping system, on 8-1/2 by 11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
 1. Valve-tag schedule shall be included in operation and maintenance data.

2.06 WARNING TAGS:

- A. Description: Preprinted or partially preprinted accident-prevention tags of plasticized card stock with matte finish suitable for writing.
 1. Size: 3 by 5-1/4 inches minimum
 2. Fasteners: Brass grommet and wire
 3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE"
 4. Color: Safety-yellow background with black lettering

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.02 GENERAL INSTALLATION REQUIREMENTS:

- A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- B. Coordinate installation of identifying devices with locations of access panels and doors.

- C. Install identifying devices before installing acoustical ceilings and similar concealment.

3.03 EQUIPMENT LABEL INSTALLATION:

- A. Install or permanently fasten labels on each major item of mechanical equipment.
- B. Locate equipment labels where accessible and visible.

3.04 PIPE LABEL INSTALLATION:

- A. Piping Color Coding: Painting of piping is specified in Section 09 90 00.
- B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ASME A13.1, with painted, color-coded bands or rectangles on each piping system.

- 1. Identification Paint: Use for contrasting background
- 2. Stencil Paint: Use for pipe marking

- C. Pipe Label Locations: Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:

- 1. Near each valve and control device.
- 2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
- 3. Near penetrations and on both sides of through walls, floors, ceilings, and inaccessible enclosures.
- 4. At access doors, maintenance holes, and similar access points that permit view of concealed piping.
- 5. Near major equipment items and other points of origination and termination.
- 6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
- 7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

- D. Directional Flow Arrows: Arrows shall be used to indicate direction of flow in pipes, including pipes where flow is allowed in both directions.

- E. Pipe Label Color Schedule:

- 1. Chilled-Water Piping: White letters on a safety-green background

2. Condenser-Water Piping: White letters on a safety-green background
3. Heating Water Piping: White letters on a safety-green background
4. Refrigerant Piping: White letters on a safety-purple background

3.05 DUCT LABEL INSTALLATION:

- A. Install self-adhesive duct labels with permanent adhesive on air ducts in the following color codes:
 1. Blue: For cold-air supply ducts
 2. Yellow: For hot-air supply ducts
 3. Green: For exhaust-, outside-, relief-, return-, and mixed-air ducts
- B. Stenciled Duct Label Option: Stenciled labels showing service and flow direction may be provided instead of plastic-laminated duct labels, at Installer's option.
- C. Locate labels near points where ducts enter into and exit from concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.06 VALVE-TAG INSTALLATION:

- A. Install tags on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, shutoff valves and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.
- B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
 1. Valve-Tag Size and Shape:
 - a. Chilled Water: 2 inches round
 - b. Condenser Water: 2 inches round
 - c. Refrigerant: 2 inches round
 - d. Hot Water: 2 inches round
 - e. Gas: 2 inches round
 2. Valve-Tag Colors:
 - a. Toxic and Corrosive Fluids: Black letters on a safety-orange background

- b. Flammable Fluids: Black letters on a safety-yellow background
- c. Combustible Fluids: White letters on a safety-brown background
- d. Potable and Other Water: White letters on a safety-green background
- e. Compressed Air: White letters on a safety-blue background

3.07 WARNING-TAG INSTALLATION:

- A. Write required message on, and attach warning tags to, equipment and other items where required.

3.08 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 93

TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide testing, adjusting and balancing for HVAC as indicated and in compliance with Contract Documents.
 - 1. Balancing Air Systems:
 - a. Constant-volume air systems
 - b. Variable air volume systems
 - 2. Balancing Hydronic Piping Systems:
 - a. Constant-flow hydronic systems
 - b. Variable-flow hydronic systems
 - c. Primary-secondary hydronic systems
 - 3. Testing, Adjusting, and Balancing Equipment:
 - a. Motors
 - b. Chillers
 - c. Boilers
 - d. Heat-transfer coils
 - 4. Testing, adjusting, and balancing existing systems and equipment
 - 5. Sound tests.
 - 6. Vibration tests.
 - 7. Duct leakage tests.
 - 8. Control system verification.

1.02 REFERENCES:

- A. Associated Air Balance Council (AABC):
 - 1. National Standards for Total System Balance
- B. Air Movement and Control Association International, Inc. (AMCA):
 - 1. 201: Fans and Systems

 - 2. 111: Measurement, Testing, Adjusting and Balancing of Building HVAC Systems
- D. National Environmental Balancing Bureau (NEBB):
 - 1. Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems
- E. Sheet Metal and Air Conditioning Contractors National Association (SMANCA):
 - 1. HVAC Systems – Duct Design
 - 2. HVAC Systems – Testing, Adjusting, and Balancing

1.03 DEFINITIONS:

- A. AABC: Associated Air Balance Council
- B. BAS: Building automation Systems
- C. NEBB: National Environmental Balancing Bureau
- D. TAB: Testing, adjusting, and balancing
- E. TAB Specialist: An independent entity meeting qualifications to perform TAB work
- F. TDH: Total dynamic head

1.04 PREINSTALLATION MEETINGS:

- A. TAB Conference: If requested by the Owner, conduct a TAB conference at Project site after approval of the TAB strategies and procedures plan to develop a mutual understanding of the details. Provide a minimum of 14 days' advance notice of scheduled meeting time and location.
 - 1. Minimum Agenda Items:
 - a. The Contract Documents examination report
 - b. The TAB plan
 - c. Needs for coordination and cooperation of trades and subcontractors
 - d. Proposed procedures for documentation and communication flow

1.05 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. TAB Report: Documentation indicating that Work complies with ASHRAE/IES 90.1, Section 6.7.2.3 - "System Balancing."
- B. Qualification Data: Within 90 days of Contractor's Notice to Proceed, submit documentation that the TAB specialist and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article.
- C. Contract Documents Examination Report: Within 90 days of Contractor's Notice to Proceed, submit the Contract Documents review report as specified in Part 3.
- D. Strategies and Procedures Plan: Within 90 days of Contractor's Notice to Proceed, submit TAB strategies and step-by-step procedures as specified in "Preparation" Article.
- E. System Readiness Checklists: Within 90 days of Contractor's Notice to Proceed, submit system readiness checklists as specified in "Preparation" Article.
- F. Examination Report: Submit a summary report of the examination review required in "Examination" Article.
- G. Certified TAB reports
- H. Sample report forms
- I. Instrument calibration reports, to include the following:
 - 1. Instrument type and make
 - 2. Serial number

3. Application
4. Dates of use
5. Dates of calibration

1.06 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

- B. TAB Specialists Qualifications: Certified by AABC.

1. TAB Field Supervisor: Employee of the TAB specialist and certified by AABC.
2. TAB Technician: Employee of the TAB specialist and certified by AABC as a TAB technician.

- C. TAB Specialists Qualifications: Certified by NEBB.

1. TAB Field Supervisor: Employee of the TAB specialist and certified by NEBB.
2. TAB Technician: Employee of the TAB specialist and certified by NEBB as a TAB technician.

- D. Instrumentation Type, Quantity, Accuracy, and Calibration: Comply with requirements in ASHRAE 111, Section 4, "Instrumentation."

- E. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6.7.2.3 - "System Balancing."

1.09 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems designs that may preclude proper TAB of systems and equipment.
- B. Examine installed systems for balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are applicable for intended purpose and are accessible.
- C. Examine the approved submittals for HVAC systems and equipment.
- D. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems output, and statements of philosophies and assumptions about HVAC system and equipment controls.
- E. Examine ceiling plenums and underfloor air plenums used for supply, return, or relief air to verify that they are properly separated from adjacent areas. Verify that penetrations in plenum walls are sealed and fire-stopped if required.
- F. Examine equipment performance data including fan and pump curves.
 - 1. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
 - 2. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or in SMACNA's "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.
- G. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.
- H. Examine test reports specified in individual system and equipment Sections.
- I. Examine HVAC equipment and verify that bearings are greased, belts are aligned and tight, filters are clean, and equipment with functioning controls is ready for operation.
- J. Examine terminal units, such as variable-air-volume boxes, and verify that they are accessible and their controls are connected and functioning.

- K. Examine strainers. Verify that startup screens have been replaced by permanent screens with indicated perforations.
- L. Examine control valves for proper installation for their intended function of throttling, diverting, or mixing fluid flows.
- M. Examine heat-transfer coils for correct piping connections and for clean and straight fins.
- N. Examine system pumps to ensure absence of entrained air in the suction piping.
- O. Examine operating safety interlocks and controls on HVAC equipment.
- P. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.02 PREPARATION:

- A. Prepare a TAB plan that includes the following:
 - 1. Equipment and systems to be tested.
 - 2. Strategies and step-by-step procedures for balancing the systems.
 - 3. Instrumentation to be used.
 - 4. Sample forms with specific identification for all equipment.
- B. Perform system-readiness checks of HVAC systems and equipment to verify system readiness for TAB work. Include, at a minimum, the following:
 - 1. Airside:
 - a. Verify that leakage and pressure tests on air distribution systems have been satisfactorily completed.
 - b. Duct systems are complete with terminals installed.
 - c. Volume, smoke, and fire dampers are open and functional.
 - d. Clean filters are installed.
 - e. Fans are operating, free of vibration, and rotating in correct direction.
 - f. Variable-frequency controllers' startup is complete and safeties are verified.
 - g. Automatic temperature-control systems are operational.
 - h. Ceilings are installed.

- i. Windows and doors are installed.
 - j. Suitable access to balancing devices and equipment is provided.
2. Hydronics:
- a. Verify leakage and pressure tests on water distribution systems have been satisfactorily completed.
 - b. Piping is complete with terminals installed.
 - c. Water treatment is complete.
 - d. Systems are flushed, filled, and air purged.
 - e. Strainers are pulled and cleaned.
 - f. Control valves are functioning per the sequence of operation.
 - g. Shutoff and balance valves have been verified to be 100 percent open.
 - h. Pumps are started and proper rotation is verified.
 - i. Pump gage connections are installed directly at pump inlet and outlet flanges or in discharge and suction pipe prior to valves or strainers.
 - j. Variable-frequency controllers' startup is complete and safeties are verified.
 - k. Suitable access to balancing devices and equipment is provided.

3.03 GENERAL PROCEDURES FOR TESTING AND BALANCING:

- A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Total System Balance" NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" SMACNA's "HVAC Systems - Testing, Adjusting, and Balancing" and in this Section.
- B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.
 - 1. After testing and balancing, install test ports and duct access doors that comply with requirements in Section 23 33 00.
 - 2. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Section 23 07 13, Section 23 07 16, and Section 23 07 19.

- C. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.
- D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.04 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS:

- A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Cross-check the summation of required outlet volumes with required fan volumes.
- B. Prepare schematic diagrams of systems' "record drawing" duct layouts.
- C. For variable-air-volume systems, develop a plan to simulate diversity.
- D. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.
- E. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.
- F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
- G. Verify that motor starters are equipped with properly sized thermal protection.
- H. Check dampers for proper position to achieve desired airflow path.
- I. Check for airflow blockages.
- J. Check condensate drains for proper connections and functioning.
- K. Check for proper sealing of air-handling-unit components.
- L. Verify that air duct system is sealed as specified in Section 23 31 13.

3.05 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS:

- A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
 - 1. Measure total airflow.
 - a. Set outside-air, return-air, and relief-air dampers for proper position that simulates minimum outdoor-air conditions.
 - b. Where duct conditions allow, measure airflow by main Pitot-tube traverse. If necessary, perform multiple Pitot-tube traverses, close to the fan and prior to any outlets, to obtain total airflow.

- c. Where duct conditions are not suitable for Pitot-tube traverse measurements, a coil traverse may be acceptable.
- 2. Measure fan static pressures as follows:
 - a. Measure static pressure directly at the fan outlet or through the flexible connection.
 - b. Measure static pressure directly at the fan inlet or through the flexible connection.
 - c. Measure static pressure across each component that makes up the air-handling system.
 - d. Report artificial loading of filters at the time static pressures are measured.
- 3. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.
- 4. Obtain approval from Engineer of Record for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in HVAC Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.
- 5. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload occurs. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.
- B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows.
 - 1. Measure airflow of submain and branch ducts
 - 2. Adjust submain and branch duct volume dampers for specified airflow
 - 3. Re-measure each submain and branch duct after all have been adjusted
- C. Adjust air inlets and outlets for each space to indicated airflows.
 - 1. Set airflow patterns of adjustable outlets for proper distribution without drafts
 - 2. Measure inlets and outlets airflow
 - 3. Adjust each inlet and outlet for specified airflow
 - 4. Re-measure each inlet and outlet after they have been adjusted

D. Verify Final System Conditions:

1. Re-measure and confirm that minimum outdoor, return, and relief airflows are within design. Readjust to design if necessary.
2. Re-measure and confirm that total airflow is within design
3. Re-measure all final fan operating data, rpms, volts, amps, and static profile
4. Mark all final settings
5. Test system in economizer mode. Verify proper operation and adjust if necessary.
6. Measure and record all operating data
7. Record final fan-performance data

3.06 GENERAL PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS:

A. Adjust the variable-air-volume systems as follows:

1. Verify that the system static pressure sensor is located two-thirds of the distance down the duct from the fan discharge.
2. Verify that the system is under static pressure control.
3. Select the terminal unit that is most critical to the supply-fan airflow. Measure inlet static pressure, and adjust system static pressure control set point so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
4. Calibrate and balance each terminal unit for maximum and minimum design airflow as follows:
 - a. Adjust controls so that terminal is calling for maximum airflow. Some controllers require starting with minimum airflow. Verify calibration procedure for specific project.
 - b. Measure airflow and adjust calibration factor as required for design maximum airflow. Record calibration factor.
 - c. When maximum airflow is correct, balance the air outlets downstream from terminal units.
 - d. Adjust controls so that terminal is calling for minimum airflow.

- e. Measure airflow and adjust calibration factor as required for design minimum airflow. Record calibration factor. If no minimum calibration is available, note any deviation from design airflow.
 - f. When in full cooling or full heating, ensure that there is no mixing of hot-deck and cold-deck airstreams unless so designed.
 - g. On constant volume terminals, in critical areas where room pressure is to be maintained, verify that the airflow remains constant over the full range of full cooling to full heating. Note any deviation from design airflow or room pressure.
5. After terminals have been calibrated and balanced, test and adjust system for total airflow. Adjust fans to deliver total design airflows within the maximum allowable fan speed listed by fan manufacturer.
- a. Set outside-air, return-air, and relief-air dampers for proper position that simulates minimum outdoor-air conditions.
 - b. Set terminals for maximum airflow. If system design includes diversity, adjust terminals for maximum and minimum airflow so that connected total matches fan selection and simulates actual load in the building.
 - c. Where duct conditions allow, measure airflow by Pitot-tube traverse. If necessary, perform multiple Pitot-tube traverses to obtain total airflow.
 - d. Where duct conditions are not suitable for Pitot-tube traverse measurements, a coil traverse may be acceptable.
 - e. If a reliable Pitot-tube traverse or coil traverse is not possible, measure airflow at terminals and calculate the total airflow.
6. Measure fan static pressures as follows:
- a. Measure static pressure directly at the fan outlet or through the flexible connection.
 - b. Measure static pressure directly at the fan inlet or through the flexible connection.
 - c. Measure static pressure across each component that makes up the air-handling system.
 - d. Report any artificial loading of filters at the time static pressures are measured.
7. Set final return and outside airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.

- a. Balance the return-air ducts and inlets the same as described for constant-volume air systems.
 - b. Verify that terminal units are meeting design airflow under system maximum flow.
8. Re-measure the inlet static pressure at the most critical terminal unit and adjust the system static pressure set point to the most energy-efficient set point to maintain the optimum system static pressure. Record set point and give to controls contractor.
9. Verify final system conditions as follows:
 - a. Re-measure and confirm that minimum outdoor, return, and relief airflows are within design. Readjust to match design if necessary.
 - b. Re-measure and confirm that total airflow is within design.
 - c. Re-measure final fan operating data, rpms, volts, amps, and static profile.
 - d. Mark final settings.
 - e. Test system in economizer mode. Verify proper operation and adjust if necessary. Measure and record all operating data.
 - f. Verify tracking between supply and return fans.

3.07 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS:

- A. Prepare test reports for pumps, coils, and heat exchangers. Obtain approved submittals and manufacturer-recommended testing procedures. Crosscheck the summation of required coil and heat exchanger flow rates with pump design flow rate.
- B. Prepare schematic diagrams of systems' "record drawing" piping layouts.
- C. In addition to requirements in "Preparation" Article, prepare hydronic systems for testing and balancing as follows:
 1. Check liquid level in expansion tank.
 2. Check highest vent for adequate pressure.
 3. Check flow-control valves for proper position.
 4. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
 5. Verify that motor starters are equipped with properly sized thermal protection.

6. Check that air has been purged from the system.

3.08 PROCEDURES FOR CONSTANT-FLOW HYDRONIC SYSTEMS:

A. Adjust pumps to deliver total design gpm.

1. Measure total water flow.
 - a. Position valves for full flow through coils.
 - b. Measure flow by main flow meter, if installed.
 - c. If main flow meter is not installed, determine flow by pump TDH or exchanger pressure drop.
2. Measure pump TDH as follows:
 - a. Measure discharge pressure directly at the pump outlet flange or in discharge pipe prior to any valves.
 - b. Measure inlet pressure directly at the pump inlet flange or in suction pipe prior to any valves or strainers.
 - c. Convert pressure to head and correct for differences in gage heights.
 - d. Verify pump impeller size by measuring the TDH with the discharge valve closed. Note the point on manufacturer's pump curve at zero flow, and verify that the pump has the intended impeller size.
 - e. With valves open, read pump TDH. Adjust pump discharge valve until design water flow is achieved.
3. Monitor motor performance during procedures and do not operate motor in an overloaded condition.

B. Adjust flow-measuring devices installed in mains and branches to design water flows.

1. Measure flow in main and branch pipes
2. Adjust main and branch balance valves for design flow
3. Re-measure each main and branch after all have been adjusted

C. Adjust flow-measuring devices installed at terminals for each space to design water flows.

1. Measure flow at terminals
2. Adjust each terminal to design flow

3. Re-measure each terminal after it is adjusted
4. Position control valves to bypass the coil, and adjust the bypass valve to maintain design flow
5. Perform temperature tests after flows have been balanced

D. For systems with pressure-independent valves at terminals:

1. Measure differential pressure and verify that it is within manufacturer's specified range.
2. Perform temperature tests after flows have been verified.

E. For systems without pressure-independent valves or flow-measuring devices at terminals:

1. Measure and balance coils by either coil pressure drop or temperature method.
2. If balanced by coil pressure drop, perform temperature tests after flows have been verified.

F. Verify final system conditions as follows:

1. Re-measure and confirm that total water flow is within design
2. Re-measure final pumps' operating data, TDH, volts, amps, and static profile
3. Mark final settings

G. Verify that memory stops have been set.

3.09 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS:

A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals, and proceed as specified above for hydronic systems.

B. Adjust the variable-flow hydronic system as follows:

1. Verify that the differential-pressure sensor is located as indicated
2. Determine whether there is diversity in the system

C. For systems with no diversity:

1. Adjust pumps to deliver total design gpm.
 - a. Measure total water flow.

- (1) Position valves for full flow through coils.
 - (2) Measure flow by main flow meter, if installed.
 - (3) If main flow meter is not installed, determine flow by pump TDH or exchanger pressure drop.
 - b. Measure pump TDH as follows:
 - (1) Measure discharge pressure directly at the pump outlet flange or in discharge pipe prior to any valves.
 - (2) Measure inlet pressure directly at the pump inlet flange or in suction pipe prior to any valves or strainers.
 - (3) Convert pressure to head and correct for differences in gage heights.
 - (4) Verify pump impeller size by measuring the TDH with the discharge valve closed. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
 - (5) With valves open, read pump TDH. Adjust pump discharge valve until design water flow is achieved.
 - c. Monitor motor performance during procedures and do not operate motor in an overloaded condition.
2. Adjust flow-measuring devices installed in mains and branches to design water flows.
 - a. Measure flow in main and branch pipes
 - b. Adjust main and branch balance valves for design flow
 - c. Re-measure each main and branch after all have been adjusted
 3. Adjust flow-measuring devices installed at terminals for each space to design water flows.
 - a. Measure flow at terminals
 - b. Adjust each terminal to design flow
 - c. Re-measure each terminal after it is adjusted
 - d. Position control valves to bypass the coil and adjust the bypass valve to maintain design flow
 - e. Perform temperature tests after flows have been balanced

4. For systems with pressure-independent valves at terminals:
 - a. Measure differential pressure and verify that it is within manufacturer's specified range.
 - b. Perform temperature tests after flows have been verified.
 5. For systems without pressure-independent valves or flow-measuring devices at terminals:
 - a. Measure and balance coils by either coil pressure drop or temperature method.
 - b. If balanced by coil pressure drop, perform temperature tests after flows have been verified.
 6. Prior to verifying final system conditions, determine the system differential-pressure set point.
 7. If the pump discharge valve was used to set total system flow with variable-frequency controller at 60 Hertz, at completion open discharge valve 100 percent and allow variable-frequency controller to control system differential-pressure set point. Record pump data under both conditions.
 8. Mark final settings and verify that all memory stops have been set.
 9. Verify final system conditions as follows:
 - a. Re-measure and confirm that total water flow is within design
 - b. Re-measure final pumps' operating data, TDH, volts, amps, and static profile
 - c. Mark final settings
 10. Verify that memory stops have been set
- D. For systems with diversity:
1. Determine diversity factor.
 2. Simulate system diversity by closing required number of control valves, as approved by the design engineer.
 3. Adjust pumps to deliver total design gpm.
 - a. Measure total water flow.
 - (1) Position valves for full flow through coils.

- (2) Measure flow by main flow meter, if installed.
 - (3) If main flow meter is not installed, determine flow by pump TDH or exchanger pressure drop.
 - b. Measure pump TDH as follows:
 - (1) Measure discharge pressure directly at the pump outlet flange or in discharge pipe prior to any valves.
 - (2) Measure inlet pressure directly at the pump inlet flange or in suction pipe prior to any valves or strainers.
 - (3) Convert pressure to head and correct for differences in gage heights.
 - (4) Verify pump impeller size by measuring the TDH with the discharge valve closed. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
 - (5) With valves open, read pump TDH. Adjust pump discharge valve until design water flow is achieved.
 - c. Monitor motor performance during procedures and do not operate motor in an overloaded condition.
- 4. Adjust flow-measuring devices installed in mains and branches to design water flows.
 - a. Measure flow in main and branch pipes
 - b. Adjust main and branch balance valves for design flow
 - c. Re-measure each main and branch after all have been adjusted
- 5. Adjust flow-measuring devices installed at terminals for each space to design water flows.
 - a. Measure flow at terminals.
 - b. Adjust each terminal to design flow.
 - c. Re-measure each terminal after it is adjusted.
 - d. Position control valves to bypass the coil, and adjust the bypass valve to maintain design flow.
 - e. Perform temperature tests after flows have been balanced.

6. For systems with pressure-independent valves at terminals:
 - a. Measure differential pressure, and verify that it is within manufacturer's specified range.
 - b. Perform temperature tests after flows have been verified.
7. For systems without pressure-independent valves or flow-measuring devices at terminals:
 - a. Measure and balance coils by either coil pressure drop or temperature method.
 - b. If balanced by coil pressure drop, perform temperature tests after flows have been verified.
8. Open control valves that were shut. Close a sufficient number of control valves that were previously open to maintain diversity, and balance terminals that were just opened.
9. Prior to verifying final system conditions, determine system differential-pressure set point.
10. If the pump discharge valve was used to set total system flow with variable-frequency controller at 60 Hertz, at completion open discharge valve 100 percent and allow variable-frequency controller to control system differential-pressure set point. Record pump data under both conditions.
11. Mark final settings and verify that memory stops have been set.
12. Verify final system conditions as follows:
 - a. Re-measure and confirm that total water flow is within design
 - b. Re-measure final pumps' operating data, TDH, volts, amps, and static profile
 - c. Mark final settings
13. Verify that memory stops have been set.

3.10 PROCEDURES FOR PRIMARY-SECONDARY HYDRONIC SYSTEMS:

- A. Balance the primary circuit flow first.
- B. Balance the secondary circuits after the primary circuits are complete.

- C. Adjust pumps to deliver total design gpm.
 - 1. Measure total water flow.
 - a. Position valves for full flow through coils.
 - b. Measure flow by main flow meter, if installed.
 - c. If main flow meter is not installed, determine flow by pump TDH or exchanger pressure drop.
 - 2. Measure pump TDH as follows:
 - a. Measure discharge pressure directly at the pump outlet flange or in discharge pipe prior to any valves.
 - b. Measure inlet pressure directly at the pump inlet flange or in suction pipe prior to any valves or strainers.
 - c. Convert pressure to head and correct for differences in gage heights.
 - d. Verify pump impeller size by measuring the TDH with the discharge valve closed. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
 - e. With valves open, read pump TDH. Adjust pump discharge valve until design water flow is achieved.
 - 3. Monitor motor performance during procedures and do not operate motor in an overloaded condition.
- D. Adjust flow-measuring devices installed in mains and branches to design water flows.
 - 1. Measure flow in main and branch pipes
 - 2. Adjust main and branch balance valves for design flow
 - 3. Re-measure each main and branch after all have been adjusted
- E. Adjust flow-measuring devices installed at terminals for each space to design water flows.
 - 1. Measure flow at terminals
 - 2. Adjust each terminal to design flow
 - 3. Re-measure each terminal after it is adjusted

4. Position control valves to bypass the coil and adjust the bypass valve to maintain design flow
5. Perform temperature tests after flows have been balanced

F. For systems with pressure-independent valves at terminals:

1. Measure differential pressure and verify that it is within manufacturer's specified range
2. Perform temperature tests after flows have been verified

G. For systems without pressure-independent valves or flow-measuring devices at terminals:

1. Measure and balance coils by either coil pressure drop or temperature method.
2. If balanced by coil pressure drop, perform temperature tests after flows have been verified.

H. Verify final system conditions as follows:

1. Re-measure and confirm that total water flow is within design
2. Re-measure final pumps' operating data, TDH, volts, amps, and static profile
3. Mark final settings

I. Verify that memory stops have been set.

3.11 PROCEDURES FOR MOTORS:

A. Motors 1/2 HP and Larger: Test at final balanced conditions and record the following data:

1. Manufacturer's name, model number, and serial number
2. Motor horsepower rating
3. Motor rpm
4. Phase and Hertz
5. Nameplate and measured voltage, each phase
6. Nameplate and measured amperage, each phase
7. Starter size and thermal-protection-element rating

8. Service factor and frame size

- B. Motors Driven by Variable-Frequency Controllers: Test manual bypass of controller to prove proper operation.

3.12 PROCEDURES FOR CHILLERS:

- A. Balance water flow through each evaporator to within specified tolerances of indicated flow with all pumps operating. With only one chiller operating in a multiple chiller installation, do not exceed the flow for the maximum tube velocity recommended by the chiller manufacturer. Measure and record the following data with each chiller operating at design conditions:
1. Evaporator-water entering and leaving temperatures, pressure drop, and water flow.
 2. Evaporator and condenser refrigerant temperatures and pressures, using instruments furnished by chiller manufacturer.
 3. Power factor if factory-installed instrumentation is furnished for measuring kilowatts.
 4. Kilowatt input if factory-installed instrumentation is furnished for measuring kilowatts.
 5. Capacity: Calculate in tons of cooling.
 6. For air-cooled chillers, verify condenser fan rotation and record fan and motor data including number of fans and entering- and leaving-air temperatures.

3.13 PROCEDURES FOR BOILERS:

- A. Hydronic Boilers:
1. Measure and record entering- and leaving-water temperatures
 2. Measure and record water flow
 3. Record relief valve pressure setting

3.14 PROCEDURES FOR HEAT-TRANSFER COILS:

- A. Measure, adjust, and record the following data for each water coil:
1. Entering- and leaving-water temperature
 2. Water flow rate

3. Water pressure drop for major (more than 20 gpm) equipment coils, excluding unitary equipment such as reheat coils, unit heaters, and fan-coil units
4. Dry-bulb temperature of entering and leaving air
5. Wet-bulb temperature of entering and leaving air for cooling coils
6. Airflow

3.15 SOUND TESTS

A. After the systems are balanced and construction is Substantially Complete, measure and record sound levels at 10 locations as designated by the Architect.

B. Instrumentation:

1. The sound-testing meter shall be a portable, general-purpose testing meter consisting of a microphone, processing unit, and readout.
2. The sound-testing meter shall be capable of showing fluctuations at minimum and maximum levels, and measuring the equivalent continuous sound pressure level (LEQ).
3. The sound-testing meter must be capable of using 1/3 octave band filters to measure mid-frequencies from 31.5 Hz to 8000 Hz.
4. The accuracy of the sound-testing meter shall be plus or minus one decibel.

C. Test Procedures:

1. Perform test at quietest background noise period. Note cause of unpreventable sound that affects test outcome.
2. Equipment should be operating at design values.
3. Calibrate the sound-testing meter prior to taking measurements.
4. Use a microphone suitable for the type of noise levels measured that is compatible with meter. Provide a windshield for outside or in-duct measurements.
5. Record a set of background measurements in dBA and sound pressure levels in the eight un-weighted octave bands 63 Hz to 8000 Hz (NC) with the equipment off.
6. Take sound readings in dBA and sound pressure levels in the eight un-weighted octave bands 63 Hz to 8000 Hz (NC) with the equipment operating.
7. Take readings no closer than 36 inches from a wall or from the operating equipment and approximately 60 inches from the floor, with the meter held or mounted on a tripod.

8. For outdoor measurements, move sound-testing meter slowly and scan area that has the most exposure to noise source being tested. Use A-weighted scale for this type of reading.

D. Reporting:

1. Report shall record the following:
 - a. Location.
 - b. System tested.
 - c. dBA reading
 - d. Sound pressure level in each octave band with equipment on and off.
2. Plot sound pressure levels on NC worksheet with equipment on and off.

3.16 VIBRATION TESTS

- A. After systems are balanced and construction is Substantially Complete, measure and record vibration levels on equipment having motor horsepower equal to or greater than 25.
- B. Instrumentation:
 1. Use portable, battery-operated, and microprocessor-controlled vibration meter with or without a built-in printer.
 2. The meter shall automatically identify engineering units, filter bandwidth, amplitude, and frequency scale values.
 3. The meter shall be able to measure machine vibration displacement in mils of deflection, velocity in inches per second, and acceleration in inches per second squared.
 4. Verify calibration date is current for vibration meter before taking readings
- C. Test Procedures:
 1. To ensure accurate readings, verify that accelerometer has a clean, flat surface and is mounted properly.
 2. With the unit running, set up vibration meter in a safe, secure location. Connect transducer to meter with proper cables. Hold magnetic tip of transducer on top of the bearing, and measure unit in mils of deflection. Record measurement, then move transducer to the side of the bearing and record in mils of deflection. Record an axial reading in mils of deflection by holding nonmagnetic, pointed transducer tip on end of shaft.

3. Change vibration meter to velocity (inches per second) measurements. Repeat and record above measurements.
4. Record CPM or rpm.
5. Read each bearing on motor, fan, and pump as required. Track and record vibration levels from rotating component through casing to base.

D. Reporting:

1. Report shall record location and the system tested.
2. Include horizontal-vertical-axial measurements for tests.
3. Verify that vibration limits follow Specifications, or, if not specified, follow the General Machinery Vibration Severity Chart or Vibration Acceleration General Severity Chart from the AABC National Standards. Acceptable levels of vibration are normally "smooth" to "good."
4. Include in report General Machinery Vibration Severity Chart, with conditions plotted.

3.17 DUCT LEAKAGE TESTS:

- A. Witness the duct pressure testing performed by Installer.
- B. Verify that proper test methods are used and that leakage rates are within specified tolerances.
- C. Report deficiencies observed.

3.18 CONTROLS VERIFICATION:

- A. In conjunction with system balancing, perform the following:
 1. Verify temperature control system is operating within the design limitations.
 2. Confirm that the sequences of operation are in compliance with Contract Documents.
 3. Verify that controllers are calibrated and function as intended.
 4. Verify that controller set points are as indicated.
 5. Verify the operation of lockout or interlock systems.
 6. Verify the operation of valve and damper actuators.

7. Verify that controlled devices are properly installed and connected to correct controller.
 8. Verify that controlled devices travel freely and are in position indicated by controller: open, closed, or modulating.
 9. Verify location and installation of sensors to ensure that they sense only intended temperature, humidity, or pressure.
- B. Reporting: Include a summary of verifications performed, remaining deficiencies, and variations from indicated conditions.
- 3.19 TOLERANCES:
- A. Set HVAC system's airflow rates and water flow rates within the following tolerances:
1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus or minus 10 percent
 2. Air Outlets and Inlets: Plus or minus 10 percent
 3. Heating-Water Flow Rate: Plus or minus 10 percent
 4. Cooling-Water Flow Rate: Plus or minus 10 percent
- B. Maintaining pressure relationships as designed shall have priority over the tolerances specified above.
- 3.20 PROGRESS REPORTING:
- A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems balancing devices. Recommend changes and additions to systems balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.
- B. Status Reports: Prepare biweekly progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.
- 3.21 FINAL REPORT:
- A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
1. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.

2. Include a list of instruments used for procedures, along with proof of calibration.
 3. Certify validity and accuracy of field data.
- B. Final Report Contents: In addition to certified field-report data, include the following:
1. Pump curves
 2. Fan curves
 3. Manufacturers' test data
 4. Field test reports prepared by system and equipment installers
 5. Other information relative to equipment performance; do not include Shop Drawings and Product Data
- C. General Report Data: In addition to form titles and entries, include the following data:
1. Title page
 2. Name and address of the TAB specialist
 3. Project name
 4. Project location
 5. Architect's name and address
 6. Engineer's name and address
 7. Contractor's name and address
 8. Report date
 9. Signature of TAB supervisor who certifies the report
 10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
 11. Summary of contents including the following:
 - a. Indicated versus final performance
 - b. Notable characteristics of systems
 - c. Description of system operation sequence if it varies from the Contract Documents

12. Nomenclature sheets for each item of equipment.
 13. Data for terminal units, including manufacturer's name, type, size, and fittings.
 14. Notes to explain why certain final data in the body of reports vary from indicated values.
 15. Test conditions for fans and pump performance forms including the following:
 - a. Settings for outdoor-, return-, and exhaust-air dampers
 - b. Conditions of filters
 - c. Cooling coil, wet- and dry-bulb conditions
 - d. Face and bypass damper settings at coils
 - e. Fan drive settings including settings and percentage of maximum pitch diameter
 - f. Inlet vane settings for variable-air-volume systems.
 - g. Settings for supply-air, static-pressure controller
 - h. Other system operating conditions that affect performance
- D. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
1. Quantities of outdoor, supply, return, and exhaust airflows
 2. Water flow rates
 3. Duct, outlet, and inlet sizes
 4. Pipe and valve sizes and locations
 5. Terminal units
 6. Balancing stations
 7. Position of balancing devices

E. Air-Handling-Unit Test Reports: For air-handling units with coils, include the following:

1. Unit Data:

- a. Unit identification
- b. Location
- c. Make and type
- d. Model number and unit size
- e. Manufacturer's serial number
- f. Unit arrangement and class
- g. Discharge arrangement
- h. Sheave make, size in inches , and bore
- i. Center-to-center dimensions of sheave and amount of adjustments in inches
- j. Number, make, and size of belts
- k. Number, type, and size of filters

2. Motor Data:

- a. Motor make, and frame type and size
- b. Horsepower and rpm
- c. Volts, phase, and Hertz
- d. Full-load amperage and service factor
- e. Sheave make, size in inches, and bore
- f. Center-to-center dimensions of sheave and amount of adjustments in inches

3. Test Data (Indicated and Actual Values):

- a. Total airflow rate in cfm
- b. Total system static pressure in inches wg
- c. Fan rpm
- d. Discharge static pressure in inches wg

- e. Filter static-pressure differential in inches wg
- f. Preheat-coil static-pressure differential in inches wg
- g. Cooling-coil static-pressure differential in inches wg
- h. Heating-coil static-pressure differential in inches wg
- i. Outdoor airflow in cfm
- j. Return airflow in cfm
- k. Outdoor-air damper position
- l. Return-air damper position

F. Apparatus-Coil Test Reports:

1. Coil Data:

- a. System identification
- b. Location
- c. Coil type
- d. Number of rows
- e. Fin spacing in fins per inch
- f. Make and model number
- g. Face area in sq. ft.
- h. Tube size in NPS
- i. Tube and fin materials
- j. Circuiting arrangement

2. Test Data (Indicated and Actual Values):

- a. Airflow rate in cfm
- b. Average face velocity in fpm
- c. Air pressure drop in inches wg
- d. Outdoor-air, wet- and dry-bulb temperatures in degrees F

- e. Return-air, wet- and dry-bulb temperatures in degrees F
 - f. Entering-air, wet- and dry-bulb temperatures in degrees F
 - g. Leaving-air, wet- and dry-bulb temperatures in degrees F
 - h. Water flow rate in gpm
 - i. Water pressure differential in feet of head or psig
 - j. Entering-water temperature in degrees F
 - k. Leaving-water temperature in degrees F
- G. Electric-Coil Test Reports: For electric furnaces, duct coils, and electric coils installed in central-station air-handling units, include the following:
- 1. Unit Data:
 - a. System identification.
 - b. Location.
 - c. Coil identification.
 - d. Capacity in Btu/h.
 - e. Number of stages.
 - f. Connected volts, phase, and hertz.
 - g. Rated amperage.
 - h. Airflow rate in cfm.
 - i. Face area in sq. ft..
 - j. Minimum face velocity in fpm.
 - 2. Test Data (Indicated and Actual Values):
 - a. Heat output in Btu/h.
 - b. Airflow rate in cfm.
 - c. Air velocity in fpm.
 - d. Entering-air temperature in deg F.
 - e. Leaving-air temperature in deg F.

- f. Voltage at each connection.
 - g. Amperage for each phase.
- H. Fan Test Reports: For supply, return, and exhaust fans, include the following:
 - 1. Fan Data:
 - a. System identification
 - b. Location
 - c. Make and type
 - d. Model number and size
 - e. Manufacturer's serial number
 - f. Arrangement and class
 - g. Sheave make, size in inches, and bore
 - h. Center-to-center dimensions of sheave and amount of adjustments in inches
 - 2. Motor Data:
 - a. Motor make, and frame type and size
 - b. Horsepower and rpm
 - c. Volts, phase, and Hertz
 - d. Full-load amperage and service factor
 - e. Sheave make, size in inches, and bore
 - f. Center-to-center dimensions of sheave, and amount of adjustments in inches
 - g. Number, make, and size of belts
 - 3. Test Data (Indicated and Actual Values):
 - a. Total airflow rate in cfm
 - b. Total system static pressure in inches wg
 - c. Fan rpm
 - d. Discharge static pressure in inches wg

- e. Suction static pressure in inches wg
- I. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:
 - 1. Report Data:
 - a. System and air-handling-unit number
 - b. Location and zone
 - c. Traverse air temperature in degrees F
 - d. Duct static pressure in inches wg
 - e. Duct size in inches
 - f. Duct area in square feet
 - g. Indicated airflow rate in cfm
 - h. Indicated velocity in fpm
 - i. Actual airflow rate in cfm
 - j. Actual average velocity in fpm
 - k. Barometric pressure in psig
 - J. Air-Terminal-Device Reports:
 - 1. Unit Data:
 - a. System and air-handling unit identification.
 - b. Location and zone.
 - c. Apparatus used for test.
 - d. Area served.
 - e. Make.
 - f. Number from system diagram.
 - g. Type and model number.
 - h. Size.
 - i. Effective area in sq. ft

2. Test Data (Indicated and Actual Values):
 - a. Airflow rate in cfm.
 - b. Air velocity in fpm.
 - c. Preliminary airflow rate as needed in cfm.
 - d. Preliminary velocity as needed in fpm.
 - e. Final airflow rate in cfm.
 - f. Final velocity in fpm.
 - g. Space temperature in deg F.
- K. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:
 1. Unit Data:
 - a. System and air-handling-unit identification
 - b. Location and zone
 - c. Room or riser served
 - d. Coil make and size
 - e. Flowmeter type
 2. Test Data (Indicated and Actual Values):
 - a. Airflow rate in cfm
 - b. Entering-water temperature in degrees F
 - c. Leaving-water temperature in degrees F
 - d. Water pressure drop in feet of head or psig
 - e. Entering-air temperature in degrees F
 - f. Leaving-air temperature in degrees F

L. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:

1. Unit Data:

- a. Unit identification
- b. Location
- c. Service
- d. Make and size
- e. Model number and serial number
- f. Water flow rate in gpm
- g. Water pressure differential in feet of head or psig
- h. Required net positive suction head in feet of head or psig
- i. Pump rpm
- j. Impeller diameter in inches
- k. Motor make and frame size
- l. Motor horsepower and rpm
- m. Voltage at each connection
- n. Amperage for each phase
- o. Full-load amperage and service factor
- p. Seal type

2. Test Data (Indicated and Actual Values):

- a. Static head in feet of head or psig
- b. Pump shutoff pressure in feet of head or psig
- c. Actual impeller size in inches
- d. Full-open flow rate in gpm
- e. Full-open pressure in feet of head or psig
- f. Final discharge pressure in feet of head or psig

- g. Final suction pressure in feet of head or psig
- h. Final total pressure in feet of head or psig
- i. Final water flow rate in gpm
- j. Voltage at each connection
- k. Amperage for each phase

M. Instrument Calibration Reports:

- 1. Report Data:
 - a. Instrument type and make
 - b. Serial number
 - c. Application
 - d. Dates of use
 - e. Dates of calibration

3.22 VERIFICATION OF TAB REPORT:

- A. The TAB specialist's test and balance engineer shall conduct the inspection in the presence of commissioning authority.
- B. Commissioning authority shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 10 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.
- C. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
- D. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.
- E. If TAB work fails, proceed as follows:
 - 1. TAB specialists shall recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.

2. If the second final inspection also fails, Owner may contract the services of another TAB specialist to complete TAB work according to the Contract Documents and deduct the cost of the services from the original TAB specialist's final payment.
3. If the second verification also fails, Owner may contact AABC Headquarters regarding the AABC National Performance Guaranty.

F. Prepare test and inspection reports.

3.23 ADDITIONAL TESTS:

- A. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.
- B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

3.24 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 07 13
DUCT INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide duct insulation as indicated and in compliance with Contract Documents.
 - 1. Indoor, concealed supply and outdoor air
 - 2. Indoor, exposed supply and outdoor air
 - 3. Indoor, concealed return located in unconditioned space
 - 4. Indoor, exposed return located in unconditioned space
 - 5. Indoor, concealed exhaust between isolation damper and penetration of building exterior
 - 6. Indoor, exposed exhaust between isolation damper and penetration of building exterior.
 - 7. Outdoor, concealed supply and return
 - 8. Outdoor, exposed supply and return

2. MIL-A-24179A: Adhesive, Flexible Unicellular-Plastic Thermal
3. MIL-C-20079H: Cloth, Glass; Tape, Textile Glass; and Thread, Glass and Wire-Reinforced Glass
4. MIL-PRF-19565C: Coating Compounds, Thermal Insulation, Fire- and Water-Resistant, Vapor-Barrier

E. National Fire Protection Association (NFPA):

1. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems
2. 90B: Standard for the Installation of Warm Air Heating and Air-Conditioning Systems

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory- and field-applied if any).
- C. Field quality-control reports.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

- C. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.
- D. Mockups: Before installing insulation, build mockups for each type of insulation and finish listed below to demonstrate quality of insulation application and finishes. Build mockups in the location indicated or, if not indicated, as directed by Architect. Use materials indicated for the completed Work.
1. Ductwork Mockups:
 - a. One 10-foot section each of rectangular and round straight duct.
 - b. One each of a 90-degree mitered round and rectangular elbow, and one each of a 90-degree radius round and rectangular elbow.
 - c. One rectangular branch takeoff and one round branch takeoff from a rectangular duct. One round tee fitting.
 - d. One rectangular and round transition fitting.
 - e. Four support hangers for round and rectangular ductwork.
 - f. Each type of damper and specialty.
 2. For each mockup, fabricate cutaway sections to allow observation of application details for insulation materials, adhesives, mastics, attachments, and jackets.
 3. Notify Architect seven days in advance of dates and times when mockups will be constructed.
 4. Obtain Architect's approval of mockups before starting insulation application.
 5. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
 6. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
 7. Demolish and remove mockups when directed.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.08 COORDINATION:

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 23 05 29.
- B. Coordinate clearance requirements with duct Installer for duct insulation application. Before preparing ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.
- C. Coordinate installation and testing of heat tracing.

1.09 SCHEDULING:

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 GENERAL:

- A. Comply with requirements in "Duct Insulation Schedule, General," "Indoor Duct and Plenum Insulation Schedule," and "Aboveground, Outdoor Duct and Plenum Insulation Schedule" articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

- F. Flexible Elastomeric Insulation: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C534, Type II for sheet materials.
 - G. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C553, Type II and ASTM C1290, Type III with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - H. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C612, Type IA or Type IB. For duct and plenum applications, provide insulation with factory-applied ASJ Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - I. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ complying with ASTM C1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- 2.02 DUCT WRAP:
- A. Resin bonded fibrous glass blanket with a damage-resistant, flame retardant, reinforced aluminum foil (FRK) facing.
 - B. Duct wrap insulation is not known to contain penta-, octa, or deca-brominated diphenyl flame retardant substances, such as deca-Bromine (deca-BDE).
 - C. Certifications:
 - 1. GREENGUARD Indoor Air Quality Certified® and GREENGUARD Gold Certified
 - 2. Certified by SCS Global Services to contain a minimum of 53 percent recycled glass content, 31 percent pre-consumer and 22 percent post-consumer
 - 3. UL labeled
 - D. Duct Wrap Insulation:
 - 1. ASTM C1290, Type III, to maximum service temperature of 250 degrees°F, and ASTM C1136, Type II, facing material.
 - E. Acceptable Product: Owens Corning® SoftR® Duct Wrap FRK.
 - 1. Type 75: 0.75 lb./cu.ft. density: 1-1/2 in, 2 in, 2.2 in or 3 in thick
 - 2. Type 100: 1.0 lb./cu.ft. density: 1-1/2 in or 2 in thick
 - 3. Type 150: 1.5 lb./cu.ft. density: 1-1/2 in or 2 in thick

F. The duct wrap insulation shall consist of a blanket of glass fibers factory-laminated to a foil reinforced kraft (FRK) vapor retarder facing with a 2 in. stapling and taping flange on one edge.

G. Manufacturers:

1. Owens Corning
2. Johns Manville
3. Knauf Insulation

2.03 ADHESIVES:

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.

B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

1. Manufacturers:

- a. Foster
- b. Johns Manville

C. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

1. Manufacturers:

- a. Foster
- b. Johns Manville

2.04 MASTICS AND COATINGS

A. Materials shall be compatible with insulation materials, jackets, and substrates.

B. Vapor-Retarder Mastic: Water based; suitable for indoor use on below ambient services.

1. Water-Vapor Permeance: Comply with ASTM C755, Section 7.2.2, Table 2, for insulation type and service conditions.
2. Service Temperature Range: Minus 20 to plus 180 deg F.

C. Vapor-Retarder Mastic: Solvent based; suitable for indoor use on below ambient services.

1. Water-Vapor Permeance: Comply with ASTM C755, Section 7.2.2, Table 2, for insulation type and service conditions.

2. Service Temperature Range: 0 to 180 deg F.
 3. Color: White.
- D. Vapor-Retarder Mastic: Solvent based; suitable for outdoor use on below ambient services.
1. Water-Vapor Permeance: Comply with ASTM C755, Section 7.2.2, Table 2, for insulation type and service conditions.
 2. Service Temperature Range: Minus 50 to plus 220 deg F.
 3. Color: White.
- E. Breather Mastic: Water based; suitable for indoor and outdoor use on above ambient services.
1. Water-Vapor Permeance: ASTM E96, greater than 1.0 perm at manufacturer's recommended dry film thickness.
 2. Service Temperature Range: Minus 20 to plus 180 deg F.
 3. Color: White.

2.05 LAGGING ADHESIVES:

- A. Description: Comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.
1. Manufacturers:
 - a. Foster
 - b. Childers
 2. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over duct insulation.
 3. Service Temperature Range: 0 to plus 180 degrees F

2.06 SEALANTS:

- A. FSK and Metal Jacket Flashing Sealants:
1. Manufacturers:
 - a. Childers
 2. Materials shall be compatible with insulation materials, jackets, and substrates

3. Fire- and water-resistant, flexible, elastomeric sealant
4. Service Temperature Range: Minus 40 to plus 250 degrees F
5. Color: Aluminum

B. ASJ Flashing Sealants, and Vinyl and PVC Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250 deg F.
4. Color: White.

2.07 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C1136, Type I.
2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C1136, Type II.
4. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C1136, Type II.
5. Vinyl Jacket: White vinyl with a permeance of 1.3 perms when tested according to ASTM E96/E96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.08 FIELD-APPLIED CLOTHS:

A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and pre-sized a minimum of 8 oz./sq. yd.

1. Manufacturers:
 - a. GLT Products
 - b. Childers

B. Metal Jacket:

1. Aluminum Jacket: Comply with ASTM B209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
 - a. Sheet and roll stock ready for shop or field sizing.
 - b. Finish: Stucco embossed.
 - c. Moisture Barrier: Heat laminated 3-mil-thick, polyethylene–Surlyn, polyfilm moisture barrier.
2. Stainless-Steel Jacket: ASTM A167 or ASTM A240.
 - a. Sheet and roll stock ready for shop or field sizing.
 - b. Moisture Barrier: Heat laminated 3-mil-thick, polyethylene–Surlyn, polyfilm moisture barrier.
3. Manufacturers:
 - a. Johns Manville
 - b. K-flex USA

2.09 TAPES:

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C1136.
 1. Width: 3 inches.
 2. Thickness: 11.5 mils.
 3. Adhesion: 90 ounces force/inch in width.
 4. Elongation: 2 percent.
 5. Tensile Strength: 40 lbf/inch in width.
 6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.
 1. Manufacturers:
 - a. 3M

- b. Nashua
 - 2. Width: 3 inches
 - 3. Thickness: 6.5 mils
 - 4. Adhesion: 90 ounces force/inch in width
 - 5. Elongation: 2 percent
 - 6. Tensile Strength: 40 lbf/inch in width
 - 7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape
- C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
- 1. Width: 2 inches.
 - 2. Thickness: 6 mils.
 - 3. Adhesion: 64 ounces force/inch in width.
 - 4. Elongation: 500 percent.
 - 5. Tensile Strength: 18 lbf/inch in width.
- D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
- 1. Width: 2 inches.
 - 2. Thickness: 3.7 mils.
 - 3. Adhesion: 100 ounces force/inch in width.
 - 4. Elongation: 5 percent.
 - 5. Tensile Strength: 34 lbf/inch in width.

2.10 SECUREMENTS:

A. Bands:

- 1. Manufacturers:
 - a. Johns Manville
 - b. Band-it

2. Stainless Steel: ASTM A167 or ASTM A240, Type 304 or Type 316; 0.020 inch thick, 3/4 inch wide with wing seal.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch diameter shank, length to suit depth of insulation indicated.

a. Manufacturers:

- (1) GLT Products

2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

a. Manufacturers:

- (1) GLT Products

3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

a. Manufacturers:

- (1) GLT Products

- b. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.

- c. Spindle: Zinc-coated, low-carbon steel or Stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.

- d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.

4. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

- a. Baseplate: Perforated, nylon sheet, 0.030 inch thick by 1-1/2 inches in diameter.

- b. Spindle: Nylon, 0.106-inch-diameter shank, length to suit depth of insulation indicated, up to 2-1/2 inches.
 - c. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
- 5. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Baseplate: Galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
 - b. Spindle: Stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.
 - c. Adhesive-backed base with a peel-off protective cover.
- 6. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick, galvanized-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
 - a. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
 - b. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
 - c. Staples: Outward-clinching insulation staples, nominal 3/4-inch-wide, stainless steel or Monel
 - d. Wire: 16 gauge soft-annealed, stainless steel
 - e. Manufacturers:
 - (1) GLT Products

2.11 CORNER ANGLES:

- A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch , PVC according to ASTM D1784, Class 16354-C. White or color-coded to match adjacent surface.
- B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B209, Alloy 3003, 3005, 3105, or 5005; Temper H-14.
- C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A167 or ASTM A240, Type 304 or Type 316.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
 - 1. Verify that systems to be insulated have been tested and are free of defects.
 - 2. Verify that surfaces to be insulated are clean and dry.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

3.03 GENERAL INSTALLATION REQUIREMENTS:

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of ducts and fittings.
- B. Install insulation materials, vapor barriers or retarders, jackets, and thicknesses required for each item of duct system as specified in insulation system schedules.
- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Keep insulation materials dry during application and finishing.
- G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- H. Install insulation with least number of joints practical.
- I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.

3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.

J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

K. Install insulation with factory-applied jackets as follows:

1. Draw jacket tight and smooth.
2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
3. Overlap jacket longitudinal seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
 - a. For below ambient services, apply vapor-barrier mastic over staples.
4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct flanges and fittings.

L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

3.04 PENETRATIONS:

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.

1. Seal penetrations with flashing sealant.
2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.

3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
 4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
1. Seal penetrations with flashing sealant.
 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
 4. Seal jacket to wall flashing with flashing sealant.
- C. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.
- D. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Terminate insulation at fire damper sleeves for fire-rated wall and partition penetrations. Externally insulate damper sleeves to match adjacent insulation and overlap duct insulation at least 2 inches.
1. Comply with requirements in Section 07 84.
- E. Insulation Installation at Floor Penetrations:
1. Duct: For penetrations through fire-rated assemblies, terminate insulation at fire damper sleeves and externally insulate damper sleeve beyond floor to match adjacent duct insulation. Overlap damper sleeve and duct insulation at least 2 inches.
 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 00.
- 3.05 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION:
- A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.06 INSTALLATION OF MINERAL-FIBER INSULATION:

A. Blanket Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
 - a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
 - b. On duct sides with dimensions larger than 18 inches, place pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
 - c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not over-compress insulation during installation.
 - e. Impale insulation over pins and attach speed washers.
 - f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
 - a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
 - b. Install vapor stops for ductwork and plenums operating below 50 degrees F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over

the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.

5. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of 18 inches o.c.
 6. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
 7. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.
- B. Board Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
 2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
 3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
 - a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
 - b. On duct sides with dimensions larger than 18 inches, space pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
 - c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not over-compress insulation during installation.
 - e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
 4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching

staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.

- a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
 - b. Install vapor stops for ductwork and plenums operating below 50 degrees F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.
5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
 6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.07 FIELD-APPLIED JACKET INSTALLATION:

- A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.
 1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
 2. Embed glass cloth between two 0.062-inch-thick coats of lagging adhesive.
 3. Completely encapsulate insulation with coating, leaving no exposed insulation.
- B. Where FSK jackets are indicated, install as follows:
 1. Draw jacket material smooth and tight.
 2. Install lap or joint strips with same material as jacket.
 3. Secure jacket to insulation with manufacturer's recommended adhesive.
 4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch-wide joint strips at end joints.
 5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.
- C. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.

1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.
 - D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.
- 3.08 FIRE-RATED INSULATION SYSTEM INSTALLATION:
- A. Where fire-rated insulation system is indicated, secure system to ducts and duct hangers and supports to maintain a continuous fire rating.
 - B. Insulate duct access panels and doors to achieve same fire rating as duct.
 - C. Install firestopping at penetrations through fire-rated assemblies. Fire-stop systems are specified in Section 07 84 00.
- 3.09 FINISHES:
- A. Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 90 00 and Section 09 91 00.
 1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size
 - B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.
 - C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
 - D. Do not field paint aluminum or stainless-steel jackets.
- 3.10 DUCT INSULATION SCHEDULE, GENERAL:
- A. Plenums and Ducts Requiring Insulation:
 1. Indoor, concealed supply and outdoor air
 2. Indoor, exposed supply and outdoor air
 3. Indoor, concealed return located in unconditioned space
 4. Indoor, exposed return located in unconditioned space

5. Indoor, concealed exhaust between isolation damper and penetration of building exterior
6. Indoor, exposed exhaust between isolation damper and penetration of building exterior

B. Items Not Insulated:

1. Fibrous-glass ducts
2. Metal ducts with duct liner of sufficient thickness to comply with energy code and ASHRAE/IESNA 90.1
3. Factory-insulated flexible ducts
4. Factory-insulated plenums and casings
5. Flexible connectors
6. Vibration-control devices
7. Factory-insulated access panels and doors

3.11 INDOOR DUCT AND PLENUM INSULATION SCHEDULE:

A. Concealed supply-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density

B. Concealed return-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
2. Mineral-Fiber Board: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

C. Concealed outdoor-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 2 inches thick and 1.5-lb/cu. ft. nominal density
2. Mineral-Fiber Board: 2 inches thick and 1.5-lb/cu. ft. nominal density

D. Concealed exhaust-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
2. Mineral-Fiber Board: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

- E. Concealed, rectangular, exhaust-air duct insulation between isolation damper and penetration of building exterior shall be one of the following:
 - 1. Mineral-Fiber Blanket: 2 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 2 inches thick and 1.5-lb/cu. ft. nominal density
- F. Concealed, outdoor-air plenum insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 3 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 3 inches thick and 1.5-lb/cu. ft. nominal density.
- G. Concealed, exhaust-air plenum insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 2 inches 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density
- H. Exposed supply-air duct insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density
- I. Exposed return-air duct insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
- J. Exposed outdoor-air duct insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 2 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 2 inches thick and 1.5-lb/cu. ft. nominal density
- K. Exposed exhaust-air duct insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 2 inches 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density
- L. Exposed, supply-air plenum insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density

- M. Exposed, return-air plenum insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density
- N. Exposed, outdoor-air plenum insulation shall be one of the following:
 - 1. Mineral-Fiber Blanket: 3 inches thick and 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 3 inches thick and 1.5-lb/cu. ft. nominal density
- O. Exposed, exhaust-air plenum insulation shall be one of the following:
 - 1. (Mineral-Fiber Blanket: 2 inches 1.5-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density

3.12 INDOOR, FIELD-APPLIED JACKET SCHEDULE:

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Ducts and Plenums, Concealed: None
- D. Ducts and Plenums, Exposed:
 - 1. Aluminum, Stucco Embossed: 0.024 inch thick
 - 2. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.016 inch thick

3.13 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 07 16

HVAC EQUIPMENT INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide insulating HVAC equipment as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. ASTM International (ASTM):
 1. A240: Standard Specification for Heat-Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels
 2. B209: Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
 3. C450: Standard Practice for Fabrication of Thermal Insulating Fitting Covers to NPS Piping and Vessel Lagging
 4. C534: Standard Specification for Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form
 5. C552: Standard Specification for Cellular Glass Thermal Insulation
 6. C585: Standard Practice for Inner and Outer Diameters of Thermal Insulation for Nominal Sizes of Pipe and Tubing
 7. C795: Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel
 8. C871: Standard Test Methods for Chemical Analysis of Thermal Insulation materials for Leachable Chloride, Fluoride, Silicate, and Sodium Ions
 9. C1136: Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation
 10. C1290: Standard Specification for Flexible Fibrous Glass Blanket Insulation Used to Externally Insulate HVAC Ducts
 11. C1393: Standard Specification for Perpendicularly Oriented Mineral Fiber Roll and Sheet Thermal Insulation for Pipes and Tanks

12. D1784: Standard Specification for Rigid Poly Vinyl Chloride (PVC) Compounds and Chlorinated Poly Vinyl Chloride (CPVC) Compounds
13. E84: Standard Test Method for Surface Burning Characteristics of Building Materials
14. E96: Standard Test Methods for Water Vapor Transmission of Materials
15. F1249: Standard Test Method for Water Vapor Transmission Rate Through Plastic Film and Sheeting Using a Modulated Infrared Sensor

B. Military and Government Specs & Standards (MIL):

1. MIL-A-3316C: Adhesives, Fire-Resistant, Thermal Insulation
2. MIL-PRF-19565C: Coating Compounds, Thermal Insulation, Fire- and Water-Resistant, Vapor-Barrier

C. National Fire Protection Association (NFPA):

1. 90A: Standard for the Installation of Air-Conditioning and Ventilating Systems
2. 90B: Standard for the Installation of Warm Heating and Air-Conditioning Systems

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied if any).
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Detail removable insulation at equipment connections.
 2. Detail application of field-applied jackets.
 3. Detail application at linkages of control devices.
 4. Detail field application for each equipment type.
- D. Qualification Data: For qualified Installer.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- C. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products in accordance with ASTM E84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less and smoke-developed index of 50 or less.
- D. Insulation Installed Outdoors: Flame-spread index of 75 or less and smoke-developed index of 150 or less.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.08 COORDINATION:

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 23 05 29.
- B. Coordinate clearance requirements with equipment Installer for equipment insulation application.
- C. Coordinate installation and testing of heat tracing.

1.09 SCHEDULING:

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products in accordance with ASTM E84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

2.02 INSULATION MATERIALS:

- A. Comply with requirements in "Breeching Insulation Schedule," "Indoor Equipment Insulation Schedule," and "Outdoor, Aboveground Equipment Insulation Schedule" articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested in accordance with ASTM C871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable in accordance with ASTM C795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- F. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C534, Type II for sheet materials.
 - 1. Manufacturers:
 - a. Armacell
 - b. Kflex
- G. Mineral-Fiber Blanket: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C553, Type II, and ASTM C1290, Type III, with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Manufacturers:
 - a. Owens Corning

- b. Johns Manville
 - c. Knauf
- H. Mineral-Fiber, Pipe and Tank: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C1393.
 - 1. Manufacturers:
 - a. Owens Corning
 - b. Johns Manville
 - c. Knauf
 - 2. Semi-rigid board material with factory-applied FSK jacket.
 - 3. Nominal density is 2.5 pounds per cubic foot or more.
 - 4. Thermal conductivity (k-value) at 100 degrees F is 0.29 Btu x in./h x sq. ft. x degrees F or less.
 - 5. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

2.03 ADHESIVES:

- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. Flexible Elastomeric and Polyolefin Adhesive: Solvent-based adhesive.
 - 1. Flame-spread index shall be 25 or less and smoke-developed index shall be 50 or less as tested in accordance with ASTM E84.
 - 2. Wet Flash Point: Below 0 degrees F
 - 3. Service Temperature Range: 40 to 200 degrees F
- C. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
- D. ASJ Adhesive and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

2.04 LAGGING ADHESIVES:

- A. Adhesives shall comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.
 - 1. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over equipment insulation.
 - 2. Service Temperature Range: 20 to plus 180 degrees F
 - 3. Color: White

2.05 SEALANTS:

- A. Materials shall be as recommended by the insulation manufacturer and shall be compatible with insulation materials, jackets, and substrates.
- B. Joint Sealants:
 - 1. Permanently flexible, elastomeric sealant
 - 2. Service Temperature Range: Minus 58 to plus 176 degrees F
 - 3. Color: White or gray
- C. FSK and Metal Jacket Flashing Sealants:
 - 1. Fire- and water-resistant, flexible, elastomeric sealant
 - 2. Service Temperature Range: Minus 40 to plus 250 degrees F
 - 3. Color: Aluminum
- D. ASJ Flashing Sealants and Vinyl, PVDC, and PVC Jacket Flashing Sealants:
 - 1. Fire- and water-resistant, flexible, elastomeric sealant
 - 2. Service Temperature Range: Minus 40 to plus 250 degrees F
 - 3. Color: White

2.06 FACTORY-APPLIED JACKETS:

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
 - 1. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.

2. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with Kraft-paper backing; complying with ASTM C1136, Type II.

2.07 FIELD-APPLIED CLOTHS:

- A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and pre-sided a minimum of 8 oz./sq. yd.
- B. Metal Jacket:
 1. Aluminum Jacket: Comply with ASTM B209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
 - a. Finish and thickness are indicated in field-applied jacket schedules
 - b. Moisture Barrier for Indoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper
 - c. Moisture Barrier for Outdoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper
 - d. Factory-Fabricated Fitting Covers:
 - (1) Same material, finish, and thickness as jacket
 - (2) Preformed two-piece or gore, 45- and 90-degree, short- and long-radius elbows
 - (3) Tee covers
 - (4) Flange and union covers
 - (5) End caps
 - (6) Beveled collars
 - (7) Valve covers
 - (8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available

2.08 TAPES:

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C1136.
 1. Width: 3 inches
 2. Thickness: 11.5 mils

3. Adhesion: 90 ounces force/inch in width
 4. Elongation: 2 percent
 5. Tensile Strength: 40 lbf/inch in width
 6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.
1. Width: 3 inches
 2. Thickness: 6.5 mils
 3. Adhesion: 90 ounces force/inch in width
 4. Elongation: 2 percent
 5. Tensile Strength: 40 lbf/inch in width
 6. FSK Tape Disks and Squares: Precut disks or squares of FSK tape
- C. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Width: 2 inches
 2. Thickness: 3.7 mils
 3. Adhesion: 100 ounces force/inch in width
 4. Elongation: 5 percent
 5. Tensile Strength: 34 lbf/inch in width

2.09 SECUREMENTS:

A. Bands:

1. Stainless Steel: ASTM A240, Type 316; 0.015 inch thick, 3/4 inch wide with wing seal.

2.10 CORNER ANGLES:

- A. Aluminum Corner Angles: 0.040-inch-thick, minimum 1- by 1-inch aluminum in accordance with ASTM B209, Alloy 3003, 3005, 3105, or 5005; Temper H-14.
- B. Stainless Steel Corner Angles: 0.024-inch-thick, minimum 1- by 1-inch stainless steel in accordance with ASTM A240, Type 316.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
 - 1. Verify that systems and equipment to be insulated have been tested and are free of defects.
 - 2. Verify that surfaces to be insulated are clean and dry.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Coordinate insulation installation with the tradesman installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

3.03 GENERAL INSTALLATION REQUIREMENTS:

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment.
- B. Install insulation materials, forms, vapor barriers or retarders, and jackets, of thicknesses required for each item of equipment, as specified in insulation system schedules.
- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Keep insulation materials dry during storage, application, and finishing. Replace insulation materials that get wet.
- G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- H. Install insulation with least number of joints practical.

- I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends attached to structure with vapor-barrier mastic.
 - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 - 4. Cover inserts with jacket material matching adjacent insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- K. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward-clinching staples along both edges of strip, spaced 4 inches o.c.
 - 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward-clinching staples along edge at 4 inches o.c.
 - a. For below-ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, in accordance with insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints.
- L. Cut insulation in a manner to avoid compressing insulation more than 25 percent of its nominal thickness.
- M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches in similar fashion to butt joints.

O. For above-ambient services, do not install insulation to the following:

1. Vibration-control devices
2. Testing agency labels and stamps
3. Nameplates and data plates
4. Maintenance holes
5. Handholes
6. Cleanouts

3.04 INSTALLATION OF EQUIPMENT, TANK, AND VESSEL INSULATION:

A. Mineral-Fiber, Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive, anchor pins, and speed washers.

1. Apply adhesives in accordance with manufacturer's recommended coverage rates per unit area, for 100 percent coverage of tank and vessel surfaces.
2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
3. Protect exposed corners with secured corner angles.
4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
 - a. Do not weld anchor pins to ASME-labeled pressure vessels.
 - b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
 - c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints and 16 inches o.c. in both directions.
 - d. Do not over-compress insulation during installation.
 - e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
 - f. Impale insulation over anchor pins and attach speed washers.
 - g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

5. Secure each layer of insulation with stainless steel or aluminum bands. Select band material compatible with insulation materials.
 6. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
 7. Stagger joints between insulation layers at least 3 inches.
 8. Install insulation in removable segments on equipment access doors, maintenance holes, handholes, and other elements that require frequent removal for service and inspection.
 9. Bevel and seal insulation ends around maintenance holes, handholes, ASME stamps, and nameplates.
 10. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.
- B. Flexible Elastomeric Thermal Insulation Installation for Tanks and Vessels: Install insulation over entire surface of tanks and vessels.
1. Apply 100 percent coverage of adhesive to surface with manufacturer's recommended adhesive.
 2. Seal longitudinal seams and end joints.
- C. Insulation Installation on Pumps:
1. Fabricate metal boxes lined with insulation. Fit boxes around pumps and coincide box joints with splits in pump casings. Fabricate joints with outward bolted flanges. Bolt flanges on 6-inch centers, starting at corners. Install 3/8-inch-diameter fasteners with wing nuts. Alternatively, secure the box sections together using a field-adjustable latching mechanism.
 2. Fabricate boxes from aluminum or stainless steel, at least 0.050 inch thick.
 3. For below-ambient services, install a vapor barrier at seams, joints, and penetrations. Seal between flanges with replaceable gasket material to form a vapor barrier.

3.05 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION:

- A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.06 FIELD-APPLIED JACKET INSTALLATION:

- A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

- 1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
- 2. Embed glass cloth between two 0.062-inch-thick coats of lagging adhesive.
- 3. Completely encapsulate insulation with coating, leaving no exposed insulation.

- B. Where FSK jackets are indicated, install as follows:

- 1. Draw jacket material smooth and tight.
- 2. Install lap or joint strips with same material as jacket.
- 3. Secure jacket to insulation with manufacturer's recommended adhesive.
- 4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch-wide joint strips at end joints.
- 5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

- C. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless steel bands 12 inches o.c. and at end joints.

3.07 FINISHES:

- A. Equipment Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 90 00.

- 1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size

- B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.

- C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
- D. Do not field paint aluminum or stainless-steel jackets.

3.08 EQUIPMENT INSULATION SCHEDULE, GENERAL:

- A. Insulation conductivity and thickness per pipe size shall comply with schedules in this Section or with requirements of authorities having jurisdiction, whichever is more stringent.
- B. Acceptable insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials is Contractor's option.

3.09 INDOOR EQUIPMENT INSULATION SCHEDULE:

- A. Insulate indoor and outdoor equipment that is not factory insulated.
- B. Chilled-glycol pump insulation shall be the following:
 - 1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density
- C. Heating-hot-glycol pump insulation shall be the following:
 - 1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density
- D. Chilled-glycol expansion/compression tank insulation shall be one of the following:
 - 1. Flexible Elastomeric: 1 inch thick
 - 2. Mineral-Fiber Board: 1 inch thick and 2-lb/cu. ft. nominal density
 - 3. Mineral-Fiber Pipe and Tank: 1 inch thick
- E. Heating-hot-water expansion/compression tank insulation shall be one of the following:
 - 1. Mineral-Fiber Board: 1 inch thick and 2-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Pipe and Tank: 1 inch thick
- F. Chilled-water air-separator insulation shall be one of the following:
 - 1. Flexible Elastomeric: 1 inch thick
 - 2. Mineral-Fiber Board: 1 inch thick and 2-lb/cu. ft. nominal density
 - 3. Mineral-Fiber Pipe and Tank: 1 inch thick

- G. Heating-hot-glycol air-separator insulation shall be one of the following:
 - 1. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density
 - 2. Mineral-Fiber Pipe and Tank: 2 inches thick
- H. Piping system filter-housing insulation shall be the following:
 - 1. Mineral-Fiber Pipe and Tank: 2 inches thick
- 3.10 INDOOR, FIELD-APPLIED JACKET SCHEDULE:
 - A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
 - B. If more than one material is listed, selection from materials listed is Contractor's option.
 - C. Equipment, Concealed: None.
 - D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces of up to 72 Inches:
 - 1. Aluminum, Stucco Embossed: 0.024 inch thick
 - E. Equipment, Exposed, Larger than 48 Inches in Diameter or with Flat Surfaces Larger than 72 Inches:
 - 1. Aluminum, Smooth with 1-1/4-Inch-Deep Corrugations: 0.032 inch thick
- 3.11 CLOSEOUT ACTIVITIES:
 - A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 07 19

HVAC PIPING INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide insulation for HVAC piping systems as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)
 - 1. 90.1-01: Energy Standard for Buildings Except Low-Rise Residential Buildings (IESNA co-sponsored; ANSI approved; Continuous Maintenance Standard).
- B. ASTM International (ASTM):
 - 1. B209: Standard Specification for Aluminum and Aluminum Alloy Sheet and Plate Metric.
 - 2. C335: Standard Test Method for Steady State Heat Transfer Properties of Horizontal Pipe Insulation.
 - 3. C411: Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation.
 - 4. C449: Standard Specification for Mineral Fiber-Hydraulic-Setting Thermal Insulating and Finishing Cement.
 - 5. C533: Calcium Silicate Block and Pipe Thermal Insulation.
 - 6. C547: Mineral Fiber Pipe Insulation.
 - 7. C795: Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel.
 - 8. C921: Standard Practice for Determining the Properties of Jacketing Materials for Thermal Insulation.

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.

- B. Product Data: For each type of product. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied if any).
 - C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 - 2. Detail attachment and covering of heat tracing inside insulation.
 - 3. Detail insulation application at pipe expansion joints for each type of insulation.
 - 4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
 - 5. Detail removable insulation at piping specialties.
 - 6. Detail application of field-applied jackets.
 - D. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use.
 - 1. Preformed Pipe Insulation Materials: 12 inches long by NPS 2.
 - 2. Sheet Form Insulation Materials: 12 inches square.
 - 3. Jacket Materials for Pipe: 12 inches long by NPS 2.
 - 4. Sheet Jacket Materials: 12 inches square.
 - 5. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.
 - E. Qualification Data: For qualified Installer.
 - F. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.
 - G. Field quality-control reports.
- 1.04 SUSTAINABLE DESIGN:
- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.
- C. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products in accordance with ASTM E84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.08 DELIVERY, STORAGE, AND HANDLING:

- A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.09 COORDINATION:

- A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Sections 23 05 29 and 23 23 00.
- B. Coordinate clearance requirements with piping Installer for piping insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.
- C. Coordinate installation and testing of heat tracing.

1.10 SCHEDULING:

- A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.
- B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 INSULATION MATERIALS:

- A. Comply with requirements in "Piping Insulation Schedule, General," "Indoor Piping Insulation Schedule," "Outdoor, Aboveground Piping Insulation Schedule," and "Outdoor, Underground Piping Insulation Schedule" articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come into contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested in accordance with ASTM C871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable in accordance with ASTM C795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- F. Fiberglass: Heavy density resin bonded inorganic glass fibers.
 - 1. Comply with:
 - a. ASTM C547
 - b. ASTM C585
 - c. ASTM C1136
 - 2. Manufacturers:
 - a. Owens Corning – SSL II with ASJ.
 - b. Armacell
 - c. Rubatex
 - 3. Preformed Pipe Insulation: Type I, Grade A.

4. Preformed Pipe Insulation: Type IV, Grade B.
 5. Factory fabricate shapes in accordance with ASTM C450 and ASTM C585.
 6. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- G. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C534, Type I for tubular materials, Type II for sheet materials.
1. Manufacturers:
 - a. Armacell
 - b. Kflex.
- 2.02 ADHESIVES:
- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. Flexible Elastomeric and Polyolefin Adhesive: Solvent-based adhesive.
1. Flame-spread index shall be 25 or less and smoke-developed index shall be 50 or less as tested in accordance with ASTM E84.
 2. Wet Flash Point: Below 0 degrees F.
 3. Service Temperature Range: 40 to 200 degrees F.
- C. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
1. Manufacturers:
 - a. Foster
 - b. Johns Manville
- D. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
1. Manufacturers:
 - a. Foster
 - b. Johns Manville

2.03 MASTICS AND COATINGS

- A. Materials shall be compatible with insulation materials, jackets, and substrates.
- B. Vapor-Retarder Mastic, Water Based: Suitable for indoor use on below-ambient services.
 - 1. Water-Vapor Permeance: Comply with ASTM E96/E96M or ASTM F1249.
 - 2. Service Temperature Range: 0 to plus 180 deg F.
 - 3. Comply with MIL-PRF-19565C, Type II, for permeance requirements, with supplier listing on DOD QPD - Qualified Products Database.
 - 4. Color: White
- C. Vapor-Retarder Mastic, Solvent Based, Indoor Use: Suitable for indoor use on below-ambient services.
 - 1. Water-Vapor Permeance: Comply with ASTM E96/E96M or ASTM F1249.
 - 2. Service Temperature Range: 0 to 180 deg F.
 - 3. Color: White
- D. Vapor-Retarder Mastic, Solvent Based, Outdoor Use: Suitable for outdoor use on below-ambient services.
 - 1. Water-Vapor Permeance: Comply with ASTM E96/E96M or ASTM F1249.
 - 2. Service Temperature Range: Minus 50 to plus 220 deg F.
 - 3. Color: White
- E. Breather Mastic: Water based; suitable for indoor and outdoor use on above-ambient services.
 - 1. Water-Vapor Permeance: ASTM E96/E96M, greater than 1.0 perm at manufacturer's recommended dry film thickness.
 - 2. 3. Service Temperature Range: 0 to plus 180 deg F.
 - 3. Color: White.

2.04 LAGGING ADHESIVES:

- A. Adhesives shall comply with MIL-A-3316C, Class I, Grade A, and shall be compatible with insulation materials, jackets, and substrates.

1. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over pipe insulation.
2. Service Temperature Range: 20 to plus 180 degrees F.
3. Color: White.

2.05 SEALANTS:

- A. Materials shall be as recommended by the insulation manufacturer and shall be compatible with insulation materials, jackets, and substrates.
- B. Joint Sealants:
 1. Permanently flexible, elastomeric sealant.
 2. Service Temperature Range: Minus 58 to plus 176 degrees F.
 3. Color: White or gray.
- C. FSK and Metal Jacket Flashing Sealants:
 1. Fire- and water-resistant, flexible, elastomeric sealant.
 2. Service Temperature Range: Minus 40 to plus 250 degrees F.
 3. Color: Aluminum.
- D. ASJ Flashing Sealants and Vinyl, PVDC, and PVC Jacket Flashing Sealants:
 1. Fire- and water-resistant, flexible, elastomeric sealant.
 2. Service Temperature Range: Minus 40 to plus 250 degrees F.
 3. Color: White.

2.06 FACTORY-APPLIED JACKETS:

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
 1. ASJ: White, Kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C1136, Type I.
 2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.
 3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with Kraft-paper backing; complying with ASTM C1136, Type II.

2.07 FIELD-APPLIED JACKETS:

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
 - 1. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.
 - 2. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with Kraft-paper backing; complying with ASTM C1136, Type II.

2.08 FIELD-APPLIED CLOTHS:

- A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and provided a minimum of 8 oz./sq. yd.
- B. Metal Jacket:
 - 1. Aluminum Jacket: Comply with ASTM B209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.
 - a. Finish and thickness are indicated in field-applied jacket schedules.
 - b. Moisture Barrier for Indoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper.
 - c. Moisture Barrier for Outdoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper.
 - d. Factory-Fabricated Fitting Covers:
 - (1) Same material, finish, and thickness as jacket.
 - (2) Preformed two-piece or gore, 45- and 90-degree, short- and long-radius elbows.
 - (3) Tee covers.
 - (4) Flange and union covers.
 - (5) End caps.
 - (6) Beveled collars.
 - (7) Valve covers.
 - (8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

2.09 TAPES:

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C1136.
 - 1. Width: 3 inches.
 - 2. Thickness: 11.5 mils.
 - 3. Adhesion: 90 ounces force/inch in width.
 - 4. Elongation: 2 percent.
 - 5. Tensile Strength: 40 lbf/inch in width.
 - 6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.
 - 1. Width: 3 inches.
 - 2. Thickness: 6.5 mils.
 - 3. Adhesion: 90 ounces force/inch in width.
 - 4. Elongation: 2 percent.
 - 5. Tensile Strength: 40 lbf/inch in width.
 - 6. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
- C. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
 - 1. Width: 2 inches.
 - 2. Thickness: 3.7 mils.
 - 3. Adhesion: 100 ounces force/inch in width.
 - 4. Elongation: 5 percent.
 - 5. Tensile Strength: 34 lbf/inch in width.

2.10 SECUREMENTS:

- A. Bands: Stainless Steel: ASTM A240, Type 316; 0.015 inch thick, 3/4 inch wide with wing seal.

- B. Staples: Outward-clinching insulation staples, nominal 3/4 inch wide, stainless steel or Monel.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
 - 1. Verify that systems to be insulated have been tested and are free of defects.
 - 2. Verify that surfaces to be insulated are clean and dry.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

- A. Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Coordinate insulation installation with the tradesman installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

3.03 GENERAL INSTALLATION REQUIREMENTS:

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.
- B. Install insulation materials, forms, vapor barriers or retarders, jackets, and of thicknesses required for each item of pipe system, as specified in insulation system schedules.
- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
- G. Keep insulation materials dry during storage, application, and finishing. Replace insulation materials that get wet.

- H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- I. Install insulation with least number of joints practical.
- J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends attached to structure with vapor-barrier mastic.
 - 3. Install insert materials and insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 - 4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- L. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward-clinching staples along both edges of strip, spaced 4 inches o.c.
 - 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward-clinching staples along edge at 4 inches o.c.
 - a. For below-ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, in accordance with insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.
- M. Cut insulation in a manner to avoid compressing insulation more than 25 percent of its nominal thickness.

- N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches in similar fashion to butt joints.
- P. For above-ambient services, do not install insulation to the following:
 - 1. Vibration-control devices
 - 2. Testing agency labels and stamps
 - 3. Nameplates and data plates

3.04 PENETRATIONS:

- A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
 - 4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.
- C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
 - 4. Seal jacket to wall flashing with flashing sealant.

- D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.
 - E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
 - 1. Comply with requirements in Section 07 84 00 for firestopping and fire-resistive joint sealers.
 - F. Insulation Installation at Floor Penetrations:
 - 1. Pipe: Install insulation continuously through floor penetrations.
 - 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 00.
- 3.05 GENERAL PIPE INSULATION INSTALLATION:
- A. Requirements in this article generally apply to all insulation materials, except where more specific requirements are specified in various pipe insulation material installation articles.
 - B. Insulation Installation on Fittings, Valves, Strainers, Flanges, Mechanical Couplings, and Unions:
 - 1. Install insulation over fittings, valves, strainers, flanges, mechanical couplings, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
 - 2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as that of adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
 - 3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as that used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
 - 4. Insulate valves using preformed fitting insulation of same material, density, and thickness as that used for adjacent pipe. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.

5. Insulate strainers using preformed fitting insulation of same material, density, and thickness as that used for adjacent pipe. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers, so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.
 6. Insulate flanges, mechanical couplings, and unions using a section of oversized preformed pipe insulation to fit. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Stencil or label the outside insulation jacket of each union with the word "union" matching size and color of pipe labels.
 7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
 8. For services not specified to receive a field-applied jacket, except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing, using PVC tape.
- C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

3.06 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION:

- A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- B. Insulation Installation on Pipe Flanges:
 1. Install pipe insulation to outer diameter of pipe flange.
 2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
 3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as that of pipe insulation.

4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install mitered sections of pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed valve covers manufactured of same material as that of pipe insulation when available.
2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties, and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.07 INSTALLATION OF MINERAL-FIBER INSULATION:

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of preformed pipe insulation to pipe with wire or bands, and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward-clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive, as recommended by insulation material manufacturer, and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.

2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Refrigerant Piping:

1. Install insulation in snug contact with pipe and in accordance with Manufacturer's recommendations.
 - a. Insulate flexible pipe connectors.
 - b. Insulate thermal expansion valves with insulating tape.
 - c. Insulate fittings with sheet insulation and as recommended by Manufacturer.
2. Slip insulation on tubing before tubing sections and fittings are assembled keeping slitting of insulation to a minimum.
3. Do not install insulation on lines through clamp assembly of pipe support. Butt insulation up against sides of clamp assembly.
4. Provide 6-inch-long, 20 ga galvanized steel sleeve around pipe insulation at each support. Extend insulation through pipe support clamps.
5. Stagger joints on layered insulation. Seal joints in insulation.
6. Install insulation exposed outside building so 'slit' joint seams are placed on bottom of pipe.
7. Paint exterior exposed insulation with two coats of specified exterior finish.
8. System Requirements:
 - a. Condensing Units - Install insulation on above-ground refrigerant suction piping and fittings, including thermal bulb, from thermal expansion valve.

- b. Split System Heat Pump Units - Install insulation on above-ground refrigerant liquid and suction piping and fittings.

E. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available.
2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

3.08 FIELD-APPLIED JACKET INSTALLATION:

A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.
2. Embed glass cloth between two 0.062-inch-thick coats of lagging adhesive.
3. Completely encapsulate insulation with coating, leaving no exposed insulation.

B. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.
2. Install lap or joint strips with same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

C. Where PVC jackets are indicated and for horizontal applications, install with 1-inch overlap at longitudinal seams and end joints. Seal with manufacturer's recommended adhesive.

1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

- D. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless steel bands 12 inches o.c. and at end joints.

3.09 FINISHES:

- A. Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 90 00 and Section 09 91 10.
 - 1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.
- C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
- D. Do not field paint aluminum or stainless steel jackets.

3.10 PIPING INSULATION SCHEDULE, GENERAL:

- A. Insulation conductivity and thickness per pipe size shall comply with schedules in this Section or with requirements of authorities having jurisdiction, whichever is more stringent.
- B. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.
- C. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
 - 1. Underground piping.
 - 2. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

3.11 INDOOR PIPING INSULATION SCHEDULE:

- A. Condensate and Equipment Drain Water below 60 Degrees F:
 - 1. All Pipe Sizes: Insulation shall be one of the following:
 - a. Flexible Elastomeric: 3/4 inch thick.
 - b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.

B. Chilled Water and Glycol:

1. NPS 2 and Smaller: Insulation shall be the following:
 - a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
2. NPS 3 to NPS 12: Insulation shall be the following:
 - a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.

C. Heating-Hot -Water or Glycol Supply and Return:

1. NPS 2 and Smaller: Insulation shall be the following:
 - a. Mineral-Fiber, Preformed Pipe, Type I: 1 inch thick.
2. NPS 3 and Larger: Insulation shall be the following:
 - a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.

3.12 OUTDOOR, ABOVEGROUND PIPING INSULATION SCHEDULE:

A. Chilled Water and Glycol:

1. All Pipe Sizes: Insulation shall be one of the following:
 - a. Flexible Elastomeric: 2 inches thick.
 - b. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.

3.13 REFRIGERANT FLEXIBLE FOAMED PIPE INSULATION

A. Flexible Foamed Pipe Insulation

1. Thickness -
 - a. 1/2 inch for one inch outside diameter and smaller pipe.
 - b. 3/4 inch for 1-1/8 through 2 inch outside diameter pipe.
 - c. One inch for 2-1/8 inches outside diameter and larger pipe (two layers of 1/2 inch.)
 - d. One inch sheet for fittings as recommended by Manufacturer.

3.14 INDOOR, FIELD-APPLIED JACKET SCHEDULE:

- A. If no factory jacket is provided install jacket over insulation material.

- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Piping, Concealed: None
- D. Piping, Exposed in Non-Abuse Areas: ASJ
- E. Piping, Exposed in Abuse Areas: PVC
- F. Fitting Exposed in All Areas: PVC

3.15 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE:

- A. If no factory jacket is provided install jacket over insulation material.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Piping, Concealed: Aluminum, Stucco Embossed: 0.024 inch thick.
- D. Piping, Exposed: Aluminum, Stucco Embossed with Z-Shaped Locking Seam: 0.024 inch thick.

3.16 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 09 23

AUTOMATIC TEMPERATURE CONTROLS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide automatic temperature controls as indicated and in compliance with Contract Documents.
- B. This Section specifies the general requirements for monitoring and controlling HVAC equipment.
- C. The automatic temperature control system shall include integration with a Building Automation System (BAS).
 - 1. The BAS and control network shall be based on the open communication BACnet protocol.
- D. The HVAC system is to be complete with all necessary control components and connections to achieve the specified functions. Reference all control narratives for general outline of expected functionality.
- E. Furnish all materials, including all Human Machine Interface (HMI) hardware and software, operator input/output peripherals, standalone local control panels, automation sensors and controls, wiring, and interface systems.
- F. The control system is to be set up and adjusted to achieve energy efficient operation of the HVAC system. This includes sequencing, timing and re-adjustment, as required.
- G. This section is a performance specification clarified in certain sections to establish minimum standard of equipment, installation and level of control.
- H. Provide following electrical work as Work of this section, complying with requirements of Division 26:
 - 1. Control and power wiring between field installed controls, indicating devices, and unit control panels.
- I. Work by Others:
 - 1. Power supply wiring for HVAC Equipment and Automatic Temperature Control Panels.
- J. Related Requirements:
 - 1. Section 23 09 93 Automatic Control Sequences.

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 70: National Electrical Code
2. NFPA 820 for Water Treatment Plants
3. ASHRAE 62.1

1.03 SUBMITTALS:

A. Provide submittals in accordance with Section 01 33 00 and the following:

1. Manufacturer's descriptive literature for each control device furnished indicating dimensions, capacities, performance characteristics, electrical characteristics, finishes of materials, and installation and startup instructions.
2. Control panel layouts including door mounted control and indication devices.
3. Interconnection schematics and communication network riser diagrams.
4. Wiring and piping diagrams.
5. One-line diagram from sensor and control devices to automatic temperature control panels including all components and cables.
6. Terminal cabinets, including termination listing.
7. Written description indicating sequence of operation.
8. Shop Drawings will be rejected if the written description is not included with the submission. Sequences should reference English descriptors and labels for each point described. Follow any established client cable and equipment tagging system.
9. All input/output points which are to include the following information associated with each point.
 - a. Sensing element type and location.
 - b. Details of associated field wiring schematics and schedules.
 - c. Software and programming details.
10. Detailed block diagrams of transmission trunk routing and configuration.
11. Valve and damper schedules indicating size, configuration, capacity and locations.

B. Submit shop drawings in accordance with Section 01 33 00.

1. Schematic flow diagram of system showing fans, pumps, coils, dampers, valves, and control devices.
 2. Label each control device with setting or adjustable range of control.
 3. Indicate required electrical wiring. Differentiate between portions of wiring factory-installed and portions field-installed.
 4. Provide details of faces of control panels including controls, instruments, and labeling.
 5. Provide one-line schematic for starters affected by control system showing interlocks between starters and control system and any other interlocks not necessarily provided as part of control system.
- 1.04 SUSTAINABLE DESIGN:
- A. Comply with the requirements specified in Section 01 81 13.01.
- 1.05 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
- 1.06 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
- 1.07 DELIVERY STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.
- 1.08 FREEZE PROTECTION:
- A. All air supply handling units containing coils are to have a non-recycling, manual reset, electric line voltage freeze protection controller that stops the system upon sensing 40 degrees F.
 - B. The freeze protection controllers are to contain an additional set of dry contacts that closes on freeze detection for remote alarm indication at the SCADA.
 - C. The freeze protection contacts are to be connected on the common line after the HOA selector switch.
 - D. BAS to shut down all supply air handling units containing coils, upon sensing air off the coils at 40 degrees F.
 - E. Allow up to three (3) restarts, over short period before generating an alarm.

1.09 ALARMS – GENERAL:

- A. No alarm is to be triggered for a device until the device has been started and is in stable operation. Use software time delays to achieve this requirement.
- B. Generate an alarm on the SCADA if any equipment is not in the intended operating condition or if any analog input is not within the intended operating range.

1.10 MAINTENANCE

- A. Within 30 days after Substantial Completion, present to OWNER for consideration, preventive maintenance contract to cover service incidental to continued proper performance of system and devices during guarantee period.
- B. Maintenance of system components are not CONTRACTOR'S responsibility during and after guarantee period, unless contracted for by OWNER.
- C. Provide schedule of maintenance tasks necessary to keep CONTRACTOR guarantee in effect through guarantee period.
- D. Provide list of recommended preventive maintenance procedures including task frequency and tools required to perform tasks. Provide instructions for each task in O&M data.
- E. OWNER will keep records, schedules, and other reports documenting OWNER-performed prescribed maintenance procedures during guarantee period. CONTRACTOR not liable for defective systems, devices or components or repair, if OWNER-performed required preventive maintenance procedures not performed and documented.
- F. Warranty period: 24 months commencing at Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturer's equipment used as basis of design for Project is name indicated in Specification for particular type of equipment or application contained in Contract Documents subject to Owner acceptance. If no manufacturer listed, basis of design is industry standard indicated.
- B. Manufacturers:
 - 1. Automated Logic
 - 2. Johnson Controls, Inc.
 - 3. Alerton
 - 4. Or equal.

2.02 GENERAL:

- A. Provide automatic temperature control products and supporting system components of type, architecture, size, and capacities indicated, conforming to manufacturer's standard materials and components as published in product information; designed and constructed as recommended by manufacturer and required for application indicated.
- B. Provide a BACNet BAS system as a distributed control system. The system shall have local temperature control panels, a communications network, and a separate workstation computer with workstation software. The workstations and network controllers shall communicate to any outside network using TCP/IP protocol and addressing.
- C. Provide an operator programmable system to perform closed-loop, modulating control of building equipment. Connect all digital controllers through the communication network to share common data and report to workstation computer. Provide workstation BAS software capable of programming and monitoring the digital controllers. The control system shall be capable of downloading programs between the workstation and digital controllers.
- D. Apply digital controllers in a distributed control manner.
- E. Design, provide and install all conduit and wiring linking all elements of system, including future capability.
- F. All control units in the BAS are to be BACnet compliant with open protocol to allow future replacement of obsolete components or integration of another manufacturer's BACnet compliant components and any existing BAS system
- G. All control units in the BAS are to be BACnet compliant with open protocol to allow for integration with the SCADA system.
- H. Location of controllers to be approved by the Engineer prior to installation.
- I. Provide analog output and input devices utilizing a 0-10 VDC or 4-20 mA control signal. Verify input and output requirements from BAS to other vendor supplied equipment controls and configure accordingly.
- J. Provide field instrumentation and sensing devices analog or digital as applicable which measure temperature, humidity, pressure, flow, current, voltage, equipment states, etc., and which input signals to the SCU terminal strip that conform to the input requirements. All field devices will be of industrial grade.
- K. Provide output devices and actuators which convert the digital or analog output signal from the SCU to activate relays or open and close valves, dampers, etc.
- L. The end-to-end accuracy called for in Subsection 2.9 includes the combined effect of sensitivity, hysteresis, linearity and repeatability between the measured variable and the

input to the analog-to-digital converter in the SCU or between the SCU input to the digital-to-analog converter and the controlled variable for the full sensing range.

2.03 BAS SYSTEM INTERNET BASED ACCESSIBILITY

- A. The control system must be capable of Internet connectivity for remote accessibility by up to four (4) simultaneous users. Internet accessibility will be provided with same level of password protection (four levels) for internal accessibility. Internet based accessibility will provide full access to the BAS system including monitoring, diagnostic functions, setpoint adjustment, access to real time and archived trending data and reports.

2.04 STAND-ALONE CONTROLLERS:

A. Inputs:

1. Provide input function integral to the standalone controllers. Provide input type(s) as required by the systems design. For each type of input used on high-level controllers, provide at least one similar spare input point per controller.
2. Analog Inputs: Allowable input types are 100-ohm (or higher) platinum RTDs, 4-20 mA, and 2-10 VDC. Direct RTD inputs must have appropriate conversion curves stored in controller software or firmware. Analog to digital (A/D) conversion shall have 16-bit minimum resolution.
3. Digital Inputs: Digital inputs shall sense open/close, on/off, or other two state indications.

B. Outputs:

1. Provide output function integral to the standalone controller. Provide output type(s) as required by the systems design. For each type of output used on high-level controllers, provide at least one (1) similar spare output point per controller.
2. Analog Outputs: Provide controllers with 16-bit minimum output resolution. Output shall be 4-20 mA or 2-10 VDC.
3. Digital Outputs: Provide contacts rated at a minimum of 1 ampere at 24 V.

C. PID Control:

1. Provide controllers with proportional integral and derivative control capability.
2. The upper level digital controllers shall be capable of networking with other similar upper level controllers. Upper level controllers shall also be capable of communicating over a network between buildings.

D. Communications Ports:

1. Controller-to-Controller LAN Communications Ports: Controllers in the building BAS system shall be connected on a communications network. Controllers shall have controller to controller communication ports to both peer controllers (upper level controllers) and terminal controllers (lower level controllers). Network may consist of more than one level of local area network and one level may have multiple drops. Communications network shall permit sharing information between controllers, allowing execution of dynamic control strategies, and coordinated response to alarm conditions. Minimum speed for all LAN's is 100 Mbps.
2. Interface Ports: Provide a RS-232 or RS-485 communications ports for each digital controller that allows direct connection of a computer or handheld terminal and through which the controller may be fully accessed. Controller access shall not be limited to access through another controller. Interface communication ports shall be in addition to the communications port(s) supporting controller to controller communications. Communication rate is 9600 Baud minimum. Every controller on the highest-level LAN shall have a communications port supporting direct connection of a computer; a handheld terminal port is not sufficient. By connecting a computer to this port, every controller in the direct digital control system shall be accessible and programmable. The following operations shall be available: downloading and uploading control programs, modifying programs and program database, and retrieving or accepting trend reports, status reports, messages, and alarms.
3. Remote Workstation Interface Port: Provide one (1) additional direct connect computer port in each BAS system for permanent connection of a remote operator's work station, unless the workstation is a node on the LAN. All operations possible by directly connecting a computer to a controller at the highest-level LAN shall be available through this port.

2.05 ETHERNET NIC:

- A. Provide one (1) Ethernet NIC per BAS system to communicate between the digital control system and the computer workstation. Minimum Ethernet transmission rate is 100 Gigahertz.
- B. The BACnet communication network system will be redundant design such that a failure of a single communication link or node will not impact the ability of the system/sub-system to communicate with other nodes.

2.06 TEMPERATURE CONTROL CABINETS:

- A. Each indoor digital controller cabinet shall protect the controller from dust and rated NEMA 1, unless specified otherwise. Refer to Electrical drawings for area classifications and categories. Each outdoor digital controller cabinet shall protect the controller from all outside conditions and rated NEMA 4. Cabinets for high level controllers shall be hinged door, lockable, and have offset removable metal back plate.

- B. Make all wiring connections in the shop from the equipment mounted on the panel to numbered terminal blocks conveniently located in the panel, including the power supply for all instruments.
- C. Identify all wiring by means of stamped markings on heat shrinkable tubing. Install all wiring neatly and laced or bunched into cable form using plastic wire clips, where practical, contained in plastic wiring channels with covers. Maximum twenty-five (25) conductors to each wire bundle.
- D. Install "Hand-Off-Auto" selector switches such that safety controls and electrical over current protection are not overridden when selector switch is in the "Hand" position.

2.07 MAIN POWER SWITCH:

- A. Each controller on the highest-level LAN or each control cabinet shall have a main external power switch for isolation of the controller from AC power. The switch shall be in the BAS cabinet.

2.08 TERMINAL CONTROL UNITS:

- A. The same company as the digital controllers shall manufacture terminal control units.
- B. Terminal control units shall automatically start-up on return of power after a failure, and previous operating parameters shall exist or shall be automatically downloaded from a parent controller on a higher-level LAN.
- C. Terminal control units do not require an internal clock if they get time information from a parent controller.

2.09 WIRE

- A. Control wiring for digital functions shall be 18 AWG minimum with 300 V insulation control wiring for analog functions shall be 18 AWG minimum with 300 V insulation, twisted and shielded, 2 or 3 wire to match analog function hardware.
- B. Sensor wiring shall be 18 AWG minimum twisted and shielded, 2 or 3 wire to match analogue function hardware or 16 AWG as required by code.
- C. Transformer current wiring shall be 16 AWG minimum.

2.10 CONDUITS AND CABLES

- A. All wiring shall be in conduit or trays. Conform to Division 26 Sections for conduit and tray requirements.
- B. Seal conduit where such conduit leaves heated areas and enters unheated area.
- C. Run low level signal lines in separate conduit from high level signal and power transmission lines.

- D. Identify each cable and wire at every termination point.
- E. Where applicable, mount field interface equipment (i.e. relays, transducers, etc.) in local device cabinets adjacent to field interface panels.
- F. Separate conduits shall be provided for pneumatic tubing and electrical wiring runs.
- G. Color code all conductors and conduits by permanently applied color bands on maximum 30-foot intervals. Color code shall follow base building schedule.

2.11 RELATED ACCESSORIES

- A. Provide and install all necessary transformers, transducers, interposing relays, interface devices, and contractors to perform control functions required.
- B. It is the responsibility of the Contractor to identify, at the time of Bid submission, all additional items not specified that are required to meet the operational intent specified.
- C. Items required but not identified at the time of Bid acceptance shall be the Contractor's responsibility.

2.12 CONTROL DAMPERS:

- A. General:
 - 1. See Section 23 09 23.12 for control damper requirements.
- B. Instrumentation and Controls:
 - 1. The dampers shall have the option of being controlled locally or remotely via the BAS system.
- C. Shop Assembly:
 - 1. The dampers shall be fully assembled to the maximum extent possible.

2.13 CONTROL DAMPER OPERATORS:

- A. General:
 - 1. See Section 23 09 23.12 for control damper actuator requirements.
 - 2. Drawings indicate only one damper motor for each motorized damper.
 - 3. Select actual quantity of motors required to operate each damper in accordance with the size of damper provided.
 - 4. Coordinate exact quantity of damper motors with electrical Work to ensure that necessary wiring and conduit is provided for installation.

5. Provide operators for motorized dampers and motorized louvers for all cases where an operator is not supplied as part of a unit.

2.14 AUTOMATIC CONTROL VALVES:

A. General:

1. See Section 23 09 23.11 for automatic control valve requirements.

2.15 VALVE ACTUATORS:

A. General:

1. See Section 23 09 23.11 for valve actuator requirements.

2.16 ELECTRIC THERMOSTATS:

A. Office Area Room Thermostat:

1. Modulating electric type, remote and average sensor capable.
2. Temperature Scale: Furnish 35 to 95 degrees F dial.
3. Temperature setpoint adjustment, temperature display, timed unoccupied override function.
4. Insulating back, where exterior wall mounting is indicated in the Contract Documents.

B. Non-Office Area Room Thermostat:

1. Modulating electric type, except where two-position action is required.
2. Temperature Scale: Furnish 35 to 95 degrees F dial.
3. Temperature setpoint adjustment, temperature display.
4. Adjustable sensitivity.
5. Insulating back where exterior wall mounting is indicated in the Contract Documents.
6. Enclosure and sensing element to match area classification and moisture/corrosion category.

2.17 ELECTRONIC SENSORS:

A. Temperature:

1. General Requirements:
 - a. Sensors and transmitters shall be provided, as outlined in the control schematics, input/output summary and sequence of operations.
 - b. Temperature sensor shall be resistance type and shall be two-wire 1,000-ohm platinum RTD.
2. Room Temperature:
 - a. Constructed for either surface or wall box mounting.
3. Room Temperature Sensors with Integral Display
 - a. Constructed for either surface or wall box mounting.
 - b. Integral LCD display and four button keypad with the following capabilities:
 - (1) Display room and outside air temperatures
 - (2) Display and adjust room comfort set point
 - (3) Display and adjust fan operation status
 - (4) Timed override request pushbutton with LED status for activation of after-hours operation
 - (5) Display controller mode
 - (6) Password selectable adjustment of set point and override modes
4. Duct Temperature:
 - a. Accuracy: +/-1 degree F
 - b. Range:
 - (1) Heating: 40 to 140 degrees F
 - (2) Cooling: 30 to 100 degrees F
 - c. Element:
 - (1) Rigid insertion, 12-inch length, through sealed opening in center of duct.
 - (2) Averaging, for ducts or plenums with any dimension greater than 36 inches. Sealed opening in duct. Sensing element incorporated in copper

capillary a minimum of 20 feet long, serpentine across full area of airflow.

5. Water Temperature:

- a. Accuracy: +/-1 degrees F
- b. Range: 30 to 100 degrees F for Chilled water supply/return; 50 to 250 degrees F for heating glycol supply and return
- c. Element: Removable insertion into pipe thermowell
- d. Cover: NEMA 250 Type, suitable for area classification; in accordance with NFPA 70

6. Outdoor Temperature:

- a. Accuracy: +/-1 degrees F
- b. Range: -40 to 140 degrees F
- c. Cover: Weathertight, with sealed conduit connection and sun shield

B. Pressure (PS):

1. Air Pressure:

- a. Accuracy: 5 percent of range
- b. Range: 150 percent of measured variable
- c. Mount non-vibrating
- d. Cover: NEMA 250 Type, suitable for area classification; in accordance with NFPA 70

2. Water Pressure:

- a. Dwyer Instruments Inc.; No. 630 Series, 0 to 20 psi
- b. Transicoil Inc. (Robinson Halpern); No. 151 Series

C. Differential Pressure:

1. General:

- a. Temperature compensated.

- b. Vary output voltage with change in differential pressure. Voltage shall vary linearly from 0 to 10V DC according to differential pressure between high and low pressure ports.
 - c. Sensing range shall be suitable for application with linearity of 1.5 percent of full scale and offset of less than 1 percent of full scale.
 - d. Capable of withstanding up to 150 percent of rated pressure without damage.
 - e. Compatible with 14V to 30V DC supply voltage range.
- 2. Duct Air Static Differential Pressure (Flow Measurement):
 - a. Ultra-low differential pressure and flow transmitter
 - b. 0.5 percent of natural span accuracy
 - c. 4-20 mA output.
 - d. Pressure range to suit application
 - e. Integral 3-way zeroing valve
 - f. Built-in square root function
 - g. NEMA 12 enclosure
 - h. Veltron DPT 2500 transmitter with NEMA 12 enclosure
 - i. Sensicon A3 controller/display with NEMA 12 enclosure
- 3. Space Air Static Differential Pressure: MAMAC Systems Inc. or Setra transmitter
- 4. Water Differential Pressure:
 - a. Dwyer Instruments Inc.; No. 630 Series, 0 to 20 PSI range
 - b. Rosemount Controls Inc.; No. 1151-DP Series
 - c. Include three-valve manifold connection
- D. Position Indicator:
 - 1. 0 to 100 percent open, for damper, inlet vane, or similar
 - 2. Potentiometer, 0 to 2,000 ohm equals 0 to 100 percent
- E. Relative Humidity (RH):

1. Room Relative Humidity
2. Accuracy: +/-2 percent
3. Range: 10 to 95 percent
4. Solid state

F. Current Sensors (CS):

1. Fixed Setpoint, Digital Output Current Switch:
 - a. Manufacturer:
 - (1) Veris Industries Inc.; Hawkeye 600/800
 - b. Application: Monitoring status of direct drive equipment
 - c. Current-operated solid-state relay
 - d. Split core design
 - e. Trip Setpoint: Fixed
 - f. Output: Digital switch
 - g. Sensor Power: Induced from line
2. Adjustable Setpoint, Analog Output Current Sensor:
 - a. Manufacturer:
 - (1) Veris Industries Inc.; Hawkeye H721LC/721HC
 - b. Application: Monitoring status of belt drive equipment
 - c. Current-operated solid state transducer
 - d. Split core design
 - e. Output: Analog
 - f. Sensor Power: Induced from line
3. Adjustable Setpoint, Digital Output, VFD Current Switch:
 - a. Manufacturer:
 - (1) Veris Industries Inc.; Hawkeye 904

- b. Application: Monitoring status of belt-drive or direct-drive equipment controlled by a VFD
- c. Microprocessor-based current-operated solid state relay
- d. Automatic compensation for VFD frequency and current changes
- e. Split core design
- f. Trip Setpoint: Self-calibrating
- g. Output: Digital switch, with normal and alarm status LED
- h. Sensor Power: Induced from line

2.18 AIR MEASURING STATION

- A. The air measuring station shall consist of multiple aluminum airflow measuring elements containing multiple total and static pressure sensing ports placed along the leading edge of the cylinder. The static pressure chamber shall incorporate dual offset static taps on opposing sides of the averaging chamber capable of accommodating flow angle variations of plus or minus 20 degrees in the approaching airstream. The probes shall be manifolded together in a 0.06 inch type 316 stainless steel duct section with 90 degree undrilled flanges, fabricated to the duct size, and shall contain multiple interconnected airflow traverse elements.
- B. Where primary flow elements are located outside of the Manufacturer's published installation guidelines the manufacturer shall be consulted, and approve of any special configurations, such as air equalizers and/or additional and strategically placed measuring points, as may be required.
- C. The airflow traverse elements shall be capable of producing steady, non-pulsating signals of true total and static pressure. Signal amplifying sensors requiring flow correction (K factors) for field calibration are not acceptable.
- D. Accuracy: Plus or minus 2 percent
- E. Operating Velocity Range: 100 to 1000 feet per minute
- F. Operating Temperature Range: minus 20 to 104 degrees F
- G. Air Pressure Drop: < 0.18 inches WG Pa at 4000 feet per second
- H. Generated Noise Level: < NC40
- I. Acceptable Manufacturers:
 - 1. Greenheck

2. Ruskin
3. PCI
4. Ebtron
5. Or equal.

2.19 HIGH TEMPERATURE DETECTORS:

- A. The high temperature switch shall be of the automatic reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC. An auxiliary contact shall be provided for remote alarm (EMS) monitoring of a high temperature condition.
- B. The sensing element shall be bi-metal type.
- C. Sensing element shall react to the warmest section of the multi section element.
- D. Thermostat element shall be a probe type.
- E. For large duct areas where the sensing element does not provide full coverage of the air stream, additional thermostats shall be provided as required to provide full protection of the air stream.
- F. Provide means of providing a time delay on the high temperature cut out where required and indicated on the Drawings.

2.20 LOW TEMPERATURE DETECTORS:

- A. The low temperature switch shall be of the automatic reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC. An auxiliary contact shall be provided for remote alarm (EMS) monitoring of a low temperature condition.
- B. The sensing element shall be a minimum of 20 feet in length and shall react to the coldest 18-inch section.
- C. Element shall be of sufficient length to allow a serpentine distribution across the duct cross section and provide an accurate indication of the air flow temperature, especially in the case where a mixed air temperature is being measured.
- D. For large duct areas where the sensing element does not provide full coverage of the air stream, additional switches shall be provided as required to provide full protection of the air stream.
- E. Provide means of providing a time delay on the low temperature cut out where required and indicated on the Drawings.

2.21 BAS SOFTWARE:

- A. Provide, in the digital controllers, software to execute the sequence of control. Provide one (1) registered copy of all software used to program control sequences in all direct digital controllers and LAN controllers on the computer workstation. Provide any access keys which restrict programming language software functions or the ability to compile or prepare programming for download to controllers. Provide final copy of each program used in the system in both compiled and editable formats. Where specially programmed factory configured smart controllers are used in the system, provide minimum factory programming tools and specialized controller programs ready for download to replacement controllers. At minimum, controllers must be capable of performing programming functions outlined in the following "Parameter Modification" section.
- B. Provide software to modify control parameters. Parameter modification for all controllers (high level and low-level application specific) is through the main workstation computer and with laptop computer or keypad terminal directly at each controller. Modifications are to be accomplished without having to make changes directly in line-by-line programming. When the control program is of the line-by-line type, database parameters in the following list that take real number values require assignment of variable names so parameters can be changed without modifying programming. Alternatively, block programming languages shall provide for modification of these database parameters in fill-in-the-blank screens. Parameters of like type, including those in different high level and low-level controllers, may be grouped together for a single, global change. For example, an operator may group all second-floor space temperature setpoints into a group and raise the setpoint by two degrees with a single command. The following parameters shall be modifiable in this way:
 - 1. Setpoints.
 - 2. Dead band limits and spans.
 - 3. Reset schedules.
 - 4. Switch over points.
 - 5. PID gains and time between control output changes.
 - 6. Time.
 - 7. Timed local override time.
 - 8. Occupancy schedules.
 - 9. Holidays.
 - 10. Alarm points, alarm limits, and alarm messages.
 - 11. Point definition database.

12. Point enable, disable, and override.
 13. Trend points, trend intervals, trend reports.
 14. Analog input default values.
 15. Passwords.
 16. Communications parameters including network and telephone communications setups.
- C. Differential:
1. Where setpoint is in response to some analog input such as temperature, pressure, or humidity, include a setpoint differential to prevent short cycling of control devices.
- D. Motor and Flow Status Delay:
- E. Provide an adjustable delay between when a motor is commanded on or off and when the control program looks to the motor or flow status input for confirmation of successful command execution.
- F. Run Time Accumulation:
1. Provide resettable run time accumulation for each controlled digital output.
- G. Time Programs:
1. Provide programs to automatically adjust for leap years, daylight savings time, and operator time adjustments.
- H. Scheduling:
1. Individual controlled equipment shall be schedulable with schedule based on time of day, day of week, and day of year. Equipment may be associated into groups. Each group may be associated with a different schedule. Changing the schedule of a group shall change the schedule of all equipment in the group. Groups may be modified, created, and deleted by the operator.
 2. Provide capability to view and modify schedules in a seven-day week format. When control program does not automatically compute holidays, provide capability to enter holiday schedules one (1) full year at a time.
- I. Point Override:
1. I/O and virtual points shall accept software overrides to any possible value.
- J. Alarming:

1. I/O points and software points shall be alarmable. Alarms may be enabled and disabled for every point. Alarm limits shall be adjustable on analog points. Controllers connected to an external communications device such as a printer, terminal, or computer, shall download alarm and alarm message when alarm occurs. Otherwise alarms will be stored and automatically downloaded when a communications link occurs. In addition to those described in Schedule 18 C11.4, the following conditions shall generate alarms:
 - a. An analog input takes a value indicating sensor failure.
 - b. A module is not communicating on the LAN.
 - c. A power outage occurs.
 - d. Activation of any emergency eyewash or emergency shower.

K. Messages:

1. Messages shall consist of the device tag number, the device/associated equipment description and fault, and be assigned to alarm or status conditions. Messages shall be displayed on the workstation and be capable of being printed when these conditions occur.

L. Trending:

1. BAS system shall have the capability to trend all I/O and virtual points. Points may be associated into groups. A trend report may be set up for each group. The period between logging consecutive trend values shall range from fifteen seconds to sixty (60) minutes at a minimum. The minimum number of consecutive trend values stored at one time shall be 6000 per variable. Trend data shall be uploaded to workstation computer automatically for archiving and processing prior to controller storage being exceeded, maximum once per day. Trend data shall be available on a real time or archived basis; trend data shall appear numerically and graphically on a connected computer's screen as the data is processed from the BAS. Workstation software will process the data into user defined reports. The system must be able to show single or multiple values in multiple ranges on a single graph, including the ability to mix analog and digital signals. The time scale must be user definable. The line types must be able to be displayed in a variety of formats including column, line, symbol, scatter or area. The user must be able to zoom and scroll on the trend. The trend should be capable of displaying a user selected point value. Database for storing of archived data and reports shall be in ASCII format compatible for export to common database manipulation programs (e.g. Microsoft Access, Microsoft Excel). Archived data and reports shall be kept and be retrievable for a minimum of two (2) years.

M. Status Display:

1. Current status of I/O and virtual points shall be displayed on command. Points shall be associated into functional groups, such as all the I/O and virtual points associated with control of a make-up air unit, and displayed as a group, so the status of a single mechanical system can be readily checked. A group shall be selectable from a menu of groups having meaningful names.

N. Diagnostics:

1. Each controller shall perform self-diagnostic routines and provide messages to an operator when errors are detected. The BAS shall be capable of recognizing a non-responsive module on a LAN. The remaining, responsive modules on a LAN shall not operate in a degraded mode.

O. Power Loss:

1. During a power outage, each controller shall assume a disabled status and outputs shall go to a user definable state. Upon restoration of power, the BAS shall perform an orderly restart, with sequencing of outputs.

P. Program Transfer:

1. Provide software for download of control programs and database from a computer to controllers and upload of same to a computer from controllers. Every digital controller in the BAS shall be capable of being downloaded and uploaded to through a single controller on the highest-level LAN.

Q. System Back-up and Restoration:

1. The entire control system shall be capable of being backed-up or restored to or from a single back-up storage media.

R. Password Protection:

1. Provide at least four (4) levels of password protection to the BAS permitting different levels of access to the system. The lowest level allows monitoring only. The highest level allows full control of all functions, including setting new passwords.

S. Operator Workstation:

1. BAS System provider will a method of human interface with the BAS via Internet or Windows 10 laptop device.

PART 3 - EXECUTION

3.01 GENERAL – INSTALLATION OF FIELD COMPONENTS AND INSTRUMENTS:

- A. The control drawings and/or control sequences indicate only the principal items of equipment controlling the systems. Supplement each control system with all devices (e.g. relays) gauges and auxiliaries required to enable each system to perform as specified and to permit proper operation and supervision of same.
- B. Upon completion of the Work, all control devices shall be calibrated, tested and verified, as required, to place the system in complete and satisfactory operating condition.
- C. Notify the Consultant in writing of any conflict between these Specifications and the manufacturer's instructions.
- D. All equipment installed shall be mechanically stable and, as necessary, fixed to floor or wall. Anti-vibration mounts to be provided, where required, for the proper isolation of equipment.
- E. Install equipment so as to allow for ease of maintenance access such that it does not interfere in any way with access to adjacent equipment and personnel traffic in the surrounding space.
- F. Install equipment in locations having suitable ambient conditions for its specified functioning, allowing for adequate ventilation and the prevention of condensation traps.
- G. Outdoor installation is to be weatherproof construction in NEMA 4X enclosures.
- H. Ensure that all holes drilled in ductwork and HVAC equipment housings are properly sealed to eliminate leakage and to maintain the pressure rating of the equipment in question.
- I. Confirm Operator Workstation location with Engineer prior to installation.
- J. Install damper motors on outside of ducts. Do not locate in air stream.
- K. Wire "hand/off/auto" selector switches such that automatic operating controls and not safety controls and electrical over current protection shall be overridden when switch is in the "hand" position.
- L. Coordinate and confirm all controller set points with the balancing Contractor to verify all minimum and maximum air volumes on VSD controlled fans, air handlers and make-up air units.
- M. Provide copies of proposed control screens to Engineer for review prior to implementation.

3.02 TEMPERATURE SENSORS AND THERMOWELLS:

- A. Provide mixed air temperature sensors of a sufficient length to give an accurate temperature indication for the cross section of mixing plenum or duct involved. Install sensors in a serpentine arrangement about the plane of stratification (horizontal or vertical) so that an equal length of the sensing element covers an equal area of the mixing plenum, and an accurate measurement of the mixed air temperature is achieved.
- B. Unless otherwise indicated in the Contract Documents, mount space sensors 60 inches above the finished floor level. Confirm exact location of all thermostats prior to roughing-in.
- C. In process/service areas, utility rooms and other areas where the thermostat might be subject to damage, provide a metal cage or cast aluminum thermostat guard.
- D. Drill holes, weld thread-o-lets and mount thermowells in piping after isolating and draining the section to be worked on. Notify the Consultant/Regions before doing so. Install sensors in thermowells with dust-tight connection heads. Ensure sensor element is immersed in heat transfer compound and firmly seated against tip of well. Element shall extend at least two thirds of the pipe diameter into the pipe. Install sensor in region of piping where well-mixed conditions exist (e.g., at a pipe bend) wherever possible. Where pipe diameter is less than the length of the sensing element, mount sensor at piping elbow. Use stainless steel thermowells with extensions, where required, to accommodate thickness of insulation. Replace and repair insulation and pipe jacketing to return to original condition.

3.03 INSTALLATION OF CONTROL SYSTEM COMPONENTS:

- A. Provide control wiring of any voltage including installation required to interconnect control components located on air handling units and power wiring between lighting panel circuits provided under Division 26 and field-mounted controllers. Refer to electrical wiring diagrams for details regarding interconnection wiring requirements with control components.
- B. Sensor and control device wiring are to be as recommended by the control system manufacturer.
- C. Provide all contacts and interfaces required for pickup of alarm and status points for systems and equipment as indicated on the Drawings.

3.04 INSTALLATION OF THERMOSTATS:

- A. Unless otherwise specified in the Contract Documents, provide all required line voltage thermostats, including those for unit heaters and fan coils.
- B. Unless otherwise indicated in the Contract Documents, mount room thermostats 60 inches above the finished floor level. Confirm exact location of all thermostats prior to roughing-in.

- C. Provide stand-off mounting and an insulated sub-base for thermostats on outside walls.
- 3.05 INSTALLATION OF HIGH AND LOW TEMPERATURE DETECTORS, AND ACCESSORIES:
- A. Element shall be mounted across duct to in a serpentine arrangement about the plane of stratification (horizontal or vertical) so that an equal length of the sensing element covers an equal area of the mixing plenum, and an accurate measurement of temperature is achieved.
- 3.06 INSTALLATION OF CONTROL COMPONENT PANELS:
- A. Provide at locations indicated on the Drawings or implied by the Drawings and Control Specifications. Locate panels to provide a convenient operator interface with control system.
 - B. Surface wall mount or secure in place between free-standing galvanized structural steel members.
 - C. Confirm exact cabinet locations prior to roughing-in.
- 3.07 ACCEPTANCE TESTING:
- A. A final operational acceptance test of seven (7) consecutive days shall be conducted on the complete and total installed and operational control system to demonstrate that it is functioning properly in accordance with the Specifications.
 - 1. Acceptance testing will require the BAS integrated systems to be functional
 - B. The correct operation of all monitored and controlled points shall be demonstrated as well as the operation and capabilities of all sequences, reports, specialized control programs and algorithms, diagnostics and all other software.
 - C. In the event of the failure of function, during the test, of any of the hardware components or software application or routines, the test will recommence and run until seven (7) failure-free test days have occurred.
 - D. After successful completion of the acceptance test, the Engineer will issue written acceptance of the control system.
 - E. Prior to acceptance of the Work, submit hard copy and electronic copy on disk of final database listings.
- 3.08 TRAINING:
- A. Construction Contractor to provide three (3) weeks written notice to the Engineer prior to commencing formal training sessions.

- B. Formal training sessions shall commence only after "As-Constructed" Drawings have been completed, reviewed and approved by the Engineer.
- C. Training activities to include 3 consecutive days of on-site training to be arranged with the owner's facility management department at least one-month prior.

3.09 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 09 23.11

CONTROL VALVES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide control valves and actuators as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. ANSI FCI:

- 1. 70-2: Control Valve Seat Leakage

- B. American Society of Mechanical Engineers (ASME):

- 1. Boiler and Pressure Vessel Code
 - 2. B16.5: Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24 Metric/Inch Standard
 - 3. B61.1: Standard Specification for Steam or Valve Bronze Castings

- C. ASTM International (ASTM):

- 1. A126: Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings
 - 2. A216: Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High-Temperature Service
 - 3. A536: Standard Specification for Ductile Iron Castings
 - 4. B61: Standards Specification for Steam or Valve Bronze Castings
 - 5. B62: Standard Specification for Composition Bronze or Ounce Metal Castings
 - 6. B584: Standard Specification for Copper Alloy Sand Castings for General Applications

2. 75.08.01: Face-to-Face Dimensions for Integral Flanged Globe-Style Control Valve Bodies (Classes 126, 150, 250, 300 and 600)

3. 75.11.01: Inherent Flow Characteristics and Rangeability of Control Valves

E. Manufacturers' Standardization Society (MSS):

1. SP-67: Butterfly Valves

2. SP-68: High Pressure Butterfly Valves with Offset Design

3. Sp-110: Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends

1.03 DEFINITIONS:

A. Cv: Design valve coefficient

B. DDC: Direct-digital control

C. NBR: Nitrile butadiene rubber

D. PTFE: Polytetrafluoroethylene

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.

2. Operating characteristics, electrical characteristics, and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.

3. Product description with complete technical data, performance curves, and product specification sheets.

4. Installation, operation, and maintenance instructions, including factors affecting performance.

C. Shop Drawings:

1. Include plans, elevations, sections, and mounting details.

2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 3. Include diagrams for power, signal, and control wiring.
- D. Delegated-Design Submittal:
1. Schedule and design calculations for control valves and actuators, including the following:
 - a. Flow at project design and minimum flow conditions.
 - b. Pressure differential drop across valve at project design flow condition.
 - c. Maximum system pressure differential drop (pump close-off pressure) across valve at project minimum flow condition.
 - d. Design and minimum control valve coefficient with corresponding valve position.
 - e. Maximum close-off pressure.
 - f. Leakage flow at maximum system pressure differential.
 - g. Torque required at worst case condition for sizing actuator.
 - h. Actuator selection indicating torque provided.
- E. Operation and Maintenance Data: For control valves to include in operation and maintenance manuals.
- 1.05 SUSTAINABLE DESIGN:
- A. Comply with the requirements specified in Section 01 81 13.01.
- 1.06 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
- 1.07 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
- 1.08 DELIVERY STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. ASME Compliance: Fabricate and label products to comply with ASME Boiler and Pressure Vessel Code where required by authorities having jurisdiction.
- C. Ground Fault: Products shall not fail due to ground fault condition when suitably grounded.
- D. Backup Power Source: Systems and equipment served by a backup power source shall have associated control valve actuators served from a backup power source.
- E. Environmental Conditions:
 - 1. Provide electric control valve actuators, with protective enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Electric control valve actuators not available with integral enclosures, complying with requirements indicated, shall be housed in protective secondary enclosures.
 - a. Hazardous Locations: Explosion-proof rating for condition.
- F. Selection Criteria:
 - 1. Control valve shutoff classifications shall be FCI 70-2, Class IV or better unless otherwise indicated.
 - 2. Valve pattern, three-way or straight through, shall be as indicated on drawings or control schematics.
 - 3. Modulating straight-through pattern control valves shall have equal percentage flow-throttling characteristics unless otherwise indicated.
 - 4. Modulating three-way pattern water valves shall have linear flow-throttling characteristics. The total flow through the valve shall remain constant regardless of the valve's position.
 - 5. Globe-type control valves shall pass the design flow required with not more than 95 percent of stem lift unless otherwise indicated.
 - 6. Selection shall consider viscosity, flashing, and cavitation corrections.
 - 7. Valves shall have stable operation throughout full range of operation, from design to minimum Cv.

8. In water systems, select modulating control valves at terminal equipment for a design Cv based on a pressure drop of 5 psig at design flow unless otherwise indicated.
9. Two-position control valves shall be line size unless otherwise indicated.
10. In water systems, use ball- or globe-style control valves for two-position control for valves NPS 2 and smaller and butterfly style for valves larger than NPS 2.
11. Globe-style motorized control valves are to be used for all modulating flow applications.

2.02 BALL-STYLE CONTROL VALVES:

A. Ball Valves with Single Port and Characterized Disk:

1. Manufacturers:
 - a. Jenkins Valves
 - b. Toyo
 - c. Crane
 - d. Kitz Corporation
 - e. Milwaukee Valve Company
 - f. WATTS
 - g. MAS
 - h. Belimo
 - i. Or equal
2. Pressure Rating for NPS 1 and Smaller: Nominal 600 WOG.
3. Pressure Rating for NPS 1-1/2 through NPS 2: Nominal 400 WOG.
4. Close-off Pressure: 200 psig.
5. Process Temperature Range: Zero to 212 degrees F.
6. Body and Tail Piece: Cast bronze ASTM B61, ASTM B62, ASTM B584, or forged brass with nickel plating.
7. End Connections: Threaded (NPT) ends.
8. Ball: Chrome-plated brass or bronze.

9. Stem and Stem Extension:
 - a. Material to match ball.
 - b. Blowout-proof design.
 - c. Sleeve or other approved means to allow valve to be opened and closed without damaging the insulation or the vapor barrier seal.
10. Ball Seats: Reinforced PTFE.
11. Stem Seal: Reinforced PTFE packing ring with a threaded packing ring follower to retain the packing ring under design pressure with the linkage removed. Alternative means, such as EPDM O-rings, are acceptable if an equivalent cycle endurance can be demonstrated by testing.
12. Flow Characteristic: Equal percentage.

2.03 BUTTERFLY-STYLE CONTROL VALVES:

A. Commercial-Grade, Two-Way Butterfly Valves:

1. Manufacturers:
 - a. Keystone
 - b. Kitz Corporation
 - c. Apollo Flow Controls
 - d. NIBCO, Inc.
 - e. Toyo
 - f. Tyco Grinnell
 - g. MAS
 - h. Or equal
2. Performance:
 - a. Bi-directional bubble tight shutoff at 250 psig.
 - b. Comply with MSS SP-67 or MSS SP-68.
 - c. Rotation: Zero to 90 degrees.
 - d. Linear or modified equal percentage flow characteristic.

3. Body: Cast iron ASTM A126, Class B, ductile iron ASTM A536 or cast steel ASTM A216 WCB fully lugged, suitable for mating to ASME B16.5 flanges.
4. Disc: 316 stainless steel.
5. Shaft: 316 or 17-4 PH stainless steel.
6. Seat: Reinforced EPDM or reinforced PTFE with retaining ring.
7. Shaft Bushings: Reinforced PTFE or stainless steel.
8. Replaceable seat, disc, and shaft bushings.
9. Corrosion-resistant nameplate indicating:
 - a. Manufacturer's name, model number, and serial number
 - b. Body size
 - c. Body and trim materials
 - d. Flow arrow

2.04 GLOBE-STYLE CONTROL VALVES:

A. General Globe-Style Valve Requirements:

1. Globe-style control valve body dimensions shall comply with ISA 75.08.01.
2. Construct the valves to be serviceable from the top.
3. For cage guided valves, trim shall be field interchangeable for different valve flow characteristics, such as equal percentage, linear, and quick opening.
4. Reduced trim for one nominal size smaller shall be available for industrial valves NPS 1 and larger.
5. Replaceable seats and plugs.
6. Furnish each control valve with a corrosion-resistant nameplate indicating the following:
 - a. Manufacturer's name, model number, and serial number.
 - b. Body and trim size.
 - c. Arrow indicating direction of flow.

B. Two-Way Globe Valves NPS 2 and Smaller:

1. Manufacturers:
 - a. Johnson Controls
 - b. Fisher
 - c. Siemens
 - d. Belimo
 - e. Or equal
2. Globe Style: Single port.
3. Body: Cast bronze or forged brass with ASME B16.5, Class 250 rating.
4. End Connections: Threaded.
5. Bonnet: Screwed.
6. Packing: PTFE V-ring.
7. Plug: Top guided.
8. Plug, Seat, and Stem: Stainless steel.
9. Process Temperature Range: 35 to 248 degrees F.
10. Ambient Operating Temperature: 35 to 150 degrees F.
11. Leakage: FCI 70-2, Class IV.
12. Rangeability: 25 to 1.
13. Equal percentage flow characteristic.

C. Three-Way Globe Valves NPS 2 and Smaller:

1. Manufacturers:
 - a. Johnson Controls
 - b. Fisher
 - c. Siemens
 - d. Belimo

- e. Or equal
 - 2. Globe Style: Mix flow pattern.
 - 3. Body: Cast bronze or forged brass with ASME B16.5, Class 250 rating.
 - 4. End Connections: Threaded.
 - 5. Bonnet: Screwed.
 - 6. Packing: PTFE V-ring.
 - 7. Plug: Top guided.
 - 8. Plug, Seat, and Stem: Stainless steel.
 - 9. Process Temperature Range: 35 to 248 degrees F.
 - 10. Ambient Operating Temperature: 35 to 150 degrees F.
 - 11. Leakage: FCI 70-2, Class IV.
 - 12. Rangeability: 25 to 1.
 - 13. Linear flow characteristic.
- D. Two-Way Globe Valves NPS 2-1/2 to NPS 6:
- 1. Manufacturers:
 - a. Johnson Controls
 - b. Fisher
 - c. Siemens
 - d. Belimo
 - e. Or equal
 - 2. Globe Style: Single port.
 - 3. Body: Cast iron complying with ASME B61.1, Class 125.
 - 4. End Connections: Flanged, suitable for mating to ASME B16.5, Class 150 flanges.
 - 5. Bonnet: Bolted.
 - 6. Packing: PTFE cone-ring.

7. Plug: Top or bottom guided.
8. Plug, Seat, and Stem: Brass or stainless steel.
9. Process Temperature Rating: 35 to 281 degrees F.
10. Leakage: 0.1 percent of maximum flow.
11. Rangeability: Varies with valve size between 6 and 10 to 1.
12. Modified linear flow characteristic.

E. Three-Way Globe Valves NPS 2-1/2 to NPS 6:

1. Manufacturers:
 - a. Johnson Controls
 - b. Fisher
 - c. Siemens
 - d. Belimo
 - e. Or equal
2. Globe Style: Mix flow pattern.
3. Body: Cast iron complying with ASME B61.1, Class 125.
4. End Connections: Flanged suitable for mating to ASME B16.5, Class 150 flanges.
5. Bonnet: Bolted.
6. Packing: PTFE cone-ring.
7. Plug: Top or bottom guided.
8. Plug, Seat, and Stem: Brass or stainless steel.
9. Process Temperature Rating: 35 to 281 degrees F.
10. Leakage: 0.1 percent of maximum flow.
11. Rangeability: Varies with valve size between 6 and 10 to 1.
12. Modified linear flow characteristic.

2.05 ELECTRIC AND ELECTRONIC CONTROL VALVE ACTUATORS:

- A. Manufacturers:
 - 1. Belimo
 - 2. Johnson Controls
 - 3. Siemens
 - 4. Or equal
- B. Actuators for Hydronic Control Valves: Capable of closing valve against system pump shutoff head.
- C. Position indicator and graduated scale on each actuator.
- D. Type: Motor operated, with or without gears, electric and electronic.
- E. Voltage: Voltage selection delegated to professional designing control system.
- F. Deliver torque required for continuous uniform movement of controlled device from limit to limit when operated at rated voltage.
- G. Function properly within a range of 85 to 120 percent of nameplate voltage.
- H. Construction:
 - 1. For Actuators Less than 100 W: Fiber or reinforced nylon gears with steel shaft, copper alloy or nylon bearings, and pressed steel enclosures.
 - 2. For Actuators from 100 to 400 W: Gears ground steel, oil immersed, shaft hardened steel running in bronze, copper alloy or ball bearings. Operator and gear trains shall be totally enclosed in dustproof cast-iron, cast-steel or cast-aluminum housing.
 - 3. For Actuators Larger than 400 W: Totally enclosed reversible induction motors with auxiliary hand crank and permanently lubricated bearings.
- I. Field Adjustment:
 - 1. Spring Return Actuators: Easily switchable from fail open to fail closed in the field without replacement.
 - 2. Gear Type Actuators: External manual adjustment mechanism to allow manual positioning when the actuator is not powered.
- J. Two-Position Actuators: Single direction, spring return or reversing type.
- K. Modulating Actuators:

1. Operation: Capable of stopping at all points across full range, and starting in either direction from any point in range.
2. Control Input Signal:
 - a. Proportional: Actuator drives proportional to input signal and modulates throughout its angle of rotation. Suitable for zero- to 10- and 4- to 20-mA signals.
 - b. Programmable Multi-Function:
 - (1) Control Input, Position Feedback, and Running Time: Factory or field programmable.
 - (2) Diagnostic: Feedback of hunting or oscillation, mechanical overload, mechanical travel, and mechanical load limit.

L. Position Feedback:

1. Equip two-position actuators with limit switches or other positive means of a position indication signal for remote monitoring of open and close position.
2. Equip modulating actuators with a position feedback through current or voltage signal for remote monitoring.
3. Provide a position indicator and graduated scale on each actuator indicating open and closed travel limits.

M. Fail-Safe:

1. Where indicated, provide actuator to fail to an end position.
2. Internal spring return mechanism to drive controlled device to an end position (open or close) on loss of power.
3. Batteries, capacitors, and other non-mechanical forms of fail-safe operation are acceptable only where uniquely indicated.

N. Integral Overload Protection:

1. Provide against overload throughout the entire operating range in both directions.
2. Electronic overload, digital rotation sensing circuitry, mechanical end switches, or magnetic clutches are acceptable methods of protection.

O. Valve Attachment:

1. Unless otherwise required for valve interface, provide an actuator designed to be directly coupled to valve shaft without the need for connecting linkages.

2. Attach actuator to valve drive shaft in a way that ensures maximum transfer of power and torque without slippage.
 3. Bolt and set screw method of attachment is acceptable only if provided with at least two points of attachment.
- P. Temperature and Humidity:
1. Temperature: Suitable for operating temperature range encountered by application with minimum operating temperature range of minus 20 to plus 120 degrees F.
 2. Humidity: Suitable for humidity range encountered by application; minimum operating range shall be from 5 to 95 percent relative humidity, non-condensing.
- Q. Enclosure:
1. Suitable for ambient conditions encountered by application.
 2. NEMA 250, Type 2 for indoor and protected applications.
 3. NEMA 250, Type 4 or Type 4X for outdoor and unprotected applications.
 4. Provide actuator enclosure with heater and control where required by application.
- R. Stroke Time:
1. Operate valve from fully closed to fully open within 60 seconds.
 2. Operate valve from fully open to fully closed within 60 seconds.
 3. Move valve to failed position within 25 seconds.
 4. Select operating speed to be compatible with equipment and system operation.
- S. Sound:
1. Spring Return: 62 dBA
 2. Non-Spring Return: 50 dBA

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

- B. Examine roughing-in for valves installed in piping to verify actual locations of piping connections before installation.
- C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 CONTROL VALVE APPLICATIONS:

- A. Control Valves:
 - 1. Select from valves specified in "Control Valves" Article to achieve performance requirements and characteristics indicated while subjected to full range of system operation encountered.

3.03 INSTALLATION, GENERAL:

- A. Furnish and install products required to satisfy most stringent requirements indicated.
- B. Install products level, plumb, parallel, and perpendicular with building construction.
- C. Properly support instruments, tubing, piping, wiring, and conduits to comply with requirements indicated. Brace all products to prevent lateral movement and sway.
- D. Provide ceiling, floor, roof, and wall openings and sleeves required by installation. Before proceeding with drilling, punching, or cutting, check location first for concealed products that could potentially be damaged. Patch, flash, grout, seal, and refinish openings to match adjacent condition.
- E. Firestop penetrations made in fire-rated assemblies and seal penetrations made in acoustically rated assemblies.
- F. Fastening Hardware:
 - 1. Stillson wrenches, pliers, and other tools that will cause injury to or mar surfaces of rods, nuts, and other parts are prohibited for assembling and tightening nuts.
 - 2. Tighten bolts and nuts firmly and uniformly. Do not overstress threads by excessive force or by oversized wrenches.
 - 3. Lubricate threads of bolts, nuts, and screws with graphite and oil before assembly.
- G. Install products in locations that are accessible and that will permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.
- H. Corrosive Environments:

1. Use products that are suitable for environment to which they will be subjected.
2. If possible, avoid or limit use of materials in corrosive environments, including, but not limited to, the following:
 - a. Laboratory exhaust airstreams.
 - b. Process exhaust airstreams.
3. Use Type 316 stainless-steel tubing and fittings when in contact with a corrosive environment.
4. When conduit is in contact with a corrosive environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive-resistant coating that is suitable for environment.
5. Where control devices are located in a corrosive environment and are not corrosive resistant from manufacturer, field install products in a NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.

3.04 ELECTRIC POWER:

- A. Furnish and install electrical power to products requiring electrical connections.
- B. Furnish and install raceways. Comply with requirements in Section 26 05 33.

3.05 CONTROL VALVES:

- A. Install pipe reducers for valves smaller than line size. Position reducers as close to valve as possible but at distance to avoid interference and impact to performance. Install with manufacturer-recommended clearance.
- B. Install flanges or unions to allow drop-in and -out valve installation.
- C. Where noted below, install control valve with three-valve bypass manifold to allow for control valve isolation and removal without interrupting system flow by providing manual throttling valve in bypass pipe.
 1. Bypass at all ERV, Air handler and Make-up Air Handler heating and cooling coils.
- D. Install drain valves in piping upstream and downstream of each control valve installed in a three-valve manifold and for each control valve larger than NPS 2.
- E. Install pressure temperature taps in piping upstream and downstream of each control valve larger than NPS 2.
- F. Valve Orientation:

1. Where possible, install globe and ball valves installed in horizontal piping with stems upright and not more than 15 degrees off of vertical, not inverted.
2. Install valves in a position to allow full stem movement.
3. Where possible, install butterfly valves that are installed in horizontal piping with stems in horizontal position and with low point of disc opening with direction of flow.

G. Clearance:

1. Locate valves for easy access and provide separate support of valves that cannot be handled by service personnel without hoisting mechanism.
2. Install valves with at least 12 inches of clear space around valve and between valves and adjacent surfaces.

H. Threaded Valves:

1. Note internal length of threads in valve ends, and proximity of valve internal seat or wall, to determine how far pipe should be threaded into valve.
2. Align threads at point of assembly.
3. Apply thread compound to external pipe threads, except where dry seal threading is specified.
4. Assemble joint, wrench tight. Apply wrench on valve end as pipe is being threaded.

I. Flanged Valves:

1. Align flange surfaces parallel.
2. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly with a torque wrench.

3.06 CONNECTIONS:

- A. Connect electrical devices and components to electrical grounding system. Comply with requirements in Section 26 05 26.

3.07 IDENTIFICATION:

- A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 26 05 53.

- B. Install engraved phenolic nameplate with valve identification on valve.

3.08 CLEANING:

- A. Remove grease, mastic, adhesives, dust, dirt, stains, fingerprints, labels, and other foreign materials from exposed interior and exterior surfaces.
- B. Wash and shine glazing.
- C. Polish glossy surfaces to a clean shine.

3.09 CHECKOUT PROCEDURES:

A. Control Valve Checkout:

1. Check installed products before continuity tests, leak tests, and calibration.
2. Check valves for proper location and accessibility.
3. Check valves for proper installation for direction of flow, elevation, orientation, insertion depth, or other applicable considerations that will impact performance.
4. Verify that control valves are installed correctly for flow direction.
5. Verify that valve body attachment is properly secured and sealed.
6. Verify that valve actuator and linkage attachment are secure.
7. Verify that actuator wiring is complete, enclosed, and connected to correct power source.
8. Verify that valve ball, disc, and plug travel are unobstructed.
9. After piping systems have been tested and put into service, but before insulating and balancing, inspect each valve for leaks. Adjust or replace packing to stop leaks. Replace the valve if leaks persist.

3.10 ADJUSTMENT, CALIBRATION, AND TESTING:

- A. Stroke and adjust control valves following manufacturer's recommended procedure, from 100 percent open to 100 percent closed back to 100 percent open.
- B. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.
- C. For control valves equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.

3.11 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 09 23.12

CONTROL DAMPERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide control dampers and actuators for DDC systems as indicated and in compliance with Contract Documents.
 - 1. Rectangular control dampers
 - 2. Round control dampers
 - 3. General control-damper actuator requirements
 - 4. Electric and electronic actuators
- B. Drawings and Control Diagrams indicate only one damper motor for each motorized damper (M).
- C. Select actual quantity of motors required to operate each damper in accordance with the size of damper provided.
- D. Coordinate exact quantity of damper motors with electrical Work to ensure that necessary wiring and conduit is provided for installation.

1.02 REFERENCES:

- A. Air Movement and Control Association International, Inc. (AMCA):
 - 1. 500D: Laboratory Methods of Testing Dampers for Rating
 - 2. 511: Certified Ratings Program Product Rating manual for Air Control Devices
- B. American Society of Mechanical Engineers (ASME):
 - 1. Boiler and Pressure Vessel Code
- C. ASTM International (ASTM):
 - 1. A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
 - 2. B211: Standard Specification for Aluminum and Aluminum-Alloy Rolled or Cold Finished Bar, Rod, and Wire

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

1.03 DEFINITIONS:

- A. DDC: Direct-digital control
- B. RMS: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product, including the following:
 1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.
 2. Operating characteristics, electrical characteristics, and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.
 3. Product description with complete technical data, performance curves, and product specification sheets.
 4. Installation instructions, including factors affecting performance.
- C. Shop Drawings:
 1. Include plans, elevations, sections, and mounting details.
 2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 3. Include diagrams for power, signal, and control wiring.
 4. Include diagrams for air and process signal tubing.
 5. Include diagrams for pneumatic signal and main air tubing.

D. Delegated-Design Submittal:

1. Schedule and design calculations for control dampers and actuators, including the following.
 - a. Flow at project design and minimum flow conditions.
 - b. Pressure drop across damper at project design and minimum airflow conditions.
 - c. Maximum close-off pressure.
 - d. Torque required at worst case condition for sizing actuator.
 - e. Actuator selection indicating torque provided.

E. Coordination Drawings: Plan drawings and corresponding product installation details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Product installation location shown in relationship to room, duct, and equipment.
2. Size and location of wall access panels for control dampers and actuators installed behind walls.
3. Size and location of ceiling access panels for control dampers and actuators installed above inaccessible ceilings.

F. Operation and Maintenance Data: For control dampers to include in operation and maintenance manuals.

1.05 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.08 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 MOTORIZED THERMALLY INSULATED CONTROL DAMPERS:

- A. Extruded aluminum (6063-T5) damper frame shall not be less than 0.08 inches in thickness. Damper frame shall be 4 inches deep x 1 inch, with duct mounting flanges on both sides of frame. Damper frame shall have a 2-inch mounting flange on the rear of the damper, when installed as Extended Rear Flange install type. Frame to be assembled using zinc-plated steel mounting fasteners.
- B. Blades shall be a maximum of 6 inches deep extruded aluminum (6063-T5) air-foil profiles with a minimum wall thickness of 0.06 inches. Blades shall be internally insulated with expanded polyurethane foam and shall be thermally broken. Complete blade shall have an insulating factor of R-2.29 and a temperature index of 55 (tested to AAMA 1502.7 Test Method).
- C. Blade seals shall be extruded EPDM, secured in an integral slot within the aluminum blade extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Adhesive or clip-on type blade seals will not be approved.
- D. Frame seals shall be extruded silicone, secured in an integral slot within the aluminum frame extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Metallic compression type jamb seals will not be approved.
- E. Bearings shall be a dual bearing system composed of a Celcon inner bearing (fixed around a 0.437-inch aluminum hexagon blade pivot pin), rotating within a polycarbonate outer bearing inserted in the frame. Single axle bearing, rotating in an extruded or punched hole shall not be acceptable.
- F. Hexagonal control shaft shall be 0.437-inches. It shall have an adjustable length and shall be an integral part of the blade axle. A field-applied control shaft shall not be acceptable. All parts shall be zinc-plated steel.
- G. Linkage hardware shall be aluminum and corrosion-resistant zinc-plated steel, installed in the frame side, out of the airstream, and accessible after installation. Linkage hardware shall be complete with cup-point trunnion screws to prevent linkage slippage. Linkage that consists of metal rubbing metal will not be approved.
- H. Dampers shall be designed for operation in temperatures ranging from -40 degrees F to 212 degrees F.
- I. Dampers shall be AMCA rated for Leakage Class 1A at 1-inch water gage static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.
- J. Dampers shall be custom made to required size, with blade stops not exceeding 1.25 inches in height.

- K. Dampers shall be opposed blade action for modulating airflow control and parallel blade for two position open – close action.
- L. Standard of Acceptance: TAMCO Series 9000 thermally insulated damper
- M. Manufacturers:
 - 1. Ruskin
 - 2. Tamco
 - 3. Nailor
 - 4. Or equal

2.02 MOTORIZED CONTROL DAMPERS:

- A. Extruded aluminum (6063-T5) damper frame shall not be less than 0.08 inches in thickness. Damper frame shall be 4 inches deep x 1 inch, with duct mounting flanges on both sides of frame. Damper frame shall have a 2-inch mounting flange on the rear of the damper, when installed as Extended Rear Flange install type. Frame to be assembled using zinc-plated steel mounting fasteners.
- B. Blades shall be maximum 6 inches deep extruded aluminum (6063-T5) air-foil profiles with a minimum wall thickness of 0.06 inches.
- C. Blade seals shall be extruded EPDM, secured in an integral slot within the aluminum blade extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Adhesive or clip-on type blade seals will not be approved.
- D. Frame seals shall be extruded silicone, secured in an integral slot within the aluminum frame extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Metallic compression type jamb seals will not be approved.
- E. Bearings shall be a dual bearing system composed of a Celcon inner bearing (fixed around 0.437 inch aluminum hexagon blade pivot pin, rotating within a polycarbonate outer bearing inserted in the frame. Single axle bearing, rotating in an extruded or punched hole shall not be acceptable.
- F. Hexagonal control shaft shall be 0.437 inch. It shall have an adjustable length and shall be an integral part of the blade axle. A field-applied control shaft shall not be acceptable. All parts shall be zinc-plated steel.
- G. Linkage hardware shall be aluminum and corrosion-resistant zinc-plated steel, installed in the frame side, out of the airstream, and accessible after installation. Linkage hardware shall be complete with cup-point trunnion screws to prevent linkage slippage. Linkage that consists of metal rubbing metal will not be approved.

- H. Dampers shall be designed for operation in temperatures ranging from -40 degrees F to 212 degrees F.
- I. Dampers shall be AMCA rated for Leakage Class 1A at 1 inch water gage static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.
- J. Dampers shall be custom made to required size, with blade stops not exceeding 1.25 inches in height.
- K. Dampers shall be opposed blade action for standard control and parallel blade for two mixing box applications.
- L. Standard of acceptance: TAMCO Series 1000 Air-Foil Control Damper
- M. Manufacturers:
 - 1. Ruskin
 - 2. Tamco
 - 3. Nailor
 - 4. Or equal

2.03 DAMPER OPERATORS:

- A. Electronic Operators for Modulating Damper:
 - 1. Fail-safe spring return, 24 VAC operating voltage, 0 to 10 VDC input signal, 0 to 10 VDC position output signal, seventy (70) seconds maximum running time for 90 degrees opening and thirty (30) seconds maximum closing time.
 - 2. Provide sufficient damper motors to achieve unrestricted movement, with a minimum of one damper operator per damper section.
 - 3. Provide manual override gear release or crank.
 - 4. For modulating actuators provide actuator with 0-10V feedback proportional to damper position.
 - 5. Provide position indicator.
 - 6. Provide two (2) auxiliary switches for position proofing, one (1) at 10 degrees rotation and one (1) adjustable up to 90 degrees rotation.
 - 7. Unless otherwise shown on the Drawings, operators to be provided and set up such that all return air dampers are normally open (fail open) and exhaust and outdoor air dampers fail normally closed (fail closed).

8. Provide “fail safe”, spring return, direct coupled type, 24 volt or 120 volt A.C. operators with accessories as required, each suitable in all respects for the application.
9. Provide Class 1 Division 2 or Class 1 Division 1 rated actuators or explosion-resistant enclosures where required.
10. All actuators provided shall be from a single manufacturer.
11. Acceptable manufacturers:
 - a. Belimo Aircontrols Inc.
 - b. Johnson Controls Inc.
 - c. Siemens Building Technologies Inc.
 - d. Or equal

B. Electronic Operators for Two Position Damper:

1. Spring return, 24 VAC operating voltage, seventy (70) seconds maximum running time for 90 degrees opening and thirty (30) seconds maximum closing time.
2. Provide sufficient damper motors to achieve unrestricted movement, with a minimum of one damper operator per damper section.
3. Provide manual override gear release or crank.
4. Provide position indicator.
5. Provide two (2) auxiliary switches for position proofing, one (1) at 10 degrees rotation and one (1) adjustable up to 90 degrees rotation.
6. Provide Class 1 Division 1 or 2 rated actuators or explosion-resistant enclosures where required

2.04 PERFORMANCE REQUIREMENTS:

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Ground Fault: Products shall not fail due to ground fault condition when suitably grounded.
- C. Backup Power Source: Systems and equipment served by a backup power source shall have associated control damper actuators served from a backup power source.

D. Environmental Conditions:

1. Provide electric control-damper actuators, with protective enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Electric control-damper actuators not available with integral enclosures, complying with requirements indicated, shall be housed in protective secondary enclosures.
 - a. Hazardous Locations: Explosion-proof rating for condition

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for dampers and instruments installed in duct systems to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 CONTROL-DAMPER APPLICATIONS:

- A. Select from damper types indicated in "Control Dampers" Article to achieve performance requirements and characteristics indicated while subjected to full range of system operation encountered.
 1. Rectangular Exhaust Air Duct Applications: Rectangular dampers with galvanized airfoil blades. Insulated rectangular dampers for non ducted applications.
 2. Rectangular Outdoor Air Duct Applications: Rectangular dampers with galvanized airfoil blades. Insulated rectangular dampers for non-ducted applications.
 3. Rectangular Return Air Duct Applications: Rectangular dampers with galvanized airfoil blades.
 4. Rectangular Supply Air Duct Applications: Rectangular dampers with galvanized airfoil blades.

3.03 INSTALLATION, GENERAL:

- A. Furnish and install products required to satisfy most stringent requirements indicated.
- B. Properly support dampers and actuators, tubing, wiring, and conduit to comply with requirements indicated. Brace all products to prevent lateral movement and sway or a break in attachment..

- C. Provide ceiling, floor, roof, and wall openings and sleeves required by installation. Before proceeding with drilling, punching, or cutting, check location first for concealed products that could potentially be damaged. Patch, flash, grout, seal, and refinish openings to match adjacent condition.
- D. Seal penetrations made in fire-rated and acoustically rated assemblies.
- E. Install products in locations that are accessible and that will permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.
- F. Corrosive Environments:
 - 1. Use products that are suitable for environment to which they will be subjected.
 - 2. If possible, avoid or limit use of materials in corrosive environments, including, but not limited to, the following:
 - a. Laboratory exhaust airstreams
 - b. Process exhaust airstreams
 - c. Odor Control Systems
 - 3. Use Type 316 stainless-steel tubing and fittings when in contact with a corrosive environment.
 - 4. When conduit is in contact with a corrosive environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive-resistant coating that is suitable for environment.
 - 5. Where actuators are located in a corrosive environment and are not corrosive resistant from manufacturer, field install products in a NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.

3.04 ELECTRIC POWER:

- A. Furnish and install electrical power to products requiring electrical connections.
- B. Furnish and install raceways. Comply with requirements in Section 26 05 33.

3.05 CONTROL DAMPERS:

- A. Install smooth transitions, not exceeding 30 degrees, to dampers smaller than adjacent duct. Install transitions as close to damper as possible but at distance to avoid interference and impact to performance. Consult manufacturer for recommended clearance.

B. Clearance:

1. Locate dampers for easy access and provide separate support of dampers that cannot be handled by service personnel without hoisting mechanism.
2. Install dampers with at least 24 inches of clear space on sides of dampers requiring service access.

C. Service Access:

1. Dampers and actuators shall be accessible for visual inspection and service.
2. Install access door(s) in duct or equipment located upstream of damper to allow service personnel to hand clean any portion of damper, linkage, and actuator. Comply with requirements in Section 23 33 00.

D. Install dampers straight and true, level in all planes, and square in all dimensions. Install supplementary structural steel reinforcement for large multiple-section dampers if factory support alone cannot handle loading.

E. Attach actuator(s) to damper drive shaft.

F. For duct-mounted and equipment-mounted dampers installed outside of equipment, install a visible and accessible indication of damper position from outside.

3.06 CONNECTIONS:

- A. Connect electrical devices and components to electrical grounding system. Comply with requirements in Section 26 05 26.

3.07 IDENTIFICATION:

- A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 26 05 53.

- B. Install engraved phenolic nameplate with damper identification on damper.

3.08 CHECKOUT PROCEDURES:

A. Control-Damper Checkout:

1. Check installed products before continuity tests, leak tests, and calibration.
2. Check dampers for proper location and accessibility.
3. Verify that control dampers are installed correctly for flow direction.

4. Verify that proper blade alignment, either parallel or opposed, has been provided.
5. Verify that damper frame attachment is properly secured and sealed.
6. Verify that damper actuator and linkage attachment are secure.
7. Verify that actuator wiring is complete, enclosed, and connected to correct power source.
8. Verify that damper blade travel is unobstructed.

3.09 ADJUSTMENT, CALIBRATION, AND TESTING:

- A. Stroke and adjust control dampers following manufacturer's recommended procedure, from 100 percent open to 100 percent closed back to 100 percent open.
- B. Stroke control dampers with pilot positioners. Adjust damper and positioner following manufacturer's recommended procedure, so damper is 100 percent closed, 50 percent closed, and 100 percent open at proper air pressure.
- C. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.
- D. For control dampers equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.

3.10 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 09 93

AUTOMATIC CONTROL SEQUENCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide control sequences for HVAC systems, subsystems, and equipment as indicated and in compliance with Contract Documents.

1.02 DEFINITIONS:

- A. Control Sequences: Manner and method by which automatic temperature controls function. Requirements for each type of operation are described in this section
- B. Analog Output: Proportional output signal (zero- to 10-V dc, 4 to 20 mA)
- C. BAS: Building automation system
- D. Binary Output: On/off output signal or contact closure
- E. Digital Output: Data output that must be interpreted digitally
- F. Manual Mode: Mode or position-controlled device assumes when under manual control. Unless otherwise specified, manual mode implied and affects only device for which manual mode or position identified
- G. Normal Mode: Mode or position-controlled device assumes without power
- H. Automatic Mode: Mode or position-controlled device assumes when under control of automatic system of controls

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data:
 - 1. An instrumentation list for each controlled system. Label each element of the controlled system in table format. Show, in the table element name, type of device, manufacturer, model number, and control device product data sheet number.
 - 2. A complete description of the operation of the control system, including sequences of operation. Include and reference a schematic diagram of the controlled system.

C. Shop Drawings:

1. Riser diagrams showing control network layout, communication protocol, and wire types.
2. Schematic diagram of each controlled system. Include all control points labeled with point names shown or listed including adjustable range of control. Show the location of control elements in the system.
3. Wiring diagram for each controlled system. Show all control elements labels. Where a control element is the same as that shown on the control system schematic, label with the same name. Label all terminals. Clearly identify factory and field wiring requirements.
4. Control panel mounted devices including door mounted control elements.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 NOT USED

PART 3 - EXECUTION

3.01 HYDRONIC SYSTEM PRIMARY LOOP

A. Units Served:

1. 10-B-1
2. 10-B-2
3. 10-P-3
4. 10-P-4

B. General:

1. Integrate Boilers 10-B-1 and 10-B-2 with the automatic temperature control communication network.
2. Interlock Circulating Pump 10-P-4 with Boiler 10-B-1 to start prior to burner ignition and stop after an adjustable timed period upon burner shutdown.
3. Interlock Circulating Pump 10-P-3 with Boiler 10-B-2 to start prior to burner ignition and stop after an adjustable timed period upon burner shutdown.
4. Shut down Boilers 10-B-1 and 10-B-2 when hydronic system primary loop temperature exceeds adjustable hydronic system primary loop high limit temperature set-point of 200°F (manual reset).
5. Shut down Boiler 10-B-1 and Circulating Pump 10-P-4 on loss of flow (automatic reset) or low water level conditions (manual reset).
6. Shut down Boiler 10-B-2 and Circulating Pump 10-P-3 on loss of flow (automatic reset) or low water level conditions (manual reset).
7. Automatically rotate lead and lag boiler assignments weekly to equalize run times.

C. Manual Mode: On

1. Boiler 10-B-1 is energized.
2. Boiler 10-B-2 is energized.
3. Circulating Pump 10-P-4 is energized.
4. Circulating Pump 10-P-3 is energized.

D. Normal Mode: Off

1. Boiler 10-B-1 is de-energized.
2. Boiler 10-B-2 is de-energized.
3. Circulating Pump 10-P-4 is de-energized.
4. Circulating Pump 10-P-3 is de-energized.

E. Automatic Mode: On

1. Operating Controls: Provide each boiler with complete system of operation and safety controls by unit manufacturer.
2. Boiler Control: Enable boilers and associated pumps to operate year round.
3. If the secondary loop supply water temperatures is below the hydronic system secondary loop supply water temperature setpoint of 180°F (adj), energize lead hydronic boiler circulating pump and energize lead hydronic boiler to maintain primary loop supply water temperature setpoint.
4. If lead hydronic boiler is energized for an adjustable timed period and the secondary loop supply water temperature remains below the hydronic system secondary loop supply water temperature setpoint of 180°F (adj), energize lag hydronic boiler circulating pump and energize lag hydronic boiler to maintain primary loop supply water temperature setpoint.
5. Reverse procedure when heating demand is satisfied.

3.02 SECONDARY HOT WATER LOOP

A. Units Served:

1. 10-P-5
2. 10-P-6

B. General:

1. The secondary loop differential pressure is detected by a differential pressure sensor.
2. Automatically rotate lead and lag pump assignments to equalize run times.

C. Manual Mode: On

1. Secondary hot water pump 10-P-5 is energized.
2. Secondary hot water pump 10-P-6 is energized.

D. Normal Mode: Off

1. Secondary hot water pump 10-P-5 is de-energized.
2. Secondary hot water pump 10-P-6 is de-energized.

E. Automatic Mode:

1. Secondary loop lead pump 10-P-5 is energized and runs continuously.
2. If the secondary loop pump 10-P-5 is commanded to run but is not running, energize the secondary loop lag pump.
3. If the secondary loop differential pressure is below the adjustable secondary loop differential setpoint, increase the secondary loop pump speed.

3.03 PRIMARY CHILLED WATER LOOP

A. Units Served:

1. 10-C-1
2. 10-P-7
3. 10-P-8

B. General:

1. Integrate the Chiller 10-C-1 with the automatic temperature control communication network.
2. Circulating Pumps 10-P-7 and 10-P-8 shall be operated in a lead lag configuration.
3. On failure of the lead chiller pump, the lag chiller pump shall be energized and the lead chiller pump shall be de-energized.
4. Automatically rotate lead and lag chiller pump assignments weekly to equalize run times.
5. Shut down Chiller 10-C-1 and the lead chiller pump when chilled water system primary loop temperature is below the adjustable chilled water system primary loop low limit temperature setpoint of 35°F (manual reset).
6. Shut down Chiller 10-C-1 and the lead chiller pump on loss of flow (automatic reset) condition (manual reset).

C. Manual Mode: On

1. Chiller 10-C-1 is energized.

2. Circulating Pump 10-P-7 is energized.
3. Circulating Pump 10-P-8 is energized.

D. Normal Mode: Off

1. Chiller 10-C-1 is de-energized.
2. Circulating Pump 10-P-7 is de-energized.
3. Circulating Pump 10-P-8 is de-energized.

E. Automatic Mode: On

1. Operating Controls: Provide Chiller 10-C-1 with complete system of operation and safety controls by unit manufacturer.
2. Boiler Control: Enable Chiller 10-C-1, Circulating Pump 10-P-7, and Circulating Pump 10-P-8 when the outdoor air temperature is above the adjustable changeover temperature setpoint of 50°F (deenergized when outdoor air temperature is below changeover temperature setpoint).
3. If the secondary loop supply water temperatures is above the chilled water system secondary loop supply water temperature setpoint of 44°F (adj), energize lead chiller circulating pump and energize Chiller 10-C-1 cooling stages in sequence to maintain primary loop supply water temperature setpoint.
4. Reverse procedure when cooling demand is satisfied.

3.04 SECONDARY CHILLED WATER LOOP

A. Units Served:

1. 10-P-1
2. 10-P-2

B. General:

1. The secondary loop differential pressure is detected by a differential pressure sensor.
2. Circulating Pumps 10-P-1 and 10-P-2 shall be operated in a lead lag configuration.
3. Automatically rotate lead and lag pump assignments to equalize run times.

C. Manual Mode: On

1. Secondary chilled water pump 10-P-1 is energized.

2. Secondary chilled water pump 10-P-2 is energized.
- D. Normal Mode: Off
1. Secondary chilled water pump 10-P-1 is de-energized.
 2. Secondary chilled water pump 10-P-2 is de-energized.
- E. Automatic Mode:
1. Secondary loop lead pump is energized and runs continuously whenever the outdoor air temperature is above the adjustable changeover temperature on setpoint of 50°F (deenergized when outdoor air temperature is below the adjustable changeover off temperature setpoint of 45°F).
 2. If the secondary loop pump 10-P-5 is commanded to run but is not running, energize the secondary loop lag pump.
 3. If the secondary loop differential pressure differential pressure is below the adjustable secondary loop differential setpoint set point, increase the secondary loop pump speed (decrease speed when differential pressure is above setpoint).

3.05 VARIABLE AIR VOLUME AIR HANDLING UNIT

A. Units Served:

1. 10-AHU-1
2. 10-EF-1
3. 10-AMS-1
4. 10-CD-1 (exhaust)
5. 10-CD-2 (outdoor air mixing)
6. 10-CD-25 (return air mixing)

B. General

1. The Air Handler 10-AHU-1 supply fan and Return Fan 10-EF-1 shall run continuously during occupied periods unless unit is shut down on alarms.
2. The controller shall measure duct static pressure and shall modulate the Air Handler 10-AHU-1 supply and Return Fan 10-EF-1 speeds to maintain a duct static pressure set point per scheduled value – adjustable. The supply and return fan speeds shall not drop below 30% (adjustable).

3. Provide supply air temperature discharge reset function. The controller shall monitor the supply air temperature and shall maintain a supply air temperature reset based on zone cooling and heating requirements.
4. Provide automatic low temperature thermostat (freeze-stat) with sensing element serpentine on chilled water cooling coil to de-energize unit fan, close outside air damper, and broadcast an alarm to the BAS system upon sensing coil temperature of 32°F (adjustable).
5. The economizer shall be enabled whenever the outside air temperature is less than 65 degrees F, supply fan status is on, and the outside air temperature is less than the return air temperature.
6. Return air damper 10-CD-25 shall act in opposition to outdoor air damper 10-CD-2 and exhaust damper 10-CD-1.
7. Provide a smoke detector in return duct to de-energize air handler 10-AHU-1 supply fan, de-energize Return Fan 10-EF-1, and close outside air damper 10-CD-2 upon sensing a return smoke condition.
8. Occupied and unoccupied periods shall be user adjustable.
9. Two way heating control valve shall fail in the open position upon loss of power. Two way cooling control valves shall fail in the closed position upon loss of power.
10. The air handling unit 10-AHU-1 shall use an optimal start algorithm for morning start-up. This algorithm shall minimize the unoccupied warm-up or cool down period while still achieving comfort conditions by the start of the scheduled occupied period.
11. A timed (3 hour) override control on room sensors shall allow an occupant to override the schedule and place the unit into occupied mode for an adjustable period of time. At the expiration of this time, control of the unit shall automatically return to schedule.

C. Manual Mode: On

1. Air Handler 10-AHU-1 is energized.
2. Return Fan 10-EF-1 is energized.
3. Exhaust Damper 10-CD-1 is open.
4. Outdoor Air Damper 10-CD-2 is open.
5. Return Air Damper 10-CD-25 is closed.

D. Manual Mode: Off

1. Air Handler 10-AHU-1 is de-energized.
2. Return Fan 10-EF-1 is de-energized.
3. Exhaust Damper 10-CD-1 is closed.
4. Outdoor Air Damper 10-CD-2 is closed.
5. Return Air Damper 10-CD-25 is open.

E. Automatic Mode: Occupied

1. Air handling unit 10-AHU-1 and Return Fan 10-EF-1 are energized and operates continuously at fan speed set points as required to maintain supply ductwork static pressure setpoint with outdoor air damper 10-CD-2 positioned to bring in the minimum outdoor air amount as detected by the air measuring station 10-AMS-1.
2. When outdoor air dry bulb temperature exceeds adjustable changeover temperature set point of 55°F modulate two way chilled water and hot water heating valves to maintain adjustable supply air temperature of 55°F.
3. When outdoor air dry bulb temperature is less than the adjustable changeover temperature set point of 55°F modulate outdoor air damper to maintain a mixed air temperature of 55°F (adjustable). If mixed air temperature setpoint can't be maintained, modulate two way chilled water and hot water valves to achieve setpoint.

F. Automatic Mode: Unoccupied

1. Air handling unit 10-AHU-1 is de-energized and outdoor air damper 10-CD-2 is closed.
2. On a call for heating or cooling when outdoor air dry bulb temperature exceeds adjustable changeover temperature set point of 55°F modulate two way chilled water valve and hot water heating valves to maintain adjustable supply air temperature of 55°F.
3. On a call for heating or cooling when outdoor air dry bulb temperature is less than the adjustable changeover temperature set point of 55°F modulate outdoor air damper to maintain a mixed air temperature of 55°F (adjustable). If mixed air temperature setpoint can't be maintained, modulate two way chilled water and hot water valves to achieve setpoint. modulate two way chilled water valves.
4. De-energize air handler 10-AHU-1 when all zone temperature setpoints are satisfied.

3.06 SINGLE ZONE AIR HANDLING UNITS WITH RETURN FAN

A. Units served:

1. 10-AHU-2
2. 10-EF-2
3. 10-CD-8 (exhaust) (10-AHU-2)
4. 10-CD-7 (outdoor air mixing) (10-AHU-2)
5. 10-CD-16 (return air mixing) (10-AHU-2)
6. 10-AHU-4
7. 10-EF-4
8. 10-CD-4 (exhaust) (10-AHU-4)
9. 10-CD-3 (outdoor air mixing) (10-AHU-4)
10. 10-CD-21 (return air mixing) (10-AHU-4)

B. General

1. The supply fans and exhaust fans shall run continuously during occupied periods unless unit is shut down on alarms.
2. Provide supply air temperature discharge reset function. The controller shall monitor the supply air temperature and shall maintain a supply air temperature reset based on zone cooling and heating requirements.
3. Provide automatic low temperature thermostat (freeze-stat) with sensing element serpentine on chilled water cooling coil to de-energize unit fans, close respective outside air dampers, and broadcast an alarm to the BAS system upon sensing coil temperature of 32°F (adjustable).
4. The economizer shall be enabled whenever the outside air temperature is less than 65 degrees F, supply fan status is on, and the outside air temperature is less than the return air temperature.
5. Return air dampers shall act in opposition to their respective outdoor air dampers and exhaust dampers.
6. Provide a smoke detector in return duct to de-energize respective air handler supply fan and close associated outdoor air damper upon sensing a return air smoke condition.
7. Two way heating control valve shall fail in the open position upon loss of power. Two way cooling control valves shall fail in the closed position upon loss of power.

C. Manual Mode: On

1. Air handlers are energized.
2. Return fans are energized.
3. Exhaust dampers are open.
4. Outdoor air dampers are open.
5. Return air dampers are closed.

D. Manual Mode: Off

1. Air handlers are de-energized.
2. Return fans are de-energized.
3. Exhaust dampers are closed.
4. Outdoor air dampers are closed.
5. Return air dampers are open.

E. Automatic Mode: Occupied

1. Air handling units and respective return fans are energized and operate continuously with their respective outdoor air dampers in the minimum position.
2. On a call for heating or cooling when outdoor air dry bulb temperature exceeds adjustable changeover temperature set point of 55°F modulate respective two way chilled water valve and hot water heating valves to maintain adjustable supply air temperature of 55°F.
3. On a call for heating or cooling when outdoor air dry bulb temperature is less than the adjustable changeover temperature set point of 55°F modulate respective outdoor air damper to maintain a mixed air temperature of 55°F (adjustable). If mixed air temperature setpoint can't be maintained, modulate respective two way chilled water and hot water valves to achieve setpoint.

3.07 SINGLE ZONE AIR HANDLING UNITS WITHOUT RETURN FAN

A. Units Served:

1. 10-AHU-3
2. 10-CD-19 (exhaust)
3. 10-CD-20 (exhaust)
4. 10-CD-6 (outdoor air mixing)

5. 10-CD-5 (outdoor air pilot)
6. 10-CD-21 (return air mixing)

B. General

1. The Air handler 10-AHU-3 supply fan shall run continuously during occupied periods unless unit is shut down on alarms.
2. Provide supply air temperature discharge reset function. The controller shall monitor the supply air temperature and shall maintain a supply air temperature reset based on zone cooling and heating requirements.
3. Provide automatic low temperature thermostat (freeze-stat) with sensing element serpentine on chilled water cooling coil to de-energize unit fan, close outside air damper, and broadcast an alarm to the BAS system upon sensing coil temperature of 32°F (adjustable).
4. The economizer shall be enabled whenever the outside air temperature is less than 65 degrees F, supply fan status is on, and the outside air temperature is less than the return air temperature.
5. Return air damper 10-CD-21 shall act in opposition to outdoor air damper 10-CD-6 and exhaust dampers 10-CD-19 and 10-CD-20.
6. Provide a smoke detector in return duct to de-energize air handler 10-AHU-3 supply fan and close outside air damper 10-CD-6 upon sensing a return smoke condition.
7. Three way heating control valve shall fail in the full non-bypass position upon loss of power. Three way cooling control valves shall fail in the full bypass position upon loss of power.

C. Manual Mode: On

1. Air Handler 10-AHU-3 is energized.
2. Exhaust Damper 10-CD-19 is open.
3. Exhaust Damper 10-CD-19 is open.
4. Outdoor Air Damper 10-CD-5 is open.
5. Outdoor Air Damper 10-CD-6 is open.
6. Return Air Damper 10-CD-21 is closed.

D. Manual Mode: Off

1. Air Handler 10-AHU-3 is de-energized.

2. Exhaust Damper 10-CD-19 is closed.
3. Exhaust Damper 10-CD-19 is closed.
4. Outdoor Air Damper 10-CD-5 is closed.
5. Outdoor Air Damper 10-CD-6 is closed.
6. Return Air Damper 10-CD-21 is open.

E. Automatic Mode: Occupied

1. Air handling unit 10-AHU-3 is energized and operates continuously with outdoor air pilot damper 10-CD-5 open and outdoor air damper 10-CD-6 set to the minimum position.
2. On a call for heating or cooling when outdoor air dry bulb temperature exceeds adjustable changeover temperature set point of 55°F modulate three way chilled water and hot water heating valves to maintain adjustable supply air temperature of 55°F.
3. On a call for heating or cooling when outdoor air dry bulb temperature is less than the adjustable changeover temperature set point of 55°F modulate outdoor air damper 10-CD-6 to maintain a mixed air temperature of 55°F (adjustable). If mixed air temperature setpoint can't be maintained, modulate three way chilled water and hot water valves to achieve setpoint.

3.08 VARIABLE AIR VOLUME (VAV) REHEAT BOXES

A. Units Served:

1. 10-V-1
2. 10-V-2
3. 10-V-3
4. 10-V-4
5. 10-V-7

B. General:

1. Temperature Sensors shall include local temperature display, a space temperature setpoint selector, and an unoccupied override selector to temporarily change the control sequence mode to occupied during the unoccupied mode of operation for a timed period that is manually adjustable by software setting.
2. VAV Reheat Box actuators shall provide a damper position indicating signal.

3. Minimum and maximum VAV Reheat Box airflow setpoints shall be manually adjustable by software setting.

C. Hand Mode:

1. VAV Reheat Box is in user selectable position with heating valve in user selected position.

D. Off Mode:

1. VAV Reheat Box is in minimum airflow position with heating valves closed.

E. Auto Mode:

1. Modulate VAV Reheat Box toward the maximum airflow position when respective temperature sensors detect a corresponding space temperature above the cooling space temperature setpoint.
2. Modulate VAV Reheat Box damper toward the minimum airflow position and modulate the heating valve toward the open position in sequence when respective Temperature Sensor detects a space temperature below the corresponding adjustable space temperature setpoint. Modulate the heating valve toward the closed position and the VAV Reheat Box damper toward the open position in sequence when the respective space temperature sensor detects space temperature above corresponding adjustable space temperature setpoint.

3.09 MECHANICAL ROOM 202

A. Units Served:

1. 10-BC-1
2. 10-BC-2
3. 10-CD-29 (outside air)
4. 10-CD-10 (exhaust) (10-EF-5)
5. 10-EF-5

B. General

1. Provide supply air temperature discharge reset function. The controller shall monitor the supply air temperature and shall maintain a supply air temperature reset based on zone cooling and heating requirements.
2. Two way heating control valve shall fail in the open position upon loss of power. Two way cooling control valves shall fail in the closed position upon loss of power.

C. Manual Mode: On

1. Blower coil 10-BC-1 is energized.
2. Blower coil 10-BC-2 is energized
3. Outdoor Air Damper 10-CD-29 is opened.
4. Exhaust Air Damper 10-CD-10 is opened.
5. Exhaust Fan 10-EF-5 is energized.

D. Manual Mode: Off

1. Blower coil 10-BC-1 is de-energized.
2. Blower coil 10-BC-2 is de-energized
3. Outdoor Air Damper 10-CD-29 is closed.
4. Exhaust Air Damper 10-CD-10 is closed.
5. Exhaust Fan 10-EF-5 is de-energized.

E. Automatic Mode: Occupied

1. If temperature is above set point, first stage, untempered cooling system energizes 10-EF-5, opens 10-CD-29, and opens 10-CD-10. If temperature is still above set point, second stage cooling energizes 10-BC-1 and 10-BC-2.
2. If temperature is below set point, first stage untempered heating systems de-energizes 10-EF-5, closes 10-CD-29, and closes 10-CD-10. If temperature is still below set point, second stage heating energizes 10-BC-1 and 10-BC-2.

3.10 TOILET 115 AND TOILET 116

A. Units Served:

1. 10-V-5
2. 10-EF-11
3. 10-EF-12

B. Hand Mode:

1. VAV Reheat Box 10-V-5 is in user selectable position with heating valve in user selected position.

2. Exhaust Fan 10-EF-11 is energized.
3. Exhaust Fan 10-EF-12 is energized.

C. Off Mode:

1. VAV Reheat Box 10-V-5 is in minimum airflow position with heating valve closed.
2. Exhaust Fan 10-EF-11 is de-energized.
3. Exhaust Fan 10-EF-12 is de-energized.

D. Auto Mode:

1. Interlock Exhaust Fans 10-EF-11 and 10-EF-12 with their respective space light switch or occupancy sensor to run when occupied or lit.
2. Set VAV Reheat Box 10-V-5 minimum position to 30% when both exhaust fans are off; 50% when one fan is running; and 100% when both fans are running.
3. Modulate VAV Reheat Box 10-V-5 toward the maximum airflow position when space temperature sensor detects a space temperature above the adjustable space temperature setpoint.
4. Modulate VAV Reheat Box 10-V-5 damper toward the minimum airflow position and modulate the heating valve toward the open position in sequence when space temperature sensor detects a space temperature below the adjustable space temperature setpoint. Modulate the heating valve toward the closed position and the VAV Reheat Box 10-V-5 damper toward the open position in sequence when the space temperature sensor detects a space temperature above adjustable space temperature setpoint.

3.11 LAB 111

A. Units Served:

1. 10-V-6
2. Lab Hood
3. 10-EF-3
4. 10-CD-9

B. Hand Mode:

1. VAV Reheat Box 10-V-6 is in user selectable position with heating valve in user selected position.

C. Off Mode:

1. VAV Reheat Box 10-V-6 is in minimum airflow position with heating valve closed.
2. Exhaust Fan 10-EF-3 is energized.
3. Control Damper 10-CD-9 is open.

D. Auto Mode:

1. Energize Exhaust Fan 10-EF-3 and open Exhaust Damper 10-CD-9 when lab hood mounted fan switch is in the on position (fan de-energized and damper closed when switch is in the off position).
2. Set VAV Reheat Box 10-V-6 minimum position to 30% when both exhaust fans are off; 50% when one fan is running; and 100% when both fans are running.
3. Modulate VAV Reheat Box 10-V-6 toward the maximum airflow position when space temperature sensor detects a space temperature above the adjustable space temperature setpoint.
4. Modulate VAV Reheat Box 10-V-6 damper toward the minimum airflow position and modulate the heating valve toward the open position in sequence when space temperature sensor detects a space temperature below the adjustable space temperature setpoint. Modulate the heating valve toward the closed position and the VAV Reheat Box 10-V-6 damper toward the open position in sequence when the space temperature sensor detects space temperature above adjustable space temperature setpoint.

3.12 CITRIC ACID 127, COAGULANT 126, AND OZONE QUENCH 125

A. Units Served:

1. 10-EF-6
2. 10-EF-7
3. 10-EF-8
4. 10-CD-11 (exhaust) (10-EF-6)
5. 10-CD-12 (exhaust) (10-EF-7)
6. 10-CD-13 (exhaust) (10-EF-8)
7. 10-CD-11 (outdoor air) (10-EF-9)
8. 10-CD-12 (outdoor air) (10-EF-10)

9. 10-CD-13 (outdoor air) (10-EF-11)

B. General:

1. Exhaust fans shall run continuously with their respective outdoor air and exhaust air dampers in the open position unless shut down on alarms.

C. Manual Mode: On

1. Exhaust fans are energized.
2. Outdoor air dampers are open.
3. Exhaust dampers are open.

D. Manual Mode: Off

1. Exhaust fans are de-energized.
2. Outdoor air dampers are closed.
3. Exhaust dampers are closed.

E. Automatic Mode: On

1. Exhaust fans are energized and run continuously.
2. Respective outdoor air dampers and exhaust dampers are open.

3.13 OZONE GENERATION 124

A. Units Served:

1. 10-CD-14 (reclaim)
2. 10-CD-15 (exhaust air)
3. 10-CD-16 (reclaim)
4. 10-CD-17 (exhaust air)
5. 10-CD-18 (exhaust air) (10-EF-9)
6. 10-CD-26 (outside air)
7. 10-CD-27 (outside air)
8. 10-EF-9

B. General

1. Exhaust Fan 10-EF-9 shall run continuously with outdoor air damper 10-CD-27 in minimum position and exhaust damper 10-CD-18 in the open position unless shut down on alarms.
 - a. Set outdoor air damper 10-CD-27 minimum position to 10% when both process chillers are off. Set outdoor air damper 10-CD-27 minimum position to fully closed.
2. Interlock Outdoor Air Dampers 10-CD-26 and 10-CD-27 each with a Process Chiller to be open when their respective Process Chiller is running (closed when respective chiller not running).
3. Interlock Exhaust Dampers 10-CD-15 and 10-CD-17 each with a Process Chiller to be open when their respective Process Chiller is running (closed when respective chiller not running).
4. Reclaim air dampers shall act in opposition to their respective outdoor air damper and exhaust dampers.
5. An ozone detector shall be provided by others to detect a high ozone concentration condition.
 - a. BAS shall accept a high ozone concentration alarm from the ozone detector for monitoring purposes.

C. Manual Mode: On

1. 10-EF-9 is energized.
2. 10-CD-14 (reclaim) is closed.
3. 10-CD-15 (exhaust air) is opened.
4. 10-CD-16 (reclaim) is closed.
5. 10-CD-17 (exhaust air) is opened.
6. 10-CD-18 (exhaust air) (10-EF-9) is opened.
7. 10-CD-26 (outside air) is opened.
8. 10-CD-27 (outside air) is opened.

D. Manual Mode: Off

1. 10-EF-9 is de-energized.
2. 10-CD-14 (reclaim air) is closed.

3. 10-CD-15 (exhaust air) is closed.
4. 10-CD-16 (reclaim) is closed.
5. 10-CD-17 (exhaust air) is closed.
6. 10-CD-18 (exhaust air) (10-EF-9) is closed.
7. 10-CD-26 (outside air) is closed.
8. 10-CD-27 (outside air) is closed.

E. Automatic Mode:

1. Exhaust Fan 10-EF-9 shall run continuously with outdoor air damper 10-CD-27 in minimum position and exhaust damper 10-CD-18 in the open position.
2. Open outdoor air damper 10-CD-26 and exhaust damper 10-CD-17 when the west process chiller is running (closed when chiller is off).
 - a. When the space temperature sensor detects a space temperature below the adjustable space temperature setpoint, modulate reclaim damper 10-CD-14 toward the open position, outdoor air damper 10-CD-27 toward the minimum position, and exhaust damper 10-CD-15 toward the closed position.
 - b. Reverse procedure when call for heating is satisfied.
3. Open outdoor air damper 10-CD-27 and exhaust damper 10-CD-15 when the east process chiller is running (closed when chiller is off).
 - a. When the space temperature sensor detects a space temperature below the adjustable space temperature setpoint, modulate reclaim damper 10-CD-16 toward the open position, outdoor air damper 10-CD-28 toward the minimum position, and exhaust damper 10-CD-17 toward the closed position.
 - b. Reverse procedure when call for heating is satisfied.

3.14 CHLORINE GAS STORAGE 123

A. Units Served:

1. 10-CD-21 (exhaust) (10-EF-10)
2. 10-CD-28 (outdoor air)
3. 10-EF-10

B. General

1. Exhaust fan shall exhaust 13,500 cubic feet of air per minute when space is occupied. Noted as “high” setting.
 2. Exhaust fan shall exhaust 1,350 cubic feet of air per minute in normal, unoccupied condition. Noted as “low” setting.
 3. Exhaust fan shall de-energize and 10-CD-21 and 10-CD-28 shall close upon high Chlorine content reading from Chlorine sensor. Chlorine scrubber shall be energized.
- C. Manual Mode: On
1. Exhaust fan 10-EF-10 is energized and is set to high.
 2. Exhaust Damper 10-CD-21 is open.
 3. Outdoor Air Damper 10-CD-28 is open.
- D. Manual Mode: Off
1. Exhaust fan 10-EF-10 is de-energized.
 2. Exhaust Damper 10-CD-21 is closed.
 3. Outdoor Air Damper 10-CD-28 is closed.
- E. Automatic Mode: Occupied
1. Exhaust fan 10-EF-10 is energized and is set to high.
 2. Exhaust Damper 10-CD-21 is open.
 3. Outdoor Air Damper 10-CD-28 is open.
- F. Automatic Mode: Unoccupied
1. Exhaust fan 10-EF-10 is energized and is set to low.
 2. Exhaust Damper 10-CD-21 is open.
 3. Outdoor Air Damper 10-CD-28 is open.
- 3.15 HYDRONIC UNIT HEATERS
- A. Units Served
1. 10-UH-1 thru 10-UH-14
- B. General:

1. Two way control valve shall fail open upon loss of power.
- C. Normal Mode: Off
1. Fan: Off
 2. Control Valve: Closed.
- D. Automatic Mode: On.
1. When the space thermostat detects a space temperature below the adjustable space temperature setpoint, the two way control valve moves to the open position. The unit heater fan energizes when the hot water return aquastat senses a warm coil. When the space thermostat detects a space temperature above the adjustable space temperature setpoint, the two way control valve moves to the closed position. The unit heater fan de-energizes when the hot water return aquastat senses a cold coil.

3.16 ELECTRIC UNIT HEATER

- A. Units Served:
1. 10-EUH-1
 2. 10-EUH-2
 3. 10-EUH-3
 4. 10-EUH-4
- B. Normal Mode: Off
1. Fan: Off
 2. Electric Heating Stages: Deenergized.
- C. Automatic Mode: On.
1. When the space thermostat detects a space temperature below the adjustable space temperature setpoint, energize the fan and engage heating coil stages. When the space thermostat detects a space temperature above the adjustable space temperature setpoint, deenergize the fan and disengage heating coil stages.

3.17 BUILDING AUTOMATION SYSTEM

- A. The Building Automation System (BAS) shall monitor and provide at a minimum the following functions. The mechanical and temperature controls contractor are responsible for coordinating the communication and protocol between the BAS controller differing manufacture supplied controllers.

1. Monitor the following status points:
 - a. Boilers:
 - (1) Hot water supply temperatures
 - (2) Hot water return temperatures
 - (3) Boiler status (on-off)
 - (4) Run time
 - b. Hot water pumps:
 - (1) Pumps status (on-off)
 - (2) Hot water differential pressure
 - (3) Hot water differential pressure set point
 - (4) Hot water pump VFD speeds
 - (5) Run time
 - c. Air handling units:
 - (1) Air handling unit status (on-off)
 - (2) Supply, mixed, return, and outside air temperatures
 - (3) VFD status (% operating) supply and return air fans
 - (4) Damper positions
 - (5) Filter status
 - (6) Valve positions (chilled and hot water)
 - (7) Chilled and hot water inlet and outlet temperatures
 - (8) Supply and return air fan status (on-off)
 - (9) Airflow readings where applicable.
 - (10) Set points (supply and economizer mixed air temperatures)
 - (11) Occupied and unoccupied schedule
 - d. Air Cooled Chillers:

- (1) Chiller Status (on-off)
- (2) Chilled water supply temperature
- (3) Chilled water return temperature
- (4) Outside air temperature
- (5) Run time

e. Chilled Water Pumps:

- (1) Chilled water differential pressure
- (2) Chilled water pump status (on-off)
- (3) Chilled water pumps VFD speed
- (4) Chilled water differential pressure set point
- (5) Run time

f. VAV Reheat Boxes:

- (1) Damper position
- (2) Hot water valve position
- (3) Room sensor set points (heating and cooling)
- (4) Airflow readings
- (5) Zone temperature
- (6) Occupied and unoccupied schedules
- (7) Discharge air temperature
- (8) Hot water supply and return temperatures

g. Space sensors:

- (1) Set points
- (2) Space temperature
- (3) Unoccupied zone override

2. Monitor the following alarm points:

- a. Boilers:
 - (1) Failure (commanded on – but status is off)
 - (2) Low water level
 - (3) High and low primary hot water supply temperature readings
- b. Hot Water Pumps:
 - (1) Failure (commanded on – but status is off)
 - (2) VFD failure
 - (3) Runtime exceeded
 - (4) High hot water differential pressure
 - (5) Low hot water differential pressure
- c. Air handling units:
 - (1) Failure (commanded on – but status is off)
 - (2) High and low supply air static pressure
 - (3) Supply fan and VFD failure
 - (4) Return fan and VFD failure
 - (5) High and low supply & return air temperatures
 - (6) High and low mixed air temperature
 - (7) Freezestat
 - (8) Return air smoke detector
- d. Air Cooled Chiller:
 - (1) Chiller failure – commanded on, but the status is off.
 - (2) Lead chiller failure – the lead chiller is in failure and the lag chiller is on.
 - (3) High and low chilled water supply temperatures
 - (4) High and low chilled water return temperatures

- e. Chilled Water Pumps:
 - (1) Pump failure – commanded on, but the status is off.
 - (2) VFD faults
 - (3) Runtime exceeded
 - (4) High chilled water differential pressure
 - (5) Low chilled water differential pressure
- f. VAV Reheat Boxes:
 - (1) Airflow sensor failure
 - (2) Valve failure
 - (3) Damper failed to open or close
 - (4) High and low space temperature (adjustable limits from space set points)
 - (5) High discharge air temperature
- g. Space sensors:
 - (1) Failure
 - (2) High and low space temperatures

END OF SECTION

SECTION 23 11 23

FACILITY NATURAL GAS PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide new and modify existing gas piping systems, complete and ready for operation. The Work of this Section shall include all labor, materials, tools, equipment, and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Specifications, the Contract Drawings, and the codes and standards listed herein.
- B. Coordinate with Dominion Energy as to any Local restrictions or requirements relative to the installation of the system.
- C. Limits of Work shall be as indicated on the Contract Drawings. Items of Work shall consist of the following:
 - 1. All gas piping downstream of gas meter/regulator outlets. Meter/regulators and gas piping upstream of meter/regulators will be furnished and installed by the local gas utility in accordance with their rules and regulations.
 - 2. Painting of pipe, fittings, and valves.

1.02 REFERENCES:

- A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.
- B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.
- C. American National Standards Institute (ANSI):
 - 1. B109.1: Diaphragm-Type Gas Displacement Meters (Under 500 Cubic Feet per Hour Capacity)
 - 2. B109.2: Diaphragm Type Gas Displacement Meters (500 Cubic Feet per Hour Capacity and Over)
 - 3. B109.3: Rotary Type Gas Displacement Meters

4. LC-1: Fuel Gas Piping Systems Using Corrugated Stainless Steel Tubing
5. LC-4: Press-Connect Metallic Fittings For Use in Fuel Gas Distribution Systems
6. Z21.24: Connectors for Gas Appliances
7. Z21.41: Quick-Disconnect Devices for Use with Gas Fuel Appliances
8. Z21.45: Flexible Connectors of Other Than All-Metal Construction for Gas Appliances
9. Z21.69: Connectors for Movable Gas Appliances
10. Z21.70: Earthquake Actuated Automatic Gas Shutoff Systems
11. Z21.80: Line Pressure Regulators
12. Z21.90: Gas Convenience Outlets and Optional Enclosures

D. American Society of Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)
2. B1.20.1: Pipe Threads, General Purpose, Inch
3. B2.1: Pipe Threads
4. B16.3: Malleable Iron Threaded Fittings Class 150 and 300.
5. B16.5: Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24 Metric/Inch Standard
6. B16.9: Factory-Made Wrought Steel Buttwelding Fittings
7. B16.11: Forged Fittings, Socket-Welding and Threaded
8. B16.38: Large Metallic Valves for Gas Distribution (Manually Operated, NPS 2 1/2 to 12, 125 psig Maximum)
9. B16.39: Malleable Iron Threaded Pipe Unions
10. B16.40: Manually Operated Thermoplastic Gas Shutoffs and Valves in Gas Distribution Systems
11. B18.2.1: Square and Hex Bolts and Screws, Inch Series
12. B18.2.2: Square and Hex Nuts
13. B31.8: Gas Transmission and Distribution Piping Systems

E. ASTM International (ASTM):

1. A36: Carbon Structural Steel
2. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
3. A182: Standard Specification for Forged or Rolled Alloy and Stainless-Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service
4. A194: Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service or Both
5. A403: Standard Specification for Wrought Austenitic Stainless-Steel Piping Fittings
6. B61: Standard Specification for Steam or Valve Bronze Castings
7. B88: Standard Specification for Seamless Copper Water Tube
8. D2513: Thermoplastic Gas Pressure Pipe, Tubing, and Fittings
9. D2517: Reinforced Epoxy Resin Gas Pressure Pipe and Fittings
10. D2683: Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing
11. F1973: Standard Specification for Factory Assembled Anodeless Risers and Transition Fittings in Polyethylene (PE) and Polyamide 11 (PA11) and Polyamide 12 (PA12) Fuel Gas Distribution Systems

F. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. SP-58: Pipe Hangers and Supports - Materials, Design, Manufacture, Application, and Installation

G. Sheet Metal And Air Conditioning Contractors' National Association (SMACNA):

1. SMACNA Seismic Restraint Mnl: Seismic Restraint Manual: Guidelines for Mechanical Systems

H. U.S. National Archives And Records Administration (NARA):

1. 49 CFR 192: Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards

I. National Fire Protection Association (NFPA):

1. NFPA 54: National Fuel Gas Code

J. Manufacturers' Standardization Society (MSS):

1. SP-43: Wrought Stainless Steel Butt-Welding Fittings

K. Fuel Gas Code 2015 of Utah (Adopts with Amendments the International Fuel Gas Code 2015 (IFGC 2015))

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: Coordination Drawings - Prepare as specified in Paragraph "Cooperation and Coordination with Other Trades" of this Section.

C. Product Data: Annotate descriptive data to show the specific manufacturer, model, type, size capacity, curves, wiring diagrams, options, etc. of each item.

1. Pipe and fittings

2. Casings

3. Warning and identification tape

4. Valves

5. Valve boxes

6. Gas equipment connectors

7. Meters

8. Regulators

9. Pipe hangers and supports

10. Access panels

D. Certification: Submit documentation certifying completion of the following items in compliance with this Section.

1. Metal welding inspection

2. PE fusion welding inspection

3. Piping pressure tests

4. System purging

- E. Certificates and Licenses: Prepare as specified in Part 1 of this Section.
 - 1. Qualifications of Installer
 - 2. Qualifications of Construction Supervisor
 - F. Manufacturer's Instructions: Submit manufacturer's installation instructions and manufacturer's visual joint appearance chart.
 - 1. PE pipe and fittings
 - G. Operation and Maintenance Manuals: Prepare manuals in accordance with Section 01 78 23.
 - 1. Valves
 - 2. Meters
 - 3. Regulators
 - H. Test Data: Submit piping system leakage test sheets as specified in Section 22 05 00.
 - I. Closeout Submittals:
 - 1. Record Drawings: Prepare as specified in Part 1 of this Section.
- 1.04 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
 - B. Qualifications of Installer:
 - 1. Prior to installation, submit data showing the name and license of the installing contractor and that they have successfully installed systems of the same type and design as specified herein. Data shall include names and locations of at least two installations of such systems. Indicate type and design of each system and certify that each system has performed satisfactorily in the manner intended for not less than 18 months. The installing contractor shall be licensed to perform applicable gas piping systems installation in the State of Utah.
 - C. Qualifications of Welder:
 - 1. Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. The Authority Having Jurisdiction shall be notified 24 hours in advance of any required testing and the tests shall be performed at the work site. The welder or welding operator shall apply their assigned symbol near each weld they make as a permanent record. Prior to installation, submit data for acceptance showing the name and certification of each welder and welding operator to be used on the project. Submit each welder's

identification symbols, assigned number, or letter, used to identify work of the welder. Welders making defective welds after passing a qualification test shall be given requalification test and, upon failing to pass this test, shall not be permitted to work on this Contract.

- a. Steel Welder's Qualifications: Comply with ASME B31.8. Each steel welder shall have a copy of a certified ASME B31.8 qualification test report. Conduct a qualification test for each welder and submit results for acceptance.
- b. PE Welder's Qualifications: Supervising and installing personnel shall be trained by a PE pipe manufacturer's sponsored course of not less than one week duration, or present proof satisfactory to the Engineer that personnel are currently working in the installation of PE gas distribution lines. Conduct a qualification test for each welder and submit results for acceptance.
- c. Safety Standards: 49 CFR 192.

D. Qualifications of Construction Supervisor:

- 1. Provide a Construction Supervisor with a minimum of 5 years of experience in fuel gas piping construction supervision who shall be responsible for the installation of the Work of this Section of the Specifications. The Construction Supervisor shall be licensed to perform applicable fuel gas piping systems supervision in the State of Utah. Prior to installation, submit data for acceptance showing the name and license of the Construction Supervisor.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in Section 01 66 10.

B. Shipping:

- 1. All equipment, material and spare parts shall be shipped, stored, handled, and installed in such a manner as not to degrade quality, serviceability, or appearance. Equipment and material warranties shall not be voided by actions of the Contractor.

C. Receiving:

- 1. All equipment, material and spare parts shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.
- 2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard equipment, material, and spare parts in accordance with manufacturer's recommendations.

1.06 SPECIAL REQUIREMENTS:

A. Refer to applicable sections of Division 1 with regard to providing the following:

1. Submittal of manufacturer's specifications, catalog data, descriptive matter, illustrations, diagrams, etc., including complete motor data for all equipment.
2. Nameplates
3. Foundations, installations, and grouting
4. Operating and maintenance instructions and parts lists
5. Lubricants
6. Special tools
7. Bolts, anchor bolts, and nuts
8. Concrete inserts
9. Sleeves
10. Electric motors
11. Voltage rating of motors
12. Equipment drive guards

1.07 COOPERATION AND COORDINATION WITH OTHER TRADES:

- A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit and installed promptly when and as directed.
- B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, sleeves, and openings needed for the Work, and furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.
- C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.
- D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section of the Specifications

required to coordinate with normal structural interferences, or for proper execution of specified work.

- E. If work is installed before coordinated with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section of the Specifications at no additional cost to the Owner.
- F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section of the Specifications and be responsible for repairing any damages caused by such work without any additional cost to the Owner.
- G. Follow Drawings in layout work. Check Drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section of the Specifications will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.
- H. Prepare and submit for acceptance Coordination Drawings consisting of 3/8 inch = 1 foot-0 inches scale or larger working plans and sections, clearly showing how this Work is to be installed in relation to the work of other Sections. Coordination Drawings shall be based upon accepted equipment submittals.
- I. Attend regular coordination and job progress meetings required.

1.08 PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION:

- A. All electrical apparatus and controls associated with equipment installed or modified under this Section, but which are not integral with the equipment served, shall be furnished under Division 26. All mounting and wiring of non-integral electrical apparatus and controls, and interconnecting wiring to equipment served will be done under Division 26.
- B. Access panels shall be furnished under this Section and installed by the trade responsible for the appropriate Section of the Specifications for the surface upon which the panels are mounted. Prepare a schedule showing location, size and function of all required access panels and deliver schedule to representatives of all installing trades.
- C. Inserts and anchor bolts shall be furnished under this Section and installed under Section 03 30 00. Prepare a schedule showing location, size and function of all required inserts and anchor bolts and deliver schedule to representative of the installing trade.
- D. Pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades.

1.09 PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION:

- A. Gas meters and regulators will be furnished by the Gas Utility.

1.10 REMOVAL WORK:

- A. Particular care shall be taken to avoid creating hazards on the site or causing disruption of service in the adjoining buildings.
- B. All existing equipment indicated to be removed shall be done in a neat and workmanlike manner. All existing equipment indicated to be turned over to the Owner shall be presented to the Owner in good condition at a location designated by the Owner. All other equipment shall be removed from the premises and disposed of at an approved disposal or recycling facility.
- C. Remove all abandoned piping and equipment not built into building construction. Where ceilings or walls are removed all abandoned conduit and piping shall be removed and ends of live services capped. Abandoned elements built into walls or located above existing ceilings shall remain and ends capped and marked abandoned.
- D. Should any asbestos and/or asbestos related products or materials be encountered during the performance of the Work, stop work immediately and inform the Engineer and the Owner of the presence of asbestos.

1.11 ELECTRICAL WORK:

- A. All electrical apparatus and controls associated with equipment installed or modified under this Section, but which are not integral with the equipment served, shall be furnished under Division 26. All mounting and wiring of non-integral electrical apparatus and controls, and interconnecting wiring to equipment served will be done under Division 26.
- B. All equipment furnished under this Section requiring motors shall have motors factory furnished and installed by the manufacturer of the equipment served and shall be mounted and aligned so as to run free and true. Provide internal wiring and motors for mechanical equipment as an integral part of the equipment. Motor starters and contactors shall be factory-furnished and wired as an integral part of packaged mechanical equipment where indicated on the Contract Drawings. Disconnect switches, and all other motor starters and contactors shall be furnished, installed, and wired by Division 26.
- C. When motors and other associated electrical apparatus furnished are larger than sizes indicated on the Drawings, the cost of additional electrical service and related work shall be included under the Section that furnished that motor.

1.12 CODES, PERMITS AND FEES:

- A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship, and equipment shall conform to the governing edition of the following regulations, and agency requirements. In the standards referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears.
 - 1. State and Local Building Codes including, but not limited to, the Utah Fuel Gas Code and the 2018 International Building Code.
 - 2. Local Fire Department.
 - 3. Dominion Energy.
 - 4. Occupational Safety and Health Administration (OSHA).
 - 5. Any other local codes or requirements of Authorities Having Jurisdiction.
- B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Architect, Owner, Engineer, and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

1.13 RECORD DRAWINGS:

- A. Prepare and maintain Record Drawing to meet the requirements of this Section of the Contract Specifications.
- B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of Drawings at the job site at all times. On a daily basis, record work completed and all changes from original Drawings clearly and accurately, including work installed as a modification or addition to the original design such as change orders, instructions issued by the Engineer, or conditions encountered in the field. Record valve tags as they are installed. In addition, take photographs of all concealed equipment in gypsum board ceilings, shafts, underground (buried) piping routes and supports and other concealed, inaccessible work. At completion of work, make copies of photographs with written explanation on back. These shall become part of Record Drawings.
- C. Record drawings shall show record condition of pipe routing and sizes, valve locations, details and sections, riser diagrams, and control changes. Schedules shall show actual manufacturer and make and model numbers of final equipment installation. Remove all

superseded data to show the completed work. Accurately indicate the location, size, type, and elevation of new buried piping and their relationship to existing buried piping.

- D. The Record Drawings will be used as a guide for determining the progress of the Work installed. They shall be inspected on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be accepted until the Record Drawings are accurate and up-to-date.
- E. At completion of Work prepare a complete set of marked-up Record Drawings on bond paper showing all systems as actually installed. The Contract Drawing electronic CAD files will be made available for this Contractor's use to serve as backgrounds for the Record Drawings. Provide all drawings necessary to show the required record information. Submit marked-up prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer.
- F. Certify the accuracy of the Record Drawings. Record Drawings shall become the property of the Owner.
- G. When required by jurisdiction, submit the Record Drawings for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

PART 2 - PRODUCTS

2.01 PIPE, FITTINGS AND JOINTS:

- A. Coated Black Steel - Welded Joints: "Yellow Jacket" Schedule 40 mild black carbon steel, ASTM A53, Grade B, factory coated with yellow plastic, mill or site beveled, and complete with forged steel butt welding fittings and welded joints. All bare metal surfaces are to be cleaned and corrosion protected with a suitable Denso primer and tape corrosion protection system.
- B. Polyethylene (Buried Piping): Safety yellow colored medium density polyethylene (MDPE) pipe shall be in accordance with ASTM D 2513, 100 psig working pressure, Standard Dimension Ratio (SDR), the ratio of pipe diameter to wall thickness, 11.5 maximum.
 - 1. Manufacturers:
 - a. Performance Pipe Driscopex 6500 Series
 - b. JM Eagle
 - c. ENDOT Industries, Inc. Yellow Gas Pipe
 - 2. Socket Fittings: Per ASTM D2683.
 - 3. Butt-Fusion Fittings: Per ASTM D2513, molded.

4. Buried Utility Warning and Identification Tape:

- a. Provide detectable aluminum-foil plastic-backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 3-inch minimum width, color-coded yellow for natural gas, with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be "CAUTION BURIED GAS PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material. Refer to Section 31 23 33 for details.
- b. Manufacturer shall be:
 - (1) Seton
 - (2) Reef Industries, Inc.
 - (3) Terra Tape Security Line Detectable
 - (4) Christy's
 - (5) Presco

5. Casing:

- a. Where indicated at railroad or other crossing, provide ASTM A53, galvanized pipe, Schedule 40, with extruded polyethylene coating.
- C. Uncoated Black Steel – Screwed Joints: Schedule 40 mild black carbon steel, ASTM A53, Grade B, complete with malleable cast iron screwed fittings to ANSI B2.1, and screwed joints.
- D. Uncoated Black Steel – Welded Joints: Schedule 40 mild black carbon steel, ASTM A53, Grade B, mill or site beveled, complete with factory made forged steel butt welding fittings and welded joints.
- E. Copper-Uncoated: Type “K” seamless copper tubing to ASTM B88, hard temper with wrought copper capillary brazed joint type fittings to ASTM B61, and brazed joints made with “Sil-Fos” or “Sil-Fos 5” brazing alloy, or, soft temper with flared brass fittings of a single 45 degree flare type, forged or with a machined long nut and copper to copper threaded connectors, and, where required, flared brass copper to NPS adapters.
- F. Coated Copper: Type “K” soft temper as above but with a factory applied external yellow plastic coating approved by governing authorities.

- G. Flexible Stainless Steel: Flexible, CGA certified, 125 psi rated, gas-tight, convoluted stainless steel tubing factory jacketed with a bright yellow PVC coating which is continuously identified. The tubing is to be supplied in coils and is to be complete with factory attached stainless steel end fittings, and adapter unions, protective plates, and steel clamps. Acceptable products are:

1. Flex Pression Ltd. (Westburne) "GAZFLEX"
2. Tru-Flex Metal Hose Corp. "Pro-Flex"
3. Titeflex Corp. "Gastite"
4. Omega Flex Canada "TracPipe"

H. Aboveground Fittings:

1. Pipe: Black steel, ASTM A 53, Type E or F, Grade A or B, Schedule 40, threaded ends or plain end socket welded for sizes 2 inches and smaller; otherwise, plain end beveled for butt welding.
2. Threaded Fittings: ASME B16.3, black malleable iron.
3. Socket-Welding Fittings: ASME B16.11, forged steel.
4. Butt-Welding Fittings: ASME B16.9, with backing rings of compatible material.
5. Unions: ASME B16.39, black malleable iron.
6. Flanges and Flanged Fittings: ASME B16.5 steel flanges or convoluted steel flanges conforming to ASME BPVC SEC VIII D1. Flange faces shall have integral grooves of rectangular cross sections which afford containment for self-energizing gasket material.
 - a. Gaskets: Fluorinated elastomer, compatible with flange faces.
 - b. Bolting: Stainless steel; ASTM A 193, Grade B8M or B8MA, Type 316, for bolts; and ASTM A 194, Grade 8M, Type 316, for nuts. Dimensions of bolts, studs, and nuts shall conform with ASME B18.2.1 and ASME B18.2.2 with coarse threads conforming to ASME B1.1, with Class 2A fit for bolts and studs and Class 2B fit for nuts. Bolts and bolt-studs shall extend through the nuts and may have reduced shanks of a diameter not less than the diameter at roof of threads. Bolts shall have American Standard regular square or heavy hexagon heads. Nuts shall be American Standard heavy semi-finished hexagon.
7. Pipe Thread Paste or Tape: Anti-seize and sealant paste or tape of polytetrafluoroethylene (PTFE).

8. Welding Filler Metal: ASME B31.8.

I. Risers:

1. Manufacturer's standard anodeless riser, transition from plastic to steel pipe with 7 to 12 mil thick epoxy coating meeting the requirements of ASTM F1973. Use swaged gas-tight construction with O-ring seals, metal insert, and protective sleeve. Provide remote bolt-on or bracket or wall-mounted riser supports as indicated.
 - a. Manufacturer shall be:
 - (1) GF Central Plastics
 - (2) Elster Perfection

J. Transition Fittings:

1. Steel to Plastic (PE): As specified for "riser" except designed for steel-to-plastic with tapping tee or sleeve. Coat or wrap exposed steel pipe with heavy plastic coating.
2. Plastic to Plastic: Manufacturer's standard bolt-on (PVC to PE) plastic tapping saddle tee, UL listed for gas service, rated for 100 psig, and O-ring seals. Manufacturer's standard slip-on PE mechanical coupling, molded, with stainless-steel ring support, O-ring seals, and rated for 150 psig gas service.

2.02 VALVES, BURIED:

A. Shutoff Valves:

1. Metallic ball valves, ANSI B16.33 corrosion-resisting steel, with threaded or flanged ends. Provide polytetrafluoroethylene (PTFE) seats.
2. PE ball or plug valves, ASME B16.40 and ASTM D 2513, Class C materials (PE 2306 or PE 3406), strength rating of Class 4 location with class factor of 0.20, and SDR matching PE pipe dimensions and working pressure.
 - a. Manufacturers:
 - (1) Poly-Valve
 - (2) Aqua-Fuse by CMF Global
 - (3) Lyall-Polytec
 - (4) GF Central Plastics

B. Valve Boxes:

1. Provide rectangular concrete valve box, sized large enough for removal of valve without removing box. Cast the word "Gas" into the box cover. Use valve box for areas as follows:
 - a. Roads and Traffic Areas: Heavy duty, cast iron cover.
 - b. Other Areas: Standard duty, concrete cover.

2.03 VALVES, ABOVEGROUND:

- A. Provide lockable valves where located outdoors and where otherwise indicated. Valves shall be of only one of the types specified herein below.
- B. Earthquake Automatic Gas Shutoff Valve:
 1. ANSI Z21.70 and UL listed or AGA listed or International Association of Plumbing and Mechanical Officials (IAPMO) listed.
 2. The valve shall provide automatic shut off when triggered by a magnitude 5.5 seismic event. Manually resettable on both sides of valve.
- C. Ball Type (1/4-inch to 4-inch diameter): minimum 450 psi WOG rated, 1/4 turn, full port non-lubricated brass ball valves, each complete with a Teflon PTFE seat, chrome plated solid ball, removable lever handle, and screwed ends. Acceptable products are:
 1. Neo Valves #525
 2. Kitz Corp. Code 58
 3. Toyo Valve Co. Fig. 5044A
 4. MAS B-3
 5. Nibco #T-FP-600
- D. Plug Type (4-inch to 8-inch diameter): Plain face flanged, Class 125, 1380 kPa rated, 1/4 turn, cast iron lubricated plug valves, each wrench operated and complete with cylindrical plug with lubricant grooves, lubricant screw, and lubricant receptacle. Acceptable products are:
 1. Neo Valves #1AS40114
 2. Newman Hattersley #171M
 3. KITZ 150 SCTAM-FS (flanged, 150 class, ball valve, 1/2-inch to 10 inches) CGA 3.16

2.04 NATURAL GAS CONVENIENCE OUTLET:

- A. Neo Valves Model 3/375 quick-connect type outlets with interlocking safety cam to prevent release of the appliance connector until the valve is off, integral thermal protection to prevent gas flow if the outlet is exposed to temperatures exceeding 200 degrees F, and a wall enclosure box.

2.05 NATURAL GAS PRESSURE REDUCING VALVE:

- A. Fisher (an Emerson Company) 1 inch x 1 inch Type S102C direct operating natural gas pressure reducing regulator with a cast iron body, 1 inch NPT connections, 9/16-inch orifice, and internal relief.

2.06 PRESSURE REDUCING REGULATORS:

- A. Provide Fisher pressure reducing regulators as presented in Schedule 23 11 23-1. Also provide pressure reducing regulators to suit the building load complete with relief.

2.07 GAS EQUIPMENT CONNECTORS:

- A. All gas equipment connectors shall be AGA-approved.
 - 1. Flexible Connectors: ANSI Z21.45 or ANSI Z21.24 and approved for use in Utah, maximum length of the connector shall not exceed 36 inches.
 - 2. Quick Disconnect Couplings: ANSI Z21.41.
 - 3. Semi-Rigid Tubing and Fittings: ANSI Z21.69.

2.08 METERS:

- A. ANSI B109.2 pipe mounted, diaphragm or bellow style, enamel coated steel case. Provide combined register totalizer reading in cubic feet, water escape hole in housing, and means for sealing against tampering. Meters shall have corrosion resistant factory painted finish.

2.09 REGULATORS:

- A. AGA-approved, self-contained with spring-loaded diaphragm pressure regulating valve and atmospheric vent, corrosion resistant construction, pressure operating range as required for the pressure reduction indicated, volume capacity not less than indicated, threaded ends for sizes 2-inch and smaller, otherwise flanged. Regulators shall have corrosion resistant factory painted finish. Regulators shall be designed for the gas used.

2.10 PRESSURE GAUGES:

- A. ASME B 40.1.

2.11 PIPE HANGERS AND SUPPORTS:

- A. Provide MSS SP-58, Type 1, 7, and 41 hangers with adjustable type steel support rods, except as specified or indicated otherwise. Attach to steel joists with Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel with drilled hole on centerline and double nut and flat washer. Attach to wood framed structures using wood screws designed for use with threaded rod adapters, or through-bolted with double nut and flat washer. Attach to concrete with Type 18 insert or drilled expansion anchor. Hangers, supports, rods and fasteners shall be hot-dipped galvanized steel. Hangers and supports in contact with bare copper tubing shall be PVC coated. Hangers and supports shall be Series 300 stainless steel. Rods and fasteners shall be Series 300 stainless steel.

2.12 SUPPLEMENTARY STEEL AND CHANNELS:

- A. Unless otherwise indicated on the Structural Drawings, provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.
- B. Supporting channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.
- C. All supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be steel, field painted after fabrication. Channels shall be painted steel.

2.13 PIPE SLEEVES:

- A. Sleeves in Masonry and Concrete Walls, Floors, Ceilings, and Flat Roofs: Schedule 40 hot dipped galvanized, standard weight ductile-iron or cast-iron pipe sleeves. Sleeves available from the manufacturer of mechanically adjustable segmented elastomeric seals shall be permitted subject to acceptance by the Engineer. Provide minimum 2 inch high waterstop for sleeves in exterior walls and floors.
- B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness.
- C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have low durometer EPDM seal elements and series 300 stainless steel hardware.

2.14 PIPE ESCUTCHEONS:

- A. General: Provide pipe escutcheons at all pipe penetrations where penetration is exposed to view as specified herein with inside diameter closely fitting pipe outside diameter. Select outside diameter of escutcheon to completely cover pipe penetration hole in

floors, wall, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be held in place by internal spring tension or set screws.

- B. Provide pipe escutcheons in finished spaces. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

2.15 ACCESS PANELS:

- A. Access panels shall give access to each valve in concealed spaces above non removable (hard) suspended ceilings, and to all other concealed parts of the system. Access panels shall be located where indicated on the Drawings and/or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.
- B. Access panels shall be Milcor Type M, 16-inch by 16-inch minimum, as manufactured by Inryco, Inc. Door shall be constructed of 18 gage galvanized steel with frame constructed of 16 gage galvanized steel. Casing bead shall be galvanized steel. Hinge shall be continuous steel with stainless steel pin. Locks shall be flush-screwdriver operated, with metal cam. Galvanized steel sleeve shall be welded to panel for access to cam lock control. Prime coat shall be factory applied rust-inhibitive light grey paint.

PART 3 - EXECUTION

3.01 NATURAL GAS SERVICE:

- A. Make all required arrangements with Dominion Energy on behalf of the Owner for installation of natural gas service piping with gas pressure regulator and meter assembly where shown.
- B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the contractor's expense.
- C. Verify all measurements at the Project Site.
- D. Avoid interferences with other trades.

3.02 NATURAL GAS PIPING INSTALLATION REQUIREMENTS:

- A. Installation, workmanship, inspection, and testing shall be in accordance with the specified Fuel Gas Code with the additions specified herein. Install natural gas piping upstream of meter/regulators or upstream of building connections in accordance with ASME B31.8. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other accepted methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position.

- B. Natural Gas Piping shall not be permitted in Electrical Rooms and stairwells.
- C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.
- D. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Make provisions in buried piping for differential settlement. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.
- E. Piping: Cut pipe to actual dimensions and assemble to prevent residual stress. Provide supply connections entering the building as indicated. Within buildings, run piping parallel to structure lines and conceal in finished spaces. Fittings installed in concealed locations shall be limited to the following types: threaded elbows, tees, and couplings, brazed fittings, welded fittings, and fittings listed to ANSI LC-1 or ANSI LC-4. Terminate each vertical supply pipe to burner or appliance with tee, nipple and cap to form a sediment trap. To supply multiple items of gas-burning equipment, provide manifold with inlet connections at both ends.

1. Cleanliness:

- a. Clean inside of pipe and fittings before installation. Blow lines clear using 80 to 100 psig clean dry compressed air. Rap steel lines sharply along entire pipe length before blowing clear.

2. Buried Polyethylene (PE) Piping:

- a. Provide totally PE piping. Buried piping shall not be permitted under any building and/or structure. Terminate buried piping not more than 6 inches above grade. Prior to installation, obtain printed instructions and technical assistance in proper installation techniques from pipe manufacturer. When joining new PE pipe to existing pipe line, ascertain when procedural changes in the fusion process is necessary to attain optimum bonding.

- (1) PE Piping: Provide fusion-welded joints except where transitions have been specified. Use electrically heated tools, thermostatically controlled and equipped with temperature indication. (Where connection must be made to existing plastic pipe, Contractor shall be responsible for determination of compatibility of materials and procedural changes in fusion process necessary to attain maximum integrity of bond.)
- (2) Laying PE Pipe: Minimum cover over pipe shall be 30 inches below finish grade or 36 inches below any drainage ditches or deeper when indicated. Minimum cover for services lines to any building or structure shall be 18 inches. Maintain 6 inches of clearance between natural gas piping and any other utility or structure. If minimum

clearance cannot be maintained, the natural gas pipe shall be protected with a casing pipe. Service lines shall be sloped to drain back to the distribution pipe. Lay in accordance with manufacturer's printed instructions.

- (3) Buried gas piping shall not penetrate building foundation walls at any point below grade per FGC of Utah Section 404.6. Gas piping shall enter buildings or structures at a point above grade and the annular space between the pipe and the wall shall be sealed.
- b. Excavating and Backfilling: Pipe bedding and compacted backfill shall be provided under this Section of the Specifications in accordance with the requirements of Section 31 22 00. Pipe bedding shall be 6 inches deep. Compacted backfill shall be to a point 12 inches above the crown of buried pipe. Bedding and compacted backfill shall be non-corrosive material such as cleaned washed sand, and contain no stones, metal, rubbish of any kind, frozen material, organic matter, or any other material capable of damaging piping or coating, and/or of settling. Gas lines shall be buried in the trenches separate from all other utilities including other gas lines. Trenches shall be wide enough to permit at least 6 inches spacing between the sides and floor of the trench. Make provisions in buried piping for differential settlement, e.g. snaking the piping in the trench before backfilling. Coordinate provision of utility warning identification tape with backfill operation. Bury utility warning and identification tape with printed side up at a depth of 12 inches below the top surface of earth or the top surface of the subgrade under pavements.
- c. PE Pipe Installation Guidelines:
- (1) Acceptable plastic PE pipe is manufactured according to standard ASTM D2513 and is marked with "ASTM D2513". The PE type designations recommended are PE 2406, and PE 3408.
 - (2) PE plastic pipe is unsuitable for aboveground installation. Plastic pipe must be buried or inserted.
 - (3) Make each joint in accordance with written procedures that have been proven by test to produce strong gas-tight joints. PE plastic pipe joining procedures can be obtained from qualified manufacturers. Do not purchase a product if the manufacturer or supplier does not certify it for qualified joining procedures.
 - (4) All pipe joining procedures must be conducted by qualified person following the written joining procedures for each type of pipe and fitting used. No person shall make a plastic pipe joint unless that person has been qualified under the applicable joining procedure by making a specimen joint that passes inspection and test. The specimen

joint must be visually examined during and after joining and found to have the same appearance as a joint or photograph of a joint that is acceptable under the procedure. In the case of heat fusion, the specimen must be cut into at least three longitudinal straps, each of which is:

- (a) Visually examined and found not to contain voids or discontinuities on the cut surfaces of the joint area;
 - (b) Deformed by bending, torque, or impact, and if failure occurs, it must not initiate in the joint area.
- (5) Install properly designed valves in a manner that will protect the plastic material. Protect the pipe from excessive twisting, shearing, or cutting loads when the valve is operated. Protect from any secondary stresses that might be induced through the valve or its enclosure.
 - (6) Prevent pullout and joint separation. Plastic pipe must be installed in such a manner that expansion and contraction of the pipe will not cause pullout or separation of the joint.
 - (7) When inserting plastic pipe in a metal pipe, make allowance for thermal expansion and contraction. Make an allowance at lateral and end connections on inserted plastic pipes, particularly those over 50 feet in length. End connections must be designed to prevent pullout caused by thermal contraction. Fittings must be able to restrain a force equal to or greater than the strength of the pipe. To minimize the stress caused by thermal contraction, pipes inserted in the summer should be allowed to cool to ground temperature before tie-ins are made. Inserted pipes, especially those pulled in, should be relaxed, mechanically compressed, or cooled to avoid initial tensile stress. Operators unfamiliar with proper insertion techniques must have a qualified person develop the procedures.
 - (8) Repair or replace imperfections or damages before placing the pipe in service.
 - (9) Install all plastic mains and service lines below ground level. Where the pipe is installed in a vault or other below-grade enclosure, it must be completely encased in gas-tight metal pipe with fittings that are protected from corrosion. Plastic pipe installation must minimize shear and other stresses. Plastic mains and service lines that are not encased must have an electrically conductive wire or other means of locating the pipe. Plastic lines must not be used to support external loads.
 - (10) A yellow insulated copper tracer wire shall be installed adjacent to underground PE pipe. Access shall be provided to the tracer wire of the tracer wire shall terminate above ground at each end of the PE

piping. The tracer wire size shall not be less than 12 AWG solid copper and the insulation type shall be 30 to 45 mils polyethylene suitable for direct burial, Southwire Tracer Wire, or approved equal.

- (11) Ensure that plastic PE pipe is continually supported along its entire length by properly tamped and compacted soil. To prevent any shear or other stress concentrations use external stiffeners at connections to main, valves, meter risers, and other places where compression fittings might be used.
- (12) In laying of plastic PE pipe, ensure adequate slack (snaking) in the pipe to prevent pullout due to thermal contraction.
- (13) Suitable bedding (sand) and backfill must be provided. Ensure backfill with material that does not contain any large or sharp rocks, broken glass, or other objects that could cut or puncture the pipe.
- (14) Take special care to prevent coal tar type coatings or petroleum base tape from contacting the plastic pipe. It can cause plastic pipe to deteriorate.
- (15) Static electricity can ignite a flammable gas-air atmosphere. When working with plastic pipe of any kind where there is (or there may be) the possibility of a flammable gas-air atmosphere, take the following precautions:
 - (a) Use a grounded wet tape conductor wound around, or laid in contact with, the entire section of the exposed piping.
 - (b) If gas is already present, wet the pipe starting from the ground end with a very dilute water and detergent solution. Apply tape immediately and leave it in place.
 - (c) Wet the tape occasionally with water. Where temperatures are below freezing (32 degrees F) add glycol to the water to maintain tape flexibility. Ground the tape with a metal pin driven into the ground.
 - (d) Do not vent gas using an ungrounded plastic pipe or tubing. Even with grounded metal piping, venting gas with high scale or dust content could generate an electric charge in the gas resulting in an arc from the dusty gas cloud back to the pipe which could ignite the gas. Vent gas only at a downwind location remote from people or flammable material.
 - i. Dissipating the static charge buildup with wet rags, a bare copper wire, or other similar techniques may not be as effective as the above procedure. In all cases, use

appropriate safety equipment such as flame resistant and static free clothing, breathing apparatus, etc.

- (16) In transition area where the plastic pipe is connected to a fitting, valve, or riser, the use of protective sleeves may be needed to distribute excessive stresses, along with attention to adequate backfill and support.

3. Aboveground Steel Piping:

- a. Determine and establish measurements for piping at job site and accurately cut pipe lengths accordingly. For 2-inch diameter and smaller, use threaded or socket-welded joints. For 2 1/2-inch diameter and larger, use flanged or butt-welded joints.
 - (1) Threaded Joints: Where possible use pipe with factory-cut threads, otherwise cut pipe ends square, remove fins and burrs and cut taper pipe threads in accordance with ASME B1.20.1. Provide threads smooth, clean and full-cut. Anti-seize jointing compound for pipe threads shall be polytetrafluoroethylene (PTFE) pipe thread paste, pipe cement and oil, or PTFE powder and oil. PTFE tape is also acceptable. Apply jointing compound to male threads only. Work piping into place without springing or forcing. Backing off to permit alignment of threaded joints will not be permitted. Engage threads so that not more than three threads remain exposed. Use unions for connections to valves, meters, and regulators for which a mean of disconnection is not otherwise provided.
 - (2) Welded Joints: Weld by the shielded metal-arc process, using covered electrodes and in accordance with procedures established and qualified in accordance with ASME B31.8.
 - (3) Flanged Joints: Use flanged joints for connecting welded joint pipe and fittings to valves, meters, and regulators to provide for disconnection. Install joints so that flange faces bear uniformly on gaskets. Engage bolts so that there is complete threading through the nuts and tighten so that bolts are uniformly stressed and equally torqued.
 - (4) Pipe Size Changes: Use reducing fittings for changes in pipe size. Size changes made with bushings will not be accepted.

4. Connections to Existing Pipeline:

- a. Dominion Energy will make the connection to the existing pipeline.

5. Wrapping:

- a. Where connection to existing steel line is made underground, tape wrap new steel transition fittings and exposed existing pipe having damaged coating. Clean pipe to bare metal. Initially stretch first layer of tape to conform to the surface while spirally half-lapping. Apply a second layer, half-lapped and spiraled as the first layer, but with spirals perpendicular to first wrapping. Use 10 mil minimum thick polyethylene tape. In lieu of tape wrap, heat shrinkable 10 mil minimum thick polyethylene sleeve may be used.

F. Valves:

1. Install valves approximately at locations indicated. Orient stems vertically, with operators on top, or horizontally. Provide support for valves to resist operating torque applied to PE pipes.
2. Stop Valve and Shutoff Valve:
 - a. Provide stop valve on service branch at connection to main and shut-off valve on riser outside of each building. Provide shut-off valve at connection to each gas utilization appliance and where otherwise indicated.

G. Gas Regulators:

1. Provide plug cock shutoff valve on both sides of each regulator. Install regulators outside of buildings and 18 inches aboveground on riser., unless specifically detailed otherwise. Install gas meter in conjunction with pressure regulator. On outlet side of regulator or meter, provide a union and a 3/8-inch gage tap with plug.

H. Pipe Hangers and Supports:

1. Selection, application, and installation of piping hangers and supports shall conform with MSS SP-58, unless otherwise indicated.
2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.
3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers will be clear of other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork, and other obstructions.
4. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.

5. Rod sizes, MSS SP-58.
6. Maximum Spacing Between Supports:
 - a. Support piping within one foot on either side of regulators, flanged valves, and changes in direction. Support within 2 feet of wall penetrations.
 - b. Vertical Piping: Support piping at each floor, but at not more than 10 foot intervals, with pipe riser clamps or offset pipe clamps. Support within 2 feet of floor and roof penetrations.
 - c. Horizontal Piping: Locate supports within one foot of each change of direction. Support straight runs of steel piping and copper tubing as follows:

Maximum Spacing Feet									
Nominal Pipe Size inches	One and under	1-1/4	1-1/2	2	2-1/2	3	4	5	6
Steel Pipe (Vapor)	8	9	12	13	14	15	17	19	21
Copper Tube (Vapor)	6	9	10	11	13	14	16	18	20

I. Seismic Bracing Requirements

1. Piping and equipment shall be supported and braced to resist seismic loads where required by the specified Building Code. Provide seismic restraints in accordance with SMACNA Seismic Restraint Manual unless otherwise required by the specified building code.

J. Pipe Through-Penetrations

1. Furnish pipe sleeves where pipe passes through walls, floors, ceilings, roofs, and partitions. Sleeves will be installed, secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, steel siding in the case of a steel building, and dry wall in the case of framed construction. Core drilled holes in masonry and concrete may be provided by this Section in lieu of pipe sleeves, however cored drilled holes in masonry shall have cavities completely grouted. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors, ceilings, roofs, and partitions.
2. Pipe Penetrations Through Building Interior Construction: Provide not less than 1/4-inch one inch space between exterior of piping and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass or silicone. Seal both

ends of penetrations through fire rated assemblies to maintain fire resistive integrity with UL listed fill, void, or cavity material.

3. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer. Seals shall have EPDM seal elements and Series 300 stainless steel hardware.
4. Extend sleeves in floor slabs 2 inches above the finished floor.
5. Seismic-braced Pipe:
 - a. Proper clearances between penetrating gas system piping and any barrier shall be provided. The penetration holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3-inch nominal, and 4 inches larger for 4 inch and larger nominal diameter pipe.
 - b. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

K. Final Connections: Make final connections to equipment and appliances using rigid pipe and fittings, except for the following:

1. Domestic Water Heaters:
 - a. Connect with semi-rigid tubing and fittings.
2. Equipment:
 - a. Install flexible connectors. Connectors shall be long enough to permit movement of equipment for cleaning and to afford access to coupling.
3. Generators and HVAC equipment.
4. Install flexible connectors. Connectors shall have sufficient slack to avoid all stresses associated with generator vibration.

L. Provide full pipe diameter 6-inch long drip pockets at the bottom of all vertical risers, at all piping low points, and wherever else shown and/or required.

M. Identify all natural gas piping with two coats of safety yellow enamel applied over primer, and SMS Ltd. coil type vinyl identification makers with arrows.

3.03 INSTALLATION OF SHUT-OFF VALVES:

- A. Provide TSSA approved ball type or lubricated plug type shut-off valves to isolate equipment, and wherever else shown.
- B. Ensure that valves are located for easy accessibility and maintenance.

3.04 INSTALLATION OF NATURAL GAS CONVENIENCE OUTLETS:

- A. Provide natural gas convenience outlets and wall mount where shown.
- B. Provide a shut-off valve in connecting piping, confirm exact location prior to roughing-in, and ensure that the outlet is rigidly secured in place.

3.05 FIELD QUALITY CONTROL:

- A. Prior to initial operation, inspect systems for compliance with Drawings, Specifications and accepted submittals. As part of inspection, perform inspections, tests and purging in compliance with the specified requirements. Have systems accepted by the Engineer before concealing.
- B. Test Procedures and Reports:
 - 1. Prepare and submit procedures, material, and equipment for all specified tests to the Engineer for acceptance prior to the planned tests. Material and equipment used in testing shall be subject to inspection by the Engineer.
 - 2. Provide all material and labor required for testing. Instruments, test equipment, and test personnel required to properly conduct all tests shall be provided. Provide water, fuel, electricity. The Owner will furnish water, fuel, and electricity for the tests.
 - 3. Repair defects disclosed by tests or, if required by the Engineer, replace defective work with new work without additional cost. If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted at no additional cost.
 - 4. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case. When tests have been completed and corrections made, submit signed and dated test reports.
- C. Metal Welding Inspection:
 - 1. Inspect for compliance with the specified Fuel Gas Code except natural gas piping upstream of meter/regulators shall be inspected for compliance with ASME B31.8. Replace, repair and then re-inspect defective welds.
- D. PE Fusion Welding Inspection:
 - 1. Visually inspect butt joints by comparing with, manufacturer's visual joint appearance chart. Inspect fusion joints for proper fused connection. Replace defective joints by cutting out defective joints or replacing fittings. Inspect 100 percent of all joints and reinspect all corrections. Arrange with the pipe

manufacturer's representative in the presence of the Engineer to make first time inspection.

E. Piping Pressure Tests:

1. Test system gas tight in accordance with the specified Fuel Gas Code with the additions specified herein. For natural gas piping upstream of meter/regulators, test system gas tight in accordance with ASME B31.8. Use test pressure of 1-1/2 times maximum working pressure, but in no case less than 50 psig. Do not test until every joint has set and cool at least 8 hours at temperatures above 50 degrees F. Use clean dry air or inert gas, such as nitrogen or carbon dioxide, for testing. Systems which may be contaminated by gas shall first be purged as specified. Make tests on entire system or on sections that can be isolated by valves. After pressurization, isolate entire piping system from sources of air during test period. Maintain test pressure for at least 8 hours between times of first and last reading of pressure and temperature. Take first reading at least one hour after test pressure has been applied. Do not take test readings during rapid weather changes.
 - a. For buried piping, conduct testing before backfilling; however, place sufficient backfill material between fittings to hold pipe in place during tests. Provide gas temperature same as actual trench conditions.
2. There shall be no reduction in the applied test pressure other than that due to a change in ambient temperature. Allow for ambient temperature change in accordance with the relationship $PF + 14.7 = (P_1 + 14.7) (T_2 + 460) / T_1 + 460$, in which "T" and "P" represent Fahrenheit temperature and gage pressure, respectively, subscripts "1" and "2" denote initial and final readings, and "PF" is the calculated final pressure. If "PF" exceeds the measured final pressure (final gage reading) by 1/2 psi or more, isolate sections of the piping system, retest each section individually, and apply a solution of warm soapy water to joints of each section for which a reduction in pressure occurs after allowing for ambient temperature change. In performing tests, use a test gage calibrated in one psi increments and readable to 1/2 psi.
3. Correct defects in Work and repeat test until no reduction in pressure occurs.

- F. System Purging: After completing pressure tests, and before testing a gas contaminated line, purge line with nitrogen at junction with main line to remove all air and gas. Clean completed line by attaching a test pilot fixture at capped stub-in line at building location and let gas flow until test pilot ignites. Procedures shall conform to the specified Fuel Gas Code and ASME B31.8, whichever is more stringent.

CAUTION

Failure to purge may result in explosion within line when air-to-gas is at correct mixture.

- G. Functional Testing: All equipment, control devices and signaling devices shall be tested individually to demonstrate proper operation. Test all control panel functions to demonstrate proper operation. Test all control system functions to demonstrate proper operation in accordance with the specified control sequences. Monitoring signals to the facility Supervisory Control and Data Acquisition (SCADA) system shall be verified.

3.06 MANUFACTURER'S INSTRUCTIONS AND SERVICES:

- A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project.
- B. Provide manufacturer's services in accordance with Section 01 78 25. Services shall be provided for the satisfactory completion of installation, start-up, testing and training for those equipment and systems described herein below.
 - 1. Gas booster system.
- C. Upon completion of all Work, furnish, in duplicate, certificates of inspection from equipment manufacturers stating that authorized factory engineers have inspected and tested the operation of their respective equipment and found same to be in satisfactory operating condition.

3.07 PAINTING:

- A. Field painting of above ground gas piping shall be provided under this Section in accordance with Section 09 96 00.
- B. Field touch-up all damaged factory or shop applied coatings for material and equipment furnished under this Section in accordance with the manufacturer's recommendation.
- C. Provide shop painting system, under this Section, of the following. Color of finish coat shall be yellow.
 - 1. Hangers and supports in exposed locations.
 - 2. Pipe, fittings, and valves in exposed locations.
- D. Do not apply paint until piping tests have been completed and accepted by the Engineer.

3.08 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

3.09 SCHEDULES:

Schedule 23 11 23-1			
Building	Projected Gas Load¹	Regulator (Fisher)	Relief (Fisher)
	SCFH	Model	Model
WTP	3,300	S202H 2-inch body 1-inch orifice	289H 1-inch
Generators	14,930	EZR ²	OSX
¹ Confirm gas load for each building prior to ordering the valves.			
² Confirm minimum and maximum pressure with Dominion Energy.			

END OF SECTION

SECTION 23 21 13
HYDRONIC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide hydronic piping as indicated and in compliance with Contract Documents.

1. Copper tube and fittings
2. Steel pipe and fittings
3. Joining Materials
4. Dielectric fittings

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of the following:

1. Pipe
2. Fittings
3. Joining materials

C. Delegated-Design Submittal:

1. Design calculations and detailed fabrication and assembly of pipe anchors and alignment guides, hangers and supports for multiple pipes, expansion joints and loops, and attachments of the same to the building structure.
2. Locations of pipe anchors and alignment guides and expansion joints and loops.
3. Locations of and details for penetrations, including sleeves and sleeve seals for exterior walls, floors, basement, and foundation walls.
4. Locations of and details for penetration and firestopping for fire- and smoke-rated wall and floor and ceiling assemblies.

D. Qualification Data: For Installer.

E. Welding certificates.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Installer Qualifications:
 - 1. Installers of Pressure-Sealed Joints: Installers shall be certified by pressure-seal joint manufacturer as having been trained and qualified to join piping with pressure-seal pipe couplings and fittings.
- C. Steel Support Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."
- D. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
 - 1. Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation.
 - 2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Hydronic piping components and installation shall be capable of withstanding the following minimum working pressure and temperature unless otherwise indicated:
 - 1. Hot-Water/Glycol Heating Piping: 150 psig at 180 degrees F
 - 2. Chilled-Water/Glycol Piping: 150 psig from 0 to 150 degrees F
 - 3. Makeup-Water Piping: 150 psig 73 degrees F
 - 4. Condensate-Drain Piping: 100 degrees F
 - 5. Air-Vent Piping: 180 degrees F
 - 6. Safety-Valve-Inlet and -Outlet Piping: Equal to the pressure of the piping system to which it is attached.

2.02 COPPER TUBE AND FITTINGS

- A. Drawn-Temper Copper Tubing: ASTM B 88, Type L
- B. Annealed-Temper Copper Tubing: ASTM B 88, Type K.
- C. DWV Copper Tubing: ASTM B 306, Type DWV.
- D. Grooved, Mechanical-Joint, Wrought-Copper Fittings: ASME B16.22.
 - 1. Grooved-End Copper Fittings: ASTM B 75, copper tube or ASTM B 584, bronze casting.
 - 2. Grooved-End-Tube Couplings: Rigid pattern unless otherwise indicated; gasketed fitting. Ductile-iron housing with keys matching pipe and fitting grooves, prelubricated EPDM gasket rated for minimum 230 deg F for use with housing, and steel bolts and nuts.
- E. Copper or Bronze Pressure-Seal Fittings:
 - 1. Housing: Copper.
 - 2. O-Rings and Pipe Stops: EPDM.
 - 3. Tools: Manufacturer's special tools.
 - 4. Minimum 200-psig working-pressure rating at 250 deg F.
- F. Copper, Mechanically Formed Tee Option: For forming T-branch on copper water tube.
- G. Wrought-Copper Unions: ASME B16.22.

2.03 STEEL PIPE AND FITTINGS:

- A. Steel Pipe: Grooved Joint, ASTM A53, black steel , Grade B, with factory or site rolled groove.
- B. Grooved Mechanical-Joint Fittings and Couplings:
 - 1. Manufacturers:
 - a. Victaulic
 - b. Gruvlock
 - c. Anvil
 - 2. Joint Fittings: ASTM A536, Grade 65-45-12 ductile iron; ASTM A47, Grade 32510 malleable iron; ASTM A53, Type F, E, or S, Grade B fabricated

steel; or ASTM A106, Grade B steel fittings with grooves or shoulders constructed to accept grooved-end couplings; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.

3. Couplings: Ductile- or malleable-iron housing and EPDM gasket rated for -30 degrees F to 230 degrees F with polypropylene glycol of central cavity pressure-responsive design; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.

2.04 JOINING MATERIALS

- A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless otherwise indicated.

- a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
- b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

- B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

- C. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

- D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

- E. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

- F. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

- G. Solvent Cements for CPVC Piping: ASTM F 493.

- H. Solvent Cements for PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.

- I. Fiberglass Pipe Adhesive: As furnished or recommended by pipe manufacturer.

2.05 DIELECTRIC FITTINGS:

- A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.

B. Dielectric Unions:

1. Description:

- a. Standard: ASSE 1079
- b. Pressure Rating: 150 psig
- c. End Connections: Solder-joint copper alloy and threaded ferrous

C. Dielectric Flanges:

1. Description:

- a. Standard: ASSE 1079
- b. Factory-fabricated, bolted, companion-flange assembly
- c. Pressure Rating: 150 psig
- d. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

D. Dielectric-Flange Insulating Kits:

1. Description:

- a. Nonconducting materials for field assembly of companion flanges
- b. Pressure Rating: 150 psig
- c. Gasket: Neoprene or phenolic
- d. Bolt Sleeves: Phenolic or polyethylene
- e. Washers: Phenolic with steel backing washers

E. Dielectric Nipples:

1. Description:

- a. Standard: IAPMO PS 66
- b. Electroplated steel nipple, complying with ASTM F1545
- c. Pressure Rating: 300 psig at 225 degrees F
- d. End Connections: Male threaded or grooved
- e. Lining: Inert and noncorrosive, propylene

PART 3 - EXECUTION

3.01 PIPING APPLICATIONS:

- A. Hot and Chilled-Water Piping, Aboveground, NPS 2-1/2 and larger shall be the following:
 - 1. Steel Pipe Schedule 40: ASTM A 53/A 53M, black steel with plain ends; welded and seamless, Grade B, and wall thickness as indicated in "Piping Applications" Article
 - 2. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed joints.
- B. Hot and Chilled-Water Piping, Aboveground, NPS 2 and smaller shall be the following:
 - 1. Schedule 40 steel pipe; Class 150, malleable iron fittings; cast-iron fittings; flanges, and flange fittings; and threaded joints.
 - 2. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed joints.
- C. Make-up water piping, Aboveground shall be the following:
 - 1. Type L, drawn-temper copper tubing, wrought-copper fittings, and brazed, or soldered, joints.
- D. Condensate-Drain Piping: Type M, drawn-temper copper tubing, wrought-copper fittings, and soldered joints.
- E. Air-Vent Piping:
 - 1. Inlet: Same as service where installed with metal-to-plastic transition fittings for plastic piping systems according to piping manufacturer's written instructions.
 - 2. Outlet: Type K, annealed-temper copper tubing with soldered or flared joints.
- F. Safety-Valve-Inlet and -Outlet Piping for Hot-Water Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed with metal-to-plastic transition fittings for plastic piping systems according to piping manufacturer's written instructions.

3.02 PIPING INSTALLATION:

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- B. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

- C. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- D. Install piping to permit valve servicing.
- E. Install piping at indicated slopes.
- F. Install piping free of sags and bends.
- G. Install fittings for changes in direction and branch connections.
- H. Install piping to allow application of insulation.
- I. Select system components with pressure rating equal to or greater than system operating pressure.
- J. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
- K. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.
- L. Install piping at a uniform grade of 0.2 percent upward in direction of flow.
- M. Reduce pipe sizes using eccentric reducer fitting installed with level side up.
- N. Install branch connections to mains using tee fittings in main pipe, with the branch connected to the bottom of the main pipe. For up-feed risers, connect the branch to the top of the main pipe.
- O. Install valves according to the following:
 - 1. Section 23 05 23.12
 - 2. Section 23 05 23.13
 - 3. Section 23 05 23.14
 - 4. Section 23 05 23.15
- P. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.
- Q. Install flanges in piping, 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.
- R. Install shutoff valve immediately upstream of each dielectric fitting.

- S. Comply with requirements in Section 23 05 53 for identifying piping.
 - T. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 23 05 17.
 - U. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 23 05 17.
 - V. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 23 05 18.
- 3.03 DIELECTRIC FITTING INSTALLATION:
- A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
- 3.04 INSTALLATION OF HANGERS AND SUPPORTS:
- A. Comply with requirements for seismic-restraint devices specified in Section 23 05 48.
 - B. Comply with requirements in Section 23 05 29 for hangers, supports, and anchor devices.
 - C. Install the following pipe attachments:
 - 1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
 - 2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
 - 3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
 - 4. Spring hangers to support vertical runs.
 - 5. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.
 - 6. On plastic pipe, install pads or cushions on bearing surfaces to prevent hanger from scratching pipe.
 - D. Install hangers for copper tubing and steel piping, with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.
 - E. Support horizontal piping within 12 inches of each fitting and coupling.

- F. Support vertical runs of copper tubing and steel piping to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

3.05 PIPE JOINT CONSTRUCTION:

- A. Ream ends of pipes and tubes and remove burrs.
- B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- C. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- D. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8/A5.8M.
- E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - 1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 - 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- F. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
- G. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.
- H. Grooved Joints: Assemble joints with coupling and gasket, lubricant, and bolts. Cut or roll grooves in ends of pipe based on pipe and coupling manufacturer's written instructions for pipe wall thickness. Use grooved-end fittings and rigid, grooved-end-pipe couplings.
- I. Plain-End Mechanical-Coupled Joints: Prepare, assemble, and test joints in accordance with manufacturer's written installation instructions.

3.06 TERMINAL EQUIPMENT CONNECTIONS:

- A. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.

- B. Install control valves in accessible locations close to connected equipment.
- C. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required.
- D. Install ports for pressure gages and thermometers at coil inlet and outlet connections. Comply with requirements in Section 23 05 19.

3.07 CHEMICAL TREATMENT:

- A. Fill system with fresh water and add liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products from piping. Circulate solution for a minimum of 24 hours, drain, clean strainer screens, and refill with fresh water.
- B. Fill systems that have antifreeze or glycol solutions with the following concentrations:
 - 1. Hot-Water Heating Piping: Minimum of 30 percent propylene glycol.
 - 2. Chilled-Water Piping: Minimum of 30 percent propylene glycol.

3.08 FIELD QUALITY CONTROL:

- A. Prepare hydronic piping according to ASME B31.9 and as follows:
 - 1. Leave joints, including welds, uninsulated and exposed for examination during test.
 - 2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
 - 3. Flush hydronic piping systems with clean water; then remove and clean or replace strainer screens.
 - 4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
 - 5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.
- B. Perform the following tests on hydronic piping:
 - 1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.

2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
3. Isolate expansion tanks and determine that hydronic system is full of water.
4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times the "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
6. Prepare written report of testing.

C. Perform the following before operating the system:

1. Open manual valves fully.
2. Inspect pumps for proper rotation.
3. Set makeup pressure-reducing valves for required system pressure.
4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.
6. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, to specified values.
7. Verify lubrication of motors and bearings.

3.09 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 21 16

HYDRONIC PIPING SPECIALTIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

- 1. Hydronic specialty valves.
 - 2. Air-control devices.
 - 3. Strainers.
 - 4. Connectors.

- B. Related Requirements:

- 1. Section 23 05 16 "Expansion Fittings and Loops for HVAC Piping" for expansion fittings and loops.
 - 2. Section 23 05 23.12 "Ball Valves for HVAC Piping" for specification and installation requirements for ball valves common to most piping systems.
 - 3. Section 23 05 23.13 "Butterfly Valves for HVAC Piping" for specification and installation requirements for butterfly valves common to most piping systems.
 - 4. Section 23 05 23.14 "Check Valves for HVAC Piping" for specification and installation requirements for check valves common to most piping systems.
 - 5. Section 23 05 23.15 "Gate Valves for HVAC Piping" for specification and installation requirements for gate valves common to most piping systems.
 - 6. Section 23 09 23.11 "Control Valves" for automatic control valve and sensor specifications, installation requirements, and locations.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product:

1. Include construction details and material descriptions for hydronic piping specialties.
2. Include rated capacities, operating characteristics, and furnished specialties and accessories.
3. Include flow and pressure drop curves based on manufacturer's testing for calibrated-orifice balancing valves and automatic flow-control valves.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For hydronic piping specialties to include in emergency, operation, and maintenance manuals.

1.05 MAINTENANCE MATERIAL SUBMITTALS

- A. Differential Pressure Meter: For each type of balancing valve and automatic flow control valve, include flowmeter, probes, hoses, flow charts, and carrying case.

1.06 QUALITY ASSURANCE

- A. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
- B. Safety Valves and Pressure Vessels: Shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.01 HYDRONIC SPECIALTY VALVES

- A. Bronze, Calibrated-Orifice, Balancing Valves:
 1. Body: Bronze, ball or plug type with calibrated orifice or venturi.
 2. Ball: Brass or stainless steel.
 3. Plug: Resin.
 4. Seat: PTFE.
 5. End Connections: Threaded or socket.
 6. Pressure Gage Connections: Integral seals for portable differential pressure meter.
 7. Handle Style: Lever, with memory stop to retain set position.

8. CWP Rating: Minimum 125 psig (860 kPa).
 9. Maximum Operating Temperature: 250 deg F (121 deg C).
- B. Cast-Iron or Steel, Calibrated-Orifice, Balancing Valves:
1. Body: Cast-iron or steel body, ball, plug, or globe pattern with calibrated orifice or venturi.
 2. Ball: Brass or stainless steel.
 3. Stem Seals: EPDM O-rings.
 4. Disc: Glass and carbon-filled PTFE.
 5. Seat: PTFE.
 6. End Connections: Flanged or grooved.
 7. Pressure Gage Connections: Integral seals for portable differential pressure meter.
 8. Handle Style: Lever, with memory stop to retain set position.
 9. CWP Rating: Minimum 125 psig (860 kPa).
 10. Maximum Operating Temperature: 250 deg F (121 deg C).
- C. Diaphragm-Operated, Pressure-Reducing Valves: ASME labeled.
1. Body: Bronze or brass.
 2. Disc: Glass and carbon-filled PTFE.
 3. Seat: Brass.
 4. Stem Seals: EPDM O-rings.
 5. Diaphragm: EPT.
 6. Low inlet-pressure check valve.
 7. Inlet Strainer: Removable without system shutdown.
 8. Valve Seat and Stem: Noncorrosive.
 9. Valve Size, Capacity, and Operating Pressure: Selected to suit system in which installed, with operating pressure and capacity factory set and field adjustable.
- D. Diaphragm-Operated Safety Valves: ASME labeled.

1. Body: Bronze or brass.
2. Disc: Glass and carbon-filled PTFE.
3. Seat: Brass.
4. Stem Seals: EPDM O-rings.
5. Diaphragm: EPT.
6. Wetted, Internal Work Parts: Brass and rubber.
7. Inlet Strainer: Removable without system shutdown.
8. Valve Seat and Stem: Noncorrosive.
9. Valve Size, Capacity, and Operating Pressure: Comply with ASME Boiler and Pressure Vessel Code: Section IV, and selected to suit system in which installed, with operating pressure and capacity factory set and field adjustable.

E. Automatic Flow-Control Valves:

1. Body: Brass or ferrous metal.
2. Flow Control Assembly, provide either of the following:
 - a. Piston and Spring Assembly: Stainless steel, tamper proof, self-cleaning, and removable.
 - b. Elastomeric Diaphragm and Polyphenylsulfone Orifice Plate: Operating ranges within 2- to 80-psig (14- to 550-kPa) differential pressure.
3. Combination Assemblies: Include bronze or brass-alloy ball valve.
4. Identification Tag: Marked with zone identification, valve number, and flow rate.
5. Size: Same as pipe in which installed.
6. Performance: Maintain constant flow within plus or minus 10 percent, regardless of system pressure fluctuations.
7. Minimum CWP Rating: 175 psig.
8. Maximum Operating Temperature: 250 deg F.

2.02 AIR-CONTROL DEVICES

A. Manual Air Vents:

1. Body: Bronze.
 2. Internal Parts: Nonferrous.
 3. Operator: Screwdriver or thumbscrew.
 4. Inlet Connection: NPS 1/2 (DN 15).
 5. Discharge Connection: NPS 1/8 (DN 6).
 6. CWP Rating: 150 psig (1035 kPa).
 7. Maximum Operating Temperature: 225 deg F (107 deg C).
- B. Automatic Air Vents:
1. Body: Bronze or cast iron.
 2. Internal Parts: Nonferrous.
 3. Operator: Noncorrosive metal float.
 4. Inlet Connection: NPS 1/2 (DN 15).
 5. Discharge Connection: NPS 1/4 (DN 8).
 6. CWP Rating: 150 psig (1035 kPa).
 7. Maximum Operating Temperature: 240 deg F (116 deg C).
- C. Bladder-Type ASME Expansion Tanks:
1. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory test after taps are fabricated and supports installed and are labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 2. Bladder: Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.
 3. Air-Charge Fittings: Schrader valve, stainless steel with EPDM seats.
- D. Air-Charge Fittings: Schrader valve, stainless steel with EPDM seats.
- E. Tangential-Type Air Separators:
1. Tank: Welded steel; ASME constructed and labeled for 125-psig minimum working pressure and 375 deg F maximum operating temperature.

2. Air Collector Tube: Perforated stainless steel, constructed to direct released air into expansion tank.
3. Tangential Inlet and Outlet Connections: Threaded for NPS 2 and smaller; flanged connections for NPS 2-1/2 and larger.
4. Blowdown Connection: Threaded.
5. Size: Match system flow capacity.

2.03 STRAINERS

A. Y-Pattern Strainers:

1. Body: ASTM A126, Class B, cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: Stainless-steel, 40-mesh strainer, or perforated stainless-steel basket.
4. CWP Rating: 125 psig.

B. Basket Strainers:

1. Body: ASTM A126, Class B, high-tensile cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: 40-mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
4. CWP Rating: 125 psig.

2.04 CONNECTORS

A. Stainless-Steel Bellow, Flexible Connectors:

1. Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket.
2. End Connections: Threaded or flanged to match equipment connected.
3. Performance: Capable of 3/4-inch misalignment.

4. CWP Rating: 150 psig.
 5. Maximum Operating Temperature: 250 deg F.
- B. Spherical, Rubber, Flexible Connectors:
1. Body: Fiber-reinforced rubber body.
 2. End Connections: Steel flanges drilled to align with Classes 150 and 300 steel flanges.
 3. Performance: Capable of misalignment.
 4. CWP Rating: 150 psig.
 5. Maximum Operating Temperature: 250 deg F.

PART 3 - EXECUTION

3.01 VALVE APPLICATIONS

- A. Install shut off-duty valves at each branch connection to supply mains and at supply connection to each piece of equipment.
- B. Install calibrated-orifice, balancing valves at each branch connection to return main.
- C. Install calibrated-orifice, balancing valves in the return pipe of each heating or cooling terminal.
- D. Install check valves at each pump discharge and elsewhere as required to control flow direction.
- E. Install safety valves at hot-water generators and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install drip-pan elbow on safety-valve outlet and pipe without valves to the outdoors; pipe drain to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.
- F. Install pressure-reducing valves at makeup-water connection to regulate system fill pressure.

3.02 HYDRONIC SPECIALTIES INSTALLATION

- A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.
- B. Install automatic air vents at high points of system piping in mechanical equipment rooms only. Install manual vents at heat-transfer coils and elsewhere as required for air venting.

- C. Install piping from boiler air outlet or air separator to expansion tank with a 2 percent upward slope toward tank.
- D. Install in-line air separators in pump suction. Install drain valve on air separators NPS 2 and larger.
- E. Install tangential air separator in pump suction. Install blowdown piping with gate or full-port ball valve; extend full size to nearest floor drain.
- F. Install expansion tanks above the air separator. Install tank fitting in tank bottom and charge tank. Use manual vent for initial fill to establish proper water level in tank.
 - 1. Install tank fittings that are shipped loose.
 - 2. Support tank from floor or structure above with sufficient strength to carry weight of tank, piping connections, fittings, plus tank full of water. Do not overload building components and structural members.
- G. Install expansion tanks on the floor. Vent and purge air from hydronic system, and ensure that tank is properly charged with air to suit system Project requirements.

END OF SECTION

SECTION 23 21 23
HYDRONIC PUMPS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide hydronic pumps as indicated and in compliance with Contract Documents.
 - 1. Close-coupled end-suction centrifugal pumps

1.02 REFERENCES:

- A. American National Standards Institute (ANSI):
 - 1. B15.1: Safety Standard for Mechanical Power Transmission Apparatus
- B. American Society of Mechanical Engineers (ASME):
 - 1. B16.1: Pipe Flanges and Fittings
- C. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code

1.03 SUBMITTALS:

- A. Submit shop drawings and product data in accordance with Section 01 33 00.
- B. Product Data: For each type of pump. Include certified performance curves and rated capacities, operating characteristics, furnished specialties, final impeller dimensions, and accessories for each type of product indicated. Indicate pump's operating point on curves.
- C. Shop Drawings: For each pump.
 - 1. Show pump layout and connections.
 - 2. Include setting drawings with templates for installing foundation and anchor bolts and other anchorages.
 - 3. Include diagrams for power, signal, and control wiring.
- D. For each device, equipment or appurtenance provide written certification in accordance with Specification 01 41 20.

E. Operation and Maintenance Data: For pumps to include in mechanical systems emergency, operation, and maintenance manuals.

F. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Mechanical Seals: One mechanical seal for each pump.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 CLOSE-COUPLED, END-SUCTION CENTRIFUGAL PUMPS:

A. Manufacturers:

1. Armstrong
2. Taco Comfort Solutions
3. Bell & Gossett
4. ITT

B. Description: Factory-assembled and tested, single stage, centrifugal, overhung-impeller, close-coupled, end-suction pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally.

C. Capacities and Characteristics:

1. Per Equipment Schedules in Drawings.

D. Pump Construction:

1. Casing: Radially split, cast iron, with drain plug at bottom and air vent at top of volute, threaded gage tappings at inlet and outlet, and flanged connection
2. Impeller: ASTM B584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For constant-speed pumps, trim impeller to match specified performance.
3. Pump Shaft: Steel, with copper-alloy shaft sleeve.
4. Mechanical Seal: Carbon rotating ring against a ceramic seat held by a stainless-steel spring, and Buna-N bellows and gasket. Include water slinger on shaft between motor and seal.
5. Pump Bearings: Per manufacturer.

E. Motor: Single speed and rigidly mounted to pump casing.

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 23 05 13.
 - a. Enclosure: Totally enclosed, fan cooled.
 - b. Motor Bearings: Per manufacturer.
 - c. Unusual Service Conditions:
 - (1) Altitude: 4221 above sea level
 - d. Efficiency: Premium efficient

2.02 PUMP SPECIALTY FITTINGS:

A. Suction Diffuser:

1. Angle pattern
2. 175-psig pressure rating, cast-iron body and end cap, pump-inlet fitting
3. Bronze startup and bronze or stainless-steel permanent strainers
4. Bronze or stainless-steel straightening vanes
5. Drain plug

6. Factory-fabricated support
 7. Manufacturers:
 - a. Armstrong
 - b. Taco Comfort Solutions
 - c. Bell & Gossett
 - d. ITT
- B. Triple-Duty Valve:
1. Angle or straight pattern
 2. 175-psig pressure rating, cast-iron body, pump-discharge fitting
 3. Drain plug and bronze-fitted shutoff, balancing, and check valve features
 4. Brass gage ports with integral check valve and orifice for flow measurement
 5. Manufacturers:
 - a. Armstrong
 - b. Taco Comfort Solutions
 - c. Bell & Gossett
 - d. ITT

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.
- C. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PUMP INSTALLATION:

- A. Comply with HI 1.4.
- B. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.
- C. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.
- D. Equipment Mounting:
 - 1. Install base-mounted pumps on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 03 30 00 "Cast-in-Place Concrete."
 - 2. Comply with requirements for vibration isolation and seismic control devices specified in Section 23 05 48.

3.03 ALIGNMENT:

- A. Perform alignment service.
- B. Comply with requirements in Hydronics Institute standards for alignment of pump and motor shaft. Add shims to the motor feet and bolt motor to base frame. Do not use grout between motor feet and base frame.
- C. Comply with pump and coupling manufacturers' written instructions.
- D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with nonshrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.04 CONNECTIONS:

- A. Where installing piping adjacent to pump, allow space for service and maintenance.
- B. Connect piping to pumps. Install valves that are same size as piping connected to pumps.
- C. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.
- D. Install triple-duty valve on discharge side of pumps.
- E. Install Y-type strainer and shutoff valve on suction side of pumps.
- F. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

- G. Install pressure gages on pump suction and discharge or at integral pressure-gage tapping, or install single gage with multiple-input selector valve.
- H. Install check valve and gate or ball valve on each condensate pump unit discharge.
- I. Ground equipment according to Section 26 05 26.
- J. Connect wiring according to Section 26 05 19.

3.05 STARTUP SERVICE:

- A. Perform Startup Service:
 - 1. Complete installation and startup checks according to manufacturer's written instructions
 - 2. Check piping connections for tightness
 - 3. Clean strainers on suction piping
 - 4. Perform the following startup checks for each pump before starting:
 - a. Verify bearing lubrication
 - b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
 - c. Verify that pump is rotating in the correct direction
 - 5. Prime pump by opening suction valves and closing drains, and prepare pump for operation
 - 6. Start motor
 - 7. Open discharge valve slowly

3.06 DEMONSTRATION:

- A. Train Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps.

3.07 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 23 00

REFRIGERANT PIPING SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. Section 23 0719 - Refrigerant Piping Insulation

1.02 SUMMARY

- A. Section Includes:
 - 1. Refrigeration piping
 - 2. Refrigeration piping supports
 - 3. Connection materials

1.03 REFERENCES

- A. American National Standards Institute / American Welding Society
 - 1. ANSI / AWS A5.8-92, 'Standard Specification for Brazing Alloys'
- B. American Society for Testing and Materials
 - 1. ASTM A 36-00a, 'Standard Specification for Carbon Structural Steel'
 - 2. ASTM A 361-94, 'Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process for Roofing and Siding'
 - 3. ASTM B 280-99, 'Standard Specification for Seamless Copper Tube for Air Conditioning and Refrigeration Field Service'

1.04 ACTION SUBMITTALS

- A. Product Data: For each type of the following products:
 - 1. Refrigeration piping and fittings.
 - 2. Piping supports and materials.

B. Shop Drawings - Show each individual equipment, refrigeration piping and piping support.

C. Quality Assurance / Control - Technician certificate for use of CFC and HCFC refrigerants

1.05 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, sections, and other details, or BIM model, drawn to scale, showing the items described in this Section and coordinated with all building trades.

1.06 QUALITY ASSURANCE

A. Qualifications - Refrigerant piping shall be installed by a refrigeration contractor licensed by State and by technicians certified in use of CFC and HCFC refrigerants.

1.07 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For equipment to include in emergency, operation and maintenance manuals.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Store piping in a clean dry location. Store on pipe racks off of the ground. Retain end caps on piping. Protect from damage and moisture.

1.09 WARRANTY

A. Warranty: Manufacturer and Installer agree to repair or replace components of that fail(s) in materials or workmanship within specified warranty period.

1. Warranty Period: 1 year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Refrigerant Piping

1. Meet requirements of ASTM B 280, hard drawn straight lengths. Soft copper tubing not permitted.

2. Do not use pre-charged refrigerant lines.

B. Refrigerant Fittings

1. Wrought copper with long radius elbows.

2. Approved Manufacturers -

- a. Mueller Streamline
 - b. Nibco Inc
 - c. Grinnell
 - d. Elkhart
 - C. Suction Line Traps
 - 1. Manufactured standard one-piece traps.
 - 2. Approved Manufacturers
 - a. Mueller Streamline
 - b. Nibco Inc
 - c. Grinnell
 - d. Elkhart
 - D. Connection Material
 - 1. Brazing Rods in accordance with ANSI / AWS A5.8 -
 - a. Copper to Copper Connections -
 - (1) Classification BCuP-4 Copper Phosphorus (6 percent silver).
 - (2) Classification BCuP-5 Copper Phosphorus (15 percent silver).
 - b. Copper to Brass or Copper to Steel Connections - Classification BAg-5 Silver (45 percent silver).
 - c. Do not use rods containing Cadmium.
 - 2. Flux -
 - a. Approved Products -
 - (1) Stay-Silv White Brazing Flux by J W Harris
 - (2) High quality silver solder flux by Handy & Harmon
- 2.02 MATERIALS

A. Refrigerant Piping Supports

- 1. Base, Angles, And Uprights - Steel meeting requirements of ASTM A 36.

2. Securing Channels -
 - a. At Free-Standing Pipe Support -
 - (1) Acceptable Products -
 - (a) P-1000 channels by Unistrut
 - (b) HS-158-12 channels by Hilti
 - (c) Equal as approved by Architect prior to installation. See Section 01600.
 - b. At Wall Support -
 - (1) Acceptable Products -
 - (a) P-3300 channels by Unistrut
 - (b) HS-1316-12 channels by Hilti
 - (c) Equal as approved by Architect prior to installation. See Section 01600.
 - c. At Suspended Support -
 - (1) Acceptable Products -
 - (a) P-1001 channels by Unistrut
 - (b) MS-41 channels by Hilti
 - (c) Equal as approved by Architect prior to installation. See Section 01600.
3. Angle Fittings -
 - a. Acceptable Products -
 - (1) P-2626 90-degree angle by Unistrut
 - (2) MW2 angle by Hilti
 - (3) Equal as approved by Architect prior to installation. See Section 01600.
4. Pipe Clamps -
 - a. Acceptable Manufacturers -

- (1) Hydra-Zorb
 - (2) ZSI Cush-A-Clamp
 - (3) Hilti Cush-A-Clamp
 - (4) Equal as approved by Architect prior to installation. See Section 01600.
5. Protective Cover - 18 ga steel, hot-dipped galvanized to meet requirements of ASTM A 361, 1.25 oz/sq ft.

2.03 MANUFACTURERS

- A. Alco Controls Div.
- B. Cush-A-Clamp by ZSI Manufacturing.
- C. Elkhart Products Corp.
- D. Grinnell Corp, Exeter.
- E. J W Harris Co Inc.
- F. Henry Valve Co.
- G. Hilti Inc, Tulsa.
- H. Hydra-Zorb Co.
- I. Mueller Steam Specialty.
- J. Nibco Inc.
- K. Packless Industries.
- L. Parker Hannefin Corp.
- M. Sporlan Valve Co.
- N. Unistrut Corp.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Refrigerant Lines
 - 1. Install as high in upper mechanical areas as possible. Do not install underground or in tunnels.

2. Slope suction lines down toward compressor one inch/10 feet. Locate traps at vertical rises against flow in suction lines.

B. Connections

1. Refrigeration system connections shall be copper-to-copper type properly cleaned and brazed with specified rods. Use flux only where necessary. No soft solder (tin, lead, antimony) connections will be allowed in system.
2. Circulate dry nitrogen through tubes being brazed to eliminate formation of copper oxide during brazing operation.

C. Refrigerant Supports

1. Support Spacing -
 - a. Piping 1-1/4 inch And Larger - 8 feet on center maximum.
 - b. Piping 1-1/8 inch And Smaller - 6 feet on center maximum.
 - c. Support each elbow.
2. Isolate pipe from supports and clamps with Hydrozorb or Cush-A-Clamp systems.
3. Run protective cover continuous from condensing units to risers or penetrations at building wall.

3.02 FIELD QUALITY CONTROL

- A. Make evacuation and leak tests in presence of Architect's Engineer after completing refrigeration piping systems. Positive pressure test will not suffice for procedure outlined below.
1. Draw vacuum on each entire system with two stage vacuum pump. Draw vacuum to 300 microns using micron vacuum gauge capable of reading from atmosphere to 10 microns. Do not use cooling compressor to evacuate system nor operate it while system is under high vacuum.
 2. Break vacuum with nitrogen and re-establish vacuum test. Vacuum shall hold for 30 minutes at 300 microns without vacuum pump running.
 3. Conduct tests at 70 deg F ambient temperature minimum.
 4. Do not run systems until above tests have been made and systems started up as specified. Inform Owner's Representative of status of systems at time of final inspection and schedule start-up and testing if prevented by outdoor conditions before this time.

5. After testing, fully charge system with refrigerant and conduct test with Halide Leak Detector.
 6. Recover all refrigerant in accordance with applicable codes. Do not allow any refrigerant to escape to atmosphere.
- B. If it's observed that refrigerant lines are being or have been brazed without proper circulation of nitrogen through lines, all refrigerant lines installed up to that point in time shall be removed and replaced at no additional cost to Owner.

END OF SECTION

SECTION 23 25 13

WATER TREATMENT FOR CLOSED-LOOP HYDRONIC SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide water treatment for closed-loop hydronic systems as indicated and in compliance with Contract Documents.

- 1. Manual chemical-feed equipment
- 2. Chemicals

1.02 REFERENCES:

- A. ASTM International (ASTM):

- 1. A269: Standard Specification for Seamless and Welded Austentic Stainless Steel Tubing for General Service
- 2. D3370: Standard Practices for Sampling Water from Flowing Process Streams

- B. American Water Works Association (AWWA):

- 1. C700: Cold Water Meters - Displacement Type, Bronze Main Case
- 2. C701: Cold Water Meters - Turbine Type, for Customer Service

- C. National Fire Protection Association (NFPA):

- 1. 70: National Electrical Code

1.03 SUBMITTALS:

- A. Product Data: Include rated capacities, operating characteristics, and furnished specialties and accessories for the following products:

- 1. Bypass feeders
- 2. Injection pumps
- 3. Chemical material safety data sheets
- 4. Inhibited propylene glycol

- B. Shop Drawings: Pretreatment and chemical-treatment equipment, showing tanks, maintenance space required, and piping connections to hydronic systems.
 - 1. Include plans, elevations, sections, and attachment details.
 - 2. Include diagrams for power, signal, and control wiring.
- C. Seismic Qualification Certificates: For components, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- D. Operation and Maintenance Data: For sensors, injection pumps, and controllers to include in emergency, operation, and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Provide all hardware, chemicals, and other material necessary to maintain HVAC water quality in all systems, as indicated in this Specification. Water quality for hydronic systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of hydronic equipment without creating a hazard to operating personnel or the environment.

- B. Sufficient chemical and consumable material shall be provided to maintain the system for one year after final commissioning and owner acceptance.
 - C. Base HVAC water treatment on quality of water available at Project site, hydronic system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.
- 2.02 MANUAL CHEMICAL-FEED EQUIPMENT:
- A. Bypass Feeders: Provide steel feeders with corrosion-resistant exterior coating, minimum 3-1/2-inch fill opening in the top, and NPS 3/4 bottom inlet and top side outlet. Provide quarter turn or threaded fill cap with gasket seal and diaphragm to lock the top on the feeder when exposed to system pressure in the vessel.
 - 1. Capacity: 5 gallons
 - 2. Minimum Working Pressure: 125 psig
- 2.03 INHIBITED PROPYLENE GLYCOL:
- A. Inhibited Propylene Glycol:
 - 1. Propylene glycol with inhibitor additive, to provide freeze protection for heat-transfer fluid and corrosion protection for carbon steel, brass, copper, stainless steel, and cast-iron piping and fittings.
 - 2. Inhibitor creates a passive layer on all surfaces that contact propylene glycol to prevent corrosion and stabilizes fluid pH, to compensate for acids formed from glycol degradation.
 - 3. Concentrated inhibited propylene glycol is to be 95.5 percent propylene glycol by weight and 4.5 percent performance additives.
 - 4. Concentrated inhibited propylene glycol is mixed with water in proper proportion specified by the manufacturer to provide freeze protection to minus 20 degrees F. Premixed heat-transfer fluid may be used, or glycol/water mixture may be prepared at the time of installation. Use only deionized water for mixing.
 - 5. Provide only propylene glycol that is specifically blended for HVAC application. Automotive-type antifreeze is unacceptable.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install chemical-application equipment on concrete bases, level and plumb. Maintain manufacturer's recommended clearances. Arrange units, so controls and devices that re-

quire servicing are accessible. Anchor chemical tanks and floor-mounting accessories to substrate.

- B. Install seismic restraints for equipment and floor-mounting accessories, and anchor to building structure. Comply with requirements in Section 23 05 48 for seismic restraints.
- C. Bypass Feeders: Install in closed hydronic systems, including glycol heating, and glycol cooling, and equip with the following:
 - 1. Install bypass feeder in a bypass circuit around circulating pumps unless indicated otherwise on Drawings.
 - 2. Install water meter in makeup-water supply.
 - 3. Install test-coupon assembly in bypass circuit around circulating pumps unless otherwise indicated on Drawings.
 - 4. Install a gate or full-port ball isolation valves on inlet, outlet, and drain below the feeder inlet.
 - 5. Install a swing check on the inlet after the isolation valve.
- D. Install automatic fluid make-up equipment for glycol water system, and include the following:
 - 1. Chemical solution tanks
 - 2. Chemical solution injection pumps
 - 3. Water meter in makeup supply to system
 - 4. Pressure switch to operate injection pump as necessary to maintain glycol system pressure

3.02 PIPING CONNECTIONS:

- A. Piping installation requirement are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Where installing piping adjacent to equipment, allow space for service and maintenance.
- C. Make piping connections between HVAC water-treatment equipment and dissimilar-metal piping with dielectric fittings. Dielectric fittings are specified in Section 23 21 13.
- D. Install shutoff valves on HVAC water-treatment equipment inlet and outlet. Metal general-duty valves are specified in Section 23 05 23.12, Section 23 05 23.13, and Section 23 05 23.15.

- E. Comply with requirements in Division 22 for backflow preventers required in makeup-water connections to potable-water systems.

3.03 ELECTRICAL CONNECTIONS:

- A. Confirm applicable electrical requirements in electrical Sections for connecting electrical equipment.
- B. Ground equipment in accordance with Section 26 05 26.

3.04 FIELD QUALITY CONTROL:

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Tests and Inspections:
 - 1. Inspect field-assembled components and equipment installation, including piping and electrical connections.
 - 2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
 - 3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of hydronic systems' startup procedures.
 - 4. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
 - 5. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
 - 6. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
 - 7. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
 - 8. Repair leaks and defects with new materials, and retest piping until no leaks exist.
- C. Equipment will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

3.05 DEMONSTRATION:

- A. Train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment.

3.06 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 31 13

METAL DUCTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide metal ducts as indicated and in compliance with Contract Documents.

1. Single-wall rectangular ducts and fittings.
2. Single-wall round ducts and fittings.
3. Sheet metal materials.
4. Duct liner.
5. Sealants and gaskets.
6. Hangers and supports.
7. Seismic-restraint devices.

 11. C920: Standard Specification for Elastomeric Joint Sealants
 12. C1071: Standard Specification for Fibrous Glass Duct Lining Insulation (Thermal and Sound Absorbing Material)
 13. D3363: Standard Test Method for Film Hardness by Pencil Test
 14. E84: Standard Test Method for Surface Burning Characteristics of Building Materials
 15. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements
- C. American Welding Society (AWS):
1. D1.1: Structural Welding Code – Steel
 2. D1.2: Structural Welding Code – Aluminum
 3. D1.3: Sheet Metal Welding Code
- D. North American Die Casting Association (NADCA):
1. ACR: Assessment, Cleaning and Restoration of HVAC Systems," "Section 5 - Cleanliness Verification and Documentation
- E. National Fire Protection Association (NFPA):
1. 45: Standard on Fire Protection for Laboratories Using Chemicals
 2. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems
- F. Sheet Metal and Air Conditioning Contractors National Association (SMANCA):
1. HVAC Air Duct Leakage Test Manual

2. HVAC Duct Construction Standards – Metal and Flexible
 3. IAQ Guidelines for Occupied Buildings under Construction
 4. Seismic Restraint Manual: Guidelines for Mechanical Systems
- G. Underwriters' Laboratories, Inc. (UL):
1. 181: UL Standard for Safety Factory-Made Air Ducts and Connectors
 2. 723: Standard for Safety Test for Surface Burning Characteristics of Building Materials
- 1.03 SUBMITTALS:
- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of the following products:
1. Liners and adhesives
 2. Sealants and gaskets
 3. Seismic-restraint devices
- C. Shop Drawings:
1. Factory- and shop-fabricated ducts and fittings
 2. Fittings
 3. Reinforcement and spacing
 4. Seam and joint construction
 5. Penetrations through fire-rated and other partitions
 6. Equipment installation based on equipment being used on Project
 7. Locations for duct accessories, including dampers, turning vanes, and access doors and panels
 8. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation
- D. Delegated-Design Submittal:
1. Sheet metal thicknesses

2. Joint and seam construction and sealing
3. Reinforcement details and spacing
4. Materials, fabrication, assembly, and spacing of hangers and supports.
5. Design Calculations: Calculations, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation] for selecting hangers and supports and seismic restraints.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Welding Qualifications: Qualify procedures and personnel in accordance with the following:
 1. AWS D1.1, "Structural Welding Code - Steel," for hangers and supports
 2. AWS D1.2, "Structural Welding Code - Aluminum," for aluminum supports
 3. AWS D9.1, "Sheet Metal Welding Code," for duct joint and seam welding

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Delegated Duct Design: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and with performance requirements and design criteria indicated in "Duct Schedule" Article.
- B. Structural Performance: Duct hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and ASCE/SEI 7. Seismically brace duct hangers and supports in accordance with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems."
 1. Refer to the requirements in Section 01 41 20.

- C. Airstream Surfaces: Surfaces in contact with airstream shall comply with requirements in ASHRAE 62.1.
- D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," and Section 7 - "Construction and System Startup."
- E. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."
- F. Duct Dimensions: Unless otherwise indicated, all duct dimensions indicated on Drawings are inside clear dimensions and do not include insulation or duct wall thickness.

2.02 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS:

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.
 - 1. Construct ducts of galvanized sheet steel unless otherwise indicated.
 - 2. For ducts exposed to weather, construct of Type 316 stainless steel indicated by manufacturer to be suitable for outdoor installation.
- B. Transverse Joints: Fabricate joints in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
 - 1. For ducts with longest side less than 36 inches , select joint types in accordance with Figure 2-1.
 - 2. For ducts with longest side 36 inches or greater, use flange joint connector Type T-22, T-24, T-24A, T-25a, or T-25b. Factory-fabricated flanged duct connection system may be used if submitted and approved by engineer of record.
- C. Longitudinal Seams: Select seam types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible." All longitudinal seams shall be Pittsburgh lock seams unless otherwise specified for specific application.
- D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Ch. 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.03 SINGLE-WALL ROUND DUCTS AND FITTINGS:

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Ch. 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.
 - 1. Construct ducts of galvanized sheet steel unless otherwise indicated.
 - 2. For ducts exposed to weather, construct of Type 316 stainless steel indicated by manufacturer to be suitable for outdoor installation.
- B. Transverse Joints: Select joint types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Round Duct Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
 - 1. Transverse Joints in Ducts Larger Than 48 Inches in Diameter: Flanged.
- C. Longitudinal Seams: Select seam types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Round Duct Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
 - 1. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
- D. Tees and Laterals: Select types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-5, "90 Degree Tees and Laterals," and Figure 3-6, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.04 SHEET METAL MATERIALS:

- A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
- B. Galvanized Sheet Steel: Comply with ASTM A653.
 - 1. Galvanized Coating Designation: G90.
- C. Stainless-Steel Sheets: Comply with ASTM A480, Type 316, as indicated in "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B, No. 2D, No. 3, or No. 4 as indicated in "Duct Schedule" Article.

- D. Aluminum Sheets: Comply with ASTM B209 Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.
 - E. Reinforcement Shapes and Plates: ASTM A36, steel plates, shapes, and bars; black and galvanized.
 - 1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.
 - F. Tie Rods: Galvanized steel, 1/4-inch-minimum diameter for lengths 36 inches or less; 3/8-inch-minimum diameter for lengths longer than 36 inches.
- 2.05 DUCT LINER:
- A. Fibrous-Glass Duct Liner: Comply with ASTM C1071, NFPA 90A, and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."
 - 1. Manufacturers:
 - a. Knauf Fiberglass
 - b. Johns Manville
 - 2. Maximum Thermal Conductivity:
 - a. Type I, Flexible: 0.27 Btu x in./h x sq. ft. x degrees F at 75 degrees F mean temperature.
 - b. Type II, Rigid: 0.23 Btu x in./h x sq. ft. x degrees F at 75 degrees F mean temperature.
 - 3. Antimicrobial Erosion-Resistant Coating: Apply to the surface of the liner that will form the interior surface of the duct to act as a moisture repellent and erosion-resistant coating. Antimicrobial compound shall be tested for efficacy by an NRTL and registered by the EPA for use in HVAC systems.
 - 4. Water-Based Liner Adhesive: Comply with NFPA 90A or NFPA 90B and with ASTM C916.
 - a. Adhesive shall have a VOC content of 80 g/L or less.
 - b. Adhesive shall comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

B. Insulation Pins and Washers:

1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch thick galvanized steel aluminum or stainless steel to match duct construction; with beveled edge sized as required to hold insulation securely in place, but not less than 1-1/2 inches in diameter.

C. Shop Application of Duct Liner: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 7-11, "Flexible Duct Liner Installation."

1. Adhere a single layer of indicated thickness of duct liner with at least 90 percent adhesive coverage at liner contact surface area. Attaining indicated thickness with multiple layers of duct liner is prohibited.
2. Apply adhesive to transverse edges of liner facing upstream that do not receive metal nosing.
3. Butt transverse joints without gaps, and coat joint with adhesive.
4. Fold and compress liner in corners of rectangular ducts or cut and fit to ensure butted-edge overlapping.
5. Do not apply liner in rectangular ducts with longitudinal joints, except at corners of ducts, unless duct size and dimensions of standard liner make longitudinal joints necessary.
6. 6. Apply adhesive coating on longitudinal seams in ducts with air velocity of 2500 fpm or greater
7. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
8. Secure transversely oriented liner edges facing the airstream with metal nosings that have either channel or "Z" profiles or are integrally formed from duct wall. Fabricate edge facings at the following locations:
 - a. Fan discharges.
 - b. Intervals of lined duct preceding unlined duct.
 - c. Upstream edges of transverse joints in ducts where air velocities are higher than 2500 fpm or where indicated.

9. Secure insulation between perforated sheet metal inner duct of same thickness as specified for outer shell. Use mechanical fasteners that maintain inner duct at uniform distance from outer shell without compressing insulation.
 - a. Sheet Metal Inner Duct Perforations: 3/32-inch diameter, with an overall open area of 23 percent.
10. Terminate inner ducts with buildouts attached to fire-damper sleeves, dampers, turning vane assemblies, or other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to duct walls with bolts, screws, rivets, or welds.

2.06 SEALANT AND GASKETS:

- A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested in accordance with UL 723; certified by an NRTL.
- B. Two-Part Tape Sealing System:
 1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.
 2. Tape Width: 4 inches.
 3. Sealant: Modified styrene acrylic.
 4. Water resistant.
 5. Mold and mildew resistant.
 6. Maximum Static-Pressure Class: 10 inch wg, positive and negative.
 7. Service: Indoor and outdoor.
 8. Service Temperature: -40 to plus 200 degrees F.
 9. Substrate: Compatible with galvanized sheet steel , stainless steel, or aluminum.
 10. Sealant shall have a VOC content of 420 g/L or less.
- C. Water-Based Joint and Seam Sealant:
 1. Application Method: Brush on.
 2. Solids Content: Minimum 65 percent.
 3. Shore A Hardness: Minimum 20.

4. Water resistant.
5. Mold and mildew resistant.
6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10 inch wg, positive and negative.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel, stainless steel, or aluminum sheets.
10. Sealant shall have a VOC content of 420 g/L or less.
11. Maximum Static-Pressure Class: 10-inch wg, positive or negative.
12. Service: Indoor or outdoor.
13. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant: Comply with ASTM C920.

1. General: Single-component, acid-curing, silicone, elastomeric
2. Type: S
3. Grade: NS
4. Class: 25
5. Use: O
6. Sealant shall have a VOC content of 420 g/L or less

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

F. Round Duct Joint O-Ring Seals:

1. Seal shall provide maximum leakage class of 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for 10-inch wg static-pressure class, positive or negative.
2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.
3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

2.07 HANGERS AND SUPPORTS:

- A. Hanger Rods for Noncorrosive Environments: Galvanized-steel rods and nuts.
- B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
- C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1 (Table 5-1M), "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."
- D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A603.
- E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A492.
- F. Steel Cable End Connections: Galvanized-steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- H. Trapeze and Riser Supports:
 - 1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
 - 2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.
 - 3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

2.08 SEISMIC-RESTRAINT DEVICES:

- A. Refer to Sections 01 41 20 and 23 05 48 for requirements for restraint components and applications.

PART 3 - EXECUTION

3.02 DUCT INSTALLATION:

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and coordination drawings.
- B. Install ducts in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

- C. Install ducts in maximum practical lengths with fewest possible joints.
 - D. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.
 - E. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
 - F. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
 - G. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.
 - H. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.
 - I. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.
 - J. Install fire, combination fire/smoke, and smoke dampers where indicated on Drawings and as required by code, and by local authorities having jurisdiction. Comply with requirements in Section 23 33 00 for fire and smoke dampers and specific installation requirements of the damper UL listing.
 - K. Install heating coils, cooling coils, air filters, dampers, and all other duct-mounted accessories in air ducts where indicated on Drawings.
 - L. Protect duct interiors from moisture, construction debris and dust, and other foreign materials both before and after installation. Comply with SMACNA's "IAQ Guidelines for Occupied Buildings Under Construction," Appendix G, "Duct Cleanliness for New Construction Guidelines."
 - M. Elbows: Use long-radius elbows wherever they fit.
 - 1. Fabricate 90-degree rectangular mitered elbows to include turning vanes.
 - 2. Fabricate 90-degree round elbows with a minimum of three segments for 12 inches and smaller and a minimum of five segments for 14 inches and larger.
 - N. Branch Connections: Use lateral or conical branch connections.
- 3.03 INSTALLATION OF EXPOSED DUCTWORK:
- A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.
 - B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

- C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.
- D. Maintain consistency, symmetry, and uniformity in arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.
- E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.04 DUCTWORK EXPOSED TO WEATHER:

- A. All external joints are to have secure watertight mechanical connections. Seal all openings to provide weatherproof construction.
- B. Construct ductwork to resist external loads of wind, snow, ice, and other effects of weather. Provide necessary supporting structures.
- C. Single Wall:
 - 1. Ductwork shall be galvanized steel or Type 316 stainless steel as indicated.
 - 2. Where ducts have external insulation, provide weatherproof aluminum jacket. See Section 23 07 13.

3.05 ADDITIONAL INSTALLATION REQUIREMENTS FOR LABORATORY EXHAUST AND FUME HOOD EXHAUST DUCTS

- A. Install ducts in accordance with NFPA 45, "Fire Protection for Laboratories Using Chemicals."
- B. Install exhaust ducts without dips and traps that may hold water. Slope ducts a minimum of 2 percent back to hood or inlet. Where indicated on Drawings, install trapped drain piping.
- C. Connect duct to fan, fume hood, and other equipment indicated on Drawings.

3.06 DUCT SEALING:

- A. Seal ducts at a minimum to the following seal classes in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":
 - 1. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
 - 2. Outdoor, Supply-Air Ducts: Seal Class A.
 - 3. Outdoor, Exhaust Ducts: Seal Class C.

4. Outdoor, Return-Air Ducts: Seal Class C.
5. Unconditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class B.
6. Unconditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.
7. Unconditioned Space, Exhaust Ducts: Seal Class C.
8. Unconditioned Space, Return-Air Ducts: Seal Class B.
9. Conditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class C.
10. Conditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class B.
11. Conditioned Space, Exhaust Ducts: Seal Class B.
12. Conditioned Space, Return-Air Ducts: Seal Class C.

3.07 HANGER AND SUPPORT INSTALLATION:

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
 1. Where practical, install concrete inserts before placing concrete.
 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.
 5. Do not use powder-actuated concrete fasteners for seismic restraints.
- C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1 (Table 5-1M), "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.

- D. Hangers Exposed to View: Threaded rod and angle or channel supports.
- E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet .
- F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.08 SEISMIC-RESTRAINT-DEVICE INSTALLATION:

- A. Install ducts with hangers and braces designed to support the duct and to restrain against seismic forces required by applicable building codes. Comply with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems", Sections 01 41 20 and Section 23 05 48.
- B. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.
- C. Install cables so they do not bend across edges of adjacent equipment or building structure.
- D. Install cable restraints on ducts that are suspended with vibration isolators.
- E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.
- F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.
- G. Drilling for and Setting Anchors:
 - 1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
 - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
 - 3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
 - 4. Set anchors to manufacturer's recommended torque, using a torque wrench.

5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

3.09 CONNECTIONS:

- A. Make connections to equipment with flexible connectors complying with Section 23 33 00.
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.10 FIELD QUALITY CONTROL:

- A. Perform tests and inspections.
- B. Leakage Tests:
 1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
 2. Test the following systems:
 - a. Supply Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.
 - b. Return Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.
 - c. Exhaust Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.
 - d. Outdoor-Air Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.
 3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
 4. Testing of each duct section is to be performed with access doors, coils, filters, dampers, and other duct-mounted devices in place as designed. No devices are to be removed or blanked off so as to reduce or prevent additional leakage.
 5. Test for leaks before applying external insulation.
 6. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at

maximum system design pressure. Do not pressurize systems above maximum design operating pressure.

7. Give seven days' advance notice for testing.

3.11 DUCT CLEANING:

- A. Clean new duct system(s) before testing, adjusting, and balancing.
- B. Use duct cleaning methodology as indicated in NADCA ACR.
- C. Use service openings for entry and inspection.
 1. Provide openings with access panels appropriate for duct static-pressure and leakage class at dampers, coils, and any other locations where required for inspection and cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Section 23 33 00 for access panels and doors.
 2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
 3. Remove and reinstall ceiling to gain access during the cleaning process.
- D. Particulate Collection and Odor Control:
 1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
 2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.
- E. Clean the following components by removing surface contaminants and deposits:
 1. Air outlets and inlets (registers, grilles, and diffusers).
 2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
 3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
 4. Coils and related components.
 5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.

6. Supply-air ducts, dampers, actuators, and turning vanes.
7. Dedicated exhaust and ventilation components and makeup air systems.

F. Mechanical Cleaning Methodology:

1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
5. Clean coils and coil drain pans in accordance with NADCA ACR. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
6. Provide drainage and cleanup for wash-down procedures.
7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents in accordance with manufacturer's written instructions after removal of surface deposits and debris.

3.12 STARTUP:

- A. Air Balance: Comply with requirements in Section 23 05 93.

3.13 DUCT SCHEDULE:

- A. Fabricate ducts with materials indicated above and as follows:

1. Fabricate all ducts to achieve SMACNA pressure class, seal class, and leakage class as indicated below.

- B. Supply Ducts:

1. Ducts Connected to Fan Coil Units and Terminal Units:
 - a. Pressure Class: Positive 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.

- c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
 - 2. Ducts Connected to Constant and Variable Volume Air-Handling Units and Makeup Air Units:
 - a. Pressure Class: Positive 3 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
- C. Return Ducts:
 - 1. Ducts Connected to Fan Coil Units and Terminal Units:
 - a. Pressure Class: Positive or negative 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
 - 2. Ducts Connected to Air-Handling Units and Makeup Air Units:
 - a. Pressure Class: Positive or negative 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
- D. Exhaust Ducts:
 - 1. Ducts Connected to Fans Exhausting (ASHRAE 62.1, Class 1 and 2) Air:
 - a. Pressure Class: Negative 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
 - 2. Ducts Connected to Air-Handling Units:

- a. Pressure Class: Positive or negative 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 8.
3. Ducts Connected to High-Humidity Locations:
- a. Type 316, stainless-steel sheet.
 - b. Exposed to View: No. 4 finish.
 - c. Concealed: No. 2D finish.
 - d. Welded longitudinal seams; welded or flanged transverse joints with water-tight EPDM gaskets.
 - e. Pressure Class: Positive or negative 3 inch wg.
 - f. Airtight/watertight.
4. Ducts Connected to Fans Exhausting Fume Hood (ASHRAE 62.1, Class 3 and Class 4) Air:
- a. Type 316, stainless-steel sheet.
 - (1) Exposed to View: No. 4 finish.
 - (2) Concealed: No. 2B finish.
 - b. Pressure Class: Positive or negative 3 inch wg.
 - c. Minimum SMACNA Seal Class A Welded seams and joints.
 - d. Airtight/watertight.
- E. Outdoor-Air (Not Filtered, Heated, or Cooled) Ducts:
1. Ducts Connected to Fan Coil Units and Terminal Units:
- a. Pressure Class: Positive or negative 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
2. Ducts Connected to Air-Handling Units and Makeup Air Units:

- a. Pressure Class: Positive or negative 2 inch wg.
 - b. Minimum SMACNA Seal Class: B.
 - c. SMACNA Leakage Class for Rectangular: 12.
 - d. SMACNA Leakage Class for Round and Flat Oval: 6.
- F. Intermediate Reinforcement:
- 1. Galvanized-Steel Ducts: Galvanized steel.
 - 2. Stainless-Steel Ducts:
 - a. Exposed to Airstream: Match duct material.
 - b. Not Exposed to Airstream: Match duct material.
- G. Liner where indicated on plans:
- 1. Supply-Air Ducts: Fibrous glass, Type I 1 inch(es) thick.
 - 2. Return-Air Ducts: Fibrous glass, Type I 1 inch(es) thick.
 - 3. Supply Fan Plenums: Fibrous glass, Type I 1 inch(es) thick.
 - 4. Return Plenums: Fibrous glass, Type I 1 inch(es) thick.
- H. Elbow Configuration:
- 1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."
 - a. Velocity 1000 fpm or Lower:
 - (1) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."
 - b. Velocity 1000 or Higher:
 - (1) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."
 - 2. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."
 - a. Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.

- b. Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.
 - c. Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."
3. Round Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "Round Duct Elbows."
- a. Minimum Radius-to-Diameter Ratio and Elbow Segments: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 3-1, "Mitered Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments.
 - (1) Velocity 1000 fpm or Lower: 0.5 radius-to-diameter ratio and three segments for 90-degree elbow.
 - (2) Velocity 1000 to 1500 fpm: 1.0 radius-to-diameter ratio and four segments for 90-degree elbow.
 - (3) Velocity 1500 fpm or Higher: 1.5 radius-to-diameter ratio and five segments for 90-degree elbow.
 - b. Round Elbows, 12 Inches and Smaller in Diameter: Stamped or pleated.
 - c. Round Elbows, 14 Inches and Larger in Diameter: Standing seam.

3.14 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 31 16
NONMETAL DUCTS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide nonmetal ducts as indicated and in compliance with Contract Documents.
 - 1. Thermoset FRP ducts and fittings.

1.02 REFERENCES:

- A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - 1. 62.1: Ventilation for Acceptable Indoor Air Quality
 - 2. 90.1: Energy Standard For Buildings Except Low-Rise Residential Buildings
- B. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):
 - 1. SMACNA's "Thermoset FRP Duct Construction Manual."
- C. National Fire Protection Association (NFPA):
 - 1. 45: Standard on Fire Protection for Laboratories Using Chemicals
 - 2. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems
- D. Underwriters' Laboratories, Inc. (UL):
 - 1. 181: UL Standard for Safety Factory-Made Air Ducts and Connectors
 - 2. 723: Standard for Safety Test for Surface Burning Characteristics of Building Materials

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of the following products:
 - 1. Sealants and gaskets
 - 2. Seismic-restraint devices

C. Shop Drawings:

1. Factory- and shop-fabricated ducts and fittings
2. Fittings
3. Reinforcement and spacing
4. Seam and joint construction
5. Penetrations through fire-rated and other partitions
6. Equipment installation based on equipment being used on Project
7. Locations for duct accessories, including dampers, turning vanes, and access doors and panels
8. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation

D. Delegated-Design Submittal:

1. Joint and seam construction and sealing
2. Reinforcement details and spacing
3. Materials, fabrication, assembly, and spacing of hangers and supports.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Protect shop fabricated and factory purchased ductwork, accessories, and purchased products from damage during shipping, storage, and handling. Prevent end damage and prevent dirt and moisture from entering ducts and fittings.

- C. Where possible, store ductwork inside and protect from weather. Where necessary to store outside, store above grade and enclose with waterproof wrapping.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Delegated Duct Design: Duct construction, including duct closure, reinforcements, and hangers and supports, shall comply with the following and with the Works' performance requirements and design criteria:
 - 1. SMACNA's "Thermoset FRP Duct Construction Manual."
 - 2. Static-Pressure Classes:
 - a. Exhaust Ducts (Negative Pressure): 1-inch wg.
- B. Structural Performance: Duct hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions to comply with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems."
 - 1. Refer to the requirements in Section 01 41 20.
- C. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1, Section 5.4 – "Airstream Surfaces."
- D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-up."
- E. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."
- F. Duct Dimensions: Unless otherwise indicated, all duct dimensions indicated on Drawings are inside clear dimensions and do not include insulation or duct wall thickness.

2.02 THERMOSET FRP DUCTS AND FITTINGS

- A. Duct and Fittings:
 - 1. Thermoset FRP Resin: Comply with UL 181, Class 1, maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested by an NRTL according to ASTM E84.
 - 2. Round Duct: ASTM D2996, Type I, Grade 2, Class E, filament-wound duct, minimum 0.125-inch wall thickness, with tapered bell-and-spigot ends for adhesive joints or with plain ends with couplings.

3. Round Fittings: Compression or spray-up/contact, molded of same material, pressure class, and joining method as duct.
4. Joining Materials: Roving and polyester resin.
5. Fabrication:
 - a. Fabricate joints, seams, transitions, reinforcement, elbows, branch connections, and access doors and panels according to SMACNA's "Thermoset FRP Duct Construction Manual," Ch. 7, "Requirements."

2.03 HANGERS AND SUPPORTS

- A. Hanger Rods for Noncorrosive Environments: Zinc-plated steel rods and nuts.
- B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
- C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."
- D. Steel Cables: ASTM A492, stainless-steel cables with end connections made of stainless-steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- E. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- F. Trapeze and Riser Supports: Steel shapes complying with ASTM A36/A36M.

2.04 SEISMIC-RESTRAINT DEVICES

1. Refer to Sections 01 41 20 and 23 05 48 for requirements for restraint components and applications.

PART 3 - EXECUTION

3.01 DUCT INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.
- B. Install duct sections in maximum practical lengths with fewest possible joints.

- C. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.
- D. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
- E. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
- F. Install ducts with a minimum clearance of 1 inch, plus allowance for insulation thickness.
- G. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.
- H. Where ducts pass through non-fire-rated interior partitions and exterior walls, and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges. Overlap openings on four sides by at least 1-1/2 inches.
- I. Install fire, combination fire/smoke, and smoke dampers where indicated on Drawings and as required by code and by authorities having jurisdiction. Comply with requirements in Section 23 33 00 "Air Duct Accessories" for fire and smoke dampers and specific installation requirements of the fire damper UL listing.
- J. Install dampers and all other duct-mounted accessories in air ducts where indicated on Drawings.
- K. Protect duct interiors from moisture, construction debris and dust, and other foreign materials both before and after installation. Comply with SMACNA's "IAQ Guidelines for Occupied Buildings under Construction," Appendix G, "Duct Cleanliness for New Construction Guidelines."
- L. Elbows: Use long-radius elbows wherever they fit.
- M. Branch Connections: Use lateral or conical branch connections.
- N. Install thermoset FRP ducts and fittings to comply with SMACNA's "Thermoset FRP Duct Construction Manual."

3.02 HANGER AND SUPPORT INSTALLATION:

- A. Install hangers and supports for fibrous-glass ducts and fittings to comply with SMACNA's "Fibrous Glass Duct Construction Standards," Ch. 6, "Hangers and Supports."
 - 1. Install hangers and supports for thermoset FRP ducts and fittings to comply with SMACNA's "Thermoset FRP Duct Construction Manual," Ch. 7, "Requirements."
- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.

1. Install concrete inserts before placing concrete.
 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.
 5. Do not use powder-actuated concrete fasteners for seismic restraints.
- C. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.03 SEISMIC-RESTRAINT-DEVICE INSTALLATION:

- A. Install ducts with hangers and braces designed to support the duct and to restrain against seismic forces required by applicable building codes. Comply with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems."
1. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.
 2. Brace a change of direction longer than 12 feet.
- B. Select sizes of components so strength will be adequate to carry present and future static and seismic loads within restraint device capacity.
- C. Install cables so they do not bend across edges of adjacent equipment or building structure.
- D. Install cable restraints where ducts are suspended with vibration isolators.
- E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.
- F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure to flanges of beams, to upper truss chords of bar joists, or to concrete members.
- G. Drilling for and Setting Anchors
1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and water and gas lines.

2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Set anchors to manufacturer's recommended torque, using a torque wrench.
5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

3.04 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- D. Perform tests and inspections with the assistance of a factory-authorized service representative.
- E. Leakage Tests:
 1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
 2. Where static pressure and leakage values shown below differ from those in the SMACNA manual, the more stringent values shall apply.
 3. Test the following systems:
 - a. Exhaust Ducts with a Pressure Class of 2-Inch wg or Higher: Test representative duct sections, selected by Architect from sections installed, totaling no less than 100 percent of total installed duct area for each designated pressure class.
 4. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
 5. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test entire system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
 6. Give seven days' advance notice for testing.

F. Duct System Cleanliness Tests:

1. Test protocols shall be performed according to NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems," "Section 5 - Cleanliness Verification and Documentation."
2. Visually inspect duct system to ensure that no visible contaminants are present.
3. Test sections of fibrous-glass duct system chosen randomly by Owner for cleanliness according to "Method 2 Protocol."
4. Test sections of Phenolic-foam, Thermoset FRP, PVC, and CPVC duct systems chosen randomly by Owner, for cleanliness according to "Method 3 - NADCA Vacuum Test."
 - a. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.

G. Duct system will be considered defective if it does not pass tests and inspections.

H. Prepare test and inspection reports.

3.05 DUCT CLEANING

A. Clean duct system(s) before testing, adjusting, and balancing.

B. Use service openings for entry and inspection.

1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch duct as recommended by duct manufacturer. Comply with Section 23 33 00 "Air Duct Accessories" for access panels and doors.
2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
3. Remove and reinstall ceiling to gain access during the cleaning process.

C. Particulate Collection and Odor Control:

1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron (or larger) particles.
2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.

D. Clean the following components by removing surface contaminants and deposits:

1. Air outlets and inlets (registers, grilles, and diffusers).

2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
3. Dedicated exhaust and ventilation components and makeup air systems.

E. Mechanical Cleaning Methodology:

1. All duct cleaning shall be performed according to NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."
2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of ducts or duct accessories.
4. Clean fibrous-glass duct with HEPA vacuuming equipment; do not permit duct to get wet. Replace fibrous-glass duct that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
6. Provide drainage and cleanup for washdown procedures.
7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removing surface deposits and debris.

3.06 STARTUP SERVICE

- A. Air Balance: Comply with requirements in Section 23 05 93 "Testing, Adjusting, and Balancing for HVAC."

3.07 DUCT SCHEDULE

- A. Indoor Ducts and Fittings:

1. Thermoset FRP Round Ducts and Fittings

3.08 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 33 00
AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section Includes:

1. Manual volume dampers.
2. Control dampers.
3. Fire dampers.
4. Combination smoke and fire dampers.
5. Turning vanes.
6. Duct-mounted access doors.
7. Flexible connectors.
8. Duct accessory hardware.

1.02 REFERENCES:

E. Underwriters' Laboratories, Inc. (UL):

1. 181: Standard for Safety Factory-Made Air Ducts and Connectors
2. 555: Standard for Safety Fire Dampers

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.
 1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:
 - a. Special fittings.
 - b. Manual volume damper installations.
 - c. Control-damper installations.
 - d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.
- C. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.
- D. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 ASSEMBLY DESCRIPTION:

- A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems" and with NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

2.02 MATERIALS:

- A. Galvanized Sheet Steel: Comply with ASTM A653.
 - 1. Galvanized Coating Designation: G90.
- B. Stainless-Steel Sheets: Comply with ASTM A480, Type 316, and having a No. 4 finish.
- C. Aluminum Sheets: Comply with ASTM B209, Alloy 3003, Temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.
- D. Extruded Aluminum: Comply with ASTM B221, Alloy 6063, Temper T5.
- E. Hard Aluminum: Comply with ASTM B221, Alloy 6065 T6.
- F. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

2.03 MANUAL VOLUME DAMPERS:

A. Single Blade Dampers:

1. Material: Fabricate from same material as duct, but one sheet metal thickness heavier. V-groove stiffened.
2. Configuration: Size and configuration to recommendations of SMACNA, except maximum height 8 inches.
3. Control: Locking quadrant with shaft extension to accommodate insulation thickness.
4. Shaft: Continuous.
5. Bearings: Inside and outside bronze end bearings.
6. Frame: Channel frame of same material as adjacent duct, complete with angle stop.

B. Multi-Bladed Dampers:

1. Material: Factory manufactured of material compatible with duct. Metal thickness and construction to recommendations of SMACNA.
2. Blade Height: Maximum blade height: 8 inches.
3. Bearings: Bronze bushings.
4. Shaft: Continuous.
5. Configuration: Linkage with opposed blade operation.
6. Control: Shaft extension with locking quadrant.
7. Frame: Channel frame of same material as adjacent duct, complete with angle stop.

2.04 CONTROL DAMPERS

- A. Refer to Section 23 09 23.12 requirements for control dampers.

2.05 FIRE DAMPERS:

A. Manufacturers:

1. E H Price
2. Ruskin

3. Nailor
 4. Greenheck
 5. Titus
 6. Or equal
- B. Type: Dynamic; rated and labeled according to UL 555 by an NRTL.
- C. Fire Rating: 1-1/2 and 3 hours to suite separation rating.
- D. Frame: Curtain type with blades outside airstream except when located behind grille where blades may be inside airstream; fabricated with roll-formed, 0.034-inch-thick galvanized steel; with mitered and interlocking corners. Provide stainless steel to match duct construction or in corrosive atmospheres.
- E. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.
1. Minimum Thickness: As indicated in manufacturer's instructions to meet code requirements, and of length to suit application.
- F. Mounting Orientation: Vertical or horizontal as required.
- G. Blades: Roll-formed, interlocking, galvanized sheet steel. In place of interlocking blades, use full-length, 0.034-inch-thick, galvanized-steel blade connectors.
- H. Horizontal Dampers: Include blade lock and stainless-steel closure spring.
- I. Heat-Responsive Device: Replaceable, 165 degrees F rated, fusible links.
- 2.06 COMBINATION SMOKE AND FIRE DAMPERS
- A. Manufacturers:
1. Ruskin
 2. E H Price
 3. Greenheck
 4. Nailor
 5. Titus
 6. Or equal
- B. Type: Dynamic; rated and labeled according to UL 555 and UL 555S by an NRTL.

- C. Closing rating in ducts up to 4-inch wg static pressure class and minimum velocity.
- D. Fire Rating: 1-1/2 and 3 hours.
- E. Frame: Hat-shaped, 0.094-inch-thick, galvanized sheet steel, with interlocking, gusseted or mechanically attached corners and mounting flange.
- F. Heat-Responsive Device: Resettable, 165 deg F rated, fusible links.
- G. Heat-Responsive Device: Electric resettable link and switch package, factory installed, rated.
- H. Smoke Detector: Integral, factory wired for single-point connection.
- I. Blades: Roll-formed, horizontal, interlocking, 0.063-inch-thick, galvanized sheet steel.
- J. Rated pressure and velocity to exceed design airflow conditions.
- K. Mounting Sleeve: Factory-installed, 0.05-inch-thick, galvanized sheet steel; length to suit wall or floor application with factory-furnished silicone calking.
- L. Master control panel for use in dynamic smoke-management systems.
- M. Damper Motors: Modulating or two-position action.
- N. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 23 05 13 "Common Motor Requirements for HVAC Equipment."
 - 1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - 2. Controllers, Electrical Devices, and Wiring: Comply with requirements for fire alarm panel.
 - 3. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
 - 4. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
 - 5. Outdoor Motors and Motors in Outdoor-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
 - 6. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.

7. Electrical Connection: 115 V, single phase, 60 Hz.
- O. Accessories:
1. Auxiliary switches for signaling or position indication.
 2. Test and reset switches, remote mounted.
- 2.07 TURNING VANES:
- A. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vanes and Vane Runners," and 4-4, "Vane Support in Elbows."
 - B. Vane Construction: Single wall for ducts up to 48 inches wide and double wall for larger dimensions.
- 2.08 DUCT-MOUNTED ACCESS DOORS:
- A. Manufacturers:
 1. Ductmate
 2. Duro Dyne
 3. Ruskin
 4. Nailor
 5. Greenheck
 6. Titus
 7. Or equal
 - B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2 (7-2M), "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct."
 1. Door:
 - a. Double wall, rectangular.
 - b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.
 - c. Hinges and Latches: 1-by-1-inch butt or piano hinge and cam latches.
 - d. Fabricate doors airtight and suitable for duct pressure class.

2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
3. Number of Hinges and Locks:
 - a. Access Doors Less than 12 Inches Square: No hinges and two sash locks.
 - b. Access Doors up to 18 Inches Square: Two hinges and two sash locks.
 - c. Access Doors up to 24 by 48 Inches: Three hinges and two compression latches with handles.
 - d. Access Doors Larger than 24 by 48 Inches: Four hinges and two compression latches with handles.

2.09 FLEXIBLE CONNECTORS:

A. Manufacturers:

1. Duro Dyne
2. Ductmate
3. Ventfabrics

B. Materials: Flame-retardant or noncombustible fabrics.

C. Coatings and Adhesives: Comply with UL 181, Class 1.

D. Metal-Edged Connectors: Factory fabricated with a fabric strip minimum 3-1/2 inches wide attached to two strips of 2-3/4-inch-wide, 0.028-inch-thick, galvanized sheet steel or 0.032-inch-thick aluminum sheets. Provide metal compatible with connected ducts.

E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.

1. Minimum Weight: 26 oz./sq. yd
2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling
3. Service Temperature: Minus 40 to plus 200 degrees F

F. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weather-proof, synthetic rubber resistant to UV rays and ozone.

1. Minimum Weight: 24 oz./sq. yd
2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling
3. Service Temperature: Minus 50 to plus 250 degrees F

- G. High-Corrosive-Environment System, Flexible Connectors: Glass fabric with chemical-resistant coating.

1. Minimum Weight: 14 oz./sq. yd
2. Tensile Strength: 450 lbf/inch in the warp and 340 lbf/inch in the filling
3. Service Temperature: Minus 67 to plus 500 degrees F

2.10 DUCT ACCESSORY HARDWARE:

- A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.
- B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.
- B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.
- C. Compliance with ASHRAE/IESNA 90.1-2004 includes Section 6.4.3.3.3 - "Shutoff Damper Controls," restricts the use of backdraft dampers, and requires control dampers for certain applications. Install control dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.
- D. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.
 1. Install steel volume dampers in steel ducts.
 2. Install aluminum volume dampers in aluminum ducts.
- E. Set dampers to fully open position before testing, adjusting, and balancing.
- F. Install test holes at fan inlets and outlets and elsewhere as indicated.

- G. Install dampers according to UL listing.
- H. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
 - 1. On both sides of duct coils.
 - 2. Upstream from duct filters.
 - 3. At outdoor-air intakes and mixed-air plenums.
 - 4. At drain pans and seals.
 - 5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.
 - 6. Adjacent to and close enough to fire dampers, to reset or reinstall fusible links. Access doors for access to fire dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
 - 7. At each change in direction and at maximum 50-foot spacing.
 - 8. Upstream and downstream from turning vanes.
 - 9. Control devices requiring inspection.
 - 10. Elsewhere as indicated.
- I. Install access doors with swing against duct static pressure.
- J. Access Door Sizes:
 - 1. One-Hand or Inspection Access: 8 by 5 inches
 - 2. Two-Hand Access: 12 by 6 inches
 - 3. Head and Hand Access: 18 by 10 inches
 - 4. Head and Shoulders Access: 21 by 14 inches
 - 5. Body Access: 25 by 14 inches
 - 6. Body plus Ladder Access: 25 by 17 inches
- K. Label access doors according to Section 23 05 53 to indicate the purpose of access door.
- L. Install flexible connectors to connect ducts to equipment.

- M. For fans developing static pressures of 5-inch w.g. and more, cover flexible connectors with loaded vinyl sheet held in place with metal straps.
- N. Connect diffusers to ducts directly.
- O. Connect flexible ducts to metal ducts with adhesive plus sheet metal screws.
- P. Install duct test holes where required for testing and balancing purposes.
- Q. Install thrust limits at centerline of thrust, symmetrical on both sides of equipment. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop of fans.

3.02 FIELD QUALITY CONTROL:

A. Tests and Inspections:

1. Operate dampers to verify full range of movement.
2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Operate fire dampers to verify full range of movement and verify that proper heat-response device is installed.
4. Inspect turning vanes for proper and secure installation.
5. Operate remote damper operators to verify full range of movement of operator and damper.

3.03 CLOSEOUT ACTIVITIES:

- #### A.
- Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 34 00
FANS AND ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide fans and accessories as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. Air Movement and Control Association Inc. (AMCA):
 - 1. 210: Laboratory Methods of Testing Fans for Rating
 - 2. 211: Certified Ratings Program – Product Rating Manual for Fan Air Performance
 - 3. 300: Reverberant Room Method for Sound Testing of Fans
 - 4. 311: Certified Sound Ratings Program for Air Moving Devices
- B. American National Standards Institute (ANSI):
 - 1. S2.19: Mechanical Vibration – Balance Quality Requirements for Rigid Rotors
- C. ASTM International (ASTM):
 - 1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus
- D. The Institute of Electrical and Electronics Engineers, Inc. (IEEE):
 - 1. 519: Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems
- E. National Fire Protection Association (NFPA):
 - 1. 90A: Standard for the Installation of Air Conditioning and Ventilating Systems

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Shop Drawings: Submit complete material, construction and performance shop drawings for fans and accessories. Include the following:
 - 1. Certified fan performance curves.

2. For fans where sound data is scheduled, certified sound power data which conforms to specified levels.
 3. Complete motor data, including manufacturer.
 4. Complete accessories data, including drawings (i.e., disconnects, curbs, dampers, belts, bearings, sheave sizes, coatings, etc.).
- C. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.
- D. Shop Drawings must confirm that proposed fan equipment conforms to requirements of this Section of the Specification.
- 1.04 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
- 1.05 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
- 1.06 DELIVERY STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

- 2.01 GENERAL:
- A. Incorporate any requirements not listed here for each individual fan as noted on the Equipment Schedules on the drawings.
- 2.02 INLINE CENTRIFUGAL FANS:
- A. Inline centrifugal fans as per the Drawing schedule, each UL certified and labelled, and each AMCA certified and labelled for air and sound performance in accordance with tests performed to AMCA Standards 210 and 300. Each fan is to be complete with:
1. Housing: Rigid structural galvanized steel framework with formed galvanized steel panels including a flanged inlet panel with fan inlet Venturi, a flanged discharge panel and two removable access panels to permit servicing and/or removal of all interior components without disturbing duct connections.

2. Housing Insulation: Factory applied, neoprene spray coated glass fiberboard material meeting NFPA 90A requirements and permanently secured in place.
3. Wheel: Centrifugal, non-overloading aluminum wheel, statically and dynamically balanced, complete with backwardly inclined blades and an inlet cone matched to the housing inlet panel Venturi.
4. Fan Shaft and Bearings: Ground and polished steel shaft sized for a first critical speed of at least 25 percent over the maximum fan operating speed and mounted in permanently sealed and lubricated pillow block ball type bearings sized for an AFBMA L-50 average life of 200,000 hours at maximum fan RPM.
5. Drive and Guard: Adjustable V-belt drive sized for 150 percent of motor nameplate horsepower, and complete with an adjustable cast iron motor pulley, and a removable galvanized steel combination OSHA motor cover/belt guard.
6. Motor: A motor conforming to requirements specified in Section 26 20 00, factory wired to a NEMA 4 disconnect mounted on the fan housing and motor and drive to be mounted out of the airstream.
7. Mounting Hardware Kit: Galvanized steel mounting brackets for all four corners, and spring type vibration isolators provided by the fan manufacturer sized to suit the fan weight and mounting arrangement, all supplied loose for field installation.
8. Wire Mesh Guard: Removable 1/2-inch x 1/2-inch welded galvanized steel wire mesh in a galvanized steel frame sized to cover the open end of the fan.
9. Disconnect switches: Factory supplied, mounted and wired with housing suitable to exposure.

B. Manufacturers:

1. Greenheck Fan Corp
2. Loren Cook
3. Twin City Fan and Blower
4. Or equal

2.03 CEILING EXHAUST FANS:

- A. Ceiling exhaust fans as per the Drawing schedule, each UL certified and labelled, and each AMCA certified and labelled for air and sound performance in accordance with tests performed to AMCA Certification Programs 211 and 311. Fans are to be complete with:
 1. Fan Housing: Steel housing with electrical receptacle and box, electrical connection access cover, and an outlet duct connection collar with backdraft damper.

2. Fan Wheel/Motor Assembly: Removable fan-motor assembly with forward curved balanced centrifugal wheel direct connected to a permanently lubricated, overload protected and vibration isolated motor which is equipped with a length of prewired power cord with plug for plug-in connection/disconnection at the housing receptacle.
3. Exhaust Grille: White, non-yellowing plastic exhaust grille.
4. Accessories: For fans as per the Drawing schedule and/or details, factory supplied accessories as follows:
 - a. An exterior discharge accessory with integral birdscreen and backdraft damper.
 - b. A ULC listed ceiling radiation damper meeting NFPA 90A requirements.
 - c. A washable aluminum mesh filter.

B. Manufacturers:

1. Greenheck Fan Corp
2. Loren Cook
3. Twin City Fan and Blower
4. Carnes Company

2.04 HOODED TYPE GRAVITY VENTILATORS:

- A. Low silhouette, rectangular, roof mounting hooded penthouse type ventilators as per the drawing schedule, each constructed of aluminum, supplied in knock-down form for site assembly, and each complete with:
1. Full 360 degree perimeter hood opening.
 2. 1/2-inch x 1/2-inch aluminum mesh birdscreen.
 3. A welded aluminum, minimum 12 inch high insulated roof mounting curb with damper tray and curb seal.
 4. An aluminum backdraft damper, for installation in the roof curb damper tray if scheduled.
 5. A motorized aluminum damper, for installation in the roof curb damper tray if scheduled.

B. Manufacturers:

1. Greenheck Fan Corp
2. Twin City Fan and Blower Co
3. PennBarry
4. Carnes Company

PART 3- EXECUTION

3.01 GENERAL:

- A. The installation of all fans is to meet the seismic restraint requirements as stated in Section 01 41 20 and Section 23 05 48.

3.02 INSTALLATION OF CENTRIFUGAL INLINE FANS:

- A. Provide inline centrifugal fans where shown.
- B. Provide flexible duct connectors.
- C. Install with motor on the bottom or side for ease of servicing.
- D. Install mounting brackets for each fan and secure in place with vibration isolators and hanger rods, independent of connecting ductwork.

3.03 INSTALLATION OF CEILING EXHAUST FANS:

- A. Provide ceiling exhaust fans where shown.
- B. Rigidly secure each fan housing in place in the ceiling space and coordinate installation with:
1. The air distribution work where duct connection are specified.
 2. The electrical work of Division 26 where electrical power connection to the housing receptacle is specified.
- C. Install fan-motor assemblies and plug into housing receptacles.
- D. Install accessories supplied loose.
- E. When installation is complete, check and test operation and adjust as required.

3.04 INSTALLATION OF ROOF MOUNTED GRAVITY VENTILATORS:

- A. Provide roof mounted gravity ventilators where shown.
- B. Supply a roof mounting curb with each ventilator and hand the curbs to the roofing trade on the roof for mounting and flashing into roof construction as part of the roofing work.
- C. Install dampers in the curb damper tray and secure in place.
- D. Secure ventilators in place on the curbs.

3.05 CONTROLS:

- A. Coordinate with HVAC control contractor to ensure tie-in between BMS controllers and VFD hard-wired control circuit.

3.06 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

3.07 SCHEDULES:

- A. See Drawings.

END OF SECTION

SECTION 23 37 13.13

AIR DIFFUSERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide square ceiling diffusers and high-capacity drum louver diffusers as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - 1. 70: Method of Testing the Performance of Air Outlets and Air Inlets

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.
 - 1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
 - 2. Diffuser Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 HORIZONTAL SQUARE CEILING DIFFUSERS:

- A. Manufacturers:
 - 1. Titus
 - 2. Price
 - 3. Nailor
 - 4. Or equal
- B. Material: Steel
- C. Finish: Powder Coat, white
- D. Face Size: As scheduled or indicated on drawings
- E. Face Style: Square Plaque
- F. Mounting: Surface or T-bar to match ceiling
- G. Pattern: Fixed Horizontal
- H. Dampers: None

2.02 HIGH-CAPACITY DRUM LOUVER DIFFUSERS:

- A. Manufacturers:
 - 1. Titus
 - 2. Price
 - 3. Nailor
 - 4. Or equal
- B. Airflow Principle: Extended distance for high airflow rates
- C. Material: Aluminum, heavy gage extruded
- D. Finish: Powder Coat
- E. Border: 1-1/4-inch width with countersunk screw holes
- F. Gasket between drum and border

- G. Body: Drum shaped; adjustable vertically
- H. Blades: Individually adjustable horizontally
- I. Mounting: Surface
- J. Size: As scheduled or indicated on drawings
- K. Accessories:
 - 1. Manual volume damper with hand quadrant.

2.03 SOURCE QUALITY CONTROL:

- A. Verification of Performance: Rate diffusers according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas where diffusers are installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. Install diffusers level and plumb.
- B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.
- C. Review the architectural reflected ceiling plan and confirm the indicated diffuser mounting style is compatible the ceiling type. Any conflicts are to be brought to the Engineer's attention for resolution.
- D. Install diffusers with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.03 ADJUSTING:

- A. After installation, adjust diffusers to air patterns indicated, or as directed, before starting air balancing.

3.04 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 37 13.23
REGISTERS AND GRILLES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide grilles as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

- 1. 70: Method of Testing the Performance of Air Outlets and Air Inlets

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product.
 - 1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
 - 2. Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 GRILLES:

A. Aluminum Fixed Blade Face Return/Exhaust/Relief Grille:

1. Manufacturers:
 - a. Titus
 - b. Price
 - c. Nailor
 - d. Or equal
2. Make/Model: Per Equipment Schedule
3. Material: Extruded Aluminum
4. Finish: Powder Coat
5. Face Blade Arrangement: Fixed 45 degree deflection louvers spaced 3/4 inch on center
6. Frame: 1-1/4 inches wide
7. Mounting: Countersunk screw for surface mounted, aluminum infill module for T-bar.
8. Damper Type: None

B. Aluminum Adjustable Blade Face Supply Grille:

1. Manufacturers:
 - a. Titus
 - b. Price
 - c. Nailor
 - d. Or equal
2. Make/Model: Per Equipment Schedule
3. Material: Aluminum
4. Finish: Powder Coat

5. Face Blade Arrangement: Adjustable double deflection with front and rear blades spaced 3/4 inch on center unless otherwise scheduled.
6. Frame: 1-1/4 inches wide
7. Mounting: Countersunk screw for surface, lay-in no screw hole for T-bar
8. Damper Type: None

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas where grilles are installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. Install grilles level and plumb.
- B. Outlets and Inlets Locations: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.
- C. Install grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.03 ADJUSTING:

- A. After installation, adjust and grilles to air patterns indicated, or as directed, before starting air balancing.

3.04 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 41 00

PARTICULATE AIR FILTRATION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide flat panel filters, pleated panel filters, front- or back-access filter frames, side-access filter housings, filter gauges as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - 1. 52.2: Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size
- B. National Fire Protection Association (NFPA):
 - 1. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems
- C. Underwriters' Laboratories, Inc. (UL):
 - 1. 900: Standard for Safety Air Filter Units

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each type of product. Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.
- C. Shop Drawings: For air filters. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show filter rack assembly, dimensions, materials, and methods of assembly of components.
 - 2. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages.

- D. Seismic Qualification Data: Certificates, for filters, accessories, and components from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- E. Operation and Maintenance Data: For each type of filter and rack to include in emergency, operation, and maintenance manuals.
- F. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Provide one complete set(s) of filters for each filter bank.

1.04 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Deliver and store products in a clean, dry place.
- C. Comply with manufacturer's written rigging and installation instructions for unloading and moving to final installed location.
- D. Handle products carefully to prevent damage, breaking, denting, and scoring. Do not install damaged products.
- E. Protect products from weather, dirt, dust, water, construction debris, and physical damage.
 - 1. Retain factory-applied coverings on equipment to protect finishes during construction and remove just prior to operating unit.

2. Cover unit openings before installation to prevent dirt and dust from entering inside of units. If required to remove coverings during unit installation, reapply coverings over openings after unit installation and remove just prior to operating unit.
3. Replace installed products damaged during construction.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Seismic Performance: Filters shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 and criteria documented in Section 01 41 20.
 1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 2. Component Importance Factor: 1.5.
- B. ASHRAE Compliance:
 1. Comply with applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality"; Section 5 - "Systems and Equipment"; and Section 7 - "Construction and Startup."
 2. Comply with ASHRAE 52.2 for MERV for methods of testing and rating air-filter units.
- C. Comply with NFPA 90A.
- D. Comply with UL 900.
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.02 PLEATED PANEL FILTERS:

- A. Description: Factory-fabricated, self-supported, extended-surface, pleated, panel-type, disposable air filters with holding frames.
- B. Source Limitations: Obtain from single source from single manufacturer.
- C. Capacities and Characteristics:
 1. Face Size: As per equipment schedule

2. Depth: 2 inches nominal.
 3. Initial Resistance: 0.1-inch wg at 350 fpm.
 4. Recommended Final Resistance: 1.0 inches wg.
 5. Minimum Efficiency Reporting Value: MERV 8, with "Composite Average Particle Size Efficiency, Percent in Size Range, Micrometers" according to ASHRAE 52.2.
 6. Access: Side.
- D. Media: Cotton and synthetic fibers or 100 percent synthetic fibers coated with non-flammable adhesive.
1. Separators shall be bonded to the media to maintain pleat configuration.
 2. Welded-wire or expanded metal grid shall be on downstream side to maintain pleat.
 3. Media shall be bonded to frame to prevent air bypass.
- E. Filter-Media Frame: Moisture resistant two piece cardboard frame with diagonal supports sealed or bonded to the media.

2.03 SIDE-ACCESS FILTER HOUSINGS:

- A. Description: Factory-assembled, side-service housings, constructed of to match duct material, with flanges to connect to duct or casing system.
- B. Source Limitations: Obtain from single source from single manufacturer.
- C. Prefilters: Integral tracks to accommodate 2-inch thick, disposable filters.
- D. Access Doors: Hinged, with continuous gaskets on perimeter and positive-locking devices, and arranged so filter cartridges can be loaded from either access door.
- E. Sealing: Incorporate positive-sealing gasket material on channels to seal top and bottom of filter cartridge frames and to prevent bypass of unfiltered air.

2.04 FILTER GAUGES:

- A. Diaphragm-type gauge with dial and pointer in metal case, vent valves, black figures on white background, and front recalibration adjustment.
 1. Manufacturers:
 - a. Dwyer – 2000 Magnehelic

- B. Source Limitations: Obtain from single source from single manufacturer.
 - 1. Diameter: 4-1/2 inches.
 - 2. Scale Range for Filter Media Having a Recommended Final Resistance of 0.5- to 1.0-Inch wg or Less: 0- to 1.0-inch wg.
- C. Accessories: Static-pressure tips, tubing, gauge connections, and mounting bracket.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine ducts, air-handling units, and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF FILTERS:

- A. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.
- B. Install filters in position to prevent passage of unfiltered air.
- C. Install filter gauge for each filter bank.
- D. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing with new, clean filters.
- E. Coordinate filter installations with duct and air-handling-unit installations.

3.03 INSTALLATION OF FILTER GAUGES:

- A. Install filter gauge for each filter bank.
- B. Install filter-gauge, static-pressure tips upstream and downstream from filters. Install filter gauges on filter banks with separate static-pressure taps upstream and downstream from filters. Mount filter gauges on outside of filter housing or filter plenum in an accessible position. Adjust and level inclined gauges.

3.04 CONTROL CONNECTIONS:

- A. Install control and electrical power wiring to field-mounted control devices.
- B. Connect control wiring between pressure sensors and control system.

3.05 CLEANING:

- A. After completing system installation and testing, adjusting, and balancing of air-handling and air-distribution systems, clean filter housings and install new filter media.

3.06 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 51 33

INSULATED SECTIONAL CHIMNEYS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Double Wall Stainless Steel Vent

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for product.
 - 2. Layout Drawings
 - 3. Sizing Calculations if applicable
 - 4. Product Catalog
 - 5. Installation Instructions
 - 6. Warranty
- B. Shop Drawings: For chimneys and stacks.
 - 1. Include plans, elevations, sections, and attachment details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Detail fabrication and assembly of hangers and seismic restraints.

1.04 INFORMATIONAL SUBMITTALS

- A. Seismic Qualification Certificates: For factory-fabricated chimneys and stacks, accessories, and components from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Sample Warranty: For special warranty.

1.05 QUALITY ASSURANCE

- A. Certified Sizing Calculations: Manufacturer shall certify venting system sizing calculations.

1.06 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of venting system that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, structural failures caused by expansion and contraction.
2. Warranty Period: 15 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 DOUBLE WALL STAINLESS STEEL VENT

- A. Z-Vent Double Wall by Z-Flex or approved equivalent
- B. UL1738 and ULC-S636 Listed.
- C. The factory built double wall vent shall be engineered for use with category I, II, III or IV gas fired appliances or as specified by the gas fired appliance manufacturer.
- D. Inner vent shall be constructed of UL Listed UNS S44735 (i.e. AL 29-4C®) superferritic stainless steel or UL Listed alternate.
- E. The outer double wall shall be constructed of 304 or 316 stainless steel and have a 1“ insulating air space around the inner vent to outer double wall.
- F. The outer double wall shall incorporate a joint closure system which includes a snap lock or flanges with ZV-Clamp.
- G. Double wall vent shall be compatible to single wall & smoothcore flexible vents with an adaptor all from the same vent manufacturer.
- H. Maximum UL rated vent gas temperature shall not exceed 550°F for up to 12“ diameter vents and 480°F for 14“ to 24“ diameter vents.

- I. Vent shall be UL rated for a maximum pressure of 8" w.c. and shall have passed UL leakage test at 20" w.c.
- J. The vent system shall be continuous from the appliance's flue outlet to the vent termination outside the building. All systems components such as vent supports, roof or wall penetrations, terminations, appliance connectors and drain fittings shall be UL/cUL listed and supplied by the same vent manufacturer.
- K. Vent components in direct contact with products of combustion must include a UL/cUL label.
- L. Inner vent shall include a factory installed Double Fail Safe FKM gasket in the female end of the vent yielding an air and water tight joint when the overlapping ends are assembled.
- M. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.
 - 1. Exhaust Termination: Stack cap designed to exclude minimum 90 percent of rainfall.
 - 2. Intake Termination: Gooseneck with birdscreen.

2.02 GUYING AND BRACING MATERIALS

- A. No guying is allowed.
- B. Vents must be self-supported above the roof.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATION

- A. Listed Double Wall Stainless Steel: High-efficiency boiler or furnace vents in masonry chimney.

3.03 INSTALLATION OF LISTED CHIMNEYS

- A. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 07 22 00 "Roof Accessories."

- B. Comply with minimum clearances from combustibles and minimum termination heights according to product listing or NFPA 211, whichever is most stringent.
- C. Seal between sections of positive-pressure vents according to manufacturer's written installation instructions, using sealants recommended by manufacturer.
- D. Lap joints in direction of flow.
- E. Erect stacks plumb to finished tolerance of no more than 1 inch out of plumb from top to bottom.

3.04 CLEANING

- A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris, and repair damaged finishes.
- B. Provide temporary closures at ends of chimneys and stacks that are not completed or connected to equipment.

END OF SECTION

SECTION 23 52 19
HOT WATER BOILERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

- 1. Copper finned-tube, high efficiency, forced draft, gas-fired, non-condensing hot water boilers.

1.03 SUBMITTALS

- A. Product Data: Submit manufacturer's technical product data including rated capacities of selected model clearly indicated, weights, furnished specialties, and accessories, and installation and startup instructions.

- B. Shop Drawings:

- 1. Submit manufacturer's assembly type shop drawings indicating dimensions, weight loadings, required clearances, and methods of assembly of components.
 - 2. Wiring Diagrams: Manufacturer's electrical requirements for power supply wiring to terminal units.
 - 3. Manufacturer's ladder type for interlock and control wiring. Differentiate between portions of wiring factory installed and portions to be field installed.

- C. Operation and Maintenance (O&M) Data:

- 1. Maintenance instructions including lubrication instructions, control motor and drive replacement, and spare parts lists.
 - 2. Include O&M data, product data, and Shop Drawings in single bound manuals.

- D. Warranty and Test Certificates.

- E. Submit in accordance with Section 01 33 00.

1.04 QUALITY ASSURANCE

- A. Manufacturers: Firms regularly engaged in manufacture of copper finned-tube, high-efficiency, non-condensing, hot water boilers, of types and capacities required, whose products have been in satisfactory use in similar service for not less than 10 yrs.
- B. Entire boiler system and its installation shall conform to the manufacturer's instructions, applicable local, state and federal codes and associated National Board requirements.
- C. Boilers must be fully factory test fired prior to shipment. Manufacturer shall supply copies of the Test Fire Report, including fuel/air settings and combustion test results.
- D. Regulatory Requirements:
 - 1. Provide hot water boilers tested and rated in accordance with Hydronics Institute and bearing HI emblem on nameplate affixed to boiler.
 - 2. National Fire Protection Association (NFPA) Compliance: Install copper finned-tube, high efficiency, non-condensing, hot water boilers in accordance with NFPA No. 54.
 - 3. ASME Compliance: Construct Install copper finned-tube, high efficiency, non-condensing, hot water boilers in accordance with ASME Boiler and Pressure Vessel Code, Section IV.
 - 4. Underwriters Laboratories (UL) Labels: Provide Install copper finned-tube, high efficiency, non-condensing, hot water boiler ancillary electrical components UL labeled

1.05 WARRANTY

- 1. Heat exchanger and burner shall be covered for a period of ten (10) years against failure due to material defects, thermal shock, or workmanship, providing the boiler is installed in a closed loop system and in accordance with all requirements outlined in the equipment manual.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Handle hot water boilers and equipment carefully to prevent damage, breaking, and scoring. Do not install damaged boilers or components; replace with new.
- B. Store hot water boilers and equipment in clean, dry place. Protect from weather, dirt, fumes, water, construction debris, and physical damage.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturer's equipment used as basis of design for this project is name indicated in schedule contained in these Contract Documents. If no manufacturer is listed, basis of design is industry standard indicated.
 - 1. Thermal Solutions
 - 2. Aerco
 - 3. Or equivalent

2.02 BOILER CONSTRUCTION

- A. Boiler shall be construction and stamped in accordance with Section IV of the ASME Code of low pressure heating boilers with a maximum water working pressure of 160 PSIG. Form H-3 Manufacturer's Data Report for Water Tube Boilers shall be provided.
- B. Combustion chamber shall be enclosed in a minimum 18-gauge stainless steel airtight inner jacket. The outer jacket shall be finished, both inside and outside, with a powder coat finish and be equipped with a sight glass.
- C. Boiler shall be capable of operating at full rated capacity with natural gas or propane gas pressure at the inlet of the boiler gas train of 3.5" to 14" W.C. and have full modulation.

2.03 BOILER DESIGN

- A. Blower motor shall be variable speed with pulse width modulation control. The variable speed drive must be built into the fan motor with no separate drives required.
- B. Boilers shall be 5:1 turndown or greater, with infinite turndown between 20% and 100% of input. Both air and gas volume must be varied to maintain proper combustion at all firing rates.
- C. The thermal efficiency of the boiler shall be 88% minimum at its low fire condition, operating with a 20 degree temperature differential with 140 degree F return water temperature.
- D. Trim shall include a combination temperature/pressure gauge and an ASME-rated pressure relief valve set at 60 PSI.
- E. Boiler shall be provided with a flow switch installed in the water outlet connection.

2.04 CONTROLS

- A. Control system shall be supplied for 120 volts, single phase, and 60 hertz.

- B. Limit circuit shall include an integral high-limit temperature controller with a field adjustable range of 180oF to 240oF, water flow switch, differential switch to sense air flow to the burner, manual reset low and high gas pressure switches, and a blocked exhaust switch.
- C. Provide a probe type, manual reset low water cut off.
- D. Boiler shall include electronic direct spark ignition.
- E. Control shall have the following integrated control functions:
 - 1. Primary Flame Safeguard Control
 - 2. Spark Generator
 - 3. Firing Rate Limiting
 - 4. PID Load Control
 - 5. Time of Day
 - 6. Pulse Width Modulation for Variable Speed Drive on the Blower Motor
 - 7. Auxiliary Output Control (3 Outputs for Pump Control)
 - 8. Fault Code History Including Equipment Status at time of Lockout
 - 9. Alert Code Status including equipment status at time of internal alerts
 - 10. Three Status LED's (Power, Flame and Alarm)
 - 11. Flame Sensing (Ultraviolet Sensors, Flame Rod)
 - 12. Analog Inputs:
 - a. Outlet Limit and Temperature
 - b. Stack Limit and Temperature
 - c. Inlet Temperature and Outdoor Temperature
 - d. Pulse Width Modulation Feedback
 - e. Flame Signal from either a Flame Rod or Ultraviolet Detector
 - f. 4-20mA Control Input
 - 13. Digital Inputs:

- a. Programmable Pre Ignition Interlock
 - b. Programmable Load/Limit Control Input
 - c. Programmable Interlock
 - d. Programmable Annunciation
 - e. Time of Day
14. Analog Outputs:
- a. Modulation – Pulse Width Modulation for Variable Frequency Drives
15. Digital Outputs:
- a. Auxiliary Output Control (3 outputs)
 - b. Combustion Blower
 - c. External Ignition
 - d. Main Gas Valve
 - e. Alarm
- F. Local operator interface shall include the following features:
- 1. Individual boiler status, configuration, history and diagnostics.
 - 2. Allows configuration and monitoring of the burner control sequence, flame signal, diagnostics, historical files and faults.
 - 3. Allows boiler naming.
 - 4. Color 3.5” x 4.625” (5.7” diagonal) user interface display.
 - 5. LED Indicators
 - 6. Flush Mounting
 - 7. Touch screen disable for screen cleaning
 - 8. Screen saver
 - 9. Contrast control
 - 10. Volume control
 - 11. Graphic user interface

12. UL Approval

- G. Provide boiler sequencing system to maximize efficiency for the boiler plant.

2.05 MAIN GAS TRAIN COMPONENTS

- A. Boiler shall have an integral gas train, factory assembled and installed. The main gas train will include:

1. Minimum incoming gas pressure of 3.5 in. w.c. Maximum incoming gas pressure of 14 in. w.c.
2. One manual shut-off valve at gas inlet.
3. Gas regulating valve.
 - a. Main valve body with two shutoff seats (double block valve).
 - b. Closing time less than one second.
 - c. Mesh screen (strainer) between inlet flange and main body.
 - d. Position indication lights for each valve stage
 - e. Class H insulation solenoid valves.
 - f. Aluminum alloy, die cast body material.
 - g. Hydrocarbon resistant NBR and rubber type seals and gaskets.
 - h. 120V, Single Phase, 60 Hertz Power Required.
 - i. UL Approval.
4. High and low gas pressure switches.
5. Fuel train shall not contain components that require ventilation to the outdoors.
6. Boiler shall initiate combustion with direct spark ignition. No pilot assembly shall be utilized.
7. Gas train shall comply with current CSD-1 fuel train codes.
8. All components of the gas train shall be IRI approved.

2.06 BOILER FITTINGS

- A. Boiler shall be supplied with an ASME Section IV approved, side outlet type safety relief valve. The safety relief valve shall be in accordance with ASME code requirements.

- B. Temperature/pressure gauge shall be included with the boiler.
- C. Boiler shall have the following accessories and options available at the time of purchase:
 - 1. Air inlet filter kit
 - 2. Low water cut off probe
 - 3. Fused external disconnect
 - 4. Alarm horn with silence switch
 - 5. Stack temperature thermometer
 - 6. Condensate drain kit

2.07 EMISSIONS

- A. Boiler shall operate with CO emissions less than 30 PPM corrected to 3% O₂ and shall operate with NO_x emissions less than 30 PPM corrected to 3% O₂ over the turndown range.

2.08 OPERATIONS MANUAL

- A. Instructions for installation, operation and maintenance of the boiler shall be contained in a manual provided with each boiler unit.
- B. Wiring diagram corresponding to the boiler configuration shall be permanently affixed to the boiler near the electrical panel.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions under which copper finned-tube high efficiency, non-condensing hot water boilers are to be installed. Do not proceed with Work until unsatisfactory conditions corrected.
- B. Equipment shall fit within the allocated space, leaving ample allowance for maintenance and inspection.

3.02 INSTALLATION OF HOT WATER BOILERS

- A. Comply with boiler manufacturer's written instructions for installation, except as otherwise indicated.
- B. Comply with installation requirements of local and state boiler codes and applicable provisions of NFPA and ASME boiler code standards.

- C. Install hot water boilers on 4 in. high concrete pad where indicated and maintain manufacturer's recommended clearances around and over top of boilers.
- D. Install boiler trim.
- E. Install electrical control items furnished by manufacturer for operation of system.
- F. Connect water, fuel, breeching, and exhaust vent as shown on Drawings. Combustion air shall come from within Boiler Room from combustion air louver...
- G. Furnish to manufacturer's wiring diagram and electrical requirements for installation of field wiring required for hot water boilers.
- H. Flush and clean hot water boilers upon completion of installation in accordance with manufacturer's startup instructions.
- I. Provide boiler manufacturer recommended manifold pipe and fittings from each boiler to nearest floor drain or as indicated.

3.03 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:

- 1. Supplier's or manufacturer's representative for equipment specified herein shall be present at jobsite for mandays indicated, travel time excluded, for assistance during equipment startup, and training of Owner's personnel for equipment operation. Include:
 - a. 1 man-day for Installation Services.
 - b. 1 man-day for Instructional Services.
- 2. Supplier or manufacturer shall direct services to system and equipment operation, maintenance, troubleshooting, and equipment and system related areas. See Section 01 60 10.

B. Testing:

- 1. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
- 2. Hydrostatically test assembled boiler and piping in accordance with applicable sections of ASME Boiler and Pressure Vessel Code.
- 3. Arrange with National Board of Boiler and Pressure Vessel Inspectors for inspection of boiler, boiler piping, observation of hydrostatic testing and certification of completed boiler units. Obtain certification for completed boiler units, deliver to Owner and obtain a receipt.

END OF SECTION

SECTION 23 64 23

AIR COOLED, SCROLL WATER CHILLER

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Performance Requirements:

1. Factory run test unit under full load operating conditions to check performance for capacity, efficiency, vibration, operating control, and safety cutouts in accordance with the requirements of ARI 550/590. Submit independently certified test data to Owner prior to shipment of unit.
2. If equipment fails to perform within allowable tolerances, manufacturer will be allowed to make necessary equipment modifications and retest as required. If modifications fail to achieve submitted performance, manufacturer agrees to following penalties.
 - a. Capacity Test: For each ton below 95% design capacity, \$500/ton will be assessed against Contract Price of machine, and fully refunded to Owner.
 - b. Power Consumption Test: Power consumption penalty shall be based on tolerances set forth in ARI 550, and shall be calculated using following formula:

$$Penalty = [Measured\ KW - (Measured\ Tons \times Allowable\ KW/T)] \times \$1,000/KW$$

where:

$$Allowable\ KW/T = 1.05 \times design\ KW/T$$

3. Total Performance Penalty: Total performance penalty shall equal sum of capacity penalty and power consumption penalty.

1.02 SUBMITTALS:

A. Product Data:

1. Include refrigerant, rated capacities, operating characteristics, and furnished specialties and accessories.
2. Condenser pressure drop.
3. Cooler pressure drop.

4. Weights (shipping, installed, and operating)
5. Furnished Accessories.
6. Installation and startup instructions.
7. Performance at AHRI standard conditions and at conditions indicated.
8. Performance at AHRI standard unloading conditions.
9. Minimum evaporator flow rate.
10. Refrigerant capacity of water chiller.
11. Oil capacity of water chiller.
12. Fluid capacity of evaporator.
13. Characteristics of safety relief valves.
14. Force and moment capacity of each piping connection.

B. Shop Drawings: Complete set of manufacturer's prints of water chiller assemblies, control panels, sections and elevations, and unit isolation. Include the following:

1. Assembled unit dimensions.
2. Weight and load distribution.
3. Required clearances for maintenance and operation.
4. Size and location of piping and wiring connections.
5. Diagrams for power, signal, and control wiring.

C. Operations and Maintenance Data (O&M):

1. Operating instructions, maintenance procedures including lubrication instructions, control motor and drive replacement, and spare parts list.

1.03 SUBMITTALS

A. Coordination Drawings:

1. Plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - a. Structural supports.

- b. Piping roughing-in requirements.
 - c. Wiring roughing-in requirements, including spaces reserved for electrical equipment.
 - d. Access requirements, including working clearances for mechanical controls and electrical equipment, and tube pull and service clearances.
- 2. Coordination drawings showing plan, section and elevation views
- 3. Each view to show screened background with the following:
 - a. Column grids, beams, columns, and concrete housekeeping pads.
 - b. Layout with walls, floors, and roofs, including each room name and number.
 - c. Equipment and products of other trades that are located in vicinity of chillers and part of final installation, such as plumbing systems.
- B. Seismic Qualification Data: Certificates, for water chillers, accessories, and components, from manufacturers.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Installation instructions.
- D. Source quality-control reports.
- E. Startup service reports.
- F. Sample Warranty: For special warranty.
- 1.04 CLOSEOUT SUBMITTALS
 - A. Operation and Maintenance Data: For each water chiller to include in emergency, operation, and maintenance manuals.
 - B. Spare Parts List: Recommended spare parts list with quantity for each.
 - C. Touchup Paint Description: Detailed description of paint used in application of finish coat to allow for procurement of a matching paint.

- D. Instructional Videos: Including those that are prerecorded and those that are recorded during training.

1.05 MAINTENANCE MATERIAL SUBMITTALS

- A. Tool kit to include the following:
- B. A tool kit specially designed by chiller manufacturer for use in servicing chiller(s) furnished.
- C. Special tools required to service chiller components not readily available to Owner service personnel in performing routine maintenance.
- D. Lockable case with hinged cover, marked with large and permanent text to indicate the special purpose of tool kit, such as "Chiller Tool Kit." Text size shall be at least 1 inch high.
- E. A list of each tool furnished. Permanently attach the list to underside of case cover. Text size shall be at least 1/2 inch high.
- F. Touchup Paint: 32 oz. container of paint used for finish coat. Label outside of container with detailed description of paint to allow for procurement of a matching paint in the future.

1.06 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.09 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.10 WARRANTY:

- A. Special Warranty: Manufacturer agrees to repair or replace components of water chillers that fail in materials or workmanship within specified warranty period.

1. Extended warranties include, but are not limited to, the following:

- a. Complete chiller including refrigerant and oil charge.

- b. Complete compressor and drive assembly including refrigerant and oil charge.
 - c. Refrigerant and oil charge.
 - d. Loss of refrigerant charge for any reason due to manufacturer's product defect and product installation.
 - e. Parts and labor.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

- A. Carrier Corporation, Division of United Technologies, Inc.
- B. Trane Company.
- C. Or equal.

2.02 UNIT DESCRIPTION

- A. Provide and install as shown on the plans factory-assembled, factory-charged air-cooled scroll compressor packaged chillers in the quantity specified. Each chiller shall consist of hermetic tandem or triple scroll compressor sets, brazed plate evaporator, air-cooled condenser section, microprocessor-based control system and all components necessary for controlled unit operation
- B. Each chiller shall be factory run-tested with water to verify full-load operation. Operating controls and refrigerant charge shall be verified for proper operation and optimum performance. Any deviation shall be remedied prior to shipment and the unit retested if necessary to confirm repairs or adjustments.

2.03 PERFORMANCE REQUIREMENTS:

- A. Seismic Performance: Scroll water chillers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Component Importance Factor: 1.5.
- B. Site Altitude: Chiller shall be suitable for altitude at which installed without affecting performance indicated. Make adjustments to affected chiller components to account for site altitude.

- C. Performance Tolerance: Comply with the following in lieu of AHRI 550/590:
 - 1. Allowable Capacity Tolerance: Zero percent.
 - 2. Allowable Full-Load Energy Efficiency Tolerance: Zero percent.
 - 3. Allowable Part-Load Energy Efficiency Tolerance: Zero percent.
- D. AHRI Rating: Rate water chiller performance according to requirements in AHRI 550/590.
- E. ASHRAE Compliance: ASHRAE 15 for safety code for mechanical refrigeration.
- F. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- G. ASME Compliance: Fabricate and stamp water chiller heat exchangers to comply with ASME Boiler and Pressure Vessel Code.
- H. Comply with NFPA 70.
- I. Comply with requirements of UL 1995, "Heating and Cooling Equipment," and include label by a qualified testing agency showing compliance.
- J. Operation Following Loss of Normal Power:
 - 1. Equipment, associated factory- and field-installed controls, and associated electrical equipment and power supply connected to backup power system shall automatically return equipment and associated controls to the operating state occurring immediately before loss of normal power without need for manual intervention by an operator when power is restored either through a backup power source, or through normal power if restored before backup power is brought on-line.
 - 2. See drawings for equipment served by backup power systems.
 - 3. Provide means and methods required to satisfy requirement even if not explicitly indicated.
- K. Outdoor Installations:
 - 1. Chiller shall be suitable for outdoor installation indicated. Provide adequate weather protection to ensure reliable service life over a 25-year period with minimal degradation due to exposure to outdoor ambient conditions.
 - 2. Chillers equipped to provide safe and stable operation while achieving performance indicated when operating at extreme outdoor temperatures encountered by the installation. Review historical weather database and provide equipment that can operate at extreme outdoor temperatures recorded over past 30-year period.

2.04 CAPACITIES AND CHARACTERISTICS:

- A. Refer to equipment schedules on drawings for performance and physical characteristics.

2.05 CHILLER COMPONENTS

A. Compressor

1. The compressors shall be sealed hermetic, scroll type with crankcase oil heater and suction strainer. The compressor motor shall be refrigerant gas cooled, high torque, hermetic induction type, two-pole, with inherent thermal protection on all three phases and shall be mounted on RIS vibration isolator pads. The 20 – 90 ton compressors shall be equipped with an internal module providing compressor protection and communication capability.

B. Evaporator

1. The evaporator shall be a compact, high efficiency, dual circuit, brazed plate-to-plate type heat exchanger consisting of parallel stainless steel plates.
 - a. The evaporator shall be protected with an electric resistance heater (heat trace tape) and insulated with 3/4" (19mm) thick closed-cell polyurethane insulation. This combination shall provide freeze protection down to -20°F ambient air temperature.
 - b. The water-side working pressure shall be a minimum of 653 psig. Vent and drain connections shall be provided in the inlet and outlet chilled water piping by the installing contractor. Evaporators shall be designed and constructed according to, and listed by, Underwriters Laboratories (UL).

C. Condenser

1. The condenser coils shall consist of 3/8 inch (10mm) seamless copper tubes mechanically bonded into plate type fins. The fins shall have full drawn collars to completely cover the tubes. A subcooling coil shall be an integral part of the main condenser coil.
 - a. Condenser fans shall be propeller type arranged for vertical air discharge and individually driven by direct drive fan motors. Each fan shall be in its own compartment to eliminate cross flow of condenser air during fan cycling and shall be equipped with a heavy-gauge vinyl coated fan guard.
 - b. Fan motors shall be weather protected, three-phase, direct-drive, 1140 rpm, TEAO type with permanently lubricated ball bearings and inherent overload protection. External coils shall have wire mesh protective guards.
2. Condenser coils shall be rippled aluminum fins.

D. Refrigerant Circuit

1. Each of the two refrigerant circuits shall include a replaceable-core refrigerant filter-drier, sight glass with moisture indicator, liquid line solenoid valve (no exceptions), thermal expansion valve, and insulated suction line.

E. Construction

1. Unit casing and all structural members and rails shall be fabricated of steel and painted to meet ASTM B117, 500-hour salt spray test.
2. Upper condenser coil section of unit shall have protective, 12 GA, PVC-coated, wire grille guards.

F. Control System

1. A centrally located weatherproof control panel shall contain the field power connection points, control interlock terminals, and control system. Power and starting components shall include factory circuit breaker of fan motors and control circuit, individual contactors for each fan motor, solid-state compressor three-phase motor overload protection, inherent fan motor overload protection and two power blocks (one per circuit) for connection to remote, contractor supplied disconnect switches. Hinged access doors shall be lockable. Barrier panels or separate enclosures are required to protect against accidental contact with line voltage when accessing the control system.
2. Shall include optional single-point connection to a non-fused disconnect switch with through-the-door handle and compressor circuit breakers.

G. Unit Controller

1. An advanced DDC microprocessor unit controller with a 4-line by 20-character liquid crystal display provides the operating and protection functions. The controller shall take pre-emptive limiting action in case of high discharge pressure or low evaporator pressure. The controller shall contain the following features as a minimum:
 - a. Equipment Protection
 - (1) The unit shall be protected in two ways: (1) by alarms that shut the unit down and require manual reset to restore unit operation and (2) by limit alarms that reduce unit operation in response to some out-of-limit condition. Shut down alarms shall activate an alarm signal.
 - b. Shutdown Alarms
 - (1) No evaporator water flow (auto-restart)
 - (2) Sensor failures

- (3) Low evaporator pressure
- (4) Evaporator freeze protection
- (5) High condenser pressure
- (6) Outside ambient temperature (auto-restart)
- (7) Motor protection system
- (8) Phase voltage protection (Optional)
- c. Limit Alarms
 - (1) Condenser pressure stage down, unloads unit at high discharge pressures.
 - (2) Low ambient lockout, shuts off unit at low ambient temperatures.
 - (3) Low evaporator pressure hold, holds stage #1 until pressure rises.
 - (4) Low evaporator pressure unload, shuts off one compressor.
- d. Unit Enable Selection
 - (1) Enable unit operation from either local keypad, digital input or BAS
- e. Unit Mode Selection
 - (1) Selects standard cooling, ice, glycol, or test operation mode
- f. Analog Inputs:
 - (1) Reset of leaving water temperature, 4-20 mA
 - (2) Current limit
- g. Digital Inputs
 - (1) Unit off switch
 - (2) Remote start/stop
 - (3) Flow switch
 - (4) Ice mode switch, converts operation and setpoints for ice production
 - (5) Motor protection

- h. Digital Outputs
 - (1) Shutdown alarm; field wired, activates on an alarm condition, off when an alarm is cleared
 - (2) Evaporator [ump field wired, starts pump when unit is set to start
- i. Condenser fan control - The unit controller shall provide control of condenser fans based on compressor discharge pressure
- j. Building Automation System (BAS) Interface
 - (1) Factory mounted DDC controller(s) shall support operation on a BACnet®, Modbus® or LONMARK ® network via one of the data link / physical layers listed below as specified by the successful Building Automation System (BAS) supplier.
 - (2) The information communicated between the BAS and the factory mounted unit controllers shall include the reading and writing of data to allow unit monitoring, control and alarm notification as specified in the unit sequence of operation and the unit points list.
 - (3) All communication from the chiller unit controller as specified in the points list shall be via standard BACnet objects. Proprietary BACnet objects shall not be allowed. BACnet communications shall conform to the BACnet protocol (ANSI/ASHRAE135-2001). A BACnet Protocol Implementation Conformance Statement (PICS) shall be provided along with the unit submittal.

2.06 OPTIONS AND ACCESSORIES

A. The following options are to be included:

- 1. High Ambient Control Panel for operation from 105°F up to 125°F ambient temperatures
- 2. BAS interface module to provide interface with the BACnet Ethernet protocol.
- 3. Unitech Sound Attenuator
- 4. The following accessories, if selected, are to be included:
 - a. Evaporator inlet strainer, 40-mesh with extension pipe and Victaulic couplings

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas to receive chillers for compliance with installation tolerances and other conditions affecting chiller performance. Examine proposed route of moving chillers into place and verify that it is free of interferences. Verify piping rough in locations. Verify branch circuit wiring suitability. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install and anchor chillers plumb and level.
- B. Maintain manufacturer's recommended clearances for service and maintenance.
- C. Install piping connections, maintaining clearances for service and maintenance.
- D. Install flanged or union connections at chillers.
- E. Install shutoff valves at chiller inlet and outlet connections.
- F. Install a field supplied strainer in the chilled water return line at the evaporator inlet; 40-mesh on units with brazed-plate evaporators or 20-mesh on shell-and-tube evaporators.
- G. Install electrical devices furnished loose by manufacturer, including remote flow switches and remote chiller control panel. Furnish copy of manufacturer's wiring diagram submittal to electrical Installer.

3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Services:
 - 1. Supplier's or manufacturer's representative for equipment specified herein shall be present at jobsite or classroom designated by Owner for mandays indicated, travel time excluded, for assistance during plant construction, plant startup, and training of Owner's personnel for plant operation. Include:
 - a. 1 manday for Installation Services.
 - b. 1/2 manday for Instructional Services.
 - 2. Supplier or manufacturer shall direct services to system and equipment operation, maintenance, troubleshooting, and equipment and system related areas. See Section 01 60 00.
 - 3. Provide services of factory authorized service representative to supervise field assembly of components and installation of chillers, including piping and electrical connections, and to report results in writing.

4. Provide factory authorized service representative to start chillers and to demonstrate and train Owner's maintenance personnel as specified below.
 - a. Test and adjust chiller controls and safeties. Lubricate rotating parts. Verify that motor amperage conforms to manufacturer's data.
 - b. Install proper charge of refrigerant and oil.
 - c. Start chiller and verify performance. Demonstrate operation to Owner.
 - d. Train Owner's maintenance personnel on procedures and schedules for startup, shutdown, troubleshooting, servicing, and preventive maintenance.

3.04 CLEANING

- A. Clean units using materials and methods recommended by manufacturer.
- B. Clean finishes to remove dust and dirt.
- C. Touch up scratches on unfinished surfaces to restore corrosion resistance.
- D. Touch up scratches on finished surfaces to restore finish.

END OF SECTION

SECTION 23 73 13

INDOOR, SEMI-CUSTOM AIR-HANDLING UNITS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide insulated, double-wall-casing, indoor, semi-custom air-handling units that are factory assembled using multiple section components, including the following as indicated and in compliance with Contract Documents.
 - 1. Casings
 - 2. Fans, drives, and motors
 - 3. Coils
 - 4. Air filtration
- B. Air-Conditioning, Heating, and Refrigeration Institute (AHRI):
 - 1. 260: Sound Rating of Ducted Air Moving and Conditioning Equipment
 - 2. 410: Forced-Circulation Air-Cooling and Air-Heating Coils
 - 3. 430: Performance Rating of Central Station Air-Handling Units
- C. Air Movement and Control Association Inc. (AMCA):
 - 1. 210: Laboratory Methods of Testing Fans for Rating
 - 2. 300: Reverberant Room Method for Sound Testing of Fans
 - 3. 99-2408: Operating Limits for Centrifugal Fans
- D. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
 - 1. 33: Methods of Testing Forced-Circulation Air-Cooling and Air-Heating Coils
 - 2. 52.2: Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size.
 - 3. 62.1: Ventilation for Acceptable Indoor Air Quality
 - 4. 90.1: Heating, Ventilating, and Air Conditioning
 - 5. 111: Measurement, Testing, Adjusting, and Balancing of Building HVAC Systems

Indoor, Semi-Custom Air-Handling Units

Section No. 23 73 13-1

E. ASTM International (ASTM):

1. A36: Standard Specification for Carbon Structural Steel
2. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
3. A568: Standard Specification for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements
4. A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
5. B88: Standard Specification for Seamless Copper Water Tube
6. B209: Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
7. C1071: Standard Specification for Fibrous Glass Duct Lining Insulation (Thermal and Sound Absorbing Material)
8. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

F. National Electrical Contractors Association (NECA):

1. 1: Standard for Good Workmanship in Electrical Construction

G. National Electrical Manufacturers Association (NEMA):

1. MG 1: Motors and Generators

H. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.
2. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems

I. Sheet Metal and Air Conditioning Contractors National Association (SMANCA):

1. HVAC Duct Construction Standards

J. Underwriters' Laboratories, Inc. (UL):

1. 181: Standard for Safety Factory-Made Air Ducts and Connectors
2. 900: Standard for Safety Air Filter Units
3. 1995: Standard for Safety Heating and Cooling Equipment

1.02 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data: For each air-handling unit.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
 - 2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
 - 3. Include unit dimensions and weight.
 - 4. Include cabinet material, metal thickness, finishes, insulation, and accessories.
 - 5. Fans:
 - a. Include certified fan-performance curves with system operating conditions indicated.
 - b. Include certified fan-sound power ratings.
 - c. Include fan construction and accessories.
 - d. Include motor ratings, electrical characteristics, and motor accessories.
 - 6. Include certified coil-performance ratings with system operating conditions indicated.
 - 7. Include filters with performance characteristics.
 - 8. Include dampers, including housings, linkages, and operators.
- C. Shop Drawings: For each type and configuration of indoor, semi-custom air handling unit.
 - 1. Include plans, elevations, sections, and mounting details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Detail fabrication and assembly of indoor, semi-custom air-handling units, as well as procedures and diagrams.
 - 4. Include diagrams for power, signal, and control wiring.

- D. Delegated-Design Submittal: For vibration isolation and seismic restraints indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - E. Coordination Drawings: Floor plans and other details, or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.
 - F. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.
 - G. Source quality-control reports.
 - H. Startup service reports.
 - I. Field quality-control reports.
 - J. Sample Warranty: For manufacturer's warranty.
 - K. Operation and Maintenance Data: For air-handling units to include in emergency, operation, and maintenance manuals.
 - L. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Filters: One set for each air-handling unit.
 - 2. Fan Belts: One set for each air-handling unit fan.
- 1.03 SUSTAINABLE DESIGN:
- A. Comply with the requirements specified in Section 01 81 13.01.
- 1.04 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
- 1.05 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
- 1.06 DELIVERY STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

1.07 WARRANTY:

- A. Warranty: Manufacturer agrees to repair or replace components of indoor, semi-custom air-handling units that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: 2 years from date of Substantial Completion on internal functional components and 5 years from date of Substantial Completion on the casing.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.
- C. ASHRAE 62.1 Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- D. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- E. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 43 00, to design vibration isolation and seismic restraints, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- F. Structural Performance: Casing panels shall be self-supporting and capable of withstanding positive/negative 4-inch wg of internal static pressure, without exceeding a midpoint deflection of 0.005 inch/inch of panel span.
- G. Casing Leakage Performance: ASHRAE 111, Class 6 leakage or better at +/- 8 inch wg.
- H. Seismic Performance: Air-handling units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Design criteria: Refer to the requirements of Section 01 41 20.

2.02 CAPACITIES AND CHARACTERISTICS:

- A. Refer to equipment schedules on drawings for performance and physical characteristics.

2.03 MANUFACTURERS:

- A. Carrier
- B. Trane
- C. Or equal

2.04 CASINGS:

A. General Fabrication Requirements for Casings;

- 1. Forming: Form walls, roofs, and floors with at least two breaks at each joint.
- 2. Joints: Sheet metal screws or pop rivets.
- 3. Sealing: Seal all joints with water-resistant sealant. Hermetically seal at each corner and around entire perimeter.
- 4. Base Rail:
 - a. Material: Galvanized steel.
 - b. Height: 4 inches.

B. Double-Wall Construction:

- 1. Outside Casing Wall:
 - a. Standard Material, Galvanized Steel: Minimum 18 gauge thick unless noted otherwise on the equipment schedule.
 - b. Alternate Material, Aluminum: Minimum 16 gauge thick when required per equipment schedule.
 - c. Alternate Material, Stainless Steel: Minimum 18 gauge thick when required per equipment schedule.
- 2. Inside Casing Wall and Floor Plate:
 - a. Standard Material, Solid galvanized Steel: Minimum 18 gauge thick unless noted otherwise on the equipment schedule.
 - b. Alternate Material, Solid aluminum: Minimum 16 gauge thick when required per equipment schedule.
 - c. Alternate Material, Solid stainless Steel: Minimum 18 gauge thick when required per equipment schedule.

3. Floor Plate: G90 galvanized steel, minimum 18 gauge thick.
- C. Casing Insulation:
1. Materials: Injected polyurethane foam insulation.
 2. Casing Panel R-Value: Minimum R-13.
 3. Insulation Thickness: 2 inches .
 4. Thermal Break: Provide continuity of insulation with no through-casing metal in casing walls, floors, or roofs of air-handling unit.
- D. Airstream Surfaces: Surfaces in contact with airstream shall comply with requirements in ASHRAE 62.1.
- E. Panels, Doors, and Windows:
1. Panels:
 - a. Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.
 - b. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against airflow
 - c. Gasket: Neoprene, applied around entire perimeters of panel frames.
 - d. Size: Large enough to allow unobstructed access for inspection and maintenance of air-handling unit's internal components.
 2. Doors:
 - a. Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing complete with viewing window.
 - b. Hinges: A minimum of two ball-bearing hinges or stainless-steel piano hinge and two wedge-lever latches, operable from inside and outside. Arrange doors to be opened against airflow. Provide safety latch retainers on doors so that doors do not open uncontrollably.
 - c. Gasket: Neoprene, applied around entire perimeters of panel frames.
 - d. Size: Large enough to allow for unobstructed access for inspection and maintenance of air-handling unit's internal components. At least 18 inches wide by full height of unit casing up to a maximum height of 72 inches.

3. Locations and Applications:
 - a. Fan Section: Doors.
 - b. Coil Section: Panels.
 - c. Access Sections Immediately Upstream and Downstream of Coil Sections: Doors.
 - d. Filter Section: Doors large enough to allow periodic removal and installation of filters.
 - e. Access Sections Immediately Upstream and Downstream of Filter Sections: Doors.

F. Condensate Drain Pans:

1. Construction:
 - a. Single-wall, dual sloped, stainless-steel sheet.
2. Drain Connection:
 - a. Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.
3. Slope: Slope is to comply with ASHRAE 62.1, in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends and to direct water toward drain connection.
4. Length: Extend drain pan downstream from leaving face for distance to comply with ASHRAE 62.1.
5. Width: Entire width of water producing device.
6. Depth: A minimum of 2 inches deep.
7. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

2.05 FANS, DRIVES, AND MOTORS:

- A. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.
- B. Fans: Centrifugal, rated according to AMCA 210; galvanized steel; mounted on solid-steel shaft.
 1. Shafts: With field-adjustable alignment.

- a. Turned, ground, and polished hot-rolled steel with keyway.
- 2. Shaft Bearings:
 - a. Heavy-duty, self-aligning, pillow-block type with an L-50 rated life of minimum 100,000 hours according to ABMA 9.
- 3. Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.
 - a. Bracing: Steel angle or channel supports for mounting and supporting fan scroll, wheel, motor, and accessories.
- 4. Housings, Plenum Fans: Steel frame and panel; fabricated without fan scroll and volute housing. Provide inlet screens for Type SWSI fans.
- 5. Forward-Curved, Centrifugal Fan Wheels: Inlet flange, backplate, and shallow blades with inlet and tip curved forward in direction of airflow and mechanically fastened to flange and backplate; steel hub swaged to backplate and fastened to shaft with setscrews.
- 6. Airfoil, Centrifugal Fan Wheels (Plenum Fan Wheels): Smooth-curved inlet flange, backplate, and hollow die-formed airfoil-shaped blades continuously welded at tip flange and backplate; steel hub riveted to backplate and fastened to shaft with setscrews.
- 7. Mounting: For internal vibration isolation and seismic control. Factory-mount fans with manufacturer's standard vibration isolation mounting devices having a minimum static deflection of 1 inch.
- 8. Flexible Connector: Factory fabricated with a fabric strip minimum 3-1/2 inches wide, attached to two strips of minimum 2-3/4-inch- wide by 0.028-inch-thick, galvanized-steel sheet.
 - a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.

C. Motors:

- 1. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 23 05 13 "Common Motor Requirements for HVAC Equipment."
- 2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
- 3. Enclosure Type: Totally enclosed, fan cooled.

4. Unusual Service Conditions:
 - a. Altitude: 4,500 feet above sea level.
5. Efficiency: Premium Efficient motors as defined in NEMA MG 1.
6. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
7. Provide full voltage non-reversing motor starters.
8. Mount unit-mounted disconnect switches on exterior of unit.

D. Variable-Frequency Motor Controller: Comply with Section 26 29 23.

2.06 COILS:

A. General Requirements for Coil Section:

1. Comply with AHRI 410.
2. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).
3. Coils shall not act as structural component of unit.

B. Heating Coils:

1. Hot-Water Coils: Self-draining.
 - a. Piping Connections: Same end of coil and
 - (1) Threaded if pipe connection is NPS 2" or less.
 - (2) Flanged if pipe connection is NPS 2-1/2" or greater.
 - b. Tube Material: Copper.
 - c. Fin Type: Plate.
 - d. Fin Material: Aluminum.
 - e. Fin Spacing: Maximum 12 fins per inch.
 - f. Fin and Tube Joint: Mechanical bond.
 - g. Headers:
 - (1) Seamless copper tube with brazed joints, prime coated.

- (2) Provide insulated cover to conceal exposed outside casings of headers.
 - h. Frames: Channel frame, 0.052-inch- thick, galvanized steel.
 - i. Coil Working-Pressure Ratings: 200 psig, 325 degrees F.
 - j. Coating: Corrosion-resistant coating. No exposed copper.

C. Cooling Coils:

- 1. Chilled-Water Coil: Self-draining.
 - a. Piping Connections: Same end of coil and
 - (1) Threaded if pipe connection is NPS 2" or less.
 - (2) Flanged if pipe connection is NPS 2-1/2" or greater
 - b. Tube Material: Copper.
 - c. Fin Type: Plate.
 - d. Fin Material: Aluminum.
 - e. Fin Spacing: Maximum 12 fins per inch.
 - f. Fin and Tube Joint: Mechanical bond.
 - g. Headers:
 - (1) Seamless copper tube with brazed joints, prime coated.
 - (2) Provide insulated cover to conceal exposed outside casings of headers.
 - h. Frames: Channel frame, 0.052-inch- thick, galvanized steel.
 - i. Coil Working-Pressure Ratings: 200 psig, 325 degrees F.
 - j. Coating: Corrosion-resistant coating. No exposed copper.

2.07 AIR FILTRATION:

- A. Particulate air filtration is specified in Section 23 41 00.
- B. Panel Filters:
 - 1. Description: Pleated factory-fabricated, self-supported disposable air filters with holding frames.
 - 2. Filter Unit Class: UL 900.

3. Media: Interlaced glass, synthetic, or cotton fibers coated with nonflammable adhesive and antimicrobial coating.
4. Filter-Media Frame: High wet-strength beverage board with perforated metal retainer, or metal grid, on outlet side.

C. Side-Access Filter Mounting Frames:

1. Particulate Air Filter Frames: Match inner casing and outer casing material, and insulation thickness. Galvanized track.
 - a. Sealing: Incorporate positive-sealing device to ensure seal between gasketed material on channels to seal top and bottom of filter cartridge frames to prevent bypass of unfiltered air.

2.08 MATERIALS:

A. Steel:

1. ASTM A36 for carbon structural steel
2. ASTM A568 for steel sheet

B. Stainless Steel:

1. Manufacturer's standard grade for casing.
2. Manufacturer's standard type, ASTM A240 for bare steel exposed to airstream or moisture.

C. Galvanized Steel: ASTM A653

D. Aluminum: ASTM B209

E. Corrosion-Resistant Coating: Coat with a corrosion-resistant coating capable of withstanding a 3000-hour salt-spray test according to ASTM B117.

1. Standards:
 - a. ASTM B117 for salt spray
 - b. ASTM D2794 for minimum impact resistance of 100 in-lb (11.3 N-m)
 - c. ASTM B3359 for cross hatch adhesion of 5B
2. Application: Immersion
3. Thickness: 1 mil

4. Gloss: Minimum gloss of 60 on a 60-degree meter

2.09 SOURCE QUALITY CONTROL:

- A. AHRI 430 Certification: Air-handling units and their components shall be factory tested according to AHRI 430 and shall be listed and labeled by AHRI.
- B. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."
- C. Water Coils: Factory tested to 300 psig according to AHRI 410 and ASHRAE 33.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.
- C. Examine roughing-in for hydronic, and condensate drainage piping systems and electrical services to verify actual locations of connections before installation.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. Equipment Mounting:
 1. Install air-handling units on cast-in-place concrete equipment bases. Coordinate sizes and locations of concrete bases with actual equipment provided. Comply with requirements for equipment bases and foundations specified in Section 03 30 00.
 2. Comply with requirements for vibration isolation and seismic-control devices specified in Section 23 05 48.
 3. The installation is to meet the seismic restraint requirements as stated in Section 01 41 20 and Section 23 05 48.
- B. Arrange installation of units to provide access space around air-handling units for service and maintenance.
- C. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.

- D. Install filter-gauge, static-pressure taps upstream and downstream of filters. Mount filter gauges on outside of filter housing or filter plenum in accessible position. Provide filter gauges on filter banks, installed with separate static-pressure taps upstream and downstream of filters.
- E. Connect duct to air-handling units with flexible connections. Comply with requirements in Section 23 33 00.

3.03 PIPING CONNECTIONS:

- A. Piping installation requirements are specified in other sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Where installing piping adjacent to air-handling unit, allow for service and maintenance.
- C. Connect piping to air-handling units mounted on vibration isolators with flexible connectors.
- D. Connect condensate drain pans using ASTM B88, Type M copper tubing. Extend to nearest equipment or floor drain. Construct deep trap at connection to drain pan and install cleanouts at changes in direction.
- E. Hot- and Chilled-Water Piping: Comply with applicable requirements in Section 23 21 13 and Section 23 21 16. Install shutoff valve and union or flange at each coil supply connection. Install balancing valve and union or flange at each coil return connection.

3.04 ELECTRICAL CONNECTIONS:

- A. Ground equipment according to Section 26 05 26.
- B. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.
- C. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.
 - 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 26 05 53.

3.05 CONTROL CONNECTIONS:

- A. Install control and electrical power wiring to field-mounted control devices.

3.06 STARTUP SERVICE:

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.

2. Verify that shipping, blocking, and bracing are removed.
 3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
 4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
 5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
 6. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
 7. Comb coil fins for parallel orientation.
 8. Install new, clean filters.
 9. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.
- B. Starting procedures for air-handling units include the following:
1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm.
 2. Measure and record motor electrical values for voltage and amperage.
 3. Manually operate dampers from fully closed to fully open position and record fan performance.

3.07 ADJUSTING:

- A. Adjust damper linkages for proper damper operation.
- B. Comply with requirements in Section 23 05 93 for air-handling system testing, adjusting, and balancing.
- C. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project for this purpose.

3.08 CLEANING:

- A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.09 FIELD QUALITY CONTROL:

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Leak Test: After installation, fill water, and test coils and connections for leaks.
 - 2. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.
- E. Prepare test and inspection reports.

3.10 DEMONSTRATION:

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units. Provide up to two full days of training for this purpose.

3.11 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 81 26

SPLIT-SYSTEM HEAT PUMPS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section includes split-system heat pump units consisting of separate evaporator-fan and compressor-condenser components.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Wiring Diagrams: For power, signal, and control wiring.
- C. Samples for Initial Selection: For units with factory-applied color finishes.

1.04 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, sections, and other details, or BIM model, drawn to scale, showing the items described in this Section and coordinated with all building trades.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For split-system air-conditioning units to include in emergency, operation, and maintenance manuals.

1.06 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE Compliance:

1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."
2. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality," Section 5 - "Systems and Equipment," Section 6 - "Procedures," and Section 7 - "Construction and System Start-up."

C. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1.

1.07 COORDINATION

- A. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork are specified in Section 033000 "Cast-in-Place Concrete."

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Store equipment in a clean dry location. Protect from damage and moisture. Follow manufacture requirements for handling and rigging.

1.09 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.

1. Warranty Period:

- a. For Compressor: Five year(s) from date of Substantial Completion.
- b. For Parts: Five year(s) from date of Substantial Completion.
- c. For Labor: Five year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide one of the following:
 1. Mitsubishi Electric & Electronics USA, Inc
 2. Carrier Corporation; a unit of United Technologies Corp
 3. Daikin Air Conditioning

4. Friedrich Air Conditioning Company
5. Mitsubishi Electric & Electronics USA, Inc
6. SANYO North America Corporation
7. LG

2.02 INDOOR UNITS (5 TONS OR LESS, CEILING CASSETTE, HEAT PUMP)

- A. Size and capacity as indicated on the drawings.
- B. Ceiling Cassette, Evaporator-Fan Components:
 1. Cabinet: Enameled steel with a four-way grille fixed to bottom of cabinet allowing two, three or four-way blow. The grille shall allow the unit to be serviceable from the bottom, without the need for an access panel.
 2. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and thermal-expansion valve. Comply with ARI 206/110.
 3. Fan: Direct drive, centrifugal.
 4. Fan Motors:
 - a. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
 - b. Enclosure Type: Totally enclosed, fan cooled.
 - c. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
 - d. Mount unit-mounted disconnect switches on exterior of unit.
 5. Condensate Drain Pans:
 - a. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.
 - b. The unit shall be provided with an integral condensate lift mechanism that will be able to raise drain water 33 inches above the condensate pan. Provide a factory-installed drain pan sensor to provide protection against drain pan overflow by sensing a high condensate level in the drain pan. Should this occur the control shuts down the indoor unit before an overflow can occur.

2.03 OUTDOOR UNITS (5 TONS OR LESS, HEAT PUMP)

- A. Size and capacity as indicated on the drawings.
- B. Air-Cooled, Compressor-Condenser Components:
 - 1. Casing: Steel, finished with baked enamel in color selected by Architect, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.
 - 2. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation device. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
 - a. Compressor Type: Scroll.
 - b. Variable-speed compressor motor with manual-reset high-pressure switch and automatic-reset low-pressure switch.
 - c. Refrigerant: R-410A.
 - d. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and liquid subcooler. Comply with ARI 206/110.
 - 3. Fan: Aluminum-propeller type, directly connected to motor.
 - 4. Motor: Permanently lubricated, with integral thermal-overload protection.
 - 5. Low Ambient Kit: Permits cooling operation down to 0 deg F.
 - 6. The outdoor unit shall be capable of guaranteed operation in heating mode down to -13°F ambient temperatures and cooling mode up to 115°F without additional restrictions on line length & vertical separation beyond those published in respective product catalogs.

2.04 ACCESSORIES

- A. Thermostat: Low voltage with subbase to control compressor and evaporator fan.
- B. Refrigerant Line Kits: Soft-annealed copper suction and liquid lines factory cleaned, dried, pressurized, and sealed; factory-insulated suction line with flared fittings at both ends.
- C. Drain Hose: For condensate.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install units' level and plumb.
- B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.
- C. Equipment Mounting:
 - 1. Install ground-mounted, compressor-condenser components on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
- D. Install and connect precharged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.02 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Tests and Inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Prepare test and inspection reports.

3.03 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.04 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION

SECTION 23 82 19

FAN AND BLOWER COIL UNITS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

- 1. Fan and blower coil units.

1.03 SUBMITTALS

- A. Product Data: For each type of product.

- 1. Include rated capacities, operating characteristics, and furnished specialties and accessories.

- B. Sustainable Design:

- 1. Comply with requirements specified in Section 01 81 13.01.

- C. Shop Drawings:

- 1. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Include diagrams for power, signal, and control wiring.
 - 3. Structural members to which fan coil units will be attached.
 - 4. Method of attaching hangers to building structure.

- D. Seismic Qualification Certificates: For fan coil units, accessories, and components, from manufacturer.

- 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Field quality-control reports.

1.04 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fan Coil Unit Filters: Furnish 2 spare filters for each filter installed.

2. Fan Belts: Furnish 2 spare fan belts for each unit installed.

1.05 QUALITY ASSURANCE

- A. Comply with NFPA 70.

- B. Comply with the requirements specified in Section 01 43 00.

- C. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

- D. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.06 COORDINATION

- A. Coordinate layout and installation of fan coil units and suspension system components with other construction that penetrates or is supported by ceilings, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

- B. Coordinate size and location of wall sleeves for outdoor-air intake.

1.07 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of units that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 2 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

- B. Factory-packaged and -tested units rated according to AHRI 440, ASHRAE 33, and UL 1995.

2.02 FAN AND BLOWER COIL UNITS

A. Manufacturers:

1. Trane
2. Carrier
3. Daikin
4. Or equal.

B. Fabrication:

1. Tubes: 1/2 inch OD seamless copper or brass arranged in parallel or staggered pattern, expanded into fins, brazed joints.
2. Fins: Aluminum or copper continuous plate type with full fin collars or individual helical spiral finned tube type wound under tension.

C. Water Coils:

1. Headers: Cast iron with tubes expanded into header, seamless copper tube with silver brazed joints, or prime coated steel pipe with brazed joints.
2. Leak Testing: Air test under water to 200 psig for working pressure of 200 psig and 200 degrees F.
3. Configuration: Self draining circuitry, with threaded plugs for drain and vent; serpentine type with return bends on smaller sizes and return headers on larger sizes.

D. Casings:

1. Heavy-gauge galvanized steel, insulated with one-inch, 1-1/2 lb density fiberglass fire resistant and odorless glass fiber material to provide thermal and acoustical insulation.
2. Coil access panels are located on the sides and allow easy removal of the internal coils and drain pan.

E. Fans:

1. DWDI (double width double inlet) forward curved centrifugal blower type.
2. Fans are dynamically balanced.

F. Filters:

Two inch pleated.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas, with Installer present, to receive fan coil units for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for piping and electrical connections to verify actual locations before fan coil unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install fan and blower coil units level and plumb.
- B. Install fan coil units to comply with NFPA 90A.
- C. Suspend fan coil units from structure with elastomeric hangers. Vibration isolators are specified in Section 23 05 48 "Vibration and Seismic Controls for HVAC Piping and Equipment."
- D. Verify locations of thermostats, humidistats, and other exposed control sensors with Drawings and room details before installation. Install devices 48 inches above finished floor.
- E. Install new filters in each fan coil unit within two weeks after Substantial Completion.

3.03 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Specific connection requirements are as follows:
 - 1. Install piping adjacent to machine to allow service and maintenance.
 - 2. Connect piping to fan coil unit factory hydronic piping package. Install piping package if shipped loose.
 - 3. Connect condensate drain to indirect waste.
 - a. Install condensate trap of adequate depth to seal against fan pressure. Install cleanouts in piping at changes of direction.

- B. Connect supply-air and return-air ducts to fan coil units with flexible duct connectors specified in Section 23 33 00 "Air Duct Accessories." Comply with safety requirements in UL 1995 for duct connections.
- C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

3.04 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 2. Operate heating and cooling elements through each stage to verify proper operation and electrical connections.
 - 3. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Prepare test and inspection reports.

3.05 ADJUSTING

- A. Adjust initial temperature and humidity set points.
- B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project for this purpose.

3.06 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain fan coil units.

3.07 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 82 39

UNIT HEATERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide unit heaters as indicated and in compliance with Contract Documents.
 - 1. Electric unit heaters.
 - 2. Hot water unit heaters.

1.02 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data:
 - 1. Submit manufacturer's instructions, printed product literature and data sheets for unit heaters and include product characteristics, performance criteria, physical size, finish and limitations.
- C. Manufacturer's Instructions: provide to indicate special handling criteria, installation sequence and cleaning procedures.
- D. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Provo and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.
- E. Closeout Submittals:
 - 1. Submit in accordance with Section 01 77 00.
 - 2. Operation and Maintenance Data: Submit operation and maintenance data for unit heaters for incorporation into manual.

1.03 SUSTAINABLE DESIGN:

- A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Deliver, store and handle materials in accordance with Section 01 61 00 and with manufacturer's written instructions.
- C. Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- D. Storage and Handling Requirements:
 - 1. Store materials off ground indoors in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
 - 2. Store and protect unit heaters from nicks, scratches, and blemishes.
 - 3. Replace defective or damaged materials with new.

PART 2 - PRODUCTS

2.01 ELECTRIC UNIT HEATERS:

- A. Unit heater: UL listed for wall or ceiling mounting. horizontal discharge complete with adjustable louvers finished to match cabinet.
- B. Capacity and power requirements as per Equipment Schedules on Drawings.
- C. Fan type unit heaters with built-in contactors, control circuit transformers, high-heat limit protection, and fan-delay switches.
- D. Fan motor: Totally enclosed, permanently lubricated with resilient mount.
 - 1. Built-in fan motor thermal overload protection.
- E. Hangers: As indicated.

- F. Elements: Nickel-chromium resistance wire surrounded with magnesium oxide and sheathed in steel spiral finned tubes.
- G. Cabinet: 18 gauge steel
 - 1. Epoxy/polyester powder coat finish.
- H. Acceptable manufacturers:
 - 1. Modine
 - 2. Trane
 - 3. Or equal

2.02 HOT WATER UNIT HEATERS:

- A. Unit heater: UL listed for wall or ceiling mounting. horizontal discharge complete with adjustable louvers finished to match cabinet.
- B. Capacity and power requirements as per Equipment Schedules on Drawings.
- C. Propeller fan type unit heaters with built-in contactors, control circuit transformers, high-heat limit protection, fan-delay switches, and aquastat.
- D. Fan motor: Totally enclosed, permanently lubricated with resilient mount.
 - 1. Built-in fan motor thermal overload protection.
- E. Coils: Seamless copper tubing, 0.025 inch minimum wall thickness, silver brazed to steel headers, and with evenly spaced aluminum fins mechanically bonded to tubing.
- F. Cabinet: 18 gauge steel
 - 1. Enamel coat finish.
 - 2. Threaded pipe connections for hanger rods.
 - 3. Fan guard.
- G. Testing: Factory test to 200 psig hydrostatic pressure and to 300 psig with air under water.
- H. Acceptable manufacturers:
 - 1. Modine
 - 2. Trane
 - 3. Or equal

2.03 CONTROLS:

- A. Wall mounted thermostat and support controls.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Suspend unit heaters from ceiling or mount on wall as indicated.
- B. Make power and control connections.
- C. Make piping connections for hot water unit heaters.

3.02 FIELD QUALITY CONTROL:

- A. Test cut-out protection when air movement is obstructed.
- B. Test fan delay switch to assure dissipation of heat after element shut down.
- C. Test unit cut-off when fan motor overload protection has operated.
- D. Ensure heaters and controls operate correctly.

3.03 CLEANING:

- A. Progress Cleaning: clean in accordance with Section 01 74 23.
 - 1. Leave work area clean at end of each day.

3.04 PROTECTION:

- A. Protect installed products and components from damage during construction.
- B. Repair damage to adjacent materials caused by unit heaters installation.

3.05 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 10

ELECTRICAL WORK – GENERAL

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide complete and operational systems for both normal and standby electric power systems, normal and emergency lighting systems, grounding systems and other specified systems, including the installation and wiring of miscellaneous equipment and devices. Perform all work and testing as indicated and in compliance with Contract Documents.
 - 1. Provide conduit, wiring and connections for power, control, lighting, instrumentation and alarms for equipment furnished by others unless otherwise specified and indicated.
 - 2. Provide temporary circuits, overcurrent devices, conduit and wiring, and other equipment required during construction and change-over from existing to proposed electric system. Perform work at the convenience of the Owner.
 - 3. Raceways supports and equipment anchoring shall be provided as specified in the Division 26 sections which form a part of the Contract Documents.
 - 4. The equipment enclosure classification of the plant areas are indicated on the drawings. Provide all equipment, devices and material meeting the requirements for these area classifications unless otherwise noted or specified.
 - 5. Review the electrical underground system and the civil yard piping. Install the electrical underground system in a manner that avoids conflicts with manholes, catch basins, etc. provided under other Divisions of the specifications

1.02 REFERENCES

- A. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).

1.03 SEQUENCING AND SCHEDULING

- A. Coordinate electrical equipment installation with other building components.
- B. Arrange for chases, slots and openings in the building structures during the progress of construction to allow for the electrical installation.
- C. Coordinate installing required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

- D. Sequence, coordinate and integrate the installation of electrical materials and equipment for efficient flow of the work.
- E. Coordinate the installation of large equipment prior to closing in the building.

1.04 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 “Quality Requirements” and as specified.
- B. Install electrical work in conformance with latest rules and requirements of National Fire Protection Association Standard No. 70 (National Electrical Code) and in accordance with requirements of State and Local Codes.

1.05 QUALIFICATIONS OF ELECTRICAL SUBCONTRACTOR

- A. The Electrical Subcontractor shall have been engaged in work of a similar nature to this contract for the past 5 years.
- B. The Electrical Subcontractor shall have a minimum of five projects of equal or greater size with the type of equipment specified under this project.

1.06 SUBMITTALS

- A. Submit the following in accordance with Section 01 33 00 “Submittals”:
 - 1. The following defines a minimum for all Division 26 shop drawing and data submittals:
 - a. Submit shop drawings delineated by specification number with all information for one piece of equipment provided as one package.
 - b. Provide PDF versions with electronic bookmarks.
 - c. Provide with a copy of the specification section with exceptions noted including explanation.
 - d. Partial submittals will be returned without action.
 - e. Submit bills of material: Include a numbered list of all components, with manufacturer's name, catalog number, rating, and other identification. Place item number or similar identification on all other drawings where item appears.
 - f. Submittal shall include:
 - (1) Manufacturer’s drawings
 - (2) Panel layout

- (3) Equipment layout
 - (4) Schematic diagram
 - (5) One line diagram
 - (6) Control sequence diagrams
 - (7) Interconnection diagrams
 - (8) Wiring diagrams
 - (9) Catalog data
- g. Submit only completed drawings showing all local and remote devices associated with each item.
 - h. Mark shop drawings and data submitted showing only items applicable to specific contract.
 - i. Where additions and modifications are made to existing equipment, provide drawings which include both retained existing equipment and new work.
 - j. Submit time-current characteristic curves for all submitted protection devices such as circuit breakers and fuses.
 - k. Submit other documentary or descriptive information as required for each assembly to demonstrate compliance with the applicable contract documents.
2. Shop drawings and data are required for the following list:
- a. Conduit and Fittings
 - b. Wire and Cable
 - c. Wiring Devices
 - d. Transformers
 - e. Low Voltage Switchboards
 - f. Low Voltage Switchgear
 - g. Manholes, Handholes, and Associated Equipment and Devices
 - h. Grounding Equipment and Devices
 - i. Panelboards

- j. Lighting Fixtures and Accessories
 - k. Lighting Control Panels
 - l. Lightning Protection System
 - m. Intrusion Alarm System
 - n. Fire Alarm System
 - o. Card Access System
 - p. Surveillance System
 - q. Control Stations
 - r. Enclosures
 - s. Control Panels
 - t. Safety Switches
 - u. Mats
 - v. 600 Volt Motor Control Centers and Motor Controls
 - w. Switchboards
 - x. Field Acceptance Test Reports
 - y. Record Drawings
3. Submit instruction manuals for installation, operation, and maintenance of equipment, and parts list for equipment listed below. Specifically mark standard publications forming a part of this contract. Cross out, blank out, or otherwise delete non-applicable items. Submittals which do not clearly indicate items and features provided shall be rejected.
- a. Low Voltage Switchgear
 - b. Lightning Protection System
 - c. Intrusion Alarm System
 - d. Fire Alarm System
 - e. Card Access System
 - f. Surveillance System

g. 600 Volt Motor Control Centers

h. Switchboards

1.07 NAMEPLATES AND LABELING

- A. Provide nameplates and labels as specified in Section 26 05 53 “Electrical Identification”.

1.08 INTERFERENCE AND ERRONEOUS LOCATIONS

- A. Locations of electrical equipment, devices, outlets, and similar items, as indicated, are approximate only. Exact locations shall be determined during construction.
- B. Verify in field, all data and final locations of work installed under other sections of specifications, required for placing of electrical work.
- C. In case of interference with other work or erroneous locations with respect to equipment or structures, furnish all labor and materials to complete the work.

1.09 SEISMIC DESIGN REQUIREMENTS

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20 and in Division 26.
- B. All raceways and equipment installed under Division 26 shall use earthquake resistant supporting systems as specifically required in each applicable section.

1.10 APPROVAL AND MARKING EQUIPMENT

- A. Ensure that devices and materials are listed and/or labeled by UL, wherever standards have been established by that organization. Where a UL listing is not available for equipment, submit certified test reports of a Nationally Recognized Testing Laboratory (NRTL), approved by the local inspecting authority, indicating that equipment is in conformance with local code requirements or any other applicable requirements. Tests and inspections for approval of equipment shall be performed at no additional cost to Owner.
- B. Clearly mark equipment, devices and material with name or trademark of manufacturer and rating in volts and amperes and other pertinent information on a nameplate.

1.11 ELECTRIC SERVICE

- A. Electrical power system for the facility operates at 277/480-volt, 3-phase, 4-wire, 60 Hertz.
 - 1. Provide electrical low voltage distribution system that operates on 208/120-volt, 3-phase, 4-wire, 60 Hertz obtained from the power system by dry-type transformer(s).

- B. Earth and rock excavation, backfill, concrete masonry, concrete reinforcement, and construction joints required for electrical work is included under this section and shall conform to requirements specified under applicable sections of Contract for General Construction.

1.12 EQUIPMENT SPECIFIED ELSEWHERE

- A. Certain items of control equipment and other equipment are indicated on electrical drawings for connection, but are specified in other sections pertaining to plumbing, heating, ventilating and air conditioning, mechanical process, instrumentation, etc. Such items are not furnished as part of electrical work.

1.13 INCOMING SERVICE

- A. Contact the following organization for coordinating the incoming power requirements for the project:

Provo Power
Jonathan Saluone
(801) 852-6831

- B. The organization identified above will furnish and install:

1. Pad-mounted transformers and sectionalizer cabinet(s).
2. Primary cable.
3. Connection of all primary cables.
4. Metering equipment.

- C. The contractor shall provide the following in accordance with the contract documents:

1. Concrete pad for transformers and sectionalizer cabinet(s).
2. Primary and secondary ductlines.
3. Secondary cables of sufficient length for termination at the transformer.
4. Connection of all secondary cables.
5. Grounding at transformer pads.
6. Provide cabinets for metering equipment and current transformers.

- D. The final, complete installation shall comply with all state and local statutory requirements having jurisdiction. The Contractor shall arrange for all necessary permits, pay all fees and arrange for all required inspections by local authorities. In general, all work shall comply

with the requirements of the National Electrical Code, all state codes and the codes and ordinances of the city or town in which the work is to be done.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 PROTECTION OF ELECTRICAL EQUIPMENT

- A. Store equipment in compliance with manufacturer's recommendations and as specified herein.
- B. Protect electrical equipment from the weather, especially from water dripping or splashing upon it, at all times during shipment, storage, and construction.
- C. Do not store equipment outdoors.
- D. Where equipment is installed or stored in moist areas, or unheated buildings, provide acceptable means to prevent moisture damage. Provide uniformly distributed source of heat in electrical equipment to prevent condensation and damage to electrical insulation systems.

3.02 DEFECTIVE OR DAMAGED EQUIPMENT

- A. Damaged equipment shall not be used. Equipment damaged in shipment, storage, installation or through other means shall be replaced without additional cost to the Owner.
- B. All equipment showing signs of water damage shall be rejected regardless of dielectric test results.
- C. All electrical equipment is considered "in storage" regardless of location until first energized. Manufacturer's recommendations for storage precautions, conditions and care shall be followed.

3.03 STARTING EQUIPMENT DATA LIST

- A. Obtain data from the equipment supplier shop drawing submittals or equipment nameplates, and prepare a complete tabulation of all motors over 1/3 hp, electric heaters over 3 kW, and starting equipment for both, to be furnished on the project.
 - 1. Include in tabulation firm the following information:
 - a. Name and identification of equipment.
 - b. Manufacturer.

- c. Horsepower or kilowatt rating.
 - d. Voltage.
 - e. Phase.
 - f. Speed.
 - g. Full load current.
 - h. Locked rotor current or code letter.
 - i. Type of enclosure (open drip-proof, totally enclosed, fan cooled, etc.).
 - j. NEMA size of starter or contactor.
 - k. Overload heater size.
 - l. Type of starter (full-voltage, reduced-voltage, autotransformer, etc.).
 - m. Breaker trip setting or fuse size.
 - n. Voltage of starter operating coil.
 - o. If starter is at a motor control center, list motor control center number.
- 2. Final acceptance of the electrical system is contingent upon submittal of the complete motor and electric heater tabulation.
 - 3. Arrange tabulation in groups by MCC or building location.
 - 4. Furnish six copies of the tabulation to the Engineer when a submission is made.

3.04 DRAWINGS AND SPECIFICATIONS

- A. Drawings and specifications are typical of work to be done and of the arrangement desired. Provide accessories and appurtenances which the Engineer deems functionally necessary for a complete installation, whether or not explicitly indicated or described.

3.05 RECORD DRAWINGS

- A. The Contractor shall maintain a master set of record drawings showing the changes and deviations from the contract drawings.
- B. A minimum of 30 days prior to application for Final Payment, submit two sets of drawings for approval that are marked to show the as-installed equipment, devices, raceway locations and wiring. The markings on the drawings are to be neat, clean and legible.

3.06 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 20

ELECTRIC WIRES AND CABLES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide wires and cables for complete electrical systems as indicated and in compliance with Contract Documents.

1.02 REFERENCES

- A. ASTM International (ASTM):
 - 1. B3: Soft or Annealed Copper Wire.
 - 2. B8: Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.
 - 3. B33: Tinned Soft or Annealed Copper Wire for Electrical Purposes.
- B. Insulated Cables Engineers Association, Inc. (ICEA)/National Electrical Manufacturer's Association (NEMA):
 - 1. S-61-4021/WC 5: Thermoplastic Insulated Wire & Cable.
 - 2. S-66-524/NEMA WC 7: Cross-Linked-Thermosetting-Polyethylene Insulated Wire and Cable.
 - 3. S-68-516/WC 8: Ethylene-Propylene-Rubber-Insulated Wire & Cable.
- C. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).
- D. American National Standards Institute (ANSI)/Telecommunications Industry Association (TIA)/Electronic Industries Association (EIA):
 - 1. ANSI/TIA/EIA-568-B; Commercial Building Telecommunications Cabling Standards.
- E. Underwriters Laboratories, Inc. (UL):
 - 1. 44: Thermoset-Insulated Wires and Cables.
 - 2. 83: Thermoplastic-Insulated Wires and Cables.
 - 3. 854: Service Entrance Cables.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Submit shop drawings and manufacturer's product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".

1.04 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.
- B. Deliver wire and cables in full reels protected against injury. Deliver reels with factory attached UL approved tags showing the manufacturers name and the type of insulation, size, and length of wire in each coil or reel.
- C. Accept wire and cable on site in manufacturer's packaging. Inspect for damage.
- D. Store and protect in accordance with manufacturer's instructions.
- E. Protect from weather. Provide adequate ventilation to prevent condensation.

1.05 DESIGN CRITERIA

- A. Wire for lighting, single phase circuits shall be Type XHHW or THWN-THHN.
- B. Wire for three phase circuits shall be Type XHHW.
- C. Service conductors shall be 600V rated type RHW.
- D. Single conductor wire for control, indication and metering shall be Type THWN-THHN No. 12 or 14 AWG, stranded.
- E. Multiconductor control cable shall be used for the underground system and shall be No. 12 or 14 AWG, stranded with overall jacket.
- F. Wire for process instrumentation shall be twisted shielded pairs No. 16 AWG, stranded with overall jacket.
- G. Ground wires shall be Type THW, green. Bare ground wires shall be soft drawn copper, 98 percent conductivity.
- H. Wire for power circuits installed in duct banks shall be type RHW.
- I. Multiconductor cables used in cable tray shall be TC-ER and VW-1 rated.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. 600V Cable:
 - 1. Okonite.
 - 2. Southwire.
 - 3. American Insulated Wire.
- B. Variable Frequency Drive Cables:
 - 1. Belden Wire and Cable.
 - 2. Southwire
 - 3. Okonite
- C. Multiconductor Tray Cables:
 - 1. Belden Wire and Cable.
 - 2. Southwire
 - 3. Okonite
- D. Control and Metering Wire:
 - 1. Belden Wire and Cable.
 - 2. Alpha Wire.
 - 3. Coleman Cable.
- E. Cable Fireproofing Tape:
 - 1. MAC Products, Inc.
 - 2. 3M Electrical Products.

2.02 MATERIALS AND COMPONENTS

- A. Furnish copper conductors. Material and stranding of conductors to conform to ASTM B3, ASTM B33, and to ASTM B8, for the appropriate class.
- B. Uncoated, soft or annealed copper wire conforming to ASTM B3.

- C. Wires and Cables for Maximum 600-Volt Power Circuits: For No. 8 AWG gauge and smaller provide type THWN/THHN or RHW. Where used in lighting or receptacle branch circuits provide No. 12 AWG gauge and No. 10 AWG gauge as solid conductor. Provide other wire with Class C stranding. Provide No. 6 AWG gauge and larger as XHHW-2 with Class B stranding. Provide wires and cable conforming to UL 83.
- D. Variable Frequency Drive (VFD) Cables – for use on load side of AFD units: 100% Ground Flexible VFD, 3 Conductor Tinned Copper XLPE Insulation M4 Color Code + Symmetrical Segmented Ground Bare Copper Stranded, Overall Dual Copper Tapes Helically Applied Shield, Black PVC Outer Jacket, 2000V TC-ER, 90C Dry/Wet, 2000V Flexible Motor Supply Cable, WTTC, 1000V CSA AWM I/II A/B, 2000V RW90 TC, Sunlight Resistant, UL Direct Burial, Oil Resistant. Refer to plans for conductor size.
- E. Multiconductor Tray Cables – Type TC-ER Control Cable 600 Volt Copper Conductors, Ethylene Propylene Rubber (EPR) Insulation XHHW-2 Chlorinated Polyethylene (CPE) Jacket, Control Cable Conductor Identification Method 1 Table 2. VW-1 Rated.
- F. Wires and Cables for Control, Indicating, Metering, or Alarm Circuits: Single and multiconductor control cable, copper conductors, Class B or C stranding. Insulation; 600-volt polyethylene, polyvinylchloride, or EPR. Continuous rating of 90C dry and 75C wet. Color coding conforming to Table K-2, ICEA/NEMA S-61-4021/WC 5.
- G. Shielded Cable for Instrumentation Wiring: 7-strand copper conductors, size No. 16 AWG. Insulate conductors individually with color coded polyethylene or polyvinylchloride. Twist pairs with varying lay (if more than one pair) and cover with cable tape and 100 percent coverage aluminum foil or tape shield and tinned copper drain wire. Jacket: flame-retardant polyvinylchloride. Where multi-conductor TSP cables are called for, each pair shall be individually shielded, continuous number coded, and the cable assembly shall have an overall shield and overall flame retardant PVC jacket. Cables: rated 600 volts, 90 degrees C, suitable for pulling in conduit and laying in cable tray, interlocked aluminum armor and outer PVC jacket.
- H. RTD and Multi Conductor Shielded Cable: Three or more copper conductors, stranded, minimum #18 AWG, PVC insulated for 600V, 100 percent coverage aluminum foil or tape shield, separate bare stranded copper drain wire, interlocked aluminum armor and outer PVC jacket, overall flame-retardant PVC jacket with NEC and UL approval. Suitable for pulling in conduit and laying in cable tray.
- I. Category 6A Cable: Category 6A cable shall consist of 4 twisted pairs, solid stranded, #24 AWG, of different lay and ground wires, enclosed by an overall conductive mylar backed aluminum foil shield. This shall be enclosed by an overall thermoplastic jacket. The cable shall meet the applicable requirements of ANSI/TIA 568 C.2. Provide cable with interlocked aluminum armor, rip cord, PVC inner and outer jackets, UL verified to Category 6A, insulated for 300V, and suitable for pulling in conduit and laying in cable tray.

PART 3 - EXECUTION

3.01 GENERAL

- A. Perform work in accordance with the National Electrical Code.
- B. Provide power cable identification as follows:

System Voltage	Neutral	Phase A	Phase B	Phase C
208/120V	White	Black	Red	Blue
240/120V	White- Gray Stripe	Black- Blue Stripe	Red- Blue Stripe	None
480/277V	Gray	Brown	Orange	Yellow

- C. Use green to identify insulated ground conductors.

NOTE: Colored insulation, tapes or sleeves may be used to provide color coding. Insulated ground conductors must have green covering.

- D. Permanently post means of identification of grounded and ungrounded conductors for each nominal voltage system at each panelboard and motor control center.
- E. In power and multiconductor cables manufactured without a grounding conductor identify one of the multiconductors as the equipment grounding conductor at each cable end and at every point where the conductors are accessible.

3.02 INSTALLATION OF WIRING

- A. Unless otherwise indicated, use no conductor smaller than No. 12 AWG for power, No. 14 AWG for control, and No. 16 AWG for shielded applications.
- B. Install conductors continuous from outlet to outlet and make no splices except within outlet or junction boxes.
- C. Install cable in underground raceway system without splices. There shall be no splices between connection points unless otherwise indicated.
- D. Draw all conductors contained within a single conduit at the same time.
- E. Apply wire pulling compound to conductors being drawn through conduits. Use pulling compound, Minerallac No. 100, Y-er-Eas, Yellow 77, High Performance Polywater Cable Lubricant or acceptable equivalent.
- F. Use no cable bend with radius of less than eight times its diameter.
- G. Wires and cables installed without prior submittal review are subject to removal at no additional expense.

- H. Use TSP cable for all low-level analog signals such as 4-20 mA, pulse type circuits 24 VDC and under, and other signals of a similar nature.
- I. Use RTD cable for connections between RTDs and transmitters or control system RTD inputs.

3.03 CONDUCTOR IDENTIFICATION

- A. Label each wire at both termination points. Carry individual conductor or circuit identification throughout, with circuit numbers or other identification clearly stamped on terminal boards and printed on directory cards in distribution cabinets and panelboards.
- B. Identify each wire in junction boxes, cabinets, and terminal boxes where total number of control, indicating, and metering wires is three or more and no terminal board is provided, including all power wire. Where no termination is made use a plastic-coated, self-adhesive, wire marker and where termination is made use a, plastic, pre-printed sleeve wire marker.
- C. In cases similar to above where terminal boards are provided for the control, indicating, and metering wires, identify all wires including motor leads and other power wires too large for connection to terminal boards, by sleeve wire markers as specified above.
- D. In manholes and handholes, identify each power wire by laminated plastic tag located so it is easily seen. Control wires to be bundled and marked as listed in conduit and wire schedule.

3.04 CONNECTORS, TERMINAL LUGS AND BOARDS

- A. For wiring of circuits consisting of No. 10 or No. 12 AWG solid wires, such as for lighting branch circuits, use self-insulated pressure type connectors for all splices or joints.
- B. Terminate all wires connected to terminal boards, terminal blocks, or to other similar terminals by means of ring and tongue, nylon self-insulated, tin-plated copper pressure terminals.
- C. Terminal boards shall be 600 volts and rated for 125 percent of the ampacity of the connected circuit. They shall have screw terminals, with white marking strips for wire identification, of the 4-, 6-, 8-, or 12-pole type, as necessary.
- D. Wire connections for which terminals are not supplied, for example, at solenoids or motor terminal junction boxes:
 - 1. 10 AWG and smaller: Use self-insulated pressure-type connectors.
 - 2. 8 AWG and larger: Use insulated, mechanical type with set screw or follower bearing directly on the wire. Split bolt connectors are not acceptable.

- E. Clearly and permanently mark terminal strips with ink or indelible pencil. Mark each wire consistently throughout entire system, using notation of wires given on manufacturer's wiring diagrams wherever possible.

3.05 FIELD TESTING

- A. Submit results of all cable tests on forms indicating cable size, voltage, and date with name of tester and witness.
- B. Test all field conductors for instrumentation and controls systems for opens, shorts, and grounds. Resistance values shall not be less than those recommended by the cable manufacturer.
- C. Provide a record of each instrumentation cable continuity verification and resistance value.

3.06 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 05 26

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide a single, complete, integrated grounding system, including conductors, raceways, and connections, as indicated and in compliance with Contract Documents, and in accordance with the National Electrical Code Article 250 and the National Electrical Safety Code, and the applicable Provincial Electrical Safety Codes and Regulations.
- B. Include grounding of switchgear, substations, motor control centers, electric equipment enclosures etc., outdoor substations, transformers, switch structures, etc.; ground grid systems with ground rod and water pipe connections; structural steel, and lightning protection system.
- C. Include grounding conductors completely inter-connecting water supply pipe, ground rods, ground grid, substation, switchgear and motor control center ground buses, other distribution equipment, and other groundable equipment.
- D. The following documents form part of the Specifications to the extent stated. Where differences exist between codes and standards, the one affording the greatest protection shall apply.
- E. Unless otherwise noted, the referenced standard edition is the current one at the time of commencement of the Work.
- F. Refer to Division 01 Section "General Requirements" for the list of applicable regulatory requirements.
- G. Refer to specific Division 26 Sections for additional referenced codes and standards.

1.02 REFERENCES

- A. American National Standards Institute (ANSI)/Institute of Electrical and Electronics Engineers (IEEE):
 - 1. ANSI/IEEE C2: National Electrical Safety Code.
- B. ASTM International (ASTM):
 - 1. B3: Standard Specification for Soft or Annealed Copper Wire.
 - 2. B8: Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

3. B33: Standard Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes.

C. Institute of Electrical and Electronics Engineers (IEEE):

1. Standard 81: Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potential of a Ground System.
2. Standard 142: Recommended Practice for Grounding of Industrial and Commercial Power systems.

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.
2. 780: Lightning Protection Code.

E. Underwriters Laboratories (UL):

1. 467: Standard for Grounding and Bonding Equipment.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00 "Submittals":
- B. Submit shop drawings and manufacturers' product data in accordance with requirements of Section 26 05 10 "Electrical Work – General".
- C. Submit catalog and dimensional data for the following:
 1. Ground rods
 2. Exothermic welding
 3. Connecting hardware
- D. Submit grounding system test results.

PART 2 - PRODUCTS

2.01 MANUFACTURER'S COMPLIANCE

- A. Manufacturer's acceptance contingent upon products' compliance with the specifications.

2.02 MANUFACTURERS

- A. Ground Rods:

1. ERICO Products Inc.
2. Galvan Electrical Products.
3. Nehring Electrical Works.

B. Exothermic Welding:

1. ERICO Products, Inc.
2. American Brass Mfg. Co.
3. Orgo-Thermit, Inc.

C. Connecting Hardware:

1. American Brass Mfg. Co.
2. Thomas and Betts
3. Anderson Electric Corp.

2.03 MATERIALS AND COMPONENTS

A. Conductors:

1. Provide copper grounding conductors bare or insulated, sized as indicated. When not indicated on the drawing provide in accordance with the NEC. Provide protection of conductors in locations where physical damage would result from direct exposure.
2. Ground and bond wires for substations, main panels and distribution points, and ground rod connections shall be annealed bare copper conforming to ASTM B3, stranded, with 98 percent conductivity.
3. Equipment ground conductors run with circuit conductors and grounding electrode conductor shall be 600-volt with green insulation, unless noted otherwise on the Contract documents.
4. Unless noted otherwise, all conductors No. 8 AWG and larger shall be stranded, Class B in accordance with ASTM B8.
 - a. Uninsulated conductors shall be bare copper in accordance with ASTM B3, tinned in accordance with ASTM B33.
 - b. Use tinned-coated in corrosive environments including when buried in earth or embedded in concrete.

B. Ground Bus:

1. Provide a 4 by 1/4 inch (100 by 6 mm) copper bar complete with bolted type connectors as indicated.
2. Bus bar shall have 18 pre-drilled holes, two standoff insulators, two stainless steel mounting brackets and four stainless steel assembly bolts and lock washer.

C. Connectors and Fasteners:

1. Provide ground clamps which are UL listed for use on copper or brass pipes.
2. Provide ground clamps, for use on iron pipes, of galvanized or malleable iron, or of standard noncorrosive material for use on iron pipes.
3. Provide ground clamps, for use on pipes, with rigid metal base providing good contact by proper seating on the pipe. Do not use strap type clamps.

D. Ground Rods:

1. Ground rods shall conform to the requirements of NFPA 70 and UL Standard 467.
2. Ground rods shall be copper-clad steel rods not less than 3/4 inch (19 mm) in diameter and not less than 10 feet (3 m) long per section.
3. Ground rods shall be clean and smooth with the following characteristics:
 - a. Cone-shaped point on the first section.
 - b. Die-stamped near the top with the name or trademark of the manufacturer and the length of the rod in millimeters or feet.

PART 3 - EXECUTION

3.01 EXOTHERMIC WELDING

- A. Welding shall be by the exothermic process.
- B. Within the welding procedure, include the proper mold and powder charge and conform to the manufacturer's recommendations.
- C. Welding processes shall be the exothermic fusion type that will make a connection without corroding or loosening.
- D. The welding process shall join all strands and not cause the parts to be damaged or weakened.

- E. Completed connection or joint shall be equal or larger in size than the conductors joined and have the same current-carrying capacity as the largest conductor.
- F. Paint buried ground connection with a bitumastic paint.

3.02 INSTALLATION OF GROUNDING AND BONDING CONDUCTORS

- A. Install grounding conductors so that they will not be exposed to physical damage. Install connections firm and tight. Arrange conductors and connectors so no strain on connections.
- B. Run grounding conductors associated with direct burial cables in common trenches above cables except as indicated otherwise.
- C. Bury equipment grounding conductors 30 inches deep. Bring loops or taps up for connection to equipment or other items to be grounded.
- D. Where raceways are used to contain and protect grounding conductors, install in accordance with Section 26 05 33 "Raceway and Boxes for Electrical Systems" and Section 26 05 43 "Underground Ducts and Raceways for Electrical Systems".
- E. Where bare grounding conductors are contained within metallic raceways, bond ends of raceways to conductors.
- F. Install loop type, low impedance, grounding system interconnecting all components so at least two grounding connections are provided for each major item of electrical equipment. Ensure that severing of any single grounding conductor in this system does not remove grounding protection on any major item.
- G. Connect structural steel to the external perimeter loop of grounding conductors installed around all sides of building foundation, buried at least 30 inches below grade. Connect to each vertical column by loop or tap. Connect two opposite points on external loop to two different points on grounding system.
- H. Buried and concealed ground connections shall use exothermic welding.
- I. Make accessible connections to structural members by exothermic welding process or by bolted connector. Connections to equipment or ground bus by bolted connectors.
- J. All metallic conduits, terminating at manholes and handholes, shall be grounded using UL approved grounding type bushings.

3.03 INSTALLATION OF GROUND RODS

- A. Install ground rods in manholes in accordance with requirements specified under the section Underground Distribution Systems. Connect each grounding conductor entering a manhole to ground rod by exothermic weld.

- B. Install ground rods where indicated. Install the top of the rod 12 inch (300 mm) below the ground surface.
- C. Make connection to overall grounding system as indicated. All connections to below grade grounding components shall be made using exothermic welds.
- D. Ensure that final resistance of interconnected ground system is 5 ohms, or less. Measure ground resistance in normally dry conditions, and not less than 48 hours after rainfall.

3.04 EQUIPMENT GROUNDING

- A. Ground each piece of electrical equipment by means of a grounding conductor installed in raceway feeding that piece of equipment. Grounding conductors installed in conduit with insulated conductors to be furnished with green, 600-volt insulation. Ground conductors are in addition to and not to be considered as the neutral wire of the system.
- B. Connect power transformer cases and neutrals to grounding system. Connect neutral ground connection at transformer terminal. Provide two separate, independent, diagonally opposite, connections for power transformers so removal of one connection will not impair continuity of other.
- C. Connect two separate ground connections from ground grid to ground bus of switchgear assemblies, motor control centers, switchboards and all outdoor substation and transformer equipment. Ensure that each connection for item of equipment is from different section of ground grid.
- D. Connect a grounding conductor between panelboard and grounding system. Where a grounding bar is furnished with panelboard, connect grounding conductor to bar.
- E. Conduits entering metal enclosures shall utilize bonding type locknuts and grounding bushings. Locknuts that gouge into the metal enclosures are not acceptable.
- F. Where conduits are not effectively grounded by firm contact with a grounded enclosure, apply grounding bushings on at least one end of conduit run. Conduit connections shall be wrench tight.
- G. Install a separate grounding conductor from ground system to motors of 100 horsepower and larger, in addition to raceway system. Ground motor ground connection to motor frame, independent of mounting bolts or sliding base. Ground motor to nearest point on grounding system, unless otherwise indicated.
- H. Connect grounding conductors from equipment in area where ground bus is required to ground bus. Connect ground bus to grounding system. Mount ground bus on 600 volt pedestal insulators.
- I. Connect lightning arresters to ground system by suitable conductors. Where lightning arresters are furnished with electrical equipment and grounding connections are not

inherently provided, ensure that suitable separate grounding conductor connects lightning arresters with system ground.

- J. Connect generator neutral to grounding system by a grounding conductor. Connect grounding conductor to generator disconnect enclosure and generator neutral on generator side of disconnect. Ground generator frame to ground grid.
- K. Ground each area lighting pole by ground rod driven near base of standard, in accordance with requirements of National Electric Safety Code. Connect ground rods to grounding conductor brought with street lighting feeder cable.
- L. Connect individual ground rods to the grounding loop using the direct burial grounding cable by exothermic weld. All connections to below grade grounding components shall be made using exothermic welds, unless the connections are made in hazardous areas which prohibit the use of exothermic weld connections.
- M. Bond individual cable tray sections with bonding jumpers.

3.05 SIGNAL GROUNDING

- A. Ground signal surge protection and shields of twisted, shielded cable using a signal bonding conductor. The signal bonding conductor shall be a continuous path from the instrument surge protection or shield to the grounding electrode conductor. The signal bonding conductor shall be isolated from the equipment grounding conductor for its entire path.
- B. Where convenient several signal bonding conductors may be combined, providing that all the following conditions are met:
 - 1. The combined signal bonding conductor shall have the equivalent cross section of the conductors that it was combined from or three times the cross section of the largest conductor that it was combined from, whichever is less.
 - 2. The combined signal bonding conductor shall be isolated from the equipment grounding conductor.
 - 3. Where two signal bonding conductors are combined use a three-port insulated splice.
 - 4. Where three or more signal bonding conductors are combined, use a copper bus mounted on 600-volt insulators. Attach each conductor to the bus using an insulated ring tongue lug and screw terminal.

3.06 FIELD TESTING

- A. Test grounding systems for ground resistance. Total resistance from any point on the ground network to the building counterpoise must not exceed 5 ohms.

- B. Ground resistance and counterpoise tests must be made during dry weather and no sooner than 48 hours after rainfall. Conditions of soil and weather shall be documented on test forms.
- C. Conduct tests using the ratio method that measures the ratio of the resistance to earth of an auxiliary test electrode to the series resistance of the electrode under test and a second auxiliary electrode. Perform measurements in accordance with IEEE Standard 81.
- D. Indicating instrument must be self-contained and include a direct-current generator, synchronized current and potential reversers, crossed-current and potential coils, direct-reading ohmmeter, series resistors, and range-selector switch. Calibrate direct-reading ohmmeter for ranges of 0 to 20 ohms and 0 to 200 ohms.
- E. Place auxiliary grounding electrodes in accordance with instrument manufacturer's recommendations but not less than 50 feet (15 m) apart, in accordance with IEEE Standard 81.
- F. Perform continuity test on all power receptacles to ensure that the ground terminals are properly grounded to the facility ground system.
- G. Submit copies of test reports on ground system to the Owner.

3.07 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 05 29

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide supports from building structure for electrical items by means of hangers, supports, anchors, sleeves, inserts, seals, and associated fastenings as indicated and in compliance with Contract Documents.

1.02 REFERENCES

- A. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00 "Submittals".
- B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Stainless steel.

2.02 MANUFACTURED SUPPORTING DEVICES

- A. Raceway Supports: Clevis hangers, riser clamps, conduit straps, threaded C-clamps with retainers, ceiling trapeze hangers, wall brackets, and spring steel clamps.
- B. Fasteners: Types, materials, and construction features as follows:
 - 1. Expansion Anchors: Stainless steel wedge or sleeve type.
 - 2. Toggle Bolts: All stainless-steel springhead type.
 - 3. Powder-Driven Threaded Studs: Stainless steel, designed specifically for intended service.
 - 4. Nuts, Washers, and Bolts: Stainless steel.

- C. Conduit Sealing Bushings: Factory fabricated watertight conduit sealing bushing assemblies suitable for sealing around conduit passing through concrete floors and walls. Construct seals with stainless steel sleeve, stainless steel body, neoprene sealing grommets or rings, metal pressure rings, pressure clamps, and cap screws.
- D. U Channel Systems: Stainless steel channels, with 9/16-inch (14 mm) diameter holes, at minimum of 8 inch (200 mm) on center, in top surface. Provide fittings and accessories that mate and match with U channel and are of same manufacture.

2.03 U CHANNEL SYSTEMS

- A. Manufacturers, Stainless Steel Channel.
 - 1. Unistrut Corp.
 - 2. Power-Strut.
 - 3. B-Line Systems, Inc.
- B. Provide Type 316 stainless-steel channel with corresponding accessories.
- C. Channels, with 9/16-inch (14 mm) diameter holes, at minimum of 8 inch (200 mm) on center, in top surface.
- D. Provide fittings and accessories that mate and match with U channel and are of same manufacture.
- E. Provide channel of the proper material to match equipment classifications.

2.04 FABRICATED SUPPORTING DEVICES

- A. Shop or field fabricate supports or manufacture supports assembled from U-channel components.
- B. Brackets: Fabricated of angles, channels, and other standard structural shapes. Connect with welds and machine bolts to form rigid supports.

2.05 FIRE RESISTANT JOINT SEALERS:

- A. Manufacturers:
 - 1. "Dow Corning Fire Stop Foam," Dow Corning Corp.
 - 2. "Pensil 851," General Electric Co.
- B. Two part, foamed-in-place, silicone sealant formulated for use in through penetration fire stopping around cables, conduit, pipes, and duct penetrations through fire-rated walls and floors.

- C. Sealants and accessories shall have fire-resistance ratings indicated, as established by testing identical assemblies in accordance with ASTM E814, by Underwriters' Laboratories, Inc., or other testing and inspection agency acceptable to authorities having jurisdiction.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install supporting devices to fasten electrical components securely and permanently in accordance with NEC requirements.
- B. Coordinate with structural system and with other electrical installation.
- C. Raceway Supports: Comply with NEC and following requirements:
 - 1. Conform to manufacturer's recommendations for selection and installation of supports.
 - 2. Strength of each support shall be adequate to carry present and future load multiplied by safety factor of at least 4. Where this determination results in safety allowance of less than 200 lbs (890 N), provide additional strength until there is minimum of 200 lbs (890 N) safety allowance in strength of each support.
 - 3. Install individual and multiple (trapeze) raceway hangers and riser clamps as necessary to support raceways. Provide U-bolts, clamps, attachments, and other hardware necessary for hanger assembly and for securing hanger rods and conduits.
 - 4. Support parallel runs of horizontal raceways together on trapeze-type hangers.
 - 5. Support individual horizontal raceways by separate pipe hangers. Spring steel fasteners may be used in lieu of hangers only for 1 inch (25 mm) and smaller raceways serving lighting and receptacle branch circuits above suspended ceilings only. For hanger rods with spring steel fasteners, use 1/4 inch (6 mm) diameter or larger threaded steel. Use spring steel fasteners that are specifically designed for supporting single conduits or tubing.
 - 6. In vertical runs, arrange support so load produced by weight of raceway and enclosed conductors is carried entirely by conduit supports with no weight load on raceway terminals.
- D. Sleeves: Install in concrete slabs and walls and other fire-rated floors and walls for raceways and cable installations. For sleeves through fire rated wall or floor construction, apply UL listed firestopping sealant in gaps between sleeves and enclosed conduits and cables.

- E. Conduit Seals: Install seals for conduit penetrations of slabs below grade and exterior walls below grade and where indicated. Tighten sleeve seal screws until sealing grommets have expanded to form watertight seal.
- F. Conduit extending through roof shall pass through ceiling box at roof line.
 - 1. Provide 14 gage (1.9 mm) minimum copper box complete with watertight soldered seams and flanged to serve as pitch pocket for each conduit.
 - 2. Install conduit and pitch pocket in advance of roofing work.
- G. Fastening: Unless otherwise indicated, fasten electrical items and their supporting hardware securely to building structure, including but not limited to conduits, raceways, cables, cable trays, busways, cabinets, panelboards, transformers, boxes, disconnect switches, and control components in accordance with following:
 - 1. Fasten by means of wood screws or screw type nails on wood, toggle bolts on hollow masonry units, concrete inserts or expansion bolts on concrete or solid masonry, and machine screws, welded threaded studs, or spring tension clamps on steel. Threaded studs driven by powder charge and provided with lock washers and nuts may be used instead of expansion bolts and machine or wood screws. Do not weld conduit, pipe straps, or items other than threaded studs to steel structures. In partitions of light steel construction, use sheet metal screws.
 - 2. Holes cut in concrete shall not cut main reinforcing bars. Fill holes that are not used.
 - 3. Load applied to any fastener shall not exceed 25 percent of proof test load. Use vibration and shock resistant fasteners for attachments to concrete slabs.

3.02 CHANNELS

- A. Support electrical components as required to produce same structural safety factors as specified for raceway supports.
- B. Install metal U channel racks for mounting cabinets, panelboards, disconnects, control enclosures, pull boxes, junction boxes, transformers, and other devices.
- C. Equipment mounted on U-channel support stands shall use single or double channel with enough supports to withstand winds up to 90 mph. The use of angle supports extending from the front or rear of the support structure is a tripping hazard and is strictly prohibited.
- D. Install Type 316 stainless steel for mounting of electrical equipment in outdoor areas and on below grade, outside building and structure walls.
- E. Install stainless steel channels for interior building mounting of electrical equipment except for those locations listed above and unless otherwise indicated.

3.03 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 05 33

RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide complete raceway systems, with matching accessories, fittings, boxes, and other hardware as indicated and in compliance with Contract Documents. When non-metallic raceway systems are specified, provide green insulated grounding conductor sized per National Electrical Code (NEC) requirements.
- B. All raceway runs are indicated diagrammatically to outline general routing of raceway. Unless specifically identified for installation in concrete walls or slabs, raceways shall be run exposed with raceway supporting systems. Avoid interfering with pipes, ducts, structural members, or other equipment. Any installation deviations from the contract requirements shall be corrected at no cost to Owner.
- C. Provide raceway systems in accordance with the following:
 - 1. Within finished walls or ceilings, use EMT raceway systems.
 - 2. In NEMA 12 or NEMA 1 areas, use galvanized rigid steel raceway systems.
 - 3. In NEMA 4 areas, and where subject to wetting or wash down, use PVC coated rigid steel raceway systems.
 - 4. In exterior building applications, use PVC coated rigid steel raceway systems.
 - 5. In chemical areas and those areas designated NEMA 4X, use PVC coated rigid steel raceway systems.
 - 6. Inside concrete slabs or walls, use PVC Schedule 40 raceway systems. Use PVC-coated rigid steel for all bends and where the conduit exits the concrete.
- D. All raceway systems shall be installed in accordance with the criteria described in this section. Any proposed deviations from these requirements shall be submitted to the Engineer in writing for review and disposition.
 - 1. Use Type 316 stainless steel support systems for exterior application and in NEMA 4 and NEMA 4X areas.
 - 2. All NEMA 1 and NEMA 12 areas shall use stainless steel support systems.
- E. Aluminum conduit and boxes are not acceptable products.

- F. All raceways shall be supported to NEC requirements. Raceways 2 inch (50 mm) outside diameter or greater shall be independently supported in a manner to meet the criteria.

- 5. 651: Schedule 40 and 80 PVC Conduit
- 6. 1684: UL Standard for Safety Reinforced Thermosetting Resin Conduit (RTRC) and Fittings

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00 "Submittals".
- B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".

1.04 1.04 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.

- B. Items provided under this section shall be listed and labeled by UL or other Nationally Recognized Testing laboratory (NRTL).
 - 1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.
 - 2. Terms “listed” and “labeled” shall be as defined in NFPA 70, National Electrical Code, Article 100.
- C. Regulatory requirements:
 - 1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

1.05 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.
- C. Install supports for raceway systems greater than 2 inches (50 mm) in diameter to meet the seismic requirements indicated and specified.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Rigid Metal Conduit, intermediate metal conduit and polyvinylchloride-coated rigid steel conduit.
 - 1. Triangle/PWC, Inc.
 - 2. Perma-Cote Industries.
 - 3. Republic Steel Corporation.
 - 4. Robroy Industries.
 - 5. Allied Tube and Conduit.
- B. Polyvinylchloride (PVC) Conduit:
 - 1. Triangle/PWC, Inc.
 - 2. Robroy Industries.

3. Carlon Electrical Sciences, Inc.

C. Flexible Conduit:

1. American Flexible Conduit Company.
2. Anamet, Inc.
3. Electri-Flex Company.
4. International Metal Hose Company.

D. Boxes and Fittings:

1. O.Z./Gedney Company.
2. Crouse-Hinds Electrical Construction Materials.
3. Appleton Electric Company.

E. Support Systems:

1. Michigan Hanger Co., (O-Strut).
2. Thomas & Betts (Superstrut).
3. Unistrut Corp.

2.02 MATERIALS AND COMPONENTS

A. Rigid Metal Conduit:

1. Provide galvanized rigid metal conduit, each with a coupling on one end and thread protector on other end.
2. Hot-dip galvanize rigid steel conduit over entire length, along interior and exterior surfaces, including threads. Conduit shall conform to UL 6.

B. Flexible-Metal Conduit:

1. Provide flexible-metal conduit for use in dry areas and match fittings, size, and material to rigid conduit to which it is connected. Flexible-metal conduit shall conform to UL 1.
2. Provide liquid-tight flexible-metal conduit for use in damp areas consisting of flexible-metal conduit, with liquid-tight, sunlight-resistant jacket extruded over the conduit. Provide stainless steel, braided flexible conduit in NEMA 4X, corrosive areas. On larger than 1-1/4 inch (30 mm), furnish separate external ground wire. Liquid-Tight flexible-metal conduit shall conform to UL 360.

C. Polyvinylchloride (PVC) Conduit:

1. Provide PVC conduit, Schedule 40 and Schedule 80 conforming to NEMA Standard TC-2 and UL-651.
2. Fittings and Conduit Bodies: NEMA TC 3 as recommended by the conduit manufacturer.

D. Polyvinylchloride-Coated Rigid Steel Conduit:

1. Provide polyvinylchloride-coated (PVC-Coated), rigid steel conduit conforming to NEMA Standard RN 1 consisting of hot-dipped galvanized rigid steel conduit, as specified hereinbefore, with a polyvinylchloride jacket bonded to the outside of all conduit surfaces with a nominal thickness of 40 mils meeting the requirements of NEMA RN 1, 3.1. The adhesive strength of the bonding to equal or exceed tensile strength of the coating. Provide couplings and fittings for this conduit conforming to the requirements of NEMA RN 1, 3.5.
2. A two-part urethane coating shall be applied to the interior of all conduit and fittings at a two-mil thickness. The interior coating shall be flexible to allow field bending without cracking or flaking.

E. Boxes:

1. In NEMA 1 and NEMA 12 areas, provide standard, sheet-metal, outlet and junction boxes constructed of code-gauge, galvanized sheet steel. Size each box as required by the NEC.
2. In NEMA 4X areas, exterior and process areas, provide 316 stainless steel junction boxes with stainless steel screw clamp or 3-point latches, stainless steel hinges and welded mounting feet. Bolted on mounting feet are unacceptable. Device boxes shall have integral mounting feet.
3. Provide boxes containing fixture studs for hanging fixtures. Use concrete-tight boxes for installation in concrete. Do not use shallow boxes unless building construction is such that it is impossible to use standard-depth boxes.
4. Provide boxes and covers for polyvinylchloride-coated steel conduit made of galvanized cast iron, with a polyvinylchloride factory-applied coating over the galvanizing. Provide coating thickness of 40 mil (1.0 mm) minimum. Boxes shall have hubs with extruded sleeves extending beyond the hub in the same manner as specified for conduit couplings. Provide cover screws of stainless steel.
5. Provide cast boxes with covers or device plates suitable for the area classification. Use cover screws of stainless steel or high brass for iron boxes.

F. Fittings:

1. Provide cast-iron fittings of malleable iron or a mixture of gray iron and cast steel.
2. Provide suitable expansion fittings where conduits cross expansion joints. Equip these fittings with grounding straps, clamps, and copper bonding jumpers.
3. LB, LR, LL, and Tee conduit fittings shall be Form 4 with clamp covers secured with stainless clamps and screws. Covers secured with screws tapped into the fitting are not acceptable.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Perform all work in accordance with the NEC.
- B. Use no conduit less than 3/4-inch (20 mm) in diameter, unless otherwise indicated.
- C. Install raceways, boxes, enclosures, and cabinets as indicated, according to manufacturer's printed instructions.

3.02 SEISMIC RESTRAINTS

- A. For conduits and other raceways installed in open areas, not adjacent to and secured to structural elements, and 2 inch (50 mm) outside diameter or greater, support such raceways using seismic restraints rated for the applicable project earthquake criteria.
- B. Methods of Restraining Raceways:
 1. Utilize stainless steel threaded rod with rod stiffeners and transverse channel braces at approximately 45 degrees angle, at 15 feet (4.5 m) on center, maximum, and on one side of rod support.
 2. Utilize longitudinal bracing with channel braces at 30 feet (9.1 m) on center, maximum.
 3. Strap raceways directly to transverse channel braces, using pipe strap with both ends of strap bolted into the channel brace.
 4. Do not rigidly brace raceways to different parts of a building that may respond differently during an earthquake. Seismic restraints shall not limit expansion and contraction of the raceway support system.
 5. Provide flexible connections for conduits 2 inch (50 mm) outside diameter or greater than when terminating to fixed equipment to prevent loss of raceway integrity in the event of an earthquake.

3.03 INSTALLATION OF FITTINGS

- A. Install expansion fittings wherever conduits cross structural expansion joints. Keep the fittings in line with conduit, and install with regard to temperature so that full working range of expansion is available.
- B. Do not install fittings to replace elbows and pull boxes, unless space or other problems make use of fittings necessary. Use oversize fittings whenever large cable is installed, in order to maintain proper bending radius.
- C. Terminate ends of all floor conduits installed for future use with couplings and readily removable plugs set flush with finished floor surface. Cap spare wall conduits at wall where they enter building.
- D. Equip ends of all conduits with conduit fittings. Fit conduits terminating at motor control center or power distribution equipment, or in box above or below, with grounding type bushings, or solidly ground by locknuts or other acceptable fittings. Connect each grounding bushing to ground bus by a bare or green-covered copper wire. Do not use ground wire smaller than 12 AWG. Install ground wire larger than 12 AWG when required by NEC. Where conduits terminate in unprotected areas or where bonding is required over expansion joint, flexible conduit or equivalent; use ground wires 6 AWG. copper or larger.
- E. Terminate conduits entering gasketed sheet-metal boxes or gasketed sheet-metal equipment enclosures with gasketed hubs.
- F. Terminate conduits entering nongasketed sheet-metal boxes or enclosures with double locknuts and insulated bushings, or with acceptable equivalent.
- G. Join raceways with fittings listed for the purpose. Make joints tight. Use raceway fittings compatible with raceway and suitable for use and location.
 - 1. Make raceway terminations tight. Use bonding bushings or wedges at connections subject to vibration. Use bonding jumpers where joints cannot be made tight.
 - 2. Use insulating bushings to protect conductors.
 - 3. Tighten set screws of threadless fittings with suitable tool.

3.04 INSTALLATION OF RACEWAYS

- A. Install exposed raceways parallel or at right angles to walls and ceiling beams. Make all changes in directions with listed bends, elbows, and pull boxes. Space parallel runs uniformly throughout. Secure in place by hangers and fasteners. Ground raceways by connection to properly grounded enclosures, bonding, or other means, to obtain permanent low resistance path to ground throughout installation. Ensure that raceway sections in single run and in parallel runs are of same type and finish.
 - 1. Run parallel or banked raceways together, on common supports where practical.

2. Install raceways level and square and at proper elevations. Provide minimum 7 feet (2 m) headroom.
- B. Support raceways concealed above suspended ceilings from slab above ceiling in same manner as exposed raceways. Do not support raceways from ceiling supports.
 - C. Provide cast-in-place inserts in concrete to support all runs, unless otherwise permitted. Use stainless steel sleeve type concrete anchors for installing boxes, and conduit supports. Provide Type 316 stainless steel nut, bolts, and washers, for use with concrete anchors.
 - D. Support conduits by hangers or pipe straps spaced according to NEC, but in no case more than 10 feet (3 m) on centers.
 - E. When specified on the Contract Drawings, install conduits in slabs as close to middle of concrete slabs as practicable without disturbing reinforcement. Do not use conduit with outside diameter exceeding one-third of slab thickness. Do not place conduits closer than three diameters on centers, except at cabinet locations where slab thickness is increased as permitted by Engineer.
 - F. Where conduits are concealed in bottom floor slab, place in concrete slab and not in fill below slab. Install in middle third of the slab thickness where practical, and leave at least 4 inches (100 mm) of concrete cover.
 1. Secure raceways to reinforcing rods and to prevent sagging or shifting during concrete placement.
 2. Space raceways laterally to prevent voids in the concrete.
 3. Run conduit larger than 1-inch (25 mm) trade size parallel to or at right angles to main reinforcement. When at right angles to reinforcement, place conduit close to slab support.
 - G. Stub-Up Connections: Extend conduits through concrete floor for connection to freestanding equipment with an adjustable top or coupling threaded inside for plugs, and set flush with the finished floor. Flexible metal conduit may be used 6 inches (150 mm) above the floor. Where equipment connections are not made under this Contract, terminate ends of floor conduits installed for future use with couplings and readily removable plugs 8 inch (250 mm) above finished floor surface. Cap spare wall conduits at wall entrance to building.
 - H. Provide sleeves passing through exterior walls and slabs which are wall entrance seals of watertight construction. For new construction, furnish watertight seal between slab and sleeve, and between sleeve and conduit or cable similar to O.Z./Gedney Type "FSK". For existing construction, furnish watertight seal for use in core bit drilled holes that provides seal between concrete and conduit or cable similar to O.Z./Gedney Type "CSM1". Use wall-entrance seals of malleable iron with watertight sealing gland which may be tightened any time after installation.

- I. Do not use dissimilar metals in conjunction with each other. Use an insulation between adjoining surfaces so as to eliminate direct contact and any resultant electrolysis. Maintain electrical continuity of system. Use bituminous impregnated felt, heavy bituminous coatings, nonmetallic separators or washers, or other acceptable materials as insulation.
- J. Install fittings to match raceway being used.
- K. Install expansion fittings wherever conduits cross structural expansion joints at connections between buildings. Keep fittings in line with conduit, and install with regard to temperature so that full working range of expansion is available.
- L. Where conduits pass through firewalls, grout hole around the conduit to the full depth of the material penetrated.
- M. Provide separate raceways, junction boxes, and wireways for all low voltage instrumentation raceways (50 volts and below) from control and power raceways.
- N. Terminations: Where raceways are terminated with locknuts and bushings, align the raceway to enter squarely, and install the locknuts with dished part against the box; use two locknuts, one inside and one outside the box. Locknut/busing terminations are only acceptable in NEMA 1 enclosures.
- O. Threaded hubs shall be used to terminate conduits in all NEMA 12, NEMA 4X and enclosures used in hazardous areas. When terminating in threaded hubs, screw the raceway or fitting tight into the hub so the end bears against the wire protection shoulder. Where chase nipples are used, align the raceway so the coupling is square to the box, and tighten the chase nipple so no threads are exposed.
- P. Install pull lines in all empty raceways. Use monofilament plastic line having not less than 200 lb (890 N) tensile strength. Leave not less than 12 inches (300 mm) of slack at each end of the pull wire.
- Q. Keep raceways at least 6 inches (150 mm) away from parallel runs of flues and steam or hot water pipes. Install horizontal raceway runs above water and steam piping.
- R. Complete raceway installation before beginning conductor installation.
- S. Use temporary closures to prevent foreign matter from entering raceway.
- T. Protect stub-ups from damage where conduits rise through floor slabs. Arrange so curved portion of bends are not visible above the finished slab.
- U. Where metal conduits rise through floor slabs in wet areas, provide PVC Coated Rigid Steel conduits for a distance of 6 inches (150 mm) above and below slab grade.

3.05 BENDS

- A. Make all bends carefully to prevent distortion of circular cross section. Field bend conduit shall have an inside radius of not less than nine diameters.
- B. Where bends of less than nine diameters are necessary, use standard factory elbows. Size conduit to permit cable-bending radius within the factory elbow of at least eight times cable diameter.
- C. Allow no conduit greater than 50 feet (15.2 meters) to have more than two 90 degree bends or equivalent thereof between pulling points. For conduits less than 50 feet (15.2 meters) in length, allow only three 90 degree bends between pulling points.

3.06 CUTTING, THREADING AND CONNECTING

- A. Make all field cuts in conduits squarely, file cut ends, ream to remove rough edges and thread in accordance with NEC. No running thread permitted. Make all connections mechanically strong and tight, and with acceptable connectors. Where conduit surface coating is damaged or removed in the cutting, threading or reaming process, restore the surface to its original condition.

3.07 CONDUIT CLEANING

- A. Clean all conduit carefully before and after installation, ream ends free of burrs, and free inside surfaces from all imperfections likely to injure cable.
- B. After installation of each complete new conduit run, snake the run with band to which is attached a tube cleaner with cylindrical mandrel of a diameter not less than 85 percent of nominal diameter of conduit. Remove and replace all conduit through which mandrel will not pass.
- C. Use a sponge with steel brush to clean steel conduit and use a sponge with nylon brush to clean PVC conduits.
- D. After cleaning, protect ends of all conduit with standard caps to prevent entrance of water, concrete, debris, or other foreign substance.

3.08 CONDUIT DRAINAGE

- A. Where practicable, pitch conduit to drain to outlet boxes, or install so as to avoid trapping moisture. Where dips are unavoidable in exposed conduits, install fitting with drain hole at low point.

3.09 INSTALLATION OF BOXES

- A. Unless otherwise indicated, install sheet metal boxes only in dry, accessible locations. Install cast-metal boxes in exterior concrete or masonry walls, in floor slabs, in basements, all other below grade locations and elsewhere as indicated. Cast metal boxes shall be used

(unless otherwise indicated) where vapor-tight fixtures are required, for all surface mounting of wall switches and receptacles and for all outdoor use. Install pull boxes for motor control centers and large ceiling hung boxes where indicated.

- B. Install boxes in conformance with all the requirements of NEC. Install boxes designed for type of construction involved. Support boxes in same manner as required for conduit. Size boxes to provide bending radius for wire or cable of at least eight times diameter or in accordance with NEC, whichever is larger.
- C. Center all outlets in panels, or spaces and adjust to structural finish. Where specific locations are not indicated, locate outlets with respect to equipment served.
- D. Place all outlet boxes, junction boxes and pull boxes, in accessible locations when they are installed above or behind plastered ceilings, furred spaces, or suspended ceilings. Install access panels of suitable size. Mark all access panels for all boxes so panels can be readily located in future. Mark, using metal tabs or plastic buttons which cannot mark ceilings or walls, appropriate for type of construction being used.
- E. All penetrations shall be made from the side or bottom. Top entry is strictly prohibited.
- F. Provide NEMA 4X stainless steel boxes with covers and device plates suitable for the area classification. Provide stainless steel screws.

3.10 FLEXIBLE CONNECTIONS TO MOTORS AND EQUIPMENT

- A. At all motors and electrically operated equipment to which conduit connections are made, install with a complete connection between end of conduit and terminal box of motor or other equipment.
- B. Install the conduits in locations permitting direct connection to motors.
- C. Make connections between rigid raceway and motor or equipment subject to vibration and adjustment using flexible conduit. Make each connection with at least one quarter bend so that no vibration can be transmitted beyond flexible connection.
- D. Install flexible metal conduit, fittings, and accessories in dry areas in accordance with requirements of NEC.
- E. Install liquid-tight flexible metal conduit in damp, wet, process, and corrosive areas. Locate conduit to reduce the possibility of damage to the exterior coating. Use fittings that screw into flexible conduit and provide gaskets.
- F. Use maximum of 3 feet (1 m) of flexible conduit for recessed and semi-recessed lighting fixtures and; for equipment subject to vibration, noise transmission, or movement; and for all motors. Use liquid tight flexible conduit in wet, process, or damp locations. Install liquid-tight flexible metal conduit in areas subject to wetting due to fire protection sprinklers or broken or ruptured water line. Locate conduit to reduce the possibility of

damage to the exterior flexible conduit jacket. Use fittings that screw into flexible conduit and provide gaskets. Install separate ground conductor across flexible connections.

3.11 PROTECTION

- A. Provide protection and install in accordance with manufacturer printed instructions. The conduit and raceway equipment manufacturers, to ensure that coatings, finishes, and enclosures are without damage or deterioration at completion of project.
 - 1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
 - 2. Repair damage to PVC or paint finishes with matching touch-up coating recommended by the manufacturer.

3.12 FINAL SYSTEM ACCEPTANCE

- A. Upon completion of installation of system, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finish, including chips, scratches, and abrasions and at no additional cost to the Owner.
- B. Label all raceways and boxes in accordance with the requirements of Section 26 05 10 “Electrical Work – General”.

3.13 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 “Execution and Closeout Requirements”.

END OF SECTION

SECTION 26 05 36

CABLE TRAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Section includes cable tray, cable tray accessories, hangers and supports as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. ASTM International (ASTM):

- 1. A123/A123M: Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
- 2. B633: Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel
- 3. B766: Standard Specification for Electrodeposited Coatings of Cadmium

- B. National Electrical Manufacturers Association (NEMA):

- 1. VE 1: Metal Cable Tray Systems

- C. National Fire Protection Association (NFPA):

- 1. 70 - National Electrical Code (NEC)

- D. Underwriter's Laboratories, Inc., (UL):

- 1. 486A: UL Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors
- 2. 486B: UL Standard for Safety Wire Connectors for Use with Aluminum Conductors

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Product Data for Each Component:

1. Show tray types, dimensions, and finishes.

D. Shop Drawings:

1. Detail fabrication and installation of cable tray, including plans, elevations, sections, details of components, and attachments to other construction elements.
2. Designate components and accessories, including clamps, brackets, hanger rods, splice plates connectors, expansion joint assemblies, straight lengths, and fittings.
3. Coordination drawings, including floor plans and sections drawn to accurate scale. Show accurately scaled cable tray layout and relationships between components and adjacent structural and mechanical elements.

E. Testing:

1. Factory certified test reports of specified products, conforming to NEMA VE 1.
2. Field test reports indicating and interpreting test results relative to compliance with performance requirements.

1.04 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements specified in Section 01 41 20.
- B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Comply with NFPA 70, "National Electrical Code" for components and installation.
- C. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
 1. The Terms "Listed and Labeled": As defined in the "National Electrical Code", Article 100.
 2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- D. Single-Source Responsibility: Cable tray components shall be product of single manufacturer.

1.06 SEQUENCING AND SCHEDULING:

- A. Coordination: Coordinate layout and installation of cable tray with other installations.
 - 1. Revise locations and elevations from those indicated as required to suit field conditions and as accepted by the engineer.

PART 2 - PRODUCTS

2.01 MATERIALS AND FINISHES:

- A. Conform to NEMA VE 1.
- B. Cable Trays, Fittings, and Accessories: Aluminum conforming to Aluminum Association alloy 6063-T6 for rails, rungs, and trays, 5052-H32 or 6061-T6 for fabricated parts.
- C. Cable Trays, Fittings, and Accessories: Stainless steel, Type 304.
- D. Fabricate cable tray products with rounded edges and smooth surfaces.

2.02 SIZES AND CONFIGURATIONS:

- A. Conform to NEMA VE 1.
- B. Ladder-Type Trays: Class 20C unless indicated.
 - 1. Width: Refer to plans for width.
 - 2. Inside Depth: 6-inch.
 - 3. Cross-Rung Spacing: 9-inch.
 - 4. Minimum Fitting Radius: 24-inch.

2.03 CABLE TRAY ACCESSORIES:

- A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, manufactured with same materials and finishes as cable trays.
- B. Barrier Strips: Same materials and finishes as cable trays.
- C. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.04 WARNING SIGNS:

- A. Lettering: 1-1/2 inch (40 mm) high, black on yellow background with legend "WARNING! NOT TO BE USED AS WALKWAY, LADDER, OR SUPPORT FOR LADDERS OR PERSONNEL."
- B. Materials and Fastening: Conform to Section 26 05 53.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine surfaces to receive cable tray for compliance with installation tolerances and other required conditions. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. Use cable tray of indicated types and sizes, complete with manufacturer's recommended covers, barrier strips, dropouts, fittings, conduit adapters, hold down devices, grommets, and blind ends.
- B. Install cable tray level and plumb according to manufacturer's written instructions, rough-in Drawings, original design, and referenced standards.
- C. Remove burrs and sharp edges of cable trays.
- D. Fasten cable tray supports securely to building structure as specified in Section 26 05 29 unless otherwise indicated.
 - 1. Locate and install supports according to recommendations of NEMA VE 1.
 - 2. Design supports, including fastenings to structure, to carry greater of calculated load multiplied by safety factor of 4, or calculated load plus 200 lbs (90 kg).
- E. Make connections to equipment with flanged fittings fastened to tray and to equipment. Support tray independently of fittings. Do not carry weight of tray on equipment enclosure.
- F. Install expansion connectors in cable tray runs that exceed 90 feet (27 m). Space connectors and set gaps according to NEMA VE 1.
- G. Make changes in direction and elevation using standard fittings.
- H. Make cable tray connections using standard fittings.
- I. Locate cable tray above piping except as required for tray accessibility and as otherwise indicated.

- J. Working Space: Install cable trays with sufficient space to permit access for installing cables.
 - K. Barriers: Install barriers to separate cables of different systems, such as power, communications, and data processing, or different insulation levels, such as 600 volts, 5,000 volts, and 15,000 volts.
- 3.03 GROUNDING:
- A. Connect cable trays to ground as instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals according to tightening torques specified in UL Standard 486A-486B.
 - B. Electrically ground cable trays and ensure continuous electrical conductivity of cable tray system. Use tray as an equipment ground conductor for itself only, not for connected equipment.
- 3.04 WARNING SIGNS:
- A. After installation of cable trays is completed, install warning signs in visible locations on or near cable trays.
- 3.05 FIELD QUALITY CONTROL:
- A. Grounding: Test cable trays to ensure electrical continuity of bonding and grounding connections.
 - B. Correct malfunctioning units at site, where possible, and retest to demonstrate compliance; otherwise, remove and replace with new units and retest.
- 3.06 CLEANING:
- A. Upon completion of installation of system, including fittings, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes, including chips, scratches, and abrasions.
- 3.07 PROTECTION:
- A. Provide final protection and maintain conditions in manner acceptable to manufacturer and Installer to ensure that cable tray is without damage or deterioration at Substantial Completion.
 - 1. Repair damage to galvanized finishes with zinc-rich paint recommended by tray manufacturer.

2. Repair damage to PVC or paint finishes with matching touch-up coating recommended by tray manufacturer.

3.08 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 43

UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide complete underground distribution system as indicated and in compliance with Contract Documents.
- B. Conform to lines, grades, elevations, and dimensions. Resolve interferences with other underground conduit, piping or equipment, either new or existing with the Engineer. Match components suitable for proper installation.
- C. Provide concrete encasement of duct system where indicated. Include forms and reinforcing in installation. Perform work in accordance with Section 26 05 10 "Electrical Work – General".
- D. Provide Schedule 40 polyvinylchloride (PVC) conduit for power and control circuits and furnish and install PVC coated rigid steel conduits for instrumentation, and communication circuits.

1.02 REFERENCES

- A. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with requirements of Section 26 05 10 "Electrical Work – General".
- B. Provide "Record" drawings.

PART 2 - PRODUCTS

2.01 MANUFACTURER'S COMPLIANCE

- A. Manufacturer's acceptance contingent upon products' compliance with specifications.

2.02 MANUFACTURERS

- A. Polyvinylchloride (PVC) Conduit:
 - 1. Specified in Section 26 05 33 "Raceway and Boxes for Electrical Systems".

B. PVC Coated Rigid Steel Conduit, Galvanized:

1. Specified in Section 26 05 33 "Raceway and Boxes for Electrical Systems".

2.03 MATERIALS AND COMPONENTS

- A. Conduit Spacers: Furnish conduit spacers made of plastic to maintain spacing between conduits.
- B. Concrete: Minimum compressive strength, 3,000 psi (20 MPa).
- C. PVC coated rigid steel conduit shall be used underground for bends and when exiting the concrete.

PART 3 - EXECUTION

3.01 INSTALLATION OF CONDUITS

- A. Lay conduits, indicated to be direct buried in the ground, in trench on 3-inch (75 mm) bed of sand and cover with an equivalent 3-inch (75 mm) bed of sand. Ensure that no rocks come in contact with conduit during backfilling. Dig trenches to depth and location indicated.
- B. Provide minimum separation of power and control conduits of 3 inch (75 mm) both vertically and horizontally. Build ductbank layer by layer, backfill and compact each layer to provide support for next layer.
- C. Separate power and control ducts from instrument ducts by a minimum of 12 inches (300 mm).
- D. Backfill ductbank in layers and tamp or "puddle" as directed by the Engineer. Provide yellow ductbank marker tapes, reading "Caution - Electrical Lines Below", over entire length of ductline. Locate tapes 12 inches (300 mm) below grade. Provide a tape for every 12 inches (300 mm) of width of ductline.
- E. Install conduit, indicated to be encased in concrete with spacers and reinforcing, as specified and as indicated. Concrete used to encase duct banks shall be dyed red in the truck before placement. Provide at least 3000-pound concrete.
- F. Install conduit runs following routing on drawing and running in straight lines. Where deviation from a straight line becomes necessary, install bends of radius which allow for rodding and installation of cable.
- G. Accomplish changes in direction of runs exceeding total of 10 degrees, either vertical or horizontal, by long sweep PVC coated rigid steel bends having minimum radius of curvature of 25 feet (8 m) Manufactured bends can be used at ends of short runs of 100 feet (30 m) or less, and then only at or close to the end of run. Provide long sweep bends made

up of one or more curved or straight sections and/or combinations thereof. Install manufactured bends with minimum radius of 36 inch (1,000 mm) where larger radius cannot be used.

- H. Lay ductlines to minimum slope of 4 inch (100 mm) per 100 feet (30 m) and slope to manholes and handholes, as indicated. Ductlines are to slope away from buildings.
- I. Install spacers at intervals of approximately 4 feet (1200 mm) and stagger between tiers of ducts to provide not less than 12 inches (300 mm) of longitudinal separation. Install base spacers to provide at least 3 inches (75 mm) between bottom of trench and underside of bottom conduits. Completely fill space with concrete. Firmly wire conduits and spacers together before concrete is placed.
- J. Ductbanks shall be formed, unless trench conditions allow for neat placement of concrete with specified clearances.
- K. Prior to placing of concrete, remove all dirt, sand, and any other debris from between conduits and from trench bottoms. Hold conduits in place to prevent floating or accidental movement.
- L. Stagger joints in conduits at least 6 inches (150 mm). Do not allow couplings to rest on bottom of trench. Install couplings for plastic conduit in accordance with manufacturer's recommendations.
- M. Install concrete encasements so minimum clearance of 12 inches (300 mm) from concrete to parallel pipes, lines, structures, etc., is maintained. Where ducts cross, minimum clearance of 6 inches (150 mm) is required. Do not allow the top of concrete to be less than 30 inches (750 mm) below finished grade or paving. Submit special conditions which may require lesser clearances or special conditions which may require greater than 30 inches (750 mm) depth to Engineer for acceptance.
- N. Where a connection is made to existing ductline, bond or dowel concrete encasement to existing encasement. Use waterstop between ductpours and between manholes or buildings and ductwork as indicated.
- O. Do not use power-driven vibrators for spading of concrete around ducts.
- P. Roll and grade backfill, and restore surface to condition equal to the site finish grade, or as otherwise indicated.
- Q. Locate ductbank markers at ends of all ductbanks except at manholes or handholes, at approximately every 200 feet (65 m) along duct run, and at each change in direction of duct run. Place markers approximately on ductbank. Install markers 6 inches (150 mm) square or round section by 3 feet (1 m) long made of Class B concrete. Imprint the letter "D" or cast it on top of the marker. Install top of duct markers flush in paved areas, protruding no more 2-inches above finished grade in unpaved areas. In finished lawns, allow marker to protrude 1/2-inch (12 mm).

- R. Keep conduits clean of concrete, dirt, and other substances during the course of construction. After the ductlines have been completed, pull a standard flexible mandrel not less than 12 inches (300 mm) long, having a diameter approximately 1/4-inch (6 mm) less than the inside diameter of the conduit, through each conduit, after which pull a brush with stiff bristles through each conduit to make certain that no particles of earth, sand, or gravel have been left in the line. Replace conduit runs that do not allow the passage of the mandrel at no additional cost to the Owner. Pneumatic rodding may be used to draw in the lead wire. Install in spare conduits a pull wire or rope, and plug and seal spare conduits after cleaning.

3.02 RECORD DRAWINGS OF UNDERGROUND WORK

- A. Furnish one set of marked copies of contract drawings, showing exact routing and depths of all underground conduit, duct handholes and manholes. Furnish scaled plot plans, showing principal outline of buildings and structures. Reference conduits, ducts, and manholes, and all bends deviating from straight line, dimensionally from fixed objects or structures.

3.03 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 05 53

ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Identification of electrical materials, equipment, and installations as indicated and in compliance with Contract Documents.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):

1. A13.1: Scheme for the Identification of Piping Systems

B. Institute of Electrical and Electronics Engineers (IEEE):

1. ANSI/IEEE C2: National Electrical Safety Code.

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

1.03 SUBMITTALS

A. Submit the following shop drawings in accordance with Section 01 33 00 "Submittals".

1. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".

B. Product Data:

C. Submit for each type of product specified.

D. Miscellaneous: Schedule of identification nomenclature to be used for identification signs and labels.

1.04 QUALITY ASSURANCE

A. Comply with the requirements specified in Section 01 43 00 "Quality Requirements".

PART 2 - PRODUCTS

2.01 RACEWAY AND CABLE LABELS

- A. Manufacturer's Standard Products: Where more than one type is listed for specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ASME A13.1, NFPA 70, or as specified elsewhere.
- B. Components and installation shall comply with NFPA 70.
- C. Conform to ASME A13.1, Table 3, for minimum size of letters for legend and minimum length of color field for each raceway or cable size.
 - 1. Color: Black legend on orange field.
 - 2. Legend: Indicates voltage.
- D. Adhesive Labels: Preprinted, flexible, self-adhesive vinyl. Legend is over-laminated with clear, wear and chemical resistant coating.
- E. Pre-tensioned, Wraparound Plastic Sleeves: Flexible, preprinted, color coded, acrylic bands sized to suit diameter of line it identifies and arranged to stay in place by pre-tensioned gripping action when placed in position.
- F. Colored Adhesive Tape: Self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inch wide (0.08 mm thick by 25 to 51 mm wide).
- G. Underground Line Warning Tape: Permanent, bright colored, continuous printed, vinyl tape with following features:
 - 1. Size: Not less than 6 inch wide by 4 mils thick (152 mm wide by 0.102 mm thick).
 - 2. Compounded for permanent direct burial service.
 - 3. Embedded continuous metallic strip or core.
 - 4. Printed Legend: Indicates type of underground line.
- H. Tape Markers: Vinyl or vinyl cloth, self-adhesive, wraparound type with preprinted numbers and letters.
- I. Aluminum, Wraparound Marker Bands: Bands cut from 0.014 inch (0.4 mm) thick aluminum sheet, with stamped or embossed legend, and fitted with slots or ears for permanently securing around wire or cable jacket or around groups of conductors.
- J. Plasticized Card Stock Tags: Vinyl cloth with preprinted and field printed legends. Orange background, except as otherwise indicated, with eyelet for fastener.

- K. Aluminum Faced Card Stock Tags: Wear resistant, 18 point minimum card stock faced on both sides with embossable aluminum sheet, 0.002 inch (0.05 mm) thick, laminated with moisture resistant acrylic adhesive, and punched for fastener. Preprinted legends suit each application.
- L. Brass or Aluminum Tags: Metal tags with stamped legend, punched for fastener. Dimensions: 2 by 2 inch (51 by 51 mm) by 0.05 inch (1.3 mm).

2.02 ENGRAVED NAMEPLATES AND SIGNS

- A. Manufacturer's Standard Products: Where more than one type is listed for specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ASME A13.1, NFPA 70, or as specified elsewhere.
- B. Engraving stock, melamine plastic laminate for Interior Use, 1/16-inch (1.6 mm) minimum thick for signs up to 20 square inches (129 sq cm), 1/8 inch (3.2 mm) thick for larger sizes.
 - 1. Engraved Legend: Black letters on white face.
 - 2. Punched for mechanical fasteners.
- C. Exterior, Metal Backed, Butyrate Signs: Wear resistant, non-fading, preprinted, cellulose acetate butyrate signs with 0.0396 inch (1 mm), galvanized steel backing, with colors, legend, and size appropriate to application. One quarter (1/4)-inch (6.4 mm) grommets in corners for mounting.
- D. Fasteners for Plastic Laminated and Metal Signs: Self tapping stainless steel screws or No. 10/32 stainless steel machine screws with nuts, flat washers and lock washers.

2.03 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Cable Ties: Fungus-inert, self-extinguishing, 1 piece, self-locking, Type 6/6 nylon cable ties with following features:
 - 1. Minimum Width: 3/16-inch (5 mm).
 - 2. Tensile Strength: 50 lb (222 N) minimum.
 - 3. Temperature Range: -40 to 185 degrees F (-40 to 85 degrees C).
 - 4. Color: As indicated where used for color coding.
- B. Paint: Alkyd-urethane enamel. Primer as recommended by enamel manufacturer.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install identification devices according to manufacturer's written instructions.
- B. Install labels where indicated and at locations for best convenience of viewing without interference with operation and maintenance of equipment.
- C. Lettering, Colors, and Graphics: Coordinate names, abbreviations, colors, and or designations used for electrical identification with corresponding designations used in Contract Documents or required by codes and standards. Use consistent designations throughout Project.
- D. Sequence of Work: Where identification is to be applied to surfaces that require finish, install identification after completion of finish work.
- E. Self-Adhesive Identification Products: Clean surfaces of dust, loose material, and oily films before applying.
- F. Identify feeders over 600 Volt with "DANGER-HIGH VOLTAGE" in black letters 2 inch (51 mm) high, stenciled with paint at 10 feet (3 m) intervals over continuous, painted orange background. Identify following:
 - 1. Entire floor area directly above conduits running beneath and within 12 inch (305 mm) of basement or ground floor that is in contact with earth or is framed above unexcavated space.
 - 2. Wall surfaces directly external to conduits concealed within wall.
 - 3. All accessible surfaces of concrete envelope around conduits in vertical shafts, exposed in building, or concealed above suspended ceilings.
 - 4. Surface of exposed conduits.
- G. Install painted identification as follows:
 - 1. Clean surfaces of dust, loose material, and oily films before painting.
 - 2. Prime Surfaces: For galvanized metal, use single component, acrylic vehicle coating formulated for galvanized surfaces. For concrete masonry units, use heavy duty, acrylic resin block filler. For concrete surfaces, use clear, alkali resistant, alkyd binder type sealer.
 - 3. Apply 1 intermediate and 1 finish coat of silicone alkyd enamel.
 - 4. Apply primer and finish materials according to manufacturer's instructions.

- H. Install Caution Signs for Enclosures Over 600 Volt: Use pressure sensitive, self-adhesive label indicating system voltage in black, preprinted on orange field. Install on exterior of door or cover.
- I. Install Circuit Identification Labels on Boxes: Label externally as follows:
 - 1. Exposed Boxes: Pressure sensitive, self-adhesive plastic label on cover.
 - 2. Concealed Boxes: Plasticized card stock tags.
 - 3. Labeling Legend: Permanent, waterproof listing of panel and circuit number or equivalent.
- J. Identify Paths of Underground Electrical Lines: During trench backfilling, for exterior underground power, control, signal, and communications lines, install continuous underground plastic line marker located directly above line at 6 to 8 inch (150 to 200 mm) below finished grade. Where multiple lines installed in common trench or concrete envelope do not exceed an overall width of 16 inch (400 mm), use single line marker.
 - 1. Install line marker for underground wiring, both direct buried and in raceway.
- K. Color Code Conductors: Secondary service, feeder, and branch circuit conductors throughout secondary electrical system.
 - 1. Field applied; color coding methods may be used in lieu of factory coded wire for sizes larger than 10 AWG.
 - a. Colored, pressure sensitive plastic tape in half lapped turns for distance of 6 inch (150 mm) from terminal points and in boxes where splices or taps are made. Apply last 2 turns of tape with no tension to prevent possible unwinding. Use 1 inch (25 mm) wide tape in colors as specified. Adjust tape bands to avoid obscuring cable identification markings.
 - b. Colored cable ties applied in groups of 3 ties of specified color to each wire at each terminal or splice point starting 3 inch (76 mm) from terminal and spaced 3 inch (76 mm) apart. Apply with special tool or pliers, tighten to snug fit, and cut off excess length.
 - 2. 208/120 Volt System – As follows:
 - a. Phase A: Black.
 - b. Phase B: Red.
 - c. Phase C: Blue.
 - d. Neutral: White.
 - e. Ground: Green.

3. 480/277 Volt System – As follows:
 - a. Phase A: Brown.
 - b. Phase B: Orange.
 - c. Phase C: Yellow.
 - d. Neutral: White.
 - e. Ground: Green.
- L. Power Circuit Identification: Use metal tags or aluminum wraparound marker bands for cables, feeders, and power circuits in vaults, pull boxes, junction boxes, manholes, and switchboard rooms.
 1. Legend: 1/4-inch (6.4 mm) steel letter and number stamping or embossing with legend corresponding to indicated circuit designations.
 2. Fasten tags with nylon cable ties; fasten bands using integral ears.
- M. Apply identification to conductors as follows:
 1. Conductors to Be Extended in Future: Indicate source and circuit numbers.
 2. Multiple Power or Lighting Circuits in Same Enclosure: Identify each conductor with source, voltage, circuit number, and phase. Use color coding for voltage and phase indication of secondary circuit.
 3. Multiple Control and Communications Circuits in Same Enclosure: Identify each conductor by its system and circuit designation. Use consistent system of tags, color coding, or cable marking tape.
- N. Apply warning, caution, and instruction signs and stencils as follows:
 1. Install warning, caution, and instruction signs where indicated or required to ensure safe operation and maintenance of electrical systems and of items to which they connect. Install engraved, plastic laminated instruction signs with accepted legend where instructions or explanations are needed for system or equipment operation. Install butyrate signs with metal backing for outdoor items.
 2. Emergency Operating Signs: Install engraved laminate signs with white legend on red background with minimum 3/8-inch (9 mm) high lettering for emergency instructions on power transfer, load shedding, and or emergency operations.
- O. Install identification as follows:
 1. Apply equipment identification labels of engraved plastic laminate on each major unit of equipment, including central or master unit of each system. This includes

communication, signal, and alarm systems, unless units are specified with their own self-explanatory identification. Except as otherwise indicated, provide single line of text with 1/2-inch (13 mm) high lettering on 1-1/2 inch (38 mm) high label; where 2 lines of text are required, use lettering 2 inch (51 mm) high. Use black lettering on white field. Apply labels for each unit of following categories of equipment.

- a. Panelboards, electrical cabinets, and enclosures.
 - b. Access doors and panels for concealed electrical items.
 - c. Electrical switchgear and switchboards.
 - d. Motor control centers.
 - e. Motor starters.
 - f. Push button stations.
 - g. Power transfer equipment.
 - h. Contactors.
 - i. Remote controlled switches.
 - j. Control devices.
 - k. Transformers.
 - l. Adjustable Frequency Drives.
 - m. Battery racks.
 - n. Power generating units.
2. Apply designation labels of engraved plastic laminate for disconnect switches, breakers, push buttons, pilot lights, motor control centers, and similar items for power distribution and control components above, except panelboards and alarm/signal components where labeling is specified elsewhere. For panelboards, provide framed, typed circuit schedules with explicit description and identification of items controlled by each individual breaker.

3.02 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 05 70

ELECTRICAL SYSTEM STUDIES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide electrical system studies as indicated and in compliance with Contract Documents.
 - 1. Provide a short circuit, protective device coordination and arc-flash study for the electrical distribution systems constructed under this contract. The study shall consider the electrical utility system upstream protective devices down to the 208Y/120V transformer secondary. The study shall include calculations used to verify the short circuit ratings of the electrical distribution equipment to be provided under this contract and to identify the required settings of associated protective devices.
 - a. Provide a report summarizing the coordination study including: one-line of system, relay and breaker setting tabulation, relay, circuit breaker, and fuse protective device coordination and short circuit calculation, all prepared by an independent specialty firm. Device calibration and settings are to be based on the results of this coordination study.
- B. The Contractor shall employ the services of a specialty firm, subject to review, with the specified demonstrated capability for calibrating and setting protective devices as specified herein.
- C. Changes and additions of equipment characteristics based on the actual equipment supplied may be suggested by the results of the short circuit and protective device coordination studies. Submit suggested changes and additions as a part of the study. Field settings of devices, adjustments, and minor modifications to equipment that are required to accomplish conformance with the accepted short circuit and protective device coordination studies shall be provided at no additional cost.
- D. The Contractor shall be responsible for providing and installing arc flash hazard equipment labels in accordance with electronic label templates provided with the electrical system study. Labels shall be provided for all electrical distribution equipment rated 120 VAC and above including but not limited to switchgear, switchboards, transformers, panelboards, disconnect switches, and vendor-supplied control panels containing power distribution equipment.
- E. Provide the following scenarios as a minimum:
 - 1. Water Treatment Plant on Utility.

2. Pump Station/Clearwell on Utility.
3. Water Treatment Plant only on Generators.
4. Pump Station/Clearwell only on Generators.
5. Water Treatment Plant and Pump Station/Clearwell combined on Generators.

 1. 70E: Standard for Electrical Safety Requirements for Employee Workplaces.
- C. National Electrical Manufacturer's Association (NEMA):
 1. Z535: Safety Alerting Standards

1.03 SUBMITTALS

- A. Submittals of electrical distribution equipment affected by the study are not to be submitted until successful review and approval of Short Circuit Study.
- B. The approved remaining reports shall be completed, and a copy sent to the electrical distribution equipment manufacturer 45 days before the equipment is shipped to the Work site. The report shall be provided to the Engineer no later than 90 days before the equipment is shipped to the Work Site. Shipment and delivery of equipment will not be accepted at the Work site until the study has been completed, submitted, and approved by the Engineer.
- C. Submit the following in accordance with Section 01 33 00.
 1. Short circuit and protective device coordination study for review and acceptance, concurrent with the preliminary shop drawing submission for the main electrical distribution system equipment and overcurrent protective devices. Submit an initial

study for comment and a final study, with all electronic files, at the completion of the project.

- a. The study shall be performed using the latest edition of one of the following commercial software programs.
 - (1) EasyPower
 - (2) SKM System Analysis
 - b. The study shall consider the effects of motor contribution during fault conditions, at various buses in the system.
 - c. The study shall include cable sizes, cable lengths and raceway types for considering the effects of cables impedance in the system based on information to be provided by the Contractor.
 - d. The maximum fault contribution at the incoming source(s) shall be documented via correspondence from the authority responsible for this source(s).
 - e. Transformer inrush points and damage curves shall be plotted on coordination curves.
 - f. Obtain from the engine generator supplier, reactance values, protective device type and data and generator decrement curves.
 - g. Plot on common drawings, single line diagrams and the curves for each protective device to verify proper selectivity and protection for all components of the system for both the normal utility and standby generator source. Label each device uniquely.
 - h. Identify recommended settings for all devices.
 - i. Devices which do not provide full selectivity and coordination are not to be used as a recommended device in the study.
2. Voltage drop motor starting study to determine system voltage dip or power in rush limitations at all locations of the distribution system due to the starting of the largest equipment.
 3. This study shall consider starting when the system is powered from the utility and from the standby generator sources.
 4. Voltage and current total harmonic analysis study at all points of common coupling and main distribution buses for cases when system powered from utility and standby generator sources.

5. After review of coordination study, the Contractor shall set all devices based on the study.
6. Qualifications of specialty testing and/or study firm, as specified.
7. Arc Flash Hazard Labels
 - a. Submit all arc flash hazard equipment labels prior to printing and application to electrical equipment.
 - b. Label Construction
 - (1) Material: Vinyl, in accordance with NEMA/ANSI Z535.
 - (2) Size: 4-inches x 6-inches.
 - (3) Outdoor Life: 5 years.
 - (4) Min/Max Service Temperature: -40°F to 200°F.
 - (5) The labels shall be printed using a thermal transfer printer.
 - (6) Labels shall be resistant to chemicals, moisture, and UV light.

1.04 QUALIFICATIONS OF SPECIALTY FIRM:

A. Submit evidence of the following:

1. Firm's experience:

- a. Specialty firm shall have been in the business of the type of work specified, for at least the past five years.
- b. The firm shall have a minimum of five projects of equal or greater size, service, and the type of equipment specified.
- c. At least the following information must be submitted:
 - (1) The number of years the firm has been in the business of performing coordination studies.
 - (2) Summary of five previously performed studies including:
 - (a) A brief description of each study.
 - (b) Name of owner of installation on which study was performed with address, telephone number, and contact person.
 - (c) Date of study.

- (3) List of projects and contact persons for which protective device settings were performed.
 - (4) Any other information indicating the firm's experience, ability to perform the work, and business status.
- B. Firm shall have a licensed Professional Electrical Engineer supervise all work and seal all reports.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 SHORT CIRCUIT STUDY

- A. Perform a short circuit study in accordance with ANSI Standard C37.010 to verify the adequacy and correct application of circuit protective devices and other electrical system components.
- B. The study shall address the case when the system is being powered from the utility source as well as from the on-site generating facilities. Minimum and maximum possible fault conditions shall be covered in the study.
- C. Include the fault contribution of all motors. Horsepower shown in the Contract Documents may be used to calculate fault contribution of motors. In the short circuit study VFDs shall be replaced by conductors of the same size as the branch circuit conductors.
- D. Calculate short-circuit momentary duties and interrupting duties on the basis of an assumed bolted 3-phase short circuit at each bus. The short circuit tabulations shall include X/R ratios, asymmetry factors, kVA and symmetrical fault-current. Where ground fault protection is specified, provide a ground fault current study for the same system areas, including the associated zero sequence impedance diagram. Include in tabulation form, fault impedance, X/R ratios, asymmetry factors, motor contribution, short circuit kVA, and symmetrical and asymmetrical fault currents.
- E. The studies shall include representation of the site power system, the base quantities selected, impedance source data, calculation methods and tabulations, one-line diagrams, conclusions and recommendations.

3.02 PROTECTIVE DEVICE COORDINATION STUDY:

- A. Provide a protective device time current coordination study with coordination plots of current limiting devices, plus tabulated data, including ratings and settings selected. In the study, balance shall be achieved between the competing objectives of protection and

continuity of service (with emphasis on continuity of service) for the system specified, taking into account the basic factors of sensitivity, selectivity and speed.

- B. Provide separate plots for utility and generator operation as applicable. Show maximum and minimum fault values in each case. Multiple power sources shown in one plot is not acceptable.
- C. Each primary protective device required for a delta-to-wye-connected transformer shall be selected so the characteristic or operating band is within the transformer parameters, which, where feasible, shall include a parameter equivalent to 58 percent of the ANSI withstand point to afford protection for secondary line-to-ground faults. Separate low voltage circuit breakers from each other and the associated primary protective device, by a 16 percent current margin for coordination and protection in the event of line-to-line faults. Separate protective relays by a 0.4 second time margin when the maximum 3 phase fault flows to assure proper selectivity. The protective device characteristics or operating bands shall be terminated to reflect the actual symmetrical and asymmetrical fault-currents sensed by the device. Provide the coordination plots for 3 phase and phase-to-ground faults on a system basis. Include all devices down to largest branch circuit feeder circuit breaker. Include all adjustable setting ground fault protective devices.
- D. Identify discrepancies in the conclusions and recommendations of the report. Upon resolution of discrepancies and recommendation, update all associated analyses and revise the affected studies.
- E. The coordination plots shall graphically indicate the coordination proposed for the several systems centered on full scale log forms. The coordination plots shall include complete titles, representative one-line diagrams and legends, associated upstream power system relays, fuse or system characteristics, significant motor starting characteristics, significant generator characteristics, complete parameters for power, and substation transformers, complete operating bands for low voltage circuit breaker trip devices, fuses, and the associated system load protective devices. The coordination plots shall define the types of protective devices selected, together with the proposed coil taps, time-dial settings and pick-up settings required. The short-time region shall indicate the relay instantaneous elements, the magnetizing inrush, and ANSI transformer damage curves, the low voltage circuit breaker and instantaneous trip devices, fuse manufacturing tolerance bands, and significant symmetrical and asymmetrical fault-currents.
- F. The thermal limit of all feeder cables to each bus and large motors, where applicable in the study, shall be shown.
- G. No more than six devices shall be shown on one coordination plot. Of these six curves, two (the largest upstream device and the smallest downstream device) shall repeat curves shown on other coordination plots in order to provide cross reference. Give each unique protective device curve in the study a study-unique number or letter identifier to permit cross reference between plots. Do not use identifier letters or numbers more than once.

- H. Each primary protective device required for delta-wye connected transformer shall be selected so that the characteristic or operating band is within the transformer parameters, which, where feasible, shall include a parameter equivalent to 58 percent of the ANSI withstand point to assure protection for secondary line-to-ground faults.
- I. Include a detailed description of each protective device identifying its type, function, manufacturer, and time-current characteristics. Tabulate recommended device tap, time dial, pickup, instantaneous, and time delay settings. Include C.T. ratio, burden and all other calculations required for the determination of settings.

3.03 MOTOR STARTING/RUNNING STUDY:

- A. Provide a motor starting study for all large electric motors and drives over 100 Hp in size to determine voltage dip or power inrush limitations at selected locations due to starting of motors. Define minimum system voltages and compare to standard equipment voltage capabilities.
- B. Provide a complete independent set of current-time characteristic curves for all motors 100 Hp (75 kW) and above indicating coordination between the protective relays and the thermal characteristics of the motor.
- C. Obtain from the motor supplier the necessary information to perform the study. Certified curves for "Safe Time vs. Current at 100 percent Voltage" and "Accelerating Time vs. Current at 100 percent Voltage" are absolutely necessary and shall become part of the final report.
- D. Provide recommended settings for all motor protective devices supplied under this contract.

3.04 ARC FLASH HAZARD ANALYSIS:

- A. Perform arc flash hazard analysis for the following items:
 - 1. Panelboards
 - 2. Control panels with voltage over 50 Volts
 - 3. Motor control centers
 - 4. Transformers that have auxiliary electrical devices operating at over 50 Volts
 - 5. Automatic transfer switches
- B. Methods of performing analysis:
 - 1. Use NFPA 70E article 130 tables if the short circuit study shows that the condition for those tables are met.
 - 2. Otherwise use IEEE 1584 calculations

- a. If the conditions fall within the IEEE 1584 parameters use the IEEE 1584 calculations based on actual OCPD curves and settings.
 - b. If the conditions do not fall within the 1584 parameters, use the Lee method.
- C. Label each item for which the calculations were performed with the following information:
 - 1. Limited approach boundary
 - 2. Information required by NFPA 70E, 130.2(D)(2).
 - 3. Restricted approach boundary
 - 4. Personal protective equipment required within restricted approach boundary
 - 5. Flash protection boundary
 - 6. Personal protective equipment required within flash protection boundary
 - 7. Prohibited approach boundary

3.05 FIELD TESTING

- A. Provide in accordance with Section 01 43 00 and as specified.
- B. Integrate results of this study with functional testing of the contract electrical equipment in accordance with Section 26 05 10 “Electrical Work – General”.

3.06 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 90

ELECTRICAL CONTROLS AND MISCELLANEOUS ELECTRICAL EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide and connect the electrical control equipment and miscellaneous electrical equipment, including such instruments and devices indicated and specified. Device enclosures for electrical equipment as indicated and in compliance with Contract Documents.
- B. Control panel enclosures and devices specified herein are provided under those specification sections which invoke this section for control panel requirements or as indicated on electrical drawings.

1.02 REFERENCES

- A. ASTM International (ASTM):
 - 1. D178: Standard Specification for Rubber Insulating Matting
- B. National Electrical Manufacturers Association (NEMA):
 - 1. 250: Enclosures for Electrical Equipment (1000 volts maximum).
 - 2. ICS 1: Industrial Control and Systems General Requirements
 - 3. ICS 2: Industrial Controls and Systems Controllers, Contactors, and Overload Relays Rated 600 Volts.
 - 4. ICS 4: Terminal Blocks for Industrial Use.
- C. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).
- D. Underwriter's Laboratories, Inc. (UL):
 - 1. 467: Standard for Grounding and Bonding Equipment.
 - 2. 486A: UL Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors.
 - 3. 486B: UL Standard for Safety Wire Connectors for Use with Aluminum Conductors.

4. 489: Standard for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures.
5. 823: Standard for Safety Electric Heaters for Use in Hazardous (Classified) Locations.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Wiring diagrams to show control interface points provided with other equipment.
- C. Shop drawings to include:
 1. Outline drawings with elevations.
 2. Equipment arrangement drawings.
 3. Anchor bolt location drawings.
 4. Electrical schematics and wiring diagrams.
 5. Electrical fuse/circuit breaker characteristic.
 6. Equipment performance curves and data.
 7. Bill of installation/assembly materials.
 8. Equipment weights.
 9. Completed manufacturer's data sheets.
 10. Sustainable design submittals.

1.04 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00 "Quality Requirements".
- B. Sustainability Standards Certifications.

1.05 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10 "Deliver, Storage and Handling".

PART 2 - PRODUCTS

2.01 MANUFACTURERS FOR ELECTRICAL DISTRIBUTION EQUIPMENT

- A. Siemens.
- B. Eaton
- C. ABB
- D. Schneider/Square D.
- E. Appleton Electric Company.
- F. Crouse-Hinds Company.
- G. O-Z/Gedney.

2.02 SAFETY DISCONNECT SWITCHES

- A. Provide heavy duty type, safety switches, with external operating handles, 3 PST, rated 600 volt, 60 Hertz with ampere rating as indicated, and having provisions for padlocking.
- B. Provide fuses for safety switches as indicated.
- C. Heavy duty safety switches to be UL listed, File E 2875 and 154828, and meet or exceed NEMA Standard KS1.
- D. Provide auxiliary electrical interlocks for motor heaters or other motor control circuits, including variable frequency drives (VFD), starter control where indicated.
- E. Provide the following type rating, unless noted otherwise on the plans.

Indoor Use	NEMA Type 12 SST
Outdoor Use	NEMA Type 4X SST
Indoor or Outdoor Use, Corrosive Area	NEMA Type 4X SST

2.03 CONDUIT AND WIRING

- A. Provide conduit and wiring necessary to make connections between instrument panels, consoles, cabinets and external equipment and devices.

2.04 PUSHBUTTON AND SELECTOR SWITCH STATIONS

- A. Provide HAND-OFF-AUTO switches, push buttons, tumbler switches and other accessory devices as necessary for the control of motors and other electrical equipment or devices.
- B. Provide pushbutton and selector switch stations designed for heavy-duty service and with momentary or maintaining contacts as indicated or as necessary for starting and stopping of equipment with 10 amp contact ratings.

- C. Provide heavy duty switches and pushbuttons, Square D Company, Class 9001 or approved equal. Indicating lights to be led cluster type.
- D. At stations provide nameplates with white letters on black background.
- E. Provide safety lockout station with position indication located near motor to prevent application of current. Where pumps are located on lower levels than driving motors, furnish safety lockout station near each pump or other item of equipment.
- F. Provide galvanized cast iron enclosures for NEMA Type 4 watertight stations.
- G. Provide fiberglass reinforced polyester NEMA Type 4X enclosures for stations located in highly corrosive areas. Provide gaskets and Type 316 stainless steel screws, to prevent entry of chemicals.

2.05 MANUAL MOTOR STARTERS

- A. Provide manual motor starters where indicated and for 120 volt, 60 Hertz fractional horsepower motors.
- B. Provide each manual motor starter with overload heater or heaters of suitable capacity for motor running overcurrent protection for motor it controls. Provide manual starters as single or 2 pole, as necessary, and with toggle mechanisms indicating OFF and ON positions.
- C. Manual starters to be located within sight of motors, as defined by NFPA 70 National Electric Code (NEC).

2.06 MANUAL MOTOR SWITCHES

- A. Provide manual motor switches where indicated and for 480 volt, 3-phase, 60 Hertz fractional horsepower motors, such as motor operated valves.
- B. Provide each manual motor switch with overload heater or heaters of suitable capacity for motor running overcurrent protection for motor it controls. Provide manual motor switches as single, 2- or 3-pole, as necessary, and with toggle mechanisms indicating OFF and ON positions. Switches shall be NEMA 4 rated.
- C. Manual motor switches to be located within sight of motors, as defined by NFPA 70 National Electric Code (NEC).

2.07 WALL MOUNTED COMBINATION STARTERS

- A. Unless otherwise indicated, provide each combination starter with motor circuit protector and full voltage magnetic starter. Provide starters in an enclosure that meets the requirements of the enclosure schedule. Provide motor circuit protectors and starters as specified in Section 26 24 19 "Motor Control Centers".

- B. Provide control transformer for the control circuit of each motor controller, rated 120/240 volts, single phase, 3 wire, 60 Hertz, of adequate VA capacity for operation of supplied equipment with spare 100 VA.
- C. Provide control transformer with current limiting primary fuses and secondary fuse.
- D. Provide LED cluster type indicating lights of heavy duty, oiltight unit rated at 120 volts.
- E. Provide heavy duty, oiltight type pushbuttons to provide momentary contacts or maintained contacts for starting and stopping the motor.
- F. Refer to plans for control diagrams.

2.08 SOLID-STATE REDUCED VOLTAGE STARTER

- A. Unless otherwise indicated, provide each solid-state reduced voltage starter with circuit breaker. Provide starters in an enclosure that meets the requirements of the enclosure schedule. Provide starters as specified in Section 26 24 19 "Motor Control Centers".
- B. Provide control transformer for the control circuit of each motor controller, rated 120/240 volts, single phase, 3 wire, 60 Hertz, of adequate VA capacity for operation of supplied equipment with spare 100 VA.
- C. Provide control transformer with current limiting primary fuses and secondary fuse.
- D. Provide LED cluster type indicating lights of heavy duty, oiltight unit rated at 120 volts.
- E. Provide heavy duty, oiltight type pushbuttons to provide momentary contacts or maintained contacts for starting and stopping the motor.

2.09 WALL MOUNTED CIRCUIT BREAKERS

- A. Provide manually operated circuit breakers, ambient compensated, providing thermal magnetic inverse time limit overload and instantaneous short circuit protection. Provide overload protection on all poles; trip settings as indicated.
- B. Provide circuit breakers as specified under Section 26 24 19 "Motor Control Centers".
- C. Provide time-current characteristic curves for each size of circuit breaker furnished.
- D. Provide circuit breakers housed in NEMA type enclosure indicated, having external operating handles with provisions for padlocking.

2.10 CONTROL PANELS AND ELECTRICAL ENCLOSURES

- A. Provide control panels as specified in Section 26 27 17 "Control Panels".

2.11 RUBBER MATS

- A. Provide rubber mats conforming to ASTM D-178 Type I, Class I: Mats shall be at least 4 feet wide and have a length at least equal to the panelboard, switchboard motor control center, or switchgear before which they are to be placed. Furnish two spare mats, each 4 feet long as spares.
- B. Place mats in front of switchboards, panelboards, motor control centers and switchgear. Place mats behind electrical assemblies with rear access.

2.12 CONTACTORS AND RELAYS

- A. Provide mechanically held, heavy duty type contactors (relays) for lighting control, rated 30 amps, 600 volts, with number of poles as indicated.
- B. Provide contactor in the required NEMA enclosure suitable for wall mounting. Provide circuit breaker or fuse protection on each ungrounded pole. Provide contactor similar to Square D Company, Class 8903, Type LX or approved equal.
- C. Provide control power transformer with primary and secondary fuse protection. Control power to be 120 volts, single phase.
- D. Provide timing relays by Allen Bradley, Series 700 or equal.
- E. Provide industrial grade relays, NEMA rated, Square D Company, Class 8501 or equal.

2.13 NAMEPLATES

- A. Provide nameplates for equipment (including pushbutton and selector switch stations) listed in this section and other controls furnished under this contract, to designate the equipment controlled and their function.
- B. Nameplates shall be laminated black bakelite with 1/4-inch (6 mm) high, white, recessed letters. Securely attach to the equipment with Type 316 stainless steel screws, or rivets. Adhesives, glue or cements will not be permitted.
- C. Provide all junction boxes, pull boxes, disconnect switches and control panels with a nameplate to designate the system wiring contained within.
- D. Install nameplates in a location near or on the equipment or devices.

2.14 HATCH POSITION/INTRUSION SWITCH

- A. Heavy duty turret head lever arm type switch. Provide an offset type lever arm with sufficient length to contact hatch lid.
- B. Rated NEMA 6P
- C. Rated 120 VAC, 6 amps.

D. Application:

1. Roof Hatches
2. Tank Hatches

E. Manufacturer:

1. Schneider Electric/Square D
2. Approved Equal

PART 3 - EXECUTION

3.01 WIRING OF MISCELLANEOUS DEVICES

- A. Make electrical connections required for recording and indicating instruments, and miscellaneous devices. Provide electrical supplies to metering, instrumentation, control, and alarm systems.
- B. Connect HAND-OFF-AUTO switches, safety switches, tumbler switches, and other accessory devices as indicated or necessary for control of motors and other electrical equipment or devices.
- C. Install conduit and wiring and make electrical connections between all instrument panels, consoles, cabinets, and external equipment and devices. Panels, cabinets, etc., are indicated.

3.02 WIRING OF EQUIPMENT FURNISHED UNDER OTHER SECTIONS

- A. As specified in Section 26 05 10 "Electrical Work – General", install conduit, wiring, and connections for equipment and devices furnished under other Sections of specifications, and as indicated.
- B. Unless otherwise indicated, control equipment, relays, control wiring, conduit, and connections for control of heating, ventilating, and air conditioning systems are provided as specified in Section 23 09 00 "Instrumentation and Control for HVAC". Refer to mechanical specifications and drawings for locations of pressure-operated control switches, float switches, butterfly valves, solenoid operated valves, sump pumps, metering instruments, control panels, alarm actuating contacts, indicating lamps, limit switches, and other devices requiring wiring or interconnections with equipment supplied under Electrical Sections of these specifications.

3.03 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 08 13

FIELD INSPECTION AND ACCEPTANCE TESTS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Perform electrical system tests to demonstrate that each component of each system is in proper working order and in accordance with applicable codes, manufacturer's instructions, drawings and specifications as indicated and in compliance with Contract Documents. Tests are in addition to, and no substitution for, factory tests of individual equipment.
 - 1. Perform insulation and ground resistance tests before operating tests.
 - 2. Determine proper rotation of motors before permanent connections are made.
- B. Testing shall be performed to:
 - 1. Provide initial acceptance tests and recorded data that can be used as a benchmark for future routine maintenance and troubleshooting by facility operating staff.
 - 2. Ensure a successful start-up with a minimum of last-minute interruptions and problems.
 - 3. Determine the suitability of the equipment and systems for energization and placing into operating service.
 - 4. Provide assurance that each system component is not only installed satisfactorily but performs, and will continue to perform, its function in the system with reasonable reliability throughout the life of the facility.
- C. Provide all supervision and labor, materials, tools, test instruments or other equipment or services and expenses required to test, adjust, set, calibrate, functionally and operationally check all work and components of the various electrical systems and circuitry throughout the installation. Provide sufficient personnel to assist in any additional checks they may require for acceptance, start-up, run-in and placing the equipment and systems into continuous service.
- D. The tests and inspections performed shall in no way relieve the Contractor of the responsibility for the performance of the tests, check outs, and inspections specified under other sections of the specification during construction.
- E. The listings and descriptions of the tests, and checks described herein shall not be considered as complete and all inclusive. Additional normal standard construction (and

sometimes repetitive) checks and tests may be necessary throughout the job, prior to final acceptance by the Owner.

- F. Pay all costs for tests including expenses incident to retests occasioned by defects and failures of equipment to meet specifications.
 - 1. Replace wiring and equipment found defective, or failing to meet specified requirements, without charge, unless written acceptance for repair is given by Engineer.
 - 2. Unless otherwise specified, the Owner will supply electric power necessary for tests.

1.02 REFERENCES

- A. All inspections and tests shall be in accordance with the following applicable codes and standards latest revisions except as provided otherwise herein.
 - 1. All Standard, Special and Supplemental Conditions of the Contract.
 - 2. Association of Edison Illuminating Companies (AEIC).
 - 3. American National Standards Institute (ANSI):
 - a. Z244-1: American National Standard for Personnel Protection
 - 4. ASTM International (ASTM).
 - 5. Insulated Cable Engineers Association (ICEA).
 - 6. Institute of Electrical and Electronic Engineers (IEEE).
 - a. C2: National Electrical Safety Code
 - 7. National Electrical Manufacturer's Association (NEMA).
 - 8. International Electrical Testing Association (NETA):
 - a. ATS: Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.
 - 9. National Fire Protection Association (NFPA):
 - a. 70: National Electrical Code
 - b. 70B: Electrical Equipment Maintenance
 - c. 70E: Electrical Safety Requirements for Employer Workplaces
 - d. 101: Life Safety Code

- e. 780: Lightning Protection Code
 - 10. Occupational Safety and Health Administration (OSHA):
 - a. Part 1926; Subpart V, 1926.950 through 1926.960
 - 11. State and Local Codes and Ordinances.
- B. All inspections and tests shall utilize the following references:
- 1. Project Design Specifications
 - 2. Project Design Drawings
 - 3. Project Electrical System Studies
 - 4. Manufacturer's instruction manuals applicable to each particular apparatus
- 1.03 SUBMITTALS
- A. Submit test plans and test data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
 - B. Submit test results.
- 1.04 SCHEDULING
- A. The Contractor shall be responsible for the preparation of proposed procedures and schedules for all inspections, tests, settings and calibrations specified or otherwise required prior to or during the check out for start-up and acceptance of all the electrical components, equipment and systems. This work shall be coordinated and to be compatible with both the work of other crafts and the project schedule. The above must be organized and submitted with all proposed testing and check out forms. The procedures shall provide specific instructions for the checking and testing of each component in addition to the system functional checks. Tests and inspections shall be scheduled as the job progresses and may require repetition in greater detail at a later stage of construction. All procedures submitted shall include job safety rules proposed.
 - B. Equipment shall be inspected and tested to determine its condition. See other applicable sections of the specifications and contract documents for required checks and responsibilities.
 - C. At any stage of construction and when observed, any electrical equipment or system determined to be damaged, faulty, or requiring repairs shall be reported to the Engineer. Corrective action may require prior approval.
 - D. Prior to check out and testing for start-up, ensure that all equipment and wiring is properly and permanently identified with nameplates and other identification as specified elsewhere. Check and tighten all terminals and connection points, remove all shipping

blocks and hardware, thoroughly clean all equipment, repair all damaged or scratched finishes, inspect for broken and missing parts and review and collect manufacturer's drawings and instructions for submittal to the Engineer. Make routine checks and tests as the job progresses and as necessary to ensure that all wiring and equipment is properly installed and wired.

- E. All testing and checkout work shall be performed with fully qualified personnel skilled in the particular tests being conducted. This is essential for obtaining and properly evaluating data while the tests are in progress and for ensuring that important facts and questionable data are reported.
- F. All inspections, tests, and calibrations shall be reported in writing on forms submitted for review under Submittals. The recorded data form shall have the signatures of the persons conducting the tests and authorized witnesses. The forms shall be designed to serve as the test and inspection checklist for inspection requirements. "As-found" and "as-left" test data shall be recorded and reported in writing.
- G. The sequence of all tests and checks shall be such that the equipment can be energized immediately after the completion of the applicable tests.
- H. When applicable electrical tests and inspections specified herein, or otherwise required are completed and results reported and reviewed then the Contractor may consider that portion of the electrical equipment system or installation electrically complete. The Contractor shall then affix appropriate dated completion or calibration labels to the tested equipment. The Contractor shall notify the Engineer and Owner of electrical completion. If the Engineer or Owner finds completed work unacceptable, the Contractor will be notified in writing of the unfinished or deficient work which shall be corrected by the Contractor. The Contractor shall notify the Engineer in writing when all exceptions have been corrected. If later in-service operation or further testing determines problems attributable to the Contractor, these shall be corrected by the Contractor or suitable arrangements shall be made to suit operating circumstances.

PART 2 - PRODUCTS

2.01 TESTING EQUIPMENT

- A. Calibration:
 - 1. Furnish all material, test equipment, and power sources required for testing, calibrating and check out. All calibration and setting checks by the independent testing laboratory shall be performed with laboratory calibrated test instruments of appropriate accuracy. This test equipment shall have calibrations traceable to the National Bureau of Standards. Testing laboratory dated calibration labels shall be visible on all test equipment. Calibrations over 6 months old will not be acceptable on field test instruments. The accuracy of all test instruments shall be at least twice that of the accuracy of the equipment, device, relay or meter under test. All testing instruments shall be checked to insure satisfactory operation prior to proceeding

with the tests. Serial and model numbers of the instruments used shall be recorded on the test forms.

2. Make necessary openings in circuits for testing instruments and place and connect all instruments, equipment, and devices, necessary for the tests. Upon completion of tests, remove instruments and instrument connections and restore all circuits to permanent condition.

2.02 TESTING

A. Coordination:

1. Coordinate activities, and cooperate with others on project, to ensure that systems are energized when required, loads applied, and other requirements of Section are carried out on timely, coordinated basis.
2. Conduct tests in presence of Engineer. Notify Engineer seven calendar days or more in advance when any test to be performed, and do not start tests without Engineer's permission.
3. Other Sections of specifications require services of one or more manufacturer's representatives, to ensure that equipment supplied has been installed properly and adjusted to proper working order. Advise representative of all applicable tests in this Section, so that work will be coordinated, and tests combined where feasible.
4. It is important that equipment warranties or guarantees not be voided by testing and checkout work. The checks and tests to normally be supplemental to and compatible with the manufacturer's installation instruction leaflets and literature. Where deviations are apparent, the manufacturer's review shall be obtained prior to testing. Reasonable cooperation shall be extended to permit witnessing by the manufacturer's representative if so requested. Where any questionable repairs, modifications, significant adjustments, tests or checks are to be made, the Contractor shall contact the Engineer to determine if the work should be performed by or with the manufacturer's representative.

B. Preparation:

1. Make up no high and/or medium-voltage connections at service entrance, transformers, substations, motors, medium voltage motor control centers, switchgear and generator permanently until correct phase rotation of all equipment is determined. Install and insulate these connections temporarily, if necessary, while determining proper rotation. Make permanent connections after proper rotation has been established and subsequent to completion of insulation resistance and dielectric tests.

PART 3 - EXECUTION

3.01 INSULATION TESTS OF EQUIPMENT, CABLE, AND CIRCUITS

A. General

1. Perform DC insulation tests of the type specified on electrical equipment, apparatus and cables under any one or more of the conditions described as follows: At the time equipment such as motors, generators, transformers, power circuit breakers and switches, switchgear, motor control centers, bus duct, and similar electrical equipment is :
 - a. Delivered to the site for care, storage, and/or installation,
 - b. Prior to energization and/or placing into service and acceptance by the Owner,
 - c. When damage to the insulation is suspected or known to exist,
 - d. After repairs or modifications to the equipment affecting the insulation,
 - e. Routinely as necessary to determine or evaluate the condition of the insulation, especially moisture conditions, to determine the need for drying, cleaning or other maintenance work or protection,
 - f. Where lightning or other surge conditions are known to have existed on the circuit.
2. Insulation tests are required to be performed by the testing firm at various stages of construction. The equipment, cable and systems that require testing, the maximum test voltages, and the type tests required shall be in accordance with the applicable paragraphs of NETA.
3. List each circuit and measured resistance as test data.
4. Maintain record of all insulation resistance values. Identify conductor, or equipment, date that value was taken and resistance value. Arrange information in suitable neat tabular form and submit to Engineer.

3.02 SPECIFIC TESTS AND INSPECTIONS BY THE CONTRACTOR

A. General:

1. The following specific items of work shall be performed by the Contractor. The list is not all inclusive, nor does it define how the tests and checks are to be made. Refer to applicable sections of NETA and equipment specifications for additional details. The equipment and cable shall be deenergized and isolated as necessary to perform the tests.

2. The Contractor shall perform all tests and inspections as defined in the other sections of this specification. Tests and inspections required by these sections are not necessarily repeated under specific equipment in Paragraph 3.02
 3. All equipment received for the job and for which the Contractor is responsible to be stored and cared for per the manufacturer's instructions. It is the Contractor's responsibility to obtain such information even where the instructions are not shipped with the equipment.
- B. Equipment Test and Inspection During Construction and Prior to Acceptance Testing:
1. Motors (5 Hp and larger):
 - a. At the time of motor receipt, each motor shall be visually inspected for any physical damage and the motor meggered as described in Paragraph 1.e below.
 - b. All voltage motors shall be provided with adequate heating during storage. See Paragraph 3.01 for additional insulation tests for all motors of different voltages.
 - c. Before energizing any machine, visually inspect for serviceability. Check manufacturer's instruction manual for correct lubrication and ventilation. Verify that proper alignment has been performed. Check nameplate for electrical power requirements.
 - d. Test run all motors preferably uncoupled or unloaded, before placing into regular service. A check on the motor for rotation, speed, current and temperature rise to be made and results recorded. The proper color codes for phase identifications to be maintained. This may require lead swaps at the motor for proper rotation. A motor phase rotation meter shall be used prior to connection at motor to prevent later swaps.
 - e. Complete visual inspection and electrical test per NETA ATS. Section 7.15.1
 2. Grounding Systems:
 - a. All grounding loops and major equipment grounds shall be tested to remote earth or directly referenced to an extremely low resistance (approximately 1 ohm) reference ground benchmark. Visual inspection of all systems, raceway and equipment grounds shall be made to determine the adequacy and integrity of the grounding. All ground testing results shall be properly recorded, witnessed, and submitted.
 - b. Ground tests shall be performed in accordance with NETA ATS, Section 8.13 using a J. G. Biddle Company low resistance, Null balance type, ground testing with 'ohmmeter with test lead compensation in place. The test instrument shall be the type which compensates for potential and current rod resistances.

- c. Test each ground rod and submit tabulation of results to Engineer. Include identification of electrode, date of reading and ground resistance value in results.
 - d. Test each entire grounding system for continuity of connections and for resistance. Ensure that ground resistance of conduits, equipment cases, and supporting frames does not vary appreciably from that of system as whole and does not exceed 5 Ohms.
 - e. Where ground test results indicate the need for additional grounding conductors or rods that are not indicated on drawings or specified, additional grounding provisions shall be initiated to obtain the acceptable values. The Contractor shall be responsible for the proper installation of the grounding shown on drawings or specified and for the correction of improper installations as determined by inspections and tests.
- 3. Power Transformers:
 - a. At the time of equipment receipt, the exterior to be visually checked for any damage or any defects.
 - b. Perform complete inspection and electrical tests in accordance with NETA ATS, Section 7.2.
- 4. Low Voltage Switchgear: Refer to NETA ATS, Section 7.2. Perform all applicable tests and checks as described in NETA ATS, Section 7.2.
- 5. Protective Relays and Metering:
 - a. Prior to final check out as described in Paragraph 3.03, visually inspect and correct, where appropriate, all relays, meters, wiring and related circuitry for tightness of connections, physical damage, compliance with specifications and Vendor data, mechanical condition, freedom of movement, and presence of or possibility of moisture, dust, or other contaminants.
 - b. Clean, check, and pre-set all protective relays.
 - c. Complete inspection and electrical tests per NETA ATS. Section 7.9.
- 6. Low Voltage Motor Control Centers:
 - a. At the time of equipment receipt, the motor control centers shall be visually checked for any damage.
 - b. Perform inspection checks and electrical tests in accordance with NETA ATS. Section 7.16.2.

C. Distribution Transformers:

1. All 480-volt primary, air-cooled, transformers shall be given an insulation test, by means of a megger, after connections with the primary cables are complete. The supply cable shall be meggered with the primary winding and to the open-air circuit breaker. Secondary leads may be meggered with the secondary windings to the open load breakers.
2. Continuity and correctness of connections of all windings, and ratings shall be checked.
3. Perform inspection checks, and electrical tests in accordance with NETA ATS Section 7.2.3.

D. Wire and Cable:

1. Before energizing, the continuity and insulation resistance of every circuit external to equipment shall be measured with a megger from each wire to all others and ground and test results recorded on forms. Tests shall normally be conducted at voltages 500 volts or lower. High potential testing will normally be performed by the independent testing laboratory as described in Paragraph 3.03.
2. Insulation resistance measurements shall be taken of the following: (Refer to Paragraph 3.01 for additional information.)
 - a. Motor Feeders: With motors disconnected, measure and record insulation resistance from load side of contactors or circuit breakers. Repeat this test after motors are connected and just before energizing at lower voltage as limited by the maximum test voltage for the motor.
 - b. Motor Control Circuits (600 Volts): With push buttons and overcurrent devices connected, measure and record insulation resistance from phase to ground only. It will be necessary to lift the neutral ground on the control transformers to perform this test. Also, isolate any control elements that should not be meggered.
 - c. Lighting Panel Feeders: Measure and record insulation resistance with circuit breakers, lighting transformers and panelboards connected, but with lighting branch circuit breakers or switches open.
 - d. Lighting Branch Circuits: Measure and record insulation resistance after all lampholders, receptacles, fixtures, etc., are connected but before lamping.
 - e. Feeder Circuits: Measure and record insulation resistance with connections to circuit breakers made up but with breakers open and loads not connected.
3. All cables and wires shall be checked for proper identification numbering and/or color coding.

E. Overhead Conduit Systems:

1. The overhead conduit system shall be checked for proper installation by using the following check list: (This list not to be considered all-inclusive but as a guide for inspection).
 - a. Conduits are supported on appropriate independent supports (i.e., not on process piping, pipe ways, or piping hangers).
 - b. Exposed conduits are run in a neat workmanlike manner, parallel or perpendicular to structural members.
 - c. Conduits are routed as far away from possible fire hazards and heat sources as practical.
 - d. Conduits are supported at the required intervals.
 - e. Pull boxes and fittings are installed so that covers are easily removable. Verify that all covers are installed and tightly bolted with gaskets provided where needed.
 - f. Number of bends in the conduit does not exceed 270 degrees without a pull box installed.
 - g. Circular cross-sectional area is uniform at conduit bends. Single bends do not exceed 90 degrees.
 - h. Conduits are terminated in threaded hubs or bushings to prevent damage to wire.
 - i. Conduits joints have joint compound of the type specified and are tight and conduit ends are properly reamed and threaded not to engage less than 5 threads.
 - j. Pull fittings are of adequate size such that cable can be installed and replaced at a later date without the bending radius of the cable being less than code or manufacturer's requirements.
 - k. Seal fittings and/or sealing compound is installed at moisture barriers to prevent entry of moisture into equipment and/or where shown on plans.
 - l. Drains and conduit seals are installed on vertical conduit runs entering devices, equipment, and enclosures to prevent entrance of moisture.
 - m. Flexible conduit is installed at motors and other equipment as specified or required. Verify that all cabling and conduit runs are properly identified at each end.

F. Underground Conduit Systems:

1. Underground conduit systems shall be inspected and checked for compliance with standard practices, plans and specifications as the job progresses.
2. Upon construction completion of the underground conduit banks or runs and prior to backfill, the routing and the elevation and depth below grade shall be checked and any deviations from plans and/or specification to be recorded and in addition noted on record drawings.

G. Relay Panels, Operator and Instrument Control Panels, Communications Systems, Static Equipment, Programmable Controllers, Micro-Processors, Battery Systems and Other Miscellaneous Equipment:

1. Upon receipt of equipment, each item shall be inspected for damage, loose or missing parts.
2. Upon completion of equipment installation, all equipment and their control devices shall be visually and functionally tested for tightness of connections and for proper operation. In the case of battery systems, static inverters and the like, manufacturer's recommended test and installation manuals shall be reviewed and complied with. In the case of operator, instrument, and relay panels and cabinets or devices used solely for control, each circuit, where possible, shall be functionally tested for proper operation and conformance with drawings. Where functional testing is deemed undesirable by the Owner's Representative from a safety or plant operational standpoint, then continuity and terminal connection verification checks will be adequate. The Contractor shall insure that instruments and associated components cannot be energized until instructed by the Owner's Representative. For functional, operational, and calibration checks of instrument loops, refer to the instrument installation specifications.
3. Panelboard electrical checks shall be as included in the Wire and Cable section of this specification, Paragraph 3.02.E. Panelboards to be checked for proper circuit identification on the door schedule.

H. Sealing of Openings: The Contractor shall inspect the entire job with the Engineer to ensure that all openings are properly sealed as specified elsewhere.

I. Record Drawings: The Contractor shall maintain a master set or record drawings that shows changes and any other deviations from the base drawing. The markups shall be made as the changes are done. At the conclusions of the job, these master record drawings shall be complete and delivered to the Owner's Representative for forwarding to the design group.

3.03 LOSS OF AC POWER TEST

- A. After the satisfactory completion of all electrical system testing, perform a loss of AC power test. The main circuit breaker at the facility shall be placed in the "OPEN" position

by the Contractor using all required safety and personal protective equipment in accordance with NFPA 70E.

B. During this test the representatives from the following organizations shall be present:

1. Contractor
2. Division 40 SCADA System Supplier
3. Engine Generator System Supplier
4. Main Electrical Distribution Equipment Supplier
5. Adjustable Frequency Drive Equipment Supplier
6. Owner Representative

C. The test shall verify that all electrical equipment in the system can withstand the loss of utility AC power. Under standby generator power, all automatically started equipment shall be witnessed to start and accept load without tripping offline or initiating false alarms.

D. The test shall be performed with the facility operated at near or full load.

E. All alarms associated with the loss of utility power and startup of the standby generator system shall be recorded.

1. Any nuisance type alarms associated with microprocessor faults or troubles shall be investigated and action taken to prevent reoccurrence.
2. When all nuisance type alarms have been resolved, the test shall be repeated to verify acceptable operation of the facility electrical system upon loss of utility power.

3.04 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 20 00
ELECTRIC MOTORS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Low voltage electric motors and accessories, furnished under other Sections, and which are a part of equipment assemblies shall be in conformance with the requirements specified in this Section, unless otherwise noted. This section includes performance, and descriptive type specifications.
- B. Unless otherwise specified or approved, all electric motors furnished and installed by the Contractor shall conform to the requirements specified herein.
 - 1. Motors connected to Variable Frequency Drives shall be inverter duty rated in accordance with the requirements of NEMA MG-1.
 - 2. Motors rated 1 hp or greater shall be premium efficient type per NEMA MG-1.

1.02 REFERENCES

- A. Institute of Electrical and Electronics Engineers (IEEE).
 - 1. 112: Test Procedures for Polyphase Induction Motors and Generators.
- B. National Electric Manufacturer's Association (NEMA):
 - 1. MG-1: Motors and Generators.
- C. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).

1.03 SUBMITTALS

- A. Shop drawings: Submit the following in accordance with Section 01 33 00 "Submittals".
- B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
 - 1. Descriptive literature and motor characteristics.
 - 2. Shop drawings and descriptive data to include:
 - a. Complete list of all motors to be furnished.

- b. Outlines, dimensions, weights, and wiring diagrams.
 - c. Location of main and accessories boxes with size of conduit entrance.
 - d. Efficiency and power factor at 1/2, 3/4 and full load.
 - e. Bearing design data and grease requirements.
 - f. Nameplate data.
 - g. Shop test report.
 - h. Field acceptance test report.
 - i. Strip heaters KW and voltage ratings.
 - j. Power factor correction capacitors, where required.
 - k. Built in overload protection device.
 - l. Starting restrictions, acceleration time-current curve of motor starting load (100 hp and larger).
 - m. Thermal damage curve and allowable stall time, full voltage (100 hp and larger).
3. Submit Pump, Motor and VFD Coordination Certificate. Refer to Section 01 33 00 "Submittals" for form.

1.04 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.
- B. Motors to comply with the latest reference standards listed below.
 - 1. National Electrical Code (NEC).
 - 2. Underwriters Laboratories, Inc. (UL).
 - 3. National Electric Manufacturer's Association (NEMA).
 - a. NEMA Standard MG-1 - Motors and Generators.
 - 4. Anti-Friction Bearing Manufacturer's Association, Inc. (AFBMA).
 - 5. American National Standard Institute (ANSI).
 - 6. Institute of Electrical and Electronics Engineers (IEEE).

- a. IEEE Standard 112 - Test Procedures for Polyphase Induction Motors and Generators.
 - C. Routine tests shall be performed on representative motors, and shall include the information described on NEMA MG1-12.54 Report of Test Form for Routine Tests on Induction Motors. Efficiency shall be determined in accordance with IEEE Publication No. 112, Method B. Power factor shall be measured on representative motors.
- 1.05 DELIVERY, STORAGE AND HANDLING
- A. Shipping:
 - 1. Ship motors assembled to driven equipment complete except where partial disassembly is required by transportation regulations or for protection of components.
 - 2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
 - 3. Deliver spare parts at same time as pertaining materials. Delivery to Owner after completion of work.
 - B. Receiving and Storage:
 - 1. Inspect and inventory items upon delivery to site.
 - 2. Store and safeguard equipment and material in heated storage facility as recommended by equipment manufacturer and required by Section 01 66 10.
 - 3. Protect motors from moisture at all times.
 - C. Prolonged Storage:
 - 1. For extended outdoor storage, remove motors from equipment and store separately.
 - 2. If storage is anticipated to be longer than two months, store in accordance with the manufacturer instructions including the following additional steps.
 - 3. Maintain motor space heaters energized.
 - 4. Fill the oil reservoirs of motors with sleeve bearings to the proper level with the specified oil.
 - 5. Motors with anti-friction bearings to receive an initial change of grease and then be re-greased every six months.
 - 6. Remove the motor shaft braces and the rotate motor shaft every two weeks. Replace the shaft braces prior to relocation to the installation site. Under no circumstances should the motor be lifted without the braces in place.

PART 2 - PRODUCTS

2.01 MOTOR MANUFACTURERS

- A. General Electric Company.
- B. Baldor-Reliance Electric/ABB.
- C. TECO-Westinghouse.
- D. Toshiba.
- E. WEG.

2.02 ELECTRIC MOTOR RATINGS

- A. Voltage Ratings:
 - 1. Unless otherwise specified, motors with ratings of 1/2 to 600 hp shall be rated 460 volt (nameplate rating), three-phase, 60 Hertz; motors of 1/3 hp or less to be rated 115-volt, single-phase, 60 Hertz.
- B. The following specific motor requirements shall be in the equipment specifications:
 - 1. RPM.
 - 2. Motor enclosure type.

2.03 MOTOR DESIGN REQUIREMENTS

- A. Motor heaters shall be supplied on all motors installed outdoors or in unheated areas. Heaters shall be of the cartridge or flexible wrap around type installed within the motor enclosure adjacent to core iron. Heaters shall be rated for 120 volt, single phase with wattage as required. The heater wattage and voltage shall be embossed on the motor nameplate.
- B. Unless otherwise specified or permitted all electric motors furnished and installed by the Contractor shall conform to the requirements hereinafter set forth.
- C. Motors connected to variable frequency drives shall be inverter duty rated.
- D. Every motor shall be of sufficient capacity to operate the driven equipment under all load and operating conditions without exceeding its rated nameplate current or power or its specified temperature limit at rated voltage. Each motor shall develop ample torque for its required service throughout its acceleration range at a voltage 10 percent below nameplate rating. Where indicated on the electrical drawings to be operated on a reduced voltage starter, the motor shall develop ample torque under the conditions imposed by the reduced voltage starting method.

- E. The motor shall have sufficient capacity to operate the driven equipment as given in the equipment detail specifications. The motor shall not be required to deliver more than its rated nameplate horsepower, at unity (1.0) service factor, under any condition of mechanical or hydraulic loading.
- F. The motor shall be suitable for rated horsepower and full service factor operation at minimum 5000 feet elevation above sea level.
- G. Type of Motors:
 - 1. All motors shall be NEMA Design B or of a type having starting characteristics and ruggedness as may be necessary under the actual conditions of operation and, unless otherwise specified, shall be suitable for full-voltage starting.
- H. Insulation:
 - 1. All motors shall have Class B or Class F insulation with temperature rise by resistance at full load rating of a Class B insulation in accordance with NEMA Standards for Motors and Generators, NEMA MG1, and based on a maximum ambient temperature of 40 degrees C unless otherwise specified.
 - 2. Insulation systems shall be manufacturer's premium grade, resistant to attack by moisture, acids, alkalies and mechanical or thermal shock for 480 volt motors. Provide 80 degrees C, Class B rise or better by resistance at 100 percent load and provide a Class F insulation system, suitable for an ambient temperature motor operation of 0 to 40 degrees C at no less than 4,500 feet above sea level for inverter duty motors. This temperature rise shall be met when motors are operated and controlled with the VFD(s). The motor insulation system shall have full capability to handle the common mode voltage conditions imposed by the VFD.
 - 3. Motors for outdoor service shall have vacuum/pressure impregnated epoxy insulation for moisture resistance.
 - 4. Insulation for inverter duty motor windings shall meet or exceed the Pulse Endurance Index for magnetic wire and shall not be injured when exposed to repeated pulse type waveforms, repetitive high voltage transients, switching frequency and rate of rise of the pulse. Class H varnish shall be used.
- I. Enclosures:
 - 1. Motors shall have a steel or cast iron frame and a cast iron or stamped steel conduit box, as specified below. Conduit box shall be split from top to bottom and shall be capable of being rotated to four positions. Synthetic rubber-like gaskets shall be provided between the frame and the conduit box and between the conduit box and its cover. Motor leads shall be sealed with a non-wicking, non-hygroscopic insulating material. A frame mounted pad with drilled and tapped hole, not less than 1/4-inch diameter, shall be provided inside the conduit box for motor frame grounding.

- a. Totally enclosed fan cooled: TEFC motors shall have a steel or cast iron frame, cast iron end brackets, cast iron conduit box, 1.15 service factor at 40 degrees C, tapped drain holes (corrosion resistant plugs for frames 286T and smaller and automatic breather/drain devices for frames 324T and larger) and upgraded insulation by additional dips and bakes to increase moisture resistance.
- b. Totally enclosed non-ventilated: TENV motors shall include the same rating and accessories as specified for TEFC motors.

J. Special Purpose Motors:

1. Chemical duty motors shall be provided with severe duty rating. Motors shall be of the corrosion resistant type conforming to motors designated by the manufacturer as Corro-Duty, Mill and Chemical, Custom Severe Duty, or similar quality designation. Severe duty motors shall have a cast iron frame, cast iron end brackets, cast iron conduit box and 1.15 service factor at 40 degrees C and tapped drain holes (corrosion resistant plug for frames 286T and smaller and automatic breather/drain devices for frames 324T and larger).
2. Hermetically sealed air conditioning units, elevators, hoists, cranes and other devices complying with special safety codes shall be furnished with motors, control equipment, accessories and safety devices for approved, safe, and efficient operation, in accordance with the manufacturer's standards and to be rated for the duty cycle as specified for the driven equipment. Minimum service factor 1.15 above 3 hp.
3. Submersible motors shall be manufacturer's standard.
4. Synchronous and wound rotor motors shall be specified elsewhere in the specifications when required.
5. Inverter duty rated: Motors for operation on variable frequency drives shall meet current power quality levels published in NEMA MG1, Part 31. Enclosures shall be equal to those furnished for severe duty or explosion proof motors. Motor shaft and bearings shall be insulated. Internal service factor shall be 1.15 that of the nameplate. Ventilation system shall be designed for maximum heat transfer. Stator laminations shall be stagger-stacked and stamped from high grade electrical steel to minimize eddy-current losses and heat build-up caused by inverter induced harmonics. Rotors shall be configured to minimize skin-effect heating.

K. Auxiliary Devices:

1. Three phase motors shall not be provided with starting capacitors.
2. Single-phase motors requiring switching devices and auxiliary starting resistors, capacitors, or reactors shall be furnished as combination units with such auxiliaries either incorporated within the motor housings or housed in suitable enclosures

mounted upon the motor frames. Each combination unit shall be mounted upon a single base and to be provided with a single conduit box.

3. Motors 200 hp or over, or where specified in other sections, shall have built-in overload protection device.
 - a. Winding temperature detectors, shall be factory installed, embedded, bi-metallic switch type or thermistors with relay with leads terminating in the main conduit box. This device shall protect the motor against damage from overheating caused by single phasing, overload, high ambient temperature, abnormal voltage, locked rotor, frequent starts or ventilation failure. The switch shall have normally closed contacts. Not less than three detectors shall be furnished with each motor.
 - b. Resistance Temperature Detectors (RTD) shall be factory installed with two stator winding RTDs embedded in each phase, total of six, and one RTD for each bearing, total of two. RTDs shall be 3-wire, 100-ohm platinum, and prewired to an auxiliary terminal box on the motor frame. Lead wires shall be stranded copper wire with Dupont Kapton insulation.

L. General Design of Motors:

1. Motors shall comply with the latest NEMA Standards Publication No. MG1 for Motors and Generators, unless otherwise specified.
2. All polyphase non-explosion proof motors shall be designed for energy efficient operation and meet the requirements of MG1-12.53 a and b.
3. Motor windings shall be braced to withstand successfully the stresses resulting from the method of starting. The windings shall be treated thoroughly with acceptable insulating compound suitable for protection against moisture and slightly acid or alkaline conditions.
4. Bearings shall be of the self-lubricating type, designed to ensure proper alignment of rotor and shaft and to prevent leakage of lubricant.
 - a. Bearings for open motors shall be of the sleeve or ball type, as specified under the respective items of mechanical equipment.
 - b. Bearings for totally enclosed and explosionproof motors shall be of the ball type.
 - c. Bearing minimum L-10 fatigue life in hours at 100 percent load shall be 60,000 (unless a greater value is indicated elsewhere in the specifications set).
 - d. Bearing grease shall be of the 120 degrees C thermal capability type.

5. Vertical motors shall be provided with thrust bearings adequate for all thrusts to which they can be subjected in operation.
6. Vertical motors of the open type shall be provided with drip hoods of acceptable shape and construction. When the drip hood is too heavy to be easily removed, provision to be made for access for testing.
7. All three phase two speed motors shall be of the two-winding design.
8. All three phase motors shall be provided with a 1.15 service factor.
9. Three phase motors shall be of cast iron construction including frame and end brackets.
10. Totally enclosed motors shall be provided with automatic breather and drain
11. Motor nameplates shall be stainless steel.
12. Motor Terminal Boxes and Leads:
 - a. Motors shall be furnished with oversize conduit terminal boxes to provide for making and housing the connections, and with flexible leads of sufficient length to extend for a distance of not less than 4 inches beyond the face of the box. The size of cable terminals, and terminal box conduit holes shall be as permitted by the Engineer. An acceptable type of solderless lug to be furnished. Totally enclosed and explosionproof motors to have cast-iron terminal boxes.
 - b. Leads for space heaters and auxiliary devices shall be brought out into an auxiliary, cast, conduit box on the motor side opposite to the main terminal box. Auxiliary box to have 1 inch threaded conduit openings (minimum) and shall be so constructed that conduit entrance may be placed at top, bottom, or either side.
 - c. A grounding terminal shall be provided in the main terminal box and a bronze grounding bolt to be furnished at the conduit side of the motor frame.

M. Motor Efficiencies:

1. Three phase motors rated 1 hp and larger shall be of the premium efficiency, "Design E", type per Table 12.1 of NEMA MG1 Part 12. Motors shall have a NEMA Nominal Efficiency not less than the values referenced in NEMA MG1. Efficiency values shall be based on tests performed in accordance with IEEE Publication No. 112, Method B. Motors with horsepower or rpm's not listed shall conform to comparable standards of construction and materials as those for listed motors.

N. Shop Painting:

1. Unless otherwise specified, motors shall be given a shop application of paint filler or enamel sealer, a flat coat of undercoated for enamel, and two coats of enamel or, in lieu of this treatment, other corrosion-resistant treatment customary with the manufacturer.

O. Motor Data:

1. The Contractor shall furnish the Engineer with five certified copies of characteristic curves of each motor furnished, except 115-volt motors. Curves shall be supplied as a part of the driven equipment submittal.

P. Motor Shop Tests:

1. Motor shop tests shall be made in accordance with the IEEE Test Codes as specified in the NEMA MG1 Standards for Motors and Generators. NEMA report-of-test forms to be used in submitting test data.
2. Motor efficiency shall be determined by use of IEEE Standard 112 Test Method B, and by use of MGI-12.53 a and b.
3. For induction motors larger than 100 hp, complete tests of each motor furnished to be made and certified tests data sheets to be submitted, unless witness shop tests are required by the technical specifications pertaining to the equipment. Each motor shall be tested at rated voltage for: efficiency and power factor at 50, 75, and 100 percent of it rated horsepower; for temperature rise, torque, no-load current, starting current, full load current, and dielectric strength; and for compliance with all specified performance requirements.
4. For induction motors 5 hp, up to and including 100 hp, copies of routine tests reports of electrically duplicate motors shall be furnished.
5. For motors 3 hp or less, no test data need be furnished.

Q. Spare Parts:

1. Provide in accordance with Section 01 61 00 and as specified.
2. Furnish one spare bearing of each type for each motor size and type.

2.04 ELECTRICAL INTERFACE

- A. All items of electrical equipment that are furnished with process, heating, ventilating, or other equipment shall conform to the requirements specified under the applicable electrical sections of the Division 26 specifications. Enclosures for electrical equipment such as switches, starters, etc., shall also conform to the requirements specified under the applicable electrical sections of the Division 26 specifications.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Verify heaters are energized on motors installed in outdoor or unheated areas.
- B. After motor installation but before connection to power wiring, test motor winding insulation in accordance with the applicable Division 26 requirements.
- C. After connection to power wiring, check for operating temperature, correct rotation, vibration, alignment and operating current drawn under load.
- D. Submit all motor test results for review and record.

3.02 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 22 14

DRY-TYPE TRANSFORMERS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide copper-wound, dry-type transformers as indicated and in compliance with Contract Documents.
- B. Provide transformer windings and enclosures rated for the installation location and in accordance with the requirements herein.
- C. Transformers shall be “Energy Star” rated.

1.02 REFERENCES

- A. American National Standards Institute (ANSI):
 - 1. Z55.1: Gray Finishes for Industrial Apparatus and Equipment
- B. ASTM International (ASTM):
 - 1. D635: Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position.
- C. National Electrical Manufacturers Association (NEMA):
 - 1. ST 20: Dry-Type Transformers for General Applications (ANSI C89.2) - withdrawn
- D. International Electrical Testing Association (NETA):
 - 1. ATS: Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.
- E. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).
- F. Underwriters' Laboratories, Inc. (UL):
 - 1. 506: Standard for Specialty Transformers.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Submit shop drawings and manufacturer's product data of the transformer. Information to include:
 - 1. Outline drawings including dimensions.
 - 2. Weight.
 - 3. Ratings and tap configuration.
 - 4. Core and coil material.
 - 5. Insulation system description.
 - 6. Loss data and efficiency.
 - 7. Accessories.
 - 8. Mounting requirements.
 - 9. Nameplate data.
 - 10. Testing data.
- C. Submit a Certificate of Compliance indicating conformance to the Seismic Requirements specified. Certificate shall be signed and sealed by a Professional Structural Engineer holding current registration in the state for work of this project.

1.04 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements specified in Section 01 41 20.
- B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01 66 10 "Deliver, Storage and Handling".
- B. Deliver transformers individually wrapped for protection and mounted on shipping skids.

- C. Accept transformers on site. Inspect for damage.
- D. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, water, construction debris, and traffic.
- E. Handle and stored in accordance with manufacturer's written instructions. Lift only with lugs provided. Handle carefully to avoid damage to transformer internal components, enclosure, and finish.

1.07 REQUIREMENTS OF REGULATORY AGENCIES

- A. Furnish transformers in accordance with NEMA ST 20 and UL 506.
- B. Furnish transformers with UL listing mark.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Square D Co.
- B. Siemens Inc.
- C. General Electric Company.

2.02 TRANSFORMERS

- A. In NEMA 1 and NEMA 12 designated areas, furnish general purpose, ventilated, dry-type transformers in indoor-style enclosure. On single-phase transformers and three-phase transformers above 9 KVA, provide not less than two windings per phase.
 - 1. Temperature rise at hottest spot shall conform to NEMA Standards, and shall not bake and peel off the enclosure paint after the transformer has been placed in service.
 - 2. Ventilation openings shall prevent accidental access to live components.
 - 3. Thoroughly clean and paint enclosure at the factory with manufacturer's prime coat and standard finish.
- B. In NEMA 4 or NEMA 4X designated areas, provide transformers with encapsulated windings and stainless-steel enclosures.
- C. Auto transformers shall not be used in place of general purpose dry-type transformers.
- D. Furnish at least two 2-1/2 percent full capacity taps above and below nominal in high voltage winding for transformers rated above 15 kVA. Two five percent taps below rated voltage for transformers rated 15 kVA and below.

- E. Furnish transformers, single-phase or three-phase, as indicated. Furnish transformers with kVA ratings as indicated.
- F. Furnish three-phase transformers, Delta-Wye connected as indicated, and conforming to latest NEMA standards. Scott Tee connected transformers are not acceptable above 9 kVA.
- G. Isolate core and coil from enclosure using vibration-absorbing mounts.
- H. Furnish transformers with primary and secondary voltages and frequency, wye connected, as indicated for secondary windings, with neutral brought out for cable termination.
- I. Furnish transformers designed for continuous operation at rated kVA with normal life expectancy as defined in NEMA ST 20.
- J. For transformers rated 30 kVA or less, ensure that performance is obtained without exceeding 115 degrees C average temperature rise by resistance or 145 degrees C hot spot temperature rise in 40 degrees C maximum ambient and 30 degrees C average ambient. Do not allow maximum coil hot spot temperature to exceed 185 degrees C.
- K. Furnish transformers with 220 degrees C insulation materials with proven reliability for 15 kVA transformers and above. Furnish 185 degrees C insulation on transformers below 15 kVA.
- L. Transformers rated greater than 30 kVA shall be provided with low-loss 80 degrees C full load operating temperature rise rating.
- M. Furnish transformers made of flame-retardant materials that will not support combustion as defined in ASTM D635.
- N. Furnish core mounting frames and enclosures of welded and bolted construction with mechanical rigidity and strength to withstand shipping, erection and short circuit stresses.
 - 1. Cores shall be grain oriented, non-aging, and silicon steel.
 - 2. Coils shall be continuous windings without splices except for tapes.
 - 3. Coil loss and core loss shall be minimum for efficient operation.
 - 4. Primary and secondary tap connections shall be razed or pressure type.
 - 5. Coil windings shall have end fillers or tie downs for maximum strength.
- O. Transformers located in areas where fire protection system sprinklers are located shall be provided with NEMA 2 rated enclosure to protect transformer from water falling at an angle of 75 degrees from the vertical.
- P. Furnish transformers designed to meet UL thermal overload test of 200 percent of rated current for one half hour.

- Q. Furnish transformers not to exceed the 65 degrees C rise established by UL as safe limit for maximum surface enclosure temperature.
- R. Furnish transformers with sound level not exceeding:

Average Sound Level in dB

kVA	NEMA ST 20
0-09	40
10-50	45
51-150	50
151-300	55
301-500	60

- S. Install transformers with sound levels greater than 50 dB on resilient vibration isolating mounts to prevent amplification of sound. Transformers rated 15 kVA and larger to be provided with rubber washer anti-vibration pads and molded neoprene assemblies to isolate noise from the transformer to the mounting surface.

2.03 SHOP TESTING

- A. Submit results of audible-sound-levels tests in accordance with NEMA ST 20 of similar size transformer.
- B. Production test each unit in accordance with NEMA ST 20.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Set transformer plumb and level. Install and guard transformers as specified by latest NEC and ANSI standards, and in accordance with manufacturer's printed instructions.
- B. Furnish adequate space around transformer to dispose of transformer full load losses by ventilation without creating excessive ambient temperature. Verify working clearances as required by the NEC are met.
- C. Unless indicated otherwise on drawings, wall mount with suitable supports, transformers rated 15 kVA and below. Floor mount transformers rated above 15 kVA unless otherwise indicated on the drawings. In addition, all transformers located in NEMA 4 or NEMA 4X designated areas shall be wall mounted on Type 316 stainless steel channel supporting systems with Type 316 stainless steel concrete inserts, minimum 7 feet-6 inches (2.3 m) AFF. Provide all required seismic restraints.
- D. Provide lifting lugs and jacking plates on transformer enclosure.

- E. Provide concrete pad for all floor mounted transformers.
- F. Clean metal parts, excepting cores and core mounting frames, then rust-proof and apply heavy coating of inert primer. Paint coverplates and external metal parts with two finish coats of ANSI Z55.1 No. 61 or 49 Gray.
- G. Verify mounting pads are in place to reduce noise.
- H. Install grounding and bonding in accordance with the drawings and Section 26 05 26 “Grounding and Bonding for Electrical Systems”.

3.02 FIELD TESTING

- A. Inspect and test in accordance with NETA ATS, except Section 4.
- B. Perform inspections and tests listed in NETA ATS, Section 7.2.1.

3.03 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 “Execution and Closeout Requirements”.

END OF SECTION

SECTION 26 24 13

LOW-VOLTAGE SWITCHBOARDS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide a 480 volt, 3-phase, 4-wire, electrical distribution rated switchboard, free-standing construction with circuit breakers, power monitor, distribution class lightning arrestors, surge arrestors, automatic transfer switch, and group-mounted circuit breakers as indicated and in compliance with Contract Documents.
- B. Provide services of a factory-trained service engineers, specifically trained to check connections, interwiring to equipment, adjustments and assisting in tests.
 - 1. Provide guidance during installation to check work of installing contractor.
 - 2. Instruct personnel in care and operation of equipment.
 - 3. Test main breaker and all branch breakers including spares; insure proper setting.
 - 4. Inspect installation and adjust as necessary when switchboard is ready to be energized and put into service.
 - 5. Test ground fault system and set all protective devices.
 - 6. Certify that equipment has been inspected and is ready to be placed into service.

1.02 REFERENCES

- A. Federal Specifications (FS):
 - 1. QQ-S-365B: General Requirements for Silver Plating, Electro Deposited
 - 2. W-C-375: Molded Case Circuit Breakers.
- B. National Electrical Manufacturers Association (NEMA):
 - 1. AB 1: Molded-Case Circuit Breakers, Molded Case Switches, and Circuit-Breaker Enclosures.
 - 2. PB-2: Switchboards.
- C. Underwriter's Laboratories (UL):
 - 1. 489: Standard for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures.

2. 91: Switchboards.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Manufacturer's certified shop drawings including outlines, schematics and wiring diagrams, coordination curves, certified test data reports, maintenance data, operating instructions and parts list with list of recommended spare parts.
- C. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final settings of devices.

1.04 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements specified in Section 01 41 20.
- B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.
- B. Provide spare parts as recommended by manufacturer.
- C. Package spare equipment in containers bearing labels clearly indicating contents and in what equipment used.
- D. Deliver spare parts at same time as equipment. Properly store and safeguard such spare parts until completion of work, at which time deliver to Owner.

1.06 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00 "Quality Requirements".
- B. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation.
- C. Single-source Responsibility: Provide switchboard products that are new, and from the same manufacturer for each building or job. Switchboard components shall be from the same manufacturer or listed as an assembly thereof.
- D. The manufacturer shall confirm and state the measure of and the set of the features that support the ease and speed of which corrective maintenance (CM) and preventive

maintenance (PM) can be conducted on the proposed system. The Mean Time To Repair (MTTR), the measure used to quantify the time required to perform CM and Mean Preventive Maintenance Time (MPMT), a measure commonly used to quantify the time required to perform PM are to be confirmed by the manufacturer.

E. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified. Times listed are for each switchboard.
2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment and field erection:
 - a. 2 person-days
3. Functional Testing: Check alignment and perform a functional test. Tests to include all items specified.
 - a. 2 person-days
4. Testing: Field performance test equipment specified.
 - a. 2 person-days
5. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
6. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
 - a. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:
 - (1) 1 person-day - switchboard

1.07 DELIVERY AND STORAGE

A. Shipping:

1. Ship equipment, and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
3. Deliver spare parts at same time as pertaining equipment. Delivery to Owner after completion of work.
4. Channel bases:
 - a. For front and rear, minimum of 1-1/2 inch (37 mm) by 3 inch (74 mm) standard channel with suitable holes for mounting switchboard, and holes for grouting and flow of concrete.
 - b. Shipped in advance with accurate template of switchboard mounting holes or dimension layout drawing for embedding in concrete pad, floor slab, or securing to floor. Coordinate with all contractors.
5. Attach lifting angles to main frame of structure to distribute weight equally. Deflection or distortion is cause for rejection.
6. Provide heavy plastic envelope directly over switchboard to protect against dust, dirt, and moisture. Provide lifting angles outside of envelope.

B. Storage:

1. Inspection and inventory items upon delivery to site.
2. Store and safeguard equipment, material and spare parts.

1.08 WARRANTY

- A. Manufacturer's Warranty: Manufacturer agrees to repair or replace switchboard that fail in materials or workmanship within specified warranty period.
1. Switchboard Warranty Period: 18 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers acceptable contingent upon products' compliance with the specifications:
1. Eaton
 2. ABB
 3. Siemens Corp.
 4. Schneider/Square D.

2.02 SWITCHBOARD EQUIPMENT

A. Structure:

1. Totally enclosed switchboard dead front, free standing, front and rear aligned with front accessibility only required.
2. General purpose switchboard with frame-work of UL gauge formed steel and channels and secured together to support all cover plates, bussing and component devices during shipment and installation. Formed removable closure plates on the front, rear and sides. Closure plates shall be single tool, screw removable.
3. Refer to contract documents for NEMA enclosure type.
4. Ventilation provided when required.
5. Each section includes a single-piece removable top plate.

B. Incoming Line; devoted to the main service entrance utility supply.

1. Utility line section consists of:
 - a. Device:
 - (1) Main RMS sensing, disconnect device shall be a solid state, true RMS adjustable trip, insulated case, circuit breaker. The main breaker shall be provided fixed style.
 - (2) In conjunction with the main device, provide undervoltage capacitor trip, phase failure and phase reversal protection, alarm switch, auxiliary switches, long time, short time, instantaneous trip and selective coordination ground fault protection with downstream ground fault protective devices.
 - (3) Provide “push to trip” push button on circuit breaker to allow manual trip with risking exposure to live parts.
 - (4) Provide trip indicator to identify type of fault, and indicate OVERLOAD, SHORT CIRCUIT or GROUND FAULT on display.
 - (5) Main breaker to be provided with capability of locking in the open position.
 - (6) The trip unit shall include local setup and readout of trip settings and digital display metering of:
 - (a) 3-phase volts
 - (b) frequency

- (c) KW
 - (d) KVA
 - (e) amps
- b. Cable termination suitable for cable entry from below, located at bottom section.
- c. Line side terminals fitted with two-hole, compression-type lugs for four copper cable conductors per phase.
- d. Provide section for Utility service meter and CTs. Verify size of section with Utility equipment.
- e. Tinned bus of suitable rating and bracing.
- f. Tinned copper ground bus 1/4-inch x 2 inch (6 mm x 50 mm) extended and tied through to all adjoining sections.

C. Power Monitor:

- 1. Provide microprocessor-based monitoring device to provide local and remote monitoring of the electrical system.
 - a. Voltage input of 120 volts using voltage transformers.
 - b. Current input from current transformers, phase A, B, C and ground.
- 2. Comply with ANSI C12.16, Class 10.
- 3. Display data:
 - a. Current A, B, C, Average, Neutral, Ground.
 - b. Voltage - Phase to phase
 - (1) Phase to neutral
 - (2) Phase to ground
 - (3) Average values
 - c. Power - Watts
 - (1) Vars
 - (2) VA

- (3) Phases A, B, C and System
 - d. Energy - KWH
 - (1) KVARH
 - e. Frequency
 - f. Demand - System current
 - (1) KW
 - (2) KVAR
 - (3) KVA
 - g. Power Factor - Phases A, B, C, System
 - h. Percent THD Current - Phases A, B, C, N
 - i. Percent THD Voltage:
 - (1) Phase to phase
 - (2) Phase to neutral
 - j. Minimum and maximum values
 - k. Monitor past events and thresholds.
- 4. Provide power monitor with Ethernet connection and capable of communicating using Modbus TCP/IP protocol.
- D. Group Mounted Branch Sections:
 - 1. The switchboard group-mounted circuit breaker branch devices shall be totally front accessible and front connectable.
 - 2. The circuit breaker connections to the distribution panel bussing shall be such that the connections grip the bus bars firmly under high-fault conditions.
 - 3. Provide wiring gutters of sufficient space to allow cable termination.
 - 4. Provide covers for gutter space and future breaker space with formed sheet steel.
 - 5. Provide circuit breakers as indicated on the one-line diagram.
- E. Enclosure - General Requirements:

1. Switchboard shall be completely self-supporting structure of the required number of vertical sections bolted together to form one metal-enclosed switchboard 90 inch (2.29 m) high.
2. Sides, top and rear covers shall be code gauge steel, bolted to the switchboard structure.
3. The frame structure members shall be die-formed, 12-gage steel bolted together and reinforced at corners with rugged gussets internal and external to the structure members.
4. The switchboard shall be completely front accessible for all installation and maintenance activities.
5. At the main service entrance section, the sheet steel panels located on the exterior and side of the section shall be removable for servicing the section.
6. The switchboard frame shall be mounted to sills embedded in a concrete housekeeping pad.
7. The switchboard and devices are fully rated at minimum short circuit rating of 65,000 rms symmetrical Amperes. Refer to contract documents for additional requirements.
8. Switchboard shall include all protective devices depicted on contract drawings and as specified in these specifications with necessary interconnection, instrumentation and control wiring.
9. Main breaker shall be individually mounted.
10. All buses are tin plated copper, supported with high impact, non-tracking insulating material, and braced to withstand mechanical forces exerted during short circuit conditions. All bus connections shall utilize silver plated bus bar surfaces.
11. The current density of the bus shall be determined from UL-891 heat rise testing and shall be rated for 1000 amperes per square inch cross-section.
12. A tinned copper, 1/4-inch x 2 inch (6 mm x 50 mm) ground bus shall furnished and secured to structure.
13. A-B-C type bus arrangement (left-to-right, top-to-bottom, front-to-rear) is to be used throughout to assure convenient and safe testing and maintenance.
14. The vertical main bus bars are furnished for future branch devices. Device mounting bolts and bus connecting straps are supplied with future unit devices. Full height bus bars shall be supplied.
15. All vertical sections comprising the switchboard are rear-aligned.

16. All steel surfaces shall be chemically cleaned and pre-treated with an iron-phosphate pre-treatment or equivalent process, providing a bond between paint and metal surfaces to help prevent the entrance of moisture and formation of rust under the paint. The switchboard exterior shall be finished with ANSI-61 light gray paint. Provide touch-up paint for coatings nicks and scratches after installation and testing.
17. Control wiring, fuse blocks and terminal blocks within the switchboard shall be furnished when required. All control wires leaving the switchboard shall be provided with terminal blocks with numbering strips.
18. All hardware used on conductors shall have a high tensile strength, and a protective finish.
19. Switchboard shall be provided with lifting means, and capable of being rolled or moved into installation position and bolted directly to floor sills.
20. Make provision for conduit and cable entrance from top or bottom as indicated on the drawings.

2.03 SWITCHBOARD SILLS

- A. Provide steel channel sills with drilled holes for mounting, aligning and bolting switchboard in place. Method of mounting as indicated. Provide in size recommended by switchboard manufacturer and acceptable to Engineer.
- B. Shop paint completed sills with two coats of a polyamide epoxy coating with a minimum dry film thickness of 2.5 mils (0.6 mm) per coat or before setting in place.
 1. Surface preparation shall conform to paint manufacturer's printed instructions.
 2. Provide additional coating for field touch-up specified in paragraph 3.01.

2.04 SWITCHBOARD INSTRUMENT TRANSFORMERS

- A. Switchboard section for main breaker shall include three 480 to 120-volt potential transformers, and one 480 to 120/240 volt single phase control power transformer. Control and potential transformers to be connected ahead of main circuit breaker and to include current limiting primary fuses. Mount transformers in isolated compartment within secondary bus transition section. Also provide, on main bus for each main breaker four window type 3000/5A current transformers for metering phase and neutral current and one 200/5A current for monitoring ground currents.
- B. Tie all instrument transformer outputs to power monitor.

2.05 FEEDER PROTECTIVE DEVICES

- A. All feeder protective devices shall be molded case circuit breakers with inverse time tripping characteristics as indicated on the contract documents and in this specification.

- B. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position. Contacts shall be non-welding silver alloy and arc extinction shall be accomplished by means of DE-ION arc chutes. A push-to-trip button on the front of the circuit breaker shall provide a local manual means to exercise the trip mechanism.
- C. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the contract documents.
- D. Circuit breakers to be either draw-out or fixed mounted, as indicated on contract documents
- E. Circuit breakers shall have microprocessor-based rms sensing trip units as specified below:
 - 1. All electronic trip molded case circuit breakers shall be equipped with a true RMS sensing, solid-state tripping system consisting of at least three current sensors microprocessor-based trip device and trip actuator. The trip unit shall use microprocessor-based technology to provide the basic adjustable time-current protection.
 - 2. Provide trip units with integral arc flash reduction mode for 1200A frame and above. The breakers shall have an input for an external switch to set in arc flash reduction mode. Provide a blue LED indicating light on front of enclosure to indicate in arc flash reduction mode. The use of zone selective interlocking to emulate this feature does not meet the intent of these specifications and will not be allowed.
 - 3. System coordination shall be provided by adjusting rotary switches for the following microprocessor-based time-current curve shaping adjustments:
 - a. Adjustable long-delay pick-up setting with minimum of 10 settings
 - b. Adjustable long-delay time - 0.5 to 24 seconds
 - c. Adjustable short-delay pick-up setting – 1.5x to Max allowable by frame
 - d. Adjustable short-delay time 0.0 sec up to 0.5 sec depending on frame with selectable flat or I²t curve shaping
 - e. Adjustable instantaneous setting 2x to Max allowable by frame
 - f. Where indicated, adjustable ground fault current pickup (0.2 – 1.0 x I_n in 0.10x increments) and time (0.1 – 1.0 sec in 0.10 sec increments), with selectable flat or I²t curve shaping. Provide switch selectable options for GF OFF, GF alarm, or GF trip.

4. Trip units shall be capable of metering phase, neutral, and ground current with an accuracy of +/- 2.0% of the reading.
5. Trip units shall collect and store pertinent information to the trip unit and circuit breaker health and event history. The trip unit shall also include diagnostic features to allow the user to investigate events and dynamically monitor the health of the trip unit and the breaker.
 - a. Number of operations (load and no-load)
 - b. Number of trips (overload trips, short circuit trips)
 - c. Run time
 - d. Breaker ambient temperature.
 - e. Breaker remaining life - The trip unit shall utilize an algorithm that applies a weighted value to monitored information to determine the remaining life of the breaker. The remaining life of the breaker shall be displayed or communicated in calculated percentage of life remaining.
 - f. All breaker health information shall be accessible via micro-USB port on front of trip unit and via embedded communications
6. Trip unit shall perform a waveform capture on trip, alarm, or user-initiated events.
 - a. Any breaker trip event shall capture a 10-cycle waveform. The trip unit shall store the most recent trip event waveform.
 - b. Any alarm event or user-initiated waveforms shall capture a 1-cycle waveform.
 - c. Waveform events shall capture and store all phase, neutral and ground currents.

2.06 SWITCHBOARD FACTORY TESTS

- A. The switchboard shall be completely assembled, wired, adjusted, temporarily powered and tested at the factory. Provide test results for acceptance.
- B. The fully assembled switchboard shall be given operational, dielectric, and all other standard tests.

2.07 MISCELLANEOUS DEVICES

- A. Kirk Key interlocks shall be provided as indicated on the drawings.
- B. Arc Flash Reduction Maintenance Switch

1. Provide switch where indicated on the plans or one-line diagrams.
2. Provide selector switch which illuminates BLUE when engaged.
3. Switch shall have a flip-up cover to operate.
4. Switch shall be NEMA 4X rated.
5. Provide label to read "Maintenance Mode" on top with "ON" and "OFF" indication. Label to read "Arc Flash Reduction Maintenance Switch" on bottom.

- C. Provide external Surge Protection Devices as indicated on the drawings. Reference Section 26 43 00 "Surge Protection Devices" for requirements.

2.08 WIRING

- A. Conductors: Copper; size as required by load, except that no control wire is smaller than 14 AWG. Use insulation that is flame retardant, and moisture and heat resistant.
- B. Cables and conductors: Bundled and tie wrapped securely in wireways furnished.
- C. Identify internal wiring at terminations by T&B wire markers or equivalent.
- D. All spare auxiliary contacts shall be wired to terminal blocks.
- E. Terminal Blocks:
 1. Rated 600 volt for power with current rating as required by loads.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. After inspection, and prior to energizing, provide 250 watts of heat within each Section.
- B. Install equipment in accordance with manufacturer's printed instructions and as indicated and specified. Install equipment on channels set flush with floor or on concrete bases. Interconnect equipment as a complete operating system.
 1. After installation, field touch-up the shop painting finish on the channels with a similar and compatible coating, including color.
- C. Have installed equipment field-checked by manufacturer's service engineer, who perform following services:
 1. Check installed equipment for proper assembly and connections, including interwiring to external equipment.

2. Set adjustable devices per the approved electrical coordination study.
3. Assist Contractor in conducting equipment acceptance tests.

3.02 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain the equipment.
- B. Training shall be a minimum of four (4) hours in operation and maintenance for up to five (5) Owner representatives. Schedule training with at least five (5) working days advance notification.

3.03 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 1. Test insulation resistance for each bus, component, connecting supply, feeder, and control circuit.
 2. Test continuity of each circuit.
- C. Tests and Inspections:
 1. Perform each visual and mechanical inspection and electrical test for low-voltage air circuit breakers and low-voltage surge arrestors stated in NETA ATS, Paragraph 7.6 Circuit Breakers and Paragraph 7.19.1 Surge Arrestors, Low-Voltage. Certify compliance with test parameters.
 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove front panels so joints and connections are accessible to portable scanner.
 - b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
 - c. Instruments and Equipment:

- (1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

D. Switchboards will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results, with comparisons of the two scans. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.04 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 24 13

LOW-VOLTAGE SWITCHBOARDS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide a 480 volt, 3-phase, 4-wire, electrical distribution rated switchboard, free-standing construction with circuit breakers, power monitor, distribution class lightning arrestors, surge arrestors, automatic transfer switch, and group-mounted circuit breakers as indicated and in compliance with Contract Documents.
- B. Provide services of a factory-trained service engineers, specifically trained to check connections, interwiring to equipment, adjustments and assisting in tests.
 - 1. Provide guidance during installation to check work of installing contractor.
 - 2. Instruct personnel in care and operation of equipment.
 - 3. Test main breaker and all branch breakers including spares; insure proper setting.
 - 4. Inspect installation and adjust as necessary when switchboard is ready to be energized and put into service.
 - 5. Test ground fault system and set all protective devices.
 - 6. Certify that equipment has been inspected and is ready to be placed into service.

1.02 REFERENCES

- A. Federal Specifications (FS):
 - 1. QQ-S-365B: General Requirements for Silver Plating, Electro Deposited
 - 2. W-C-375: Molded Case Circuit Breakers.
- B. National Electrical Manufacturers Association (NEMA):
 - 1. AB 1: Molded-Case Circuit Breakers, Molded Case Switches, and Circuit-Breaker Enclosures.
 - 2. PB-2: Switchboards.
- C. Underwriter's Laboratories (UL):
 - 1. 489: Standard for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures.

2. 91: Switchboards.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Manufacturer's certified shop drawings including outlines, schematics and wiring diagrams, coordination curves, certified test data reports, maintenance data, operating instructions and parts list with list of recommended spare parts.
- C. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final settings of devices.

1.04 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements specified in Section 01 41 20.
- B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 SPARE PARTS

- A. Comply with the requirements specified in Section 01 31 00 "Project Management and Coordination Requirements".
- B. Provide spare parts as recommended by manufacturer.
- C. Package spare equipment in containers bearing labels clearly indicating contents and in what equipment used.
- D. Deliver spare parts at same time as equipment. Properly store and safeguard such spare parts until completion of work, at which time deliver to Owner.

1.06 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00 "Quality Requirements".
- B. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation.
- C. Single-source Responsibility: Provide switchboard products that are new, and from the same manufacturer for each building or job. Switchboard components shall be from the same manufacturer or listed as an assembly thereof.

- D. The manufacturer shall confirm and state the measure of and the set of the features that support the ease and speed of which corrective maintenance (CM) and preventive maintenance (PM) can be conducted on the proposed system. The Mean Time To Repair (MTTR), the measure used to quantify the time required to perform CM and Mean Preventive Maintenance Time (MPMT), a measure commonly used to quantify the time required to perform PM are to be confirmed by the manufacturer.
- E. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified. Times listed are for each switchboard.
 - 2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment and field erection:
 - a. 2 person-days
 - 3. Functional Testing: Check alignment and perform a functional test. Tests to include all items specified.
 - a. 2 person-days
 - 4. Testing: Field performance test equipment specified.
 - a. 2 person-days
 - 5. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 - 6. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
 - a. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:
 - (1) 1 person-day - switchboard

1.07 DELIVERY AND STORAGE

- A. Shipping:

1. Ship equipment, and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.
2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
3. Deliver spare parts at same time as pertaining equipment. Delivery to Owner after completion of work.
4. Channel bases:
 - a. For front and rear, minimum of 1-1/2 inch (37 mm) by 3 inch (74 mm) standard channel with suitable holes for mounting switchboard, and holes for grouting and flow of concrete.
 - b. Shipped in advance with accurate template of switchboard mounting holes or dimension layout drawing for embedding in concrete pad, floor slab, or securing to floor. Coordinate with all contractors.
5. Attach lifting angles to main frame of structure to distribute weight equally. Deflection or distortion is cause for rejection.
6. Provide heavy plastic envelope directly over switchboard to protect against dust, dirt, and moisture. Provide lifting angles outside of envelope.

B. Storage:

1. Inspection and inventory items upon delivery to site.
2. Store and safeguard equipment, material and spare parts.

1.08 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace switchboard that fail in materials or workmanship within specified warranty period.

1. Switchboard Warranty Period: 18 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers acceptable contingent upon products' compliance with the specifications:

1. Eaton
2. ABB

3. Siemens Corp.
4. Schneider/Square D.

2.02 SWITCHBOARD EQUIPMENT

A. Structure:

1. Totally enclosed switchboard dead front, free standing, front and rear aligned with front accessibility only required.
2. General purpose switchboard with frame-work of UL gauge formed steel and channels and secured together to support all cover plates, bussing and component devices during shipment and installation. Formed removable closure plates on the front, rear and sides. Closure plates shall be single tool, screw removable.
3. Refer to contract documents for NEMA enclosure type.
4. Ventilation provided when required.
5. Each section includes a single-piece removable top plate.

B. Incoming Line; devoted to the main service entrance utility supply.

1. Utility line section consists of:
 - a. Device:
 - (1) Main RMS sensing, disconnect device shall be a solid state, true RMS adjustable trip, insulated case, circuit breaker. The main breaker shall be provided fixed style.
 - (2) In conjunction with the main device, provide undervoltage capacitor trip, phase failure and phase reversal protection, alarm switch, auxiliary switches, long time, short time, instantaneous trip and selective coordination ground fault protection with downstream ground fault protective devices.
 - (3) Provide “push to trip” push button on circuit breaker to allow manual trip with risking exposure to live parts.
 - (4) Provide trip indicator to identify type of fault, and indicate OVERLOAD, SHORT CIRCUIT or GROUND FAULT on display.
 - (5) Main breaker to be provided with capability of locking in the open position.
 - (6) The trip unit shall include local setup and readout of trip settings and digital display metering of:

- (a) 3-phase volts
 - (b) frequency
 - (c) KW
 - (d) KVA
 - (e) amps
- b. Cable termination suitable for cable entry from below, located at bottom section.
- c. Line side terminals fitted with two-hole, compression-type lugs for four copper cable conductors per phase.
- d. Provide section for Utility service meter and CTs. Verify size of section with Utility equipment.
- e. Tinned bus of suitable rating and bracing.
- f. Tinned copper ground bus 1/4-inch x 2 inch (6 mm x 50 mm) extended and tied through to all adjoining sections.

C. Power Monitor:

- 1. Provide microprocessor-based monitoring device to provide local and remote monitoring of the electrical system.
 - a. Voltage input of 120 volts using voltage transformers.
 - b. Current input from current transformers, phase A, B, C and ground.
- 2. Comply with ANSI C12.16, Class 10.
- 3. Display data:
 - a. Current A, B, C, Average, Neutral, Ground.
 - b. Voltage - Phase to phase
 - (1) Phase to neutral
 - (2) 2) Phase to ground
 - (3) 3) Average values
 - c. Power - Watts

- (1) Vars
 - (2) VA
 - (3) Phases A, B, C and System
- d. Energy - KWH
 - (1) KVARH
- e. Frequency
- f. Demand - System current
 - (1) KW
 - (2) KVAR
 - (3) KVA
- g. Power Factor - Phases A, B, C, System
- h. Percent THD Current - Phases A, B, C, N
- i. Percent THD Voltage:
 - (1) Phase to phase
 - (2) Phase to neutral
- j. Minimum and maximum values
- k. Monitor past events and thresholds.
- 4. Provide power monitor with Ethernet connection and capable of communicating using Modbus TCP/IP protocol.

D. Group Mounted Branch Sections:

- 1. The switchboard group-mounted circuit breaker branch devices shall be totally front accessible and front connectable.
- 2. The circuit breaker connections to the distribution panel bussing shall be such that the connections grip the bus bars firmly under high-fault conditions.
- 3. Provide wiring gutters of sufficient space to allow cable termination.
- 4. Provide covers for gutter space and future breaker space with formed sheet steel.

5. Provide circuit breakers as indicated on the one-line diagram.

E. Enclosure - General Requirements:

1. Switchboard shall be completely self-supporting structure of the required number of vertical sections bolted together to form one metal-enclosed switchboard 90 inch (2.29 m) high.
2. Sides, top and rear covers shall be code gauge steel, bolted to the switchboard structure.
3. The frame structure members shall be die-formed, 12-gage steel bolted together and reinforced at corners with rugged gussets internal and external to the structure members.
4. The switchboard shall be completely front accessible for all installation and maintenance activities.
5. At the main service entrance section, the sheet steel panels located on the exterior and side of the section shall be removable for servicing the section.
6. The switchboard frame shall be mounted to sills embedded in a concrete housekeeping pad.
7. The switchboard and devices are fully rated at minimum short circuit rating of 65,000 rms symmetrical Amperes. Refer to contract documents for additional requirements.
8. Switchboard shall include all protective devices depicted on contract drawings and as specified in these specifications with necessary interconnection, instrumentation and control wiring.
9. Main breaker shall be individually mounted.
10. All buses are tin plated copper, supported with high impact, non-tracking insulating material, and braced to withstand mechanical forces exerted during short circuit conditions. All bus connections shall utilize silver plated bus bar surfaces.
11. The current density of the bus shall be determined from UL-891 heat rise testing and shall be rated for 1000 amperes per square inch cross-section.
12. A tinned copper, 1/4-inch x 2 inch (6 mm x 50 mm) ground bus shall furnished and secured to structure.
13. A-B-C type bus arrangement (left-to-right, top-to-bottom, front-to-rear) is to be used throughout to assure convenient and safe testing and maintenance.

14. The vertical main bus bars are furnished for future branch devices. Device mounting bolts and bus connecting straps are supplied with future unit devices. Full height bus bars shall be supplied.
15. All vertical sections comprising the switchboard are rear-aligned.
16. All steel surfaces shall be chemically cleaned and pre-treated with an iron-phosphate pre-treatment or equivalent process, providing a bond between paint and metal surfaces to help prevent the entrance of moisture and formation of rust under the paint. The switchboard exterior shall be finished with ANSI-61 light gray paint. Provide touch-up paint for coatings nicks and scratches after installation and testing.
17. Control wiring, fuse blocks and terminal blocks within the switchboard shall be furnished when required. All control wires leaving the switchboard shall be provided with terminal blocks with numbering strips.
18. All hardware used on conductors shall have a high tensile strength, and a protective finish.
19. Switchboard shall be provided with lifting means, and capable of being rolled or moved into installation position and bolted directly to floor sills.
20. Make provision for conduit and cable entrance from top or bottom as indicated on the drawings.

2.03 SWITCHBOARD SILLS

- A. Provide steel channel sills with drilled holes for mounting, aligning and bolting switchboard in place. Method of mounting as indicated. Provide in size recommended by switchboard manufacturer and acceptable to Engineer.
- B. Shop paint completed sills with two coats of a polyamide epoxy coating with a minimum dry film thickness of 2.5 mils (0.6 mm) per coat or before setting in place.
 1. Surface preparation shall conform to paint manufacturer's printed instructions.
 2. Provide additional coating for field touch-up specified in paragraph 3.01.

2.04 SWITCHBOARD INSTRUMENT TRANSFORMERS

- A. Switchboard section for main breaker shall include three 480 to 120-volt potential transformers, and one 480 to 120/240 volt single phase control power transformer. Control and potential transformers to be connected ahead of main circuit breaker and to include current limiting primary fuses. Mount transformers in isolated compartment within secondary bus transition section. Also provide, on main bus for each main breaker four window type 3000/5A current transformers for metering phase and neutral current and one 200/5A current for monitoring ground currents.

- B. Tie all instrument transformer outputs to power monitor.

2.05 FEEDER PROTECTIVE DEVICES

- A. All feeder protective devices shall be molded case circuit breakers with inverse time tripping characteristics as indicated on the contract documents and in this specification.
- B. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position. Contacts shall be non-welding silver alloy and arc extinction shall be accomplished by means of DE-ION arc chutes. A push-to-trip button on the front of the circuit breaker shall provide a local manual means to exercise the trip mechanism.
- C. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the contract documents.
- D. Circuit breakers to be either draw-out or fixed mounted, as indicated on contract documents
- E. Circuit breakers shall have microprocessor-based rms sensing trip units as specified below:
 - 1. All electronic trip molded case circuit breakers shall be equipped with a true RMS sensing, solid-state tripping system consisting of at least three current sensors microprocessor-based trip device and trip actuator. The trip unit shall use microprocessor-based technology to provide the basic adjustable time-current protection.
 - 2. Provide trip units with integral arc flash reduction mode for 1200A frame and above. The breakers shall have an input for an external switch to set in arc flash reduction mode. Provide a blue LED indicating light on front of enclosure to indicate in arc flash reduction mode. The use of zone selective interlocking to emulate this feature does not meet the intent of these specifications and will not be allowed.
 - 3. System coordination shall be provided by adjusting rotary switches for the following microprocessor-based time-current curve shaping adjustments:
 - a. Adjustable long-delay pick-up setting with minimum of 10 settings
 - b. Adjustable long-delay time - 0.5 to 24 seconds
 - c. Adjustable short-delay pick-up setting – 1.5x to Max allowable by frame
 - d. Adjustable short-delay time 0.0 sec up to 0.5 sec depending on frame with selectable flat or I2t curve shaping
 - e. Adjustable instantaneous setting 2x to Max allowable by frame

- f. Where indicated, adjustable ground fault current pickup ($0.2 - 1.0 \times I_n$ in 0.10x increments) and time (0.1 – 1.0 sec in 0.10 sec increments), with selectable flat or I²t curve shaping. Provide switch selectable options for GF OFF, GF alarm, or GF trip.
- 4. Trip units shall be capable of metering phase, neutral, and ground current with an accuracy of +/- 2.0% of the reading.
- 5. Trip units shall collect and store pertinent information to the trip unit and circuit breaker health and event history. The trip unit shall also include diagnostic features to allow the user to investigate events and dynamically monitor the health of the trip unit and the breaker.
 - a. Number of operations (load and no-load)
 - b. Number of trips (overload trips, short circuit trips)
 - c. Run time
 - d. Breaker ambient temperature.
 - e. Breaker remaining life - The trip unit shall utilize an algorithm that applies a weighted value to monitored information to determine the remaining life of the breaker. The remaining life of the breaker shall be displayed or communicated in calculated percentage of life remaining.
 - f. All breaker health information shall be accessible via micro-USB port on front of trip unit and via embedded communications
- 6. Trip unit shall perform a waveform capture on trip, alarm, or user-initiated events.
 - a. Any breaker trip event shall capture a 10-cycle waveform. The trip unit shall store the most recent trip event waveform.
 - b. Any alarm event or user-initiated waveforms shall capture a 1-cycle waveform.
 - c. Waveform events shall capture and store all phase, neutral and ground currents.

2.06 SWITCHBOARD FACTORY TESTS

- A. The switchboard shall be completely assembled, wired, adjusted, temporarily powered and tested at the factory. Provide test results for acceptance.
- B. The fully assembled switchboard shall be given operational, dielectric, and all other standard tests.

2.07 MISCELLANEOUS DEVICES

- A. Kirk Key interlocks shall be provided as indicated on the drawings.
- B. Arc Flash Reduction Maintenance Switch
 - 1. Provide switch where indicated on the plans or one-line diagrams.
 - 2. Provide selector switch which illuminates BLUE when engaged.
 - 3. Switch shall have a flip-up cover to operate.
 - 4. Switch shall be NEMA 4X rated.
 - 5. Provide label to read "Maintenance Mode" on top with "ON" and "OFF" indication. Label to read "Arc Flash Reduction Maintenance Switch" on bottom.
- C. Provide internally Surge Protection Devices as indicated on the drawings. Reference Section 26 43 00 "Surge Protection Devices" for requirements.

2.08 WIRING

- A. Conductors: Copper; size as required by load, except that no control wire is smaller than 14 AWG. Use insulation that is flame retardant, and moisture and heat resistant.
- B. Cables and conductors: Bundled and tie wrapped securely in wireways furnished.
- C. Identify internal wiring at terminations by T&B wire markers or equivalent.
- D. All spare auxiliary contacts shall be wired to terminal blocks.
- E. Terminal Blocks:
 - 1. Rated 600 volt for power with current rating as required by loads.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. After inspection, and prior to energizing, provide 250 watts of heat within each Section.
- B. Install equipment in accordance with manufacturer's printed instructions and as indicated and specified. Install equipment on channels set flush with floor or on concrete bases. Interconnect equipment as a complete operating system.
 - 1. After installation, field touch-up the shop painting finish on the channels with a similar and compatible coating, including color.

- C. Have installed equipment field-checked by manufacturer's service engineer, who perform following services:
 - 1. Check installed equipment for proper assembly and connections, including interwiring to external equipment.
 - 2. Set adjustable devices per the approved electrical coordination study.
 - 3. Assist Contractor in conducting equipment acceptance tests.

3.02 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain the equipment.
- B. Training shall be a minimum of four (4) hours in operation and maintenance for up to five (5) Owner representatives. Schedule training with at least five (5) working days advance notification.

3.03 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- C. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test for low-voltage air circuit breakers and low-voltage surge arrestors stated in NETA ATS, Paragraph 7.6 Circuit Breakers and Paragraph 7.19.1 Surge Arrestors, Low-Voltage. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Perform the following infrared scan tests and inspections and prepare reports:
 - a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard.

Remove front panels so joints and connections are accessible to portable scanner.

- b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
- c. Instruments and Equipment:
 - (1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

D. Switchboards will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results, with comparisons of the two scans. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 24 19

MOTOR CONTROL CENTERS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide motor control center, totally enclosed, free-standing, cabinet-type structure with motor starters, circuit breakers and/or fused switches and other equipment, as indicated and specified. Motor control center to operate at 480-volt, 3-phase, 4-wire, 60-Hertz as indicated and in compliance with Contract Documents.
- B. Complete motor control center to be designed, assembled, wired, and tested at the point of manufacture in accordance with the latest NEMA, UL, and ANSI standards.
- C. Use manufacturer's standard when data is not specified.
- D. Provide Surge Protection Devices (SPD) as indicated, and as specified in Section 26 43 00 "Surge Protection Devices".

1.02 REFERENCES

- A. General:
 - 1. The following documents form part of the Specifications to the extent stated. Where differences exist between codes and standards, the one affording the greatest protection shall apply.
 - 2. Unless otherwise noted, the edition of the referenced code or standard that is current at the time of the "date of record" for the Work shall be considered the effective code or standard for the duration of the project.
 - 3. Refer to Division 01 Section "General Requirements" for the list of applicable regulatory requirements.
 - 4. Refer to specific Division 26 Sections for additional referenced codes and standards.
- B. American National Standards Institute (ANSI):
 - 1. C39.1: Electrical Analog Indicating Instruments
- C. Institute of Electrical and Electronic Engineers (IEEE):
 - 1. C57.13: Standard Requirements for Instrument Transformers

- D. National Electrical Manufacturers Association (NEMA):
 - 1. AB 1: Molded Case Breakers
 - 2. ICS 2: Industrial Controls and Systems Controllers, Contactors, and Overload Relays Rated 600 Volts.
 - 3. KS 1: Enclosed Switches
- E. National Fire Protection Association (NFPA):
 - 1. 70: National Electric Code (NEC).
- F. Underwriters' Laboratories, Inc. (UL):
 - 1. 489: Molded-Case Breakers, Molded-Case Switches, and Circuit Breaker Enclosures
 - 2. 508: Industrial Control Equipment.
 - 3. 845: Standards for Motor Control Centers
 - 4. 1008: Standard for Automatic Transfer Switches
 - 5. 1066: Low Voltage AC and DC Power Circuit Breakers Used in Enclosures
- G. Electrical Safety Program, Electrical Equipment Safety Program, and Lockout/Tagout Program of NTMWD.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.
- B. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, installation instructions.
- C. Complete wiring and schematic diagrams for the equipment furnished. Each wiring diagram shall be legible and not reduced from the original design drafted format. Provide a list of equipment on each wiring diagram for which it is applicable.
- D. Equipment layout.
- E. Time versus current curves for protective devices.
- F. Data sheets for all devices provided as part of the assembly.
- G. All other details required to demonstrate that system has been coordinated and will properly function as a unit.

- H. Spare Parts Data: Provide a list of recommended spare parts for the material and equipment to be provided, including current unit prices and source of supply (indicate which supplies are furnished at no extra cost with purchase of equipment) and in accordance with Section 01 78 23 "Operation and Maintenance Data".
 - I. Operating and Maintenance Instruction Manuals:
 - 1. Furnish:
 - a. Operating instruction manuals outlining step-by-step procedures required for system startup and operation and in accordance with Section 01 78 23 "Operation and Maintenance Data".
 - b. Manufacturer's name, model number, service manual parts list.
 - c. Brief description of equipment and basic operating features.
 - d. Maintenance instruction manuals outlining maintenance procedures, for all devices, including compartment installation, circuit breakers, motor starters and fuses.
 - e. Troubleshooting guide listing possible breakdown and repairs.
 - f. As-built wiring diagrams for the system.
 - J. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final position of controls.
 - K. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.
- 1.04 SEISMIC DESIGN REQUIREMENTS:
- A. Conform to the requirements specified in Section 01 41 20.
 - B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.
- 1.05 QUALITY ASSURANCE
- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.
 - B. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation.

- C. The manufacturer shall confirm and state the measure of and the set of the features that support the ease and speed of which corrective maintenance (CM) and preventive maintenance (PM) can be conducted on the proposed system. The Mean Time To Repair (MTTR), the measure used to quantify the time required to perform CM and Mean Preventive Maintenance Time (MPMT), a measure commonly used to quantify the time required to perform PM are to be confirmed by the manufacturer.
- D. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified. Times listed are for each MCC installed.
 - 2. Assist in location of devices, methods of mounting, field erection, etc.
 - a. 2 person-day
 - 3. Functional Completion testing.
 - a. 2 person-days
 - 4. Startup.
 - a. 2 person-days
 - 5. Commissioning.
 - a. 2 person-days
 - 6. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:
 - a. 2 person-days
 - 7. Person-day is defined as one 8-hour day, excluding travel time.
 - 8. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 - 9. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01 66 10 “Delivery, Storage and Handling” and as specified.
- B. Shipping:
 - 1. Ship equipment, and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.
 - 2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
 - 3. MCCs shall be separated into shipping blocks no more than three vertical sections each. Each shipping block shall include a removable lifting angle, to allow attachment by suitable lifting equipment.
 - 4. Deliver spare parts at same time as pertaining equipment. Delivery to Owner after completion of work.
 - 5. Channel bases:
 - a. For front and rear, minimum of 1-1/2 inch by 3 inch (38 mm by 76 mm) standard channel with suitable holes for mounting motor control center, and holes for grouting and flow of concrete.
 - b. Shipped in advance with accurate template of motor control center mounting holes or dimension layout drawing for embedding in concrete pad, floor slab, or securing to floor.
 - 6. Attach lifting angles to main frame of structure to distribute weight equally. Deflection or distortion is cause for rejection.
 - 7. If the equipment cannot be placed into service after its receipt, store in a closed building or structure, in a clean, dry and ventilated area free from temperature, dirt and moisture extremes. Acceptable storage temperatures are from 0 degrees C (32 degrees F) to 40 degrees C (104 degrees F) with temporary heaters provided within enclosures to prevent condensation. Provide heavy plastic envelope directly over motor control center to protect against dust, dirt, and moisture. Provide lifting angles outside of envelope.
- C. Storage:
 - 1. Inspection and inventory items upon delivery to site.
 - 2. Store and safeguard equipment, material, and spare parts.

1.07 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 - 2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
 - 3. Indicating Lights: Two of each type and color installed.
 - 4. Auxiliary Contacts: Furnish one spare for each size and type of magnetic controller installed.
 - 5. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.08 WARRANTY AND SERVICE

- A. Guarantee components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 12 months.
- B. Ensure that equipment manufacturer has local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. The equipment manufacturer shall be ISO 9001 or 9002 certified.
- B. Manufacturer's acceptable contingent upon products' compliance with the specifications.
 - 1. ABB.
 - 2. Siemens Energy & Automation, Inc.
 - 3. Schneider/Square D Company.
 - 4. Eaton.

2.02 COMPONENTS

- A. Motor control center construction: Comply with UL 845.

- B. Starters: Comply with the requirements of NEMA ICS 2.
- C. Instruments: Comply with ANSI C39.1.
- D. Enclosures:
 - 1. Enclosures for motor control centers: NEMA Type 1 gasketed, unless otherwise indicated on the Contract Drawings.
 - 2. Motor control centers: NEMA Class II-S, Type B wiring.
 - 3. Outline dimensions of motor control centers and arrange equipment and devices as indicated.
 - 4. The minimum depth of a motor control center is 20 inch (508 mm). Arrange motor control centers for back-to-back mounting of the starter units where indicated.
 - 5. Each MCC shall consist of one or more vertical sections of heavy gauge steel bolted together to form a rigid, free-standing assembly. A removable 7 gage structural steel lifting angle shall be mounted full width of the MCC shipping block at the top. Removable 7 gage bottom channel sills shall be mounted underneath front and rear of the vertical sections extending the full width of the shipping block. Vertical sections made of welded side-frame assembly formed from a minimum of 12 gage steel. Internal reinforcement structural parts shall be of 12 and 14 gage steel to provide a strong, rigid assembly. The entire assembly shall be constructed and packaged to withstand normal stresses included in transit and during installation.
- E. Buses:
 - 1. Locate main horizontal bus at top with ampere rating as indicated. Isolate bus from both front and back compartments.
 - 2. Neutral bus if required: Rated at full capacity.
 - 3. Main, vertical, and ground buses: 98 percent conductivity tinned copper bars of suitable size carried on supports fabricated from an acceptable insulating material.
 - 4. Short circuit bus bracing: As indicated.
 - 5. Vertical buses: A minimum rating of 300 amperes for front only units, a minimum rating of 600 ampere for back-to-back units. Insulate or isolate vertical buses.
 - 6. Provide continuous 2 inch by 1/4 inch (50 mm by 6 mm) tinned copper ground bus along length of the motor control center.
 - 7. Contact surfaces of bar-to-bar connections and lug-to-bar connections: Silver plated.
 - 8. Phase rotation of vertical buses: Make same when viewed from front or from either side of motor control center.

9. Bolts and other hardware: Galvanized or stainless steel or equal.
10. Provide horizontal wireways at top and bottom of each vertical section. Provide vertical wireways with wire supports for each vertical section. Interconnect all wireways.
11. Provide standard corrosion resistant fasteners for unit doors hardware which operate without special tools.

F. Barriers:

1. All power bussing and splice connections shall be isolated from the unit compartments and the wireways. The horizontal bus shall be mounted onto a glass filled polyester support assembly that braces the bus against the forces generated during a short circuit. The horizontal bus shall be isolated from the top horizontal wireway by a two-piece rigid non-conductive barrier. The barrier design shall allow qualified personnel to slide the barriers both left and right, to allow access to the bus and connections for maintenance without having to remove the barrier. Barrier sliding shall occur via an upper and lower track system.
2. The vertical bus shall be housed in a molded glass-filled polyester support that provides bus insulation and braces the bus against the forces generated during a short circuit. These supports shall have openings every 3 inch (75 mm) for unit stab-on connections. Each opening shall be provided with an automatic shutter to close off the stab opening. These shutters shall be attached to the structure so that when they are removed (to allow a stab connection) they are retained in the structure and are readily accessible for use should a plug-in unit be removed from the MCC.
3. Barriers shall be provided in the vertical structure and unit designs to prevent the contact of any energized bus or terminal by a pull wire routed through the conduit or wireway areas.

G. Motor Control Center Units:

1. Motor control center units: Drawout type. Units larger than NEMA Size 4 having bolt-in construction. Provide fully interchangeable removable units of same size and type.
2. Interlock disconnect devices with associated doors, to prevent closing the disconnect device with the door open unless a tool is used or a defeater device is operated.
3. Furnish disconnect devices capable of being locked in either the open or closed position.
4. Arrange each unit so that when its starter has been removed, its door may be closed to cover the opening.

H. Motor Control Center Starter Units:

1. Unless otherwise indicated, use minimum NEMA Size 1 combination starter, consisting of a circuit breaker, or motor circuit protector and magnetic starter, as indicated. Momentary and interrupting ratings of circuit breakers, and motor circuit protectors coordinated with main bus bracing. Type of starters, i.e., full voltage, reduced voltage, reversing, non-reversing, two-speed, etc., are as indicated. Furnish magnetic starters with thermal overload protection on each phase with external manual reset.
2. Solid-State Overload Relay:
 - a. Provide a solid-state overload relay for protection of the motors.
 - b. The overload relay shall provide high accuracy through the use of state-of-the-art microelectronic packaging technology. The relay shall be suitable for application with NEMA Size 1 through Size 7 motor starters.
 - c. The overload relay shall be modular in design, be an integral part of family of relays to provide a choice of levels of protection, be designed to directly replace existing electromechanical overload relays, and be listed under UL Standard 508.
 - d. The overload relay shall have the following features:
 - (1) Self-powered.
 - (2) Class 10 or 20 fixed tripping characteristics.
 - (3) Manual or automatic reset.
 - (4) Phase loss protection. The relay shall trip in 2 seconds or less under phase loss condition when applied to a fully loaded motor.
 - (5) Visible trip indication.
 - (6) One normally open and one normally closed isolated auxiliary contact.
 - (7) Test button that operates the normally closed contact.
 - (8) Test trip function that trips both the normally and normally closed contacts.
 - (9) A current adjustment range of 3.2:1 or greater.
 - (10) Ambient temperature compensated.
 - (11) Ground fault protection. Relay shall trip at 50 percent of full load ampere setting.

- (12) Jam/Stall protection. Relay shall trip at 400 percent of full load ampere setting, after inrush.
3. Verify type (single- or 2-winding) of two-speed motor being installed. Furnish type of motor starter necessary for control of motor. Furnish decelerating, time-delay relay for each two-speed starter.
 4. Provide reduced voltage solid-state type starters (RVSS) with thyristor (SCR) bridge consisting of at least two SCRs per phase to control the starting and stopping of industry standard motors.
 - a. The soft start shall provide torque control for linear acceleration without external feedback independent of motor load or type of application.
 - b. The gating of the thyristors will be controlled in such a manner to ensure smooth and stable acceleration ramp.
 - c. The soft start shall be controlled by a microprocessor that continuously monitors the current and controls the phasing of the SCRs. Analog control algorithms shall not be allowed.
 - d. All soft start power ratings will utilize the same control board/module.
 - e. A shorting contactor shall be supplied with the soft start controller units. Protective features and deceleration control options integral to the soft start shall be available even when the shorting contactor is employed.
 - f. The soft start controller unit shall be designed to operate from an input voltage between minus 10 percent and plus 10 percent of nominal voltage rating.
 - g. The soft start controller unit shall operate from an input voltage frequency range of plus or minus 5 percent. By configuration, it shall be capable of operation at a supply line frequency that can vary by plus or minus 20 percent during steady state operation.
 - h. The soft start shall be capable of supplying 400 percent of rated full load current for 23 seconds at maximum ambient temperature.
 - i. All soft start controller unit power and control devices shall be rated heavy duty and capable of 5 evenly spaced starts per hour at 400 percent of full rated current for 25 seconds per start without tripping.
 5. Furnish starter operating coils suitable for operation on 120 volt, single-phase, 60 Hertz.
 6. Furnish each starter with at least one normally open and one normally closed auxiliary contact. Furnish additional normally open and/or normally closed auxiliary contacts for indicating lights, interlocking and other requirements as indicated.

7. Motor horsepower indicated on Contract Drawings may not be same as furnished, if larger motors are furnished, circuit breakers, fused switches, starters, wire and conduits of larger capacity may be necessary and, if so, furnish them at no additional cost.
 8. Furnish within each starter compartment a control transformer with primary fuses and secondary fuse. Secondary voltage 120 VAC, unless otherwise indicated. Determine load of each motor control circuit including equipment and devices provided under the other specification sections and furnish control circuit transformer 2-winding, dry-type of suitable volt-ampere rating, but not less than 75 volt-amperes. Control circuit loads may consist of but not be limited to solenoid operators, motorized valves, motorized dampers, relays, motor heaters, etc.
 9. Provide RVSS with Ethernet connection and capable of communicating using Modbus TCP/IP protocol.
- I. Variable frequency drives (VFDs) shall be provided in MCCs where indicated. VFDs shall be in accordance with Section 26 29 23 "Variable Frequency Drives", and include 5 percent input reactors, and dV/dt output filters.
- J. Circuit Breakers:
1. Main, tie, and feeder breakers to be molded case circuit breaker with auxiliary contact for alarm on open or trip condition.
 2. Unless otherwise indicated, furnish manually operable circuit breakers and provide thermal-magnetic, inverse-time-limit overload, and instantaneous, short-circuit protection. U.L. listed circuit breakers conforming to NEMA Std. AB-1 and UL Std. 489.
 3. Breakers: Molded case type, rated 480 volts, 2 or 3 pole and having 100 ampere or larger frames. Minimum interrupting rating equal to bus bracing required. Furnish current limiting type, where indicated.
 4. Furnish overload protection on all poles with trip settings as indicated. Breakers of 225 ampere frames and larger with interchangeable trip units and adjustable magnetic trip elements.
 5. Furnish time-current characteristic curves and other necessary information and data for each size of breaker furnished.
 6. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position. Contacts shall be non-welding silver alloy and arc extinction shall be accomplished by means of DE-ION arc chutes. A push-to-trip button on the front of the circuit breaker shall provide a local manual means to exercise the trip mechanism.

7. Circuit breakers shall have microprocessor-based rms sensing trip units as specified below:
 - a. All electronic trip molded case circuit breakers shall be equipped with a true RMS sensing, solid-state tripping system consisting of at least three current sensors microprocessor-based trip device and trip actuator. The trip unit shall use microprocessor-based technology to provide the basic adjustable time-current protection.
 - b. Provide trip units with integral arc flash reduction mode for 1200A frame and above. The use of zone selective interlocking to emulate this feature does not meet the intent of these specifications and will not be allowed.
 - c. System coordination shall be provided by adjusting rotary switches for the following microprocessor-based time-current curve shaping adjustments:
 - (1) Adjustable long-delay pick-up setting with minimum of 10 settings
 - (2) Adjustable long-delay time - 0.5 to 24 seconds
 - (3) Adjustable short-delay pick-up setting – 1.5x to Max allowable by frame
 - (4) Adjustable short-delay time 0.0 sec up to 0.5 sec depending on frame with selectable flat or I2t curve shaping
 - (5) Adjustable instantaneous setting 2x to Max allowable by frame
 - (6) Where indicated, adjustable ground fault current pickup ($0.2 - 1.0 \times I_n$ in 0.10 x increments) and time (0.1 – 1.0 sec in 0.10 sec increments), with selectable flat or I2t curve shaping. Provide switch selectable options for GF OFF, GF alarm, or GF trip.
8. Trip units shall be capable of metering phase, neutral, and ground current with an accuracy of $\pm 2.0\%$ of the reading.
9. Trip units shall collect and store pertinent information to the trip unit and circuit breaker health and event history. The trip unit shall also include diagnostic features to allow the user to investigate events and dynamically monitor the health of the trip unit and the breaker.
 - a. Number of operations (load and no-load)
 - b. Number of trips (overload trips, short circuit trips)
 - c. Run time
 - d. Breaker ambient temperature.

- e. Breaker remaining life - The trip unit shall utilize an algorithm that applies a weighted value to monitored information to determine the remaining life of the breaker. The remaining life of the breaker shall be displayed or communicated in calculated percentage of life remaining.
 - f. All breaker health information shall be accessible via micro-USB port on front of trip unit and via embedded communications
10. Trip unit shall perform a waveform capture on trip, alarm, or user-initiated events.
- a. Any breaker trip event shall capture a 10-cycle waveform. The trip unit shall store the most recent trip event waveform.
 - b. Any alarm event or user-initiated waveforms shall capture a 1-cycle waveform.
 - c. Waveform events shall capture and store all phase, neutral and ground currents.

K. Motor Circuit Protectors:

- 1. Motor circuit protectors being completely enclosed molded case devices with current sensing coil in each of 3 poles having adjustable magnetic trip setting by means of single knob on front. Motor circuit protector manually operable. Protector designed to meet NEC requirement concerning motor full load and locked-rotor current. Minimum interrupting rating equal to bus bracing required.
- 2. Where indicated, current limiters, completely enclosed in molded case, bolted to load end of motor circuit protector to provide at least 100,000 amperes symmetrical interrupting rating at 600 volts. Limiters coordinated with protector so at low level short circuit, protector interrupts circuit without limiter operation. Faults interrupted by limiter also trip the protector and open all 3 poles. Equip each limiter with an indicator to show that the limiter has interrupted a fault.

L. L. Contactors:

- 1. Contactors for electric heating and other non-motor loads: Similar to motor starters except without overload relays or heaters. NEMA size as indicated, except 30 amperes minimum rating, tungsten lampload.
- 2. Contactors for lighting loads: Mechanically held. Ampere ratings as indicated, except 30 amperes minimum rating tungsten lampload.

M. Control Devices:

- 1. Control relays: Heavy-duty, industrial or machine tool type with at least two normally open and two normally closed contacts. Coils 120 volts, 60 Hertz.

2. Contacts: Rated 10 amperes, 250 volt alternating current.
3. Time-delay relays: Adjustable, pneumatic type, range 2 to 60 seconds and operated on 120 volts, 60 Hertz, with at least one normally open and one normally closed timed contact.
4. Pushbuttons and instrument selector switches: Heavy-duty, oil tight units, 30 mm, rated 10 amperes continuous current at 120 volts.
5. Indicating lights: LED type, heavy-duty, oil-tight, 30 mm units with push-to-test features.
6. Control and selector switches: Rotary type with enclosed contacts. Equip each switch with rectangular escutcheon and pistol-grip handle, except handles for instrument phase selector switches equipped with round knurled or slotted handles. Switch contacts rated 10 amperes continuous, 600 volts.

N. Harmonic Equipment:

1. An active harmonic filter shall be provided to perform electronic cancellation of load produced harmonic currents such that the upstream power harmonic current and voltage shall be reduced below the IEEE 519 guidelines for load demand and voltage distortion limits. Performance of the filter shall be independent of the impedance of the power source, AC lines or back-up generator(s). Necessary current transducers, reactors, and operator interfaces shall be supplied with the MCC. A factory certified start-up technician shall be used to start up each harmonic filter to achieve optimum system performance.

O. Nameplates: Furnish each motor control center and each unit of motor control center with engraved nameplate. Nameplates of laminated sheet plastic, 1/16 inch (1.6 mm) thick, engraved to provide black letters on white background. Fasten nameplates in place with corrosion-resistant screws.

P. Instruments:

1. Instruments: Panel type, approximately 3-1/2 inch (89 mm) or 4-1/2 inch (114 mm) square as indicated, semi-flush mounted. Accurate within 1 percent of full scale. Select scales so full load readings occur at approximately 70 percent of full scale. U.L. listed instruments conforming to ANSI C39.1.
2. Furnish suitable instrument transformers. Conforming to ANSI C57.13.
 - a. Current transformers of window type and insulated for 600 volts.
 - b. Furnish potential transformers with current limiting primary fuses.
 - c. Current transformers for meters shall be metering accuracy.

- d. Terminate the secondary of all current transformers on shorting type terminal blocks before proceeding to any other device.
- 3. Running time meters: Mechanical style, panel-mounted, round, UL Certified, nonreset type, 3-1/2 inch (89 mm) with register to indicate hours and tenths of hours up to 99,999.9 hours. Meters to operate on 120 volts, 60 Hertz. Provide with 3-hole bezel mount.
- 4. Furnish current and potential test blocks with plugs where indicated. Clearly identify current, voltage and phase for blocks and plugs.

Q. Power Monitor:

- 1. Provide microprocessor-based monitoring device to provide local and remote monitoring of the electrical system.
 - a. Voltage input of 120 volts using voltage transformers.
 - b. Current input from current transformers, phase A, B, C and ground.
- 2. Comply with ANSI C12.16, Class 10.
- 3. Display data:
 - a. Current A, B, C, Average, Neutral, Ground.
 - b. Voltage - Phase to phase
 - (1) Phase to neutral
 - (2) Phase to ground
 - (3) Average values
 - c. Power - Watts
 - (1) Vars
 - (2) VA
 - (3) Phases A, B, C and System
 - d. Energy - KWH
 - (1) KVARH
 - e. Frequency
 - f. Demand - System current

- (1) KW
 - (2) KVAR
 - (3) KVA
- g. Power Factor - Phases A, B, C, System
- h. Percent THD Current - Phases A, B, C, N
- i. Percent THD Voltage:
 - (1) Phase to phase
 - (2) Phase to neutral
- j. Minimum and maximum values
- k. Monitor past events and thresholds.
- 4. Provide power monitor with Ethernet connection and capable of communicating using Modbus TCP/IP protocol.

2.03 WIRING

- A. Conductors: Copper; size as required by load, except that no control wire is smaller than 14 AWG. Use insulation that is flame retardant, and moisture and heat resistant.
- B. Cables and conductors: Bundled and tie wrapped securely in wireways furnished.
- C. Identify internal wiring at terminations by T&B wire markers or equivalent.
- D. All spare starter auxiliary contacts to be wired to terminal blocks.
- E. Terminal Blocks:
 - 1. Rated 600 volt for power with current rating as required by loads.

2.04 MISCELLANEOUS DEVICES

- A. Kirk Key interlocks shall be provided as indicated on the drawings.

2.05 SPARE PARTS

- A. Furnish following spare parts for each motor control center:
 - 1. Twelve lamps for indicating lights.
 - 2. One coil for each size of starter furnished for each motor control center.

3. One complete set of fuses for each size furnished.
 4. One set of contacts for each size of starter furnished.
 5. One control transformer for each volt-ampere capacity unit furnished.
- B. Package items in suitable containers bearing labels clearly indicating contents and equipment with which used.

2.06 FINISH

- A. Finish motor control centers with ANSI No. 61, light-gray enamel over rust-resistant undercoat.
- B. Furnish instruments and control devices with standard black finish.
- C. Use, mixing, application, and curing of paint on items requiring painting in accordance with paint manufacturer's written recommendations.

2.07 FACTORY TESTS

- A. The entire MCC shall go through a quality inspection before shipment, verifying the equipment to the factory shop drawings. This inspection will include:
1. Physical inspection and verification of:
 - a. Structure including verification of all bolted connections,
 - b. Electrical conductors, including:
 - (1) Bussing including verification of all bolted connections.
 - (2) Wiring.
 - (3) Unit compartments.
 2. Electrical Tests:
 - a. Electrical tests include:
 - (1) Power circuit phasing.
 - (2) Control circuit wiring and verification of satisfactory operation of all relays and other devices.
 - (3) Instrument transformers.
 - (4) Meters.

- (5) Ground fault system.
 - (6) Device electrical operation.
 - b. AC dielectric tests shall be performed on the power circuit.
- 3. Markings/Labels, include:
 - a. Instructional and warning type labels.
 - b. Underwriters Laboratory (UL)
 - c. Inspector's stamps.
- 4. The manufacturer shall use integral quality control checks throughout the manufacturing process to ensure that the MCC meets operating specifications.
- B. Equipment that is shipped without evidence of the required tests being performed to verify satisfactory operation will be subject to non-acceptance.
- C. If the MCC cannot be placed into service reasonably soon after its receipt, store it in a clean, dry and ventilated building free from temperature extremes. Acceptable storage temperature is from 0 degrees C (32 degrees F) to 40 degrees C (104 degrees F).

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install steel channel sills that have suitable drilled holes for mounting, aligning, and bolting each motor control center in place. Method of mounting, as indicated. Size and arrangement of sills, as recommended by motor control center manufacturer and acceptable to Engineer. Paint completed sills with two coats of aluminum paint or other acceptable corrosion-resistant finish before being set in place. Properly set and level channel sills.
- B. If motor control center equipment pads are located on concrete floor slabs, furnish painted steel channel mounting sills and anchor bolts, in time for placing concrete for construction of concrete equipment pads.
- C. Install items in accordance with manufacturers' printed instructions.
- D. Verify all loads on the motor control center including equipment and devices provided under the other electrical and non-electrical specification sections. Provide information to motor control center manufacturer for sizing of buses, control transformers, and protective devices. Verify that cables and conduits for loads are sized for the actual equipment provide in accordance with the NEC.
- E. Set motor circuit protectors and circuit breakers based on load installed.

- F. Check and provide a thermal overload on each phase of a starter unit. Match overloads to motor being installed.
- G. Deliver spare parts to Owner.
- H. Provide conduit, wiring, and grounding interconnections.
- I. Perform continuity and operational tests on circuits to demonstrate that motor control center is operationally safe and functionally correct.
- J. Provide one set of manufacturer wiring diagrams marked with all changes made in the field.

3.02 TESTING

- A. Factory authorized technician shall witness all testing as required by Section 26 08 13 “Field Inspection and Acceptance Tests”.
- B. Adjust and verify all settings and inputs to meters and relays.

3.03 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain the equipment.
- B. Training shall be a minimum of four (4) hours in operation and maintenance for up to five (5) Owner representatives. Schedule training with at least five (5) working days advance notification.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 27 17
CONTROL PANELS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section describes materials and installation of custom control panels as indicated and in compliance with Contract Documents.

1.02 REFERENCES

A. General:

1. The following documents form part of the Specifications to the extent stated. Where differences exist between codes and standards, the one affording the greatest protection shall apply.
2. Unless otherwise noted, the edition of the referenced code or standard that is current at the time of the "date of record" for the Work shall be considered the effective code or standard for the duration of the project.
3. Refer to Division 01 Section "General Requirements" for the list of applicable regulatory requirements.
4. Refer to specific Division 26 Sections for additional referenced codes and standards.

B. Underwriters' Laboratories, Inc., (UL):

1. 486A: UL Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors
2. 508: Electrical Industrial Control Equipment.
3. 508A: Industrial Control Panels.
4. 1059: Safety Terminal Blocks.

- C. Electrical Safety Program, Electrical Equipment Safety Program, and Lockout/Tagout Program of Provo Public Works.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".

B. Submit a complete list of equipment, materials, and any details required to demonstrate that the equipment will function properly as a unit. This material shall include:

1. System configuration with single-line diagrams.
2. Detailed descriptions of equipment including weights, dimensions, installation requirements, and heat dissipations.
3. Internal panel layouts indicating spacing and dimensions.
4. Panel front layouts.
5. Comprehensive panel construction bill of materials.
6. Catalog cuts of devices used.
7. Control schematics, ladder diagrams, and interconnection drawings.
8. Nameplates.

1.04 MANUFACTURER'S SERVICES

A. Services of Manufacturer's Representative as stated in Section 01 43 00 "Quality Requirements" and as specified herein.

1.05 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Indicating Lights: Two of each type and color installed.
4. Auxiliary Contacts: Furnish one spare for each size and type of magnetic controller installed.
5. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.
6. Control relays: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.

PART 2 - PRODUCTS

2.01 DIAGRAMS

- A. Schematic diagrams shall show the equipment serial or tag number, the Owner's drawing number, contract number, or similar identification which will indicate the particular equipment to which the diagrams apply. Diagrams shall show all equipment in the electrical system including internal wiring of subassemblies. Diagrams of subassemblies may be furnished on separate sheets.
- B. Identify each device by a unique number or number-letter combination.
- C. Conductor Identification: Identify each conductor by a unique number, letter, or number-letter combination. Consecutive numbering is preferred. Conductors connected to the same terminal or tie point shall have the same identification. Where multiconductor cable is used, a color code may be used to supplement the above identification. Where color-coded multiconductor cable is used for wiring identical components, such as limit switches, the color code used shall be consistent and charted on related diagrams.
- D. Provide a schematic diagram for each electrical system. The schematic diagram shall be drawn between vertical lines that represent the source of control power. Show control devices between these lines. Show actuating coils of control devices on the right-hand side. Show contacts between the coils and the left vertical line.
 - 1. Where the internal wiring diagrams of subassemblies are furnished on separate sheets, they shall be shown as a rectangle in the schematic diagram with external points identified and cross-referenced to the separate sheets of the control circuit. Show coils and contacts internal to the subassemblies in the rectangle connected to their terminal points.
 - a. Exception No. 1: Where relay and electronic circuits are mixed, diagrams may be drawn between horizontal lines that represent the source of control power.
 - b. Exception No. 2: Overload relay contacts may be connected to the right of the coil (common) if the conductors between such contacts and the coils of the magnetic devices do not extend beyond the control enclosure.
 - 2. For clarity, show control device symbols in the order in which the controls are positioned on the diagram.
 - 3. Use a cross-referencing system in conjunction with each relay coil so that associated contacts may be readily located on the diagram. Where a relay contact appears on a sheet separate from the one on which the coil is shown, describe the purpose of the contact on the same sheet.

4. Show spare contacts.
 5. Show limit, pressure, float, flow, temperature sensitive, and similar switch symbols on the schematic diagram with utilities turned off (electric power, air, gas, oil, water, lubrication, etc.) and with the equipment at its normal starting position.
 6. Show contacts of multiple contact devices, e.g., selector switches, on the line of the schematic diagram where they are connected in a circuit. Indicate a mechanical connection between the multiple contacts by a dotted line or arrow. This does not apply to control relays, starters, or contactors.
 7. Additional charts or diagrams may be used to indicate the position of multiple contact devices such as drum, cam, and selector switches.
 8. Show the purpose or function of switches adjacent to the symbols.
 9. Show the purpose or function of controls such as relays, starters, contactors, solenoids, subassemblies, and timers on the diagram adjacent to their respective symbols. Show the number of positions of solenoid valves adjacent to the valve solenoid symbol.
 10. Show values of capacitors and resistors on the diagram.
 11. Descriptive terms for command and status functions shall be in the present or past tense. For example, Raise Transfer-Transfer Raised; Advance Transfer-Transfer Advanced. Do not use terms such as "Transfer Up."
- E. The panel front and internal layouts shall show the general physical arrangement of components on the control panel. Identify devices with the same marking as used on the schematic diagram. Spare panel space shall be dimensioned. The drawings shall include a layout of the operator's console or push-button station, but terminal numbers need not be shown.

2.02 CONTROL ENCLOSURES

- A. Design and test control enclosures in conformance with UL 508. Enclosure types shall be as follows unless noted otherwise in the drawings:

Indoor Use	NEMA Type 12 SST
Outdoor Use	NEMA Type 4X SST
Indoor or Outdoor Use, Corrosive Area	NEMA Type 4X SST

- B. The depth of the control enclosure or compartment shall be a minimum consistent with the maximum depth of the control devices plus the required electrical clearance. In no case shall the depth of the enclosure be less than 8 inches.

- C. Provide mounting panel for mounting of interior components. Panel finish shall be white enamel.
- D. Where heating from control devices results in a temperature rise which is detrimental to the contained equipment or its operation, provide louvers or forced air ventilation. Design ventilating openings to prevent the entrance of any deleterious substance. When forced air ventilation is required, the cabinets shall be pressurized. Air filters shall be of commercially available types and sizes.
- E. Where installed outside, provide panel with a sunshield cover to completely protect and enclose the control panel. Ensure the control panel HMI screen, where provided, is continuously shaded during operation such that the sunshield cover does not require removal to access the HMI.
- F. Provide a permanent metal data pocket attached to the inside of the enclosure. If space permits, the pocket shall be at least 10 1/2 inches (267 mm) wide and of depth and thickness to accommodate electrical diagrams.
- G. Enclosure construction shall be minimum 316 stainless steel. Finish shall be white enamel inside. Provide continuous hinges for enclosure doors with a single handle three-point latch system with padlocking provisions. Provide hasp and staples for padlocking.

2.03 CONTROL WIRING

- A. 120-volt control wiring shall be Type MTW, THWN, or THHN. Conductors shall not be smaller than No. 14 AWG. Ampacity shall be in accordance with the NEC.
- B. Instrumentation signal cables shall be of the type used for field wiring.

2.04 MARKING

- A. Identify wire terminations with a number to correspond with the schematic diagrams. Identification tags shall be preprinted white heat-shrinkable tubing, Raychem Thermofit TMS or equal.
- B. Plainly and permanently identify control and power devices using the same identification as shown on the schematic diagrams. Show identification for devices inside the enclosure on a plate adjacent to, not on, the device.
 - 1. Exception No. 1: Where the size or location of the devices make individual identification impractical, such as on electronic assemblies, use group identification.
 - 2. Exception No. 2: Where panel layouts do not permit mounting identification plates adjacent to components, such as relays, place the permanent relay identification on the relay where it is plainly visible, and provide a second identification on the top of the panel wireway cover directly below the relay. Identify the wireway covers to show their proper location.

C. Identification plates for devices mounted inside and outside the control enclosure shall be one of the following:

1. Laminated phenolic for engraving stock; white background with black lettering, a minimum of 0.062 inch (1.57 mm) thick. Hold plates in place with metallic drive screws or the equivalent. Use permanent adhesives for attaching nameplates to wireway covers.
2. Noncorrodible metal; a minimum of 0.031 inch (0.78 mm) thick for engraving stock or 0.012 inch (0.30 mm) thick for embossing stock. Hold plates in place with metallic drive screws.

2.05 SUPPLY CIRCUIT DISCONNECTING MEANS

A. Provide a supply circuit disconnect for each control panel. Disconnect shall be a circuit breaker mounted within the control enclosure operated by a variable depth flange-mounted circuit breaker operating mechanism.

2.06 PLC AND OIT EQUIPMENT

- A. Refer to Section 40 62 43 Programmable Logic Controllers.
- B. Each new PLC panel assembly is to include a constant voltage regulating transformer suitably sized for the panel load equal to Sola Hevi-Duty MCR series and incoming power transient surge suppression equal to Sola Hevi-Duty STV100K series. Connect the surge suppressor dry contacts to a PLC input at each panel and notify the control system integrator/programmer.

2.07 UNINTERRUPTIBLE POWER SUPPLY (UPS)

- A. Control panels shall be equipped with a UPS for surge protection and battery backup of critical process control equipment. The UPS shall be panel mountable, and each control panel shall be appropriately sized to fit the unit. The UPS shall be a double-conversion system.
- B. Each UPS shall be sized for, and capable of, running the connected load for a minimum of 30 minutes. UPS shall be sized for 80% of rated load at maximum connected load.
- C. UPS Electrical Input Specifications
1. Nominal Voltage: 120VAC
 2. Voltage Range: 80-144VAC
 3. Input Power Factor: > 0.95
 4. Frequency: 60 Hertz +/- 3 Hertz.
- D. UPS Electrical Output Specifications

1. Voltage Regulation: +/- 3 percent of Nominal
2. Efficiency: > 85 percent
3. Frequency Regulation: +/- 3 Hertz on utility, +/- 1 Hertz on battery

E. UPS Communications Specifications:

1. A USB port shall be available for monitoring and configuring the UPS. An appropriate cable shall be supplied to connect to the UPS with a PC.
2. An Ethernet port shall be available with the ability to monitor the UPS utilizing the SNMP protocol.
3. A UPS Trouble normally closed contact shall be provided from the UPS and shall be connected to a PLC discrete input channel for notification and alarming.

F. UPS Battery Specifications:

1. All batteries shall be sealed, lead-acid batteries and shall be maintenance free. Batteries shall be hot-swappable. The UPS will indicate when the battery is weak and needs to be replaced.
2. The UPS shall be able to accept additional battery modules to extend the runtime of the UPS.

G. Acceptable Manufacturers:

1. Powerware 5 or 9 Series.
2. Liebert GTX Series.
3. APC Smart-UPS Series.

2.08 CONTROL DEVICES

- A. Provide 120-volt control circuit transformer if incoming power supply is not 120 volts. Provide minimum volt-ampere spare capacity that is in addition to the loads specified. Fuse one side of secondary winding and ground other side. Provide primary winding fuses on both lines.
- B. Provide indicator lights, selector switches, push buttons, meters, etc., as shown in the schematic diagrams, single-line diagrams, and as required for correct operation. Mount on the front panel of the control enclosure.
- C. Push buttons and selector switches shall be NEMA Type 4X. Provide with quantity of contact blocks required for correct operation. Units shall be UL listed with NEMA A600 rated contacts.

- D. Push buttons shall be standard size, round, flush head with momentary contacts.
- E. Selector switches shall be round with standard operator.
- F. Indicating lights shall be round, transformer type, NEMA Type 13, complete with color of lens indicated in drawings or as required and legend plate. Lamps shall be high-density LEDs. Indicating lights shall be push-to-test type.
- G. Control relays shall be magnetically held and shall have convertible contacts. Control relays shall be UL listed with NEMA A300 rated contacts and coil voltage, number of poles, and pole arrangement as indicated in the drawings. All relays shall be of the same manufacturer. Relays shall be Allen-Bradley Bulletin 700 or equal.
- H. Time delay relays shall be UL listed with contacts rated 10 ampere noninductive load, 120 volts, with coil voltage, number of poles, pole arrangement, and maximum timing adjustment as indicated in the drawings. Relays shall be plug-in, solid-state type with timing knob adjustment. Provide Potter Brumfield, Syracuse Electronics, ISSD, Allen-Bradley Type RT, or equal.
- I. Mechanically held relays shall have coil voltage, number of poles, and pole arrangement and rating as shown in the drawings. Provide integral coil clearing contacts.
- J. DC power supplies shall have ratings as required by the powered equipment. Provide integral overcurrent protection.

2.09 TERMINAL BLOCKS

- A. Provide terminal blocks for incoming and outgoing control wires. Wire and mount terminal blocks so that internal and external wiring do not cross over the terminals. Do not terminate more than two conductors at each terminal connection.
- B. Field wiring shall terminate on the "field side" of the terminal blocks. Do not connect internal panel wiring to the "field side" of the terminal blocks. Do not connect field wiring to the "panel side" of the terminal blocks.
- C. Terminal blocks shall be modular, rail mounted, rated at 20 amperes, 600 volts capable of terminating wire sizes No. 12 through No. 24 AWG and constructed of polyamide thermoplastic. Terminal blocks shall be UL listed in accordance with UL 486A and UL 1059. Current-carrying parts shall be copper or brass electroplated with tin/lead. Terminal connection shall be a screw clamp pressure plate connection, designed such that the clamping screw does not clamp the screw directly to the wire.
- D. Provide symmetrical steel assembly rails, end brackets, jumper bars, and other accessories as required for a complete terminal block assembly.
- E. Consecutively number terminal blocks from top to bottom with preprinted marking tags. Tags shall be white polyamide and hot printed with black symbols so that the print is permanent.

2.10 WIRING METHODS

- A. Panel wiring shall be neatly contained in panel wireways, including incoming and outgoing field control wiring. Panelways shall be white or light gray colored, restricted slot design, with matching snap-on covers. Provide panelways with mounting holes and nylon "push" rivets or machine screws for mounting. Panelways material shall be PVC or noryl.
- B. Provide minimum 2 inches (50 mm) of clearance between panelway and wire terminations to allow for clear viewing of wire identification marking.
- C. Tie wiring run to control devices on the front door together at short intervals and secure to the inside front door with adhesive mounts. Mounts shall be adjustable releasable-clamp type for wire bundles 0.69 inch (17 mm) in diameter or smaller or releasable nylon cable ties for bundles larger than 0.69 inch (17 mm) in diameter. Attach mounts to front panel with adhesive.

2.11 FACTORY TESTS

- A. Inspect and test control panel for correct operation. Test each circuit for continuity, short circuits, and fault grounds.

PART 3 - EXECUTION

3.01 FIELD TESTS

- A. Test control panel with field wiring connected. Set adjustable set points and time delays for proper operation of equipment. Check operation of control panel and field devices to verify correct operation. Perform required adjustments for correct operation.

3.02 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 27 26

WIRING DEVICES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide field test, and place in operating condition, wiring devices as indicated and in compliance with Contract Documents.
- B. Provide exterior lighting control as indicated and in compliance with Contract Documents.

1.02 REFERENCES

- A. Federal Specifications (FS):
 - 1. W-C-596-F: Plug, Electrical Connector, Receptacle, Electrical.
 - 2. W-S-896-F: (1P-2P-3W) Switch, Toggle, Single Unit with wall plates.
- B. National Electrical Manufacturers Association (NEMA):
 - 1. WD 1: General Requirements for Wiring Devices
 - 2. WD 6: Wiring Devices – Dimensional Requirements
- C. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).
- D. Underwriters' Laboratories, Inc. (UL):
 - 1. 20: General Use Snap Switches.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturer's product data in accordance with requirements of Section 26 05 10 "Electrical Work – General".

PART 2 - PRODUCTS

2.01 MANUFACTURER'S COMPLIANCE

- A. Manufacturer's acceptance contingent upon products compliance with specifications.
- B. Provide all devices with UL label.

2.02 MANUFACTURERS

- A. Allen-Bradley Co.
- B. Appleton Electric Co.
- C. Cooper Wiring Devices.
- D. Crouse-Hinds Co.
- E. Hubbell Electrical Products.
- F. Pass & Seymour, Legrand.
- G. OZ Gedney.
- H. Nelson Electric.
- I. Wattstopper.
- J. Greengate.

2.03 MATERIALS AND COMPONENTS

- A. Wall Switches:
 - 1. Provide alternating current, general-use, snap switches, in flush device boxes or on outlet box covers, totally enclosed in composition case, with insulated mounting yoke and sidewired, binding screw-type terminals. Single-pole, 2-pole, 3-way, or 4-way switches rated 20 amperes at 120/277 volts AC. Switch to meet Fed. Spec. W-S-896-F and UL-20.
 - 2. Switches for controlling lighting:
 - a. Cooper Wiring Device Cat. No. 2221, 222, 2223, or 2224.
 - b. Hubbell Cat. No. 1221, 1222, 1223 or 1224.
 - c. Bryant Electric Cat. No. 4901, 4902, 4903 or 4904.
 - d. Pass & Seymour, Cat. No. 20AC1, 20AC2, 20AC3 or 20AC4
 - 3. Provide pilot type lighting for switches controlling lights in seldom frequented locations.

B. Watertight Switches:

1. Provide watertight switches consisting of flush mounting switches in NEMA Type 4 gasketed cast metal boxes. Switch operable through shaft in matching cast metal cover, twenty-ampere, 120/277-volt switch enclosures:
 - a. Crouse-Hinds Type MC or MCC.
 - b. Appleton Cat. No. WDM 175 and WVG1.
 - c. OZ Gedney Cat. No. WSP and WCT120.

C. Occupancy Sensors:

1. Provide Occupancy Sensors as indicated on the plans. Provide power packs as need.
 - a. Low-Voltage Dual-Technology Ceiling Sensor: Wattstopper DT-305 or equal by Greengate.
 - b. Line-Voltage PIR Wall Sensor Switch, Wattstopper PW-301 or equal by Greengate.
 - c. Line-Voltage Dual-Technology Wall Sensor Dimmer, Wattstopper DW-311 or equal by Greengate.
 - d. Low-Voltage Dual-Technology Corner-Mount Sensor, Wattstopper DT-205 or equal by Greengate.

D. Flush Receptacles:

1. Provide 20-ampere, 125-volt flush receptacles constructed in flush device boxes, and of grounding type in composition case with insulated mounting yoke, side-wired, binding screw-type terminals. Receptacles to conform to Fed. Spec. W C 596-F.
2. Duplex receptacles:
 - a. Cooper Wiring Devices Cat. No. 5362.
 - b. Hubbell Cat. No. 5362.
 - c. Bryant Electric Cat. No. 5362.
 - d. Pass & Seymour Cat. No. 5342.
3. Duplex GFCI Type Receptacles:
 - a. Harvey Hubbell, Inc. Cat. No. CR5352.

- b. Cooper Wiring Devices Cat. No. GF20.
 - c. Leviton Manufacturing Company Cat. No. 6899.
4. Single receptacles:
- a. Cooper Wiring Devices Cat No. 5361.
 - b. Hubbell Cat. No. 5361.
 - c. Pass & Seymour Cat. No. 5351.

E. Special Receptacles:

- 1. Provide weatherproof while-in-use devices rated 20 ampere, 125-volt, consisting of duplex GFI receptacles with diecast powder coated aluminum, soft-gasketed hinged covers with stainless steel hardware. Covers as follows:
 - a. Hubbell Cat. No. WP26E.
 - b. Crouse-Hinds Cat. No. WIUMV-1X.
- 2. Provide in corrosive areas (NEMA 4X) a 20 ampere, 125-volt, consisting of duplex GFI receptacles with spring-loaded, soft-gasketed hinged covers with stainless steel spring. Device described above. Cover as follows:
 - a. Crouse-Hinds Cat. No. WLRS-1-S752.
- 3. Provide watertight, gasketed cast-metal enclosures with covers in areas subject to hose-down, meeting requirements, and either standard single or duplex type:
 - a. Appleton Electric Cat. No. AEE3382 and AEP3361, Style 2.
 - b. Crouse-Hinds Cat. No. ARRH33 and APJ3385, Style 2.
- 4. Provide receptacles with matching plug or cord cap designed to meet NEMA 4 requirements when plug, cord and receptacle are assembled.
- 5. Provide surface mounted “tombstone” style receptacles on laboratory island as shown on the plans. Provide die cast aluminum housing with minimum 3/4" conduit opening, two duplex GFI receptacles (one on each side) and stainless steel coverplates. For data outlets, provide the correct mounting for number of data connections shown.

F. Outlet Boxes and Enclosures:

- 1. Provide outlet boxes and enclosures conforming to Section 26 05 33 “Raceway and Boxes for Electrical Systems” and enclosure schedule on the drawings unless otherwise indicated.

G. Device Plates:

1. Provide device plates suitable for type of outlet boxes and enclosures used. Plates for flush-mounting by device manufacturer. Plates for surface-mounting boxes by either device manufacturer or box manufacturer.
2. Provide flush device plates of high corrosion resistant, Type 302 stainless steel.
3. Provide flush device plates of material and finish indicated, in certain designated areas.

H. Exterior Lighting Control Panel:

1. Provide Lighting Control Panel as indicated on the plans. Panel shall be UL listed and consist of the following:
 - a. Enclosure/Tub: NEMA 1.
 - b. Cover: Surface, hinged, lockable and shall restrict access to line voltage section.
 - c. Interior: Barrier for separation of high voltage (class 1) and low voltage (class 2) wiring. It shall include intelligence boards, power supply and control relays. Clock display and keypad shall be mounted on interior cabinet door for easy user access and programming.
2. Features:
 - a. Panel shall accept up to eight single pole relays. Relays shall be individual latching relays with 20 Amp load contacts for LED lighting loads. Provide isolated auxiliary contacts for pilot light switching. Relays shall use quick connectors and be individually replaceable to facilitate ease of use.
 - b. Panel shall provide a stagger up delay, override push buttons, pilot light outputs, and LED status light indicators for each relay or contactor control channel.
 - c. The clock shall have a backlight display, user keypad and shall provide 8 channels of time or astronomical control. Time clock shall provide up to 42 holidays, automatic daylight savings adjustment, astronomic coordinates by major cities, and help screens. Program memory shall be non-volatile and clock shall retain time keeping during power outages for at least 48 hours. Preprogrammed lighting control scenarios shall include:
 - (1) Scheduled On/Off
 - (2) Manual On/Scheduled Off

- (3) Manual On/Automatic Switch Sweep Off
 - (4) Astronomic Or Photocell On/Off and Astronomic or Photocell Control With Scheduled On/Off.
 - d. The panel shall have 8 universal switch inputs that are low voltage, self-configuring and shall not require programming to accept momentary on/momentary off switch, push button switch (cycling), maintained switch or 24VDC signals from occupancy sensors, photocells or other interfacing devices.
3. Manufacturer:
- a. Provide Wattstopper LP8S-8-115 Surface Mount with photocell EM-2-A2 or equal by Greengate.

PART 3 - EXECUTION

3.01 GENERAL

- A. Perform all work in accordance with the NEC.

3.02 CONNECTION

- A. Securely and rigidly attach wiring devices in accordance with regulating agency, and as indicated, avoiding interference with other equipment.
- B. Securely fasten nameplates using screws, bolts, or rivets and centered under or on the device, unless otherwise indicated.

3.03 GROUNDING

- A. Ground all devices in accordance with NEC.
- B. Ground switches and their metal plates through switch mounting yoke, outlet box, and raceway system.
- C. Ground flush receptacles and their metal plates through positive ground connection to outlet box and grounding system. Maintain ground to each receptacle by spring-loaded grounding contact to mounting screw, or by grounding jumper, both making positive connection to outlet box and grounding system at all times.
- D. Ground explosion proof receptacles and plugs by making contact between the metal shells, and also by using a grounding pin to make contact before power contacts are made.

3.04 LABELING

- A. All wall plates to be engraved with the panelboard alpha-numeric identifier and circuit breaker number.
 - 1. Characters to be 5/16 inch (8 mm) in size and black in color.
 - 2. All engravings to match panelboard typed circuit breaker directories.

3.05 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 29 23

VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide complete simplex type Variable Frequency Drive (VFD) units and appurtenances including drive reactors, DC chokes, harmonic filters, enclosures, and certain auxiliary items, as indicated and as specified, to provide a complete operating system as indicated and in compliance with Contract Documents.
- B. If not installed in Motor Control Center, VFD units shall be furnished by the driven equipment manufacturer (pump, fan, etc.) supplier unless otherwise noted. Installation of the units shall be the responsibility of the General Contractor. All conduit and wire installations associated with each VFD shall be provided under Division 26.
- C. Provide individual stand-alone VFD units for the High Service Pumps as indicated on the plans and in this specification.
- D. VFD units shall be manufacturer's standard technology and in production for a minimum of 2 years.
- E. Provide control system operation, input and control signals, status signals and devices in accordance with Section 40 99 90 "Package Control Systems".
- F. Each VFD unit shall exhibit less than 3 percent voltage total harmonic distortion and less than 3 percent voltage distortion on each harmonic at their immediate upstream distribution bus as verified by calculation and testing. Harmonic current distortion to be in accordance with Table 26 29 23-1. This bus shall be referred to as the point of common coupling (PCC).
- G. Ratings shall be based on an altitude of approximately 4500'.

1.02 REFERENCES

- A. General:
 - 1. The following documents form part of the Specifications to the extent stated. Where differences exist between codes and standards, the one affording the greatest protection shall apply.
 - 2. Unless otherwise noted, the edition of the referenced code or standard that is current at the time of the "date of record" for the Work shall be considered the effective code or standard for the duration of the project.

3. Refer to Division 01 Section "General Requirements" for the list of applicable regulatory requirements.
 4. Refer to specific Division 26 Sections for additional referenced codes and standards.
- B. ASTM International (ASTM):
1. D178: Standard Specification for Rubber Insulating Matting
- C. National Electrical Manufacturers Association (NEMA):
1. ICS 2: Industrial Control and Systems Controllers, Contactors, and Overload Relays Rated 600 Volts.
 2. ICS 6: Enclosures for Industrial Controls and Systems.
 3. AB 1: Molded-Case Circuit Breakers, Molded Case Switches, and Circuit-Breaker Enclosures.
 4. KS 1: Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum).
 5. MG 1: Motors and Generators.
- D. National Fire Protection Association (NFPA):
1. 70: National Electrical Code (NEC).
- E. Underwriter's Laboratories Inc. (UL):
1. 198C: High-Intensity Capacity Fuses; Current-Limiting Types
 2. 489: Molded-Case Breakers, Molded-Case Switches, and Circuit Breaker Enclosures.
 3. 508: Electrical Industrial Control Equipment.
 4. 1066: Low Voltage AC and DC Power Circuit Breakers Used in Enclosures.
- F. National Electrical Contractors Association (NECA)
1. NECA Standard of Installation
- G. Electrical Safety Program, Electrical Equipment Safety Program, and Lockout/Tagout Program of NTMWD.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions for all major components.
- C. Complete wiring and schematic diagrams for the equipment furnished. Each wiring diagram shall be legible and not reduced from the original design drafted format. Provide a list of equipment on each wiring diagram for which it is applicable.
- D. Panel layout and front view drawings.
- E. Time versus current curves for protection devices.
- F. Data sheets for all devices provided as part of the assembly.
- G. All other details required to demonstrate that system has been coordinated and will properly function as a unit.
- H. Provide enclosure drawings and details showing all dimensions and construction details.
- I. Submit information relative to location and expertise of local service office and personnel.
- J. Submit a Statement of Compliance indicating conformance to the Seismic Requirements specified. Certificate shall be signed and sealed by a Professional Structural Engineer holding current registration in the state for work of this project.
- K. For informational purposes only, submit manufacturer's printed installation instructions.
- L. Spare Parts Data: Submit a list of spare parts for the equipment specified.
- M. Operating and Maintenance Instruction Manuals:
 - 1. Furnish:
 - a. Operating instruction manuals outlining step-by-step procedures required for system startup and operation.
 - b. Manufacturer's name, model number, service manual parts list.
 - c. Brief description of equipment and basic operating features.
 - d. Maintenance instruction manuals outlining maintenance procedures.
 - e. Troubleshooting guide listing possible breakdown and repairs.
 - f. Point-to-point connection wiring diagram for the system.

- g. Performance Test Reports: Upon completion of installed system, submit in booklet form all shop and field tests performed to prove compliance with specified performance criteria.

N. Submit Pump, Motor and VFD Statement of Compliance Coordinate Certificate.

1.04 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 “Quality Requirements” and as specified.
- B. Provide VFDs in accordance with UL 508A, supplement SB, and Article 409 of the National Electrical Code (NEC). All VFD units shall be provided with a UL label.
- C. The manufacturer shall confirm and state the measure of and the set of the features that support the ease and speed of which corrective maintenance (CM) and preventive maintenance (PM) can be conducted on the proposed system. The Mean Time To Repair (MTTR), the measure used to quantify the time required to perform CM and Mean Preventive Maintenance Time (MPMT), a measure commonly used to quantify the time required to perform PM are to be confirmed by the manufacturer.
- D. Review the proper installation of each type of VFD unit with the equipment supplier prior to installation.
- E. Services of Service Engineer, specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time. Times listed are per VFD not mounted in a Motor Control Center (MCC).
 - 1. Assist in location of devices, methods of mounting, field erection, etc.
 - a. 2 person-days
 - 2. Functional Completion Testing
 - a. 2 person-days
 - 3. Startup.
 - a. 2 person-days
 - 4. Commissioning.
 - a. 2 person-days
 - 5. At the end of start-up service provide for a maximum of six members of the owners staff at the facility site to receive training from the startup/testing service Engineer.
 - a. 1 person-day

6. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:
 - a. 2 person-days
7. Person-day is defined as one 8-hour day, excluding travel time.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01 66 10 "Deliver, Storage and Handling" and as specified.
- B. Shipping:
 1. Ship equipment and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.
 2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
 3. Deliver spare parts after installation but as specified before start-up of drives. Deliver to Owner after completion of work.
- C. Storage:
 1. Inspect and inventory items upon delivery to site.
 2. Store and safeguard equipment, material and spare parts.
 - a. If the equipment cannot be placed into service after its receipt, store in a closed building or structure, in a clean, dry and ventilated area free from temperature, dirt and moisture extremes. Acceptable storage temperatures are from 32 degrees F (0 degrees C) to 104 degrees F (40 degrees C) with temporary heaters provided within enclosures to prevent condensation. Provide heavy plastic envelope directly over motor control center to protect against dust, dirt, and moisture. Provide lifting angles outside of envelope.

1.06 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.

3. Indicating Lights: Two of each type and color installed.
4. Auxiliary Contacts: Furnish one spare for each size and type of magnetic controller installed.
5. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.07 WARRANTY AND SERVICE

- A. Guarantee components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 24 months after turning the equipment over to the Owner, and in this time period include onsite, parts and labor warranty. All labor to be performed by local factory trained service engineers.
- B. Ensure that equipment manufacturer has local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturer shall have at least five years commercial experience in the manufacture, operation and servicing of equipment of type, size, quality, performance, and reliability equal to that specified.
- B. Variable Frequency Drive Units:
 1. ABB Drives.
 2. Eaton.
 3. Schneider/Square D Company.
 4. Siemens Inc.

2.02 HARMONIC ANALYSIS

- A. Each VFD unit shall be designed such that there is less than 3 percent voltage total harmonic distortion at the PCC. Current distortion at the PCC will be in accordance with Table 26 29 23-1. For the purpose of the analysis, it will be assumed that the facility transformer feeding the electrical system is at a lightly (50 percent) loaded condition.

<p style="text-align: center;">Table 26 29 23-1 Maximum Harmonic Current Distortion in Percent II</p>
--

Odd Harmonic						
Ratio	5 to 9	11 to 15	17 to 21	23 to 33	35 +	TDD
Less than 20	4.0	2.0	1.5	0.6	0.3	5.0
20 to 50	7.0	3.5	2.5	1.0	0.5	8.0
50 to 100	10.0	4.5	4.0	1.5	0.7	12.0
100 to 1000	12.0	5.5	5.0	2.0	1.0	15.0
1000 +	15.0	7.0	6.0	2.5	1.4	20.0
Notes: 1. Even harmonics are limited to 25 percent of odd harmonics. 2. DC offset distortions not allowed. 3. Ratio = I_{sc}/I_L where: I_{sc} = Maximum short circuit current at PCC. I_L = Maximum demand load current at PCC (fundamental frequency component)						

- B. For each VFD unit, provide a harmonic analysis study at the point of connection to the immediate upstream distribution bus (PCC), based on pre-submittal data.
1. Each VFD unit shall be designed such that there is less than 3 percent voltage total harmonic distortion and less than 3 percent voltage distortion on each harmonic at the PCC. Current distortion to be within the limits of Table 26 29 23-1. For the purpose of the analysis, it will be assumed that the electrical system is at a lightly loaded condition, 50 percent load. If the VFD loads exceed 50 percent system loading, assume system is loaded at VFD full load ratings.
 2. At each PCC, where more than one type or size VFD unit is to be connected, provide the following:
 - a. Contractor shall have the supplier of the largest drive (in Hp) provide a harmonic study for each point of common coupling based on pre-submittal information
 3. The Contractor shall supply the following pre-submittal information to the largest VFD supplier to complete the harmonics study.
 - a. Full load fundamental current for each VFD unit.
 - b. Harmonic currents on per unit basis of full load fundamental for each VFD unit.
 - c. Available fault current information from the electric utility and upstream transformer data.
 - d. Distribution transformer sizes and impedances, if any.

- e. VFD input line reactor and/or isolation transformer sizes and impedances from the utility source to the VFD units.
 - f. Conductor information between transformer secondary or generator terminals to the distribution buses and VFDs.
 - g. Generator kW, impedance, subtransient reactance generator constants for the condition when the electrical system is powered from the generator.
4. The results of the harmonics study shall verify that the levels of total harmonic voltage at each point of common coupling are less than 5 percent and that the voltage distortion on each harmonic is less than 3 percent. In addition, harmonic currents at the PCC will be within the limits of Table 26 29 23-1. The study shall separately consider each VFD distribution bus as points of common connection (PCCs). The study shall specify additional equipment required (e.g., filters) at each harmonic where harmonic reduction is required to ensure compliance.
- C. The study shall consider the following conditions:
- 1. The electrical system shall be powered by the electric utility, case 1, or solely by local generation, case 2.
 - 2. The study shall include an explanation of all assumptions, sources of data, methodologies and formulas used in the study and a summary of the study results.
 - 3. The Contractor shall supply all equipment required as a result of the final accepted harmonics study to comply with the requirements of Paragraph 1.01 F.

2.03 SYSTEM DESCRIPTION

- A. General Requirements for VFDs:
- 1. VFDs and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 2. Comply with NEMA ICS 7, NEMA ICS 61800-2, and UL 508C.
- B. Application: Constant torque and variable torque. Provide as required for the application.
- C. VFD Description: Variable Frequency Drive, consisting of power converter that employs pulse-width-modulated inverter, factory built and tested in an enclosure, with integral disconnecting means and overcurrent and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and adjustable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.
- 1. Units suitable for operation of NEMA MG 1, Design A and Design B motors, as defined by NEMA MG 1, Section IV, Part 30, "Application Considerations for

Constant Speed Motors Used on a Sinusoidal Bus with Harmonic Content and General Purpose Motors Used with Adjustable-Voltage or Adjustable-Frequency Controls or Both."

2. Units suitable for operation of inverter-duty motors as defined by NEMA MG 1, Section IV, Part 31, "Definite-Purpose Inverter-Fed Polyphase Motors."
 3. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to authorities having jurisdiction.
- D. Design and Rating: Match load type, such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- E. Output Rating: Three phase; 10 to 66 Hz, with torque constant as speed changes; maximum voltage equals input voltage.
- F. Unit Operating Requirements:
1. Input AC Voltage Tolerance: Plus 10 and minus 10 percent of VFD input voltage rating.
 2. Input AC Voltage Unbalance: Not exceeding 3 percent.
 3. Input Frequency Tolerance: Plus or minus 3 percent of VFD frequency rating.
 4. Minimum Efficiency: 96 percent at 60 Hz, full load.
 5. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or speed condition.
 6. Minimum Short-Circuit Current (Withstand) Rating: 22 kA, refer to plans for higher ratings as required.
 7. Ambient Temperature Rating: Not less than 32 deg F (0 deg C) and not exceeding 104 deg F (40 deg C).
 8. Humidity Rating: Less than 95 percent (noncondensing).
 9. Altitude Rating: Not exceeding 3300 feet (1000 m).
 10. Starting Torque: Minimum 100 percent of rated torque from 3 to 60 Hz.
 11. Speed Regulation: Plus or minus 5 percent.
 12. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.
 13. Stop Modes: Programmable; includes fast, free-wheel, and dc injection braking.

- G. Inverter Logic: Microprocessor based, 16 bit, isolated from all power circuits.
- H. Isolated Control Interface: Allows VFDs to follow remote-control signal over a minimum 40:1 speed range.
 - 1. Signal: Electrical.
- I. Internal Adjustability Capabilities:
 - 1. Minimum Speed: 5 to 25 percent of maximum rpm.
 - 2. Maximum Speed: 80 to 100 percent of maximum rpm.
 - 3. Acceleration: 0.1 to 999.9 seconds.
 - 4. Deceleration: 0.1 to 999.9 seconds.
 - 5. Current Limit: 30 to minimum of 150 percent of maximum rating.
- J. Self-Protection and Reliability Features:
 - 1. Loss of Input Signal Protection: Selectable response strategy, including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
 - 2. Under- and overvoltage trips.
 - 3. Inverter overcurrent trips.
 - 4. VFD and Motor-Overload/Overtemperature Protection: Microprocessor-based thermal protection system for monitoring VFDs and motor thermal characteristics, and for providing VFD overtemperature and motor-overload alarm and trip; settings selectable via the keypad.
 - 5. Critical frequency rejection, with three selectable, adjustable deadbands.
 - 6. Instantaneous line-to-line and line-to-ground overcurrent trips.
 - 7. Loss-of-phase protection.
 - 8. Reverse-phase protection.
 - 9. Short-circuit protection.
 - 10. Motor-overtemperature fault.
- K. Automatic Reset/Restart: Attempt three restarts after drive fault or on return of power after an interruption and before shutting down for manual reset or fault correction; adjustable delay time between restart attempts.

- L. Bidirectional Autospeed Search: Capable of starting VFD into rotating loads spinning in either direction and returning motor to set speed in proper direction, without causing damage to drive, motor, or load.
- M. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- N. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- O. Integral Input Disconnecting Means and OCPD: UL 489, instantaneous-trip circuit breaker with pad-lockable, door-mounted handle mechanism.
 - 1. Disconnect Rating: Not less than 115 percent of VFD input current rating.
 - 2. NO alarm contact that operates only when circuit breaker has tripped.
- P. To avoid damage of output IGBT components or slamming to motors, an E-stop operation shall trigger a freewheel stop on the drive before the main 3 phase contacts open from the E-stop.

2.04 PERFORMANCE REQUIREMENTS

- A. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified."

2.05 CONTROLS AND INDICATION

- A. Refer to control diagrams on plans for additional requirements.
- B. Status Lights: Door-mounted LED indicators displaying the following conditions, as a minimum:
 - 1. Power on.
 - 2. Run.
 - 3. Overvoltage.
 - 4. Line fault.
 - 5. Overcurrent.
 - 6. External fault.
- C. Panel-Mounted Operator Station: Manufacturer's standard front-accessible, sealed keypad and plain-English-language digital display; allows complete programming, program copying, operating, monitoring, and diagnostic capability.

1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.
 2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
 - a. Control Authority: Supports at least four conditions: Off, local manual control at VFD, local automatic control at VFD, and automatic control through a remote source.
- D. Historical Logging Information and Displays:
1. Real-time clock with current time and date.
 2. Running log of total power versus time.
 3. Total run time.
 4. Fault log, maintaining last four faults with time and date stamp for each.
- E. Indicating Devices: Digital display mounted flush in VFD door and connected to display VFD parameters including, but not limited to:
1. Output frequency (Hz).
 2. Motor speed (rpm).
 3. Motor status (running, stop, fault).
 4. Motor current (amperes).
 5. Motor torque (percent).
 6. Fault or alarming status (code).
 7. PID feedback signal (percent).
 8. DC-link voltage (V dc).
 9. Set point frequency (Hz).
 10. Motor output voltage (V ac).
- F. Control Signal Interfaces:
1. Electric Input Signal Interface:
 - a. A minimum of two programmable analog inputs: 4-20mA dc.

- b. A minimum of six multifunction programmable digital inputs.
- G. Output Signal Interface: A minimum of two programmable analog output signal(s) 4-20mA dc, which can be configured for any of the following:
 - 1. Output frequency (Hz).
 - 2. Output current (load).
 - 3. DC-link voltage (V dc).
 - 4. Motor torque (percent).
 - 5. Motor speed (rpm).
 - 6. Set point frequency (Hz).
- H. Remote Indication Interface: A minimum of six programmable dry-circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
 - 1. Motor running.
 - 2. Set point speed reached.
 - 3. Fault and warning indication (overtemperature or overcurrent).
 - 4. PID high- or low-speed limits reached.
 - 5. Drive in remote.
- I. Provide an Ethernet port for network connection.
 - 1. VFD shall be capable of communicating via Modbus TCP/IP protocol.
 - 2. Network to allow a selection of standard and custom register values to communicate drive parameters, including:
 - a. Drive fault
 - b. Overload
 - c. Trip
 - d. Loss of control power
 - e. Speed
 - f. Power (kW)

- g. Amps (Phase A, B and C)
 - h. Voltage (Phase A-B, B-C, C-A)
3. Provide all components and drive programming to allow network interface with control system.

2.06 MOTOR PROTECTION RELAY

- A. For each High Service Pump VFD, provide a definite purpose microprocessor-based Motor Protective Relay (MPR) for protection, control and monitoring of the motors. The MPR shall meet UL 1053 standard.
- B. The true rms current into the motor shall be constantly monitored, and by means of a protective algorithm, separated into positive and negative sequence components. These components shall be used to determine the heating effects on the stator and rotor of the motor to provide maximum motor protection and utilization. The relay shall be capable of being connected by three-wire conductor or fiber optic to a remote Universal Resistance Temperature Detection Module (URTDM) located at the motor to monitor up to six motor winding, four bearing and one auxiliary RTD inputs or the relay shall be able to be direct connected to the RTD inputs. The MPR shall integrate the temperature input data from the URTDM with the protective algorithm. The protective curve algorithm shall be adaptive based on the motor temperature as measured by the URTD. The protective algorithm shall provide faster trip times for higher temperatures providing maximum motor protection and shall operate with a longer trip time for lower temperatures allowing maximum motor utilization. The MPR shall provide the following protective functions:
 - 1. Motor running time overcurrent protection (IEEE Device 49/51).
 - 2. Adjustable instantaneous overcurrent protection (IEEE Device 50) with adjustable start delay in one-cycle increments.
 - 3. Adjustable current unbalance protection (IEEE Device 46 -adjustable in percent unbalance).
 - 4. Rotor protection.
 - 5. Underload trip with start and run time delays (IEEE Device 37/2).
 - 6. Jam trip with start and run time delays.
 - 7. Auxiliary overtemperature protection with URTDM.
 - 8. Zero sequence ground fault protection (IEEE Device 50/51G) with adjustable start delay and run delay in one-cycle increments.
 - 9. Stator protection with URTDM (IEEE Device 49).

10. Motor bearing over temperature protection with URTDM (IEEE Device 38)
 11. Load bearing over temperature protection with URTDM (IEEE Device 38).
- C. Only the following settings shall be needed to define the motor thermal protection curve.
1. Motor full load amperes (FLA)
 2. Locked Rotor Current in percent of FLA
 3. Locked rotor stall time in seconds
 4. Ultimate trip current based on motor service factor.
- D. The following control functions shall be provided by internal solid-state based timers or relays:
1. Incomplete sequence delay (IEEE Device 2/19).
 2. Limitation on number of starts per time period in minutes (IEEE Device 66).
 3. Anti-backspin time delay (IEEE 2).
 4. Programmable transition relay based on current and/or time.
 5. Time between starts.
 6. Number of cold starts.
 7. Mechanical load shedding and restore function with timers.
 8. Zero speed switch input timer for use with long accelerating time motors.
- E. The MPR shall have a real-time clock for time tagging of events, operations and history. The relay shall have quick and easy access to monitored values, view settings, motor history and motor log records. The relay shall monitor and display the following:
1. Motor currents: Average current (Iave), individual phase and ground current in primary amperes and percent of full load and percent phase unbalance.
 2. Motor RTD: Individual winding, motor bearing, load bearing and auxiliary temperatures.
 3. Motor: Percent I²t (thermal accumulation), time until next start can occur, remaining number of starts, and time left on oldest start.
- F. The MPR shall be capable of accommodating external current transformers with ranges from 10/5 through 4000/5 amperes. Provide three current transformers sized per manufacturer's recommendations based on motor full-load amperes and service factor.

Where ground fault protection is specified, it shall be from an independent measuring circuit that utilizes either a separate zero sequence current transformer (50/51G) or residual scheme utilizing the three-phase current transformers (50/51N). For zero sequence ground fault protection, provide 50/5-ampere zero sequence transformer.

- G. Two user-programmable discrete inputs shall be provided for external control or trip functions. Programmable input functions shall be included for shutdown based on external contacts for incomplete sequence of operation and remote trip, remote reset, differential trip, motor stop, reset disable, zero speed switch or emergency override.
- H. The MPR shall be capable of providing a 4 to 20 mA output signal proportional to either the average of the three-phase currents, hottest winding RTD temperature or I₂t level.
- I. The unit shall draw its power from a control power transformer located in the starter.
- J. Provide separately mounted RTDM, mounted near the motor, to provide up to six stator RTDs, two motor bearing RTDs, and two load bearing RTDs and one auxiliary RTD.
- K. The device shall have separate Form C (NO/NC) Trip, two programmable Form C (NO/NC) Alarm and Auxiliary contacts. All contacts shall have ratings of 10-amperes at 115/240 Vac or 30 Vdc resistive. The alarm and auxiliary relay output contacts shall be programmable to operate from any internal protection function or from a discrete input signal such as differential trip or remote trip. All contacts shall be programmable to function in either a mode 1 (non-fail-safe) or mode 2 (fail-safe) operation. The device shall be capable of providing a 4 to 20 mA output signal proportional to one of the following user-selectable parameters:
 - 1. Average of the three-phase currents.
 - 2. Hottest winding RTD temperature
 - 3. I₂t level.
- L. The relay shall be capable of monitoring electrical current, receiving commands from remote sources either by contact closures or digital data, giving commands by means of contact closure to the motor starters and other devices under its control. The MPR shall be capable of displaying information by alphanumeric display to the operator or by digital communication signals to a remote location.
 - 1. The combination relay and operator panel shall be mounted on the door of the starter. Specific data entry to suit the actual motor application shall be programmed into the device by means of the operator panel pushbuttons
 - 2. Entered data shall be stored in non-volatile memory so as not to require battery backup. Non-volatile memory shall be capable of storing all setup information even after power failure, all monitored information at the time of a trip, and cause of trip even after power failure. Access to all programmed set points shall be restricted by means of a secured and sealed access cover.

3. Alphanumeric display shall read out (in English) complete description of all protective functions e.g., “instantaneous overcurrent” and all monitored and programmable data such as “percent of full load in amps” and “motor bearing temperature”.
 4. The MPR shall be user-selectable as to being programmable while the motor is running or require a motor shutdown for programming. If configured for programming while the motor is running, the protection shall stay active while programming is based on previous settings. Upon the user exiting the programming mode, the new settings shall take effect.
 5. The MPR shall have a user-selectable emergency override feature to reset I²t thermal accumulation and de-active start inhibit timers for emergency starting of the motor. The emergency override feature shall be capable of being activated from an access-restricted button, communications or via a contact input into the MPR.
 6. The MPR shall provide a programmable control function for reduced voltage applications for the transition from reduced to full voltage starting. The transition shall be programmable based on current, time current, and time.
- M. The MPR shall provide the following data logging and display capability for history including the date and time from when the history was last reset and counting began. The history shall include:
1. Resettable motor history for operational counter, run time, highest starting and running currents, highest percent phase unbalance, maximum winding, bearing and load RTD temperature, and number of emergency overrides.
 2. Re-settable Trip history for number of trips for ground faults, overloads, instantaneous overcurrent, JAM, underload, phase unbalance, RTDs, phase reversal, incomplete sequence, remote differential, communication, starts exceeded, time between starts, and transition.
 3. Re-settable Alarm history for number of alarms, for ground faults, overloads, JAM, underload, phase unbalance, RTDs, starts exceeded.
 4. A permanent history record which cannot be reset shall include total trips, run time and operations count.
 5. A log book including a chronological list of events or operations as detected by the MPR, such as, starts, stops, setting change, emergency override, trips, alarms or changes in the state of discrete inputs.
 6. An event log providing detailed information on trips and alarms including phase and ground currents, percent phase unbalance, maximum RTD temperatures, and cause of trip or alarm.

7. A start log providing information on the four most recent starts including maximum phase, and ground starting current, maximum percent unbalance, time from start to transition, current at transition, and time from start to run or trip.
- N. The MPR shall be provided in a quick release drawout case. The MPR shall have a user-programmable armed/disarmed feature with alarm indication. The disarmed mode shall permit relay installation while the motor is running with the trip outputs blocked. The draw-out case shall have a spare self-shorting contact to allow for continuous motor running or relay removed alarm functions.
- O. Provide a network communications card capable of changing set points, real time temperature for each RTD, transmitting all data, including trip/alarm data, a starting profile of the average phase current for the two most recent starts, all on MODBUS TCP/IP over Ethernet to the SCADA system.

2.07 LINE CONDITIONING AND FILTERING

- A. All VFDs shall include 3% effective impedance. If integral to the VFD, a DC choke shall be used. External line reactors must be used if no DC Choke is integral to the VFD.
- B. All VFDs shall include 5% effective line impedance. If integral to the VFD, a DC choke may be used in series with a 3% reactor. An external 5% impedance reactor must be used if no DC Choke is integral to the VFD.
- C. For VFD rated 480 volts, 50 horsepower and below 300 horsepower, supply an 18-pulse design using a multiple bridge rectifier with integral reactor and phase shifting transformer. The 18-pulse configuration shall result in a multiple pulse current waveform that approximates near sinusoidal input current waveform. The power section shall be insensitive to phase rotation of the AC line.
- D. For VFD rated 480 volts, 300 horsepower and up, supply with an Active Harmonic Filter (AHF). Provide a AHF in the same enclosure and sized for each VFD. The VFD and AHF shall come as a packaged unit with no additional cabling between units.

2.08 ENCLOSURES

- A. VFD Enclosures: NEMA 250, to comply with environmental conditions at installed location.
 1. Dry and Clean Indoor Locations: Type 1.
 2. Outdoor Locations: Type 4X.
 3. Other Wet or Damp Indoor Locations: Type 4X.
 4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: Type 12.

2.09 SHOP TESTING

- A. Provide in accordance with Section 01 43 00.
- B. Provide a factory performance test for each variable frequency drive unit. The test to consist of simulating the expected load to be driven. The drive to operate the actual motor load through the expected speed ranges. Test length to be a minimum of two hours.
- C. Provide a factory burn-in test for 24 hours minimum and a control and alarm test on each drive unit by simulating each control signal and each alarm function to verify proper and correct drive unit action.
- D. Provide typical prototype factory test data for short circuit testing of each type of drive supplied. Data to verify that each drive can be started into a line-to-line fault and line-to-ground fault on the drive terminals. Each drive can be operating at full load and be subjected to a line-to-line fault and line-to-ground fault on the drive terminals. All phases (A, B & C) to be included in test data.
- E. Provide certified documentation of all tests performed.
- F. Provide above stated tests in addition to routine factory tests.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Examine VFD location for satisfactory preparation. Check conduits and raceway location for connection to units.
- B. Visually inspect delivered unit(s) and accessories for conformance with specification and drawings.
- C. Verify availability of appropriate pacing signal.
- D. Maintain variable frequency drive in upright position at all times.
- E. Protect adjustable frequency drive against damage. Store drive in clean, dry environment with temperature and humidity within range as specified by drive manufacturer. Energize space heaters during storage as recommended by manufacturer.

3.02 INSTALLATION

- A. Erect, install, and start-up equipment.
- B. The VFDs shall be installed as shown on the drawings, in accordance with the manufacturer's installation instructions, and accepted shop drawings.

- C. Install VFDs to allow complete door swing required for component removal. This is specifically required where a VFD is set in the corner of a room.
- D. Factory-trained service personnel, other than sales representatives, shall supervise field installation, inspect, make final adjustments and operational checks, make functional checks of spare parts, and prepare a final report for record purposes. Adjust control and instrument equipment until this equipment has been field tested.

3.03 RUBBER MATS

- A. For stand-alone units, three foot wide rubber mats shall be furnished and installed on the floor and in front of each VFD assembly. The mats shall be long enough to cover the full length of each VFD system. The mats shall be 1/2-inch (12 mm) thick with beveled edges, canvas back, solid type with corrugations running the long way, and shall be guaranteed extra quality, free from cracks, blow holes or other defects detrimental to their mechanical or electrical strength. The mats shall meet the requirements of ASTM D178 for Type II, Class 4 insulating matting.

3.04 FIELD TESTING

- A. Provide in accordance with Section 01 43 00 "Quality Requirements".
- B. Perform testing checkout, and start-up for VFD equipment under technical direction of manufacturer's service engineer. Under no circumstances energize any portion of the drive system without authorization from manufacturer's technical representative.
- C. Field Tests:
 - 1. Test each drive over the total speed range that it will be required to operate through for the load being driven for a minimum of two hours. Determine for each drive, motor, and load combination the following at minimum speed, maximum speed, and at 1/3 and 2/3 points between the minimum and maximum speeds:
 - a. Input power (kW), voltage, current and RMS power factor on the line side of the drive isolation device.
 - b. Output to the driven load in kilowatts.
 - c. For each drive, measure the harmonic voltage distortion and harmonic current distortion for each harmonic at the main distribution bus for maximum and minimum load conditions.
 - d. Measure the total harmonic voltage distortion and total harmonic current distortion at each PCC for maximum and minimum load conditions.
 - 2. Test each drive by using the actual control signal for remote and local operation.
 - 3. Test each drive's alarm functions.

4. Perform all tests in the presence of the Owner's representative.
5. Perform the above test in addition to the manufacturer's normal field tests.
6. Submit final test report with summary comparing field test data with harmonic analysis design calculated values for each drive.
7. Testing determined not in compliance with Contract documents shall be repeated by the Contractor at no additional cost to the Owner.

3.05 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain the equipment.
- B. Training shall be a minimum of four (4) hours in operation and maintenance for up to five (5) Owner representatives. Schedule training with at least five (5) working days advance notification.

3.06 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 32 13

ENGINE GENERATORS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide and test ready for operation, three (3) natural gas engine-generator sets complete with appurtenances as indicated and in compliance with Contract Documents.
- B. The unit shall be provided in an outdoor, weatherproof, sound attenuated enclosure.
- C. The units shall have a 1000 kW (1250 kVA) power rating, standby, at .80 lagging power factor, three-phase, 60-Hertz, 480/277 volt, three-wire, four-wire alternating current generator. Rating shall be based on an altitude of approximately 4500'.
- D. The units shall be arranged for automatic starting and stopping, and load transfer upon failure of the normal source of power through automatic throw over system. The engine generator sets shall exhibit less than 20 percent voltage dip and less than 5 percent frequency dip during starting of the connected loads shown on the Contract Drawings one-line diagrams.
- E. The engine-generator package shall be complete in all respects and shall include all equipment and controls necessary for a fully operational standby power supply system.
- F. Provide galvanized steel platform and steps, with railing system at both sides of the engine generator sets to allow servicing the units from a raised platform.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Submit shop drawings to show physical arrangements, connections, finishes, provisions for connections, access requirements for installation and maintenance, physical size, mechanical and electrical characteristics and ratings, foundation and support details, and equipment weights, where such details are not indicated on the catalogue cuts. The drawings and sketches shall be prepared in the latest version of AutoCAD. Within thirty (30) days after award, the vendor shall submit a complete set of shop drawings and product data. Provide specific data on the following:
 - 1. Outline drawings showing overall assembly and drawings illustrating arrangement (plan, front, and side views) and lifting provisions.
 - 2. Certified outline plan, general arrangement (setting plan), and anchor bolt details, including locations, sizes and model numbers of seismic isolators. Drawings shall show the total weight and center of gravity of the assembled engine-generator set on the structural steel sub-base.
 - 3. Arrangement detail of exhaust duct and muffler piping systems and the natural gas piping systems.
 - 4. Arrangement, size, and location of all electrical interface points and detailed elementary, schematic, wiring, and interconnection diagrams of the generator, exciter, governor, and other integral devices. Provide a wiring diagram including a complete schematic diagram.
 - 5. Dimensional drawings or catalog cuts of the exhaust silencer, oxidation catalyst, intake filter, pumps, starting equipment, battery chargers, batteries, battery racks, generator enclosure (if required) and dBA rating, and other auxiliary equipment.
 - 6. Arrangement or assembly drawings showing location of major auxiliary equipment in relation to the engine-generator set and details of fabricating all supports and connections thereto.
 - 7. Piping schematics for natural gas oil showing pipe sizes and valve locations.
 - 8. Engine-generator control panel.
 - 9. Specifications for a suitable fuel showing consumption performance using this fuel.
 - 10. Certified factory test.

- C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.
 - 1. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review and consideration until the marked-up specification are resubmitted with the entire package.
- D. Outline equipment and enclosure drawings, equipment catalog cuts, wiring and connection diagrams and other documents required to completely describe the systems and equipment being furnished. Elevation drawings with shipping splits and estimated weights identified.
- E. Identification, description and dimensions.
- F. Engine-generator skid base drawings including spring vibration isolators. Drawings shall indicate size and location of anchor bolts, and conduit electrical device locations.
- G. Performance specifications of all items of equipment.
- H. Control panel layout drawings, dimensions, and component bill of materials. Outline drawings showing conduit entry areas and anchoring information. Description of control including operation of interface equipment.
- I. Complete electrical, instrumentation, control and wiring diagrams in sufficient detail to allow installation of instrumentation and controls and electrical components.
- J. Provide certificate of conformance to UL Standard 2200, Stationary Engine Generator Assemblies.
- K. Attenuation curve for the silencing equipment as offered to accomplish the required silencing for this installation.
- L. Information on the proposed jacket water treatment and procedures for flushing of the cooling systems.
- M. Operations and Maintenance Manuals, covering all equipment furnished, annotated to reference only the specific model numbers supplied. Include parts lists and parts prices current to the date of submittal; include information relevant to part supply and ordering. Submit prior to the startup and testing of the engine/generator units. Submit in accordance with Section 01 33 00 "Submittals", 01 78 23 "Operation and Maintenance Data" and as specified herein.
- N. Maintenance Manuals:
 - 1. Submittals shall include, but not be limited to, five (5) copies of the items listed below. Electronic files of all drawings and sketches using the latest version of AutoCAD. In addition, the vendor shall include any additional procedures judged necessary by the manufacturer to insure the maximum performance and service reliability for the engine-generator set.

2. The engine shop manual(s) including complete service instructions.
 3. Parts list with the manufacturer's or interchangeable part number.
 4. Drawings of the engine-generator set with center of gravity clearly indicated.
 5. Schematic and wiring diagrams of all power and control circuits for the engine-generator set and all its appliances and options.
 6. Fuel system piping diagram.
- O. Manufacturer's certified shop test record of complete engine driven generator unit.
- P. As-built drawings and material summary shall be shipped with the equipment.
- Q. Engine generator loading calculation, per the requirements of the connected loads shown on the one-line diagrams and other Contract Drawings.
- R. Data to be provided by engine generator system supplier:
1. Submit generator loading calculations and data for engine, generator, and accessories: (for rated kW capacity).
 - a. Engine Data:
 - (1) Manufacturer.
 - (2) Model.
 - (3) Number and arrangement of cylinders:
 - (a) RPM.
 - (b) Bore X stroke.
 - (c) Maximum power at rated RPM.
 - (d) BMEP at rated kW (including any parasitic loads and generator efficiency).
 - (e) Piston speed, feet per minute.
 - (f) Make and model of governor.
 - (g) Make and model of overspeed shutdown device.
 - b. Generator Data:
 - (1) Manufacturer.

- (2) Model.
- (3) Rated kVA.
- (4) Rated kW.
- (5) Voltage.
- (6) Temperature rise above 40 degrees C ambient. Stator by thermometer and field by resistance in degrees C.
- (7) Class of insulation.
- (8) Generator efficiency including excitation losses at 80 percent PF:
 - (a) Full load.
 - (b) Three quarters load.
 - (c) Half load.
- (9) Generator subtransient reactance in ohms and Per Unit value.
- c. Guaranteed maximum fuel consumption rate at generator terminals:
 - (1) Full load.
 - (2) Three-quarters load.
 - (3) Half load).
- d. Generator unit and accessories.
- e. Weight of complete unit, with break down by engine-generator set.
- f. Exhaust gas emissions data, maximum values at full load, 3/4 load, 1/2 load, and 1/4 load:
 - (1) Temperature in degrees F (degrees C).
 - (2) Flow in ACFM (mass and volume) (L/s).
- g. Combustion air requirement in CFM (L/s).
- h. Cold cranking amperes rating of engine starting batteries (CCA) at 0 degrees F (-18 degrees C).

- S. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final settings of devices.

1.04 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.
- B. Contractor to ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Contractor to review the proper installation of the equipment and of each type of device with the equipment supplier prior to installation. The following service times are per generator.
 - 1. Services of Service Engineer, specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time.
 - a. Assist in location of devices, methods of mounting, field erection, etc.
 - (1) 1 person-day
 - b. Start-up and testing.
 - (1) 10 person-days
 - c. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:
 - (1) 2 person-days
 - d. Person-day is defined as one 8-hour day, excluding travel time.
- C. Anchorage of the system shall be designed to comply with the current applicable seismic source within 2 kilometers of the place of installation. The dead load assumed to resist overturning shall not exceed 0.75W.
- D. Manufacturer's Representative: Furnish the services of a qualified field engineer, experienced in the installation and operation of the type of systems being provided, to supervise the installation, testing, adjustment of the system, and to provide training for personnel.
- E. Manufacturer's Responsibility:
 - 1. The engine-generator set shall be manufactured by a single manufacturer who has been regularly engaged in the production of engine-generator sets for a minimum of 10 years. The emergency generator system described herein, including these components shall be factory built, factory-tested at rated load, starting duty and power factor, and shipped by this single manufacturer, so there is one source of supply and responsibility for guarantee, parts, and service. This manufacturer shall

- have a local representative in the Provo, UT Area who can provide factory-trained servicemen, required stock of replacement parts, and technical assistance.
2. The emergency generator system shall meet all requirements of NFPA 110, Level 2, including design specifications, prototype tests, one-step full load pickup, and installation acceptance.
 3. The responsibility for performance to this Section in its entirety shall not be split up among individual suppliers of components comprising the system but shall be assumed solely by the engine-generator set manufacturer. All controls shall be the standard of the engine-generator set manufacturer. Control parts shall be identified by parts numbers of this manufacturer and shall have second source listing where applicable. Control systems that are supplied by a vendor and not incorporated within the documentation drawings of the engine-generator set manufacturer are not acceptable.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 01 66 10 "Delivery, Storage and Handling" and as specified.
- B. Protect all equipment placed into storage from weather, humidity and temperature variations, dirt, dust, and other contaminants.

1.06 REGULATORY REQUIREMENTS

- A. Local State and City Air Pollution Control Laws.
- B. Provide all required data and information for a Title V local air pollution control district operating permit.
- C. Federal Clean Air Act (42 United States Code (U.S.C.) 7401 et. seq.)
- D. Federal Air Pollution Control Regulations: 40 Code of Federal Regulations (CFR) Parts 50-99, as amended by the Federal Register.
- E. Furnish to the Owner, within 15 working days of the date of any request, all documents and other information required to verify compliance with permit and applicable air pollution control laws and regulations, including EPA Tier 2 emission requirements in effect at the bid date of the project.

1.07 WARRANTY AND SERVICE

- A. Provide in accordance with Section 01 78 36.
- B. Guarantee all components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 24 months.

- C. Ensure that equipment manufacturer has local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Cummins Power Generation Inc.
- B. Caterpillar Inc.
- C. MTU.
- D. Kohler.

2.02 GENERAL

- A. Engine-generator set shall be a factory-assembled unit that is a standard production unit with existing torsional analysis data. Mixing and matching engine and generator by a third-party supplier is not acceptable. The engine and generator shall be directly connected with a flexible coupling, shall be free from injurious torsional or other vibration.
- B. The engine and generator shall be directly connected.
- C. The engine-generator set shall allow easy access to the various parts for maintenance purposes.
- D. The engine-generator set shall be pre-piped and pre-wired.
- E. The complete engine-generator unit shall be free from harmful torsional or other vibration throughout the entire operating range of speed and load. The engine manufacturer shall provide an analysis of the complete engine-generator unit, which shall show where any critical speed will be encountered, together with the order, the frequency and magnitude of any critical speed.
- F. The engine-generator set operating in an ambient temperature of 40 degrees C shall have a standby power capacity of not less than that indicated at 0.80 power factor, and shall operate at a speed not to exceed 1,800 rpm. It shall be rated 480/277 volt, as indicated, 3 phase, 4 wire, 60 Hertz.
- G. Frequency regulation shall not exceed 3 Hertz for step load from no load to rated load. Frequency variation shall not exceed plus or minus 0.3 Hertz for constant loads from no load to rated load.
- H. Voltage regulation for step load from no load to rated load shall be within +/- 4 percent of rated voltage for units up to and including 25 kW and within +/- 5 percent or percent of

rated voltage for units rated 30 kW or higher. Voltage variation shall be within +/- 1 percent of the mean value for constant loads from no load to rated load.

- I. The engine generator set shall be mounted on a heavy steel sub-base with spring type vibration isolators.

2.03 GENERATOR

- A. Generator shall be rated for continuous duty; shall be rotating field, engine-driven, direct-connected, synchronous type with amortisseur winding. Generator frame shall be dripproof with all openings guarded. Bearings shall be sleeve or sealed ball type. The generator shall be mechanically and torsionally matched to the engine driver and shall be provided to withstand inherent pulsating torques of the engine. Full load efficiency of the combined generator, exciter and regulator shall be not less than 95 percent. The generator windings, insulation and excitation system shall be braced to withstand any possible short-circuit stresses.
- B. Generator insulation shall be Class H or F in accordance with NEMA Standard MG1-1.65. Temperature rise shall be in accordance with NEMA Standard MG1-22.40 for continuous duty at all output ratings.
- C. Voltage regulator shall be an automatic, temperature compensated, solid-state type with a manual adjustment range of plus or minus 5 percent of rated voltage. The generator windings, insulation and excitation system shall be braced to withstand any possible short-circuit stresses.
- D. Exciter shall be PMG type. Minimum rating of exciter shall be as indicated in NEMA Std. MG-1-22.16.
- E. Components for field flashing and field discharge shall be included, if required. Fast acting fuses or other protective devices shall be incorporated where failure of regulator or exciter components could result in damage to the generator field or exciter windings.
- F. Voltage regulator and static exciter shall be mounted in generator control panel or elsewhere so as to protect from and isolate from vibration.
- G. The generator shall conform to the applicable parts of the following standards, unless otherwise specified:
 - 1. NEMA MG1, Motors and Generators.
 - 2. IEEE 43, Recommended Practice for Insulation Testing of Large AC Rotating Machinery.
 - 3. CSA C22.2- No. 100, Motors and Generators.
 - 4. Testing shall be in accordance with IEEE-115 and NEMA MG-1 standards

- H. The stator frame shall be fabricated bar and plate steel construction.
 - 1. All insulation materials used in the stator shall have a temperature rating of Class H per IEEE Standard 1. The coils shall be of a formed coil construction using a magnet wire meeting NEMA MW36-C specifications.
 - 2. The complete stator shall be wound with a 2/3 stator winding pitch and processed in a vacuum pressure impregnation chamber. Encapsulation of the stator shall be accomplished with a two-part epoxy system.
- I. Generator lead terminal box shall be of ample size to accept and terminate connecting cables as indicated on the drawings. Generator leads shall be furnished with terminal connectors suitable for the customers connecting cables.
- J. Provide generator stator winding heater with thermostat wired at 120 VAC to prevent formation of condensation.

2.04 ENGINE

- A. Heavy-duty compression-ignition, cold-starting natural gas type arranged for direct connection to an alternating current generator. It shall be a current model of a type in a regular production by a manufacturer regularly engaged in building this type of engine. Engine shall have at least a published intermittent brake horsepower rating at specified generator speed required by generator at rated full load output and shall operate without undue heating, vibration, or wear.
- B. Engine may be a two-cycle or four-cycle and may be naturally aspirated, scavenged, or turbocharged.

2.05 ENGINE ELECTRICAL SYSTEM

- A. Electrical system shall include a battery, starting motor, voltage and current-regulated charging generator or alternator, and a separate battery charger. Battery shall be of suitable capacity to start engine at conditions specified and shall be guaranteed for three years.
- B. Battery charger shall be automatic, two rate type providing for equalizing charge and continuous taper charging. Output characteristics shall match requirements of battery furnished. Provide charger suitable for operation on 120 volt, single-phase, 60 Hertz current to be rated not less than 10-amp direct current. Furnish battery charger with following features:
 - 1. Direct current voltage regulation: +/- 2 percent for variations in line voltage of +/- 10 percent.
 - 2. Direct current voltmeter and direct current ammeter, each with suitable scales.
 - 3. Automatic surge suppressor.
 - 4. Automatic current limiting to prevent overloading due to engine cranking, shorted output or reversed battery connections.
 - 5. Alternating current line fusing.

6. Equalize charge rate with manually set timer.
7. Integral protection to prevent battery discharge through charger on loss of alternating current line voltage.
8. Terminal block with terminals for all external connections.
9. Dry contacts to indicate charger failure.

C. Provide battery rack to accommodate starting batteries and supporting rack for battery charger. Rack shall be mounted in the enclosure.

D. Provide 120 VAC battery pad heater with thermostat.

2.06 ENGINE APPURTENANCES

A. Furnish engine with following appurtenances:

1. Combustion air cleaner of oil bath type or dry replaceable filter type. A tube shall connect crankcase breather with air cleaner to prevent accumulation of objectionable smoke and fumes.
2. Critical grade exhaust silencers complete with drains and flexible stainless-steel connection. The entire exhaust system shall be insulated.

B. Governors:

1. Provide electronic type governor capable of maintaining engine speed from no load to full load within 3 percent of synchronous speed.
2. Provide governors equipped with load sensing and load sharing controls.

2.07 CONTROL PANELS

A. Provide a fully solid-state, microprocessor based, generator control panel wired, tested and shock mounted on the generating set by the manufacturer of the generating plant.

B. Provide the following functionality integral to the control panel:

1. A minimum 64 x 240 pixel white backlight graphical display with text based alarm/event descriptions.
2. A minimum of 3-line data display.
3. Audible horn for alarm and shutdown with horn silence switch.
4. Standard ISO labeling
5. Multiple language capability
6. Remote start/stop control. Provide for multiple start/stop signals on separate inputs.
7. Local run/off/auto control integral to system microprocessor
8. Cool down timer
9. Speed adjust
10. Lamp test
11. Push button emergency stop button

12. Voltage adjust
13. Voltage regulator V/Hz slope – adjustable
14. Power Factor Control for paralleling units
15. Password protected system programming
16. Paralleling functions, including automatic and manual synchronizing, dead bus arbitration, load sharing, and load sense/load demand (LSLD).
17. Paralleling up to 16 generator sets (MGDL operation) or up to 8 generator sets (hard wired operation)
18. Automatic transfer/ Auto mains failure (AMF) functionality
19. Single generator to utility paralleling operation for temporary and extended utility paralleling operation.

C. Provide the panel with the following Digital indications:

1. AC voltage, 3-phase (L-L and L-N)
2. AC amps (3-phase and total)
3. KW (total and per phase)
4. KVA (total)
5. KVAR (total)
6. KWHR (total)
7. KVARHR (total)
8. PF (average total and 3-phase)
9. % of rated (total)
10. Frequency
11. DC voltage
12. System diagnostic
13. Excitation voltage
14. Excitation current
15. Engine oil pressure
16. Engine oil temperature
17. Engine coolant temperature
18. Engine RPM
19. Battery volts
20. Engine hours
21. Engine crank attempt counter
22. Engine successful start counter
23. Service maintenance interval
24. Real time clock
25. Oil filter differential pressure
26. Fuel temperature
27. Fuel pressure
28. Fuel filter differential pressure
29. Fuel consumption rate
30. Total fuel consumed
31. Engine intake manifold temperature
32. Engine intake manifold pressure
33. Engine crankcase pressure

34. Air filter differential pressure
 35. Boost pressure
 36. Oil filter differential pressure
- D. Provide alarm indication and subsequent shutdown for the following conditions (Store in the control panel the first and last occurrences of all alarms and shutdowns with a time, date, and engine hour stamp):
1. Low oil pressure alarm/shutdown
 2. High coolant temperature alarm/shutdown
 3. Loss of coolant shutdown
 4. Overspeed shutdown
 5. Overcrank shutdown
 6. High intake manifold temperature alarm/shutdown
 7. High exhaust manifold temperature alarm/shutdown
 8. High crankcase pressure alarm/shutdown
 9. High air inlet temperature alarm/shutdown
 10. Emergency stop depressed shutdown
 11. Low coolant temperature alarm
 12. Low battery voltage alarm
 13. High battery voltage alarm
 14. Control switch not in auto position alarm
 15. Battery charger failure alarm
 16. Generator over voltage
 17. Generator under voltage
 18. Generator over frequency
 19. Generator under frequency
 20. Generator reverse power
 21. Generator overcurrent
 22. Loss of excitation alarm/shutdown
 23. Instantaneous over excitation alarm/shutdown
 24. Time over excitation alarm/shutdown
 25. Rotating diode failure
 26. Loss of sensing
 27. Loss of PMG
- E. Provide accessible through a single electronic service tool all engine, voltage regulator, control panel and accessory units. Provide the following maintenance functionality:
1. Engine running hours display
 2. Service maintenance interval (running hours or calendar days)
 3. Engine crank attempt counter
 4. Engine successful starts counter
 5. 20 events are stored in control panel memory
 6. Programmable cycle timer that starts and runs the generator for a predetermined time. The timer shall use 14 user-programmable sequences that are repeated in a 7-day cycle. Each sequence shall have the following programmable set points:

- a. Day of week
 - b. Time of day to start
 - c. Duration of cycle
 - F. Provide Ethernet port for communication with SCADA system via Modbus TCP/IP.
 - G. Parallel Engine Generators:
 - 1. Automatic reactive output power control and load sharing between engine generators operated in parallel.
 - 2. Automatic regulation, automatic connection to a common bus, and automatic synchronization, with manual controls and instruments to monitor and control paralleling functions.
 - 3. Protective relays required for equipment and personnel safety.
 - 4. Paralleling suppressors to protect excitation systems.
 - 5. Reverse power protection.
 - 6. Loss of field protection.
- 2.08 CIRCUIT BREAKER
- A. Provide circuit breaker with solid-state adjustable instantaneous and short time delay features and ground-fault protection.
- 2.09 ENGINE COOLING SYSTEM (RADIATOR COOLED)
- A. Provide a unit-mounted radiator with integral jacket water circulating pump, and thermostatic control for cooling system.
 - B. Provide radiator of sufficient capacity to operate engine at full rated generator load at 120 degrees F (50 degrees C) ambient temperature.
 - C. Provide radiator with flange for connection to exhaust duct specified under Heating and Ventilating.
 - D. Provide engine coolant heater rated 208V, single phase, with thermostat.
 - E. Engine cooling system shall be charged with inhibited ethylene-glycol solution to provide antifreeze protection to -10 degrees F.
- 2.10 ENGINE LUBRICATION
- A. Provide full pressure system, supplying oil to all surfaces requiring lubrication. Circulation shall be by positive displacement pump. Full flow-type filters or filters with bypass feature shall be included. Filter elements shall be replaceable without disconnecting oil piping. Provide an oil cooler, if recommended by engine manufacturer, to properly lubricate engine at full rated generator load. Provide full charge of new oil after tests have been completed.

2.11 ENGINE GENERATOR SET ENCLOSURE

- A. Provide sound attenuated, weather-proof outdoor, walk-in type enclosure.
- B. Rigidity wind test equal to 120 mph.
- C. Roof load equal to 30 psf.
- D. Rain test equal to 5 inches per hour.
- E. Certified to meet following codes:
 - 1. IBC Code.
- F. Building to consist of roof, two side walls, and two end walls of pre-painted aluminum stressed-skin construction, door and door frame, lifting rings, mounting frame, insulation, electrical package, louvers, exhaust fan, muffler mounting bracket, and other appurtenances to make complete installation.
 - 1. Roof:
 - a. One piece combered roof sheet, min. 0.040 inch thick aluminum alloy, with extruded recessed side and end rails.
 - b. Roof bows, extruded "I" beams, spaced as required to carry loads.
 - 2. Walls:
 - a. Posts to be extruded aluminum sections, sized and spaced as required to carry loads.
 - b. Panels to be min. 0.045 inch thick aluminum sheet, mill-pre-painted, inside and outside, and riveted to posts.
 - 3. Door and Door Frame:
 - a. Provide welded aluminum door frame of extruded aluminum alloy, riveted to side panels.
 - b. Provide personnel door gasketed to form weathertight seal, panic bar hardware with three-point stainless steel locks and opening from inside in locked condition.
 - 4. Lifting Rings:
 - a. Provide four lifting rings, two in each side of roof, for lifting shelter only. Capacity of lifting rings to match load.

5. Mounting Frame:
 - a. Provide steel perimeter mounting frame for mounting onto concrete pad.
6. Insulation:
 - a. Provide semi-rigid fiberglass thermoacoustic insulation.
7. Sound Attenuation:
 - a. Provide sound attenuating features in the enclosure to maintain a maximum sound pressure level of 70 dBA at 7 meters with the generator operating at full load.
8. Electrical Package:
 - a. All equipment and devices UL listed. Provide 120/208V, 1-phase, 4-wire, with 60-amp main breaker. Provide eight (8) 20 amp branch circuit breakers. Panelboards shall conform to the latest NEMA standards, National Electrical Code and Underwriters Laboratories, Inc.
 - b. Circuits as follows:
 - (1) No. 1 - Lighting
 - (2) No. 2 - Receptacles
 - (3) No. 3 - Electric Heater
 - (4) No. 4 - Exhaust Fan
 - (5) No. 5 - Engine and Battery Heaters
 - (6) No. 6 - Battery Charger
 - (7) No. 7 - Motorized Dampers
 - (8) No. 8 - Spare
 - c. Electric heater, control stations, and thermostat shall be as recommended by the manufacturer, subject to review by the Engineer.
 - d. Receptacles shall be duplex, 20-amp, 125-volt, 3 pole, 2 wire and shall be a ground fault interrupter receptacle.
 - e. Light switch shall be toggle type, 15-amp, 120-volt, single pole.
 - f. Light fixtures shall be a ceiling or pendant mounted enclosed and gasketed vapor tight LED type with acrylic lens.
9. Manual Motor Starters:
 - a. Provide manual motor starters where indicated and for 120 volt, 60-Hertz fractional horsepower motors that do not have built-in thermal overload devices.

- b. Manual starters within sight of motors, as defined by NEC.

10. Louvers:

- a. Provide louvers and dampers for engine generator inlet and exhaust and ventilation air.
- b. Fixed louvers, all aluminum construction, riveted into aluminized steel frame to form rigid, water resistant assembly. Motorized dampers as specified hereinafter.
- c. Properly size louvers and dampers to allow sufficient engine combustion air, radiator cooling air, and ventilation air with maximum 0.5-inch water (125 Pa) restriction. Coordinate with engine generator manufacturer.

11. Muffler Mounting Bracket:

- a. Provide suitable bracket to secure critical grade generator silencer within the enclosure.
- b. Coordinate with engine generator supplier as required.

2.12 PAINT

- A. Paint for exterior surfaces of equipment shall be two coats of acceptable oil- and heat-resistant paint, applied after surfaces have been thoroughly cleaned and prepared with suitable priming coat.
- B. Provide touch-up paint in a quart container to Owner for use in field.

2.13 TOOLS

- A. Provide in accordance with Section 01 66 10.
- B. Provide all special tools required for maintenance and repair of unit in metal box complete with lock and keys.

2.14 FACTORY TESTING

- A. The complete engine-generator sets with enclosure shall be factory tested at full load using a 0.8 power factor reactive load bank to simulate a complete and integrated system prior to shipment.
- B. Provide all details of the proposed testing, including arrangements, test instruments and calibration, and procedures to be used to verify controls and alarms. The completed certified test record shall be submitted within 30 days after the completed test.
- C. Tests shall verify that unit will operate successfully and meet all specified operational requirements and verify adequate means of enclosure ventilation is provided.

- D. The factory test shall include four continuous hours of operation at full load and rated power factor. Voltage and frequency regulation and transient response shall be tested and recorded to show full compliance with this specification. During the factory test, readings shall be taken and recorded every thirty minutes for each of the following:
1. Time.
 2. Ambient temperature.
 3. Volts for each phase.
 4. Load:
 - a. Amps for each phase.
 - b. kW.
 - c. Power factor.
 - d. Frequency.
 5. Engine jacket water temperature.
 6. Lubricating oil pressure.
 7. Exhaust gas temperature.
 8. Fuel consumption.
 9. Noise Level measured 3 feet from source (dB)
- E. The procedure for the factory test of the engine shall include the engine manufacturer's standard practice.

PART 3 - EXECUTION

3.01 COORDINATION

- A. Coordinate with ventilation, fuel supply, and exhaust, to provide an efficient, well-coordinated layout.

3.02 INSTALLATION

- A. Install unit complete and make operational.
- B. Install muffler horizontally on spring type compensating hangers in generator enclosure.

- C. Provide 1/2-inch (12 mm) copper drain with draincock from bottom of muffler to nearest floor drain for periodic draining of muffler.
- D. Install engine at sufficient height above base to permit dropping oil pan without removing unit.
- E. Provide vibration isolation of exhaust equipment to prevent transfer of vibration into building components enclosing the standby power system.
- F. External conduit and wiring and transfer switch will be furnished and installed under applicable electrical sections, but all conduit, wiring and connections between the engine and its control panel and generator and its control panel, is included herein.
- G. Mount engine-generator set on a structural steel frame or skid. Provide vibration isolators suitable to prevent transmission of vibration to building structure between set and frame, and securely anchored to the concrete foundation. Obtain from supplier of engine-generator set a drawing giving location and size of foundation bolts for unit proposed, in sufficient time to be available when needed to place foundation. Galvanized anchor bolts shall be furnished by engine-generator set manufacturer.
- H. Electrical equipment and materials shall be listed by UL wherever standards have been established by that agency.

3.03 WIRING AND CONNECTIONS

- A. Provide conduit, wiring, and connections required and recommended by unit supplier. All conduit shall be terminated with flexible conduit. All wiring shall be multi-stranded.
- B. Connect neutral point of generator and generator frame to ground by green insulated copper conductor of adequate size.
- C. Connect motorized dampers in cooling and exhaust equipment to auxiliary contact on transfer controls to open dampers when unit is energized.

3.04 EQUIPMENT START-UP

- A. Operate the unit to demonstrate ability to operate continuously without vibration, jamming, leaking or overheating and to perform specified functions, after installation and after manufacturer's representative check of installed equipment.
- B. Comply with manufacturer's operating and maintenance instructions during start-up and operation.
- C. Make all final adjustments necessary to place the equipment in working order. Prior to any testing or operation of the units, the manufacturer's service representative shall inspect the installation, and shall certify, in writing, that the assemblies are, in all ways, ready for operation. Start-up shall not commence without the presence of the manufacturer's representative.

3.05 FIELD TEST

- A. Upon completion of the installation and as soon as conditions permit, the engine driven generator, including the engine, generator, electrical circuit controls, transfer controls other devices shall be tested in the presence of the Owner by the service representative for the manufacturer of the engine driven generator unit to verify that the system functions as specified.
 - 1. Perform load test with 0.8 power factor reactive load bank connected to the generator for a full load nameplate test. Run the test for a duration of four hours. Take system data readings each 20 minutes. Contractor to provide load bank for testing.
 - 2. The manufacturers' representatives shall make such changes in wiring or connections and such adjustments, repairs or replacements to make the circuit, device or control system function as specified and comply with the Contract Documents.
 - 3. Acceptance of test will be verified when the unit operates without alarm or abnormal conditions for the duration of the entire test. Retest if this requirement is not met until acceptance criteria has been verified.
- B. Record in 20-minute intervals during four-hour test:
 - 1. Kilowatts
 - 2. Amps
 - 3. Voltage
 - 4. Coolant temperature
 - 5. Air temperature
 - 6. Frequency
 - 7. Oil pressure
- C. As part of the field test, each of the automatic shutdown devices shall be tested and the respective values recorded at which the devices will stop engine. Any adjustments required shall be made in the devices to make the operating values correspond to those recommended by the engine manufacturer and as recorded during the stop test.

3.06 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 32 14

LOAD BANK

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This specification contains the minimum requirements for the design, manufacture and testing of outdoor weatherproof resistive load bank.

1.02 REFERENCES

- A. The equipment covered by this specification shall be designed with the latest applicable NFPA-70, NEMA, NEC, IEEE, and ANSI standards.
- B. The load bank certified to a Nationally Recognized Training Laboratory (NRTL) such as UL.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. The manufacturer shall submit for review technical data including features, performance, electrical characteristics, physical characteristics, ratings, accessories, and finishes.
- C. Shop drawings shall include dimensional plans and mounting details sufficient to properly install the load bank. Load bus configuration and load connections termination area shall be clearly identified.
- D. Electrical schematic drawings shall be provided to detail the operation of the load bank and the provided safety circuits. Over-current protection and control devices shall be identified and their ratings marked. An interconnection drawing shall be included for control wiring related to the load bank.
- E. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final settings of devices.

1.04 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.
- B. Contractor to ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Contractor to review the proper installation of the equipment and of each type of device with the equipment supplier prior to installation.

C. Manufacturer's Representative: Furnish the services of a qualified field engineer, experienced in the installation and operation of the type of systems being provided, to supervise the installation, testing, adjustment of the system, and to provide training for NTMWD personnel.

1. Services of Service Engineer, specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time.

a. Assist in location of devices, methods of mounting, field erection, etc.

(1) 1 person-day

b. Start-up and testing.

(1) 2 person-days

c. Person-day is defined as one 8-hour day, excluding travel time.

1.05 DELIVERY, STORAGE AND HANDLING

A. Provide in accordance with Section 01 31 00 "Project Management and Coordination" and as specified.

B. Protect all equipment placed into storage from weather, humidity and temperature variations, dirt, dust, and other contaminants.

1.06 WARRANTY AND SERVICE

A. Provide in accordance with Section 01 31 00 "Project Management and Coordination".

B. Guarantee all components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 12 months.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. ASCO.

B. Approved Equal.

2.02 GENERAL

A. The following specification is based on Model 3110 as manufactured by ASCO and is named to establish standards of quality. Equal products of other manufacturers conforming to these specifications may be provided as approved by the Engineer.

2.03 RATINGS

- A. The total capacity of the load bank system shall be rated at a minimum of 1000 kW 480 Volts, 3-Phase, 4-Wire, 60 Hertz, at 0.8 pf.
- B. The duty cycle shall be continuous, and the load bank shall operate in an ambient temperature of 40°C (102°F).
- C. Load steps are in minimum increments of 1 kW switchable to 100% of load.

2.04 ENCLOSURE CONSTRUCTION

- A. The load bank is packaged in an enclosure.
- B. The frame of the load bank is constructed from 2mm 'Zintec' steel, folded and welded to form a monocoque construction.
- C. Double skinned recessed doors allow easy access to the separate enclosures for control, switch gear and power connections.
- D. The double skinned, horizontal discharge duct with aluminised steel heat shield contains the resistive load elements and the cooling fan.
- E. Provide stainless-steel mesh screens on the main air inlet and outlet to provide protection against access to hazardous parts to IP1X.
- F. All electrical enclosures are to IP54.
- G. Provide a four-point lifting frame with corner tie bars to connect the frame to the fork base.
- H. High quality two-pack industrial acrylic paint system applied to an electro-plated zinc base and low-bake finish. Grey is color (RAL7042).

2.05 RESISTIVE ELEMENTS

- A. Provide with replaceable, non-finned sheathed elements. The outer sheath is made from stainless steel to give good corrosion resistance. The heating element shall be an 80/20 nickel-chrome wire embedded in compacted magnesium oxide powder, providing good thermal and insulation properties.
- B. The elements shall be conservatively rated and have no need for cooling fins to dissipate the heat into the airflow.
- C. The elements shall be designed to operate continuously at up to 800°C (red/orange). The operating temperature shall be below 500°C (dull red).
- D. Load tolerance shall be within 2-1/2% of total capacity.

- E. Elements shall be continuously rated at the specific voltage. Short-term tests with fluctuations up to 10% above rated voltage shall be permissible. Tests at lower voltages, with a corresponding reduction in overall rating, may be carried out. Power is proportional to voltage squared.

2.06 PROTECTION

- A. Provide with an emergency stop/disconnect switch with full isolation of the fan and control supply.
- B. A 110 Volt AC control circuit transformer provides isolation and operator safety.
- C. Provide with Stop/start buttons to ensure the load bank will not automatically restart.
- D. The fan motor shall be fully protected with fuses and a thermal overload.
- E. Each element group and its associated contactor shall be protected by an HRC fuse.
- F. The load contactors shall be interlocked with the fan controls to ensure load can be applied only when the fan is running.
- G. Internal access shall be restricted by key operated door catches. Polycarbonate screens behind the doors prevent accidental contact with live parts.

2.07 LOAD BANK CONTROL SYSTEM

- A. The system shall be controlled by a microprocessor-based module with non-volatile memory, specifically developed for load bank control and protection.
- B. All instrumentation measurements shall be made from high accuracy voltage and current transformers located within the load bank.
- C. To compensate for the voltage drop between supply and load bank, provision shall be made for remote voltage sensing via terminals.
- D. Load bank calibration and configuration shall be software controlled.
- E. The system shall have full three phase true RMS instrumentation.
- F. A load correction facility shall compensate for any voltage variation to ensure that the correct load is always applied.
- G. The system shall be capable of controlling up to 14 load banks including a mixture of resistive/ reactive units with proportional load sharing from one hand-held controller or a single PC.
- H. Control shall provide three phase instrumentation to class 0.5 accuracy.
- I. Control system shall provide 1kW load step resolution.

2.08 FACTORY TESTING

- A. The complete load bank with enclosure shall be factory tested at full load prior to shipment.
- B. Provide all details of the proposed testing, including arrangements, test instruments and calibration, and procedures to be used to verify controls and alarms. The completed certified test record shall be submitted within 30 days after the completed test.
- C. Tests shall verify that unit will operate successfully and meet all specified operational requirements and verify adequate means of enclosure ventilation is provided.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install unit complete and make operational.
- B. Securely anchor to the concrete foundation. Obtain from supplier of load bank a drawing giving location and size of foundation bolts for unit proposed, in sufficient time to be available when needed to place foundation.

3.02 WIRING AND CONNECTIONS

- A. Provide conduit, wiring, and connections required and recommended by unit supplier. All conduit shall be terminated with flexible conduit. All wiring shall be multi-stranded.

3.03 EQUIPMENT START-UP

- A. Operate the unit to demonstrate ability to operate continuously without vibration, jamming, leaking or overheating and to perform specified functions, after installation and after manufacturer's representative check of installed equipment.
- B. Comply with manufacturer's operating and maintenance instructions during start-up and operation.
- C. Make all final adjustments necessary to place the equipment in working order. Prior to any testing or operation of the units, the manufacturer's service representative shall inspect the installation, and shall certify, in writing, that the assemblies are, in all ways, ready for operation. Start-up shall not commence without the presence of the manufacturer's representative.

3.04 FIELD TEST

- A. The load bank shall be fully tested using a test specification written by the supplier. Tests shall include electrical functional testing, verifying conformance to assembly drawings and specifications.

3.05 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 36 23

AUTOMATIC TRANSFER SWITCHES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section includes materials and installation of bypass-isolation automatic transfer switches with bypass as indicated and in compliance with Contract Documents.

1.02 REFERENCES

- A. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).
- B. National Electrical Manufacturers Association (NEMA):
 - 1. ICS 2: Industrial Controls and Systems Controllers, Contactors, and Overload Relays Rated 600 Volts.
- C. Underwriters Laboratories (UL):
 - 1. 1008: Automatic Transfer Switches.
- D. Lateral Force Design Criteria as per applicable requirements for place of installation.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Submit manufacturer's descriptive data including ratings, circuit diagrams, dimensional data, conduit entry restrictions, and a list of accessories.

1.04 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. Conform to the requirements specified in Section 01 41 20.
- C. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 OPERATION AND MAINTENANCE MANUALS

- A. Submit operation and maintenance manuals in accordance with Section 01 78 23 "Operations and Maintenance Data".

1.06 MANUFACTURER'S SERVICES

- A. Provide manufacturer's services at the jobsite for the minimum labor days listed below, travel time excluded:
 - 1. Two labor days to check the installation and advise during start-up, testing, and adjustment of the transfer switches.

PART 2 - PRODUCTS

2.01 TRANSFER SWITCH MANUFACTURERS

- A. The transfer switch shall be as manufactured by:
 - 1. Automatic Switch Company (ASCO).
 - 2. Russelectric Co.
 - 3. Zenith (ZTS).

2.02 TRANSFER SWITCH

- A. Transfer switch shall be as shown in the drawings. Transfer switch shall have number of poles, amperage, and voltage ratings as shown in the drawings. Withstand current rating shall not be less than 65,000 ampere rms symmetrical.
- B. Switch shall be listed per UL 1008 as a recognized component for emergency systems and be rated for all classes of loads.
- C. Automatic Open-Transition Transfer Switch: Interlocked to prevent the load from being closed on both sources at the same time.
 - 1. Sources shall be mechanically and electrically interlocked to prevent closing both sources on the load at the same time.
- D. Operation shall be inherently double throw where normal and emergency contacts operate simultaneously with a momentary delay in a mid-position. An overload or short circuit shall not cause the switch to go to a neutral position. Do not use main contact structures not originally manufactured for transfer switch service (molded case circuit breakers or contactors). Inspection and replacement of all contacts (stationery and arcing) shall be possible from the front of the switch without any disassembly of operating linkages or power conductors. Provide a handle to permit no-load manual operation.

- E. Transfer switches with neutral controls shall have fully rated neutral transfer contacts that momentarily interconnect the neutrals of the two sources during the transfer/retransfer operations. The neutrals shall remain interconnected until the power source contacts close on the source to which the load is being transferred.
- F. The automatic transfer switch shall be mechanically held double-throw with a uni-directional drive mechanism. The transfer action shall be completely electrical and shall not rely on springs or counterweights. Operating coils shall be momentarily energized from the source to which the load is being transferred. The switch shall be interlocked electrically and mechanically to prevent simultaneous feeding of the load from both normal and emergency power sources. The transfer switch shall not have an intermediate position. A handle shall be provided to operate the transfer switch mechanism manually in case of automatic drive mechanism failure.
- G. Transfer switch shall be draw-out type with automatic secondary disconnects remove control power as switch is withdrawn and automatic shutters isolate bus when the transfer switch is withdrawn.
- H. Bypass-Isolation Switch Features
 - 1. Bypass switch and transfer switch have identical electrical ratings.
 - 2. Mechanical interlocks prevent unintended operation.
 - 3. Bypass contacts carry current only during bypass operation.
 - 4. Draw-out design eases transfer switch maintenance.
 - 5. The bypass switch has dead-front quick-make, quick-break operation for transferring loads between live sources.
 - 6. Bypass switch is rated for use as a 3-position manual transfer switch.
 - 7. Bypass-Isolation Handles are permanently mounted
 - 8. Mechanical indicators show bypass and transfer switch positions.

2.03 ACCESSORIES

- A. Provide a solid-state sensing and control logic panel. Include the following operational characteristics:
 - 1. Adjustable (0.5 to 6.0 seconds) time delay on engine starting to override momentary dips in normal source, set at 1 second.
 - 2. Full phase voltage relay supervision of the normal source with at least one close differential relay to detect "brownout" condition, set at 70 percent dropout and 90 percent pickup.

3. Voltage/frequency lockout relay to prevent premature transfer, set at 90 percent voltage and 90 percent frequency.
 4. Engine starting control contacts. Provide for multiple start control contacts. Provide a minimum of two normally open and two normally closed.
 5. Adjustable (2 to 25 minutes) time delay on retransfer to normal, set at 20 minutes.
 6. Unloaded running time delay for generator cool down (adjustable 0.1 to 10 minutes), set at 5 minutes.
 7. Transfer to emergency time delay (adjustable 1 to 300 seconds), set at 1 second.
- B. Provide a system test switch (momentary type) on the front of the enclosure.
 - C. Manual push button to bypass the time delay on retransfer.
 - D. Indicating lights to indicate source to which the load is connected.
 - E. Indicating light to indicate presence of normal power source.
 - F. Auxiliary contacts for remote indication of switch position, one normally open and one normally closed contact for normal and emergency position. Auxiliary contacts for remote indication of switch failure.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Secure transfer switch rigidly to wall and floor or mounting pad with anchor bolts or Phillips Drill Company concrete anchors. Anchor bolts or concrete anchors shall be Type 316 stainless steel.

3.02 FIELD TESTING

- A. Field test per manufacturer's recommended standard test procedure.
- B. Field test and calibrate timing and monitoring logic. All adjustments shall be within 5 percent of the previously specified set points.
- C. The transfer switch shall be tested under full load rating with external load in accordance with Codes and Standards as specified. The Subcontractor shall be responsible for providing test equipment required for testing under full load rated condition.
- D. The transfer switch shall be full load tested. Controls shall be tested under modes of operations.
- E. The switch testing shall be performed by the Subcontractor.

- F. The Subcontractor shall be responsible for correcting any deficiency found during testing of the unit at no cost to the owner.
- G. The Subcontractor shall provide the owner the factory certified test report within five (5) days of the completion of testing.

3.03 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 “Execution and Closeout Requirements”.

END OF SECTION

SECTION 26 41 13

LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide lightning protection system on each building and structure consisting of air terminals, conductors, ground terminals, interconnection conductors, arresters, and other connectors or fittings required for a complete system as indicated and in compliance with Contract Documents.
- B. All systems are to be designed, furnished and installed by a Lightning Protection Contractor.

1.02 REFERENCES

- A. American National Standards Institute/Institute of Electrical and Electronics Engineers (ANSI/IEEE):
 - 1. 837: Standard for Qualifying Permanent Connections Used in Substation Grounding.
 - 2. 70: National Electrical Code (NEC).
 - 3. 780: Lightning Protection Code.
- B. Underwriters' Laboratories, Inc. (UL):
 - 1. 96: Lightning Protection Components.
 - 2. 96A: Installation Requirements for Lightning Protection Systems.

1.03 SUBMITTALS

- A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Shop Drawings:
 - 1. Consisting of a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, installation instructions.
 - 2. Shop drawings indicating type, placement, and location of protection devices, including cable attachments, grounding, mounting and any other details integral with the system.

- C. Spare Parts Data: Provide a list of recommended spare parts for the material and equipment to be provided, including current unit prices and source of supply (indicate which supplies are furnished at no extra cost with purchase of equipment).
- D. Inspection and Maintenance: Provide a written recommended inspection and maintenance procedure, including periodicity of inspections.
- E. Record Drawings: Provide a complete set of "as-constructed" drawings showing the location of all grounds as well as a detailed layout of type, size, location and method of installation of all downleads, roof cables, bonding leads and connections, air terminals, etc., and in the case where structural steel is used for downleads, the method and location of all roof and ground connections to the steel must be clearly detailed.

1.04 QUALITY ASSURANCE

- A. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied.
- B. Services of Manufacturer's Representative as stated in Section 01 43 00 "Quality Requirements" and as specified herein.
- C. Provide systems designed, furnished and installed by a Lightning Protection Contractor.
- D. Provide a "Certificate of Compliance" for work performed after completion. The certificate should state that the following has been done:
 - 1. The Contractor has complied with all requirements of Underwriters' Laboratories, Inc. Master Label Service as outlined in UL 96A including the completion and execution of the Master Label application form and the procurement and delivery of the U/L "C" plate to the Owner or his representative.
 - 2. The lightning protection system ground system has been tested and interconnected to the facility grounding system as required by NFPA 70.
 - 3. Record drawings have been turned over to the Owner or his representative.
- E. Use UL listed components.

1.05 REQUIREMENTS OF REGULATORY AGENCIES

- A. Conform to UL 96 and 96A and NFPA 780.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10 "Delivery, Storage and Handling".

B. Shipping:

1. Ship equipment and materials, complete with identification and quantity of items.
2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
3. Deliver spare parts at same time as pertaining equipment. Delivery to Owner after completion of work.

C. Storage:

1. Inspection and inventory items upon delivery to site.
2. Store and safeguard equipment, material and spare parts.

1.07 WARRANTY AND SERVICE

- A. Guarantee components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 12 months.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Thompson Lightning Protection Company, St. Paul, MN.
- B. Heary Brothers Lightning Protection Company, Springville, NY.
- C. American Lightning Rod Co., Dover, NH.

2.02 MATERIALS

- A. Class I Materials: Provide conductors, fittings, and fixtures necessary to protect ordinary buildings and structures not exceeding 75 feet (23 m) in height.
- B. Materials, Class I. Table I gives minimum sizes and weights for air terminals, and main and secondary conductors. Secondary conductors which are used for bonding and interconnecting metallic bodies to the main conductor, and which will not be required to carry the main lightning current, may be reduced in size but not less than No. 6 AWG copper or equivalent. Provide main conductor size for interconnection to metal water systems, steam or hot water heating systems, or other metallic masses having a low resistance to ground.

C. Table I: Class I Material Requirements.

Type of Copper Conductor		Standard	Metric
Air Terminal, Solid	Min. Diameter	3/8-inch	9.5 mm
Air Terminal, Tubular	Min. Diameter Min. Wall Thickness	0.032 inch	15.9 mm 0.8 mm
Main Conductor, Cable	Min. Size ea. Strand Wgt. per Length Cross Sect. Area	17 AWG 187 lbs/1000 ft. 57,400 cm	278 g/m 29 square mm
Main Conductor, Solid Strip	Thickness Width	16 AWG 1 inch	25.4 mm
Secondary Conductor Cable	Wire Size Number of Wires	17 AWG 14	14
Secondary Conductor Solid Strip	Thickness Width	16 AWG 1/2 inch	12.7 mm

D. Class II Materials: Provide conductors, fittings and fixtures necessary to protect ordinary buildings and structures exceeding 75 feet (23 m) in height; or one of any height which has a structural steel frame that may be substituted for lightning down conductors. Table II give minimum sizes and weights for air terminals and secondary conductors for Class II structures.

E. Table II: Class II Material Requirements.

Type of Copper Conductor		Standard	Metric
Air Terminal, Solid	Min. Diameter	1/2-inch	12.7 mm
Main Conductor, Cable	Min. Size ea. Strand Wgt. per Length Cross Sect. Area	16 AWG 375 lbs/1000 ft. 115,000 cm	558 g/m 58 square mm
Secondary Conductor Cable	Wire Size Number of Wires	17 AWG 14	14
Secondary Conductor Solid Strip	Thickness Width	16 AWG 1/2-inch	12.7 mm

F. Where any part of a protection system is exposed to mechanical injury, provide protection by covering it with molding or tubing. If ferrous metal pipe or tubing is used around the conductor, connect the conductor electrically to the pipe or tubing at both ends.

G. Furnish conductors made of stranded copper.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Provide all material, equipment, and labor to install the lightning protection system as indicated and as specified.
- B. No bend of conductor is to form an included angle of less than 90 degrees nor have a radius of bend less than 8 inches (203 mm).
- C. Interconnect all conductors, air terminals to form a two-way path from each air terminal horizontally or downward to connections with ground terminals.
- D. Conductors may be coursed through air without support for a distance of 3 feet (900 mm) or less. With a 5/8-inch (15.9 mm) rod or its equivalent as a support, securely fastened at each end, a conductor may be coursed through air for a distance not to exceed 6 feet (1800 mm).
- E. Install roof conductors to interconnect all air terminals and provide a two-way path to ground horizontally or downward from the base of each terminal.
- F. Install at least two down conductors on any kind of structure. Location depends on placement of air terminals, size of structure, most direct coursing, security against displacement and location of metallic bodies, water pipes, and ground conditions. Separate down conductors as widely as practicable. For structures over 200 feet (60 m) in perimeter, install one additional down conductor for each additional 100 feet (30 m) of perimeter or fraction thereof.
- G. Terminate each down conductor at a ground terminal.
- H. Bond radio and television masts of metal, located on a protected building, to the lightning protection system with a main-size conductor and fittings.
- I. Use connector fittings on all lightning conductors at "end-to-end" "tee" or "Y" splices. Attach them so as to withstand a pull test of 200 pounds (890 N). Make fittings for connection to metal tracts, gutters, downspouts, ventilators, chimney extensions, or other metal parts about the structure tight to the object by compression under bolt heads. Both crimp type and exothermic weld splicers of stamped or cast metal are acceptable under Class I requirements. Do not use crimp type clamps and splicers in Class II installations.
- J. Securely attach conductors to the building or other object upon which they are placed. Use fasteners not subject to breakage. Furnish nails, screws and bolts, with which fasteners are secured, of the same material as the conductor or of such nature that there will be no electrolytic corrosion in the presence of moisture because of contact between the different parts. Space conductor fasteners not more than 3 feet (900 mm) apart on all conductors.

- K. All requirements covering exposed systems apply to concealed installations. Conductors are coursed the same except that they may be coursed behind the exterior wall facing, in concealed or embedded conduit, or embedded directly in concrete.
- L. L. In a concealed installation where conductors are embedded in concrete, bond the reinforcing steel to the cable with a main size conductor. Bond reinforcing steel at the top and bottom of each embedded downlead.
- M. Materials, installation methods and procedures are to be in accordance with UL 96 and 96A, NFPA 780, NEC, and local electrical codes. Provide for and obtain a "Certificate of Compliance" for the work performed.

3.02 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 43 00

SURGE PROTECTION DEVICES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide Surge Protection Devices (SPD) components either integral to or in combination with the electrical distribution system equipment as indicated and in compliance with Contract Documents. The distribution system includes switchboards, motor control centers, 480V distribution panels and 120V panelboards.
- B. The components shall provide protection for electrical and electronic devices against the damaging effects of surges, transients and electrical line noise.
- C. Where indicated on the electrical contract drawings, provide separate, modular components from the electrical distribution equipment enclosures. Provide conduit, cable and all associated components for a complete SPD system installation. It shall be the Electrical Contractor's responsibility to verify adequate space for locating modular SPD equipment adjacent to associated electrical distribution equipment.

1.02 REFERENCES

- E. Underwriters Laboratory (UL):
 - 1. 1449: Standard for Safety, Surge Protective Devices - Fourth Edition.
 - 2. 1283: Standard for Safety, Electromagnetic Interference Filters

1.03 SUBMITTALS

- A. Shop drawings, manufacturer's product data, and component ratings in accordance with this section and the requirements of Section 26 05 10 "Electrical Work – General".
- B. SPD type, model number, system voltage, phases, modes of protection, Maximum Continuous Operating Voltage (MCOV) Voltage Protection Rating (VPR), Short Circuit Current Rating (SCCR), and Nominal Discharge Current (In).
- C. Provide outline drawings and internal wiring diagrams.
- D. List all required installation criteria including circuit breaker trip rating to meet UL 1449, Four Edition.
- E. Identify all cable sizes, distance limits and accessory devices when SPD units are to be provided in separate enclosures, where applicable.
- F. For informational/purposes only, submit installation instructions and separate from all other submittals.
- G. UL 1449 listing and summary of factory test data.

1.04 QUALITY ASSURANCE

- A. SPD units and all components shall be designed manufactured and tested in accordance with the latest applicable UL Standard ANSI/UL 1449 Third Edition.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Provide in accordance with Section 26 05 10 "Electrical Work – General" and as specified.
- B. Shipping:
 - 1. Ship equipment and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.
 - 2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.
 - 3. Deliver spare parts after installation but before start-up of system as specified. Deliver to Owner after completion of work.

C. Storage:

1. Inspect and inventory items upon delivery to site.
2. Store and safeguard equipment, material and spare parts.

1.06 WARRANTY AND SERVICE

- A. The SPD manufacturer is to warranty the components against defective materials and workmanship for a period of five years following delivery from the manufacturer.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Surge Protection Device Components.

1. Eaton/Cutler-Hammer.
2. Schneider/Square D
3. Siemens.
4. General Electric Company.

2.02 PROVISIONS

A. Environmental Requirements:

1. Operating Temperature: minus 40 degrees C to 60 degrees C.
2. Relative Humidity: 5 to 95 percent.
3. Operating Altitude: 0 to 12,000 Feet (0 to 3,660 meters).
4. Audible Noise: Less than 35 dBA at 3 feet (1 m).

B. Electrical Requirements:

1. The maximum continuous operating voltage of all suppression components utilized is not to be less than 115 percent of the nominal operating voltage at the installed location.
2. ANSI/UL 1449 3rd Edition Voltage Protection Rating (VPR) – The maximum ANSI/UL 1449 3rd Edition VPR for the device shall not exceed the following:

<u>Volts</u>	<u>L-N</u>	<u>L-L</u>	<u>N-G</u>
208Y/120	460V	1000V	700V
480Y/277	1100V	1800V	1000V

3. The ANSI/IEEE C62.41.1-1991 Category C3 let through voltages shall not exceed the following

<u>Volts</u>	<u>L-N</u>	<u>N-G</u>
208Y/120	550V	470V
480Y/277	900V	920V

4. The SPD components are to be rated as follows:

480V Service Entrance at each Structure	250 kA per phase 125 kA per mode
480V Distribution Panels	160 kA per phase 80 kA per mode
120/208V Panelboards	120 kA per phase 60 kA per mode

5. The mode of operation is to protect against surges and transients as follows:

<u>System Configuration</u>	<u>Protection Mode</u>
Single Phase, Two Wire (L,N) + Ground	L to G,L to N, and N to G
Single Phase, Two Wire (L,L) + Ground	L to L, and L to G
Split Phase, Three Wire + Ground	L to L, L to G,L to N, and N to G
Three Phase, Three Wire (Delta) + Ground	L to L, and L to G
Three Phase, Four Wire (Wye) + Ground	L to L, L to G,L to N, and N to G

2.03 OPERATION

- A. The suppression system shall incorporate a hybrid designed Metal-Oxide Varistors (MOV) surge suppressor. The system shall not use silicone avalanche diodes, air gaps or other methods of suppression.
- B. Each unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be 50 dB at 100 kHz.
- C. SPD shall provide surge current diversion between each phase conductor and the neutral conductor, between each phase conductor and ground and between the neutral conductor and ground. For delta systems, the SPD shall have components directly connected between each phase conductor and between each phase conductor and ground.
- D. The SPD shall provide a low impedance path for surge current using oversized conductors with equal impedance paths to each suppression element. Plug-in style connections or printed circuit boards for use in the path of surge current shall not be used.
- E. Operating Parameters:

1. The maximum response time shall not exceed 1 nanosecond.
2. Provide with a noise filtering system capable of managing noise levels produced by electro-magnetic interference and radio frequency interference. The noise filtering system shall reject a minimum of 50db at 100 kHz as measured by the 50 Ohm Insertion Loss Method (Military Standard 220A).
3. The parallel system components shall operate over a minimum frequency range of 47 Hertz to 63 Hertz.
4. The SPD components shall limit total harmonic distortion produced by the SPD to less than one percent.
5. SPD component ratings to be per UL 1449.
6. Each unit shall be factory tested at the maximum continuous operating voltage and short circuit tested, prior to delivery.

F. Product Components:

1. Protection and Filtering Elements:
 - a. The SPD components shall consist of replaceable protection modules designed to suppress and divert transient voltages and surge currents. Each protection module shall contain one or more individually fused metal oxide varistors capable of withstanding over 1000 surges of Category C (IEEE/ANSI C62.41.1) current rated at 10,000 amperes.
 - b. Each protection module shall contain filtering elements capable of providing noise attenuation.
 - c. The SPD components shall substantially limit transient waveform rise-time characteristics. The components are to be configured as parallel connected, current carrying elements designed to enhance the surge suppression and diversion performance of the protection modules.
2. Provide individual fusing to allow the SPD to be isolated during fault conditions.
3. Provide red and green solid-state status lights which indicate operational status of each unit and visual diagnostic monitoring of each component and module. Provide audible alarm to activate on fault condition, with a silence switch and push-to-test alarm switch.
4. Provide surge counter with battery backup to retain memory upon loss of AC power.
5. Provide remote status monitoring with form C dry contacts monitoring all phases.

2.04 SHOP TESTING

- A. Perform factory performance testing on each unit. The test to consist of the following:
 - 1. High voltage impedance test.
 - 2. Current test.
- B. Tests shall be in accordance with the following standards:
 - 1. ANSI/IEEE C62.41.1 Cat. A, B, & C.
 - 2. ANSI/IEEE C62.45.
 - 3. Military Standard 220A.
 - 4. Underwriters Laboratory UL 1449.
- C. Submit certified documentation of all factory tests performed.
- D. Perform above tests in addition to standard factory tests.

2.05 SPARE PARTS

- A. Provide in accordance with Section 01 78 23 "Operation and Maintenance Data" and as specified.
- B. Provide one spare protection module of each type for on-site spare parts purposes.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Visually inspect delivered unit(s) and accessories for conformance with drawings and specifications. Replace all components found to exhibit defects.

3.02 INSTALLATION

- A. Install unit in compliance with the manufacturers printed instructions. All electrical installation work shall be in accordance with UL Listing Requirements and applicable National or Local Electrical Codes.
- B. For units mounted adjacent to electrical distribution equipment, verify conduit and wire for the SPD components are as specified by the SPD manufacturer and installed in strict accordance with the National Electrical Code.
- C. Verify UL 1449, fourth edition, label is provided on each unit.

3.03 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 “Execution and Closeout Requirements”.

END OF SECTION

SECTION 26 50 00
INTERIOR LIGHTING

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide complete indoor lighting systems as indicated and in compliance with Contract Documents.
- B. Light fixture schedules are provided on the Contract Drawings. These Specifications are to be considered supplementary to the information contained in the light fixture schedule. In areas of conflict the scheduled items shall be provided.
- C. Fixtures shall be "Energy Star" rated.
- D. Provide a Ultraviolet (UV) Surface Disinfection Lighting System as stated in the specifications and as shown on the plans.

1.02 DEFINITIONS

- A. Emergency Lighting Unit: Fixture with integral emergency battery-powered supply and means for controlling and charging battery. Also known as an emergency light set.
- B. Fixture: Complete lighting unit, exit sign, or emergency lighting unit. Fixtures include lamps and parts required to distribute light, position and protect lamps, and connect lamps to power supply. Internal battery-powered exit signs and emergency lighting units also include battery and means for controlling and recharging battery. Emergency lighting units include ones with and without integral lamp heads.

1.03 REFERENCES

2. 773A: Nonindustrial Photo Electric Switches for Lighting Control.
3. 924: Standard for Emergency Lighting and Power Equipment.
4. 1598: UL Standard for Safety Luminaires
5. 8750: Light Emitting Diode (LED) Equipment for Use in Lighting Products.

E. Illuminating Engineering Society of North America (IESNA or IES):

1. LM-79: IESNA Approved Method for the Electrical and Photometric Measurements of Solid-State Lighting Products
2. LM-80: IESNA Approved Method for Measuring Lumen Maintenance of LED Light Sources

1.04 SUBMITTALS

- A. Submit shop drawings and manufacturer's product data with installation instructions in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Submit manufacturer's shop drawings including photometric laboratory test data to show that luminaires proposed are of same type, construction and quality as those indicated. Luminaires are to be listed and labeled by Underwriters' Laboratories.
- C. Submit manufacturer's data for each ballast provided. Include detailed information for each luminaire showing wattage, voltage, and full load amp draw for each.
- D. Submit photometric calculations based on maintained lighting foot candle levels for areas where lighting fixtures are substituted. Substituted fixtures must provide similar lighting performance and energy usage as those scheduled, and must be constructed of similar quality and materials.

1.05 QUALITY ASSURANCE

- A. Provide in accordance with Section 01 43 00 "Quality Requirements" and as specified.
- B. Provide hangers and supports to resist failure from earthquake damage in accordance with NEC and all local and State codes.
- C. Lighting fixtures to be provided with dedicated supporting systems.
- D. Comply with the Code for Buildings and all local and State energy laws and regulations.

1.06 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. Plastic Diffusers and Lenses: 1 for every 100 of each type and rating installed. Furnish at least 1 of each type.
2. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least 1 of each type.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Metal Parts: Free from burrs, sharp corners, and edges.
- B. Sheet Metal Components: Steel, except as indicated. Form and support to prevent warping and sagging.
- C. Doors, Frames, and Other Internal Access: Smooth operating, free from light leakage under operating conditions, and arranged to permit relamping without use of tools. Arrange doors, frames, lenses, diffusers, and other pieces to prevent accidental falling during relamping and when secured in operating position.
- D. Reflecting Surfaces: Minimum reflectance as follows, except as otherwise indicated:
 1. White Surfaces: 85 percent.
 2. Specular Surfaces: 83 percent.
 3. Diffusing Specular Surfaces: 75 percent.
 4. Laminated Silver Metallized Film: 90 percent.
- E. Lenses, Diffusers, Covers, and Globes: 100 percent virgin acrylic plastic or water white, annealed crystal glass, except as otherwise indicated.
 1. Plastic: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
 2. Lens Thickness: 0.125 inches minimum; except where greater thickness is indicated.
- F. Fixture Support Components:
 1. Single Stem Hangers: 1/2 inches steel tubing with swivel ball fitting and ceiling canopy. Finish same as fixture.
 2. Twin Stem Hangers: Two, 1/2-inch steel tubes with single canopy arranged to mount a single fixture. Finish same as fixture.
 3. Rod Hangers: 3/8 inch minimum diameter, zinc plated, threaded steel rod.

4. Hook Hanger: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking type plug.

G. Provide EMI filters in each light fixture mounted in shielded enclosures.

1. Filters shall be integral to the fixture assembly with one filter per ballast.
2. Filters shall suppress electromagnetic interference in the AM radio band from 500 to 1700 kHz.

2.02 LED FIXTURES

- A. Provide fixtures on the Design Lights Consortium (DLC) Qualified Products List.
- B. Thermal Management: Liquids or other moving parts shall be clearly indicated in submittals, and shall be consistent with product testing.
- C. Color Rendering Index (CRI): >70.
- D. Correlated Color Temperature: 4000K.
- E. Minimum luminaire efficacies: 85 lumens per watt. Nominal input wattage shall account for nominal applied voltage and any reduction in driver efficiency due to sub-optimal driver loading.
- F. Fully enclosed wiring and LED diodes enclosed to prevent penetration of dust, insects, and other debris into the lamp and driver compartment.
- G. Driver/LED combined system shall have rated life based on IESNA LM-80-2008 (or latest) of 50,000 hours at 70% lumen maintenance.
- H. Driver is high efficiency type with THD < 20 percent and power factor > 0.90.

2.03 EMERGENCY LIGHTING AND EXIT LIGHTING UNITS

- A. Exit Signs: Conform to UL 924 and following:
 1. Sign Colors: Conform to local code.
 2. Minimum Height of Letters: Conform to local code.
 3. Arrows: Include as indicated.
- B. Emergency Lighting Units: Conform to UL 924. Provide self-contained units with following features:
 1. Battery: Sealed, maintenance free, lead acid type with minimum 10-year nominal life and special warranty. Battery shall be sized for a minimum of 90 minutes run time.

2. Charger: Minimum 2 rate, fully automatic, solid-state type, with sealed transfer relay.
3. Operation: Relay automatically turns lamp on when supply circuit voltage drops to 80% of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep discharge level. Relay disconnects lamps and battery and automatically recharges and floats on trickle charger when normal voltage is restored. Provide test switch and operation light indication.
4. Wire Guard: Where indicated, provide heavy chrome plated wire guard arranged to protect lamp heads or fixtures.
5. Time Delay Relay: Provide time delay relay in emergency lighting unit control circuit arranged to hold unit ON for fixed interval after restoration of power after outage. Provide adequate time delay to permit HID lamps to restrike and develop adequate output.

2.04 ULTRAVIOLET SURFACE DISINFECTION LIGHTING SYSTEM

A. Manufacturer:

1. PURO Lighting
2. Approved Equal

B. Manufacturer and models are shown to establish standards. Equal products can be submitted for approval.

C. Lights:

1. Provide ceiling mounted, 120V, 60W, hard wire UV light with 24"x24" flange kit for drop-in ceiling mount.
2. PURO Helo F1 - H-F1-6-FC-COM-110 with H1-GA-24.

D. Control System:

1. Provide disinfection control system with Ethernet connectivity, motion detector, main control box, and two touch screens (one inside the lab and one on the wall outside the lab).
 - a. Main Control Box: Provide junction box with system controller, power supply, relay modules, and terminal blocks.
 - b. Motion Sensor: Provide wide-angle motion sensor with CAT5 connectivity.
 - c. In-Room Screen: Provide 3.5" x 5.25" minimum touch screen located in the room. Screen shall connect to the system via CAT5.

- d. External Screen: Provide 10” minimum touch screen located external to the room. Screen shall connect to the system via CAT5.
- 2. PURO Disinfection Control System - DCS-E-DT-x with motion detector(s) and touch screens.
- E. Commissioning:
 - 1. Provide commissioning by manufacturer approve and trained representative.
- F. Layout:
 - 1. The layout shown on the plans is for design intent only. Vendor shall provide calculations and layout which incorporates the lab layout with all equipment including all obstructions.
 - 2. Layout and calculations shall be submitted for approval including wiring diagram.
- G. Manufacturer's Warranty:
 - 1. Manufacturer agrees to repair or replace system components that fail in materials or workmanship within specified warranty period.
 - 2. Warranty Period: 60 months from date of Substantial Completion.

PART 3 - EXECUTION

3.01 LUMINAIRES AND LAMPS

- A. Install types and sizes indicated, complete. Deliver lamps of proper type, wattage and voltage rating to site and install in luminaires prior to completion of project.
- B. Install all luminaires to comply with applicable provisions of National Electrical Code. Suspend pendant luminaires by means of suitable outlet box cover-type aligners, each having flexible joint permitting unit to hang plumb.
 - 1. Provide hangers capable of supporting twice the combined weight of fixtures supported by hangers.
 - 2. Provide with swivel hangers to ensure a plumb installation. Hangers shall be cadmium-plated steel with a swivel-ball tapped for the conduit size indicated.
 - 3. Brace pendants 4 feet or longer to limit swinging.
 - 4. Single-unit suspended fixtures shall have twin-stem hangers.

5. Multiple-unit or continuous row fixtures shall have a tubing or stem for wiring at one point and a tubing or rod suspension provided for each unit length of chassis, including one at each end.
 6. Rods shall be a minimum 3/8-inch diameter.
- C. Use aligners of shock absorbing type, where indicated.
 - D. Use vaportight aligners with vaportight luminaires.
 - E. Install each explosion-proof pendant luminaire having stem longer than 12 inches, with explosion-proof swivel or flexible fitting permitting luminaire to hang plumb. Luminaires with stems shorter than 12 inches aligned by level outlet box mounting, explosion-proof swivels, or other acceptable means.
 - F. Install luminaires with adjustable fittings to permit alignment with ceiling panels. Install luminaires in fire-resistive type of suspended ceiling construction, equipped with fireproofing boxes constructed of materials of same fire rating as ceiling panels. Materials in conformance with UL approved building materials list.
 - G. Support for Recessed and Semi-recessed Grid Type Fixtures: Support Units from suspended ceiling support system. Install ceiling support system rods or wires at minimum of 4 rods or wires for each fixture, located not more than 6 inches from fixture corners.
 1. Install support clips for recessed fixtures, securely fastened to ceiling grid members, at or near each fixture corner.
 2. Fixtures Smaller than Ceiling Grid: Install minimum of 4 rods or wires for each fixture and locate at corner of ceiling grid where fixture is located. Do not support fixtures by ceiling acoustical panels.
 3. Fixtures of Sizes Less than Ceiling Grid: Center in acoustical panel. Support fixtures independently with at least two 3/4-inch metal channels spanning and secured to ceiling tees.
 - H. Install accessories such as straps, mounting plates, nipples, or brackets necessary for proper installation.
 - I. Connect emergency light units to the unswitched branch circuit powering the luminaires in the same space.
- 3.02 CONTRACT CLOSEOUT
- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 26 56 00
EXTERIOR LIGHTING

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide complete outdoor lighting systems as indicated and in compliance with Contract Documents.
- B. Light fixture schedules are provided on the Contract Drawings. These Specifications are to be considered supplementary to the information contained in the light fixture schedule. In areas of conflict the scheduled items shall be provided.
- C. Fixtures shall be "Energy Star" rated.

1.02 REFERENCES

- A. ASTM International (ASTM):
 - 1. A500/A500M: Cold Formed Welded and Seamless Carbon Steel Structural Tubing.
 - 2. B209/B209M: Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
 - 3. B429/B429M: Standard Specification for Aluminum-Alloy Extruded Structural Pipe and Tube
- B. Institute of Electrical and Electronics Engineers (IEEE):
 - 1. C62.41.1: IEEE Guide on the Surges Environment in Low-Voltage (1000V and Less) AC Power Circuits
 - 2. C62.41.2: IEEE Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits
- C. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).
- D. Underwriters' Laboratories, Inc. (UL):
 - 1. 773: UL Standard for Safety Plug-In Locking Type Photocontrols for Use with Area Lighting-Fourth Edition
 - 2. 844: UL Standard for Safety Luminaires for Use in Hazardous (Classified) Locations-Twelfth Edition

3. 1029: Standard for Safety High Intensity Discharge Lamp Ballasts.
4. 1598: UL Standard for Safety Luminaires

1.03 DEFINITIONS

- A. Fixture: Complete lighting device. Fixtures include lamp or lamps and parts required to distribute light, position and protect lamps, and connect lamps to power supply.
- B. Lighting Unit: Fixture or assembly of fixtures with common support, including pole or bracket plus mounting and support accessories.
- C. Luminaire: Fixture.

1.04 SUBMITTALS

- A. Submit shop drawings and manufacturer's product data with installation instructions in accordance with the requirements of Section 26 05 10 "Electrical Work – General".
- B. Submit manufacturer's shop drawings including photometric laboratory test data to show that luminaires proposed are of same type, construction and quality as those indicated. Luminaires are to be listed and labeled by Underwriters' Laboratories.
- C. Submit manufacturer's data for each ballast provided. Include detailed information for each luminaire showing wattage, voltage, and full load amp draw for each.
- D. Submit photometric calculations based on maintained lighting foot candle levels for areas where lighting fixtures are substituted. Substituted fixtures must provide similar lighting performance and energy usage as those scheduled, and must be constructed of similar quality and materials.
- E. Product Data:
 1. Describe fixtures, lamps, ballasts, poles, and accessories. Arrange Product Data for fixtures in order of fixture designation. Include data on features, poles, accessories, finishes, and following:
 - a. Outline drawings indicating dimensions and principal features of fixtures and poles.
 - b. Electrical Ratings and Photometric Data: Certified results of laboratory tests for fixtures and lamps.
- F. Operating and Maintenance Data (O&M): Maintenance data for products to include operation and maintenance information.

1.05 QUALITY ASSURANCE

- A. Comply with IEEE C2.

- B. Items provided under this section shall be listed or labeled labelled by UL or other Nationally Recognized Testing Laboratory (NRTL).
 - 1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.
 - 2. Terms “listed” and “labeled” shall be as defined in National Electrical Code (NEC), Article 100.
 - C. Regulatory Requirements:
 - 1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.
 - D. Fixtures for Hazardous Locations: Conform to UL 844. Provide units that have Factory Mutual Engineering and Research Corporation (FM) certification for indicated class and division of hazard.
- 1.06 STORAGE AND HANDLING OF POLES
- A. Store poles on decay resistant treated skids at least 12 inches (300 mm) above grade and vegetation. Support pole to prevent distortion and arrange to provide free air circulation.
 - B. Metal Poles: Retain factory applied pole wrappings until just before pole installation. For poles with nonmetallic finishes, handle with web fabric straps.
- 1.07 EXTRA MATERIALS
- A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
 - 1. Glass and Plastic Lenses, Covers, and Other Optical Parts: 1 for every 100 of each type and rating installed. Furnish at least one of each type.
 - 2. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least one of each type.

PART 2 - PRODUCTS

2.01 FIXTURES AND FIXTURE COMPONENTS

- A. Metal Parts: Free from burrs, sharp edges, and corners.
- B. Sheet Metal Components: Corrosion resistant aluminum, except as otherwise indicated. Form and support to prevent warping and sagging.
- C. Housings: Rigidly formed, weather and light tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed fixtures.

- D. Doors, Frames, and Other Internal Access: Smooth operating, free from light leakage under operating conditions, and arranged to permit relamping without use of tools. Arrange doors, frames, lenses, diffusers, and other pieces to prevent accidental falling during relamping and when secured in operating position. Provide for door removal for cleaning or replacing lens. Arrange for door opening to disconnect ballast.
- E. Exposed Hardware Material: Stainless steel.
- F. Reflecting Surfaces: Minimum reflectances as follows, except as otherwise indicated:
 - 1. White Surfaces: 85 percent
 - 2. Specular Surfaces: 83 percent
 - 3. Diffusing Specular Surfaces: 75 percent
- G. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- H. Lenses and Refractors: Materials as indicated. Use heat and aging resistant, resilient gaskets to seal and cushion lens and refractor mounting in fixture doors.

2.02 LED FIXTURES

- A. Provide fixtures on the Design Lights Consortium (DLC) Qualified Products List.
- B. Thermal Management: Liquids or other moving parts shall be clearly indicated in submittals, and shall be consistent with product testing.
- C. Color Rendering Index (CRI): >70.
- D. Correlated Color Temperature: 4000K.
- E. Minimum luminaire efficacies: 85 lumens per watt. Nominal input wattage shall account for nominal applied voltage and any reduction in driver efficiency due to sub-optimal driver loading.
- F. Fully enclosed wiring and LED diodes enclosed to prevent penetration of dust, insects, and other debris into the lamp and driver compartment.
- G. Driver/LED combined system shall have rated life based on IESNA LM-80-2008 (or latest) of 50,000 hours at 70 percent lumen maintenance.
- H. Driver is high efficiency type with THD < 20 percent and power factor > 0.90.
- I. Outdoor fixtures capable of reliable operation in temperature range of -30 degrees C to +40 degrees C minimum.

2.03 FIXTURE SUPPORT COMPONENTS

- A. Pole Mounted Fixtures: Conform to AASHTO LTS-6.
- B. Wind load strength of total support assembly, including pole, arms, appurtenances, base, and anchorage, is adequate to carry itself plus fixtures indicated at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of 100 mi./h (160 km/h) with gust factor of 1.3.
- C. Arm, Bracket, and Tenon Mount Materials: Match poles' finish.
- D. Mountings, Fastenings, and Appurtenances: Corrosion resistant items compatible with support components. Use materials that will not cause galvanic action at contact points. Use mountings that correctly position luminaire to provide indicated light distribution.
- E. Poles: As indicated in Lighting Fixture Schedule.
- F. Pole Bases: Anchor type with galvanized steel hold-down or anchor bolts, leveling nuts, and bolt covers.
- G. Concrete for Pole Foundations:
 - 1. Comply with Section 03 30 00 "Cast-in-Place Concrete".
 - 2. Use 3000 psig (20 MPa) strength, 28 day concrete.

2.04 FINISHES

- A. Metal Parts: Manufacturer's standard finish, except as otherwise indicated, applied over corrosion resistant primer, free of streaks, runs, holidays, stains, blisters, and similar defects.
- B. Other Parts: Manufacturer's standard finish, except as otherwise indicated.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Set units plumb, square, level, and secure according to manufacturer's written instructions and accepted submittals.
- B. Concrete Foundations: Construct according to Section 03 30 00 "Cast-in-Place Concrete".
 - 1. Comply with details and manufacturer's recommendations for reinforcing, anchor bolts, nuts, and washers. Verify anchor bolt templates by comparing with actual pole bases furnished.
 - 2. Finish: Trowel and rub smooth parts exposed to view.

- C. Pole Installation: Use web fabric slings (not chain or cable) to raise and set poles.
- D. Fixture Attachment: Fasten to indicated structural supports.
- E. Fixture Attachment with Adjustable Features or Aiming: Attach fixtures and supports to allow aiming for indicated light distribution.
- F. Lamp fixtures with indicated lamps according to manufacturer's written instructions. Replace malfunctioning lamps.

3.02 GROUNDING

- A. Ground fixtures and metal poles according to Section 26 05 26 "Grounding and Bonding for Electrical Systems".
 - 1. Poles: Install 10 feet (3 m) driven ground rod at each pole.
 - 2. Nonmetallic Poles: Ground metallic components of lighting unit and foundations. Connect fixtures to grounding system with No. 6 AWG conductor.

3.03 FIELD QUALITY CONTROL

- A. Inspect each installed unit for damage. Replace damaged fixtures and components.
- B. Tests and Observations:
 - 1. Give advance notice of dates and times for field tests.
 - 2. Replace or repair damaged and malfunctioning units, make necessary adjustments, and retest. Repeat procedure until units operate properly.

3.04 ADJUSTING AND CLEANING

- A. Clean units after installation. Use methods and materials recommended by manufacturer.

3.05 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00 "Execution and Closeout Requirements".

END OF SECTION

SECTION 27 05 53

IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Labels.
2. Bands and tubes.
3. Underground-line warning tape.
4. Signs.
5. Cable ties.
6. Miscellaneous identification products.

1.02 ACTION SUBMITTALS

A. Product Data:

1. Labels.
2. Bands and tubes.
3. Underground-line warning tape.
4. Signs.
5. Cable ties.
6. Miscellaneous identification products.

B. Product Data Submittals: For each product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for communications identification products.

C. Identification Schedule:

1. Outlets: Scaled drawings indicating location and proposed designation.
2. Backbone Cabling: Riser diagram showing each communications room, backbone cable, and proposed backbone cable designation.

3. Racks: Scaled drawings indicating location and proposed designation.
4. Patch Panels: Enlarged scaled drawings showing rack row, number, and proposed designations.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- D. Comply with NFPA 70 and TIA 606-B.
- E. Comply with ANSI Z535.4 for safety signs and labels.
- F. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.
- G. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.
 1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.02 COLOR AND LEGEND REQUIREMENTS

- A. Equipment Identification Labels:
 1. Black letters on a white field.

2.03 LABELS

- A. Vinyl Wraparound Labels: Preprinted, flexible labels laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing label ends.
- B. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameters sized to suit diameters of raceway or cable they identify, that stay in place by gripping action.
- C. Self-Adhesive Wraparound Labels: Preprinted, 3-mil- (0.08-mm-) thick, vinyl flexible labels with acrylic pressure-sensitive adhesive.
 1. Self-Lamination: Clear; UV-, weather- and chemical-resistant; self-laminating protective shields over the legend. Labels sized such that the clear shield overlaps the entire printed legend.

2. Marker for Labels:

- a. Machine-printed, permanent, waterproof black ink recommended by printer manufacturer.

D. Self-Adhesive Labels: Vinyl, thermal, transfer-printed, 3-mil- (0.08-mm-) thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.

1. Minimum Nominal Size:

- a. 1-1/2 by 6 inches (37 by 150 mm) for raceway and conductors.
- b. 3-1/2 by 5 inches (76 by 127 mm) for equipment.
- c. As required by authorities having jurisdiction.

2.04 BANDS AND TUBES

- A. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2 inches (50 mm) long, with diameters sized to suit diameters of raceway or cable they identify, that stay in place by gripping action.

2.05 UNDERGROUND-LINE WARNING TAPE

A. Tape:

1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground communications utility lines.
2. Printing on tape shall be permanent and shall not be damaged by burial operations.
3. Tape material and ink shall be chemically inert and not subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.

B. Color and Printing:

1. Comply with ANSI Z535.1, ANSI Z535.2, ANSI Z535.3, and ANSI Z535.4.
2. Inscriptions for Orange-Colored Tapes: "TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL-FIBER CABLE"
3. Foil Core Thickness: 0.35 mil (0.00889 mm).
4. Weight: 28 lb/1000 sq. ft. (13.7 kg/100 sq. m).
5. Tensile According to ASTM D882: 70 lbf (311.3 N) and 4600 psi (31.7 MPa).

C. Tag, Detectable, Reinforced:

1. Reinforced, detectable three-layer laminate, consisting of a printed pigmented woven scrim, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core; bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
2. Width: 3 inches (75 mm).
3. Overall Thickness: 8 mils (0.2 mm).
4. Foil Core Thickness: 0.35 mil (0.00889 mm).
5. Weight: 34 lb/1000 sq. ft. (16.6 kg/100 sq. m).
6. Tensile According to ASTM D882: 300 lbf (1334 N) and 12,500 psi (86.1 MPa).

2.06 SIGNS

A. Baked-Enamel Signs:

1. Preprinted aluminum signs, high-intensity reflective, punched for fasteners, with colors, legend, and size required for application.
2. 1/4-inch (6.4-mm) grommets in corners for mounting.
3. Nominal Size: 7 by 10 inches (180 by 250 mm).

B. Metal-Backed Butyrate Signs:

1. Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs, with 0.0396-inch (1-mm) galvanized-steel backing, punched and drilled for fasteners, and with colors, legend, and size required for application.
2. 1/4-inch (6.4-mm) grommets in corners for mounting.
3. Nominal Size: 10 by 14 inches (250 by 360 mm).

C. Laminated-Acrylic or Melamine-Plastic Signs:

1. Engraved Legend: With black letters on white face.
2. Thickness:
 - a. For signs up to 20 sq. in. (129 sq. cm), minimum 1/16 inch (1.6 mm) thick.
 - b. For signs larger than 20 sq. in. (129 sq. cm), 1/8 inch (3.2 mm) thick.

3. Attachment: Punched or drilled for mechanical fasteners with 1/4-inch (6.4-mm) grommets in corners for mounting.
4. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.07 CABLE TIES

A. General-Purpose Cable Ties: Fungus inert, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

1. Minimum Width: 3/16 inch (5 mm).
2. Tensile Strength at 73 deg F (23 deg C) According to ASTM D638: 12,000 psi (82.7 MPa).
3. Temperature Range: Minus 40 to plus 185 deg F (Minus 40 to plus 85 deg C).
4. Color: Black, except where used for color-coding.

B. UV-Stabilized Cable Ties: Fungus inert, designed for continuous exposure to exterior sunlight, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

1. Minimum Width: 3/16 inch (5 mm).
2. Tensile Strength at 73 deg F (23 deg C) According to ASTM D638: 12,000 psi (82.7 MPa).
3. Temperature Range: Minus 40 to plus 185 deg F (Minus 40 to plus 85 deg C).
4. Color: Black.

C. Plenum-Rated Cable Ties: Self-extinguishing, UV stabilized, one piece, and self-locking.

1. Minimum Width: 3/16 inch (5 mm).
2. Tensile Strength at 73 deg F (23 deg C) According to ASTM D638: 7000 psi (48.2 MPa).
3. UL 94 Flame Rating: 94V-0.
4. Temperature Range: Minus 50 to plus 284 deg F (Minus 46 to plus 140 deg C).
5. Color: Black.

2.08 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Retain paint system applicable for surface material and location (exterior or interior).
- B. Fasteners for Labels and Signs: Self-tapping, stainless steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Self-Adhesive Identification Products: Before applying communications identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

3.02 INSTALLATION

- A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.
- B. Install identifying devices before installing acoustical ceilings and similar concealment.
- C. Verify identity of each item before installing identification products.
- D. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and operation and maintenance manual.
- E. Apply identification devices to surfaces that require finish after completing finish work.
- F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of communications systems and connected items.
- G. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.
- H. Vinyl Wraparound Labels:
 - 1. Secure tight to surface of raceway or cable at a location with high visibility and accessibility.
 - 2. Attach labels that are not self-adhesive type with clear vinyl tape, with adhesive appropriate to the location and substrate.
 - 3. Provide label 6 inches (150 mm) from cable end.

I. Snap-Around Labels:

1. Secure tight to surface at a location with high visibility and accessibility.
2. Provide label 6 inches (150 mm) from cable end.

J. Self-Adhesive Wraparound Labels:

1. Secure tight to surface at a location with high visibility and accessibility.
2. Provide label 6 inches (150 mm) from cable end.

K. Self-Adhesive Labels:

1. On each item, install unique designation label that is consistent with wiring diagrams, schedules, and operation and maintenance manual.
2. Unless otherwise indicated, provide a single line of text with 1/2-inch- (13-mm-) high letters on 1-1/2-inch- (38-mm-) high label; where two lines of text are required, use labels 2 inches (50 mm) high.

L. Snap-Around, Color-Coding Bands: Secure tight to surface at a location with high visibility and accessibility.

M. Underground-Line Warning Tape:

1. During backfilling of trenches, install continuous underground-line warning tape directly above cable or raceway at 6 to 8 inches (150 to 200 mm) below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches (400 mm) overall.
2. Install underground-line warning tape for direct-buried cables and cables in raceways.

N. Cable Ties: General purpose, except as listed below:

1. Outdoors: UV-stabilized nylon.
2. In Spaces Handling Environmental Air: Plenum rated.

3.03 IDENTIFICATION SCHEDULE

- A. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment. Install access doors or panels to provide view of identifying devices.
- B. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, pull points, and locations with high visibility. Identify by system and circuit designation.

- C. Accessible Fittings for Raceways and Cables within Buildings: Identify covers of each junction and pull box with self-adhesive labels containing wiring system legend.
 - 1. System legends shall be as follows:
 - a. Telecommunications.
- D. Faceplates: Label individual faceplates with self-adhesive labels. Place label at top of faceplate. Each faceplate shall be labeled with its individual, sequential designation, numbered clockwise when entering room from primary egress, composed of the following, in the order listed:
 - 1. Wiring closet designation.
 - 2. Colon.
 - 3. Faceplate number.
- E. Equipment Room Labeling:
 - 1. Racks, Frames, and Enclosures: Identify front and rear of each with self-adhesive labels containing equipment designation.
 - 2. Patch Panels: Label individual rows in each rack, starting at top and working down, with self-adhesive labels.
 - 3. Data Outlets: Label each outlet with a self-adhesive label indicating the following, in the order listed:
 - a. Room number being served.
 - b. Colon.
 - c. Faceplate number.
- F. Backbone Cables: Label each cable with a vinyl-wraparound label] indicating the location of the far or other end of the backbone cable. Patch panel or punch down block where cable is terminated should be labeled identically.
- G. Horizontal Cables: Label each cable with a self-adhesive wraparound label indicating the following, in the order listed:
 - 1. Room number.
 - 2. Colon.
 - 3. Faceplate number.

- H. Locations of Underground Lines: Underground-line warning tape for copper, coaxial, hybrid copper/fiber, and optical-fiber cable.
- I. Instructional Signs: Self-adhesive labels.
- J. Warning Labels for Indoor Cabinets, Boxes, and Enclosures: Metal-backed, butyrate warning signs.
 - 1. Apply to exterior of door, cover, or other access.
- K. Equipment Identification Labels:
 - 1. Indoor Equipment: Self-adhesive label.
 - 2. Outdoor Equipment: Laminated-acrylic or melamine-plastic sign.
 - 3. Equipment to Be Labeled:
 - a. Communications cabinets.
 - b. Network Racks
 - c. Uninterruptible power supplies.
 - d. Fire-alarm and suppression equipment.
 - e. Egress points.

END OF SECTION

SECTION 27 11 16

COMMUNICATIONS RACKS, FRAMES, AND ENCLOSURES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

- 1. 19-inch freestanding and wall-mounted equipment racks.
 - 2. 19-inch freestanding and wall-mounted equipment cabinets.
 - 3. Power strips.
 - 4. Grounding.
 - 5. Labeling.

- B. Related Requirements:

- 1. Section 26 05 26 "Grounding and Bonding for Electrical Systems".
 - 2. Section 26 05 36 "Cable Trays for Electrical Systems" for cable trays and cable tray accessories.
 - 3. Section 27 15 13 "Communications Copper Horizontal Cabling" for copper data cabling associated with system panels and devices.

1.03 DEFINITIONS

- A. Access Provider: An operator that provides a circuit path or facility between the service provider and user. An access provider can also be a service provider.
- B. BICSI: Building Industry Consulting Service International.
- C. LAN: Local area network.
- D. RCDD: Registered communications distribution designer.
- E. Service Provider: The operator of a telecommunications transmission service delivered through access provider facilities.

- F. TGB: Telecommunications grounding bus bar.
- G. TMGB: Telecommunications main grounding bus bar.

1.04 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets.
 - 2. Include rated capacities, operating characteristics, electrical characteristics, certifications, standards compliance, and furnished specialties and accessories.
- B. Shop Drawings: For communications racks, frames, and enclosures. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.
 - 3. Grounding: Indicate location of TGB and its mounting detail showing standoff insulators and wall-mounting brackets.
- C. Qualification Data: For Installer, qualified layout technician, installation supervisor, and field inspector.
- D. Seismic Qualification Data: Certificates, from manufacturer.
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.
 - 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Cabling installer must have personnel certified by BICSI on staff.
 - 1. Layout Responsibility: Preparation of Shop Drawings shall be under direct supervision of RCDD.

2. Installation Supervision: Installation shall be under direct supervision of Installer 2, Copper or Fiber, who shall be present at all times when Work of this Section is performed at Project site.
3. Field Inspector: Currently registered by BICSI as Technician to perform on-site inspection.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Equipment shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified."
- B. UL listed.
- C. RoHS compliant.

2.02 BACKBOARDS

- A. Backboards: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches (19 by 1220 by 2440 mm). Comply with requirements for plywood backing panels specified in Section 06 10 00 "Rough Carpentry."

2.03 19-INCH EQUIPMENT RACKS

- A. Description: four-post racks with threaded rails designed for mounting telecommunications equipment. Width is compatible with EIA/ECIA 310-E, 19-inch (482.6-mm) equipment mounting with an opening of 17.72-inches (450-mm) between rails.
- B. General Requirements:
 1. Frames: Modular units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
 2. Material: Extruded steel.
 3. Finish: Manufacturer's standard, baked-polyester powder coat.
 4. Color: Black.
- C. Floor-Mounted Racks:
 1. Overall Height: 72 inches (1828.8 mm).

2. Overall Depth: 23 inches (584.2 mm).
3. Upright Depth: 3 inches (76.2 mm)
4. Four-Post Load Rating: 1000 lb (454 kg).
5. Number of Rack Units per Rack: 38.
 - a. Numbering: Every rack units, on interior of rack.
6. Threads: 10-32.
7. Vertical and horizontal cable management channels, top and bottom cable troughs, grounding lug, and a power strip.
8. Base shall have a minimum of four mounting holes for permanent attachment to floor.
9. Top shall have provisions for attaching to cable tray or ceiling.
10. Self-leveling.

D. Wall-Mounted Racks:

1. Height: 36 inches (914.4 mm).
2. Depth: 24 inches (609.6 mm).
3. Load Rating: 200 lb (91 kg).
4. Number of Rack Units per Rack: 12.
5. Threads: 10-32.
6. Wall Attachment: Four mounting holes.
7. Equipment Access: Integral swing.

E. Cable Management:

1. Metal, with integral wire retaining fingers.
2. Baked-polyester powder coat finish.
3. Vertical cable management panels shall have front and rear channels, with covers.
4. Provide horizontal crossover cable manager at the top of each relay rack, with a minimum height of two rack units each.

2.04 19-INCH EQUIPMENT CABINETS

- A. Description: Manufacturer-assembled four-post frame enclosed by side and top panels and front and rear doors, designed for mounting telecommunications equipment. Width is compatible with EIA/ECIA 310-E, 19-inch (482.6-mm) equipment mounting with an opening of 17.72 inches (450 mm) between rails.
- B. General Cabinet Requirements:
 - 1. Modular units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
 - 2. Material: Extruded steel.
 - 3. Finish: Manufacturer's standard, baked-polyester powder coat.
 - 4. Color: Black.
- C. Modular Freestanding Cabinets:
 - 1. Overall Height: 72 inches (1828.8 mm).
 - 2. Overall Depth: 23 inches (584.2 mm).
 - 3. Load Rating: 3000 lb (1362 kg).
 - 4. Number of Rack Units: 38.
 - a. Numbering: Every rack units, on interior of rack.
 - 5. Threads: 10-32.
 - 6. Removable and lockable side and top panels.
 - 7. Hinged and lockable front doors with viewing window. Rear shall be open.
 - 8. Adjustable feet for leveling.
 - 9. Screened ventilation openings in roof and rear door.
 - 10. Cable access provisions in roof and base.
 - 11. TGB.
 - 12. Roof-mounted, 550-cfm (260-L/s) fan with filter.
 - 13. Power strip.
 - 14. All cabinets keyed alike.

D. Modular Wall Cabinets:

1. Height: 22 inches (558.8 mm).
2. Depth: 23 inches (584.2 mm).
3. Load Rating: 200 lb (91 kg).
4. Number of Rack Units: 12.
5. Threads: 10-32.
6. Lockable front doors with viewing window.
7. Louvered side panels.
8. Cable access provisions top and bottom.
9. Grounding lug.
10. Roof-mounted, 250-cfm (118-L/s) fan.
11. Power strip.
12. All cabinets keyed alike.

E. Cable Management:

1. Metal, with integral wire retaining fingers.
2. Baked-polyester powder coat finish.
3. Vertical cable management panels shall have front and rear channels, with covers.
4. Provide horizontal crossover cable manager at top of each relay rack, with a minimum height of two rack units each.

2.05 POWER STRIPS

A. Power Strips: Comply with UL 1363.

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Rack mounting.
3. Six 20-A, 120-V ac, NEMA WD 6, Configuration 5-20R receptacles.
4. LED indicator lights for power and protection status.

5. LED indicator lights for reverse polarity and open outlet ground.
6. Circuit Breaker and Thermal Fusing: Unit continues to supply power if protection is lost.
7. Cord connected with 15-foot (4.5-m) line cord.
8. Rocker-type on-off switch, illuminated when in on position.
9. Peak Single-Impulse Surge Current Rating: 33 kA per phase.
10. Protection modes shall be line to neutral, line to ground, and neutral to ground. UL 1449 clamping voltage for all three modes shall be not more than 330 V.

2.06 GROUNDING

- A. Comply with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems" for grounding conductors and connectors.
- B. Rack and Cabinet TGBs: Rectangular bars of hard-drawn solid copper, accepting conductors ranging from No. 14 to No. 2/0 AWG, NRTL listed as complying with UL 467, and complying with TIA-606-B. Predrilling shall be with holes for use with lugs specified in this Section.
 1. Cabinet-Mounted TGB: Terminal block, with stainless-steel or copper-plated hardware for attachment to cabinet.
 2. Rack-Mounted Horizontal TGB: Designed for mounting in 19-inch equipment racks. Include a copper splice bar for transitioning to an adjoining rack, and stainless-steel or copper-plated hardware for attachment to the rack.
 3. Rack-Mounted Vertical TGB: 72 or 36 inches (1828.8 or 914.4 mm) long, with stainless-steel or copper-plated hardware for attachment to rack.

2.07 LABELING

- A. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Comply with NECA 1.
- B. Comply with BICSI TDMM for layout of communications equipment spaces.
- C. Comply with BICSI ITSIMM for installation of communications equipment spaces.

- D. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.
- E. Coordinate layout and installation of communications equipment in racks and room. Coordinate service entrance configuration with service provider.
 - 1. Meet jointly with system providers, equipment suppliers, and Owner to exchange information and agree on details of equipment configurations and installation interfaces.
 - 2. Record agreements reached in meetings and distribute them to other participants.
 - 3. Adjust configurations and locations of distribution frames, cross-connects, and patch panels in equipment spaces to accommodate and optimize configuration and space requirements of telecommunications equipment.
 - 4. Adjust configurations and locations of equipment with distribution frames, cross-connects, and patch panels of cabling systems of other communications, electronic safety and security, and related systems that share space in equipment room.
- F. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

3.02 GROUNDING

- A. Comply with NECA/BICSI 607.
- B. Install grounding according to BICSI ITSIMM, "Bonding, Grounding (Earthing) and Electrical Protection" Ch.
- C. Locate TGB to minimize length of bonding conductors. Fasten to wall, allowing at least 2 inches (50 mm) of clearance behind TGB. Connect TGB with a minimum No. 4 AWG grounding electrode conductor from TGB to suitable electrical building ground. Connect rack TGB to near TGB or the TMGB.
 - 1. Bond the shield of shielded cable to patch panel, and bond patch panel to TGB or TMGB.

3.03 IDENTIFICATION

- A. Coordinate system components, wiring, and cabling complying with TIA-606-B. Comply with requirements in Section 27 0 553 "Identification for Electrical Systems."
- B. Labels shall be machine printed. Type shall be 1/4 inch (6 mm) in height.

END OF SECTION

SECTION 27 13 23

OPTICAL FIBER BACKBONE CABLING

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide fiber optic cables as indicated and as specified.
- B. Fiber optic cables shall be provided for use with plant-wide systems, including the plant SCADA network as detailed on the Contract Drawing Network Architecture Diagram.
- C. Provide fiber optic patch panels, splice closures, terminal connectors and ancillary equipment.
- D. Provide fiber optic pull boxes based on fiber optic cable with a maximum allowable pulling tension of 600 lbs (2700 N). Provide calculations for pulling with innerduct shop drawing submittal.
- E. Provide innerduct, distribution pedestals, terminal connectors and ancillary equipment needed for a complete installation.

1.02 REFERENCES:

- A. American National Standards Institute (ANSI):
 - 1. TIA-568C: Generic Telecommunications Cabling for Customer Premises
 - 2. TIA/EIA 598-C: Optical Fiber Cable Color Coding.
 - 3. TIA/EIA 606-A: Administration Standard for Commercial Telecommunications Infrastructure
- B. Insulated Cable Engineers Association, Inc. (ICEA):

- C. International Electrical Testing Association (NETA):
 - 1. ATS: Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.
- D. National Fire Protection Association (NFPA):
 - 1. 70: National Electrical Code (NEC).

E. Underwriters Laboratories, Inc. (UL):

1. 94: UL Standard for Safety Tests for Flammability of Plastic Materials for Parts in Devices and Appliances
2. 1666: UL Standard for Safety Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.

1.03 DEFINITIONS:

- A. OFNR: Nonconductive optical fiber riser cable.
- B. OFCR: Conductive optical fiber riser cable.
- C. FOTP: Fiber Optic Test Procedure.

1.04 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Installer Qualifications - Include resumes of staff and previous project experience with references. Proposed Products List.
2. Outline drawings of termination cabinets showing dimensions, cables, jumpers and associated hardware for termination.
3. Provide written confirmation that product is to be submitted as acceptable to control systems supplier.
4. For each component and material submit shop drawing which shall include:
 - a. Manufacturer.
 - b. Model number.
 - c. General data and description.
 - d. Engineering specifications and data sheets.
 - e. Catalog cuts.
 - f. For information purposes only, submit manufacturer's printed installation instructions.

B. Submit a drawing showing the routing for the fiber optic network. Include the following information:

1. Routing, length, and attenuation based on TIA-568-C.

2. Cable and conduit identification.
 3. Locations of manholes, pull boxes, pedestals and patch panels.
- C. Test Documentation:
1. Document results of tests (shop test, field test, acceptance test) and submit copies of documents to the Engineer as tests are completed.
- 1.05 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
 - B. Furnish two spare connectors for each type used.
- 1.06 QUALITY ASSURANCE:
- A. Provide in accordance with Section 01 43 00 and as specified.
 - B. Fiber optic cables and related equipment shall be the products of approved manufacturers. Fabrication of the fiber optic cables and related equipment shall utilize the most advanced commercial materials and manufacturing processes. Manufacturer shall be ISO 9001 and TL 9000 certified.
 - C. Fiber optic cable installation shall be performed by experienced fiber optic cable installers who shall have been regularly engaged in the installation of fiber optic cables for the last five years at the minimum. The installer shall be MDIS certified with current qualifications provided by the fiber optic cable manufacture.
 - D. Fiber optic cable splicing and terminations shall be performed by experienced cable splicers who shall have been regularly engaged in splicing and termination of fiber optic cables for the last five years at the minimum.
 - E. Provide the services of the fiber optic cable manufacturer's technical representative to certify that the fiber optic cable installation is in accordance with the manufacturer's installation requirements.
 - F. Provide the services of an independent testing firm who shall perform acceptance testing of the fiber optic cable installation. The testing firm shall have experience in the inspection and testing of cables of the specified type and shall be a member company of NETA.
- 1.07 DELIVERY, STORAGE AND HANDLING:
- A. Provide in accordance with Section 01 66 10 and as specified.

1.08 EQUIPMENT IDENTIFICATION:

- A. Each fiber shall be labeled at each termination point and all splice location. Conductor or circuit identification shall be applied at specified points with circuit numbers or other identification stamped on terminal boards when provided, or on the cable itself in such a manner that the identification is visible around the cable's circumference.
- B. Each fiber shall be identified in junction boxes, pull boxes, manholes, handholes, terminal boxes, and cabinets. Where no termination is made, use a plastic-coated, self-adhesive, wire marker. Where termination is made, use a plastic, pre-printed sleeve wire marker. Paper self-adhesive wire markers are not acceptable.

1.09 WARRANTY:

- A. The Contractor shall be a manufacturers' certified installer and shall provide a five-year extended warranty program; and shall also provide written warranty certification and evidence of current program membership.
- B. The Contractor shall warrant that all materials and equipment furnished under the contract are in good working order, free from defects, and in conformance with system specifications. All installed equipment shall conform to the manufacturer's official published specifications. The warranty shall begin at the system acceptance date and remain in effect for a period of five years from that date. The Contractor shall agree to repair, adjust, and/or replace (as determined by the Engineer to be in its best interest) any defective equipment, materials, or other parts of the system at the Contractor's sole cost. The Owner will incur no costs for service or replacement of parts during the warranty period of five years. All third party warranties shall be passed through from the Contractor to the Owner.
- C. The Contractor shall warrant and supply evidence that the installation of materials and hardware will be made in strict compliance with all applicable provisions of the National Electrical Code (NEC), the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply.
- D. The Contractor shall warrant that the system will function in accordance with the manufacturer's published technical description guide.
- E. The Contractor shall warrant that the system shall accommodate traffic at the levels specified in the Specification.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Corning Cable Systems.
- B. Belden.

C. Draka.

D. OFS Fiber.

2.02 FIBER OPTIC CABLE:

A. Single Mode Fiber Optic Cable:

1. Provide indoor/outdoor tight bound tight buffered fiber optic cable. Provide gel free and powder free tight buffered water block cable. Provide cable fiber count as indicated on the drawings. Provide cable that shall pass the TIA 455 83B water block test for 48 hours.
2. Provide Single Mode fiber optic cable as specified and as shown on the contract drawings.
3. Provide optical fiber proof tested by the fiber manufacturer at a minimum of 100 kpsi (0.7 GN/m²).
4. Provide fiber that meets the following minimum specifications in 12 fiber subgroups as:

Feature Performance	Specification Requirement
Fiber Type	Single Mode
Core Diameter	9 µm
Cladding Diameter	125 µm
Secondary Buffer Diameter	900 µm
Wavelength	1310 nm
Gigabit Ethernet Distance	2 km
Max Attenuation	1 dB/km
Cable Diameter	~15 mm (30 fiber count)
Installation:	
Max Tensile Load	~5600 N
Min Bend Radius	~23 cm
Operating:	
Max Tensile Load	~2400 N
Min Bend Radius	~23 cm
Operating Temperature	-40 degrees C to +85 degrees C
Installation Temperature	-10 degrees C to + 60 degrees C
Flame Retardancy	UL Listed

B. Fiber Optic Non-Breakout Cable:

1. Heavy duty, tight buffer construction with additional strength members, and an oil, water, and chemical resistant, UV stabilized, flame retardant, PVC outer jacket, UL

listed OFNR. Fiber cladding shall be 125 micron and fiber buffer shall be 900 micron.

2. Cable specifications:

- a. Fiber Count: 12
- b. Minimum Installation Load: 100 lbs (450 N).
- c. Minimum Long Term Application Load: 14 lbs (63 N).
- d. Minimum Crush Resistance: 80 lbs/inch (3.2 kg/cm).
- e. Operating Temperature: 14 to 122 degrees F (-10 to 50 degrees C).

C. Code Compliance:

- 1. The cable must meet the requirements of the National Electrical Code (NEC) Section 770.
- 2. Non-Plenum Applications: Applicable Flame Tests: UL 1666. All-dielectric cables shall be listed OFNR. Armored cables and Interlocking armored cables shall be listed OFCR.
- 3. Finished cables shall conform to the applicable performance requirements of the Insulated Cable Engineers Association, Inc. (ICEA) Standard for Indoor-Outdoor Optical Fiber Cable (ICEA S-104-696).

D. Fiber Specifications:

- 1. General Fiber Specifications:
 - a. All fibers in the cable must be usable and meet required specifications.
 - b. Each optical fiber shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this specification.
 - c. Each optical fiber shall be proof tested by the fiber manufacturer at a minimum of 100 kpsi (0.7 GN/m²).
 - d. The fiber shall be coated with a dual layer acrylate protective coating. The coating shall be in physical contact with the cladding surface.

E. Cable Construction:

- 1. Tight Buffer Fiber Optic Cable: Cladded Optic fiber strands shall be coated with a 900 microns protective coating and arranged in a PVC Subcable containing 12 coated fiber strands surrounded by yarn strength members. Subcables are contained

within a PVC Outer jacket. The number of strands specified on the drawings will determine the number of Subcables.

2. Fiber Optic Cable Core: A central, nonmetallic core member shall be included to serve as a cable core foundation to reduce strain on the fibers, but not to serve as a pulling strength member. Fillers shall be used to ensure cable has a circular shape. Fiber optic cable and subcables shall have a rip cord.
3. Each buffer tube shall contain up to 12 fibers.
4. The fibers shall not adhere to the inside of the buffer tube.
5. Each fiber shall be distinguishable by means of color coding in accordance with TIA/EIA-598-C, "Optical Fiber Cable Color Coding."
6. The fibers shall be colored with ultraviolet (UV) curable inks. In buffer tubes containing multiple fibers, the colors shall be stable across the specified storage and operating temperature ranges, and not subject to fading or smearing onto each other. Colors shall not cause fibers to stick together.
7. Buffer tubes containing fibers shall be color coded with distinct and recognizable colors in accordance with TIA/EIA-598-C, "Optical Fiber Cable Color Coding." Buffer tube colored stripes shall be inlaid in the tube by means of co-extrusion when required. The nominal stripe width shall be 0.04 inch. For dual layer buffer tube construction cables, standard colors are used for tubes 1 through 12 and standard colors with stripes are used to denote tubes 13 through 24. The color sequence applies to tubes containing fibers only, and shall begin with the first tube. The tube color sequence shall start from the inside layer and progress outward.
8. The buffer tubes shall be resistant to kinking.
9. The cable shall contain at least one ripcord under the sheath for easy sheath removal.
10. The tensile strength shall be provided by the central member, and additional dielectric yarns. The dielectric yarns shall be helically stranded evenly around the cable core.
11. A flame-retardant tape may be applied to provide additional resistance to flame propagation for higher fiber count cables.
12. Cables shall be sheathed with flame-retardant polyvinyl chloride (PVC). The nominal jacket thickness shall be 0.08 inch. Jacketing material shall be applied directly over the tensile strength members and water blocking tape. The PVC shall contain carbon black to provide ultraviolet light protection and shall not promote the growth of fungus.

13. The jacket shall be continuous, free from pinholes, splits, blisters, or other imperfections. The jacket shall have a consistent, uniform thickness; jackets extruded under high pressure are not acceptable.
14. Cable jackets shall be marked with the manufacturer's name or file number, month and year of manufacture, sequential meter or foot markings, a telecommunication handset symbol as required by Section 350G of the National Electrical Safety Code (NESC[®]), fiber count, and fiber type, flame rating and listing marking. The actual length of the cable shall be within +/- 1 percent of the length markings. The print color shall be white, with the exception that cable jackets containing one or more coextruded white stripes, which shall be printed in light blue. The height of the marking shall be approximately 0.1 inch.
15. If the initial marking fails to meet the specified requirements (i.e., improper text statement, color, legibility, or print interval), the cable may be remarked using a contrasting alternate color. The numbering sequence will differ from the previous numbering sequence, and a tag will be attached to both the outside end of the cable and to the reel to indicate the sequence of remarking. The preferred remarking color will be yellow, the secondary choice will be blue.
16. The maximum pulling tension shall be 600 lb (2,700 N) during installation (short term) and 135 lb (600 N) long-term installed.
17. The cable specified herein shall be available in three sheath designs. Un-armored, all-dielectric cables shall be listed OFNR and shall be as described previously in this section.
18. Armored cables shall be as described previously in this section, but shall also include a corrugated steel tape armor applied longitudinally underneath the cable jacket. The armor shall be plastic-coated on both sides for corrosion resistance and shall have an overlapping seam with the corrugations in register. Because of the metallic armor, this cable shall be listed OFCR and shall provide improved resistance to rodent damage. The corrugated armor option will be specified on the purchase order.
19. Interlocking armored cables shall be as described previously in this section but shall also include an interlocking steel or aluminum armor applied helically around the outside of the cable jacket. The interlocking armor may be left un-jacketed or may have a PVC outer jacket. The color of the armor jacket (if specified), shall match the jacket color of the optical fiber cable located inside of the armor. The armor for these cables shall be comparable to liquid tight flexible metal conduit if jacketed, or flexible metal conduit if not jacketed. Because of the interlocking metallic armor, this cable shall be listed OFCR and shall provide improved resistance to crush damage. The interlocking armor and outer jacket options will be specified on the purchase order.

F. Packing and Shipping:

1. The completed cable shall be packaged for shipment on non-returnable wooden reels. Required cable lengths shall be stated in the purchase order.
2. Top and bottom ends of the cable shall be available for testing.
3. Both ends of the cable shall be sealed to prevent the ingress of moisture.
4. Each reel shall have a weather resistant reel tag attached identifying the reel and cable.
5. Each cable shall be accompanied by a cable data sheet.

2.03 INNERDUCT:

A. Manufacturers:

1. Carlon.
2. Innerduct.
3. A-D Technologies

B. Features:

1. 2 inch (50 mm) smooth wall HDPE role pipe innerduct designed for fiber optic cabling and telecommunications.
2. System shall include:
 - a. Innerduct.
 - b. Gasketing that allows watertight assembly and disassembly of outer and innerducts for direct buried and encased installations.
 - c. Couplings, access hole terminators, innerduct seals for both empty and cabled ducts, and fixed and flexible bends.

2.04 TERMINAL CONNECTORS:

A. Manufacturers:

1. Corning Cable Systems.
2. AFL Telecommunications.
3. 3M Telecom Systems Group.

- B. Field installable LC type fiber optic connectors, with ceramic ferrule material and a maximum insertion loss of 0.5 dB. If Pre-Connectorized cable assemblies or pigtails are used, the connectors shall terminate on a 3.0 m (10-foot) length single-fiber cable. The fiber-cable shall contain a buffered optical fiber of the same type and specification as that used in the multi-fiber cable. Connectors and pre-connectorized cable assemblies or pigtails shall be in accordance with EIA ANSI/TIA/EIA-568-B.3.

2.05 OPTICAL HARDWARE:

A. Manufacturers:

1. Corning Cable Systems.
2. 3M Telecom Systems.
3. AFL Telecommunications AMP
4. OCC.

B. Optical Slicing and Distribution Enclosure:

1. Provide pedestal type enclosure.
2. Provide NEMA 3 fiber enclosure.
3. Provide pedestal mounted on precast concrete base with bollard type traffic protection.
4. Provide splicing and distribution enclosure to support up to 240 single mode fibers.
5. Provide distribution hub within pedestal. Provide hub with grommet seal. Provide cable strain relief system.

C. Connector Panels: Rack and wall mountable connector housings shall accept an interchangeable connector panel. A connector panel is defined as a modular removable plate containing optical fiber connector adapters or copper jacks. The connector panel shall have the following characteristics:

1. The connector panel shall utilize a single mounting footprint and shall be available with three, four, six, eight or twelve connector adapters in each panel. Copper jack panels shall accept up to four copper jacks. The connector panel shall be interchangeable between the rack and wall mountable hardware being proposed. The panel shall be attached with two push-pull latches to allow quick installation and removal.
2. The connector panel shall be available with industry standard single fiber and small form factor multi-fiber adapters, utilizing only LC connectors. It shall also be available with industry standard copper jacks.

3. The connector panel shall include removable icons that identify the circuits. As a minimum, these icons shall be available with the following symbols: blank, telephone, computer, CATV, video camera, satellite dish, or CAT5. The icons shall also be available in a variety of colors, including blue, yellow, red, white, electric ivory, ash, green, purple, gray, black, brown and orange.
 4. Blank connector panels shall be available to fill unused space within the housings. The blank connector panel shall be attached with at least two push-pull latches to allow quick installation and removal. Housings shall be supplied with blank connector panels for all available positions unless the housing is ordered with optical fiber adapters or copper jacks pre-installed. The blank panels shall be manufactured from injection molded polycarbonate and shall be finished with a wrinkled black texture to match the housing.
 5. Panels shall be manufactured from 16 gage cold rolled steel or injection molded polycarbonate for structural integrity.
 6. Panels shall be finished with a wrinkled black texture to match other hardware.
- D. Connector Modules: Rack mountable connector housings shall accept an interchangeable connector module. A connector module is defined as a modular removable case containing optical fiber connector adapters and provisions for strain-relief, slack storage, and the furcation of fiber optic cables. The connector module shall have the following characteristics:
1. The connector module shall consist of a panel incorporated into a protective case with a removable cover for access to the interior connectors and fibers. Modules shall contain a fiber-retaining spool for managing fiber slack.
 2. The connector module shall utilize a single mounting footprint and shall be available with three, four, six, eight or twelve connector adapters in each module. The module shall be attached with two push-pull latches to allow quick installation and removal.
 3. The connector module shall be available with industry standard single fiber and small form factor multi-fiber adapters, utilizing only LC connectors.
 4. The connector module shall include removable icons that identify the circuits. As a minimum, these icons shall be available with the following symbols: blank, telephone, computer, CATV, video camera, satellite dish, or CAT5. The icons shall also be available in a variety of colors, including blue, yellow, red, white, electric ivory, ash, green, purple, gray, black, brown and orange.
 5. Modules shall be manufactured from 16 gage cold rolled steel or injection molded polycarbonate (or thermoplastic resin) for structural integrity.
 6. Modules shall be finished with a wrinkled black texture to match other hardware.

7. Modules shall be available in the following configurations: adapter modules, pigtailed modules, and pre-terminated system modules.
- E. Rack Mountable Connector Housings: Rack mountable connector housings shall be available for cross-connecting or inter-connecting purposes. The units shall provide for direct connectorization and pigtail splicing.
1. The unit shall meet the design requirements of ANSI/TIA/EIA-568 and the plastics flammability requirements of UL 94 V-0.
 2. Housings shall be manufactured using 16 gage aluminum or equivalent for structural integrity and shall be finished with a wrinkled black powder coat for durability. Installation fasteners shall be included and shall be black in color.
 3. The unit shall have routing guides that allow a transition and segregation point for jumpers exiting the sides of the housing.
 4. The unit shall include a clamshell-type cable clamping mechanism to provide cable strain relief. The cable clamp shall accept one cable from 0.37 to 1.13 inch in diameter. The cable clamp mechanism shall also handle multiple smaller fiber count cables when used with the multiple cable insert. The total cable capacity per clamp shall be five cables less than 0.4 inch OD when used with the multiple cable insert.
 5. The connector housings shall have a labeling scheme that complies with ANSI/TIA/EIA 606.
 6. Provisions for mounting fiber fan-out devices shall be incorporated into the housing.
 7. The housings shall be available with factory installed connectorized cable stubs in multiple cable and connector types.
- F. Wall Mountable Combination Connector/Splice Housings: Wall mountable combination connector and splice housings shall be available for splicing inside the same housing as the connectorized fiber. These combination units shall be the units described in the previous section for wall mountable connector housings; additionally they shall contain provisions for mounting splice trays and routing the associated fibers.
1. Splice tray mounting shall allow individual splice tray access without disturbing adjacent splice trays or fibers.
 2. Splice tray shall be retained in the splice tray holder by a hook and loop strap.
 3. Access to splice trays shall be accomplished by rotating the splice tray holder horizontally from the housing.
 4. Wall mountable connector housings shall be convertible to combination connector/splice housings with the installation of a splice tray conversion kit.

- G. Wall Mountable Splice Housings: Wall mountable splice housings shall be available for splicing multiple optical fiber cables. These units shall contain provisions for mounting splice trays and routing the associated fibers.
1. Splice tray mounting shall allow individual splice tray access without disturbing adjacent splice trays or fibers.
 2. Splice trays shall be retained in the splice tray holder by a hook and loop strap.
 3. Cable ports in the splice housing shall line up with the cable and jumper ports in the appropriate wall mountable connector housing so as to allow direct routing of cables and jumpers from one housing into the other.
 4. Wall-mountable splice housing shall accept splice trays for industry standard splice types and store routing slack for these trays.
 5. The unit shall be mountable on standard plywood walls.
 6. The housing shall not exceed the following dimensions:
 - a. 13.5 inch (343 mm) high x 22.5 inch wide x 5.1 inch deep.
 7. The unit shall meet the design requirements of ANSI/TIA/IEA-568 and the plastics flammability requirements of UL 94 V-0.
 8. Housing shall be manufactured using 16 gage (1.6 mm) aluminum or equivalent for structural integrity and shall be finished with a wrinkled black powder coat for durability. Assembly hardware and equipment attaching machine screws shall be included and shall be black in color.
 9. The unit shall have fiber cable routing guides that allow a transition and segregation point for fibers existing the top and bottom of the housing. Cable entries shall be grommets to minimize dust/water intrusion.
 10. The unit shall accept a clamshell type cable clamping mechanism to provide cable strain relief. This clamp shall be included with the housing and also shall be available with an external mounting bracket as an optional accessory. The cable clamp shall accept one cable from 0.37 to 1.13 inch in diameter. The cable clamp mechanism shall also handle multiple smaller fiber count cables when used with the multiple cable insert. The total cable capacity per clamp shall be five cables less than 0.4 inch OD when used with the multiple cable insert. Housing cable clamp capacity shall be at least four clamps.
 11. The splice housing shall have a metal door. This door shall be lockable when used with an optional key lock kit.
 12. The splice housings shall have a labeling scheme that complies with ANSI/TIA/EIA 606.

13. Brackets shall be available that allow rack mounting of the wall-mount housings.
 14. An optional offset bracket kit shall be available that allows mounting the housing away from the wall to give space for cable routing behind the unit. The offset brackets shall be stackable to allow incremental increase in the amount of offset from the wall.
- H. Wall Mount Jumper Management: Wall mountable housings shall have an optional external means available to transition between the housing and nearby cable trough or tray. This means shall provide 38 mm minimum bend radius protection for cables.

2.06 SPLICE CLOSURES:

A. Manufacturers:

1. Corning Cable Systems.
2. 3M Telecom Systems, Group.
3. AFL Telecommunications.

B. Splice Closures: Constructed of thermoplastic, suitable for “butt” or “through” cable entry, moisture tight sealing arrangement, removable splice tray organizer, splice trays for mechanical splices, suitable for single mode system operation at 1,310 and 1,550 nm, grounding lugs or equivalent for grounding cable armor.

1. The optical fiber splice closure shall meet all requirements stated in this specification.
2. The splice closure housing shall be non-metallic. It shall be resistant to solvents, stress cracking, and creep. The housing materials shall also be compatible with chemicals and other materials to which they might be exposed in normal applications.
3. The optical fiber closure shall be capable of accepting any optical fiber cable used in interoffice, outside plant, and building entrance facilities.
4. As an option, the ability to double the cable capacity of an installed canister splice closure by use of a kit shall be available. Such a conversion shall not disturb existing cables or splices.
5. Encapsulation shall not be required to resist water penetration.
6. The splice closure shall be re-enterable. The closure end cap shall be capable of accepting additional cables without removal of the sheath retention or strength member clamping hardware on previously installed cables or disturbing existing splices. The optical fiber splice closure shall provide a clamping mechanism to

prevent pistoning of the central member or strength members and to prevent cable sheath slip or pullout.

7. The splice closure shall have appropriate hardware and installation procedures to facilitate the bonding and grounding of metal components in the closure and the armored cable sheath. The cable bonding hardware shall be able to accommodate a copper conductor equal to or larger than a 6 AWG.
8. Aerial splice closures shall have available the necessary hardware to attach and secure the closure to an aerial strand.
9. The closure shall accommodate splice trays suitable for single fiber, single fiber heat shrink, mechanical, or ribbon heat shrink splices.
10. The small splice closure shall accommodate up to 72 single fiber splices or 144 ribbon fiber splices using 12-fiber ribbons. The medium sized closure shall accommodate up to 288 single fiber splices or 432 ribbon fiber splices. The large closure shall accommodate up to 480 single fiber splices or 864 ribbon fiber splices.
11. Spliced fibers shall not be subjected to a bend radius smaller than 1.2 inch. Buffer tubes shall not be subjected to a bend radius smaller than 1.5 inch.
12. The installation of the splice closure shall not require specialized tools or equipment, other than those normally carried by installation crews.

2.07 SHOP TESTS:

- A. Fiber optic cables shall be shop tested at the manufacturer's plant in accordance with the manufacturer's standard testing procedures. Shop tests shall be performed prior to shipment of the fiber optic cables.
- B. Provide test plan defining all tests required to ensure that the system meets specified requirements. The test plan shall define milestones for the tests, equipment, personnel, facilities, and supplies required. The test plan shall identify the capabilities and functions to be tested.
- C. Provide test reports in booklets form showing all field tests performed shall be submitted no later than 7 days after completion and testing of the installed system.
- D. Measurements shall be tabulated on a strand-by-strand basis.
- E. Factory test results showing routine tests performed by the manufacturer shall be submitted prior to installation.
- F. Optical fibers in cables shall be 100 percent attenuation tested. The attenuation shall be measured at 850 nm and 1300 nm for multimode fibers. The attenuation shall be measured at 1310 nm and 1550 nm for single-mode fibers. The manufacturer shall store these values for a minimum of five years. These values shall be available upon request.

- G. The Contractor shall submit manufacturer's shop test reports.

PART 3 - EXECUTION

3.01 GENERAL

- A. Provide all material, equipment, and labor to install the fiber optic cables as indicated and as specified.
- B. Installation shall be in accordance with the National Electrical Code and all local codes.

3.02 INSTALLATION:

- A. Install cables in accordance with manufacturer's printed instructions.
- B. Install cable directly from shipping reels. Ensure that cable is not:
 - 1. Dented, nicked, or kinked.
 - 2. Subjected to pull stress greater, or bend radius less, than manufacturer's specification.
 - 3. Subjected to treatment which may damage fiber strands during installation.
- C. Conduit: Install fiber optic cable directly in conduit/innerduct.
- D. Identification: Identify each cable on both ends and in all manholes and pull points it goes through.
- E. Sequencing: Provide cables in accordance with sequencing requirements.
- F. Sealing: Seal cables into innerducts to stop ingress of water and grit with expansion plugs or ductseal.
- G. Manholes:
 - 1. Provide supports for cables at maximum 12 inch centers along sides of manholes.
 - 2. Provide a minimum 4 foot coil of spare fiber in each manhole throughout the cable length.
- H. Install fiber optic cables in underground ducts. Rod and swab out ducts prior to installing cables.
- I. Install fiber optic cables in the conduit systems provided inside buildings and structures.
- J. Lubricate cables with lubricants specially formulated for fiber cabling jackets during installation. Do not exceed cable manufacturer's specifications for tensile strength and

bending radius. All pulleys used to aid in the installation of the fiber optic cable must be sized according to the minimum bending radius.

- K. Provide breakout kits, splice closures, patch panels, pigtails, and jumpers and as indicated to install a complete data highway communications network as indicated. Patch panels shall be wall mounted plumb and level. Splice closures shall be installed in pullboxes.
- L. Splices: Splices shall be made only where indicated. Provide adequate put-up lengths on cable reels to make termination-to-termination runs without splices. Where splices are indicated provide mechanical splices with attenuation losses of 0.3 dB or less. Make splices watertight and provide mechanical protection equal to the cable jacket, or better.
- M. Support cables in riser conduits at intervals as required by the National Electrical Code.
- N. Installation tools and materials shall be provided by the cable manufacturer.
- O. The polishing process of terminal connectors shall be a multi-stage dry and wet process using multiple lapping films for initial and final polishing polish.

3.03 CABLE TERMINATIONS:

- A. Terminate cables in accordance with ANSI/TIA 568.
- B. Fan out fibers to allow flexibility and ease of installations for future expansion at connection points. Provide a metal or high density plastic fan-out collar to relieve the stress on the individual fibers. To protect the individual fibers, provide sleeves from the fan-out collar to the terminal point. Terminate all fibers in each cable with a suitable connector as specified below.
- C. Fiber connectors shall be bayonet-type with “twist-lock” mounting for quick and secure installation. Connectors shall be pull-proof with a durable ceramic tip to protect the fibers from damage during installation and frequent rearrangements. “Push-pull” couplings are unacceptable. Provide a sample of the connector to the Engineer for inspection and acceptance prior to installation.
- D. Provide all equipment, mounting kits and consumable materials required for a proper installation as defined by the manufacturer.
- E. Each individual cable shall be clearly and uniquely identified. At a terminal cabinet or backboard provide a type written directory listing the cable, identification code and type of signal. The directory shall be mounted within the termination cabinet or on the backboard and protected by a clear plastic cover.
- F. Provide a minimum of 20 feet of neatly coiled, slack fiber optic cable at each terminal cabinet or backboard for flexibility.

3.04 MANHOLES, INTERMEDIATE PULL BOXES AND DISTRIBUTION PEDESTALS:

- A. Provide pull boxes and manholes so the fiber pulling requirement is at least 5 percent below the manufacturers pulling strength recommendations. Provide pulling procedures as part of the fiber installation submittal requirements:
- B. Provide plans showing proposed pull boxes, manholes and distribution pedestals.
- C. Provide distribution pedestal at the beginning and end point of the contract installation.
- D. Provide fiber testing from the contract endpoint distribution pedestals.

3.05 PHYSICAL CHECKOUT:

A. General Procedures:

- 1. Conduct physical checkout of the fiber optic data highway network.
- 2. Physical checkout shall be performed prior to functional testing.

B. Check Procedures:

- 1. Verify that fiber optic cables reels have been off-loaded from truck carefully and not damaged.
- 2. Verify that the optical fibers of the cable assembly are the type and quantity as specified or as recommended by the supplier.
- 3. Verify that cable construction is the type specified.
- 4. Verify that fiber optic patch panels have been installed plumb and level at locations indicated.
- 5. Verify that fiber optic splice closures have been installed at locations indicated.
- 6. Verify that optical fiber connections or terminations within patch panels and splice closures are in accordance with cable manufacturer's printed recommendations.

3.06 FIELD TESTING:

A. Conduct the following field tests after cable installation:

- 1. Visually, inspect terminal connectors for out-of-round condition and surface defects such as micro-chips and cracks using a 100X (minimum) inspection microscope.

B. Cable Testing:

1. Provide equipment, instrumentation, and supplies necessary to perform testing. Engineer and Owner shall have the option to witness and participate actively in on-site tests.
 - a. Notify Engineer and Owner at least 3 days prior to testing.
2. Perform all tests and inspections as required by NETA ATS, paragraph 7.25.
3. Post-Installation Testing: Demonstrate that all fibers in each cable meet requirements of TIA-568 as modified here:
 - a. Maximum attenuation as specified.
 - b. Measure attenuation in both directions, not in one direction only.
4. Replace all cables or mated connector pairs that do not meet attenuation standards and redo tests until cable meets requirements and at no additional cost to the Owner.

3.07 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 15 13

COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Shielded twisted pair (STP) cabling.
2. Multiuser telecommunications outlet assemblies.
3. Cable connecting hardware, patch panels, and cross-connects.
4. Telecommunications outlet/connectors.
5. Cabling system identification products.

1.02 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate layout and installation of telecommunications cabling with Owner's telecommunications and LAN equipment and service suppliers.
- B. Coordinate telecommunications outlet/connector locations with location of power receptacles at each work area.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings:

1. System Labeling Schedules: Electronic copy of labeling schedules that are part of the cabling and asset identification system of the software.
2. Wiring diagrams to show typical wiring schematics, including the following:
 - a. Cross-connects.
 - b. Patch panels.
 - c. Patch cords.
3. Cross-connects and patch panels. Detail mounting assemblies, and show elevations and physical relationship between the installed components.

1.04 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified layout technician, installation supervisor, and field inspector.
- B. Source quality-control reports.
- C. Field quality-control reports.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance data.

1.06 QUALITY ASSURANCE

- A. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.
 - 1. Layout Responsibility: Preparation of Shop Drawings Cabling Administration Drawings, and field-testing program development by an RCDD.
 - 2. Installation Supervision: Installation shall be under the direct supervision of Level 2 Installer, who shall be present at all times when Work of this Section is performed at Project site.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Test cables upon receipt at Project site. Test each pair of STP cable for open and short circuits.

PART 2 - PRODUCTS

2.01 HORIZONTAL CABLING DESCRIPTION

- A. Horizontal cable and its connecting hardware provide the means of transporting signals between the telecommunications outlet/connector and the horizontal cross-connect located in the communications equipment room. This cabling and its connecting hardware are called a "permanent link," a term that is used in the testing protocols.
 - 1. TIA/EIA-568-B.1 requires that a minimum of two telecommunications outlet/connectors be installed for each work area.
 - 2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications outlet/connector.
 - 3. Bridged taps and splices shall not be installed in the horizontal cabling.

2.02 PERFORMANCE REQUIREMENTS

- A. General Performance: Horizontal cabling system shall comply with transmission standards in TIA/EIA-568-B.1 when tested according to test procedures of this standard.
- B. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Flame-Spread Index: 25 or less.
 - 2. Smoke-Developed Index: 450 or less.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Grounding: Comply with J-STD-607-A.

2.03 BACKBOARDS

- A. Backboards: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches (19 by 1220 by 2440 mm).

2.04 STP CABLE

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. ADC.
 - 2. Belden Inc.
 - 3. Berk-Tek; a Nexans company.
 - 4. Approved Equal
- B. Description: 100-ohm, four-pair STP, formed into 25-pair, binder groups covered with a blue thermoplastic jacket.
 - 1. Comply with ICEA S-90-661 for mechanical properties.
 - 2. Comply with TIA/EIA-568-B.1 for performance specifications.
 - 3. Comply with TIA/EIA-568-B.2, Category 6.
 - 4. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444 and NFPA 70 for the following types:

- a. Communications, General Purpose: Type CM or CMG; or MPP, CMP, MPR, CMR, MP, or MPG.
- b. Communications, Plenum Rated: Type CMP or MPP, complying with NFPA 262.
- c. Communications, Riser Rated: Type CMR; or MPP, CMP, or MPR, complying with UL 1666.
- d. Communications, Limited Purpose: Type CMX; or MPP, CMP, MPR, CMR, MP, MPG, CM, or CMG.
- e. Multipurpose: Type MP or MPG; or MPP or MPR.
- f. Multipurpose, Plenum Rated: Type MPP, complying with NFPA 262.
- g. Multipurpose, Riser Rated: Type MPR or MPP, complying with UL 1666.

2.05 STP CABLE HARDWARE

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. ADC.
 - 2. American Technology Systems Industries, Inc.
 - 3. Belden Inc.
 - 4. Approved Equal
- B. General Requirements for Cable Connecting Hardware: Comply with TIA/EIA-568-B.2, IDC type, with modules designed for punch-down caps or tools. Cables shall be terminated with connecting hardware of same category or higher.
- C. Connecting Blocks: 110-style IDC for Category 6. Provide blocks for the number of cables terminated on the block, plus 25 percent spare. Integral with connector bodies, including plugs and jacks where indicated.
- D. Cross-Connect: Modular array of connecting blocks arranged to terminate building cables and permit interconnection between cables.
 - 1. Number of Terminals per Field: One for each conductor in assigned cables.
- E. Patch Panel: Modular panels housing multiple-numbered jack units with IDC-type connectors at each jack for permanent termination of pair groups of installed cables.

1. Number of Jacks per Field: One for each four-pair conductor group of indicated cables, plus spares and blank positions adequate to suit specified expansion criteria.
- F. Jacks and Jack Assemblies: Modular, color-coded, eight-position modular receptacle units with integral IDC-type terminals.
- G. Patch Cords: Factory-made, four-pair cables in 48-inch (1200-mm) lengths; terminated with eight-position modular plug at each end.
 1. Patch cords shall have bend-relief-compliant boots and color-coded icons to ensure Category 6 performance. Patch cords shall have latch guards to protect against snagging.

2.06 CONSOLIDATION POINTS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. American Technology Systems Industries, Inc.
 2. Belden Inc.
 3. Chatsworth Products, Inc.
 4. Approved Equal
- B. Description: Consolidation points shall comply with requirements for cable connecting hardware.
 1. Number of Terminals per Field: One for each conductor in assigned cables.
 2. Number of Connectors per Field:
 - a. One for each four-pair STP cable indicated.
 - b. One for each four-pair conductor group of indicated cables, plus 25 percent spare positions.
 3. Mounting: Wall.
 4. NRTL listed as complying with UL 50 and UL 1863.
 5. When installed in plenums used for environmental air, NRTL listed as complying with UL 2043.

2.07 MULTIUSER TELECOMMUNICATIONS OUTLET ASSEMBLY (MUTOA)

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Belden Inc.
 - 2. Chatsworth Products, Inc.
 - 3. Hubbell Premise Wiring.
 - 4. Approved Equal
- B. Description: MUTOAs shall meet the requirements for cable connecting hardware.
 - 1. Number of Terminals per Field: One for each conductor in assigned cables.
 - 2. Number of Connectors per Field:
 - a. One for each four-pair STP cable indicated.
 - b. One for each four-pair conductor group of indicated cables, plus 25 percent spare positions.
 - 3. Mounting: Wall.
 - 4. NRTL listed as complying with UL 50 and UL 1863.
 - 5. Label shall include maximum length of work area cords, based on TIA/EIA-568-B.1.
 - 6. When installed in plenums used for environmental air, NRTL listed as complying with UL 2043.

2.08 TELECOMMUNICATIONS OUTLET/CONNECTORS

- A. Jacks: 100-ohm, balanced, twisted-pair connector; four-pair, eight-position modular. Comply with TIA/EIA-568-B.1.
- B. Workstation Outlets: Two-port-connector assemblies mounted in single faceplate.
 - 1. Metal Faceplate: Stainless steel.
 - 2. For use with snap-in jacks accommodating any combination of STP work area cords.
 - a. Flush mounting jacks, positioning the cord at a 45-degree angle.
 - 3. Legend: Machine printed, in the field, using adhesive-tape label.

2.09 GROUNDING

- A. Comply with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems" for grounding conductors and connectors.
- B. Comply with J-STD-607-A.

2.10 IDENTIFICATION PRODUCTS

- A. Comply with TIA/EIA-606-A and UL 969 for labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.11 SOURCE QUALITY CONTROL

- A. Factory test STP cables on reels according to TIA/EIA-568-B.1.
- B. Factory test STP cables according to TIA/EIA-568-B.2.
- C. Cable will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 ENTRANCE FACILITIES

- A. Coordinate backbone cabling with the protectors and demarcation point provided by communications service provider.

3.02 WIRING METHODS

- A. Install cables in pathways and cable trays except within consoles, cabinets, desks, and counters. Conceal pathways and cables except in unfinished spaces.
- B. Wiring within Enclosures:
 - 1. Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.
 - 2. Install lacing bars and distribution spools.
 - 3. Install conductors parallel with or at right angles to sides and back of enclosure.

3.03 INSTALLATION OF CABLES

- A. All cable terminations to be completed by manufacturer or manufacturer approved installer.

B. Comply with NECA 1.

C. General Requirements for Cabling:

1. Comply with TIA/EIA-568-B.1.
2. Comply with BICSI ITSIM, Ch. 6, "Cable Termination Practices."
3. Install 110-style IDC termination hardware unless otherwise indicated.
4. MUTOA shall not be used as a cross-connect point.
5. Consolidation points may be used only for making a direct connection to telecommunications outlet/connectors:
 - a. Do not use consolidation point as a cross-connect point, as a patch connection, or for direct connection to workstation equipment.
 - b. Locate consolidation points for STP at least 49 feet (15 m) from communications equipment room.
6. Terminate conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.
7. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches (760 mm) and not more than 6 inches (150 mm) from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
8. Install lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.
9. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIM, "Cabling Termination Practices" Chapter. Install lacing bars and distribution spools.
10. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
11. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.
12. In the communications equipment room, install a 10-foot- (3-m-) long service loop on each end of cable.
13. Pulling Cable: Comply with BICSI ITSIM, Ch. 4, "Pulling Cable." Monitor cable pull tensions.

D. STP Cable Installation:

1. Comply with TIA/EIA-568-B.2.
2. Do not untwist STP cables more than 1/2 inch (12 mm) from the point of termination to maintain cable geometry.

E. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.
2. Suspend STP cable not in a wireway or pathway a minimum of 8 inches (200 mm) above ceilings by cable supports not more than 60 inches (1524 mm) apart.
3. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

F. Group connecting hardware for cables into separate logical fields.

G. Separation from EMI Sources:

1. Comply with BICSI TDMM and TIA-569-B for separating shielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.
2. Separation between open communications cables or cables in nonmetallic raceways and shielded power conductors and electrical equipment shall be as follows:
 - a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches (127 mm).
 - b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches (300 mm).
 - c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches (610 mm).
3. Separation between communications cables in grounded metallic raceways and shielded power lines or electrical equipment shall be as follows:
 - a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches (64 mm).
 - b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches (150 mm).
 - c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches (300 mm).

4. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
 - a. Electrical Equipment Rating Less Than 2 kVA: No requirement.
 - b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches (76 mm).
 - c. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches (150 mm).
5. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches (1200 mm).
6. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches (127 mm).

3.04 FIRESTOPPING

- A. Comply with TIA-569-B, Annex A, "Firestopping."
- B. Comply with BICSI TDMM, "Firestopping Systems" Article.

3.05 GROUNDING

- A. Install grounding according to BICSI TDMM, "Grounding, Bonding, and Electrical Protection" Chapter.
- B. Comply with J-STD-607-A.
- C. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall allowing at least 2-inch (50-mm) clearance behind the grounding bus bar. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.
- D. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.

3.06 IDENTIFICATION

- A. Identify system components, wiring, and cabling complying with TIA/EIA-606-A.
 1. Administration Class: 2.
 2. Color-code cross-connect fields. Apply colors to voice and data service backboards, connections, covers, and labels.

- B. Paint and label colors for equipment identification shall comply with TIA/EIA-606-A for Class 2 level of administration, including optional identification requirements of this standard.
- C. Cable Schedule: Post in prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.
- D. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications closets, backbone pathways and cables, entrance pathways and cables, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors. Follow convention of TIA/EIA-606-A. Furnish electronic record of all drawings, in software and format selected by Owner.
- E. Cable and Wire Identification:
 - 1. Label each cable within 4 inches (100 mm) of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.
 - 2. Each wire connected to building-mounted devices is not required to be numbered at device if color of wire is consistent with associated wire connected and numbered within panel or cabinet.
 - 3. Exposed Cables and Cables in Cable Trays and Wire Troughs: Label each cable at intervals not exceeding 15 feet (4.5 m).
 - 4. Label each terminal strip and screw terminal in each cabinet, rack, or panel.
 - a. Individually number wiring conductors connected to terminal strips, and identify each cable or wiring group being extended from a panel or cabinet to a building-mounted device shall be identified with name and number of particular device as shown.
 - b. Label each unit and field within distribution racks and frames.
 - 5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and connecting hardware. Where similar jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.
 - 6. Uniquely identify and label work area cables extending from the MUTOA to the work area. These cables may not exceed the length stated on the MUTOA label.
- F. Labels shall be preprinted or computer-printed type with printing area and font color that contrasts with cable jacket color but still complies with requirements in TIA/EIA-606-A.

1. Cables use flexible vinyl or polyester that flex as cables are bent.

3.07 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Visually inspect STP jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA/EIA-568-B.1.
2. Visually confirm Category 6, marking of outlets, cover plates, outlet/connectors, and patch panels.
3. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
4. Test STP backbone copper cabling for DC loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination but not cross-connection.
 - a. Test instruments shall meet or exceed applicable requirements in TIA/EIA-568-B.2. Perform tests with a tester that complies with performance requirements in "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
5. STP Performance Tests:
 - a. Test for each outlet and MUTOA. Perform the following tests according to TIA/EIA-568-B.1 and TIA/EIA-568-B.2:
 - (1) Wire map.
 - (2) Length (physical vs. electrical, and length requirements).
 - (3) Insertion loss.
 - (4) Near-end crosstalk (NEXT) loss.
 - (5) Power sum near-end crosstalk (PSNEXT) loss.
 - (6) Equal-level far-end crosstalk (ELFEXT).
 - (7) Power sum equal-level far-end crosstalk (PSELFEXT).
 - (8) Return loss.

(9) Propagation delay.

(10) Delay skew.

- B. Document data for each measurement. Data for submittals shall be printed in a summary report that is formatted similar to Table 10.1 in BICSI TDMM, or transferred from the instrument to the computer, saved as text files, and printed and submitted.
- C. End-to-end cabling will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

3.08 DEMONSTRATION

- A. Train Owner's maintenance personnel in cable-plant management operations, including changing signal pathways for different workstations, rerouting signals in failed cables, and keeping records of cabling assignments and revisions when extending wiring to establish new workstation outlets.

END OF SECTION

SECTION 28 10 00

ACCESS CONTROL AND VIDEO SURVEILLANCE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Access Control system.
2. Video Surveillance system

B. Products Installed, but Not Furnished, under This Section:

1. See Section 08 71 00 "Door Hardware" for the following:
 - a. Electric strike(s).
 - b. Electromagnetic lock(s).
 - c. Delayed-egress electromagnetic lock(s).
 - d. Electromechanical lock(s).
 - e. Self-contained electronic lock(s).
 - f. Exit lock(s) and alarm(s).
 - g. Auxiliary electrified door hardware.

1.02 DEFINITIONS

- A. AGC: Automatic gain control.
- B. BNC: Bayonet Neill-Concelman - type of connector.
- C. B/W: Black and white.
- D. CCD: Charge-coupled device.
- E. DGP: Data gathering panel.
- F. FTP: File transfer protocol.
- G. IP: Internet protocol.
- H. LAN: Local area network.

- I. MPEG: Moving Picture Experts Group.
- J. NFC: Near field communications.
- K. NTSC: National Television System Committee.
- L. PC: Personal computer.
- M. PTZ: Pan-tilt-zoom.
- N. RAID: Redundant array of independent disks.
- O. REX: Request-to-exit.
- P. TCP: Transmission control protocol - connects hosts on the Internet.
- Q. UPS: Uninterruptible power supply.
- R. WAN: Wide area network.

1.03 QUALITY ASSURANCE

- A. The system shall be furnished and installed by Stone Security. Contact:

Jonny Burton
Account Manger
351 W. Lawndale Drive
Salt Lake City, UT 84115
jonny@stonesecurity.net
Tel: 877.888.0129
Cell: 801.857.4811
www.stonesecurity.net

- B. Contractor:

- 1. Shall be fully and solely responsible for the work of the systems supplier and solely responsible to the Owner for having supplied to the Owner the complete system.
- 2. To provide personal superintendence and direction to the work, maintaining and supplying complete supervision over and coordination between all subcontractors employed by him.
- 3. To be responsible for defining the limits of his subcontractor's work.

- C. Technical services:

- 1. Provide supervisory service of a factory trained service engineer, specifically trained on the type of equipment herein specified, during construction to assist the Contractor in the location of sleeves, methods of installing conduit and special cable,

mounting, piping, and wiring of one of each type of service, and the methods of protecting all of the equipment prior to placing it into service.

2. Upon completion of equipment installation, provide services of the above service engineer for a period of not less than ten 8-hour days for calibration and start-up of the equipment and instructing the operating personnel.
3. The minimum days specified above do not relieve the system manufacturer of providing sufficient service to place the system in satisfactory operation.

1.04 SUBMITTALS

A. Shop Drawings:

1. Project general notes.
2. Head-end hardware, equipment, and device locations.
3. Block diagram and cable/conduit routing illustrating end-to-end system wiring.
4. End-to-end system communications details.
5. Secondary power calculations.
6. Battery calculations.

B. Field Quality-Control Submittals:

1. Field quality-control reports.

C. Sample warranties.

D. Manufacturers' Published Instructions and Manuals: Record copy of official installation instructions and manual for each piece of equipment

E. Warranty documentation.

1.05 REGULATORY AGENCY APPROVALS

- A. Submittals for access control system requiring approval by authorities having jurisdiction must be signed and sealed by qualified life safety professional engineer responsible for their preparation.
- B. Submittals for access control system require action by Architect prior to submitting for approval by authorities having jurisdiction.

1.06 WARRANTY FOR ACCESS CONTROL SYSTEM

- A. Special Installer Extended Warranty: Installer warrants that fabricated and installed access control system performs in accordance with specified requirements and agrees to repair or replace components that fail to perform as specified within extended-warranty period.
 - 1. Extended-Warranty Period: Two years from date of Substantial Completion; full coverage for labor, materials, and equipment.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Manufacturer and model numbers are listed per owner standards. Provide updated equipment of equal or better quality and/or functions where model numbers or owner standards have changed.
- B. Provide quantities of each piece of equipment as required for a complete and operating system.

2.02 ACCESS CONTROL SYSTEM EQUIPMENT:

- A. Access Control and CCTV Power Supply
 - 1. Provide 16 door, 4-amp, 12VDC and 24VDC, 16 lock and 16 auxiliary distribution outputs Access Control and CCTV power supply in UL listed indoor electrical enclosure. Life Safety Power # FPO150-B1002C82D8E4.
 - 2. Provide 12VDC, 12AH batteries. Altronix BT1212.
- B. Network Node
 - 1. Provide wall mounted Network Node with extension blades. S2 Security S2-NN-E2R-WM and S2-ACM.
- C. Keypad/Card Reader
 - 1. Provide reader with Signo 40 Smartcard Keypad Reader, Multi-Technology, Mobile Ready, Wall Switch Mount, Pigtail, Black/Silver. HID Global 40KNKS-T0-000000.
- D. Request-to-exit
 - 1. Provide REX exit motion sensor with sounder, door monitor and trim plate. Bosch Security Systems DS160 and TP160.

E. Door Sensor

1. Provide 1” recessed, steel door contact, white door sensors. GRI Telemark Corp. 184-12-W.

F. Cabling

1. Provide 4 Element Access Control Cable 18-04 + 22-3P OAS + 22-02 + 22-04 Plenum White Jacket. Windy City Wire 446100.
2. Provide 15’ Patch Cables, CAT6, PVC. Windy City Wire.

2.03 VIDEO SURVEILLANCE EQUIPMENT:

A. Cameras:

1. Fixed Indoor Dome Camera: 1080 HDTV / 2MP, IR, 3.4-8.9mm lens, Vandal, Lightfinder 2.0, Forensic WDR, Zipstream, H.265, Two-way Audio, I/O, DLPU, SD Slot. Axis P3265-LV.
2. Fixed Outdoor Dome Camera: HDTV 1080 2MP Vandal Resistant, Optimized IR 9mm. Axis P3265-LVE.
3. Outdoor/Indoor, Fixed Multi-sensor Dome, 8MP, 4x1080P 12.5 / 15FPS or 4 x 720P Full Frame, IR, Forensic WDR, Lightfinder, SD Slot. Axis P3727-PLE.

B. Camera Mounts:

1. Pendant Kit for P32-VE Series, fits directly to 1.5" threaded pipe. Axis T94T01D.
2. Wall Bracket for P33-V/VE Series, Q35-V/VE Series 1.5" NPS thread for fixed dome pendant kits. Includes white mounting plate, pipe seal and conduit hole cover. Axis T91D61.
3. Pendant Kit for AXIS P3717-PLE / P3719-PLE / P3727-PLE, IP Camera, 1.5-inch NPS thread. Axis T94N01D
4. Wall Mount designed with a built-in RJ45 cable and connection, 1.5" NPS thread, Compatibility with all pendant kits for Axis Fixed Dome Cameras. Axis T91H61.
5. Corner Bracket (requires T91D61 Wall Bracket) for Axis P55-series, Q60-series, P33-series Pendant Kit. Axis T91A64.

C. Cabling

1. Provide CAT6, Unshielded, Solid, Plenum, White. CommScope CS34P WHT
2. Provide 7’ Patch Cables, CAT6, PVC. Windy City Wire.

3. Provide power over Ethernet extender where needed. Axis T8129.

PART 3 - EXECUTION

3.01 INSTALLATION OF ACCESS CONTROL SYSTEM

- A. Description: Access control system provides a means of regulating or controlling physical entry into an area, or access to or use of a device by electrical, electronic, and/or mechanical means. Typical access control system includes a card reader at a controlled door, which reads a user credential and sends the collected data to a centrally located DGP over the cabling infrastructure. DGP may hold a user database onboard or may communicate with a user database over the network. If user is authorized for access at a controlled door, DGP signals the electronic lock at the door to unlock. If user credential is not authorized according to user database, the door remains locked and access is denied. In addition to card readers and electronic locks, access control systems may include various other connected devices programmed for a desired function.
- B. Performance Criteria:
 1. Regulatory Requirements:
 - a. Components listed and labeled in accordance with NFPA 70 and NFPA 72, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.
 - b. Comply with NFPA 1, NFPA 730, NFPA 731, and ICC IBC.
- C. Selection of Access Control System Components:
 1. Source Limitations: Obtain components for access control system from sources approved by Installer warranting performance of entire system.
- D. Special Techniques:
 1. Comply with manufacturer's published instructions.
 2. Mounting Heights: Mount field devices in accessible locations in accordance with United States Access Board ADA-ABA Accessibility Guidelines standards.
- E. Interfaces with Other Work:
 1. Coordinate with Section 08 71 00 "Door Hardware" for interfacing access control system devices with door hardware.

3.02 WIRING

- A. Wiring Method: Install cables in raceways unless otherwise indicated.

1. Conceal raceways and wiring except in unfinished spaces.
 2. Minimum raceway shall be 3/4".
- B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.
- C. Splices, Taps, and Terminations: For power and control wiring, use numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
- D. Grounding: Provide independent-signal circuit grounding recommended in writing by manufacturer.

3.03 VIDEO SURVEILLANCE INSTALLATION

- A. Install cameras and infrared illuminators level and plumb.
- B. Install cameras with 84-inch- (2134-mm-) minimum clear space below cameras and their mountings. Change type of mounting to achieve required clearance.
- C. Set pan unit and pan-and-tilt unit stops to suit final camera position and to obtain the field of view required for camera. Connect all controls and alarms and adjust.
- D. Install power supplies and other auxiliary components at control stations unless otherwise indicated.
- E. Avoid ground loops by making ground connections only at the control station.
1. For 12- and 24-V dc cameras, connect the coaxial cable shields only at the monitor end.
- F. Identify system components, wiring, cabling, and terminals according to Section 27 05 53 "Identification for Communications Systems."

3.04 FIELD QUALITY CONTROL

- A. Field tests and inspections must be witnessed by owner or owner's representative.
- B. Tests and Inspections:
1. Perform manufacturer's recommended tests and inspections for access control system components.
 2. Perform industry standard tests and inspections for power supplies, batteries, and other standby power provisions.

3. Engage factory-authorized service representative to test end-to-end system connection and functionality.
 4. Verify monitoring of access control system status and diagnostics information.
- C. Nonconforming Work:
1. Access control equipment will be considered defective if it does not pass tests and inspections.
 2. Video surveillance system will be considered defective if it does not pass tests and inspections.
 3. Remove and replace defective units and retest.
- D. Collect, assemble, and submit test and inspection reports.
- E. Tests and Inspections Video Surveillance:
1. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.
 2. Pretesting: Align and adjust system and pretest components, wiring, and functions to verify that they comply with specified requirements. Conduct tests at varying lighting levels, including day and night scenes as applicable. Prepare video-surveillance equipment for acceptance and operational testing as follows:
 - a. Prepare equipment list described in "Informational Submittals" Article.
 - b. Verify operation of auto-iris lenses.
 - c. Set back-focus of fixed focal length lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Adjust until image is in focus with and without the filter.
 - d. Set back-focus of zoom lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Additionally, set zoom to full wide angle and aim camera at an object 50 to 75 feet (17 to 23 m) away. Adjust until image is in focus from full wide angle to full telephoto, with the filter in place.
 - e. Set and name all preset positions; consult Owner's personnel.
 - f. Set sensitivity of motion detection.
 - g. Connect and verify responses to alarms.
 - h. Verify operation of control-station equipment.

3. Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
4. Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.

3.05 SYSTEM STARTUP

- A. Engage a factory-authorized service representative to perform startup service.
 1. Complete installation and startup checks in accordance with manufacturer's published instructions.

3.06 ADJUSTING

- A. Control Sensor Adjustments: Adjust control devices to suit actual occupied conditions.
 1. For proximity motion sensors, verify operation at outer limits of detector range. Set time delay to suit Owner's operations.

3.07 PROTECTION

- A. After installation, protect access control system components from construction activities. Remove and replace items that are contaminated, defaced, damaged, or otherwise caused to be unfit for use prior to acceptance by Owner.

3.08 MAINTENANCE

- A. Control Sensor Readjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Tasks shall include, but are not limited to, the following:
 1. Check cable connections.
 2. Check proper operation of cameras and lenses. Verify operation of auto-iris lenses and adjust back-focus as needed.
 3. Adjust all preset positions; consult Owner's personnel.
 4. Recommend changes to cameras, lenses, and associated equipment to improve Owner's use of video surveillance system.
 5. Provide a written report of adjustments and recommendations.

3.09 CLEANING

- A. Clean installed items using methods and materials recommended in writing by manufacturer.
- B. Clean video-surveillance-system components, including camera-housing windows, lenses, and monitor screens.

3.10 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain video-surveillance equipment.

END OF SECTION

SECTION 28 31 00

FIRE DETECTION AND ALARM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide fire detection and alarm as indicated and in compliance with Contract Documents.
- B. Provide, test, and place into operating condition an electrically operated, microprocessor based, UL listed, four-wire, analog/addressable, electrically supervised fire detection and evacuation system as indicated and specified.
- C. The System shall include, but not be limited to: Fire Alarm Control Panel (FACP), Remote Annunciator Command Center (ACC), power supplies and fire alarm initiating and notification devices including addressable monitor and control modules.
- D. The fire alarm system shall include conduit, wire, fittings, and accessories required to provide a complete operating system.
- E. Connect fire alarm control panels in a local area network via twisted pair cable for data communication with other areas. Display local information at each network node and the entire network monitored at the network remote annunciator panel.
- F. All charges and fees required by the local Authority having jurisdiction (AHJ) to inspect the installation and implement fire alarm notification are to be included by the Contractor under this section at no additional cost to the Owner.
- G. System shall include a voice evacuation panel in compliance with NFPA 72 requirements.

1.03 SYSTEM DESCRIPTION:

A. Type of System:

1. Fire Alarm System: The fire alarm system shall operate as a low voltage analog/addressable type system and shall automatically initiate fire alarm signals whenever any manual or automatic fire detecting devices are placed into an alarm mode. The system shall indicate areas of alarm and sound local alarms. Initiating loops and notification loops shall be wired as four-wire class A loops. Initiating loops and notification loops shall be complete with necessary switches, meters, relays, pilot lights, surge arresters and addressable modules as required. A minimum of one thermal cut-out or fuse and surge arrestor for every notification circuit shall be provided. An annunciator shall indicate the specific location of the fire.
2. The system shall be capable of operating with a single break or ground fault condition in the initiating or alarm sounding circuits.
3. Evacuation Alarms: Coded evacuation alarm: A fire alarm signal shall be employed for notifying the occupants to evacuate.

4. Trouble Signals: During abnormal conditions such as an open wire or a ground fault, or where both conditions occur at one point, the system shall be capable of automatically transmitting clear, intelligible trouble signals.
5. Power Supply for the System: A dedicated branch-circuit for supplying power to the alarm system shall be provided for the Fire Alarm Control Panel (FACP). The branch circuits shall be automatically energized from an auxiliary electrical power system during failures of the normal power supply. Provide battery backup power consisting of rechargeable, sealed type storage batteries and battery charger.
6. The system shall interface to HVAC system and other building systems as shown on the Contract Drawings and required by applicable codes to provide all required monitoring and control functions.

B. Sequence of Operation:

1. When a fire-alarm condition is detected by one of the system initiating devices, the following functions shall immediately occur:
 - a. Automatic programs assigned to the alarm point shall be executed and the associated indicating devices and relays activated.
 - b. Fire-alarm notification devices in the building shall operate.
 - c. The system alarm on the Fire Alarm Control Panel and Remote Annunciator Command Center will indicate condition.
 - d. The alarm shall be signaled automatically to an FM Approved company.
 - e. Shutdown of HVAC equipment and associated exhaust and pressurization operations to be initiated.
2. When a trouble condition is detected by one of the system initiating or indicating circuits, the following functions shall immediately occur:
 - a. System Trouble will be indicted on FACP and Annunciator Command Center.
 - b. A local trouble-sounding device in the FACP and Annunciator Command Control shall be activated. This sound shall be distinct from the alarm sound.
 - c. The appropriate message will appear on the LCD display at the FACP and Annunciator Command Center.

1.04 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Copy of this specification section with addenda and all referenced specification sections with addenda check-mark each paragraph to indicate specification compliance or indicate deviation and reason for deviation.
 - a. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal with no further review and consideration.
2. Installer and system supplier qualifications and list of three similar projects with name and phone number of contact person.
3. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts. Shop drawings shall contain complete conduit riser diagrams, wiring diagrams, and schematic diagrams for the equipment furnished. Riser diagrams shall identify cable sizes and quantities, equipment layout, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.
4. Manufacturer's printed installation instructions.
5. Battery capacity calculations to demonstrate that the battery size selected is a minimum of 125 percent of the calculated requirement. Calculation to include supervisory power requirements for all equipment, and alarm power requirements for all equipment.
 - a. Calculations to show amplifiers have sufficient capacity to simultaneously drive fire alarm speakers at their 1/2 watt tap plus 50 percent spare capacity.
6. Wiring diagrams from the fire alarm system integrator or supplier differentiating clearly between factory and field installed wiring. Include diagrams for equipment and for system with all terminals and interconnections identified. Identify all diagrams to be specific to this project and distinguish between field and factory wiring.

B. Spare Parts Data:

1. After approval of the list of shop drawings, and not later than six months prior to the date of substantial completion, furnish copies of spare parts data for each different item of materials and equipment specified. The data shall include a complete list of parts and supplies with current unit prices and source of supply, a list of supplies that are either normally furnished at no extra cost with the purchase of the equipment, or specified to be furnished in accordance with paragraph Special Tools and Spare Parts and a list of additional items recommended by the manufacturer to assure efficient operation for a period of 120 days.

C. Operating and Maintenance Instruction Manuals:

1. At end of project, submit operating instruction manuals as specified in 01 78 23, outlining the step-by-step procedures required for system startup and operation

shall be furnished. The instructions shall include the manufacturer's name, model number, service manual parts list and brief description of all equipment and their basic operating features.

2. Maintenance instructions manuals outlining maintenance procedures shall be furnished. The manual shall include a troubleshooting guide listing possible breakdown and repairs and a simplified connection wiring diagram for the system as installed. Provide the names, addresses, and telephone numbers of service organizations that provide technical assistance and carry stock of repair parts for the system to be furnished.
 3. Performance Test Reports: Upon completion of the installed system, submit in booklet form field tests performed to prove compliance with the specified performance criteria. Each test report shall indicate the final position of controls.
- D. Submit Certificate of Compliance, signed by manufacturers of fire alarm system components certifying that their products comply with specified requirements.
- E. Submission to Authorities Having Jurisdiction: In addition to routine submission of the above material, make an identical submission to the authorities having jurisdiction. Include copies of annotated Contract Drawings as needed to depict component locations to facilitate review. Upon receipt of comments from the authorities having jurisdiction, submit them for review. Resubmit if required to make clarifications or revisions to obtain approval.

1.05 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.
- B. Provide one spare FACP mother board and 10 percent or a minimum of 2 devices of the total devices provided for this Contract as listed below.
1. Pull Stations.
 2. Manual Pull Stations
 3. Weatherproof Smoke Detectors.
 4. Photoelectric Smoke Detectors.
 5. Thermal Detectors, 135 degrees F (57 degrees C).
 6. Thermal Detectors, 190 degrees F (88 degrees C).
 7. Alarm Audible Devices.
 8. Alarm Strobes.

- C. Three sets of special tools necessary for the maintenance of the equipment shall be furnished. Two spare sets of fuses of each type and size required and five spare lamps for each type shall be furnished. Spare parts shall be listed on submittal list.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Standard Products: Material and equipment shall be the latest standard products of a single manufacturer regularly engaged in the manufacture of the product for the 5 years as a minimum.
- C. Qualifications of the installer before commencing work: Submit information demonstrating that the supplier has successfully installed fire alarm systems of the same scope, type and design as specified.
 - 1. Submit copies of all required Licenses and Bonds as required by the AHJ. Employ on staff a minimum of one full time NICET level 2 Technicians or a professional engineer.
 - 3. Certify that the completed system conforms with UL standards upon completion of the installation.
 - 4. Ongoing maintenance and testing shall be provided to the Owner under a maintenance contract to maintain the UL listing.
- D. Nameplates: The components of equipment shall have the manufacturer's name, address, type or style, and catalog number on a plate securely attached to the equipment.
- E. Tags: Tags with stamped identification number shall be furnished for keys and locks. Tags shall be furnished to identify cable and conduit runs, wiring circuits, and all spare parts furnished for Authority's stock to maintain the system.
- F. Keys and Locks: All locks shall be keyed alike.
- G. Verification of Dimensions: Become familiar with details of the work and verify dimensions in the field.
- H. Compliance: The fire detection and internal alarm system shall be configured in accordance with NFPA 72. The equipment furnished shall be compatible and be UL listed or FM approved in accordance with the applicable NFPA standards.
- I. Accessibility: Enclosures shall be provided with ample gutter space to allow proper clearance between the enclosure and live parts of the panel equipment. If more than one modular unit is required to form a control panel, the units shall be installed in a single cabinet large enough to accommodate all units, and allow ample gutter space for interconnections of panels and field wires.

- J. Verify conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier.
 - K. Review selected arrangement with local fire authority for conformance with local and state requirements.
 - L. Onsite Technician Services:
 - 1. Provide the services of a representative or technician certified by the manufacturer of the system, experienced in the installation and operation of the type of system provided.
 - 2. The representative shall be licensed in the State if required by law.
 - 3. The technician shall supervise installation, software documentation, adjustment, preliminary testing, final testing and certification of the system, and Underwriters Laboratories listing certification requirements.
 - 4. The technician shall provide the required instruction to the Owner's personnel in the system operation, maintenance and programming.
 - 5. Provide services of the manufacturer's service representative during installation, startup and testing, for a period of three working days plus travel where a working day is equivalent to 8 hours.
- 1.07 DELIVERY, STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.
 - B. Equipment placed into storage shall be protected from the weather, humidity and temperature variations, dirt, dust, and other contaminants.
- 1.08 SEISMIC DESIGN REQUIREMENTS:
- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
 - B. It shall be the responsibility of the manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

- A. Notifier

- B. Honeywell
- C. Simplex – Grinnell
- D. Or Approved Equal

2.02 MATERIAL AND EQUIPMENT:

A. General Product Description:

1. Each Fire-Alarm Control Panel (FACP) shall be capable of fire detection, equipment supervision and control, alarm management, and historical data collection and archiving.

B. Communications:

1. The FACP shall have sufficient memory to support its operating system and databases including:
 - a. Fire management
 - b. Alarm management
 - c. Historical/Trend Data
 - d. Maintenance Support Applications
 - e. Custom Processes
 - f. Operator I/O
2. Communication Ports: Provide data communication ports for simultaneous operation of devices such as industry standard printers, programming terminal, PC, transponder and annunciator.
3. Integrated On-Line Diagnostics: The FACP shall continuously perform self-diagnostics, communication diagnostics and diagnostics on all subsidiary equipment.
4. Surge and Transient Protection: Isolation shall be provided at all field point terminations to suppress induced voltage transients where required. Surge arrestors shall provide protection from all non-signal electrical surges that could cause damage to the equipment. Line surge arrestors shall be isolated from the electrical circuitry that they are protecting.

C. System Software Features:

1. Provide software to form a complete operating system as described in this specification shall be provided.

2. The software programs specified in this section shall be provided as an integral part of the panel and shall not be dependent upon any higher level computer for execution.
3. Alarm Management: Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. The control unit shall have capability of performing alarm analysis and signaling. At no time shall the panel's ability to report alarms be affected by operator activity.
4. Status Change Report: All alarm or point change reports shall include the point's English language description, and the time and date of occurrence.
5. Prioritization: The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of three priority levels shall be provided.
6. Report Routing: Alarm reports shall be archived for future recall.
7. Alarm Messages: In addition to the point's description and the time and date, the user shall be able to print, display or store a custom alarm message to more fully describe the alarm condition or direct operator response.
8. The FACP shall be capable of storing a library of at least 900 events.
9. History Mode:
 - a. The system shall be able to store and display at least 900 system events that have occurred in a non-volatile buffer memory. Display of these events shall be accomplished on-site through the use of the front control panel indicators and switches.
10. Field Configurable:
 - a. The system shall be fully configurable and expandable without the need for EPROM programmers. All configurations shall be accomplished through downloading of programs from a computer. Reconfiguration shall not require knowledge of any programming languages or require any special training. All programs shall be stored in non-volatile memory. Entry into program mode shall require a special key and a special password entered into the front panel.

D. Analog Device Interface:

1. The Analog Device Interface will be capable of supporting devices as indicated on drawings with 25 percent spare slots for future devices.

2. The analog addressable device interface shall contain its own microprocessor control.
3. The analog addressable device interface shall communicate and provide power to all devices on its loop over a single pair of wires. The fire-alarm system shall function as a Class A system.
4. The analog interface board shall receive analog information from intelligent detectors and shall process this information to determine normal, alarm, or trouble conditions. The analog information may also be used for automatic test and determination of maintenance requirements.
5. Communication with connected devices shall be performed every 5 seconds or less. Average time to detect an alarm shall be less than 10 seconds (longer for alarm verification detectors).

E. Notification Appliance Circuit:

1. The FACP shall provide supervised Class A notification circuits as indicated on drawings with 50 percent spare capacity for future devices. The circuit capacity shall be 2.0 amperes maximum per circuit, maximum of 8.0 amperes from the FACP's power supply. If a short-circuit trouble occurs on one of the circuits, it will not affect the operation of the remaining circuits.

F. Amplifiers, Preamplifiers, Tone Generators:

1. Any amplifiers, preamplifiers, tone generators, digitalized voice generators, and other hardware necessary for a complete, operational, textual audible circuit conforming to NFPA 72 shall be housed in a fire alarm control unit, terminal cabinet, or in the fire alarm control panel. The system shall automatically operate and control all building fire alarm speakers except those installed in the stairs and within elevator cabs. The speakers in the stairs and elevator cabs shall operate only when the microphone is used to deliver live messages. Each amplifier shall have two channels; one to broadcast a message and the other for paging.
 - a. Construction: Amplifiers shall utilize computer grade solid state components and shall be provided with output protection devices sufficient to protect the amplifier against any transient up to 10 times the highest rated voltage in the system.
 - b. Inputs: Each system shall be equipped with separate inputs from the tone generator, digitalized voice driver and panel mounted microphone. Microphone inputs shall be of the low impedance, balanced line type. Both microphone and tone generator input shall be operational on any amplifier.
 - c. Tone Generator: The tone generator shall be of the modular, plug-in type with securely attached labels to identify the component as a tone generator and to identify the specific tone it produces. The tone generator shall

produce a slow whoop tone, which shall slowly ascend from low (500 Hertz) to high (1200 Hertz), and shall be constantly repeated until interrupted by either the digitalized voice message, the microphone input, or the alarm silence mode as specified. Each slow whoop cycle shall last approximately 4 seconds. The tone generator shall be single channel with an automatic backup generator per channel such that failure of the primary tone generator cause the backup generator to automatically take over the functions of the failed unit and also causes transfer of the common trouble relay.

- d. Protection Circuits: Each amplifier shall be constantly supervised for any condition which could render the amplifier inoperable at its maximum output. Failure of any component shall cause automatic transfer to a designated backup amplifier, illumination of a visual “amplifier trouble” indicator on the control panel, appropriate logging of the condition of the system printer, and other actions for trouble conditions as specified.

G. Function Relays:

1. The FACP shall provide of Form “C” relay contacts, quantity as required, rated at 2 A at 120 VAC. These relays may be programmed to activate on alarm from any initiating zone or any combination of initiating zones, analog devices or addressable modules.

H. Central Processing Unit (CPU):

1. The CPU shall communicate with the operator interface, LCD display, LED display and control other modules in the panel. Removal, disconnection or failure of any control panel shall be detected and reported by the Central Processing Unit.
2. The CPU shall contain and execute all control-by-event programs for specific action to be taken if a fire situation is detected in the system. Such control-by-event programs shall be held in non-volatile programmable memory, and shall not be lost even if system primary and secondary power failure occurs. The CPU shall also provide a real time clock for time annotation on the display and remote optional printer.

I. Operator Display:

1. The operator display shall provide controls and indicators used by the system operator. The display shall contain, and display as needed, custom alphanumeric message for all intelligent detectors and addressable modules. Such message information shall be stored in programmable non-volatile memory.
2. The display board shall provide an 80-character alphanumeric Liquid Crystal Display (LCD). It shall also 24 LEDs for system indication such as AC POWER; SYSTEM ALARM; SYSTEM TROUBLE; ACKNOWLEDGE; SIGNAL SILENCE, etc.

3. Factory programmable system indications and keys shall be available for unique functions. Keys shall be referred to as “Hot Keys”.
4. The Display Interface shall provide a 15-key touch keypad with control capability to command all system functions, and entry of any numeric information. The keypad shall include means to enter a minimum of two different passwords to prevent unauthorized manual control.
5. Ground fault indication shall be displayed on a system and initiating zone basis.

J. Communications Ports:

1. The system shall provide the following interfaces:
 - a. One port for remote annunciator command center.
 - b. One port for central station communication.
 - c. One port for service and field programming.
 - d. One port for Printer.

K. Mechanical Design:

1. The Fire Alarm Control Panel (FACP) shall be housed in a cabinet designed for mounting recessed or directly to a wall or vertical surface. The back box and door shall be constructed with provisions for electrical conduit connections. The door shall provide a key lock and shall include an opening for viewing.
2. The FACP shall be modular in structure for ease of installation and maintenance.

L. One Person Test Feature: The control unit shall include a special one-person test feature, which will allow a single person to test all initiating devices and indicating appliance in a system without returning to the panel to reset the system. A special password shall be required to enter the test mode. The service-technician shall be able to re-select the initiating and indicating circuits that are to be included in the one-person test mode. The Walk-Test shall include a special audible indication that a trouble has been detected on an analog device, for the service-technician to check proper system wiring.

M. Provide addressable monitor modules to interface manual FACP to stations and other non-addressable detection components as required. The modules shall be capable of being mounted in a 4 x 4 x 2 1/8 inch (100 x 100 x 54 mm) junction box.

N. Provide addressable control modules to interface FACP to fire alarm reporting panel, audible and visual devices and other control components as required. The modules shall be capable of being mounted in a 4 x 4 x 2 1/8 inch (100 x 100 x 54 mm) junction box.

O. Fire-Alarm Initiating Devices:

1. Addressable Devices: All addressable detectors shall:
 - a. Provide a test means whereby they will simulate an alarm condition and report that condition to the FACP. Such a test may be initiated at the detector itself, by activating a magnetic switch, or may be activated remotely on command from the control panel.
 - b. Provide address-setting means on the detector head using switches. The detectors shall also store an internal identifying code which the FACP shall use to identify the type of detector.
 - c. Provide dual alarm and power LEDs. Both LEDs shall flash under normal conditions, indicating that the detector is operational and in regular communication with the control panel. Both LEDs may be placed into steady illumination by the control panel, indicating that an alarm condition has been detected. An output connection shall also be provided in the base to connect an external remote alarm LED.
2. Addressable pull stations shall, on command from the control panel, send data to the panel representing the state of the manual switch and the addressable communication module status. They shall use a key operated test-reset lock, and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a key. Operated stations shall have a positive, visual indication of operation and utilize a key type reset. Manual stations shall be constructed of Lexan with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters, 1.75 inch (45 mm) or larger. Mount stations inside a red, weatherproof enclosure with a clear polycarbonate hinged front cover where station is indicated on the drawings as NEMA 4, NEMA 4X and hazardous areas including Class I, Division 1 and 2.
3. Analog/Addressable Area Photoelectric Smoke Detectors: Photoelectric Smoke Detectors shall use the photoelectric principle to measure smoke density and shall, on command from the control panel send data to the panel representing the analog level of smoke density. These addressable detectors shall connect with two wires to one of the control addressable input circuits.
4. Analog/Addressable Thermal Detectors: Thermal detectors shall use an electronic sensor to respond to temperatures exceeding 135 degrees F (57 degrees C) or 190 degrees F (88 degrees C) as noted on the plans. Sensing elements shall be replaced without removing the detector base. The detector shall, on command from the control panel, send data to the panel representing the analog temperature level. These addressable detectors shall connect with two wires to one of the control addressable input circuits.
5. Each detector shall be provided with a steel mounting plate, and the entire unit shall mount on a double gang electrical box.

6. Analog/Addressable Duct Smoke Detectors: Provided under Section 23 00 00.
 - a. The detectors shall, on command from the control panel, send data to the panel representing the analog level of smoke intensity.
7. Provide devices suitable for the area classifications as indicated on the Contract Drawings (i.e., NEMA 1, NEMA 4, NEMA 4X, and NEMA 7 (Class I, Division 1 or 2) NEMA 4X, etc).

P. Fire Alarm Indicating Devices:

1. Visual appliances shall be installed as shown on the drawings in accordance with the requirements of the UL 1971 standard and NFPA 72. Where multiple visual signals are visible from any location, circuitry shall be incorporated for the synchronization of the flash rate.
 - a. UL 1971 Listed for Emergency Devices for Hearing Impaired in all public mode installations.
 - b. Strobes shall meet UL 1971 flash rate.
 - c. Visual signals shall incorporate a Xenon flashtube enclosed in a rugged Lexan lens or equivalent with solid state circuitry.
 - d. The strobe intensity shall be rated per UL 1971.
 - e. The strobes shall be available for semi-flush or surface mounting and in conjunction with audible signals as required.
2. Audible Devices: Audible evacuation signals shall be provided meeting the following requirements:
 - a. Audible Notification appliance shall be electronic and use solid state components.
 - b. Each electronic signal shall provide four field selectable alarm tones. The tones shall consist of: slow hoop, continuous, temporal or interrupted.
 - c. The device shall provide UL dBA measurement at 10 feet (3 m) shall be a minimum of 85 dBA at 10 feet (3 m) for separately mounted audible signals.
 - d. The device shall have provisions for standard reverse polarity type supervision and in/out field wiring using terminals that accept 14 AWG wiring.
 - e. Combination audiovisual alarm horns shall have a high intensity flashing light and alarm horn as an integral unit. Both audio and visual components shall operate from the 24 volt dc polarized indicating circuits. The horn

assembly shall be housed in a rugged, die-cast enclosure, and the electronic light source shall be sealed in silicone and protected by a Lexan lens. The word FIRE shall appear on the lens. Audiovisual alarm devices shall meet the requirements of visual appliances and alarm horns above. Single and/or dual projectors shall be supplied as shown on the plans.

3. Fire Alarm Speakers:

- a. Provide fire alarm speakers conforming to UL 464 having a minimum of three tap settings and separate terminations for each in and out connection. Tap settings shall include taps of 1/4, 1/2 and 1 watt. Speakers shall utilize the 1/2 watt tap in the system. Speakers shall have an output rating of 84 dBA at 10 feet (3 m) as determined by the reverberant room test; data on peak output as determined in an anechoic chamber is not suitable. Speakers shall be capable of installation on standard 4 inch (100 mm) square electrical boxes. Where speakers and strobes are provided in the same location, they may be combined into a single wall mounted unit.
- b. Provide speaker mounting plates equipped with mounting holes and other opening as needed for a complete installation. Fabrication marks and holes shall be ground and finished to provide a smooth and neat appearance for each plate. Each plate shall be primed and painted.

Q. Power Supply:

1. The power supply for the FACP and fire alarm peripherals shall be integral to the FACP. The power supply shall provide FACP and peripheral power needs.
2. Positive-temperature-coefficient thermistors, circuit breakers, or other over-current protection shall be provided on all power outputs.
3. Input power shall be 120 VAC, 60 Hertz. The power supply shall provide internal batteries and charger. Internal battery capacity shall be sized as required to meet system requirements.
4. The main power supply shall provide a battery charging circuit consisting of a fully automatic standby battery charger, rate compensated, capable of maintaining battery in fully charged state and be capable of recharging batteries to 70 percent of alarm capacity within 12 hours. Provide for normal operation of entire system for 24 hours with power remaining to sound alarms for 5 minutes. For remote stations, provide battery capacity to operate for 60 hours followed by 5 minutes of alarm in accordance with NFPA 72B. Alarm control panels for automatic release of pre-action or deluge sprinkler systems are required to have 90 hours of secondary power followed by 10 minutes of release power and alarm operations.
5. Provide charger with the following supervised functions: circuit protection for shorts, open, disconnected or reversed polarity battery connection, supervision or

protection of high or low voltage, overcharging and charger failure. Automatic load shedding or battery disconnect on deep discharge to prevent battery damage.

6. Batteries shall be 24 volt, rechargeable, gelled electrolyte, totally sealed, fully charged with all interconnections ready for service, maintenance free, long-life.

R. Wiring within Cabinets, Enclosures, Boxes, Junction Boxes, and Fittings:

1. Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet.
2. Conductors which are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box shall be connected to terminal blocks.
3. Mark each terminal in accordance with the wiring diagrams of the system.
4. Make connections with approved pressure type terminal blocks, which are securely mounted.
5. The use of wire nuts or similar devices shall be prohibited.

S. Terminal Cabinets:

1. Provide a terminal cabinet at the base of any circuit riser, and where indicated on the drawings.
2. Terminal size shall be appropriate for the size of the wiring to be connected.
3. Conductor terminations shall be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection shall be permanently mounted in the terminal cabinet.
4. Minimum size is 8 inch (200 mm) high by 8 inch (200 mm).

T. Alarm Wiring:

1. Signaling line circuits and initiating device circuit field wiring shall be copper, 18 AWG size conductors at a minimum.
2. Notification appliance circuit conductors, that contain audible alarm devices, shall be solid copper 14 AWG size conductors at a minimum.
3. Where a voice evacuation system is specified, speaker circuits shall be copper 16 AWG size conductors at a minimum.
4. Wire size shall be sufficient to prevent voltage drop problems.

5. Power wiring, operating at 120 VAC minimum shall be 12 AWG solid copper having similar insulation.
6. Provide all wiring in rigid metal conduit, minimum 3/4".

U. Conductor Terminations:

1. Labeling of conductors at terminal blocks in terminal cabinets, FACP, and remote fire alarm control units shall be provided at each conductor connection.
2. Each conductor or cable shall have a shrink-wrap label to provide a unique and specific designation.
3. Each terminal cabinet, FACP, and fire alarm control unit shall contain a laminated drawing which indicates each conductor, its label, circuit, and terminal.
4. The laminated drawing shall be neat, using 12 point lettering minimum size, and mounted within each cabinet, panel, or unit so that it does not interfere with the wiring or terminals.
5. Maintain existing color code scheme where connecting to existing equipment.

V. Wiring to Station Fire Alarm Circuit:

1. Wiring from the master fire alarm box to the fire department monitoring station fire alarm circuit shall be a two-conductor 10 AWG type UF cable in conduit.

W. Remote Annunciator Command Center:

1. The remote Annunciator Command Center (ACC) shall be an 80 (4 x 20) character back-lit LCD type capable of displaying up to 3200 point messages. The remote annunciator shall have the capability of driving up to 576 LEDs for future graphic notification. They shall be sixteen switch inputs that can be used for various system functions; lamp test, trouble silence, general alarm, scroll, system reset, network reset, etc. All fire-alarm controls shall be operational from the Annunciator Command Center.
2. The ACC shall have non-volatile memory. Annunciators which rely on the FACP for memory will not be accepted.
3. The ACC shall be surface mounted with switches located with a locked panel, and easily visible through a glass or plastic viewing plate. Panel door shall have a keyed lock identical to the lock on the fire alarm control panel (FACP).

X. Cellular Dialer:

1. Provide a cellular dialer for communication to central monitoring system. Provide City approved cellular dialer.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install fire alarm system as indicated on the drawings, in accordance with the manufacturer's diagrams and printed instructions, except where otherwise indicated.
1. Wiring: Wiring for systems shall be installed in conduit. Reuse existing fire alarm conduit system where applicable; otherwise, provide conduit as specified in Section 26 05 33 "Raceway and Boxes for Electrical Systems".
 2. Station loops shall be arranged to permit disconnecting and bypassing the system at the base of each riser. External wiring between the control panel and the stations and horns/lights shall connect to terminal strips in accessible locked cabinets. Connections to the terminal strips shall be made with terminal spade lugs or with approved type terminal blocks. Terminal cabinets shall be installed at each point where a station circuit riser originates or any point along a circuit where a tap is made. The conductors for the fire alarm system shall not be installed in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems. The sum of the cross-sectional areas of individual conductors shall not exceed 40 percent of the interior cross-sectional area of the conduit. Gutter space to accommodate all necessary wiring shall be provided.
 3. Panels: Panel enclosures shall comply with the requirements of UL 864. Enclosures having doors over 48 inch (1200 mm) in height shall be provided with a three-point catch and lock; all other doors shall contain a cabinet type cylinder lock. Inserts shall be blind fastened so that no screws show on the panel front.
 4. Detectors: Detectors shall be installed in accordance with manufacturer's printed instructions.
 5. Provide complete wiring and conduit between all equipment. Devices shall be mounted upon UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted.
 6. Junction boxes shall be painted red and labeled as "Fire Alarm System" with decal or approved markings.
 7. Fire Alarm control systems and equipment shall be connected to separate dedicated branch circuits, sized as required for proper service. Circuits shall be labeled "FIRE ALARM."
 8. Review the design drawings and perform a walk-through of all areas with the AHJ.

3.02 PERMITS AND CERTIFICATIONS:

- A. Obtain required local permits.

1. Provide UL certification of the installation.

3.03 FIELD TESTING:

- A. Notify the AHJ and the Owner 30 days before the performance and acceptance tests are to be conducted. The tests shall be performed in the presence of the Owner or his authorized representative. Furnish instruments and personnel required for the tests. Perform an acceptance test on 100% of the system as described in the checklist in Table 1 of FM Global Property Loss Prevention Data Sheet 5-40, Fire Alarm Systems. Tests shall be conducted for the following:
 1. Verify that the system is free of grounds or open circuits. Wiring runs shall be tested for continuity, short circuits and grounds before system is energized. The FACP shall indicate when a ground or open circuit exists.
 2. Alarm initiating devices shall be observed and logged for correct zone and sensitivity. These devices and their bases shall be tagged with adhesive tags located in an area not visible when installed, showing the initials of the installing technician and date.
 3. Verify that all strobes, audible devices, pull stations, transmitters, automatic detectors and supervisory devices are functioning as specified.
 - a. Strobes shall deliver the correct foot-candle. Audible devices shall deliver the correct sound pressure levels decibels of the specified device.
 - b. Stations shall close the circuits specified and deliver specified alarm codes. Verify central station receives alarm.
 - c. Automatic detectors shall actuate the specified zones when the appropriate fire or smoke conditions are generated. The detectors shall be exposed to actual smoke used to simulate this test on each and every smoke detector as located in the building; no other test will be accepted.
 - d. Panels and supervisory devices shall display and control functions as specified. Loss of AC system power shall also be tested.
 - e. Close each sprinkler system valve and verify proper supervisory alarm.
 - f. Verify activation of all water flow switches.
- B. System tests to be performed under the supervision of a qualified representative and the AHJ.
- C. Perform all tests to verify the correction of defects found in the initial testing. If testing identifies system modifications are required to accomplish the required operation, perform work at no additional cost to the Owner and retest the system.

D. Furnish training as follows:

1. Training in the receipt, handling and acknowledgment of alarms.
2. Training in the system operation including manual control of output functions from the system control panel.
3. Training in the testing of the system.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 05 19.13

GEOTEXTILES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide geotextile indicated or in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Association of State Highway and Transportation Officials (AASHTO):

- 1. M288: Standard Specification for Geotextile Specification for Highway Applications.

- B. ASTM International (ASTM):

- 1. D4355: Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc Type Apparatus.
- 2. D4491: Standard Test Methods for Water Permeability of Geotextiles by Permittivity.
- 3. D4533: Standard Test Method for Trapezoid Tearing Strength of Geotextiles.
- 4. D4632: Standard Test Method for Grab Breaking Load and Elongation of Geotextiles.
- 5. D4751: Standard Test Method for Determining Apparent Opening Size of a Geotextile.
- 6. D6241: Standard Test Method for Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe

1.03 DEFINITIONS:

- A. Minimum Average Roll Value (MARV): All property values, with the exception of apparent opening size (AOS), represent minimum average roll values in the weakest principal direction. MARV listings for AOS represent the maximum average roll value.

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. Manufacturer Certificates.

2. Manufacturer Installation Instructions and Details.

3. Manufacturer Catalog Data.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in Section 01 66 10.

B. Label each roll of geotextile fabric with geotextile manufacturer, product width, length, and package weight, number, or symbol to identify production run.

C. Wrap fabric in a heavy-duty protective covering until it is ready for installation. Recover previously opened rolls with a waterproof cover.

D. Protect the fabric from direct sunlight, ultraviolet rays, temperatures greater than 140 degrees F, mud, dirt, dust, and debris at all times during shipment and storage.

E. Store fabric on clean, dry surfaces, free of foreign substances such as grease, oil, paint, epoxy, cement, or any other substances which would have a deleterious effect on the fabric.

F. Elevate fabric a minimum of 12 inches above ground level when stored outside.

G. Do not use hooks, tongs, or other sharp tools and instruments when handling fabric.

H. Unload or handle fabric in one of the following ways:

1. By placing slings under the rolls.

2. By using a pole inserted through a hollow core, provided the pole extends 1-foot minimum beyond each end of the core and lifting and handling devices are attached to only that portion of the pole located outside the ends of the core.

3. By hand.

PART 2 - PRODUCTS

2.02 SILT FENCE GEOTEXTILE:

A. Conforming to AASHTO M288.

B. Service requirements Table 31 05 19.13-1

Table 31 05 19.13-1			
Woven Property	Test Method	Units	Value (MARV)
Grab Strength (minimum)	ASTM D4632	lbs	100
Permittivity (maximum)	ASTM D4491	sec ⁻¹	0.10
Apparent Opening Size (AOS)	ASTM D4751	U.S. Sieve No.	20-30
Ultraviolet Stability (minimum)	ASTM D4355	Percent	70

C. Manufacturers or approved equal:

1. Geotex 2130 as manufactured by Propex.
2. Baltech 940 by Belton Industries
3. W100 by SKAPS Industries

2.03 SEPARATION GEOTEXTILE:

- A. Physical Requirements: AASHTO M288.
- B. Class 2 fabric according to AASHTO M288.
- C. Service Requirements Table 31 05 19.13-2

Table 31 05 19.13-2			
Non-Woven Property	Test Method	Units	Value (MARV)
Grab Strength	ASTM D4632	lbs	160
Elongation	ASTM D4632	Percent	50
Trapezoidal Tear Strength	ASTM D4533	lbs	60
CBR Puncture Strength	ASTM D6241	lbs	410
Permittivity	ASTM D4491	sec ⁻¹	1.5
Apparent Opening Size (AOS)	ASTM D4751	U.S. Sieve No.	70
Ultraviolet Stability	ASTM D4355	Percent	70

D. Manufacturers or approved equal:

1. Mirafi 160N as manufactured by TenCate Geosynthetics
2. 160NW by US Fabrics
3. Geotex 601 by Propex Geosolutions

2.04 PERFORMANCE/DESIGN CRITERIA:

- A. The average test results of any roll in a lot sampled for conformance or quality assurance testing shall meet or exceed the MARV.
- B. Erosion Control Silt Fence: Woven, Table 31 05 19.13-1.
- C. Metal Geotextile Pins:
 - 1. Diameter: 3/16 inch, minimum.
 - 2. Length: 18 inches], minimum.
 - 3. Shape: Pointed at one end with head on other end for retaining washer.
 - 4. Washer: Steel, with minimum outside diameter of 1-1/2 inches.
- D. Wire Staples: 8 gage (4.3 mm) minimum.

PART 3 - EXECUTION

3.01 GENERAL:

- A. Place geotextile on areas that are smooth and free of projections or depressions.
 - 1. Do not drag the geotextile across the subgrade.
 - 2. Roll geotextile out as smoothly as possible in the direction of vehicle travel.
- B. Do not operate construction equipment or traffic directly on geotextile.
- C. Cover the geotextile with indicated cover material as soon as possible when placed for construction.
 - 1. Do not leave uncovered for more than five days.
- D. Place cover material on the geotextile in a manner that the geotextile is not torn, punctured, or shifted.
 - 1. Use at least a 6-inch-thick cover layer or twice the maximum aggregate size, whichever is thicker.
 - 2. Do not end-dump cover material directly on the geotextile except as a starter course.
- E. Limit construction vehicles in size and mass so rutting in the initial layer above the geotextile is not more than 3 inches deep or half the layer thickness, whichever is less.
 - 1. Do not turn vehicles on the first layer.

- F. Install geotextile fabric in accordance with manufacturer's printed instructions.
- 3.02 INSTALL SILT FENCE GEOTEXTILE:
- A. Conforming to AASHTO D6462.
- 3.03 INSTALL SEPARATION GEOTEXTILE:
- A. Install for pavement sections or other applications at locations shown.
 - B. Overlap the geotextile at least 2 feet at all longitudinal and transverse joints or sew the geotextile unless otherwise specified.
 - C. Repair: Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.
 - D. Place fill, beginning with the sheets overlapped, above subsequent sheets to hold geotextile in place.
 - E. Use pins 18 inches long to help secure the geotextile during installation.
- 3.04 INSTALLATION – TRENCHES:
- A. Install in accordance with AASHTO M288, Appendices A1 and A3 except as modified below.
 - B. Place filter fabric in the manner and at the locations indicated. Do not use fabric with defects, rips, holes, flaws, deterioration, or damage of any nature.
 - C. Handle and place filter fabric in accordance with the manufacturer's recommendations. Stretch, align, and place the fabric in a wrinkle-free manner.
 - D. Place fabric with the long dimension parallel to the centerline of the trench and lay smooth and free of tension, stress, folds, wrinkles, or creases. Place the strips to provide a minimum width of 18 inches of overlap for each joint.
 - E. Insert securing pins with washers through both strips of overlapped fabric at intervals not greater than 5 feet, along a line through the midpoint of the overlap.
 - F. Install additional pins regardless of location to prevent any slippage of the filter fabric. Place the fabric so that the upstream strip of fabric will overlap the downstream strip. Push each securing pin through the fabric until the washer bears against the fabric and secures it firmly to the foundation.
- 3.05 REPAIR/RESTORATION:
- A. Protect the fabric at all times during construction from contamination by surface runoff. Remove and replace fabric so contaminated with uncontaminated fabric. Repair any

damage to the fabric during its installation or during placement of crushed rock or bedding materials.

- B. Repair fabric damaged during placing, in other than underdrain piping service, by placing a piece of fabric large enough to cover the torn or punctured area, meet the overlap requirement, and extend a minimum of 12 inches beyond the edge of the damaged area.
- C. Replace fabric that has become damaged from vehicular traffic, equipment, or repetitive operations.

3.06 SEWING:

- A. Perform sewing as specified in AASHTO M288, Appendix, Seaming.

3.07 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 10 00

SITE CLEARING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide site clearing as indicated and in compliance with Contract Documents.
- B. Section Includes:
 - 1. Clearing and grubbing.
 - 2. Tree and shrub protection and removal.
 - 3. Removal of debris related to clearing and grubbing operations.

1.02 DEFINITIONS:

- A. Caliper: Instrument used to measure tree diameter.
- B. Clearing: Removal and disposal of above-ground items defined herein.
- C. Grubbing: Removal and disposal of below-ground items defined herein.

1.03 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 - 1. Permits
 - a. Copy of Land Disturbance Permit
 - 2. Certificates
 - a. Copy of herbicide label bearing EPA registration number.
 - b. Copy of Arborist Certification

1.04 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Permits:
 - 1. The Contractor shall be responsible for obtaining required permits and complying with all City, State, and Federal storm water management regulations and requirements, including preparing and implementing a Storm Water Pollution

Prevention Plan (SWPPP) for Construction Activities. The Contractor shall submit a copy of the Notice of Intent and the SWPPP to the Owner for review and approval.

C. Certifications:

1. Certified Arborist: All tree pruning, tree repair, and tree removal shall be performed by competent workers, under the supervision of an arborist holding certification from the International Society of Arboriculture (ISA) or equivalent education and experience.

1.05 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Herbicide: Comply with Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) – Title 7 U.S.C. Section 136. Submit copy of herbicide label, bearing EPA registration number.

1.06 SITE CONDITIONS:

- A. Existing facilities, structures, and utilities are shown in accordance with available surveys and records. The indicated locations of underground utilities and structures are approximate. Other utilities may exist which are not indicated.

PART 2 - PRODUCTS

2.01 ACCESSORIES:

- A. Herbicide: Registered EPA Pesticide.
- B. Tree Wound Paint: Bituminous based paint formulated for tree wounds.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verify survey benchmarks and intended elevations for the Work are as indicated.
- B. Verify temporary erosion and sediment control measures are installed before commencing with any other work at the site.
- C. Prior to any excavation in the vicinity of any existing underground facilities, including all water, sewer, storm drain, gas, petroleum products, or other pipelines; all buried electric power, communications, or television cables; all traffic signal and street lighting facilities; and all roadway and state highway rights-of-way, the Contractor shall notify the regional notification center (Blue Stakes of Utah) at 1-800-662-4111 or 811 or submit an on-line

request at www.bluestakes.org at least 3 days, but no more than 7 days, prior to such excavation.

- D. Contact utility companies and authorities to make arrangements for handling and disposal of utilities encountered during construction.

3.02 PREPARATION:

- A. Protect benchmarks, survey control points, and existing structures to remain from damage or displacement.
- B. Protect trees and vegetation to remain. Do not cut or injure trees and vegetation outside easement lines and outside designated clearing areas.
- C. Protect all underground utilities and structures that are to remain. If damage occurs, immediately notify the utility owner within the hour.
- D. Protect site features to remain from damage by construction equipment and vehicular traffic.
- E. Identify waste and salvage areas for stockpiling of removed materials.

3.03 RESTORATION:

- A. Existing surfaces, features, utilities, or structures that are to remain but are damaged during construction shall be restored to at least the condition in which they were found immediately before work began, unless noted otherwise.
- B. Restore damaged utilities to the satisfaction of the utility owner.
- C. Restore damaged private property to the satisfaction of the property owner.

3.04 CLEARING:

- A. Remove and dispose of off-site:
 - 1. Trees, snags, brush, shrubs, downed timber, decayed wood, and other vegetative growth.
 - 2. Rocks, tiles, lumps of concrete, trash piles, debris, refuse, and rubbish. Remove all evidence of their presence from the surface.
- B. Clear ground within limits of work and width of permanent easement, unless otherwise noted.
- C. Manual cutting of trees, stumps, and stubs during clearing shall be as close to ground surface as practicable but no higher than 6-inches above ground for small trees (8-inches or less), and not higher than 12 inches above ground for larger trees (greater than 8-inches).

- D. Obey all federal, state, and local regulations and guidance regarding the cutting, burning, and disposal of diseased trees and vegetation.

3.05 GRUBBING:

- A. Remove and dispose of all stumps, buried logs, matted roots, roots larger than 2 inches, and organic materials off site.
- B. Roots larger than 2 inches in diameter shall be removed to a depth of 12 inches, and roots larger than 1/2-inches in diameter to a depth of 6 inches .
- C. Areas designated to receive pavement or structures shall be grubbed a depth of 18 inches. Measure depths of cut from existing ground surface or proposed finished grade, whichever is lower.
- D. Apply herbicide to remaining roots and vegetation to inhibit growth.
- E. Depressions made by grubbing shall be filled with suitable material and compacted to conform to original adjacent grade.
- F. Do not grub areas within drip line of trees to remain to avoid damage to roots.

3.06 TREE AND SHRUB REMOVAL:

- A. Remove trees and shrubs within permanent and temporary easement by felling or cutting individual vegetation and grubbing. The Contractor may dispose of the material at the Provo City composting facility located at 1625 S Industrial Parkway.

3.07 TREE AND SHRUB PROTECTION:

- A. Protect and prune indicated designated trees and shrubs within the clearing limits.

3.08 PRUNING:

- A. Trim dead branches 1-1/2-inches or more in diameter and branches to heights and in a manner as indicated. Neatly cut limbs and branches close to the bole of the tree or main branches. Paint cuts more than 1-1/4-inches in diameter tree wound paint.

3.09 BURNING:

- A. Burning is not permitted on site.

3.10 CLEANING:

- A. Promptly dispose of excess and unsuitable material off site.
- B. Remove debris, junk, and trash from site.
- C. Leave site in clean condition, ready for subsequent work.

- D. Clean up spillage and wind-blown debris before entering public or private property, adjacent to site.

3.11 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 22 00

GRADING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide grading as indicated and in compliance with Contract Documents.
- B. Section Includes:
 - 1. Rough grading.
 - 2. Finish grading.
 - 3. Stockpiling of topsoil and subsoil.
 - 4. Disposal of unsuitable and excess materials.

1.02 DEFINITIONS:

- A. Unsuitable Material: Defined in Section 31 23 00.
- B. Foundation Influence Zone (under foundations, pavements, or sidewalks): Area below base bounded by 1H:1V slope extending outward from 1 foot beyond outer edges.
- C. Utility Influence Zone (around piping or ducts): Area below with limits bounded by perpendicular line, 6 inches below pipe or duct with a 1H:1V slope extending outward from that line, from 1 foot beyond the edge of pipe or duct.

1.03 SUBMITTALS:

- A. Submit in accordance with Section 01 33 00.

1.04 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.05 SITE CONDITIONS:

- A. Existing Conditions:
 - 1. See Section 01 14 14 for additional requirements.
 - 2. Existing facilities, structures, and utilities are shown in accordance with available surveys and records. The indicated locations of underground utilities and structures are approximate. Other utilities may exist which are not indicated.

3. Prior to any excavation in the vicinity of any existing underground facilities, including all water, sewer, storm drain, gas, petroleum products, or other pipelines; all buried electric power, communications, or television cables; all traffic signal and street lighting facilities; and all roadway and state highway rights-of-way, the Contractor shall notify the regional notification center (Blue Stakes of Utah) at 1-800-662-4111 or 811 or submit an on-line request at www.bluestakes.org at least 2 days, but no more than 7 days, prior to such excavation.
- B. Geotechnical Report, Attachment A: The report is attached for information only. Logs of borings are included in the report and indicate conditions encountered only at test boring locations. Nothing in the contract documents shall be construed as guarantee that other materials will not be encountered or that proportion of materials will not vary from proportions shown on the logs of test borings.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verify survey benchmarks and intended elevations for the work are as indicated.
- B. Verify temporary erosion and sediment control measures are installed before commencing with any other work at the site.
- C. Immediately notify the Engineer if suspected hazardous materials are encountered and cease operations in that area.
- D. Identify areas loosened by frost action, softened by flooding or weather, or containing unsuitable material.

3.02 PREPARATION:

- A. Remove material loosened by frost action, softened by flooding or weather, or containing unsuitable material. Replace and compact to same requirements as for specified fill in Section 31 23 00.
- B. Identify required lines, levels, grades, and datum.
- C. Stake and flag locations of known utilities.
- D. Locate, identify, and protect from damage all above- and below-ground utilities to remain.
- E. Notify utility owner prior to removal or relocation of utility. See Sections 01 11 00 and Section 01 50 00 for notification requirements.

Grading
Section No. 31 22 00-2

- F. When necessary to excavate through roots of trees or vegetation to remain – perform work by hand and cut roots with sharp axe.

3.03 ROUGH GRADING:

A. Topsoil removal and stockpiling:

1. Strip topsoil from areas that are to be excavated, landscaped, or graded.
2. Separate organic matter (e.g., root zones) from topsoil. Dispose of organic material off site.
3. Do not strip topsoil while wet.
4. Stockpile excavated topsoil on site. Do not mix topsoil with foreign materials.

B. Subsoil removal and stockpiling:

1. Remove subsoil from areas that are to be excavated, landscaped, or graded.
2. Do not remove wet subsoil unless it is subsequently processed to obtain optimum moisture content.
3. Stockpile suitable subsoil on-site.

C. Provide for free drainage of construction site.

D. Benching Slopes: Horizontally bench existing slopes greater than 4H:1V to key fill material to slope for firm bearing.

E. Stability: Replace damaged or displaced subsoil to same requirements as for specified fill in Section 31 23 00.

F. Disc level surfaces.

G. Rough grade site to achieve lines and grades indicated with allowances for imported fill thicknesses.

H. Provide positive drainage away from buildings and structures by sloping a minimum of 2 inches over 10 feet in paved areas or 5 inches over 10 feet in unpaved areas.

3.04 FINISH GRADING:

A. Before finish grading:

1. Verify subgrade is contoured and compacted.
2. Verify backfill has been inspected.

- B. Fine grade to eliminate uneven areas and depressions. Follow profiles and contours of subgrade and bring to finish grade as indicated.

3.05 STOCKPILING:

- A. Location: As indicated or directed. Do not locate stockpiles over existing or new utilities unless directed.
- B. Height: 8 feet maximum.
- C. Slope: 2H:1V, maximum
- D. Drainage: Grade to prevent standing water.
- E. Provide erosion and sediment control around downhill-side of stockpile perimeter.
- F. Immediately stabilize dormant stockpiles within 7 days. Stockpiles and portions of stockpiles that will not be actively used for at least 30 days shall be considered dormant.

3.06 EXCESS MATERIAL:

- A. Excess grading material, suitable for backfilling or site grading, that is not necessary to complete the work at the project site shall be properly removed and disposed by Contractor.
- B. Dispose offsite any unsuitable materials and excess materials not received by Owner.

3.07 TOLERANCES:

- A. Subgrade:
 - 1. Elevation: 2 inches, from required elevation.
 - 2. Grade: 1 inch per 10 feet.
- B. Finish Grade:
 - 1. Elevation: 1/2 inch, from required elevation.

3.08 FIELD QUALITY CONTROL:

- A. See Section 31 23 00 for compaction and testing requirements.

3.09 CLEANING:

- A. See Sections 01 14 14 and 01 74 23 for additional requirements.
- B. Remove unused stockpiles, grade area to prevent standing water, protect from erosion, and stabilize.

- C. Leave site clean and raked, ready to receive landscaping.

3.10 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.
- B. Submit existing utility location information as part of record drawings. Include ticket numbers and original information from utility owners.

END OF SECTION

SECTION 31 23 00

EXCAVATION AND FILL

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide excavation and fill as indicated and in compliance with Contract Documents.
- B. Section includes:
 - 1. Excavation and fill for: Foundations, structures, and pavement; site drainage, structures, and features.
 - 2. Below-grade utilities within building footprints. (Refer to Section 31 23 23 for all other utility trenching and backfill).
 - 3. Embankments.
 - 4. Dewatering excavations.
 - 5. Controlled fill using materials from imported and on-site sources.
 - 6. Soil and aggregate materials.
 - 7. Compaction and testing.

C. Occupational Safety and Health Administration (OSHA) Standards and Regulations:

1. 29 CFR 1926, Subpart P: Safety and Health Regulations for Construction, Excavations.

1.03 DEFINITIONS

- A. Percent Compaction or Compaction Density: The field dry density of compacted material, expressed as a percentage of the maximum dry density.
- B. Field Dry Density or Field Density: In-place density as determined by ASTM D1556 (Sand Cone Method), ASTM D2167 (Rubber Balloon Method), or ASTM D6938 (Nuclear Method).
- C. Maximum Dry Density: Laboratory density as determined by ASTM D698 (Standard Proctor) or ASTM D1557 (Modified Proctor) and occurring at the optimum moisture content of the material being tested.

1.04 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 1. Temporary excavation and shoring drawings for worker protection in accordance with the General Conditions.
 2. Gradation analysis.
 3. Dewatering plan including disposition of groundwater.

4. Materials Sources: Name of source, location, date of sample, sieve analysis, and laboratory compaction characteristics.
5. Test and Evaluation Reports:
 - a. Field density testing reports: Provide results from field density testing of prepared subgrade and compacted fill.
 - b. Grain-size analysis.
 - c. Laboratory compaction characteristics of soils.
 - d. Water content.
6. Geotextile:
 - a. At least two weeks prior to shipment, submit manufacturer's certificate of compliance and physical property data sheet indicating that requirements for materials and manufacture are in conformance as specified.
 - b. For informational purposes only, submit manufacturer's printed installation instructions.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Testing will be provided by the Owner as specified. Contractor shall be responsible for cost of testing and inspection conducted as a result of non-conforming work.
- C. Protect excavations by shoring, bracing, sheet piling, underpinning or other methods required to prevent cave-in of loose soil. Protection shall be in accordance with OSHA 29 CFR 1926, Subpart P.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Geotextile Fabric:
 1. Provide rolls wrapped with protective covering to protect from mud, dirt, dust, and debris. Label each roll with number or symbol to identify production run.
 2. Protect from sunlight during transportation and storage. Do not leave exposed to sunlight for more than two weeks during installation operations.

1.07 SITE CONDITIONS:

- A. Existing Conditions:

1. Geotechnical Report, Attachment A: The report is attached for information only and is not part of the contract documents. Logs of borings are included in the report and indicate conditions encountered only at test boring locations. Nothing in the contract documents shall be construed as guarantee that other materials will not be encountered or that proportion of materials will not vary from proportions shown on the logs of test borings.

PART 2 - PRODUCTS

2.01 FILL MATERIALS:

- A. Suitable Material: Material from on-site excavation and permitted off-site sources that meets all the specified requirements for its intended use and is not unsuitable. Wet subgrade material which meets other requirements for suitable material is suitable.
- B. Unsuitable Material: Material that fails to meet requirements for suitable materials; or contains any of the following:
 1. Organic clay, organic silt, or peat, as defined in ASTM D2487.
 2. Vegetation, wood, roots, leaves, and organic, degradable material.
 3. Stones or rock fragments over 6 inches in any dimension.
 4. Porous biodegradable matter, excavated pavement, construction debris, rubbish, or refuse.
 5. Ice, snow, frost, or frozen soil particles.
- C. Untreated Base Course: Refer to APWA 2017 Standard Specifications Section 32 11 23 Grade 1-1/2 Untreated Base Course.
- D. Granular Borrow: Refer to APWA 2017 Standard Specifications Section 31 05 13 Common Fill.
- E. Free Draining Granular Backfill: Refer to UDOT 2017 Standard Specifications Section 02056 Embankment, Borrow, and Backfill.
- F. General Fill: Suitable, unclassified material.
- G. Structural Fill: Suitable material, as directed by the Geotechnical Engineer, that is classified by the Unified Soil Classification System (USCS) in accordance with ASTM D2487 as GW, GP, GM, GC, SW, SP, SM, SC. Verify that the largest particles in the fill are no greater in dimension than one-half the thickness of the compacted lift thickness.
- H. Controlled Low-Strength Material (CLSM): Section 03 34 00.
- I. Concrete Fill: Section 03 30 00. Minimum compressive strength, 2,000 psi.

Excavation and Fill
Section No. 31 23 00-4

J. Granular Fill:

1. Densely Graded: ASTM D2940 for base under onsite paving.
2. Open Graded: ASTM C33, coarse aggregate, No. 57

2.02 EQUIPMENT:

- A. Compaction equipment shall be capable of consistently achieving the specified compaction requirements.

2.03 ACCESSORIES:

- A. Geotextile: Section 31 05 19.13.

PART 3 - EXECUTION

3.1 EXAMINATION:

- A. Verify that dewatering support systems are in place before commencing with excavation.
- B. Verify that excavation safety and support systems meeting the requirements of OSHA 29 CFR 1926, Subpart P are in place before commencing with excavation.
1. Minimum slopes for laying back excavations or materials are contained in OSHA 29 CFR 1926, Subpart P; Appendices A and B.
 2. Minimum requirements for shoring and bracing are contained in OSHA 29 CFR 1926, Subpart P; Appendix C.
- C. Verify that fill materials submittals have been accepted by Engineer before commencing with work requiring the use of these materials.
- D. Verify that erosion and sediment control measures are in place and functioning properly.
- E. Immediately notify the Engineer if unexpected subsurface facilities or suspected hazardous materials are encountered during excavation. Discontinue affected work in area until notified to resume work.
- F. Test Pits:
1. Comply with the requirements in Section 01 14 14.
 2. Excavate test pits to field verify the locations of existing underground utilities at crossings and at tie-in points before ordering materials or commencing excavation. Immediately notify the Engineer if conflicts are encountered.

3.2 PREPARATION:

- A. Underpin adjacent structures that could be damaged by excavation work.
- B. Cut pavement with saw or pneumatic tools to prevent damage to remaining pavement. Dispose of large pieces of demolished pavement before proceeding with excavation.
- C. Remove subsurface structures and related obstructions.
- D. Remove boulders within excavation limits.

3.3 PROTECTION OF IN-PLACE CONDITIONS:

- A. Comply with the requirements specified in Section 01 14 14.
- B. Support and protect from damage – existing pipes, poles, wires, fences, curbs, property line markers, and other features or structures which must be preserved in place to avoid being temporarily or permanently relocated.
- C. Excavation Near Existing Structures:
 - 1. Discontinue digging by machinery when excavation approaches pipes, conduits, or other underground structures. Continue excavation by use of hand tools. Include such manual excavation in work to be done when incidental to normal excavation and under items involving normal excavation.
 - 2. Excavate test pits near, or at intersection with, existing utilities or underground structures to determine the exact location of existing features.
- D. Excavation Near Private Property:
 - 1. Record existing condition of features on adjacent property by means of dated photographs or cameras. Provide construction photographs according to Section 01 32 33.
 - 2. Enclose uncut tree trunks adjacent to work in wooden boxes of such height necessary to protect tree from injury due to piled material, equipment, or operations. Operate excavating machinery and cranes to prevent injury to overhanging branches and limbs.
 - 3. Protect cultivated hedges, shrubs, and plants which would otherwise be damaged by the work.
 - 4. Where protection of vegetation is not possible, dig up, temporarily transplant, and maintain. After active construction operations in the area have ceased, transplant vegetation to the original positions and provide water and nursery care until growth is re-established.

5. Do not use or operate tractors, bulldozers, or other power-operated equipment on paved surfaces. Provide protection on pavement or tracks if construction traffic is unavoidable.

3.4 RESTORATION:

- A. Restore private property and structures promptly. Begin restoration work within 24 hours of when damage occurred.
- B. Existing surfaces, features, or utilities that are to remain but are damaged during construction shall be repaired or replaced to at least the condition in which they were found immediately before work began, unless noted otherwise.
- C. Damaged Trees To Remain: Cut all damaged branches, limbs, and roots smoothly and neatly without splitting or crushing. Neatly trim, cut the injured portions and cover with an application of grafting wax or tree healing paint. Replace damaged trees which subsequently die or continue to show lack of growth due to damage.
- D. Cultivated Vegetation: Includes, but is not limited to, hedges, shrubs, and plants. Vegetation that is damaged shall be replaced with equal kind and of at least the quality before work began.

3.5 EXCAVATION:

- A. Excavate to accommodate new structures and construction operations.
- B. Excavate to lines and grades necessary to provide finish grades.
- C. Excavations that are not shored and deeper than 4 feet shall have banks laid back to a minimum stable slope matching the angle of repose of the excavated material.
- D. Workers shall have an adequate means of exit from excavations that are 4 feet or more in depth. The means of exit shall not require more than 25 feet of lateral travel.
- E. Establish limits of excavation to allow adequate working space for installing forms and for safety of personnel.
- F. Carry out program of excavation, dewatering, and excavation support systems to eliminate possibility of undermining or disturbing foundations of existing structures or the work.
- G. Provide dewatering system in accordance with Section 31 23 19.
- H. Provide sheeting and shoring in accordance with Section 31 50 00.
- I. Preserve material below and beyond the lines of excavations.
- J. Locate stockpiled excavated material at least 3 feet from edge of excavations to prevent cave-ins or bank slides.

- K. Excavate for depressed mat foundations so that adjacent sections of foundation mat will rest on undisturbed ground.

3.6 SUBGRADE PREPARATION:

- A. The exposed surface shall be examined by an engineering geologist or soils engineer to determine that the proper bearing material has been exposed.
- B. Materials which are determined to be unsuitable by visual inspection shall be over-excavated below the foundation subgrade and backfilled with structural fill.
- C. Backfill with compacted open-graded granular fill wrapped with nonwoven geotextile fabric. In no case shall the aggregate be placed directly on the exposed subgrade prior to placing the geotextile fabric.
- D. Compact subgrade and proof roll to identify soft spots or other deficiencies prior to filling operations or placing foundations. Correct deficiencies as specified for AUTHORIZED OVER-EXCAVATION and repeat proof roll procedure until successful.
- E. When subgrade is below controlled fill, scarify subgrade to bond with subsequent material lifts.
- F. Proof roll foundation subgrade prior to filling operation or placing foundation concrete. Continue until successful proof test is attained.

3.7 AUTHORIZED OVER-EXCAVATION:

- A. If proof roll test fails then remove unsuitable material plus an additional 6 inches, and backfill with structural fill.

3.8 UNAUTHORIZED EXCAVATION:

- A. Contractor is responsible for backfilling unauthorized excavations with structural fill.

3.9 FILL:

- A. Fill to lines and grades necessary to provide finish grades.
- B. Use a placement method that does not disturb or damage other work or existing features.
- C. Maintain fill materials within 3 percent of optimum moisture, to attain required compaction density.
- D. Place and compact material in equal continuous layers.
- E. General fill may be used in open areas, over lot fill, and areas which are not load bearing.
- F. Use structural fill beneath and adjacent to buildings and structures, and beneath pavements.

- G. Use concrete fill where footing bearing surfaces are over-excavated or footing is otherwise not bearing on undisturbed soil.
- H. Maximum compacted depth is 6 inches for aggregate materials and 8 inches for soil materials, unless noted otherwise.
- I. Do not backfill against or on hydraulic structures until testing is completed. See Section 03 05 10 for leakage testing requirements of concrete containment structures. Conduct hydraulic testing as soon as practicable after structures are constructed and other necessary work has been done. Start backfilling promptly after completion of tests.
- J. Deposit material evenly around structure to avoid unequal soil pressure.
- K. Do not place backfill against or on structures until they have attained sufficient strength to support the loads (including construction loads) to which they will be subjected, without distortion, cracking, or other damage.

3.10 COMPACTION:

- A. Compact to density specified and indicated for various types of material. Control moisture content of material being placed as specified, or if not specified - at a level slightly lower than optimum.

Table 31 23 00-2	
Area	Percentage of Maximum Dry Density as defined by ASTM D1557 (Modified Proctor)
Scarified subgrades	90
Under pavement, slabs	95
Under structures or within 25 feet of structures	95
Under exterior concrete slab and sidewalks	95
Open or grassed areas	85
Topsoil	85 (maximum)

3.11 BACKFILLING AGAINST STRUCTURES:

- A. Backfill shall not be placed against foundation walls until all interior floors have been placed and the concrete has attained design strength. This includes the floor level at grade or the next level above grade if no floor is within 2 feet of finished grade.
- B. Backfill shall not be placed against cantilever walls until the concrete has attained design strength.

3.12 EMBANKMENT FILL AND COMPACTION:

- A. Begin filling in lowest section of work area. Grade surface of fill approximately horizontal but provide with sufficient longitudinal and transverse slope to allow for runoff of surface water from every point.
- B. Install temporary dewatering sumps in low areas during filling operation where excessive amounts of rain runoff collect.
- C. Reduce moisture content of fill material, if necessary, in source area by aerating it over during warm and dry atmospheric conditions. A large disc harrow with two to three foot diameter disks may be required for working soil in a drying operation.
- D. Compact uniformly throughout. Keep fill surfaces sufficiently smooth and free from humps and hollows to allow for proper and uniform compaction. Do not permit hauling equipment to follow a single track on the same layer but direct equipment to spread out to prevent over compaction in localized areas. Take care in obtaining thorough compaction at edges of fill.
- E. Slightly slope surface of fill to ensure drainage during periods of wet weather. Do not place fill while rain is falling or after a rain-storm until the Engineer considers conditions satisfactory. During such periods and upon suspension of filling operations for periods in excess of 12 hours, roll smooth the surface of fill using a smooth wheel static roller to prevent excessive absorption of rainfall and surface moisture. Prior to resuming compaction operations, remove muddy material off surface to expose firm, compacted material, as determined by the Engineer.
- F. When fill is placed against an earlier fill or against in-situ material under and around structures, including around piping beneath structures or embankments, slope junction between two sections of fill at 1.5 to 1 (horizontal to vertical). Bench edge of existing fill 24 inches to form a serrated edge of compact stable material against which to place the new fill. Ensure that rolling extends over junction between fills.
- G. Clean debris, remove loose material, and proof roll previously placed fill which has had time to become desiccated or littered with debris.
- H. After spreading each loose lift to the required thickness and adjusting its moisture content, roll with sufficient number of passes to obtain the required compaction. One pass is defined as the required number of successive trips which by means of sufficient overlap will insure complete coverage and uniform compaction of an entire lift. Do not make additional passes until previous pass has been completed.
- I. Fill surface shall be firm and hard when rolled. Reduce moisture content when fill material sinks and weaves under rollers and equipment. Spread out rolling operations over the maximum practicable area to minimize condition of sinking and weaving. Suspend fill operations on portions of embankment where inundations produce surface cracks.
- J. Remove material which fails testing requirements and replace work.

3.13 GEOTEXTILE:

- A. Install geotextile fabric in accordance with manufacturer's printed instructions and Section 31 05 19.13.
- B. Place geotextile fabric on the foundation subgrade prior to placing aggregate material.
- C. Overlap geotextile fabric 18 inches minimum for unsown lap joint. Overlap fabric 6 inches at seam for sewn joint.
- D. Do not permit traffic or construction equipment to travel directly on geotextile fabric.
- E. Place geotextile fabric in relatively smooth condition to prevent tearing or puncturing. Lay geotextile fabric loosely but without wrinkles or creases so that placement of the backfill materials will not stretch or tear geotextile fabric. Leave sufficient slack in geotextile fabric around irregularities to allow for readjustments.
- F. Patch all tears in geotextile fabric by placing additional section of geotextile fabric over tear with a minimum of 3 feet overlay.
- G. Extend the geotextile fabric and wrap around aggregate material along the perimeter of the foundation.

3.14 FIELD QUALITY CONTROL:

- A. See Section 01 43 00 for general requirements for field inspection and testing.
- B. Perform inspection at least once daily to confirm lift thickness and compaction effort for entire fill area.
- C. Perform particle size distribution and gradation analyses using ASTM D422 and following standard practices in ASTM D421. Perform 1 test for every source and submit results to Engineer for acceptance. Repeat the moisture density test for every 5,000 cubic yard of material used.
- D. Perform field density testing in accordance with ASTM D1556, ASTM D2167, or ASTM D6938.
- E. Evaluate field density test results in relation to maximum dry density as determined by testing material in accordance with ASTM D1557 (Modified Proctor).
- F. Perform tests in accordance with ASTM D4318 to determine Liquid Limit, Plastic Limit and Plasticity Index and submit test results to Engineer for acceptance. Minimum of one test per 5,000 cubic yard of soil for use as fill material and whenever classification of material is in doubt as determined by the Engineer.
- G. Location of field density tests shall be as recommended by the Engineer.

- H. In the event compacted material does not meet specified in-place density, re-compact material and re-test area until specified results are obtained.
- I. Frequency of field density tests:

Table 31 23 00-5	
Area	Frequency
Roadways	1 per lift for every 200 linear feet of roadway
Paved Areas	1 per lift for every 3,500 square feet of pavement
Open Areas	1 per lift for each 25,000 square feet of open area
Isolated Footing Perimeter	1 per alternate lift for each 25 linear feet
Footing and Wall Backfill	1 per alternate lift for each 50 linear feet (both sides of wall)
Under Structures	1 per lift for every 1,000 square feet of structure
Around Structures	1 per lift for every 1,500 square feet of structure
Embankment Fills	1 per lift for every 10,000 square feet of embankment
Regardless of the minimum testing frequency specified, field density tests shall be performed by the Contractor in sufficient number for the Contractor's quality control purposes to ensure that specified density is obtained.	

3.15 ADJUSTING:

A. Shrinkage:

1. Build embankments or backfill to a height above finished grade which will, in the opinion of the Engineer, allow for the shrinkage or consolidation of material. Initially, provide at all points, an excess of at least one percent of total height of backfill measured from stripped surface to top of finished surface.
2. Supply specified materials to build up low places when embankment or backfill settles below the finished grade at any time before substantial completion.

3.16 TOLERANCES:

- A. Construct finished surfaces to plus or minus 1 inch of the elevations indicated.
- B. Grade areas of cut and fill to plus or minus 0.20 foot of the grades indicated.
- C. Complete embankment edges to plus or minus 6 inches of the slope lines indicated.
- D. Provide the Engineer with adequate survey information to verify compliance with above tolerances.

3.17 PROTECTION:

- A. Formulate excavation, backfilling, and filling schedule and procedures to eliminate possibility of undermining or disturbing foundations of partially and completed structures, pipelines and embankments or existing structures and pipelines.

3.18 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 23 19

DEWATERING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide dewatering as indicated and in compliance with Contract Documents.
- B. Design, furnish, operate, maintain, and remove temporary dewatering systems to control groundwater and surface water to maintain stable, undisturbed subgrades, and permit work to be performed under dry and stable conditions. Work to be done as part of dewatering includes, but is not limited to:
 - 1. Lower the groundwater level.
 - 2. Lower hydrostatic pressure.
 - 3. Prevent surface water from entering the excavation during construction.
 - 4. Implement erosion control measures for disposing of discharge water.
 - 5. Provide and monitor observation wells and geotechnical instrumentation as specified and indicated.
- C. Groundwater within the excavation area shall be lowered to at least 2 feet below the lowest excavation levels as specified and as indicated.
- D. Common dewatering methods include, but are not limited to, sump pumping, deep wells, well points, vacuum well points or combinations thereof.
- E. Common groundwater recharge methods include, but are not limited to, deep wells, large sumps or combination thereof.
- F. The Contractor shall obtain the required permits for discharge from the Contractor's dewatering systems in accordance with 40 CFR Part 122. The discharge location shall be in accordance with permit requirements.

1.02 REFERENCES:

- A. Code of Federal Regulations, Title 40 – Protection of Environment (CFR):
 - 1. 40 CFR Part 122: EPA Administered Permit Programs: The National Pollutant Discharge Elimination System.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Qualification of the Contractor's dewatering specialist's or firm's qualifications a minimum of 4 weeks prior to dewatering work. The submittal shall include, but not be limited to:
 - a. Qualifications of specialist's or firm's Registered Professional Engineer.
 - b. Qualifications of specialist's or firm's field representative who will oversee the installation, operation, and maintenance of the dewatering system.
2. Submit a dewatering plan, and, if applicable, a groundwater recharge plan at least 2 weeks prior to start of dewatering work. Do not submit design calculations. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor shall remain responsible for the adequacy and safety of the means, methods, and sequencing of construction. The plan shall include the following items as a minimum:
 - a. Dewatering plan and details stamped and signed by a Registered Professional Engineer registered in the state where the project resides.
 - b. Certificate of Design: Refer to Section 01 33 00.
 - c. A list of equipment including, but not limited to, pumps, prime movers, and standby equipment.
 - d. Detailed description of dewatering, maintenance, and system removal procedures.
 - e. Monitoring plan and details, including, but not limited to, number and locations of observation wells and geotechnical instruments such as settlement markers (reference points on structures; minimum of 2 per structure) and piezometers (minimum of 2), and frequency of reading the monitoring devices.
 - f. Erosion and sedimentation control measures, and methods for disposal of pumped water.
 - g. List of all applicable laws, regulations, rules, and codes to which dewatering design conforms.
 - h. List of assumptions made for design of dewatering and for groundwater recharge systems, including but not limited to groundwater levels, soil profile, permeabilities, and duration of pumping and or recharge.

3. Measurement records consisting of observation well groundwater records and the geotechnical instrumentation readings within one day of monitoring.
4. A modified dewatering plan within 24 hours, if open pumping from sumps and ditches results in boils, loss of fines or softening of the ground.

1.04 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Employ the services of a dewatering specialist or firm having the following qualifications:
 1. Have completed at least 5 successful dewatering projects of equal size and complexity and with equal systems within the last 5 years.
 2. Retain the services of a Registered Professional Engineer (in the state where the project is located) having a minimum of 5 years of experience in the design of well points, deep wells, recharge systems, or equal systems.
 3. Retain the services of a field representative having a minimum of 5 years of experience in installation of well points, deep wells, recharge systems, or equal systems.
- C. If subgrade soils are disturbed or become unstable due to dewatering operation or an inadequate dewatering system, notify the Engineer, stabilize the subgrade, and modify system to perform as specified.
- D. Notify the Engineer immediately if settlement or movement is detected on structures. If the settlement or movement is deemed by the Engineer to be related to the dewatering, take actions to protect the adjacent structures and submit a modified dewatering plan to the Engineer within 24 hours. Implement the modified plan and repair damage incurred to adjacent structures.
- E. Immediately notify the Engineer if oil or other hazardous materials are encountered after dewatering begins.

1.05 HYDRAULIC UPLIFT OF STRUCTURES:

- A. The Contractor shall be responsible for the protection of all structures against hydraulic uplift until such structures have been accepted finally by the Owner.
- B. In this regard, the Contractor is advised that all tanks when completed are designed to resist hydraulic uplift from groundwater up to the elevation indicated on the structural drawings when the structure is completed. The concrete slab bottoms shall be placed in the dry, with the use of wellpoints or other dewatering means to keep the water elevation sufficiently low to carry on the work.
- C. Buildings with basements are not designed to resist hydraulic uplift from groundwater.

1.06 PRECAUTIONS AGAINST HYDROSTATIC UPLIFT DURING CONSTRUCTION:

- A. The Contractor shall maintain a low groundwater elevation in the vicinity of the structures until they are complete. In case of extremely high-water during construction of the structures, it may be necessary to flood the structures to maintain stable conditions.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.08 SITE CONDITIONS:

- A. Subsurface Conditions: Refer to Geotechnical Report. Report is provided for information only and are representative of site conditions at time of geotechnical investigation. Contractor is responsible to verify site conditions.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Provide settlement markers, piezometers, and other geotechnical instruments in accordance with the submitted dewatering plan or as specified.
- B. Provide casings, well screens, piping, fittings, pumps, power, and other items required for dewatering system.
- C. Provide sand and gravel filter around the well screen. Wrapping geotextile fabric directly around the well screen shall not be allowed.
- D. When deep wells, well points, or vacuum well points are used, provide pumping units capable of maintaining high vacuum and handling large volumes of air and water at the same time.
- E. Provide auxiliary dewatering equipment in the event of breakdown. Equipment shall consist of pumps and hoses and be stored on site. Provide at least one auxiliary pump for every five pumps used.
- F. Provide and maintain erosion and sedimentation control devices as indicated or specified and in accordance with the dewatering plan.
- G. Provide temporary pipes, hoses, flumes, or channels for the transport of discharge water to the discharge location.
- H. Provide cement grout having a water cement ratio of 1 to 1 by volume.

3.01 INSTALLATION:

- A. Execution of earth excavation, installing earth retention systems, and dewatering shall not commence until the related submittals have been reviewed by the Engineer with all Engineer's comments satisfactorily addressed and the geotechnical instrumentation has been installed.
- B. Provide and maintain dewatering system in accordance with the dewatering plan.
- C. Carry out dewatering program in such a manner as to prevent undermining or disturbing foundations of existing structures or of work ongoing or previously completed.
- D. Do not excavate until the dewatering system is operational.
- E. Unless otherwise specified, continue dewatering uninterrupted until all structures, pipes, and appurtenances below groundwater level have been completed such that they will not be floated or otherwise damaged by an increase in groundwater elevation.
- F. Discontinue open pumping from sumps and ditches when such pumping results in boils, loss of fines, softening of the ground, or instability of the slopes. Modify dewatering plan and submit revised plan to the Engineer for acceptance.
- G. Where subgrade materials are disturbed or become unstable due to dewatering operations, remove and replace the materials in accordance with Section 31 23 00.
- H. Dewatering Discharge:
 - 1. Install sand and gravel filters in conjunction with well points and deep wells to prevent the migration of fines from the existing soil during the dewatering operation.
 - 2. Transport pumped or drained water to discharge location without interference to other work, damage to pavement, other surfaces, or property.
 - 3. Provide separately controllable pumping lines.
 - 4. The Engineer reserves the right to sample discharge water at any time.
 - 5. Immediately notify the Engineer if suspected contaminated groundwater is encountered. Do not pump water found to be contaminated with oil or other hazardous material to the discharge locations.
- I. Monitoring Devices and Records:
 - 1. Install, maintain, monitor, and take readings from the geotechnical instruments in accordance with the dewatering plan.
 - 2. Install settlement markers on structures within the zone of influence for dewatering a distance equal to twice the depth of the excavation, from the closest edge of the excavation. Conduct and report settlement surveys to 1/8-inch.

3. For large rectangular, square, or circular mass excavations the zone of influence shall be defined by the actual cone of dewatering influence corresponding to a 10 percent increase in effective vertical stress.

J. Install and maintain erosion/sedimentation control devices at the point of discharge as indicated or specified and in accordance with the dewatering plan.

K. Removal:

1. Do not remove dewatering system without written acceptance from the Engineer.
2. Backfill and compact sumps or ditches with screened gravel or crushed stone wrapped with geotextile fabric in accordance with Section 31 23 00.
3. All dewatering wells shall be abandoned upon completion of the work, and completely backfilled with cement grout.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 23 33
TRENCHING AND BACKFILL

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide trenching and backfill as indicated and in compliance with Contract Documents.
- B. Section includes:
 - 1. Trench excavation width and safety.
 - 2. Backfill materials and placement.
 - 3. Utility identification using marking tape and trace wire
 - 4. Soil and aggregate materials.
 - 5. Compaction and testing.

E. Occupational Safety and Health Administration (OSHA) Standards and Regulations:

1. 29 CFR 1926, Subpart P: Safety and Health Regulations for Construction, Excavations.

1.03 CLASSIFICATION OF EXCAVATION:

- A. Excavation is part of the bid item for pipeline installations paid for at lump sum or linear foot as defined in the Bid Schedule.

1.04 DEFINITIONS:

- A. Percent Compaction or Compaction Density: The field dry density of compacted material, expressed as a percentage of the maximum dry density.
- B. Field Dry Density or Field Density: In-place density as determined by ASTM D1556 (Sand Cone Method), ASTM D2167 (Rubber Balloon Method), or ASTM D6938 (Nuclear Method).
- C. Maximum Dry Density: Laboratory density as determined by ASTM D698 (Standard Proctor) or ASTM D1557 (Modified Proctor) and occurring at the optimum moisture content of the soil being tested.
- D. Pipe Embedment: Comprised of the following or combination thereof:
 - 1. Foundation: Required only when the native trench bottom does not provide a firm working platform or the necessary uniform and stable support for the install pipe.
 - 2. Bedding: Placed directly underneath the pipe and brings the trench bottom to grade. Provides a firm, stable, and uniform support of the pipe.
 - 3. Haunching: From bottom of pipe to springline.
 - 4. Initial Backfill: From top of bedding or foundation to 12 inches above top of pipe, unless noted otherwise.
 - 5. Final Backfill: Above the initial backfill to a level below that required for the trench restoration area.
 - 6. Backfill: Includes initial and final backfill.

1.05 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 - 1. Qualifications of Independent Testing Laboratory, four weeks prior to earthwork.
 - 2. Temporary excavation and shoring drawings for worker protection in accordance with the General Conditions.
 - 3. Gradation analysis.
 - 4. Dewatering plan including disposition of groundwater.

5. Materials Sources: Name of source, location, date of sample, sieve analysis, and laboratory compaction characteristics.
6. Test and Evaluation Reports:
 - a. Field density testing reports: Provide results from field density testing of prepared subgrade and compacted fill.
 - b. Grain-size analysis.
 - c. Laboratory compaction characteristics of soils.
 - d. Water content.
7. Compaction method and removal sequence of shoring.
8. Mix design and test results for controlled low-strength material (CLSM).

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Sustainability Standards Certifications.
- C. Sample backfill materials in accordance with ASTM D75.
- D. Provide testing in accordance with Part 3 of this section.
 1. Employ an independent testing laboratory with the following qualifications: Accreditation by the American Associates of State Highway and Transportation Officials (AASHTO) Accreditation Program.
 2. Minimum of three years experience in sampling, testing and analysis of soil and aggregates, and monitoring field compaction operations. Minimum of three references from previous work.
- E. Protect excavations by shoring, bracing, sheet piling, underpinning or other methods required to prevent cave-in of loose soil. Protection shall be in accordance with OSHA 29 CFR 1926, Subpart P.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Provide geotextile fabric in rolls wrapped with protective covering to protect geotextile fabric from mud, dirt, dust, and debris. Label each roll of geotextile fabric with number or symbol to identify production run.

- C. Protect geotextile fabric from sunlight during transportation and storage. Do not leave geotextile fabric exposed to sunlight for more than two weeks during installation operations.

1.08 SITE CONDITIONS:

A. Existing Conditions:

1. Geotechnical Report: The report is attached for information only and is not part of the contract documents. Logs of borings are included in the report and indicate conditions encountered only at test boring locations. Nothing in the contract documents shall be construed as guarantee that other materials will not be encountered or that proportion of materials will not vary from proportions shown on the logs of test borings.

PART 2 - PRODUCTS

2.01 BACKFILL MATERIALS:

- A. Stabilization Material for Foundation: Stabilization material shall consist of hard, durable particles of stone or gravel, screened or crushed to the required size and gradation. The material shall be free from vegetation matter, lumps or balls of clay, or other deleterious matter and shall conform to the following gradation when tested in accordance with AASHTO T27 or ASTM C136.

1. Coarse material shall be crushed or washed and fine material shall be wasted to meet the grading requirements set forth below. Note that if stabilization material is required, an 8 oz. non-woven filter fabric shall be placed between the stabilization material and the pipe zone material.
2. Coarse aggregate, retained on the No. 4 sieve, shall have a percentage of wear not greater than 40 percent when tested by the Los Angeles Test, AASHTO T-96 or ASTM C 131.

- B. Pipe Zone Material: All material in the pipe zone shall be clean and free from alkali, salt, petroleum products, vegetative matter or other deleterious matter, slag, cinders, ashes and rubbish, recycled RAP, or other material that in the opinion of the ENGINEER may be objectionable or deleterious. "Squeegee" or any other flowable material shall not be permitted. Pipe zone material shall conform to the following:

1. Rigid Pipelines - RCP – Gravel, 100 percent crushed mineral aggregate per the following gradation:

Sieve Size	Percentage Passing
1-1/2 inch	100
1 inch	95 to 100
1/2 inch	25-60
No. 4	0-10
No. 200	0-5

2. Flexible Pipelines - DIP– Sand per the following gradation:

Sieve Size	Percentage Passing
3/8 inch	100
No. 10	30-60
No. 40	0-30
No. 200	0-15

3. HDPE and Steel Pipeline - Controlled Low-Strength Material (Flowable Fill) as specified in Section 03 31 05 Controlled Low Strength Material.

- C. Granular Trench Backfill: Granular trench backfill may be imported or native fill materials and shall consist of materials meeting soils classifications A-1, A-2 or A-3 of AASHTO M145, with a maximum particle size no greater than 3-inches in any dimension and shall be capable of meeting the compaction requirements. Trench backfill shall be non-plastic. Trench backfill shall be free from alkali, salt, petroleum products, vegetative matter or other deleterious matter, slag, cinders, ashes and rubbish, recycled RAP, or other material that in the opinion of the ENGINEER may be objectionable or deleterious. “Squeegee” or any other flowable material shall not be permitted.

2.02 EQUIPMENT:

- A. Compaction equipment shall be capable of consistently achieving the specified compaction requirements.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verify that dewatering support systems are in place before commencing with excavation.
- B. Verify that excavation safety and support systems meeting the requirements of OSHA 29 CFR 1926, Subpart are in place before commencing with excavation.

1. Minimum slopes for laying back excavations or materials are contained in OSHA 29 CFR 1926, Subpart P; Appendices A and B.
 2. Minimum requirements for shoring and bracing are contained in OSHA 29 CFR 1926, Subpart P; Appendix C
- C. Verify that fill materials submittals have been accepted by Engineer before commencing with work requiring the use of these materials.
- D. Verify that erosion and sediment control measures are in place and functioning properly.
- E. Immediately notify the Engineer if unexpected subsurface facilities or suspected hazardous materials are encountered during excavation. Discontinue affected work in area until notified to resume work.
- F. Test Pits:
1. Comply with the requirements in Section 01 14 14.
 2. Excavate test pits to field verify the locations of existing underground utilities at crossings and at tie-in points before ordering materials or commencing excavation. Immediately notify the Engineer if conflicts are encountered.
- 3.02 PREPARATION:
- A. Underpin adjacent structures that could be damaged by excavation work.
 - B. Cut pavement with saw or pneumatic tools to prevent damage to remaining pavement. Dispose of large pieces of demolished pavement before proceeding with excavation.
- 3.03 PROTECTION OF IN-PLACE CONDITIONS:
- A. Comply with the requirements specified in Section 01 14 14.
 - B. Support and protect from damage – existing pipes, poles, wires, fences, curbs, property line markers, and other features or structures which must be preserved in place to avoid being temporarily or permanently relocated.
 - C. Excavation Near Existing Structures:
 1. Discontinue digging by machinery when excavation approaches pipes, conduits, or other underground structures. Continue excavation by use of hand tools. Include such manual excavation in work to be done when incidental to normal excavation and under items involving normal excavation.
 2. Excavate test pits near, or at intersection with, existing utilities or underground structures to determine the exact location of existing features.
 - D. Excavation Near Private Property:

1. Record existing condition of features on adjacent property by means of dated photographs or cameras. Provide construction photographs according to Section 01 32 33.
2. Enclose uncut tree trunks adjacent to work in wooden boxes of such height necessary to protect tree from injury due to piled material, equipment, or operations. Operate excavating machinery and cranes so as to prevent injury to overhanging branches and limbs.
3. Protect cultivated hedges, shrubs, and plants which would otherwise be damaged by the work.
4. Where protection of vegetation is not possible, dig up, temporarily transplant, and maintain. After active construction operations in the area have ceased, transplant vegetation to the original positions and provide water and nursery care until growth is re-established.
5. Do not use or operate tractors, bulldozers, or other power-operated equipment on paved surfaces. Provide protection on pavement or tracks if construction traffic is unavoidable.

3.04 RESTORATION:

- A. Restore private property and structures promptly. Begin restoration work within 24 hours of when damage occurred.
- B. Existing surfaces, features, or utilities that are to remain but are damaged during construction shall be repaired or replaced to at least the condition in which they were found immediately before work began, unless noted otherwise.
- C. Damaged Trees To Remain: Cut all damaged branches, limbs, and roots smoothly and neatly without splitting or crushing. Neatly trim, cut the injured portions and cover with an application of grafting wax or tree healing paint. Replace damaged trees which subsequently die or continue to show lack of growth due to damage, one year after substantial completion.
- D. Cultivated Vegetation: Includes, but is not limited to, hedges, shrubs, and plants. Vegetation that is damaged shall be replaced with equal kind and of at least the quality before work began.

3.05 TRENCH EXCAVATION:

- A. Provide dewatering system to allow for working conditions in dry, stable soil. Properly dispose of water to avoid damage to property and in accordance with laws and regulations. Lower groundwater table prior to excavation and keep a minimum of 24 inches below lowest excavation subgrade until structure has sufficient strength to withstand soil and water pressures.

- B. Sheet and brace trenches, excavations, and adjacent structures to comply with laws and regulations and to provide protection of life, property, and the Work. Where close sheeting is necessary, drive to prevent adjacent soil from entering excavation. Remove close sheeting only when removal would not damage property or the Work. Sheeting shall not be left in place.
- C. Preserve material below and beyond the lines of excavations.
- D. Locate stockpiled excavated material at least 3 feet from edge of excavations to prevent cave-ins or bank slides.
- E. Bottom Preparation:
 - 1. Where rock, hard pan, boulders or other material which might damage the pipe are encountered, the bottom of the trench shall be over excavated 4 inches below the required grade and replaced with Stabilization Material. Otherwise, the bottom of the trench shall be over excavated 6 inches or 1/12 the outside diameter of the pipe, whichever is greater, below the required grade and replaced with Pipe Zone Backfill.
 - 2. The bottoms of trenches shall be accurately graded to provide uniform bearing and support for the bottom quadrant of each section of the pipe. Bell holes shall be excavated to the necessary size at each joint or coupling to eliminate point bearing. Stones of 1-inch or greater in any dimension, or as recommended by the pipe manufacturer, whichever is smaller, shall be removed to avoid point bearing.
 - 3. If the soils at the base of the pipeline excavations consist of higher clay content or looser sands, then it may be necessary to increase the thickness of the bedding layer to approximately 18 to 24 inches with geotextiles placed on the base of the trench and extending up to the spring line of the pipe, depending on the stability of the soil at the time of construction. Backfill shall be Stabilization Material or Pipe Zone Backfill.
- F. Removal of Unstable Material
 - 1. Where unstable material is encountered in the bottom of the trench, such material shall be removed to the depth directed by Engineer and replaced to the proper grade with Stabilization Material. When removal of unstable material is required due to the fault or neglect of Contractor in his performance of the work, the resulting material shall be excavated and replaced by Contractor without additional cost to Owner.
- G. The trench bottom (at the level of the base of the pipe) shall be given a final trim using a string line, laser, or another method approved by Engineer for establishing grade, such that each pipe section when first laid will be continually in contact with the ground along the extreme bottom of the pipe. Bell holes shall be provided at each joint to permit the jointing to be made properly. The trench grade shall permit the pipe spigot to be accurately centered in the preceding laid pipe joint, without lifting the pipe above the grade, and without exceeding the permissible joint deflection.

3.06 UNAUTHORIZED EXCAVATION:

- A. Contractor is responsible for backfilling unauthorized excavations with bedding material.

3.07 BACKFILL:

- A. Fill to lines and grades necessary to provide finish grades.
- B. Use a placement method that does not disturb or damage other work or existing features.
- C. Maintain fill materials within optimum moisture, to attain required compaction density.
- D. Place and compact material in equal continuous layers.

E. Pipe Zone:

1. Pipe Zone Backfill shall be placed in layers not exceeding 6 inches loose thickness for compaction by hand operated machine compactors, and 8 inches loose thickness for other than hand operated machines, unless otherwise approved or specified. The backfill shall be brought up evenly on both sides of the pipe for the full length of the pipe. Care shall be taken to ensure thorough compaction of the fill under the haunches of the pipe. Each layer shall be compacted to at least 95 percent of the maximum Modified Proctor density (ASTM D-1557), unless otherwise specified or indicated in the geotechnical report.
2. Replacement of Unyielding Material: Unyielding material removed from the bottom of the trench shall be replaced with Stabilization Material placed in layers not exceeding 6 inches loose thickness.
3. Replacement of Unstable Material: Unstable material removed from the bottom of the trench or excavation shall be replaced with Stabilization Material placed in layers not exceeding 6 inches loose thickness.
4. Where the pipe grade exceeds 30%, cohesive material shall be used in lieu of pipe bedding. The cohesive material shall be moistened to within 2% of optimum moisture and compacted as noted.
5. The relative density of the compacted cohesionless material shall not be less than 60% as determined by the Bureau of Reclamation Relative Density of Cohesionless Soil Test (Designation E-12) of the "Earth Manual."

F. Trench Backfill: Trenches shall be backfilled to the grade shown with Trench Backfill material as specified.

1. Trench backfill in asphalted road shall consist of backfilling the trench from above the pipe zone up to underneath the noted recommended depth for untreated base course and asphalt or concrete of finished grade with Trench Backfill material compacted to at least 95 percent of maximum density (ASTM D-1557), unless

otherwise specified or indicated in the geotechnical report. Backfill shall be placed in layers not exceeding 6-inches loose thickness for compaction by hand operated machine compactors, and 8 inches loose thickness for other than hand operated machines, unless otherwise approved or specified.

2. Trench Backfill in unimproved or landscaped areas shall consist of backfilling the trench from above the pipe zone to 8-inches below finished grade with Trench Backfill material compacted to 90 percent of maximum density (ASTM D-1557), unless otherwise specified or indicated in the geotechnical report. Backfill from 8-inches below finished grade to finished grade shall consist of topsoil replacement in addition to replacement of all landscaped materials. Trench Backfill shall be placed in layers not exceeding 8 inches loose thickness.
3. It shall be the responsibility of Contractor to be assured that the Trench Backfill material is capable of being compacted to the degree specified. It shall be Contractor's responsibility to remove and dispose of all excess excavated material.

G. Final Backfill:

1. Unimproved and Landscaped Areas: The top 8-inches of the trench shall be filled with topsoil. Topsoil may be native material stripped prior to excavation of the trench. Backfill shall be deposited in layers of a maximum of 12-inch loose thickness and compacted to a minimum of 85 percent maximum density (ASTM D-1557). Compaction by water flooding or jetting will not be permitted. This requirement shall also apply to all other areas not specifically designated above.
2. Roadways shall be completed with the type and thickness of materials (i.e., Untreated Road Base and Asphalt) as indicated or shown on the Contract Drawing.

3.08 CLSM PLACEMENT:

- A. Place the CLSM so that it flows easily into all openings between the pipe and the excavated trench. In some cases, such as trenches on a slope, a stiffer mix may be required to prevent it from flowing down the trench. In this case, use vibration to ensure that the CLSM completely fills all spaces.
- B. Lay the pipe on the soil pads and place the CLSM bedding as shown in the drawings. Place bedding under pipe from one side and vibrate so that it flows under the pipe until it appears on the other side. Then add CLSM to both sides of the pipe and vibrate until it completely fills the space between the pipe and the excavated trench bottom. This operation shall follow as closely behind pipe laying operations as possible. Place CLSM in such a way as to prevent uplift or buckling of the pipe. Deposit CLSM as nearly as practicable in its final position. Do not disturb the pipe trench or cause foreign material to become mixed with the cement slurry.
- C. Do not place backfill above the pipe until the CLSM has reached the initial set. Place and maintain a 6-inch cover of moist backfill cover until additional backfill is placed. If the

ambient temperature is 50 degrees F or less, place an additional 6-inch cover of backfill over the moist backfill cover prior to the end of the working day.

- D. Whenever freezing temperatures are imminent, maintain the CLSM at a temperature of not less than 50 degrees F for 24 hours after placement. The temperature of the mix shall be 50 degrees F or greater at the time of placement. Monitor the temperature by placing a thermometer in the CLSM immediately after sampling at the placement site. When freezing weather appears imminent, make ready at the placement site materials that may be required for protection of the CLSM. Delay placement of CLSM until adequate provisions for protection against weather are made. Do not place CLSM bedding in pipe trenches when the trench bottom or walls are frozen or contain frozen material. Backfill placed as cover over the CLSM is prohibited from containing any frozen material.

3.09 SPECIAL REQUIREMENTS

- A. Special requirements for both excavation and backfill relating to the specific utilities from above the pipe zone to the natural surface level or the finished grade indicated on the Plans shall be placed and compacted as follows:
 - 1. Where existing underground pipes or conduits larger than 3 inches in diameter and all sizes of sewer lines or sewer laterals cross the trench above the new work, the backfill from the bottom of the trench to 1 foot above the top of the intersecting pipe or conduit shall be pipe zone material compacted to 95 percent of maximum density (ASTM D-1557). The pipe zone material shall extend 2 feet on either side of the intersecting pipe or conduit to ensure that the material will remain in place while other backfill is placed.
- B. The maximum trench length open at any given time shall not exceed 200 feet unless approved by ENGINEER and must be backfilled in a timely manner.

3.10 COMPACTION:

- A. Compact to density specified and indicated for various types of material. Control moisture content of material being placed as specified, or if not specified - at a level slightly lower than optimum.
- B. Compaction Density: Provide trench backfill densities according to Table 31 23 33-4. The values listed are minimum percentages, unless noted otherwise.

Table 31 23 33-4	
Area	Percentage of Maximum Dry Density as defined by ASTM D1557 (Modified Proctor)
Trench Backfill (under pavement, slabs)	95
Trench Backfill (under structures or within 25 feet (7.5 m) of structures)	95
Trench Backfill (through embankment)	98
Trench Backfill (under exterior concrete slab and sidewalks)	95
Trench Backfill (in open or grassed areas)	90

3.11 UTILITY IDENTIFICATION:

- A. Install marking tape over all site utilities, 18inches above pipeline.
- B. Install trace wire at top center of pipeline; pull wire taut to remove any slack.
- C. Extend trace wire to utility boxes, manholes and junctions to allow for connection to subsurface location equipment.

3.12 FIELD QUALITY CONTROL:

- A. See Section 01 40 00 for general requirements for field inspection and testing.
- B. Compaction shall be deemed to comply with the specifications when no more than one (1) test of any 3 consecutive tests falls below the specified relative compaction. The one test shall be no more than 3 percentage points below the specified compaction. The Contractor shall pay the costs for any retesting or additional testing of work not conforming to the specifications.
- C. Where compaction tests indicate a failure to meet the specified compaction, the Owner will take additional tests every 25 feet in each direction until the extent of the failing area is identified. Rework the entire failed area until the specified compaction has been achieved.
- D. Perform particle size distribution and gradation analyses using ASTM D422 and following standard practices in ASTM D421. Perform one (1) test for every source and submit results to Engineer for acceptance. Repeat the moisture density test for every 5,000 cubic yard of material used.
- E. Perform field density testing in accordance with ASTM D1556, ASTM D2167, or ASTM D6938.

- F. Evaluate field density test results in relation to maximum dry density as determined by testing material in accordance with ASTM D1557 (Modified Proctor).
- G. Perform tests in accordance with ASTM D4318 to determine Liquid Limit, Plastic Limit and Plasticity Index and submit test results to Engineer for acceptance. Minimum of one test per 5,000 cubic yard of soil for use as fill material and whenever classification of material is in doubt as determined by the Engineer.
- H. Location of field density tests shall be mutually acceptable to testing laboratory and the Engineer.
- I. Frequency of field density tests:

Table 31 23 33-5	
Area	Frequency
Trench	1 per lift for each 200 linear feet of trench
Regardless of the minimum testing frequency specified, field density tests shall be performed by the Contractor in sufficient number for the Contractor's quality control purposes to ensure that specified density is obtained.	

- J. Owner may retain the services of an independent testing laboratory to conduct confirmatory testing and inspection.

3.13 ADJUSTING:

A. Shrinkage:

1. Backfill to a height above finished grade which will allow for the shrinkage or consolidation of material. Initially, provide at all points, an excess of at least one percent of total height of backfill measured from stripped surface to top of finished surface.
2. Supply specified materials and build up low places, without additional cost if embankment or backfilling settles so as to be below the indicated level for proposed finished surface at any time before final acceptance of the work.

3.14 PROTECTION:

- A. Formulate excavation, backfilling, and filling schedule and procedures to eliminate possibility of undermining or disturbing foundations of partially and completed structures, pipelines and embankments or existing structures and pipelines.

3.15 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 70 00.

END OF SECTION

SECTION 31 24 02

GROUND IMPROVEMENT USING SOIL MIX COLUMNS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This specification covers the following items of work:
1. Furnishing all labor, supervision, equipment, and materials necessary to perform a soil mix column performance-based design, test section and install production soil mix columns within the improvement zones and depths as shown on the Contract Drawings and herein in this Specification with all associated acceptance testing, monitoring, sampling, recording, and site restoration and provide all associated documentation.
 2. Evaluate site conditions and data provided and perform any additional investigation, testing or analysis materials necessary to complete the design and a compliant installation.
 3. Deliver and place all materials necessary in the improvement process.
 4. Collect, store, and dispose of all spoils and water produced by the installation process, including groundwater that may rise to the surface during installation.
 5. Monitor and mitigate impacts of the ground improvement operation on existing utilities, roadways, and nearby structures, including, but not limited to potential vibrations, settlement, heave, and coordination with other site activities.
 6. Perform and document post installation testing to verify the required level of improvement.

1.02 DEFINITIONS

- A. Contractor – refers to the general contractor for the Project.
- B. Ground Improvement (GI): Treating soil in situ by soil-cement mixing technology. Ground Improvement Columns (GIC) are formed by soil-mixing shaft(s) guided by a lead mounted on a crawler base machine. The mixing shaft(s) shall be driven by a power source sufficient to provide torque for a wide range of drilling conditions and to maintain continuous installation of GIC. As the mixing shaft(s) are advanced into the soil, Portland cement grout is pumped through the hollow stem of the shaft(s) and injected into the soil at the shaft tip(s). Auger flights and mixing blades on the shaft(s) blend the soil with grout in a pugmill fashion. When the design depth is reached, the mixing shafts are withdrawn while the mixing process is continued. In some cases, the mixing shaft(s) are positioned to overlap one another, forming continuously-mixed overlapping columns.

- C. GI Contractor – refers to the subcontracted ground improvement contractor for the Project.
- D. Grout: A stable mixture of water, Portland cement, and possibly admixtures. The purpose of the grout is to assist in loosening the soils for penetration and optimum mixing, and upon setting, to decrease the compressibility and increase the strength of the in-situ soil.
- E. Grout-Soil Ratio: A volumetric ratio of grout to *in situ* soil to be mixed.
- F. Cement Content in Place: The ratio of cement (in terms of dry weight) used to treat a given volume of in situ soil and the grout volume.
- G. Mixing Spoils: All materials including liquids, semi-solids, and solids that are discharged above ground surface during or because of GI operations.
- H. Quality Control Testing Laboratory: An independent testing laboratory retained by the Contractor that is responsible for obtaining and testing GIC specimens for quality control. Testing costs for the Provo River Water Treatment Plant area shall be incurred by the GI Contractor.
- I. Working Platform Level: The ground surface level from which the GI is installed.
- J. Pre-Drilling: Performed up to an equivalent diameter, up to the design depth to move soil, reduce the mixing resistance or remove obstructions.

1.03 GROUND IMPROVEMENT DESIGN

- A. The GI Contractor shall design patterns based on soil mixing technology to satisfy requirements for the treatment zone specified herein. GI Design submittal shall include a Quality Control Plan confirming required acceptance criteria which shall be submitted to the Engineer for review and approval.
- B. This specification is for installation of soil mix columns. Alternate bids using Aggregate Columns, Section 31 24 03, will be considered.
- C. Use a qualified, Utah registered professional engineer experienced in GI to design GI including column size and layout and provide supporting calculations.
- D. Design requirements include, but are not limited to, the analysis to conform the GI treatment adequately satisfied the site performance criteria. The GI Contractor design shall be responsible to obtain adequate site soil samples, to perform lab mixing tests and determined the mixing binder dosage, and all the soil-cement design and mixing parameters.
- E. Performance criteria documented by the design analysis shall provide the following ground control for foundation support of all structures in the mitigation area:
 - 1. A minimum area replacement ratio of 0.25. The Contractor may include an alternative providing a line item deduct for consideration by the Owner using a

lower area replacement ratio if accompanied by attached supporting design and calculations or modeling (sealed by a Utah registered professional engineer) demonstrating conformance to other performance criteria below.

2. A minimum bearing capacity of 6,000 pounds per square foot.
3. Mitigation of static settlement to less than one inch.
4. Mitigation of seismic shaking and liquefaction settlement to less than three inches, using the 2021 method of analysis including its approach for silts where applicable. (ref. Boulanger & Shao, 2021).

F. Site Preparation by the Contractor:

1. The building pads identified on the plan will be over-excavated to the elevation shown on the Contract Drawings. The Contractor will provide GI Contractor a flat, dry, stable working platform, suitable for the soil mixing equipment operation.

G. Contract Work Includes:

1. In accordance with the specifications contained in this Section and as shown on the plans, the GI Contractor shall furnish all plant, equipment, labor, and materials required to construct all the GI as indicated in the Contract Documents.
2. The GI Contractor shall determine and be responsible for providing all mixing binder material.
3. Construct GI in area shown on the plans.
4. Implement the Quality Control Plan and provide all submittals and documentation as required in these specifications, include, but are not limited to monitor the mixing tool penetration depth, RPM, grout flow rate and specific gravity, etc., provide daily production/QC reports, provide remixing or repair plans as needed, collect wet soil mixing samples every shift and transport the samples to an accredited laboratory (Lab) for Unconfined Compressive Strength (UCS) testing, drill confirmation core holes at randomly selected Ground Improvement Column (GIC) locations.

H. Owners Representative

The Owner's Quality Assurance (QA) representative Engineer for the Provo River Water Treatment Plant project (Project) will be AECOM. They will perform the following the following tasks:

1. Observe and document soil improvement activities.
2. Log confirmation core borings drilled at selected GIC locations.
3. Select locations of confirmation core borings.

4. Accept and transport core samples to the Lab to cure samples to the planned test dates.
5. Oversee UCS tests performed by the Lab on selected wet and core samples and evaluate the test results.
6. Prepare a final report that will include a summary of field observations, laboratory test data and an opinion as to whether the GI meets the acceptance criteria. The final inspection report will be submitted to the Engineer and the Owner for review and approval.

1.04 REFERENCES

A. Standards

The following publications form a part of this specification to the extend referenced.

1. American Concrete Institute (ACI).
2. American Society of Testing and Materials (ASTM) ASTM D1143: Standard Test Methods for Deep Foundations Under Static Axial Compressive Load.
3. ASTM D1586: Standard Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils.
4. ASTM D5778: Standard Test Method for Electronic Friction Cone and Piezocone Penetration Testing of Soils.

B. References

1. Geotechnical Report, Attachment A: The report is attached for information only. GI Contractor shall base their design on their own assessment of site geotechnical conditions and proposed foundation system.
2. Applicable Contract Drawings including improvement area plan and underground utilities plan.
3. Contract Documents.

1.05 SUBMITTALS

A. Qualifying experiences:

1. The following shall be submitted to and approved by the Engineer:

2. Qualifying Experience. The GI Contractor shall have at least 10 years of documented cement deep soil mixing experience and minimum of five deep soil mixing projects.
 - a. Submit a copy of the last five completed cement deep soil mixing projects including the job name, date, location, project description, treated cubic yards and professional references.
3. Qualifying Individual Experiences. The subcontractor shall submit the name and resume of the proposed individuals for the following job classifications. Resume shall include the individual's number of years of experience, project name, project descriptions and references.
 - a. Utah registered Engineer with geotechnical training and experience who will be responsible to prepare and manage the design and construction of the cement deep soil mixing program, including the mix design and drawings, and to review the QC/QA records, as-built drawings and to confirm that the GI work meets the design intent. Minimum of five years of experience designing GIC projects required.
 - b. All quality control/quality assurance supervisor(s), testing technician(s), and laboratory technician(s) shall have a minimum of one year of experience in cement deep soil mixing.
 - c. Project manager shall have managed a minimum of five years of experience managing GIC projects. The project manager shall be on-site for at least half of each shift.
 - d. Project Superintendent shall have five years of experience as GI Superintendent.
 - e. Two Equipment Operators shall each have a minimum experience of two GIC Projects. One of the two operators must be continuously onsite during each shift.
 - f. Grout Mixing Plant Operator shall have a minimum experience of two GIC projects. The operator must have experience operating the same equipment that will be utilized onsite.
4. Personnel Substitutions: The cement deep soil mixing contractor must submit a formal request in writing to the Owner and Engineer to request the substitution of any personnel previously approved by the Owner and Engineer. Personnel substitutions will not be granted in the event the experience level of the substituted professional(s) is less than required above.

B. Design Performance Criteria

Evidence of conformance to the referenced standards and requirements shall be submitted for the following:

1. Final GI Design Plan: The GI Contractor shall submit a Final GI Plan for review and approval by the Engineer. This Final GI Design Plan shall be a deferred submittal, and must gain all approval from Engineer, prior to start of work. This design should include:
 - a. Grout Mix: Proposed mix designs including all materials and quantities and documentation of calibration of the mixing plant. The mix design shall be supported by the GI Contractor lab mixing program.
 - b. GIC Layout and Construction Sequence: The GIC layout shall include at a minimum: individual column designations, column center coordinates (northing and easting coordinates to the nearest 0.1 feet), and anticipated column lengths (based on depth elevations shown in the plans). The GIC layout shall meet the horizontal alignment requirements of 3.02 herein. The anticipated column construction sequence shall be included in the submittal.
 - c. Equipment and Procedures: Submit a detailed description of the equipment and procedures to be used during all facets of the project including, but not limited to, predrilling, construction of GIC, monitoring the quality control parameters outlined in 1.04.C herein, and the collection of samples for laboratory confirmation testing. Procedures shall include methods for locating the GIC in the field and confirming that the columns are plumb. The GI Contractor shall also submit the anticipated cement dosages to achieve the acceptance criteria outlined in 3.06 herein.
 - d. Quality Control Program: The Contractor shall submit a detailed work plan for the Quality Control Program. The work plan shall include, as a minimum, a description of all procedures to be implemented, parameters to be monitored, tolerances for the parameters monitored, and the names of any subcontractors used for testing.
2. Cement: Certificate for each truck load delivery, if requested.
3. Admixtures: If used.
4. Construction Schedule: Submit a detailed schedule that identifies start dates and duration of each major task in the work. The schedule shall include information regarding a lab strength testing program for the GI area, equipment mobilization, equipment setup, GI production installation, and verification testing.
5. Mixing Spoils: Submit sketches and narrative that describe the procedures to collect, contain, and temporarily store mixing spoils. Temporary storage area and spoil

storage areas shall be identified and coordinated with the owner and prime contractor.

C. Daily Production/Quality Control Report:

1. Submit the Daily Production/Quality Control Report at the end of next working day. Fill out the Daily Production/Quality Control Report, check for correctness, and have it signed by the GI Contractor's field superintendent. The report shall be in conformance with requirements herein.
2. The report shall contain, but not be limited to, the following information:
 - a. Day, month, year, time of beginning and end of work shift; name of each superintendent in charge of the work for the GI Contractor; a list of all worker names associated with each GIC rig; and a summary of equipment used during the shift.
 - b. Details of predrilling activities, including but not limited to, depth, diameter, drilling equipment, portion of boring backfill, and type of backfill materials used.
 - c. The locations, installation sequence, and as-installed top and bottom elevations of the GIC installed during the work shift, and any deviations from the planned locations and vertical alignment.
 - d. Time of start and completion of each GIC installed during the work shift and a summary of any downtime during the shift including time of work stoppage, duration, reason, and if work stoppage occurred while mixing a GIC.
 - e. Specific gravity of the cement grout, grout injection pressures and rates, quantities of cement, cement factors, cement additives, and water used, mixing rotational speeds, penetration, and withdrawal rates of the mixing equipment within every foot depth increment, and mixing time at the bottom of the column for each GIC.
 - f. Include grout batching records or real-time specific gravity coinciding with GIC installation.
 - g. Other pertinent observations including, but not limited to, the operator's log including a description of the drill rig performance, operator observations, description of spoil returns, cement grout escapes, ground settlement and/or heave, collapses of the GIC, remixing of columns, obstructions, and any unusual behavior of the equipment during the GI process.
 - h. All electronic data collected from all the GIC shall be submitted to the Owner on an electronic media, or printed sheets before the completion of the next soil mixing shift.

- i. Logs of core borings and records of GIC wet grab samples and core samples taken during the work shift including sample designation, date, time, plan location, elevation, and the name of the firm and person(s) obtaining the samples.
 - j. The report shall include as a minimum the results of the following QC parameter monitoring for each GIC:
 - (1) Rig number.
 - (2) Type of mixing tool.
 - (3) Date and time (start and finish) of GIC construction.
 - (4) GIC number and reference drawing number.
 - (5) GIC average diameter and length.
 - (6) GIC top and bottom elevations.
 - (7) Grout mix design designation or specific gravity measurements.
 - (8) Description of obstructions, interruptions, or other difficulties during installation and how they were resolved.
 - k. The report shall also include the following parameters recorded automatically for each GIC at intervals no greater than 1.0 foot and submitted in a PDF file in either tables or figures:
 - (1) Depth vs. real time.
 - (2) Mixing blade rotation number vs. depth.
 - (3) Penetration and withdrawal rates vs. depth; and
 - (4) Grout injection rate vs. depth for each column within the GIC for each separate grout injection
 - (5) Binder content (cement weight/unit soilcrete volume) vs depth for each GIC.
- D. Remixing or Repair Plan: If the GIC acceptance criteria are not achieved the GI Contractor shall submit to the Owner a proposed plan for remixing, or adding columns, or repair of failed sections for review and approval.
- E. GIC Samples: Submit GIC samples (other than those required for the GI Contractor testing) as outlined in 1.01 D.4 herein at the end of each day that the samples are collected.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Grout: The material added to the blended *in situ* soils shall be a water-based Portland cement grout. The grout shall be premixed in a mixing plant which combines dry materials and water in predetermined proportions. The grout shall not have begun its initial set before it is injected into the ground. The grout must be used within three hours of first mixing or be discarded.
- B. Portland Cement: Cement shall conform to ASTM C150 "Standard Specification for Portland Cement" Type II/V. The cement shall be adequately protected from moisture and contamination while in transit to the job site and while in storage at the job site. Reclaimed cement or cement containing lumps or deleterious matter shall not be used. Cement containing lumps or foreign matter of a nature and in amounts that might be deleterious to the grouting operations shall not be used. All cement shall be homogeneous in composition and properties.
- C. Water: Fresh water, free of deleterious substances that may adversely affect the strength and mixing properties of the grout or any substance that may be considered an environmental concern, shall be used to manufacture grout. Owner will provide water sources of up to 500 gpm.
- D. Admixtures: Admixtures are added to the mixture immediately before or during mixing. Admixtures of softening agents, dispersions, retarders or plugging or bridging agents may be added to the water or the grout to permit efficient use of the materials and proper workability of the grout. If admixtures are proposed, the GI Contractor shall provide a written statement from the manufacturer as to the use of any such admixture, its effect on the GIC material, its long-term performance and stability, and its effect on the environment.
- E. Blended Portland Cement: Additional solids such as ground slag may also be used in the grout mix design. Fly ash or other solids containing heavy metals or other substances that may be considered an environmental concern shall not be used in the grout mix design.

2.02 EQUIPMENT

- A. The GIC equipment shall meet the following requirements:
 - 1. Single or multi-shaft shaft mixing equipment is allowed. The mixing shaft(s) shall have mixing augers and blades (paddles) configured in a manner so that they are capable of thoroughly blending the in-situ soils and grout. Auger flights and mixing paddles on the shaft(s) shall extend to the full diameter of the GIC being formed.
 - 2. The power source for driving the mixing shafts shall be sufficient to maintain the required revolutions per minute (RPM) and penetration rate from a stopped position at the maximum depth required. Mixing equipment shall be capable of advancing

- through previously installed and hardened GIC material. Pre-drilling may be used to assist GIC installation.
3. The GIC rig shall be equipped with electronic sensors built into the leads to determine vertical alignment in two directions: forward-aft and left-right. The output from the sensors shall be routed to a console that is visible to the operator and the Engineer during penetration.
 4. The equipment and/or GIC overlapping technique shall be configured so that the length of the overlapping extends for the full depth of the GIC.
 5. The GIC equipment shall be adequately marked and have electronic depth display to allow the Engineer to evaluate the penetration depth to within 6 inches during construction.
 6. As a minimum, the grout shall be premixed in a mixing plant that combines dry materials and water in predetermined proportions. The mixing plant shall consist of a jet valve, grout circulation pump, variable speed cement feeding system, and a mass flow meter. The mass flow meter shall be used to accurately determine mix proportions in terms of specific gravity. The GI Contractor shall provide the calibration sheet of the mass flow meter at the beginning of the project and monthly thereafter.
 7. Progressive cavity pumps shall be used to transfer the grout from the mixing plant to the auger(s). Grout pumps shall be capable of pumping the required distance and elevations to provide and maintain an adequate supply of grout to the mixing augers or mixing tools. The grout shall be delivered to the slurry-injecting auger by an individual progressive cavity pump having an inline flow meter and pressure gauge.
 8. All equipment shall have devices to permit accurate and continuous monitoring and control of: (1) specific gravity, (2) cement-grout injection pressures and quantities, (3) mixing tool rotation speeds, (4) advancement and withdrawal rates of the mixing tools, and (5) other operations required to install and mix GI materials.
 9. Pre-drilling equipment shall be of sufficient capacity to excavate the GI bore hole to the design depth, or shallower, as required.

2.03 GROUT MIXES

- A. GIC: The grout mixed with the in-situ fill soils shall achieve an average unconfined compressive strength of no less than 150 psi at 56 days. The unconfined compressive strength (UCS) of individual samples shall be determined in accordance with ASTM D1633 "Standard Test Methods for Compressive Strength of Molded Soil-Cement Cylinders." An average UCS shall be calculated for the treatment area. In calculating an average UCS, test results at 56 days for both wet samples and core samples shall be used and a ceiling, not-to-exceed value of twice the target average UCS (i.e., 300 psi) shall be used for individual samples. No more than 10 percent of all specimens in the area shall exhibit an UCS of less than 60 psi at 56 days.

PART 3 - EXECUTION

3.01 GENERAL

- A. The GI shall be constructed within the area designated and to the lines, grades, and cross section indicated on the plans. The GI shall have essentially vertical columns, with a minimum diameter of four feet and shall extend to Elevation 4578 feet. Columns shall be terminated either as shown on the plans, or at a depth determined by the GI Contractor, whichever is deeper. The completed GIC shall be a near homogeneous mixture of grout and each of the situ soil layers. Mixing is to be controlled by shaft rotational speed, drilled speed, and grout injection rate.
- B. The GIC installation may encounter obstructions in the treatment zones. In case the GI Contractor has difficulties in mixing, the GI Contractor shall perform pre-drilling to remove the obstruction in GI Contractor cost. In case pre-drilling cannot penetrate the obstruction, the GI Contractor shall provide alternative solutions to Engineer and Owner. The alternative constructions will be paid by the Owner.
- C. The Contractor shall supply the GI Contractor with a suitable working platform, capable of supporting the weight of the drill and allowing it to move from location to location without difficulty.

3.02 HORIZONTAL ALIGNMENT

- A. The GI Contractor will accurately stake the locations of the proposed GIC shown on the plans before installation. Selected locations will be verified by a surveyor provided by the Engineer. The columns shall be constructed within a tolerable distance for the plan, which the tolerance is defined as the half of the mixing columns overlap distance.
- B. Beneath the footings of the structures, the GIC shall be constructed to create a continuous wall, and all have an adequate overlap to transfer the seismic lateral loads without tensile cracks. The horizontal configuration of the GIC shall be consistent with the layout detail on the plans. The overall design shall also be configured with overlapping columns in panels or cells to resist cracking or buckling during seismic loading.
- C. Movement of the crawler base machine shall provide the preliminary alignment of the augers and the final alignment shall be adjusted by hydraulic manipulation of the leads. The GIC shall be advanced stepwise by overlapping the adjacent columns of the previous strokes where applicable.

3.03 VERTICAL ALIGNMENT

- A. Vertical alignment of the mixing shaft stroke shall be controlled by the equipment operator. Two measurements of vertical shall be monitored, the forward-aft and left-right. The GIC shall be installed at an average inclination deviating no more than 1.5% from vertical.

3.04 COLUMN DEPTH

- A. The anticipated GIC depth at each column location shall be determined by the depth elevations shown on the plans. The contour elevations represent the GI Contractor's best estimate of the approximate elevation of the base of the GIC. Columns shall be terminated either at the contour elevations shown on the plans, or at a depth revised by the GI Contractor, whichever is deeper. In no case shall the columns be terminated at an elevation higher than the contours shown on the plans. In the field, the GI Contractor shall determine the actual depth of each column, based on the soil conditions and obstacles.
- B. The total depth of penetration shall be measured either by observing the length of the inserted mixing shaft and by the on-board computer data acquisition system. The final depth of the stroke shall be noted and recorded on the Daily Production/Quality Control Report by the GI Contractor. The equipment shall be adequately marked to allow the Engineer to evaluate the penetration depth during construction.
- C. The GI Contractor is responsible for penetrating any unexcavated soil, in order to reach the bottom of the treatment zone. This includes, as necessary – excavation, predrilling, use of an advance, etc., to penetrate the treatment zone as shown to the minimum treatment elevation of 4578 feet.
- D. Site conditions are variable. Most but not all borings encountered a zone of near surface dense to very dense sand and gravel overlying the site. Historical fill with construction debris was observed in various areas of the site as was detailed in the Geotechnical Investigation Report referenced above. Conditions other than those depicted in the Geotechnical Investigation Report may also be encountered.
- E. The GI Contractor should not advance soil mixing into soil layers that have artesian pressures. It is the GI Contractor's responsibility to account for artesian pressures in design. A Cone Penetration Test report has been included with the above referenced Geotechnical Report, Attachment A.

3.05 EQUIPMENT AND PROCEDURES

- A. Completed columns shall be a uniform mixture of cement and the in-situ soils. Soil and grout shall be mixed in place by the pugmill-type action of the specially designed blades on the mixing shaft. The grout shall be pumped through the mixing shaft and injected from the tip of the shaft. The shaft shall break up the soil and blend it with cement grout. The mixing action of the shaft shall blend, circulate, and knead the soil over the length of the column while mixing it in place with the grout. The quality of the mixing may be evaluated by the Engineer by observing core samples from the verification borings drilled by the GI Contractor.
- B. Flow of grout through the GI equipment during mixing shall be verified before each stroke by observing the flow out of the auger as it is suspended in the air above the GIC. Any blockage in any mixing auger during construction of a GIC shall be cleared immediately upon discovery. If a blockage occurs while mixing a GIC, the blockage shall be cleared,

and the auger shall be raised 10 feet above the depth at which the blockage occurred before recommencing soil mixing.

- C. Once mixing of a GIC is started, continue the mixing operation until the GIC is completed. If an interruption of more than 2 hours occurs during the installation of any GIC, the column shall be remixed for the entire length of the column using the correct dosage of fresh grout, at no additional cost to the Owner, or the GI Contractor shall install additional column next to the un-finished column.
- D. Debris shall not be allowed to enter the top of the GIC while it is curing.
- E. If observations during installation of a GIC indicate a potential for discontinuity of the column due to improper installation procedures, equipment problems or collapse of the surrounding soil, the GIC shall be remixed to full depth, or add another column, at no additional cost to the Owner.

F. Shaft Rotational Speed and Penetration/Withdrawal Rate

The mixing shaft rotational speed (measured in RPMs) and penetration/withdrawal rates may be adjusted to achieve the required mixing. The required blade rotation number and the binder content shall be determined at the beginning of the work and shall be used during the remainder of the work. If these parameters vary by more than 15 percent from those determined during the beginning of the work, the Engineer may require additional testing to help verify acceptable results at no additional cost to the Owner. The blade rotation number and the binder content shall be recorded on the Daily Production/Quality Control Report.

G. Grout Batching and Injection

Dry material shall be stored in silos and fed to mixers for agitation and shearing. To accurately control the mixing ratio of grout, the addition of water and cement shall be determined by a mass flow meter in the circulation line. The dry admixtures, if used, for mixing with water and cement, may be delivered to the mixing plant by a variable speed cement feeding system maintaining mass flow meter accuracy requirements.

- H. The specific gravity of the grout shall be determined during the lab mix program and approved by the Engineer.
- I. Grout shall be pre-mixed in a mixing plant, which combines dry materials and water in predetermined proportions. The mixing plant shall consist of a jet valve, grout circulation pump, variable speed cement feeding system, and a mass flow meter. The mass flow meter shall be used to accurately determine mix proportions in terms of specific gravity.
- J. Proportioning equipment may use meters, weights, or weight-volumes to ensure proper proportions. Progressive cavity pumps shall be used to transfer the grout from the mixing plant to the augers or mixing tools.

- K. The grout injection rate per vertical foot of column shall be in accordance with the requirements of the design mix. The grout injection rate and specific gravity shall be constantly monitored, calculated, and controlled. Additional mixing shall be used when necessary to evenly distribute the grout throughout the entire column to overcome excess or deficient initial grout applications. The volume of the grout injected for each vertical foot of each column shall be monitored, checked by calculation, and recorded on the Daily Production/Quality Control Report by the GI Contractor.

3.06 QUALITY CONTROL

A. General:

1. The GI Quality Control Program shall be the responsibility of the GI Contractor and shall include, as a minimum, the following components: field monitoring during installation and verification strength testing. During the beginning stages of installation, the GI Contractor may decide whether his work yields acceptable results, and he may proceed further with the same methods. The GI Contractor's decision may be based the verification test results for the wet samples and interpolated based on the soilcrete/age curve developed from the lab test program. The Engineer shall use the results of the verification strength tests on the wet and core samples and the acceptance criteria in evaluating the performance of the GI Contractor. The GI Contractor shall provide all the personnel and equipment necessary to implement the Quality Control Program. In addition, the Engineer will observe construction on as needed basis, will perform lab strength tests, and will review GI Contractor submittals to check that the Quality Control Program is being properly implemented.
2. Based on the GI Contractor's evaluation at the beginning stages of the installation, the Quality Control Program may be revised, if agreed to by the Engineer and Owner. The established quality control procedures shall be maintained throughout the production GIC installation to ensure consistency in the GIC construction and to verify that the work complies with all requirements indicated in the plans and specifications.

B. Sample Collection and Strength Testing:

1. The acceptance of the work shall be based on demonstrating that the in-place mixing of grout with the fill soils has achieved the average strength requirements outlined herein. Average strengths shall be determined by testing wet (grab) and core samples collected by the GI Contractor. Confirmation sample collection and testing, other than the testing required by the GI Contractor, may be conducted by the Engineer. Both the Contractor's and the Engineer's testing must demonstrate that the required average strengths are met prior to acceptance of the work. Samples shall be collected by the GI Contractor using wet sampling and continuous core sampling techniques described below. Tests shall be performed at the frequencies described below.

2. Wet (grab) soil mix samples shall be retrieved and cast into molds from one column per shift, at one random depth for each rig each production shift. Samples shall be retrieved using an in situ wet sampler immediately after column construction and shall consist of no fewer than 8 specimens. Soil clods more than 10 percent of the mold diameter shall be screened off. The GI Contractor shall prepare 3-inch by 6-inch cylindrical molded specimens from each wet sample. Appropriate curing techniques shall be implemented until testing. Unconfined compression testing (ASTM D1633) shall be performed by the Engineer at selected ages, including at 56 days for the GIC. The Engineer shall perform unconfined compression testing on the wet and core samples collected from the test and production columns for the treatment zone. The GI Contractor may use the results of specimens tested less than 56 days to provide an early indication of GIC strength and the trend of strength increase with curing time, and to evaluate whether the work can achieve the average strength requirements specified.
3. Continuous core samples shall be retrieved by the GI Contractor from at least one percent production columns and shall be 2.0 inches in diameter (HQ) or larger. Core boring locations shall be selected by the Engineer and flagged by the Contractor's surveyor. Samples shall be retrieved using continuous coring techniques after the soil-grout mixture has hardened sufficiently, i.e., older than 28 days of age and/or the achieving a minimum of 100 psi from associated wet sample testing (or at the discretion of the GI Contractor). The continuous core holes shall extend the entire depth of the soil-grout column. An estimated recovery of 70 percent for each core run and 85 percent for each core hole shall be achieved and each core run shall contain at least one possible test specimen with a length to diameter ratio of at least 2. The GI Contractor may use the down hole image survey to prove the GIC continuity exceeding 85% of the column length. The GI Contractor may select to re-core the same GIC if the initial coring obtained low recovery. If samples are retrieved prior to 56-day strength testing they shall be stored as required to achieve proper curing or, as determined by the GI Contractor, to break the samples earlier. For each core location, four samples selected by the Engineer shall be submitted to an Engineer-approved testing laboratory for unconfined compressive strength testing at 56 days of age. The remainder of the samples recovered shall be submitted to the Engineer for possible inspection and confirmation testing. All core holes shall be grouted after coring. The grout for filling core holes shall have strength equal to or more than that specified for the GIC.
4. Wet coring method, with double pipes inserted into the fresh mixed columns to obtain "core samples", cannot be used as the soil mixing quality evaluation method.
5. GI Contractor shall calculate the average 56-day UCS value from all wet samples and all core samples. A ceiling, not-to-exceed 300 psi shall be used for individual specimens in calculating the average strength achieved in the field from each coring and wet sample and for the entire project. This average 56-day UCS value shall be no less than 150 psi. No more than 10 percent of all specimens tested shall exhibit a UCS of less than 60 psi at 56 days.

6. During the soil mixing production, GI Contractor will review the wet soilcrete strength development and may add additional soil mixing columns if the soilcrete strength is below the target strength. Considering the soil profile and soilcrete strength variation, GI Contractor will set 10 percent of the total soil mixing column as a contingency for additional columns.

C. Consistency of Construction

1. The production GIC s shall be constructed using the same procedures and equipment described in these Specifications and provided by the GI Contractor in the approved design submittals. If procedures and/or equipment used after the beginning stages of production installation are changed by the GI Contractor, the Owner reserves the right to require sampling and testing at the expense of the GI Contractor.

D. Daily Production/Quality Control Report:

1. The Contractor shall submit Daily Production/Quality Control Reports at the end of the next working day. Quality control monitoring during GI construction shall at a minimum include continuous real time monitoring of blade rotation number and the binder content as a function of the depth.
2. The Daily Production/Quality Control Reports shall document the progress on the GI construction. Additionally, the following parameters shall be recorded automatically at intervals not more than 1-foot and the data submitted in the form of either tables or figures, or Excel sheets attached to the Daily Quality Control Report:
 - a. Blade rotation number and vs. depth
 - b. Binder content vs. depth

Contents of the report shall also include all items listed in 1.04.C herein.

3. All strength test results shall be submitted as soon as they become available with the Daily Production/Quality Control Reports; areas treated with GI will not be evaluated by the Engineer until at least one working day following receipt of the applicable Daily Quality Control Report and applicable laboratory test results.

E. Acceptance Criteria:

1. The GI material shall meet all the following acceptance criteria:
 - a. Minimum area replacement ratio of 25 percent for the specified improvement zone and depths.
 - b. The GIC shall be installed within the geometric locations set forth in the approved design, with tolerances provided in 3.02 and 3.03. The depths of the GIC shall be in accordance with 3.01.

- c. The acceptance of the work shall be based on demonstrating that the in-place mixing of grout with the soils has achieved the average strength requirements outlined in the approved design and set forth in 2.03. Average strengths shall be determined by testing wet (grab) and core samples collected by the GI Contractor. The testing must demonstrate that the required average strengths are met prior to acceptance of the work. Wet and core specimens will be tested at 56 days or earlier at the discretion of the GI Contractor. The UCS results from the wet and core samples shall be used in the statistical calculation for the average UCS; however, the ratio of wet sample to core sample UCS test results used to determine the overall average strength in a designated area shall not exceed 1.55.
 - d. Uniformity of mixing shall be evaluated by the Engineer based on the continuous core samples recovered by the GI Contractor. The continuous core-holes shall extend the entire depth of the soil-grout column. An estimated recovery of 70 percent for each core run of a boring and at least 85 percent when averaged over all core runs within a single boring shall be achieved. The GI Contractor may use the down hole image survey to prove the GIC continuity exceeding 85 percent of the column length. Lumps of unimproved soils shall not exceed 20 percent of the total volume of any core run from a boring. Any single unimproved soil section shall not exceed 12 inches. In the fill layer, especially soil containing construction debris and gravels, the unrecovered core length shall be reviewed by the down-hole image survey.
 - e. The Owner may allow the GI Contractor to obtain core samples before the soilcrete achieved 56 days of age. The GI Contractor shall be given the opportunity to conduct additional coring, sampling and strength testing in the failed area.
2. If the acceptance criteria are not achieved, the failed section area shall be rejected. GI Contractor may be given the opportunity to conduct additional coring, sampling and strength testing in the failed area to better define the average design strength at the GI Contractor's expense. Additional core boring locations and sample depths shall be selected by the Engineer. If a designated area is rejected, the GI Contractor shall submit a Remixing or Repair Plan as described 1.04 D for review and approval by the Owner. Remixing or repairs of the failed section areas shall be completed by the GI Contractor at no additional cost to the Owner.

3.07 QUALITY ASSURANCE PROGRAM

A. General:

1. The GI Quality Assurance (QA) Program shall be the responsibility of the Engineer and shall include, as a minimum, the following components: field monitoring during installation and verification strength testing. More specifically, the Engineer shall perform the following tasks as part of the QA program:

- a. Observe and document soil improvement activities at the discretion of the Owner, including primarily observing the soil at the bottom of the predrilled holes,
- b. Select locations of confirmation core borings,
- c. Log confirmation core borings drilled at selected GIC locations,
- d. Review electronic GI outputs in the Daily Production/Quality Control Reports for inconsistencies/issues,
- e. Collect and transport of selected core samples for QA testing,
- f. Complete unconfined compression (UCS) tests at the laboratory on wet and core samples from selected GIC, and
- g. Evaluate whether GIC meet the acceptance criteria in the Specifications. The Engineer shall make the sole determination as to whether the UCS test results indicate that the acceptance criteria have been satisfied. The Engineer will spot check by survey selected GIC locations during construction.

3.08 OBSTRUCTIONS

- A. If obstructions are encountered that prevent advancement of the mixing shaft, the Contractor shall use pre-drilling to penetrate or remove obstructions. If the pre-drill still refuses due to the obstruction, Contractor may consider the following or other remedial options (including jet grouting).
 - 1. If obstruction is shallow, excavate, remove obstruction, and then backfill with engineered fill.
 - 2. Perform additional GIC around the obstruction,
 - 3. Perform jet grouting columns through the obstruction,
- B. If containments in the soil have significant impact on the soil mixing work, Engineer will conduct further investigation and lab tests, and guide the GI Contractor to modify the soil mixing program.
- C. If obstructions are encountered that prevent soil mixing work, include but not limited to, live underground pipes, power lines, and other utilities, the GI Contractor shall modify the soil mixing program and provide to Engineer for approval.

3.09 CONTAINMENT AND COLLECTION OF SPOIL RETURN

- A. Containment

1. Positive means shall be provided for containing all spoil return, flush water, and other waste materials within the work area. Spoil materials should be piped or channeled into holding ponds, tanks, or other retention structures or facilities.
2. Take all necessary precautions and implement measures to prevent any spoil return, waste materials, or stockpiled materials from entering storm drain structures, drainage courses and other utilities, or from leaving the site via surface runoff.

B. Cleaning and Removing

1. In the event spoil return, waste materials, or stockpiled materials enter an area outside of the approved work area or mixing spoils storage area, the Contractor shall be responsible for immediately and completely cleaning and removing these materials to the approval of the Owner at no additional cost to the Owner.

3.10 SITE RESTORATION

- A. Remove the working platform from the GI treatment area and site following acceptance of the stabilization and prior to placement of the foundations as shown on the Contract Drawings.

END OF SECTION

SECTION 31 24 03

GROUND IMPROVEMENT USING AGGREGATE COLUMNS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This specification covers the following items of work:
1. Furnishing all labor, supervision, equipment, and materials necessary to perform aggregate column (AC) performance-based design, test section and install production ACs within the improvement zones and depths as shown on the Contract Drawings and in this Specification with all associated acceptance testing, monitoring, sampling, recording, and site restoration and provide all associated documentation.
 2. Evaluate site conditions and data provided and perform any additional investigation, testing or analysis materials necessary to complete the design and a compliant installation.
 3. Deliver and place all materials necessary in the improvement process.
 4. Collect, store, and dispose of all spoils and water produced by the installation process, including groundwater that may rise to the surface during installation.
 5. Monitor and mitigate impacts of the ground improvement operation on existing utilities, roadways and nearby structures, including, but not limited to potential vibrations, settlement, heave and coordination with other site activities.
 6. Perform and document post installation testing to verify the required level of improvement.

1.02 DEFINITIONS

- A. Contractor – refers to the general contractor for the Project.
- B. Ground Improvement (GI): Treating soil in situ by installing aggregate columns.
- C. Aggregate Columns (AC): columns of compacted aggregate which also densify the surrounding soil; either rammed aggregate piers installed in the ground by drilling an open or cased hole, introducing aggregate and compacting by tamping in lifts, or stone columns installed by the bottom-feed vibro-replacement method, compacting by vibrating the stone injected as a large vibratory probe is moved up and down while progressively withdrawn from the column bottom to the ground surface.
- D. GI Contractor – refers to the subcontracted ground improvement contractor for the Project.

- E. Spoils: All materials including liquids, semi-solids, and solids that are discharged above ground surface during, or as a result of, GI operations.
- F. Quality Control Testing Laboratory (Lab): An independent testing laboratory retained by the Contractor that is responsible for obtaining and testing specimens for quality control.
- G. Working Platform Level: The ground surface level from which the AC are installed.
- H. Pre-Drilling: Performed up to an equivalent diameter, up to the design depth to move soil and reduce penetration resistance or remove obstructions.
- I. Water Jetting: The use of water jets emitted from the bottom tip of the vibrator during column installation or vibrator penetration.
- J. Lift: The height of stone column that is constructed with the stone from one hopper load.
- K. Power Consumption: The amount of effort expended by the vibratory probe (electric or hydraulic) during stone column construction.
- L. Amperage: The strength of electric current expressed in amperes. During stone column construction, the measurement of amperage (from the generators powering an electric vibrator) is a measure of the power consumption of the vibrator.

1.03 GROUND IMPROVEMENT DESIGN

- A. The GI Contractor shall design patterns based on AC technology to satisfy requirements for the treatment zone specified herein. Ground Improvement Design submittal shall include a Quality Control Plan confirming required acceptance criteria which shall be submitted to the Engineer for review and approval.
- B. This specification is for installation of soil mix columns. Alternate bids using Soil Mix Columns, Section 31 24 02, will be considered.
- C. Use a qualified, registered professional engineer experienced in GI to design AC including column size and layout and provide supporting calculations.
- D. Design requirements include, but are not limited to, the analysis to conform the AC treatment adequately satisfies Project performance criteria. The GI Contractor shall obtain adequate samples, perform aggregate tests, and determine the final gradation mix compliant with the specifications and the AC design and installation parameters.
- E. Performance criteria documented by the design analysis shall provide the following ground control for foundation support of all structures in the mitigation area:
 - 1. A minimum area replacement ratio of 0.25. The GI Contractor may include an alternative providing a line item deduct for consideration by the Owner using a lower area replacement ratio if accompanied by supporting design and calculations

or modeling (sealed by a Utah registered professional engineer) demonstrating conformance to other performance criteria below.

2. A minimum bearing capacity of 6,000 pounds per square foot.
3. Mitigation of static settlement to less than one inch.
4. Mitigation of seismic shaking and liquefaction settlement to less than three inches, using the 2021 method of analysis for silts where applicable. (ref. Bray, Shao et al.)

F. Site Preparation by the Contractor:

1. The building pads identified on the drawings will be over-excavated to the elevation shown on the Contract Drawings. The Contractor will provide GI Contractor a flat, dry, stable working platform, suitable for the soil mixing equipment operation.

G. Contract Work Includes:

1. In accordance with the specifications contained in this Section and as shown on the plans, the GI Contractor shall furnish all plant, equipment, labor, and materials required to construct all the AC as indicated in the Contract Documents.
2. The GI Contractor shall determine and be responsible for providing all mixing binder material.
3. Construct AC in area shown on the plans.
4. Implement the Quality Control Plan and provide all submittals and documentation as required in these specifications, include, but are not limited to monitor the tool penetration depth, rate etc., provide daily production and QC reports, provide remixing or repair plans as needed, collect aggregate samples every shift and transport the samples to Lab for gradation and soundness testing, drill confirmation core holes at randomly selected locations.

H. Owners Representative

The Owner's Quality Assurance (QA) representative Engineer for the Provo River Water Treatment Plant project (Project) will be AECOM. They will perform the following the following tasks:

1. Observe and document soil improvement activities,
2. Log confirmation core borings drilled at selected AC locations,
3. Select locations of confirmation test locations,
4. Accept and transport samples to an accredited laboratory to cure samples to the planned test dates,

5. Oversee aggregate tests performed by the Lab on selected wet and core samples and evaluate the test results,
6. Prepare a final report that will include a summary of field observations, laboratory test data and an opinion as to whether the AC meet the acceptance criteria. The final inspection report will be submitted to the Owner for review and approval.

1.05 SUBMITTALS

Prepare and submit to the Engineer a work plan including:

A. Qualifications

1. The qualifications of a registered Professional Engineer licensed in the state of Utah to design, and of a GI Contractor to perform, the ground improvement, each with a minimum 5-years of experience. Document five recent, successful projects completed with site conditions and improvement criteria similar to this project.

B. Design Performance

1. A ground improvement design including calculations prepared and stamped by the qualified, Professional Engineer, based on information contained in the project geotechnical report, prepared by the engineer licensed in the state of the work to be performed that demonstrates that the program achieves the performance criteria in these specifications.
2. The design shall include Ground Improvement drawings signed and sealed by the registered Professional Engineer, depicting the spacing and approximate depth at each AC location. Show on the drawings the location of the ACs with respect to the structure footprint and footings. The Contractor is responsible for providing all lines and grades for the ACs, including locations of all utilities and survey markers.
3. Use a square or equilateral triangular grid pattern that will provide the required improvement in the soils, meeting the following minimum criteria:
 - a. The zones of soil to be improved shown in the drawings, both vertical and lateral limits.
 - b. For each structure provide a minimum factor of safety of 2.5 for bearing capacity.
 - c. The design should consider the impacts of loads or fills adjacent to structures. Grading by the GI Contractor is expected to be minimal.
 - d. The GI Contractor should provide all testing and analysis to verify the design parameters used in the mitigate analysis are appropriate.
 - e. The Contractor should verify improvement by using the Standard Penetration Test (SPT), Cone Penetrometer Test (CPT) or another method accepted by the Engineer at a minimum of one test per 3000 square feet of improved footprint, evenly distributed across each structure. If the SPT is used, conduct tests at depth intervals of two feet (i.e., 6 inches between each 18-inch sample).
 - f. Where the bearing capacity controls the column spacing, unless an alternate test method is accepted in advance by the Owner, conduct load tests on at least one column per 5000 square feet of structure, one per building, and a minimum of two tests in total, using the procedures of ASTM D1143 to determine the modulus of the columns. Tests should be performed in locations selected by the Engineer following production installation.
 - g. Identify the load-deflection criteria to be verified by the tests.

- h. Preproduction test columns and reaction piles/columns not meeting the design mitigation criteria should be considered sacrificial unless additional columns are added, and retesting shows the criteria are met.
 - i. Additional test column locations should be approved by the Engineer.
- 4. Installation methods for preproduction test columns should be identical to installation methods for production columns.
- 5. Place a layer of compacted structural fill at least 24 inches in thickness beneath each structure to help provide uniform foundation support and distribute loads across the AC system. Structural fill should be 3-inch minus Granular Backfill Borrow. Where fine grained soils are encountered, place a stabilization-separation geotextile at the base of the structural fill.
- 6. Footing Subgrade Preparation (by others)

The footing base shall be free of all water and compacted prior to placement of any reinforcement. Compaction can be by any heavy tamping type compaction equipment designed for compaction in small spaces. Reinforcement and concrete placement shall be placed in a timely manner so that no degradation of the bearing surface occurs.
- C. A ground improvement QA plan, as detailed in Section 3.6 of these specifications.
- D. Proposed monitoring and mitigations for existing building or facilities.
- E. Resumes of the management, supervisory, and key personnel.
- F. A description of the proposed construction process. Including:
 - 1. A detailed written procedure to be followed to improve the soils through installation of the ACs.
 - 2. Describe the equipment to be used.
 - 3. Describe the proposed documentation, and submittal frequency proposed to document aggregate quantities, density and diameters of the installed columns.
 - 4. Test data on the stone to be used for constructing the ACs that demonstrates the stone backfill conforms to the material specifications provided herein.
- G. Submit to the Engineer the GI Contractor's signed certification and installation quantity and vibration data for each column, as required by this specification.
- H. Prior to demobilization of the GI Contractor from the site, the Contractor must submit documentation to the Owner indicating that the acceptance criteria outlined in this specification have been met and approved by the Engineer.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Use stone backfill consisting of Grade A 57 clean, hard, durable crushed rock, free of organic matter and other deleterious substances. Test stone in accordance with ASTM C131 and demonstrate a maximum loss of 40 percent or less. Provide stone meeting the following gradation:

Table 1: Recommended Stone Gradation	
Sieve Size	Percent Passing (by weight)
1 ½ inch	100
1 inch	90-100
½ inch	5-80
No. 40	0-5

2.02 EQUIPMENT – SEE SECTION 3.5

- A. Vibratory Probe
- B. Vibratory Casing Hammer
- C. Load Test Equipment

PART 3 - EXECUTION

3.01 GENERAL

- A. Arrange for a qualified representative of the GI Contractor to be onsite, directly involved and provide technical assistance during all phases of the AC installations. A qualified representative is defined as a person with a minimum of five years of experience with similar AC installations.
- B. Install and document all in accordance with foundation improvement plans, this specification, and the GI Contractor's work plan.
- C. Provide assurance that the completed installations meet all Project specifications. Where this specification and the specifications of the GI Contractor differ, the stricter of the two shall control.
- D. Provide quality control of the construction of ACs.
- E. Report any non-conformance or other irregularity to the Engineer within one working day of observing the irregularity.

- F. Stake the AC locations to within 2 inches to avoid conflicts with utilities and other Project features.

3.02 HORIZONTAL ALIGNMENT

- A. The GI Contractor will accurately stake the locations of the proposed AC shown on the plans before installation. Selected locations will be verified by a surveyor provided by the Owner. The columns shall be constructed within a tolerable distance from the plan location. Tolerable deviation shall be stated on the plan.
- B. Beneath the footings of the structures for the layout detail on the plans the AC shall be configured to provide consistent footing support.
- C. Movement of the crawler base machine shall provide the preliminary alignment of the AC locations and the final alignment shall be adjusted by hydraulic manipulation of the leads. The AC shall be advanced stepwise where applicable.

3.03 VERTICAL ALIGNMENT

- A. Vertical alignment of the columns shall be controlled by the equipment operator. Two measurements of vertical shall be monitored, the forward-aft and left-right. The AC shall be installed at an average inclination deviating no more than two percent from vertical.

3.04 COLUMN DEPTH

- A. The anticipated AC depth at each column location shall be determined by the depth elevations shown on the plans. Columns shall be terminated either at the contour elevations shown on the plans, or at a depth revised by the GI Contractor, whichever is deeper. In no case shall the columns be terminated at an elevation higher than the contours shown on the plans. In the field, the GI Contractor shall determine the actual depth of each column, based on the soil conditions and obstacles.
- B. The GI Contractor is responsible for penetrating any unexcavated soil, including any materials overlying the designated treatment zone, in order to reach the bottom of the treatment zone. This includes, as necessary – excavation, predrilling, use of an advance, etc., in order to penetrate the treatment zone as shown to the minimum treatment elevation on the plans.
- C. Site conditions are variable. Most, but not all, borings encountered a zone of near surface dense to very dense sand and gravel overlying the site. Historical fill with construction debris was observed in various areas of the site as was detailed in the Geotechnical Report, Attachment A, referenced above. Conditions other than those depicted in the Geotechnical Report could also be encountered.
- D. The GI Contractor should not advance ACs into soil layers that have artesian pressures. It is the GI Contractor's responsibility to account for artesian pressures in design. A Cone Penetration Test report has been included in the Geotechnical Report, Attachment A.

- E. Additional soils testing may be performed by the Contractor at the Contractor's expense.

3.05 EQUIPMENT & PROCEDURES

- A. The GI Contractor shall determine the construction procedures and the specific equipment to be used to achieve the design criteria specified below; however, the following general equipment and construction procedure requirements should be met:
 - 1. A rammed aggregate pier or dry bottom-feed vibro-replacement method shall be used.
 - 2. Water or air jets to aid the advance of the vibrator, follower tubes and tremie system, or to otherwise assist with the installation of the columns may not be used, unless specifically approved by the Engineer.
 - 3. ACs shall be backfilled above the designated treatment zone by extending the AC through the overlying soils to subgrade level of the structure, using the same dry bottom-feed method and the same compaction and quantity criteria that were used in the treatment zone.
 - 4. Rammed ACs
 - a. All AC elements shall be pre-augered using mechanical drilling or excavation equipment.
 - b. Installation of AC without pre-augering shall not be allowed because this technique results in significant disturbance and remolding of the matrix soils surrounding the columns.
 - c. If cave-ins occur during excavation such that the sidewalls of the hole are deemed to be unstable, steel casing or a drilling slurry shall be used to stabilize the excavation. If cave-ins occur on top of a lift of aggregate such that the volume of the caved soils is more than 10 percent of the volume of the aggregate in the lift, then the aggregate shall be considered contaminated and shall be removed and replaced with uncontaminated aggregate.
 - d. Special high-energy impact densification apparatus shall be employed to densify the AC elements during installation. The apparatus shall apply direct downward impact energy to each lift of aggregate. A minimum tamper energy level of 250,000 foot-pounds of force per minute shall be applied by the apparatus.
 - e. The bottom of the excavation shall be densified prior to the placement of the aggregate. If wet, soft or sensitive soils are present, open-graded aggregate, such as ASTM No. 57 stone or other, shall be placed at the bottom of the excavation and compacted to stabilize the element bottom and may serve as the initial lift. Densification shall be performed using a beveled tamper. The beveled tamper foot is required to adequately increase the lateral earth

pressure in the matrix soil during installation. Downward pressure shall be applied to the tamper shaft during tamping. Each lift of aggregate shall be tamped for a minimum of 15 seconds.

5. Vibroreplacement:

- a. Provide a down hole vibratory probe producing horizontal vibrations from an energy source located near the tip of the probe. The GI Contractor shall use an electric vibrator capable of providing at least 80 HP of rated energy and a centrifugal force of 15 tons. An appropriate metering device should be provided at such a location that inspection of amperage increase may be verified during the operation of the equipment. The metering device may be an ammeter directly indicating the performance of the vibrator. The vibrator shall be a minimum of 16 inches in diameter and be capable of creating stone columns with diameters up to 36 inches. A crane or crawler base rig shall be provided, compatibly to operate the probe. Complete equipment specifications should be submitted to the Engineer prior to commencement of the fieldwork.
- b. Install AC with a down-hole vibrator capable of densifying the aggregate by forcing it radially into the surrounding soil. The vibrator shall be of sufficient size and capacity to construct AC to the diameters and lengths shown on the installer's approved construction drawings.
- c. The probe and follower tubes shall be of sufficient length to reach the elevations shown on the installer's approved construction drawings. The probe, used in combination with the available pressure to the tip jet, shall be capable of penetration to the required tip elevation. Pre-boring shall be permitted if it is specified in the installer's approved construction procedure submittal.
- d. The probe and follower shall have visible markings at regular increments to enable measurement of penetration and re-penetration depths.
- e. Provide methods for supplying to the tip of the probe enough air or water to widen the probe hole to allow adequate space for stone backfill placement around the probe.
- f. The probe shall penetrate into the foundation soil layer to the minimum depths required in the installer's construction plans.
- g. Lift thickness shall not exceed four feet. After penetration to the treatment depth, slowly retrieve the vibrator in 12-inch to 18-inch increments, allowing for backfill placement.

3.06 QUALITY CONTROL

A. Documentation

Submit any proposed change in the approved construction program in writing to the Engineer.

Submit daily to the Engineer: a log including.

1. Accurate daily records that include column numbers, depth of treatment, approximate backfill quantities for each column, and recordings of ground resistance (e.g., amperage or hammer energy) readings the type and size of compaction equipment and predrill auger diameter used (when needed), and a shop drawing indicating the as-constructed location. The daily logs must demonstrate that the column installation and performance across the site are consistent with the design and performance achieved in the tested columns.
2. A record for each AC that includes a log of the aggregate consumption per 5-foot maximum increment, energy used to compact the column per 5-foot maximum increment, column identification number, bottom depth, column length, time to construct the column, and a note of any obstructions or other problems encountered during column installation.
3. Any change in the subsurface conditions observed during the work.

B. Testing

1. Penetrometer Testing: standard penetration test (SPT) or cone penetration test (CPT), if appropriate for soil conditions and if specified.

All testing to determine specification compliance will be provided by the Contractor, and will consist of Penetration Testing and on-site observation by the Engineer during the AC installation.

- a. SPT/CPT testing shall be performed at locations which are equidistant and farthest from two, three, or four probes, whichever is applicable, with a multiple probe pattern under a column or wall footing.
 - b. The work shall consider an averaging of SPT/CPT values for the test hole, and also the location of the test hole within the treated area.
 - c. Areas of the site not adequately densified as determined by the specified SPT/CPT values shall be recompactd by installing additional AC at no additional cost to the Owner.
 - d. The Engineer will provide site inspection to insure proper performance of the AC. This inspection may include the following: observance of the AC Contractor's procedures, recording of backfill quantities, and recording of ammeter information.
2. Static Load Testing (if specified)

Testing to determine specification compliance will be provided by the Contractor, and will consist of a full-scale Static Load Test (Section 1.03.A.1).

- a. The load test shall be performed at an actual foundation location chosen by the Engineer. The foundation area to be tested should be a minimum 5-foot diameter plate.
- b. The load test shall be erected and performed by the Contractor at the Contractor's expense.
- c. The load test shall be performed in general accordance with ASTM D1143 Quick Test. The test foundation shall be loaded to 1.5 times the design load of 6,000 psf. Settlements of the test foundation shall be measured halfway between the center and each of the four corners. The average of the four readings shall be used to confirm acceptance of the required settlement criteria. The contractor shall submit load test detail and prior to load testing.
- d. The QC representative will provide site inspection to insure proper performance of the AC work. This inspection may include the following: observance of the AC Contractor's procedures, recording of backfill quantities, and recording of ammeter information.
- e. If uplift elements are used to develop the reaction load for the load test, they shall develop their uplift capacity below the depth being improved by the AC or located horizontally at least 10 feet away from the edge of the load test footing columns.

C. Consistency of Construction

1. The production ACs shall be constructed using the same procedures and equipment described in these Specifications and provided by the GI Contractor in the approved design submittals. If procedures and/or equipment used after the beginning stages of production installation are changed, the Owner reserves the right to require additional sampling and testing at the expense of the Contractor.

D. Daily Production/Quality Control Report:

1. The GI Contractor shall submit Daily Production/Quality Control Reports at the end of the next working day. Quality control monitoring during AC construction shall at a minimum include continuous real time monitoring of aggregate quantity and the binder content as a function of depth.
2. The Daily Production/Quality Control Reports shall document the progress on the AC construction. Additionally, the following parameters shall be recorded automatically at no less than 1 foot interval and the data submitted in the form of either tables or figures, or Excel sheets attached to the Daily Quality Control Report:
 - a. Column number and depth

- b. Aggregate consumption with depth
- 3. All QC test results shall be submitted as soon as they become available with the Daily Production/Quality Control Reports; areas treated with AC will not be evaluated by the Engineer until at least one working day following receipt of the applicable Daily Quality Control Report and applicable laboratory test results.

E. Acceptance Criteria:

- 1. The AC treated zone shall meet all of the following acceptance criteria:
 - a. The AC shall be installed within the geometric tolerances, area and depths specified herein.
 - b. The acceptance of the work shall be based on demonstrating that AC treatment matrix of improved ground has achieved the average strength requirements outlined herein. Average strengths shall be determined by composite strength analysis methods. The testing must demonstrate that the required average strengths are met prior to acceptance of the work.
 - c. Uniformity of work shall be evaluated by the Engineer based on the production logs of the GI Contractor.
 - d. If the acceptance criteria are not achieved, the failed area shall be rejected. The Contractor may be given the opportunity to conduct additional testing in the failed area to better define the average design strength at the Contractor's expense. Additional test locations and depths shall be selected by the Engineer. If a designated area is rejected, the Contractor shall submit a Remedial Plan as described herein for review and approval by the Owner. Remedial work of failed section areas shall be completed by the GI Contractor at no additional cost to the Owner.

3.07 QUALITY ASSURANCE PROGRAM

A. General:

- 1. The GI Quality Assurance (QA) Program shall be the responsibility of the Engineer and shall include, as a minimum, the following components: field monitoring during installation and verification strength testing. More specifically, the Engineer shall perform the following tasks as part of the QA program:
 - a. Field monitoring during installation and verification testing, recording observed results.
 - b. Observe and document soil improvement activities at the discretion of the Owner, including primarily observing the soil at the bottom of the predrilled holes.

- c. Notify the GI Contractor if the soil at the bottom of a predrilled hole is not the targeted, dense, competent materials.
- d. Review electronic GI outputs in the Daily Production/Quality Control Reports for inconsistencies/issues.
- e. Review Lab test data
- f. Evaluate whether AC meet the acceptance criteria in the specifications. The Engineer shall make the sole determination as to whether the acceptance criteria have been satisfied. The Engineer will spot check by survey selected AC locations during construction.

3.08 OBSTRUCTIONS

- A. If obstructions are encountered that prevent advancement of the mixing shaft, the Contractor shall use pre-drilling to penetrate or remove obstructions. If the pre-drill still refused due to the obstruction, Contractor may consider the following or other remedial options (such as jet grouting).
 - 1. If an obstruction is shallow, excavate then remove obstruction and then backfill with engineered fill.
 - 2. Perform additional AC around the obstruction.
- B. If contaminants in the soil have significant impact on the GI work, Engineer will conduct further investigation and lab tests, and guide the GI Contractor to modify the program.
- C. If obstructions are encountered that prevent AC work, include but not limited to, live underground pipes, power lines, and other utilities, the GI Contractor shall modify the program and provide to Engineer for approval.

3.09 CONTAINMENT AND COLLECTION OF SPOIL RETURN

- A. Containment
 - 1. Positive means shall be provided for containing all spoil return, flush water, and other waste materials within the work area. Spoil materials shall be piped or channeled into holding ponds, tanks, or other retention structures or facilities.
 - 2. Take all necessary precautions and implement measures to prevent any spoil return, waste materials, or stockpiled materials from entering storm drain structures, drainage courses and other utilities, or from leaving the site via surface runoff.
- B. Cleaning and Removing
 - 1. In the event spoil return, waste materials, or stockpiled materials enter an area outside of the approved work area or spoils storage area, the Contractor shall be

responsible for immediately and completely cleaning and removing these materials to the approval of the Owner at no additional cost to the Owner.

3.10 RESTRICTIONS

- A. AC construction is typically performed under the site permit. The Contractor shall be responsible for obtaining any state and local permits (if required) and conforming to all state and local regulations.
- B. The Contractor will be responsible for the precise delineation of all above and below ground utilities and obstructions.
- C. The following shall also be listed within this section when applicable:
 - 1. Environmental restrictions.
 - 2. Work boundaries.
 - 3. Hours for construction.

END OF SECTION

SECTION 31 50 00

EXCAVATION SUPPORT SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide excavation support systems as indicated and in compliance with Contract Documents.
- B. Design, furnish and install excavation support systems to maintain lateral support, prevent loss of ground, limit soil movements to acceptable limits and protect from damage existing and proposed improvements including pipelines, utilities, structures, roadways, railroads and other facilities.
- C. The requirement of specified excavation support systems in areas indicated on the drawings does not relieve the Contractor from the responsibility of furnishing and installing proper temporary excavation support systems in other areas.
- D. Common types of excavation support system include, but are not limited to; singular or multiple stages comprised of cantilevered or internally braced soldier piles and lagging, steel sheetpile wall, timber sheetpile wall, trench box, or combinations thereof. Trench box temporary excavation support system is only acceptable for pipe or utility trench excavations approved by the Engineer. Temporary unsupported open cut excavation with stable sloping sides is allowed where applicable.
- E. Extraction of steel sheetpile wall, timber sheetpile wall, or soldier piles are not permitted unless otherwise indicated, specified or approved by the Engineer.
- F. Wherever the word "sheeting" is used in this section or on the contract drawings, it shall be in reference to any type of excavation support system specified except trench box.
- G. Construction of the excavation support systems shall not disturb the existing structures or the completed proposed structures. Damage to such structures shall be repaired at Contractor's expense.
- H. Adjacent structures are those that are bear upon soils above the proposed excavation depth and within a distance equal to twice the total depth of the excavation away from the closest edge of the excavation. Monitor and protect adjacent structures as specified and indicated.
- I. Vibration monitoring for excavation support systems shall be performed as specified in Section 02 32 14.
- J. Construction operations not to exceed specified noise limits in permits.

- K. Bear the entire cost and responsibility of correcting any failure, damages, subsidence, upheaval or cave-ins as a result of improper installation, maintenance or design of the excavation support systems. Pay for all claims, costs and damages that arise as a result of the Work performed at Contractor's expense.

1.03 SUBMITTALS

A. Submit the following in accordance with Section 01 33 00.

- 1. Submit the following qualifications four weeks prior to the construction:
 - a. Qualifications of Contractor's excavation support system designer as specified in Paragraph 1.04.G.

- b. Qualifications of Contractor's excavation support system installer as specified in Paragraph 1.04.H.
 - c. Qualifications of Contractor's independent tieback testing laboratory as specified in Paragraph 1.04.I, if a tieback system is utilized.
 - d. Qualifications of Contractor's excavation support system installation supervisor as specified in Paragraph 1.04.J.
 - e. Qualifications of vacuum excavation subcontractor as specified in Paragraph 1.04.F, if DMPs for utilities are utilized.
2. Submit an excavation support plan stamped and signed by a Registered Professional Engineer in the State of Utah at least two weeks prior to start of the construction. Do not submit design calculations. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor remains responsible for the adequacy and safety of the means, methods and sequencing of construction. The plan shall include the following items as a minimum:
- a. Proposed excavation support system(s), details, location, layout, depths, extent of different types of support relative to existing features and the permanent structures to be constructed, and methods and sequence of installation and removal.
 - b. Certificate of Design: Refer to Section 01 33 00.
 - c. A list of all design assumptions, including safety factors used for the excavation support system(s) and all lateral pressures used for each system.
 - d. If utilizing a tieback system, include tieback installation procedures and criteria for acceptance of tiebacks for performance and proof tests. Submit the tieback testing results to the Engineer for information only.
 - e. Requirements of dewatering during the construction.
 - f. Minimum lateral distance from the edge of the excavation support system for use for vehicles, construction equipment, and stockpiled construction and excavated materials.
 - g. List of equipment used for installing the excavation support systems.
 - h. Monitoring schedule, installation procedures and location plans for vibration/noise monitoring, geotechnical instrumentation (deformation monitoring points and inclinometers) and observation wells/piezometers to monitor ground, excavation support system, adjacent structures and groundwater fluctuation during the entire construction period.

3. Submit a Construction Contingency Plan specifying the methods and procedures to maintain excavation support system stability if the allowable movement of the adjacent ground and adjacent structures is exceeded. Include movement thresholds that trigger review and/or remediation measures to be implemented.
4. Monitoring data within one day of data collection from vibration and noise recording equipment, observation wells, deformation monitoring points and offset lines. Data shall include:
 - a. Horizontal and vertical movements of geotechnical instruments and groundwater readings.
 - b. New movements since the initial readings of the geotechnical instruments.
 - c. Weekly summary in tabular and graphic form at the end of each week.
 - d. A schematic plan of excavation and/or relevant construction activities at the time of monitoring.
5. For excavation support systems left in place, submit the following as-built information prior to backfilling and covering the excavation support systems:
 - a. Survey locations of the excavation support systems, including coordinates of the ends and points of change in direction.
 - b. Type of the excavation support system.
 - c. Elevations of top and bottom of the excavation support systems left in place.

1.04 QUALITY ASSURANCE:

- A. Provide in accordance with Section 01 45 00.
- B. Conform to the requirements of the OSHA Standards and Interpretations: "Part 1926 Subpart P - Excavation, Trenching, and Shoring".
- C. Construction operations to conform to noise regulations provided in the Noise Control Plan and this Section.
- D. Retain the services of an independent vibration consulting firm meeting the requirements as specified in Section 02 32 14.
- E. The peak particle velocity for pile driving, or other vibration-inducing operations, shall meet the requirements as specified in Section 02 32 14.
- F. If utilizing deformation monitoring points (DMPs) for utilities, vacuum excavation shall be performed by subcontractor having five years of experience in non-destructive vacuum excavation methods for utilities.

- G. Prepare design, including calculations and drawings, under the direction of a Professional Engineer registered in the State of Utah and having the following qualifications:
 - 1. Not less than ten years of experience in the design of specific excavation support systems to be used.
 - 2. Completed not less than five successful excavation support system projects of equal type, size, and complexity within the last five years.
- H. Excavation Support System Installer's Qualifications:
 - 1. Not less than three years of experience in the installation of similar types and equal complexity as the proposed system.
 - 2. Completed not less than three successful excavation support systems of similar type and equal complexity as the proposed system.
- I. If utilizing a tieback system, employ an independent testing laboratory to test the tieback system with the following qualifications:
 - 1. Be accredited by the American Association of State Highway and Transportation Officials (AASHTO) Accreditation Program.
 - 2. Employ personnel conducting testing who are trained in the methods and procedures to test and monitor tieback systems of similar type and equal complexity, as the proposed system.
 - 3. Have not less than five years of experience in testing of tieback systems of similar type and equal complexity as the proposed system.
 - 4. Have successfully tested at least three tieback systems of similar type and equal complexity as the proposed system.
- J. Install all excavation support systems under the supervision of a supervisor having the following qualifications:
 - 1. Not less than five years of experience in installation of systems of similar type and equal complexity as the proposed system.
 - 2. Completed at least five successful excavation support systems of similar type and equal complexity as the proposed system.
- K. All welding shall be performed in accordance with AWS D1.1.

1.05 DESIGN CRITERIA:

- A. Design of excavation support systems shall meet the following minimum requirements:
1. Support systems shall be designed for earth pressures, hydrostatic pressure, equipment, temporary stockpiles, construction loads, roadways, railroads, and other surcharge loads.
 2. Design a bracing system to provide sufficient reaction to maintain stability.
 3. Limit movement of ground adjacent to the excavation support system to be within the allowable ground deformation as specified.
 4. Design the embedment depth below bottom of excavation to minimize lateral and vertical earth movements and provide bottom stability. Toe of braced temporary excavation support systems shall not be less than 5 feet below the bottom of the excavation.
 5. Design excavation support systems to withstand an additional 2 feet of excavation below proposed bottom of excavation without redesign except for the addition of lagging and/or bracing.
 6. Maximum width of pipe trench excavation shall be as indicated on the drawings.
 7. Do not cast permanent structure walls directly against excavation support walls.
 8. The design location of the excavation support wall shall be determined such that the installed wall and bracing system components are all located outside the limits of the permanent structure. Construction tolerances (e.g. wall verticality) shall be considered in determining the plan location.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Provide in accordance with APWA Sections 01 66 00 and as specified.
- B. Store sheeting and bracing materials to prevent sagging which would produce permanent deformation. Keep concentrated loads which occur during stacking or lifting below the level which would produce permanent deformation of the material.

1.07 PROJECT CONDITIONS:

- A. Subsurface Conditions: Refer to Section 00 21 13.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Structural Steel: All soldier piles, wales, rakers, struts, wedges, plates, waterstop and accessory steel shapes shall conform to ASTM A36.
- B. Steel Sheet Piling: ASTM A572, continuous interlocking type.
- C. Timber Lagging Left in Place: Pressured treated per AWP standards.
- D. Tieback Tendons: Tieback tendons shall be high strength steel wire strand cables conforming to ASTM A416, or bars conforming to ASTM A722. Splicing of individual cables shall not be permitted.
- E. Raker Ties: ASTM A615 Grade 60.
- F. Cement Grout Materials and Admixtures For Tieback Anchorages: Grout cube strength shall be a minimum 3500 psi at 7 days and 5000 psi at 28 days.
- G. Concrete: Section 03 30 00.
- H. Tamping tools adapted for backfilling voids after removal of the excavation support system.
- I. Provide specific trench box sizes for each pipe and utility excavation with structural capacity of retaining soil types as described in OSHA's 29 CFR Part 1926 Subpart P.

2.02 EQUIPMENT:

- A. Install shoring to required depth with suitable equipment for installation of shoring materials. Equipment can include vibratory hammers, impact hammers, hydraulic push-in tools, drills or other equipment that meets vibration and noise requirements.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Installation of the excavation support systems shall not commence until the related earth excavation and dewatering submittals have been reviewed by the Engineer with all Engineer's comments satisfactorily addressed.
- B. Install excavation support systems in accordance with the excavation support plan.
- C. If utilizing a tieback system, all performance and proof tests shall be conducted in the presence of the Engineer. Testing performed without the Engineer present is considered invalid. Repeat testing in the Engineer's presence at Contractor's expense.

- D. Do not drive sheeting within 100 feet (30 m) of concrete less than seven days old.
- E. Carry out program of excavation support in such a manner as to prevent undermining or disturbing foundations of existing structures of Work ongoing or previously completed.
- F. Bottom of the trench box excavation support system shall be above the pipe invert prior to installing the pipe.
- G. Install and read geotechnical instrumentation in accordance with the excavation support plan. Notify the Engineer immediately if any geotechnical instrumentation is damaged. Repair or replace damaged geotechnical instrumentation at the sole option of the Engineer and at Contractor's expense.
- H. Continuously monitor movements of the ground adjacent to excavation support systems and adjacent structures. In events of the measured movements approaching or exceeding the allowable movements, take immediate steps to arrest further movement by revising procedures such as providing supplementary bracing, filling voids behind the trench box, supporting utilities or other measures (Construction Contingency Plan).
- I. Notify utility owners if existing utilities interfere with the excavation support system. Modify the existing utility with the utility owner's permission or have the utility owner make the modifications at Contractor's expense.

3.02 GROUND DEFORMATION ADJACENT TO EXCAVATION SUPPORT SYSTEMS:

- A. Allowable Vertical (heave/settlement) and Lateral Movements: Two inches maximum for the trench box excavation support system, and one inch maximum for other types of excavation support systems at any location behind the excavation support system.
- B. Monitoring personnel shall use a procedure for reading and recording geotechnical instrumentation data which compares the current reading to the last reading during data collection to eliminate spurious readings.
- C. Plot the observed ground deformation readings versus time. Annotate the plots with construction loading and excavation events having an impact on the readings. Evaluate plots by means of secondary rate-of-change plots to provide early warning of accelerating ground movements.
- D. Notify the Engineer when the allowable ground deformation is exceeded.
- E. Implement Construction Contingency Plan under direction of the temporary excavation support system designer and the Engineer.

3.03 REMOVAL OF EXCAVATION SUPPORT SYSTEMS:

- A. Sheet piling shall be left in place unless otherwise indicated.

- B. When indicated, remove the excavation support system without endangering the constructed or adjacent structures, utilities, or property. Immediately backfill all voids left or caused by withdrawal of excavation support systems with bank-run gravel, screened gravel or select borrow by tamping with tools specifically adapted for that purpose.
 - C. When tiebacks are used, release tension in tiebacks as the excavation is backfilled. Do not leave tensioned tieback in place at the completion of the Work.
 - D. The excavation support system left-in-place shall be cut-off a minimum of two feet below the bottom of the next higher foundation level or a minimum of five feet below finished grade.
 - E. Conduct survey of the locations and final cut-off elevations of the excavation support systems left in place.
- 3.04 CONTRACT CLOSEOUT:
- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 32 12 05M

BITUMINOUS CONCRETE

This Section modifies portions of Section 32 12 05 entitled “Bituminous Concrete” (APWA 2017 as outlined below).

Add Article 1.1, paragraph B as follows:

- B. Restoration Work within University Avenue shall be according to UDOT 2022 Standard Specification Sections 02735 Micro-Surfacing, 02741 Hot Mix Asphalt (HMA), and/or 02744 Stone Matrix Asphalt.

Delete Article 1.4, paragraph D.7 and replace with the following:

- 7. Binder target percentage, dust to binder ratio, and the following as applicable.
 - a. For Marshall mix design provide (1) tensile strength ratio (moisture sensitivity), (2) voids in the mineral aggregate (VMA), (3) stability, (4) flow, (5) voids in the bituminous mix, (6) voids filled with bituminous binder (VFA), (7) virgin binder replacement, (8) RAP asphalt content, and (9) effective asphalt content.
 - b. For Superpave mix design provide (1) voids in the mineral aggregate (VMA), (2) voids filled with bituminous binder (VFA), and (3) Hamburg Wheel Tracker results.

Delete Article 2.3, paragraph D and replace with the following:

- D. RAP or ROSP: Free of detrimental quantities of deleterious materials.
 - 1. Allowed up to 15 percent by weight of RAP or binder, whichever is lesser, with no change in specified binder grade.
 - 2. Allowed from 15 to 25 percent by weight of RAP or binder, whichever is lesser, if the binder grade is adjusted according to AASHTO M323 to meet the specified binder grade.
 - 3. Determine RAP binder content by chemical extraction.

Delete Table 4 from Article 2.4, paragraph B and replace with the following:

Table 4 - Master Grading Band limits - Marshall Mix Design							
Sieve	Aggregate Grade						
	DM-1	DM-3/4	DM-1/2	DM-3/8	OM-1/2	FM-1	FM-1/2
1 inch	100						
3/4 inch		100				100	
1/2 inch	75 - 91		100		100	90 - 100	100
3/8 inch		75-91		100	93 - 100	60 - 100	90 - 100
No. 4	47 - 61	46-62	60 - 80	60 - 80	36 - 44	15 - 40	30 - 50
No. 8					14 - 21	4 - 12	5 - 15
No. 16	23 - 33	22-34	28 - 42	28 - 42			
No. 50	12 - 22	11-23	11 - 23	11 - 23			2 - 5
No. 200	3 - 7	3-7	3 - 7	3 - 7	2 - 4	2 - 5	
NOTES <ul style="list-style-type: none"> (a) Gradation is expressed in percent passing by weight. ASTM C136. Percentage of fines passing No. 200 sieve determined by washing, ASTM C117. (b) Friction Mixture, ASTM D 3515. (c) The alpha portion of the grade designator (DM, OM, FM) represents dense mix, open mix, and friction mix. The numerical portion (1, 3/4, 1/2) represents the <i>maximum</i> sieve size. 							

Delete Table 6 from Article 2.4, paragraph D and replace with the following:

D. Design Parameters: Table 6, determined by AI MS2.

Table 6 - Mix Design Parameters						
Criteria		SuperPave			Marshall	
Mix Designator	(a)	50Nd	75Nd	100Nd	50 blow	75 blow
Compaction (blows)	(b)	-			50	75
Compaction (gyrations)		50	75	100	-	
Design Air Void Target, percent		3.5			3.5	
Stability, lbs., minimum	(d)	-			1200	1800
Flow, in 0.01 inch units	(d)	-			10-18	
Voids in Mineral Aggregate (VMA), percent, minimum, relative to maximum or nominal sieve size grading and calculated using Gsb (dry) for virgin aggregate and RAP aggregate		ASTM D 3203			ASTM D 6927	
		Maximum Grading			Nominal Grading	
		1		12.0	1	13.0
		3/4		13.0	3/4	14.0
		1/2		14.0	1/2	15.0
		3/8		15.0	3/8	16.5
RAP or ROSP specific gravity for calculations		Gsb (dry) by chemical extraction				
Dust to Binder Ratio, maximum		1.4			1.6	
Tensile Strength Ratio (moisture sensitivity), minimum	(e)	-			0.80	
Rutting (Hamburg rut test)	(f)	AASHTO T324				
Road Class I		-			-	-
Road Class II		15 mm/10,000 passes			-	-
Road Class III		10 mm/20,000 passes			-	-
NOTES						
(a) Road Class is defined in Section 32 01 31						
(b) 100Nd mix is for very high traffic applications only as defined by ENGINEER. 100Nd mix is intended for lower lift applications or surface applications with proactive seal coat program.						
(c) Number of compaction blows each end of specimen.						
(d) Design Density Target: ASTM D 2041. Percent of maximum theoretical specific gravity						
(e) Stability, Flow, Voids: ASTM D 6927.						
(f) Tensile Strength Ratio (moisture sensitivity): ASTM D 4867. Use freeze thaw conditioning. Compact test specimen to seven (7) percent plus or minus one (1) percent air voids.						
(g) With testing performed at temperatures representing the <u>specified</u> binder grade in the Hamburg rut test, the average rut depth of two (2) mix design test samples is less than amount shown for the respective Road Classes.						

END OF SECTION

SECTION 32 17 23
PAVEMENT MARKING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide pavement marking as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. Military and Government Specs & Standards (Naval Publications and Form Center (NPFC):

- 1. TT-P-1952F: Paint, Traffic and Airfield Marking, Waterborne
- 2. FS 595B: Colors Used in Government Procurement

- B. American Standards for Testing of Materials (ASTM):

- 1. D562: Standard Test Method for Consistency of Paints
- 2. D1644: Standard Test Methods for Nonvolatile Content of Varnishes
- 3. D2805: Standard Test Method for Hiding Power of Paints by Reflectometry
- 4. D3723: Standard Test Method for Measuring Neutron Fluence and Average Energy from $^3\text{H(d,n)}$ ^4He Neutron Generators by Radioactivation Techniques

- 7. E1347: Standard Test Method for Color and Color-Difference Measurement by Tristimulus Colorimetry

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Test Results:
 - 1. Provide test reports of material supplied.

1.04 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.05 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Furnish paint in sealed containers that legibly indicate at time of use designated name, formula or specification number, batch number, color, date of manufacturer, manufacturer's name, formulation number, and directions.

PART 2 - PRODUCTS

2.01 PAINT:

- A. FS TT-P-1952F, Type II.
- B. Paint shall be homogeneous, easily stirred to smooth consistency, and show no hard settlement or other objectionable characteristics during storage period of 6 months.
- C. Paint shall meet the requirements for Acrylic Water Based Paint as specified in Table 32 17 23-1 below.

Table 32 17 23-1					
Property	White	Yellow	Blue	Red	Test
Pigment – Percent by weight, minimum	60 - 62	60 - 62	60 - 62	60 - 62	ASTM D3723
Total Solids – Percent by weight, minimum	77 +/-2	77 +/-2	77 +/-2	77 +/-2	ASTM D1644
Nonvolatile Vehicle – Percent by weight vehicle, minimum	42 +/-2	42 +/-2	42 +/-2	42 +/-2	ASTM D3723 ASTM D1644
Viscosity, KU at 77 degrees F	80-110	80-110	80-100	80-110	ASTM D562
Volatile Organic Content (VOC) – g/L, maximum	<100	<100	<100	<100	ASTM D3960
Color Definition	#37925	#33538	#35180	#31136	FS 595B
Directional Reflectance, minimum	85 percent	NA	NA	NA	ASTM E1347
Dry Opacity – minimum (5 mils wet)	0.92	0.92	0.92	0.92	ASTM D2805

- D. Traffic Pickup Time: Paint may not smear or track 10 minutes after application using standard application equipment, at the mil thickness required, and with an ambient shaded temperature of at least 50 degrees F.
- E. Additional Requirements
1. Free of lead, chromium, and other related heavy metals. Refer to ASTM D5381.

2. Refer to ASTM D5381 for tests used to verify paint samples meet ASTM requirements.
- F. Manufacturers:
1. Allstates Coatings Co.
 2. Swarco Colorado Paint Company II, LLC
 3. SealMaster

PART 3 - EXECUTION

3.01 APPLICATION EQUIPMENT:

- A. Machines, tools, and equipment used in performance of work shall be capable of applying stripe widths indicated, at paint coverage rate specified, and of even uniform thickness with clear-cut edges.
- B. Paint Applicator:
1. Traffic Line Paint Applicator:
 - a. Self-propelled or mobile-drawn pneumatic spraying machine with suitable arrangements of atomizing nozzles and controls to obtain specified results.
 - b. Speed during application of not less than 5 mph.
 - c. Spray mechanism tanks with air-driven mechanical agitators.
 - d. Equip with quick-action valves conveniently located, and include necessary pressure regulator and gauges in full view and reach of operator.
 - e. Provide paint strainers in supply lines to ensure freedom from residue and foreign matter that may cause malfunction of spray guns.
 2. Provide pneumatic spray guns for application of paint for letters, handicapped symbols, and hand application of paint in areas where mobile paint applicator cannot be used.
- C. Provide stencils for handicapped symbols and letters.
- D. Sandblasting Equipment:
1. Includes air compressor, hoses, and nozzles of size and capacity as required for cleaning surfaces to be painted.

2. Compressor shall be capable of furnishing not less than 150 cfm of air at pressure of not less than 90 psi at nozzle for each nozzle used.

3.02 PREPARATION:

- A. Cure pavement surfaces for period of not less than 30 days before application of marking materials.
- B. Clean surfaces to be marked before application of paint.
- C. Remove dust, dirt, and other granular surface deposits by sweeping, blowing with compressed air, rinsing with water or combination of these methods as required.
- D. Remove rubber deposits and other coatings adhering to pavement with scrapers, wire brushed, sandblasting, approved chemicals or mechanical abrasion.

3.03 APPLICATION:

- A. Apply paint pneumatically.
- B. Apply evenly to clean, dry surfaces of pavement at rate producing initial (wet) thickness of 15 mils, and only when air and pavement temperatures are above 50 degrees F and less than 90 degrees F. Do not apply when the relative humidity exceeds 85 percent or when the temperature falls below the dew point. Maintain paint temperature within these same limits.
- C. Provide guidelines and templates as necessary to control paint application. Special precautions shall be taken in marking letters and handicapped symbols. Edges of markings shall be sharply outlined.
- D. Maximum drying time requirements of paint will be enforced to prevent undue softening of bitumen and pickup, displacement or discoloration by tires of traffic. If there is deficiency in drying of markings, discontinue painting operations until cause of slow drying is determined and corrected.
- E. Protect markings from traffic until dry to prevent tracking.

3.04 CLEANING:

- A. At completion of work, remove rubbish, debris, equipment, and excess material from site. Clean adjoining surfaces soiled by and during this work.

3.05 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 32 31 13

CHAIN LINK FENCES AND GATES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section includes:

1. PVC coated chain link fence framework, fabric, and accessories.
2. Excavation for post bases.
3. Manual gates and related hardware.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. M181: Standard Specification for Chain-Link Fence.

B. ASTM International (ASTM):

1. A53/A53M: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
2. A121: Standard Specification for Metallic-Coated Carbon Steel Barbed Wire.
3. A392: Standard Specification for Zinc-Coated Steel Chain-Link Fence Fabric.
4. F567: Standard Practice for Installation of Chain-Link Fence.
5. F626: Standard Specification for Fence Fittings
6. F654: Standard Specification for Residential Chain Link Fence Gates.
7. F668: Standard Specification for Polyvinyl (PVC), Polyolefin and Other Polymer-Coated Steel Chain Link Fence Fabric
8. F900: Standard Specification for Industrial and Commercial Swing Gates.
9. F934: Standard Specification for Standard Colors for Polymer-Coated Chain Link Fence Materials
10. F1184: Standard Specification for Industrial and Commercial Horizontal Slide Gates.

11. F1665: Standard Specification for Poly (Vinyl Chloride) (PVC) and Other Conforming Organic Polymer-Coated Steel Barbed Wire Used with Chain-Link Fence

C. Chain Link Fence Manufacturers Institute (CLFMI):

1. PM 2445: Chain Link Fence Manufacturers Institute Product Manual.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Sustainable Design Submittals.
2. Submit Manufacturer's specifications, drawings, details, and fence layout with appurtenances.
3. Submit two samples of fencing materials. Mark or tag each sample and submit 30 days prior to erection of fence.
4. Submit certified test reports with results of tests for fence finish.
5. Submit shop drawings, samples, and certificates simultaneously as one complete package.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 MANUFACTURERS OR APPROVED EQUAL:

- A. Wheatland Tube Co.,
- B. Master Halco, Inc.,
- C. Southwestern Wire, Inc.,

2.02 GENERAL:

- A. Dimensions indicated herein for roll-formed pipe and H-sections are outside dimensions, excluding coatings.
- B. Fence fabric height shall be 4 feet on top of the retaining wall and Diversion Box Structure and 6 feet for swing gates and adjacent connecting fences unless otherwise indicated.
- C. Fencing materials shall be galvanized and PVC coated after fabrication.
- D. The color of the fencing fabric, poles, and fittings shall be black.
- E. Provide framework, fabric, accessories, and gates in accordance with ASTM F567.
- F. Fence heights as indicated with top rail and bottom tension wire.
- G. Gates:
 - 1. Industrial and Commercial:
 - a. Provide swing gates in accordance with ASTM F900.

2.03 FENCE FABRIC:

- A. Colored PVC-coated steel fabric with galvanized and factory-painted steel posts, hardware, and fittings.
- B. Fence fabric shall be 9-gauge steel wire, 2-inch mesh, with top selvages knuckled and bottom selvages twisted and barbed.
- C. Fabric shall be hot-dip galvanized and PVC coated according to ASTM F668, Class 2a or Class 2b. The weight of the zinc shall meet the requirements of STM F 668, Table 4.

2.04 TENSION WIRE:

- A. Tension wire shall be located at the bottom of the fabric and shall consist of 7-gauge wire complying with ASTM F 1664. Wire gauge specified is the core wire gauge. The color shall match the coating of the chain link fabric and shall be Class 2a or Class 2b. Tension wire shall be interlaced with the fabric or attached to the fabric with wire ties at a spacing of no more than 18 inches apart.

2.05 TIE WIRES AND HOG RINGS:

- A. Galvanized minimum zinc coating 1.20 oz/ft², 9-gauge (0.148-inch) steel wire in compliance with ASTM F626. Tie wire and hog rings shall be polymer coated and match the color of the fence system.

2.06 FRAMING AND ACCESSORIES:

- A. Round steel pipe and rail: Schedule 40 standard weight pipe, in accordance with ASTM F1083, 1.8 oz/ ft² hot dip galvanized zinc exterior and 1.8 oz/ft² hot dip galvanized zinc interior coating. Intermediate Strength Grade: Minimum yield strength 50,000 psi.
 - 1. Line post shall be 2-3/8" outside diameter, 1.8 oz/ft² zinc coating.
 - 2. End, Corner, Pull post 2-7/8" outside diameter, 1.8 oz/ft² zinc coating.
 - 3. Top, brace, bottom, and intermediate rails, 1.660" outside diameter, 1.8 oz/ft² zinc coating.
- B. Polymer Coated Pipe: Polymer coated pipe shall have a PVC coating fused and adhered to the exterior zinc coating of the galvanized pipe in accordance with ASTM F1043. The minimum thickness of the PVC coating shall be 10-mils (0.254 mm). The color shall match fabric black per ASTM F934.
- C. Gate Posts:
 - 1. 2-7/8 inches outside diameter steel pipe and gate posts, for gate leaves up to and including 6 feet wide, weighing not less than 5.79 lb. per ft., or 2-1/2 inch square steel tube weighing not less than 5.14 lb. per ft., or 3-1/2 inch roll-formed, steel corner section weighing not less than 5.14 lb/ft.
 - 2. 4 inch outside diameter steel pipe, gate posts for gate leaves over 6 feet wide and up to and including 13 feet wide and weighing not less than 9.10 lb/ft .
 - 3. 6-5/8 inch outside diameter steel pipe, gate posts for gate leaves over 13 feet wide and up to and including 18 feet weighing not less than 18.97 lb/ft.
- D. Tension and Brace Bands: Galvanized pressed steel complying with ASTM F626, minimum steel thickness of 12 gauge (0.105 inch), minimum width of 3/4 inch and minimum zinc coating of 1.20 oz/ft². Secure bands with 5/16-inch galvanized steel carriage bolts.
- E. Terminal Post Caps, Line Post Loop Tops, Rail and Brace Ends, Boulevard Clamps, Rail Sleeves: In compliance to ASTM F626, pressed steel galvanized after fabrication having a minimum zinc coating of 1.20 oz/ft² and PVC coated.
- F. Truss Rod Assembly: In compliance with ASTM F626, 3/8-inch diameter steel truss rod with a pressed steel tightener, minimum zinc coating of 1.2 oz/ft² and PVC coated, assembly capable of withstanding a tension of 2,000 lbs.
- G. Tension Bars: Tension bars shall be in accordance with ASTM F626 and shall be galvanized steel one-piece length 2-inch less than the fabric height. Minimum zinc coating 1.2 oz. /ft². Bars for 2-inch mesh shall have a minimum cross section of 3/16 inch by 3/4-inch.

- H. Polymer Coated Color Fittings: In compliance with ASTM F626, PVC coating minimum thickness 0.006-inch fused and adhered to the zinc coated fittings. Match color to fence system.

2.07 STRETCHER BARS:

- A. Flat bars with minimum cross section dimensions of 1/4-inch by 3/4 inch, full height of fabric, secured with bar bands of minimum 11-gage sheet steel, spaced approximately 15 inches on centers and bolted with 3/8-inch diameter bolts, for attaching fabric to terminal posts.

2.08 SWING GATES:

- A. **Swing Gates:** Galvanized steel pipe welded fabrication in compliance with ASTM F900. Gate frame members 1.900-inch outside diameter, ASTM F 1083 schedule 40 galvanized steel pipe. Frame members spaced no greater than 8 ft. apart vertically and horizontally. Welded joints protected by applying zinc-rich paint in accordance with ASTM Practice A 780. Positive locking gate latch, pressed steel galvanized after fabrication. Galvanized malleable iron or heavy gauge pressed steel post and frame hinges. Provide lockable drop bar and gate holdbacks with double gates. Match gate fabric to that of the fence system. Gateposts per ASTM F1083 schedule 40 galvanized steel pipe. The gatepost diameter from table 2.5.B. Gate frames and gate posts shall be PVC coated and match the color of the fence system.
- B. Gateposts: Schedule 40 pipe in compliance with ASTM F1083.

Gate fabric height up to and including 6 ft.		
Gate leaf width	Post Outside Diameter	Weight
up to 4 ft.	2.375 in.	3.65 lb/ft
over 4 ft. to 10 ft.	2.875 in.	5.79 lb/ft
over 10 ft. to 18 ft.	4.000 in.	9.11 lb/ft
Gate fabric height over 6 ft. to 12 ft.		
Gate leaf width		
up to 6 ft.	2.875 in.	5.79 lb/ft
over 6 ft. to 12 ft.	4.000 in.	9.11 lb/ft
over 12 ft. to 18 ft.	6.625 in.	18.97 lb/ft
over 18 ft. to 24 ft.	8.625 in.	28.58 lb/ft

2.09 GATE HINGES:

- A. Heavy pattern of adequate strength for gate size, with large bearing surfaces for clamping or bolting in position.

2.10 LATCH:

- A. Gates with suitable latch, accessible from both sides and with provision for padlocking.

2.11 CONCRETE FOOTINGS:

- A. Section 03 30 00 Cast-In-Place Concrete, Class A concrete.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine conditions under which fence and gates are to be installed. Notify Engineer, in writing, of improper conditions of work.
- B. Do not proceed with work until unsatisfactory conditions have been corrected.
- C. Verify measurements at site.
- D. Check location of underground work to make sure fence footings clear utilities and drainage work.
- E. Do not install fence until final grading is complete and finish elevations are established.
- F. Do not drive equipment on areas to be landscaped, except as accepted by Engineer. Areas not accessible from roads shall be protected with heavy wood planking. Remove barricades and protection at completion of project. Repair damaged landscape surfaces.

3.02 INSTALLATION:

- A. Footings:
 - 1. Vertical sides to minimize up-lift. Dispose of excavated material in accordance with Section 01 74 23.
 - 2. Rod and compact concrete around posts. Slope top of footings above level of adjacent grade, and trowel finish.
 - 3. Time of Set: 48 hours before rails are erected or before fabric is applied or stretched.
- B. Framing:
 - 1. Install corner posts where the fence line changes direction by more than 30 degrees.
 - 2. Set posts in concrete footings, plumb and true to line.
 - 3. Brace and truss end, pull, corner, and gate posts to adjacent line posts. Provide brace to match top rail spaced midway between top rail and tension wire and extending to adjacent line posts. Provide brace to match top rail spaced midway between top rail and tension wire and extending to adjacent line post. Truss diagonally with 5/16-inch diameter tension rod with turnbuckle.

4. Fasten top rail to end, pull, gate and corner posts. Pass top rail through fittings of line posts.
5. Provide expansion and contraction joints in top rail for each 100 linear feet of fence.
6. Fasten bottom tension wire to end, pull, gate, corner, and line posts.
7. Maximum area of unbraced fence shall not exceed 1,500 square feet.
8. Use galvanized sleeve and grout posts or install with suitable galvanized flange casings and galvanized anchor bolts as accepted by Engineer.
9. When rock is encountered, set posts into rock a minimum depth of 12 inches for line posts and 18 inches for terminal posts. If solid ledge is encountered without overburden of soil. Provide post holes at least 1 inch greater in diameter than post, fill post holes with concrete work post into hole taking care not to cause voids, remove excess concrete and crown remainder at top to shed water. Where solid rock is covered by overburden, do not exceed total setting depth required for setting in earth, grout posts into rock as described.

C. Fabric:

1. Place fabric on outside of posts and stretch to avoid bulging or buckling.
2. Fasten at line posts, top rail, and bottom tension wire with zinc PVC coated ties. Space ties not more than 15 inches apart on line posts and not more than 24 inches apart on rail and tension wire.
3. Fasten at terminal posts at intervals not exceeding 15 inches using flat or beveled galvanized steel bands with 5/16-inch x 1-1/4 inch galvanized carriage bolts and nuts.
4. Make tie connections on interior side of fence.
5. Provide steel angle metal closures where finished ground surface is more than two inches below bottom tension wire. Bolt steel angle to fence posts, and install reinforcing rods and bracing members as accepted. Install rods of accepted length vertically. Where drainage ditches cross fence line, provide concrete ditch lining and steel reinforcing bar grill.
6. Install gates plumb, level, and secure for full width of opening and hardware adjusted for smooth operation.
7. Electrical Ground where a power line carrying more than 600 volts passes over fence, install ground rod at nearest point directly below each point of crossing.
 - a. Provide at least one electrical ground for each 1,000 feet of fence, located near the center of the run.

- b. Ground at or near point of overhead line crossing and at distances not exceeding 150 feet each side of line crossing.
- c. Make connection to ground from metal posts electrically continuous with the fencing.
- d. Vertically drive or drill in the grounding rod until the top of the rod is approximately six (6) inches below the top of the ground. Connect a No. 6 solid copper conductor to the rod and to the fence by a UL-listed method so that each element of the fence is grounded.
- e. Set ground rods eight (8) feet from fence.

3.03 REPAIR:

- A. Remove and replace fencing which is improperly located or is not true to line, grade and plumb within tolerances as indicated.
- B. Repair damaged vinyl-coated components as recommended by manufacturer.

3.04 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 32 32 16

PRECAST MODULAR BLOCK RETAINING WALLS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This Section includes furnishing all materials and labor required for the design and construction of a precast concrete modular block (PMB) retaining wall with or without geosynthetic reinforcement. Precast modular block retaining wall blocks under this section shall be cast utilizing a wet-cast concrete mix and exhibit a final handling weight in excess of 1,000 pounds per unit.
- B. Scope of Work: The work shall consist of furnishing materials, labor, equipment, and supervision for the construction of a precast modular block (PMB) retaining wall structure in accordance with the requirements of this section and in acceptable conformity with the lines, grades, design, and dimensions shown in the project site plans.

- 1.03 DEFINITIONS:
 - A. Precast Modular Block (PMB) Unit: Concrete, modular facing block provided by an authorized manufacturer.
 - B. Geogrid: A geosynthetic material manufactured of high tensile materials specifically for the purpose of reinforcing and creating a structural soil mass.
 - C. Drainage Aggregate: Clean, crushed rock located within and immediately behind PMB units to facilitate drainage and avoid compaction in close proximity to PMB wall units.
 - D. Reinforced Soil: Soil zone extending from the Drainage aggregate zone to the back of the embedded geogrid.
 - E. Foundation Soil: Soil zone immediately beneath the retaining wall facing units, the wall leveling pad and the reinforced soil zone.
 - F. Retained Soil: Soil immediately behind retaining wall facing and drainage aggregate for modular gravity structures or behind the reinforced soil for wall that utilize geogrid.
 - G. Construction Drawings: Approved final plan for construction prepared and stamped by the wall design engineer licensed to practice in the State of Utah.

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Product Data. The Contractor shall submit the retaining wall product submittal package to the Engineer for review and approval. The submittal package shall include technical specifications and product data from the manufacturer for the following:
 - 1. Precast Modular Block System brochure, product data, and installation instructions.
 - 2. Manufacturer's test reports certifying that the PMB units manufactured at their production facility meet the requirements of this Specification and the requirements of the Construction Drawings.
- C. Contractor shall submit one electronic PDF file of the Construction Drawings for all retaining walls on the project.
 - 1. The design shall be prepared by a Professional Engineer licensed to practice in the State of Utah.
 - 2. The design shall be per NCMA Design Guidelines for Segmental Retaining Walls, or the AASHTO Standard Specifications for Highway Bridges, whichever is applicable as determined by the retaining wall design engineer.
 - 3. Construction Drawings shall include:
 - a. The retaining wall layout and retaining wall heights.
 - b. Proper placement, lengths, and types of geogrid reinforcement where necessary.
 - c. Typical wall sections.
 - d. Types, locations and properties of all drainage materials, appurtenances and special installation requirements not covered in this specification.
 - e. Retaining wall elevation views.
 - f. Any soils information or testing conducted in addition to that included within the project drawings and specifications.
 - g. Design assumptions.
 - 4. If geogrid reinforcement is required in the final engineered construction drawings, submit manufacturer's product literature, product testing reports and a twelve inch or larger sample of each type to be used in wall construction.

5. Submit gradation reports for aggregates used for the wall leveling pad, unit / drainage fill and for select reinforced fill if required in the final engineered wall design.
 6. All submittals must be provided and reviewed prior to the start of retaining wall construction.
 7. Drainage Pipe, if required.
 8. Geotextile
- D. Installer Qualification Data. The Contractor shall submit the qualifications of the business entity responsible for installation of the retaining wall, the Retaining Wall Installation Contractor, per the requirements of this section.

1.05 ADMINISTRATIVE REQUIREMENTS:

- A. Preconstruction Meeting. The General Contractor shall schedule a preconstruction meeting at the project site prior to commencement of retaining wall construction. Participation in the preconstruction meeting shall be required of the General Contractor, Retaining Wall Design Engineer, Retaining Wall Installation Contractor, Grading Contractor, and Engineer. The General Contractor shall provide notification to all parties at least 10 calendar days prior to the meeting.

1. Preconstruction Meeting Agenda:

- a. The Retaining Wall Design Engineer shall explain all aspects of the retaining wall construction drawings.
- b. The Retaining Wall Design Engineer shall explain the required bearing capacity of soil below the retaining wall structure and the shear strength of in-situ soils assumed in the retaining wall design to the Engineer.
- c. The Retaining Wall Design Engineer shall explain the required shear strength of fill soil in the reinforced, retained and foundation zones of the retaining wall to the Engineer.
- d. The Retaining Wall Design Engineer shall explain any measures required for coordination of the installation of utilities or other obstructions in the reinforced or retained fill zones of the retaining wall.
- e. The Retaining Wall Installation Contractor shall explain all excavation needs, site access and material staging area requirements to the General Contractor and Grading Contractor.

1.06 CONSTRUCTION SHOP DRAWINGS PREPARATION

- A. The Retaining Wall Design Engineer shall coordinate the retaining wall construction shop drawing preparation with the project Civil Engineer and project Geotechnical Engineer. The General Contractor shall furnish the Retaining Wall Design Engineer the following project information required to prepare the construction shop drawings. This information shall include, but is not limited to, the following:
 - 1. Current versions of the site, grading, drainage, utility, erosion control, landscape, and irrigation plans;
 - 2. electronic CAD file of the civil site plans listed in (1);
 - 3. report of geotechnical investigation and all addenda and supplemental reports;
 - 4. recommendations of the project Geotechnical Engineer regarding effective stress shear strength and total stress shear strength (when applicable) parameters for in-situ soils in the vicinity of the proposed retaining wall(s) and for any fill soil that may potentially be used as backfill in retained and/or foundation zones of the retaining wall.
- B. The Retaining Wall Design Engineer shall provide the Engineer with a certificate of professional liability insurance verifying the minimum coverage limits of \$1 million per claim and \$1 million aggregate.
- C. Design of the precast modular block retaining wall shall satisfy the requirements of this section. Where local design or building code requirements exceed these specifications, the local requirements shall also be satisfied.
- D. The Retaining Wall Design Engineer shall note any exceptions to the requirements of this section by listing them at the bottom right corner of the first page of the construction shop drawings.
- E. Approval or rejection of the exceptions taken by the Retaining Wall Engineer will be made in writing as directed by the Engineer.
- F. The precast modular block design, except as noted herein, shall be based upon AASHTO Load and Resistance Factor Design (LRFD) methodology.
- G. In the event that a conflict is discovered between these specifications and a reasonable interpretation of the design specifications and methods referenced in paragraph F above, these specifications shall prevail.
- H. Soil Shear Parameters. The Retaining Wall Design Engineer shall prepare the construction shop drawings based upon soil shear strength parameters from the available project data and the recommendations of the project Geotechnical Engineer. If insufficient data exists to develop the retaining wall design, the Retaining Wall Design

Engineer shall communicate the specific deficiency of the project information or data to the Owner in writing.

- I. Allowable bearing pressure requirements for each retaining wall shall be clearly shown on the construction drawings.
- J. Global Stability. Overall (global) stability shall be evaluated in accordance with the principals of limit equilibrium analysis as set forth in FHWA-NHI-10-024 Volume I and FHWA-NHI-10-025 Volume II GEC 11 Design of Mechanically Stabilized Earth Walls and Reinforced Soil Slopes. The minimum factors of safety shall be as follows:
 - 1. Normal Service (Static): 1.4
 - 2. Seismic: 1.1
 - 3. Rapid Drawdown (if applicable): 1.2
- K. Seismic Stability. Seismic loading shall be evaluated in accordance with AASHTO Load and Resistance Factor Design (LRFD).

1.07 PERFORMANCE REQUIREMENTS:

- A. Basis of Design: Design of segmental retaining walls is based on products indicated. If comparable products of other manufacturers are proposed, provide engineering design for proposed products, including comprehensive engineering analysis by a qualified and registered professional engineer in State of Utah, using performance requirements and design criteria indicated.
- B. Delegated Design: Design segmental retaining walls, including comprehensive engineering analysis by a qualified and registered professional engineer in State of Utah, using performance requirements and design criteria indicated.
- C. Structural Performance: Engineering design shall be based on the following loads and be according to the current version of AASHTO LRFD Standard Specification for Highway Bridges.
 - 1. Gravity loads due to soil pressures resulting from grades and sloped backfill indicated.
 - 2. Superimposed loads (surcharge) indicated on Drawings.
- D. Seismic Performance: Engineering design shall be based on the following loads and factors and be according to the current version of AASHTO LRFD Standard Specification for Highway Bridges.
 - 1. Gravity loads due to soil pressures resulting from grades indicated.
 - 2. Superimposed loads (surcharge) indicated on Drawings.

3. Horizontal Peak Ground Acceleration (A) for Project: 0.62g.

1.08 PRECONSTRUCTION TESTING:

- A. Preconstruction Testing Service: Engage a qualified testing agency to perform the following preconstruction testing:
1. Test soil reinforcement and backfill materials for pullout resistance according to ASTM D6706.
 2. Test soil reinforcement and backfill materials for coefficient of friction according to ASTM D5321.

1.09 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Prepare design, including calculations and drawings, under the direction of a Professional Engineer registered in State of Utah and having the following qualifications:
1. Not less than ten (10) years' experience in the design of precast modular block retaining wall systems.
 2. Completed not less than five (5) successful segmental retaining wall systems for projects of equal type.
- C. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated.
- D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects.
1. Build mockup of segmental retaining wall approximately 72 inches long by not less than 36 inches high above finished grade at front of wall.
 - a. Include typical soil reinforcement.
 - b. Include typical base and cap or finished top construction.
 - c. Include backfill to typical finished grades at both sides of wall.
 - d. Include typical end construction at one end of mockup.
 - e. Include 36-inch return at 1 end of mockup, with typical corner construction.
 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

- E. Preinstallation Conference: Conduct conference at Project site.
1. Review methods and procedures related to segmental retaining walls including, but not limited to, the following:
 - a. Structural load limitations.
 - b. Construction schedule. Verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
- F. Retaining Wall Installation Contractor Qualifications. In order to demonstrate basic competence in the construction of precast modular block walls, the Retaining Wall Installation Contractor shall document compliance with the following:
1. Experience.
 - a. Construction experience with a minimum of 30,000 square feet of the proposed precast modular block retaining wall system.
 - b. Construction of at least ten (10) precast modular block (large block) retaining wall structures within the past three (3) years.
 - c. Construction of at least 50,000 square feet of precast modular block (large block) retaining walls within the past three (3) years.
 2. Retaining Wall Installation Contractor experience documentation for each qualifying project shall include:
 - a. Name and location
 - b. Date (month and year) of construction completion
 - c. Contact information of Owner or General Contractor
 - d. Type (trade name) of precast modular block system built
 - e. Maximum height of the wall constructed
 - f. Face area of the wall
 3. In lieu of the requirements set forth in items 1 and 2 above, the Retaining Wall Installation Contractor must be a certified Precast Modular Block Retaining Wall Installation Contractor as demonstrated by satisfactory completion of a certified precast modular block retaining wall installation training program administered by the precast modular block manufacturer.
- G. Retaining Wall Design Engineer Qualifications and Statement of Experience. The Retaining Wall Design Engineer shall submit a written statement affirming that he or she has the following minimum qualifications and experience.

1. The Retaining Wall Design Engineer shall be licensed to practice in the State of Utah.
2. The Retaining Wall Design Engineer shall be independently capable of performing all internal and external stability analyses, including those for seismic loading, compound stability, rapid draw-down and deep-seated, global modes of failure.
3. The Retaining Wall Design Engineer shall affirm in writing that he or she has personally supervised the design of the retaining walls for the project, that the design considers all the requirements listed above and that he or she accepts responsibility as the design engineer of record for the retaining walls constructed on the project.
4. The Retaining Wall Design Engineer shall affirm in writing that he or she has personally designed in excess of 100,000 face square feet of modular block earth retaining walls within the previous three (3) years.
5. In lieu of these specific requirements, the engineer may submit alternate documentation demonstrating competency in Precast Modular Block retaining wall design.

H. The Owner reserves the right to reject the design services of any engineer or engineering firm who, in the sole opinion of the Owner, does not possess the requisite experience or qualifications.

1.10 QUALITY CONTROL:

- A. Comply with the requirements specified in Section 01 43 00.
- B. The Engineer shall review all submittals for materials, design, Retaining Wall Design Engineer qualifications and the Retaining Wall Installation Contractor qualifications.
- C. The General Contractor shall retain the services of an Inspection Engineer who is experienced with the construction of precast modular block retaining wall structures to perform inspection and testing. The cost of inspection shall be the responsibility of the General Contractor. Inspection shall be continuous throughout the construction of the retaining walls.
- D. The Inspection Engineer shall perform the following duties:
 1. Inspect the construction of the precast modular block structure for conformance with construction shop drawings and the requirements of this specification.
 2. Verify that soil or aggregate fill placed and compacted in the reinforced, retained and foundation zones of the retaining wall conforms with requirements of this section and exhibits the shear strength parameters specified by the Retaining Wall Design Engineer.

3. Verify that the shear strength of the in-situ soil assumed by the Retaining Wall Design Engineer is appropriate.
4. Inspect and document soil compaction in accordance with these specifications:
 - a. Required dry unit weight
 - b. Actual dry unit weight
 - c. Allowable moisture content
 - d. Actual moisture content
 - e. Pass/fail assessment
 - f. Test location – wall station number
 - g. Test elevation
 - h. Distance of test location behind the wall face
5. Verify that all excavated slopes in the vicinity of the retaining wall are bench-cut as directed by the project Geotechnical Engineer.
6. Notify the Retaining Wall Installation Contractor of any deficiencies in the retaining wall construction and provide the Retaining Wall Installation Contractor a reasonable opportunity to correct the deficiency.
7. Notify the General Contractor, Owner and Retaining Wall Design Engineer of any construction deficiencies that have not been corrected timely.
8. Document all inspection results.
9. Test compacted density and moisture content of the retained backfill with the following frequency:
 - a. At least once every 1,000 square feet (in plan) per 9-inch vertical lift, and
 - b. At least once per every 18 inches of vertical wall construction.
- E. The General Contractor's engagement of the Inspection Engineer does not relieve the Retaining Wall Installation Contractor of responsibility to construct the proposed retaining wall in accordance with the approved construction shop drawings and these specifications.
- F. The Retaining Wall Installation Contractor shall inspect the on-site grades and excavations prior to construction and notify the Retaining Wall Design Engineer and General Contractor if on-site conditions differ from the elevations and grading conditions depicted in the retaining wall construction shop drawings.

1.11 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. The Retaining Wall Installation Contractor shall inspect the materials upon delivery to ensure that the proper type, grade, and color of materials have been delivered.
- C. The Retaining Wall Installation Contractor shall store and handle all materials in accordance with the manufacturer's recommendations as specified herein and in a manner that prevents deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breaking, chipping, UV exposure or other causes. Damaged materials shall not be incorporated into the work.
- D. Retaining wall units shall be stored in a location and manner that protects against excessive weathering and damage.
- E. Contractor shall prevent PMB units from excessive soiling and coming in contact with substances which may stain or adhere to the finished visual surfaces of the unit.
- F. Store geosynthetics in manufacturer's original packaging with labels intact and in accordance with ASTM D4873. Store and handle geosynthetics to prevent deterioration or damage due to sunlight, chemicals, flames, temperatures above 160 degrees F or below 32 degrees F, and other conditions that might damage them. Verify identification of geosynthetics before using and examine them for defects as material is placed.
- G. Precast Modular Blocks
 - 1. Precast modular blocks shall be stored in an area with positive drainage away from the blocks. Be careful to protect the block from mud and excessive chipping and breakage. Precast modular blocks shall not be stacked more than three (3) units high in the storage area.
- H. Drainage Aggregate and Backfill Stockpiles
 - 1. Drainage aggregate or backfill material shall not be piled over unstable slopes or areas of the project site with buried utilities.
 - 2. Drainage aggregate and/or reinforced fill material shall not be staged where it may become mixed with or contaminated by poor draining fine-grained soils such as clay or silt.

PART 2 - PRODUCTS

2.01 PRECAST MODULAR BLOCK (PMB) RETAINING WALL UNITS:

- A. Concrete Units: All units shall be wet-cast precast modular retaining wall units conforming to ASTM C1776.

- B. All units for the project shall be obtained from the same manufacturer. The manufacturer shall be licensed and authorized to produce the retaining wall units by the precast modular block system patent holder/licensor and shall document compliance with the published quality control standards of the proprietary precast modular block system licensor for the previous three (3) years or the total time the manufacturer has been licensed, whichever is less.

Table 32 32 16-1 Concrete Mix Properties					
Freeze Thaw Exposure Class ⁽¹⁾	Minimum 28-Day Compressive Strength ⁽²⁾	Maximum Water Cement Ratio	Nominal Maximum Aggregate Size	Aggregate Class Designation ⁽³⁾	Air Content ⁽⁴⁾
Moderate	4,000 psi (27.6 MPa)	0.45	1 inch (25 mm)	3M	4.5% +/- 1.5%
Severe	4,000 psi (27.6 MPa)	0.45	1 inch (25 mm)	3S	6.0% +/- 1.5%
Very Severe	4,500 psi (30.0 MPa)	0.40	1 inch (25 mm)	4S	6.0% +/- 1.5%
Maximum Water-Soluble Chloride Ion (Cl ⁻) Content in Concrete, Percent by Weight of Cement ^(5,6)					0.15
Maximum Chloride as Cl ⁻ Concentration in Mixing Water, Parts Per Million					1000
Maximum Percentage of Total Cementitious Materials By Weight ^(7,9) (Very Severe Exposure Class Only):					
Fly Ash or Other Pozzolans Conforming to ASTM C618					25
Slag Conforming to ASTM C989					50
Silica Fume Conforming to ASTM C1240					10
Total of Fly Ash or Other Pozzolans, Slag, and Silica Fume ⁽⁸⁾					50
Total of Fly Ash or Other Pozzolans and Silica Fume ⁽⁸⁾					35
Alkali-Aggregate Reactivity Mitigation per ACI 201					
Slump (Conventional Concrete) per ASTM C143 ⁽¹⁰⁾			5 inches +/- 1½ inches (125 mm +/- 40 mm)		
Slump Flow (Self-Consolidating Concrete) per ASTM C1611			18 inches – 32 inches (450 mm – 800 mm)		
NOTES:					
(1) Exposure class is as described in ACI 318. “Moderate” describes concrete that is exposed to freezing and thawing cycles and occasional exposure to moisture. “Severe” describes concrete that is exposed to freezing and thawing cycles and in continuous contact with moisture. “Very Severe” describes concrete that is exposed to freezing and thawing cycles and in continuous contact with moisture and exposed to deicing chemicals. Exposure class should be specified by owner/purchaser prior to order placement.					
(2) Test method ASTM C39.					
(3) Defined in ASTM C33 Table 3 <i>Limits for Deleterious Substances and Physical Property Requirements of Coarse Aggregates for Concrete</i> .					
(4) Test method ASTM C231.					
(5) Test method ASTM C1218 at age between 28 and 42 days.					
(6) Where used in high sulfate environments or where alkali-silica reactivity is an issue, water soluble chloride shall be limited to no more than trace amounts (from impurities in concrete-making components, not intended constituents).					
(7) The total cementitious material also includes ASTM C150, C595, C845, C1157 cement. The maximum percentages shall include:					
(a) Fly ash or other pozzolans in type IP, blended cement, ASTM C595, or ASTM C1157.					
(b) Slag used in the manufacture of an IS blended cement, ASTM C595, or ASTM C1157.					
(c) Silica fume, ASTM C1240, present in a blended cement.					
(8) Fly ash or other pozzolans and silica fume shall constitute no more than 25 and 10 percent, respectively, of the total weight of the cementitious materials.					
(9) Prescriptive limits shown may be waived for concrete mixes that demonstrate excellent freeze/thaw durability in a detailed and current testing program.					
(10) Slump may be increased by a high-range water-reducing admixture.					

- C. Concrete used in the production of the precast modular block units shall be first-purpose, fresh concrete. It shall not consist of returned, reconstituted, surplus or waste concrete. It shall be an original production mix meeting the requirements of ASTM C94 and exhibit the properties as shown in Table 32 32 16-1:
- D. Each concrete block shall be cast in a single continuous pour without cold joints.
- E. Depth of units should be as per the Construction Drawings and shall range from 24 inches to 84-inches.
- F. Individual block units shall have a nominal height of between 16 to 18 inches.
- G. Exterior dimensions of the face shall be 46-inch to 48-inch for full units.
- H. Units shall maintain tolerances of +/- 3/16-inch of height and +/- 1/2-inch of width.
- I. Special shape units should be obtained and used where indicated on the final engineered construction drawings.
- J. PMB unit face texture shall be ReCon Limestone, ReCon Granite, RediRock Limestone, or RediRock Kingston.
 - 1. Manufacturers:
 - a. Redi-Rock Retaining Wall Systems
 - b. ReCon Wall Systems, Inc.

2.02 GEOGRID REINFORCEMENT:

- A. Geosynthetic reinforcement shall be high tensile geogrid or geotextile manufactured specifically for soil reinforcement applications.
 - 1. Construction Drawings shall indicate the type, strength, location, and lengths of reinforcement used.
 - 2. The geosynthetic manufacturer shall provide all relevant testing to the wall design engineer for incorporation in the wall design and shall be included in the submittal for the Construction Drawings.
 - 3. No substitutions of geosynthetic shall be allowed that was not evaluated in the Construction Drawings.
- B. Constructability Requirements. Geogrid design embedment length shall be measured from the back of the precast modular block facing unit and shall be consistent for the entire height of a given retaining wall section.

- C. Geogrid shall be positively connected to every precast modular block unit. Design coverage ratio, R_c , as calculated in accordance with AASHTO LRFD Bridge Design Specifications Figure 11.10.6.4.1-2 shall not exceed 0.50.
- D. Preapproved Geogrid Reinforcement Products.
 - 1. Miragrid XT Geogrids as manufactured by TenCate Geosynthetics.

2.03 GEOTEXTILE:

- A. Nonwoven geotextile fabric shall be placed as indicated on the retaining wall construction shop drawings. Additionally, the nonwoven geotextile fabric shall be placed in the v-shaped joint between adjacent block units on the same course. The nonwoven geotextile fabric shall meet the requirements Class 3 construction survivability in accordance with AASHTO M 288.
- B. Preapproved Nonwoven Geotextile Products:
 - 1. Mirafi 140N
 - 2. Propex Geotex 451
 - 3. Skaps GT-142
 - 4. Thrace-Linq 140EX
 - 5. Carthage Mills FX-40HS
 - 6. Stratatex ST 142

2.04 DRAINAGE AGGREGATE AND WALL INFILL:

- A. Drainage aggregate (and wall infill for retaining walls designed as modular gravity structures) shall be a durable crushed stone conforming to No. 57 size per ASTM C33 with the following particle-size distribution requirements per ASTM D422:

U.S. Standard	
Sieve Size	Passing
1 – 1-1/2 inches	100
1 inch	95-100
1/2 inch	25-60
No. 4	0-10
No. 8	0-2

2.05 REINFORCED FILL:

- A. Material used as reinforced backfill material in the reinforced zone (if applicable) shall be a granular fill material meeting the requirements of USCS soil type GW, GP, SW or

SP per ASTM D2487 or alternatively by AASHTO Group Classification A-1-a or A-3 per AASHTO M 145. The backfill shall exhibit a minimum effective internal angle of friction, $\phi = 34$ degrees at a maximum 2 percent shear strain and meet the following particle-size distribution requirements per ASTM D422.

U.S. Standard	
Sieve Size	Passing
3/4 inch	100
No. 4	0-100
No. 40	0-60
No. 200	0-15

- B. The reinforced backfill material shall be free of sod, peat, roots or other organic or deleterious matter including, but not limited to, ice, snow or frozen soils. Materials passing the No. 40 sieve shall have a liquid limit less than 25 and plasticity index less than 6 per ASTM D4318. Organic content in the backfill material shall be less than 1 percent per AASHTO T-267 and the pH of the backfill material shall be between 5 and 8.
- C. Soundness. The reinforced backfill material shall exhibit a magnesium sulfate soundness loss of less than 30 percent after four (4) cycles, or sodium sulfate soundness loss of less than 15 percent after five (5) cycles as measured in accordance with AASHTO T-104.
- D. Reinforced backfill shall not be comprised of crushed or recycled concrete, recycled asphalt, bottom ash, shale or any other material that may degrade, creep or experience a loss in shear strength or a change in pH over time.

2.06 LEVELING PAD:

- A. The precast modular block units shall be placed on a leveling pad constructed from crushed stone or unreinforced concrete. The leveling pad shall be constructed to the dimensions and limits shown on the retaining wall design drawings prepared by the Retaining Wall Design Engineer.
- B. Crushed stone used for construction of a granular leveling pad shall meet the requirements of the drainage aggregate and wall infill in Paragraph 2.04 or a preapproved alternate material.
- C. Concrete used for construction of an unreinforced concrete leveling pad shall satisfy the criteria for AASHTO Class B. The concrete should be cured a minimum of 12 hours prior to placement of the precast modular block wall retaining units and exhibit a minimum 28-day compressive strength of 2,500 psi.

2.07 DRAINAGE:

A. Drainage Pipe:

1. Drainage collection pipe shall be a 4-inch diameter, 3-hole perforated, HDPE pipe with a minimum pipe stiffness of 22 psi per ASTM D2412.
2. The drainage pipe shall be manufactured in accordance with ASTM D1248 for HDPE pipe and fittings.

B. Preapproved Drainage Pipe Products:

1. ADS 3000 Triple Wall pipe as manufactured by Advanced Drainage Systems.

2.08 UNIT ADHESIVES:

- A. Adhesive shall be a premium, construction grade suitable for concrete and exterior applications.

2.09 FINISHES:

- A. Finished retaining wall shall be stained in accordance with Section 09 93 13.13 "Exterior Staining".

1. Acceptable product stains:
 - a. Sherwin Williams H & C SHIELD PLUS CONCRETE STAIN
 - b. TK Products TRI-SHEEN PIGMENTED STAIN TK-5272
2. Color shall match building CMU Block and Clearwell exterior wall stain.

B. Graffiti Resistant Coatings

1. Acceptable sealers and anti-graffiti coatings
 - a. TK Products 1496 TK Perma-Clean OTC (anti-graffiti)

PART 3 - EXECUTION

3.01 GENERAL:

- A. All work shall be performed in accordance with OSHA safety standards, state and local building codes and manufacturer's requirements.
- B. The General Contractor is responsible for the location and protection of all existing underground utilities. Any new utilities proposed for installation in the vicinity of the retaining wall, shall be installed concurrent with retaining wall construction. The

General Contractor shall coordinate the work of subcontractors affected by this requirement.

- C. New utilities installed below the retaining wall shall be backfilled and compacted to a minimum of 98% maximum dry density per ASTM D698 standard proctor.
- D. The General Contractor is responsible to ensure that safe excavations and embankments are maintained throughout the course of the project.
- E. All work shall be inspected by the Inspection Engineer as directed by the Owner.
- F. General: Place units according to NCMA's "Segmental Retaining Wall Installation Guide" and segmental retaining wall unit manufacturer's written instructions.

3.02 EXAMINATION:

- A. Examine areas and conditions, with Installer present, for compliance with requirements for excavation tolerances, condition of subgrades, and other conditions affecting short-term and long-term performance of segmental retaining walls.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.03 PREPARATION:

A. Fill Soil:

- 1. The Inspection Engineer shall verify that reinforced backfill placed in the reinforced soil zone satisfies the criteria of this section.
- 2. The Inspection Engineer shall verify that any fill soil installed in the foundation and retained soil zones of the retaining wall satisfies the specification of the Retaining Wall Design Engineer as shown on the Contract Drawings.

B. Excavation:

- 1. The Grading Contractor shall excavate to the lines and grades required for construction of the precast modular block retaining wall as shown on the construction drawings. The Grading Contractor shall minimize over-excavation. Excavation support, if required, shall be the responsibility of the Grading Contractor.
- 2. Over-excavated soil shall be replaced with compacted fill in conformance with the specifications of the Retaining Wall Design Engineer.
- 3. Embankment excavations shall be bench cut as directed by the project Geotechnical Engineer and inspected by the Inspection Engineer for compliance.

C. Foundation Preparation:

1. Prior to construction of the precast modular block retaining wall, the leveling pad area and undercut zone (if applicable) shall be cleared and grubbed. All topsoil, brush, frozen soil and organic material shall be removed. Additional foundation soils found to be unsatisfactory beyond the specified undercut limits shall be undercut and replaced with approved fill as directed by the project Geotechnical Engineer. The Inspection Engineer shall ensure that the undercut limits are consistent with the requirements of the project Geotechnical Engineer and that all soil fill material is properly compacted according to project specifications. The Inspection Engineer shall document the volume of undercut and replacement.
2. Following excavation for the leveling pad and undercut zone (if applicable), the Inspection Engineer shall evaluate the in-situ soil in the foundation and retained soil zones.
 - a. The Inspection Engineer shall verify that the shear strength of the in-situ soil assumed by the Retaining Wall Design Engineer is appropriate. The Inspection Engineer shall immediately stop work and notify the Owner if the in-situ shear strength is found to be inconsistent with the retaining wall design assumptions.
 - b. The Inspection Engineer shall verify that the foundation soil exhibits sufficient ultimate bearing capacity to satisfy the requirements indicated on the retaining wall construction shop drawings.

D. Leveling Pad:

1. The leveling pad shall be constructed to provide a level, hard surface on which to place the first course of precast modular block units. The leveling pad shall be placed in the dimensions shown on the retaining wall construction drawings and extend to the limits indicated.
2. Crushed Stone Leveling Pad. Crushed stone shall be placed in uniform maximum lifts of 6-inches. The crushed stone shall be compacted by a minimum of 3 passes of a vibratory compactor capable of exerting 2,000 pounds of centrifugal force and to the satisfaction of the Inspection Engineer.
3. Unreinforced Concrete Leveling Pad. The concrete shall be placed in the same dimensions as those required for the crushed stone leveling pad. The Retaining Wall Installation Contractor shall erect proper forms as required to ensure the accurate placement of the concrete leveling pad according to the retaining wall construction drawings.

3.04 PRECAST MODULAR BLOCK WALL SYSTEM INSTALLATION:

- A. The precast modular block structure shall be constructed in accordance with the construction drawings, these specifications and the recommendations of the retaining

wall system component manufacturers. Where conflicts exist between the manufacturer's recommendations and these specifications, these specifications shall prevail.

B. Drainage components. Pipe, geotextile and drainage aggregate shall be installed as shown on the construction shop drawings.

C. Precast Modular Block Installation:

1. The first course of block units shall be placed with the front face edges tightly abutted together on the prepared leveling pad at the locations and elevations shown on the construction drawings. The Retaining Wall Installation Contractor shall take special care to ensure that the bottom course of block units are in full contact with the leveling pad, are set level and true and are properly aligned according to the locations shown on the construction drawings.
2. Backfill shall be placed in front of the bottom course of blocks prior to placement of subsequent block courses. Nonwoven geotextile fabric shall be placed in the V-shaped joints between adjacent blocks. Drainage aggregate shall be placed in the V-shaped joints between adjacent blocks to a minimum distance of 12 inches behind the block unit.
3. Drainage aggregate shall be placed in 9 inch maximum lifts and compacted by a minimum of three (3) passes of a vibratory plate compactor capable exerting a minimum of 2,000 pounds of centrifugal force.
4. Unit core fill shall be placed in the precast modular block unit vertical core slot. The core fill shall completely fill the slot to the level of the top of the block unit. The top of the block unit shall be broom-cleaned prior to placement of subsequent block courses. No additional courses of precast modular blocks may be stacked before the unit core fill is installed in the blocks on the course below.
5. Base course blocks for gravity wall designs (without geosynthetic soil reinforcement) may be furnished without vertical core slots. If so, disregard item 4 above, for the base course blocks in this application.
6. Nonwoven geotextile fabric shall be placed between the drainage aggregate and the retained soil (gravity wall design) or between the drainage aggregate and the reinforced fill (reinforced wall design) as required on the retaining wall construction drawings.
7. Subsequent courses of block units shall be installed with a running bond (half block horizontal course-to-course offset). With the exception of 90 degree corner units, the shear channel of the upper block shall be fully engaged with the shear knobs of the block course below. The upper block course shall be pushed forward to fully engage the interface shear key between the blocks and to ensure consistent face batter and wall alignment. Geogrid, drainage aggregate, unit core fill,

geotextile and properly compacted backfill shall be complete and in-place for each course of block units before the next course of blocks is stacked.

8. The elevation of retained soil fill shall not be less than 1 block course below the elevation of the reinforced backfill throughout the construction of the retaining wall.
9. If included as part of the precast modular block wall design, cap units shall be secured with an adhesive in accordance with the precast modular block manufacturer's recommendation.

D. Geogrid Reinforcement Installation (if required):

1. Geogrid reinforcement shall be installed at the locations and elevations shown on the construction drawings on level fill compacted to the requirements of this specification.
2. Continuous 12 inches wide strips of geogrid reinforcement shall be passed completely through the vertical core slot of the precast modular block unit and extended to the embedment length shown on the construction plans. The strips shall be staked or anchored as necessary to maintain a taut condition.
3. Reinforcement length (L) of the geogrid reinforcement is measured from the back of the precast modular block unit. The cut length (Lc) is two times the reinforcement length plus additional length through the block facing unit. The cut length is calculated as follows:

$$L_c = 2 * L + 3 \text{ ft } (2 * L + 0.9 \text{ m}) \text{ (28" (710 mm) block unit)}$$

$$L_c = 2 * L + 5 \text{ ft } (2 * L + 1.5 \text{ m}) \text{ (41" (1030 mm) block unit)}$$

4. The geogrid strip shall be continuous throughout its entire length and may not be spliced. The geogrid shall be furnished in nominal, prefabricated roll widths of 12 inches, plus or minus 1/2 inch. No field modification of the geogrid roll width shall be permitted.
5. Neither rubber tire nor track vehicles may operate directly on the geogrid. Construction vehicle traffic in the reinforced zone shall be limited to speeds of less than 5 mph once a minimum of 9 inches of compacted fill has been placed over the geogrid reinforcement. Sudden braking and turning of construction vehicles in the reinforced zone shall be avoided.

E. Construction Tolerance. Allowable construction tolerance of the retaining wall shall be as follows:

1. Deviation from the design batter and horizontal alignment, when measured along a 10-foot straight wall section, shall not exceed 3/4 inches.

2. Deviation from the overall design batter shall not exceed 1/2 inch per 10-feet of wall height.
3. The maximum allowable offset (horizontal bulge) of the face in any precast modular block joint shall be 1/2 inch.
4. The base of the precast modular block wall excavation shall be within 2 inches of the staked elevations, unless otherwise approved by the Inspection Engineer.
5. Differential vertical settlement of the face shall not exceed 1-foot along any 200-feet of wall length.
6. The maximum allowable vertical displacement of the face in any precast modular block joint shall be 1/2 inch.
7. The wall face shall be placed within 2 inches of the horizontal location staked.

3.05 WALL INFILL AND REINFORCED BACKFILL PLACEMENT:

- A. Backfill material placed immediately behind the drainage aggregate shall be compacted as follows:
 1. 98 percent of maximum dry density at plus or minus 2 percent optimum moisture content per ASTM D698 standard proctor or 85 percent relative density per ASTM D4254.
- B. Compactive effort within 3-feet of the back of the precast modular blocks should be accomplished with walk-behind compactors. Compaction in this zone shall be within 95 percent of maximum dry density as measured in accordance with ASTM D698 standard proctor or 80 percent relative density per ASTM D 4254. Heavy equipment should not be operated within 3-feet of the back of the precast modular blocks.
- C. Backfill material shall be installed in lifts that do not exceed a compacted thickness of 9-inches.
- D. At the end of each work day, the Retaining Wall Installation Contractor shall grade the surface of the last lift of the granular wall infill to a 3 percent, plus or minus 1 percent slope away from the precast modular block wall face and compact it.
- E. The General Contractor shall direct the Grading Contractor to protect the precast modular block wall structure against surface water runoff at all times through the use of berms, diversion ditches, silt fence, temporary drains and/or any other necessary measures to prevent soil staining of the wall face, scour of the retaining wall foundation or erosion of the reinforced backfill or wall infill.

3.06 OBSTRUCTIONS IN THE INFILL AND REINFORCED FILL ZONE:

- A. The Retaining Wall Installation Contractor shall make all required allowances for obstructions behind and through the wall face in accordance with the approved construction shop drawings.
- B. Should unplanned obstructions become apparent for which the approved construction shop drawings do not account, the affected portion of the wall shall not be constructed until the Retaining Wall Design Engineer can appropriately address the required procedures for construction of the wall section in question.

3.07 COMPLETION:

- A. For walls supporting unpaved areas, a minimum of 12-inch of compacted, low-permeability fill shall be placed over the granular wall infill zone of the precast modular block retaining wall structure. The adjacent retained soil shall be graded to prevent ponding of water behind the completed retaining wall.
- B. For retaining walls with crest slopes of 5H:1V or steeper, silt fence shall be installed along the wall crest immediately following construction. The silt fence shall be located 3-feet to 4-feet behind the uppermost precast modular block unit. The crest slope above the wall shall be immediately seeded to establish vegetation. The General Contractor shall ensure that the seeded slope receives adequate irrigation and erosion protection to support germination and growth.
- C. The General Contractor shall confirm that the as-built precast modular block wall geometries conform to the requirements of this section. The General Contractor shall notify the Owner of any deviations.

3.08 CONSTRUCTION TOLERANCES:

- A. Variation from Level: For bed-joint lines along walls, do not exceed 1-1/4 inches in 10 feet, 3 inches maximum.
- B. Variation from Indicated Batter: For slope of wall face, do not vary from indicated slope by more than 1-1/4 inches in 10 feet.
- C. Variation from Indicated Wall Line: For walls indicated as straight, do not vary from straight line by more than 1-1/4 inches in 10 feet.

3.09 FIELD QUALITY CONTROL:

- A. Comply with requirements in Section 31 22 00 for field quality control.
 - 1. In each compacted backfill layer, perform at least 1 field in-place compaction test for each 100 feet or less of segmental retaining wall length.

2. In each compacted backfill layer, perform at least 1 field in-place compaction test for each 24 inches of fill depth and each 50 feet or less of segmental retaining wall length.

3.10 ADJUSTING:

- A. Remove and replace retaining wall construction of the following descriptions:
 1. Broken, chipped, stained, or otherwise damaged units. Units may be repaired if Engineer approves methods and results.
 2. Segmental retaining walls that do not match approved Samples and mockups.
 3. Segmental retaining walls that do not comply with other requirements indicated.
- B. Replace units so segmental retaining wall matches approved Samples and mockups, complies with other requirements, and shows no evidence of replacement.

3.11 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 32 84 00
PLANTING IRRIGATION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Pipes, tubes, and fittings.
2. Encasement for piping.
3. Manual valves.
4. Pressure-reducing valves.
5. Automatic control valves.
6. Automatic drain valves.
7. Transition fittings.
8. Dielectric fittings.
9. Miscellaneous piping specialties.
10. Sprinklers.
11. Quick couplers.
12. Drip irrigation specialties.
13. Controllers.
14. Boxes for automatic control valves.

B. Related Requirements:

1. Section 220519 "Meters and Gages for Plumbing Piping" for water metering requirements.
2. Section 230923.14 "Flow Instruments" for water metering equipment.

1.02 DEFINITIONS

- A. Circuit Piping: Downstream from control valves to sprinklers, specialties, and drain valves. Piping is under pressure during flow.

- B. Drain Piping: Downstream from circuit-piping drain valves. Piping is not under pressure.
- C. Main Piping: Downstream from point of connection to water distribution piping to, and including, control valves. Piping is under water-distribution-system pressure.
- D. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

1.03 ACTION SUBMITTALS

A. Product Data:

1. Pipes, tubes, and fittings.
2. Encasement for piping.
3. Manual valves.
4. Pressure-reducing valves.
5. Automatic control valves.
6. Automatic drain valves.
7. Transition fittings.
8. Dielectric fittings.
9. Miscellaneous piping specialties.
10. Sprinklers.
11. Quick couplers.
12. Drip irrigation specialties.
13. Controllers.
14. Boxes for automatic control valves.
15. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Wiring Diagrams: For power, signal, and control wiring.

1.04 INFORMATIONAL SUBMITTALS

- ##### A. Coordination Drawings: Irrigation systems, drawn to scale, on which components are indicated and coordinated with each other, using input from Installers of the items

involved. Also include adjustments necessary to avoid plantings and obstructions, such as signs and light standards.

- B. Zoning Chart: Indicate each irrigation zone and its control valve.
- C. Controller Timing Schedule: Indicate timing settings for each automatic controller zone.
- D. Field Quality-Control Submittals:
 - 1. Field quality-control reports.
- E. Qualification Statements: For Installer.
- F. Delegated design engineer qualifications.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For sprinklers controllers and] automatic control valves to include in operation and maintenance manuals.

1.06 MAINTENANCE MATERIAL SUBMITTALS

- A. Extra Stock Material: Furnish extra materials to Owner that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Spray Sprinklers: Equal to 10 percent of amount installed for each type and size indicated, but no fewer than 1 unit.
 - 2. Bubblers: Equal to 10 percent of amount installed for each type indicated, but no fewer than 3 units.
 - 3. Emitters: Equal to 10 percent of amount installed for each type indicated, but no fewer than 10 units.
 - 4. Drip-Tube System Tubing: Equal to 10 percent of total length installed for each type and size indicated, but not less than 50 ft.
 - 5. Soaker Tubes: Equal to 10 percent of total length installed for each type and size indicated, but not less than 50 ft.
- B. Schedule of maintenance material items.

1.07 QUALITY ASSURANCE

- A. Qualifications:
 - 1. Installers: Entity that employs a Certified Irrigation Designer - Landscape qualified by the Irrigation Association.

- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and entrance of dirt, debris, and moisture.
- B. Store plastic piping protected from direct sunlight. Support piping to prevent sagging and bending.

1.09 FIELD CONDITIONS

- A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
 - 1. Notify Construction Manager no fewer than three days in advance of proposed interruption of water service.
 - 2. Do not proceed with interruption of water service without Construction Manager's written permission.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Irrigation Zone Control: Automatic operation with controller and automatic control valves.
- B. Location of Sprinklers and Specialties: Design location is approximate. Make minor adjustments necessary to avoid plantings and obstructions, such as signs and light standards. Maintain 100 percent irrigation coverage of areas indicated.
- C. Minimum Working Pressures: The following are minimum pressure requirements for piping, valves, and specialties unless otherwise indicated:
 - 1. Irrigation Main Piping: 60 psig min.
 - 2. Circuit Piping: 45 psig min.

2.02 PIPES, TUBES, AND FITTINGS

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

- B. Galvanized-Steel Pipe: ASTM A53/A53M, Standard Weight, Type E, Grade B.
 - 1. Galvanized-Steel Pipe Nipples: ASTM A733, made of ASTM A53/A53M or ASTM A106/A106M, Standard Weight, seamless-steel pipe with threaded ends.
 - 2. Galvanized, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
 - 3. Malleable-Iron Unions: ASME B16.39, Class 150, hexagonal-stock body with ball-and-socket, metal-to-metal, bronze seating surface, and female threaded ends.
 - 4. Cast-Iron Flanges: ASME B16.1, Class 125.
- C. Hard Copper Tube: ASTM B88, Type K water tube, drawn temper.
 - 1. Copper Pressure Fittings: ASME B16.18, cast-copper-alloy or ASME B16.22, wrought-copper solder-joint fittings. Furnish wrought-copper fittings if indicated.
 - 2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end.
 - 3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and-socket, metal-to-metal seating surfaces and solder-joint or threaded ends.
- D. ASME Seamless Red Brass Pipe: ASTM B43, Strong Class, O61 annealed
 - 1. Threaded nipples shall conform to ASME B1.20.1.
 - 2. Cast Threaded Joint Fittings: Cast bronze per ASTM B62, ASME B16.15. Threads adhering to ASME B1.20.1.
 - 3. Unions: Brass bodies per ASTM B16
- E. PE Pipe with Controlled ID: ASTM D2239, PE 3408 compound; SIDR 11.5 and SIDR 15.
 - 1. Insert Fittings for PE Pipe: ASTM D2609, nylon or propylene plastic with barbed ends. Include bands or other fasteners.
- F. PE Pipe with Controlled OD: ASTM D3035, PE 3408 compound, SIDR 11.
 - 1. PE Butt, Heat-Fusion Fittings: ASTM D3261.
 - 2. PE Socket-Type Fittings: ASTM D2683.
- G. PE Pressure Pipe: AWWA C906, with DR of 7.3, 9, or 9.3 and PE compound number required to give pressure rating of not less than 200 psig.
 - 1. PE Butt, Heat-Fusion Fittings: ASTM D3261.
 - 2. PE Socket-Type Fittings: ASTM D2683.

- H. PVC Pipe: ASTM D1785, PVC 1120 compound, Schedule 40.
 - 1. PVC Socket Fittings: ASTM D2466, Schedule 40.
 - 2. PVC Threaded Fittings: ASTM D2464, Schedule 80.
 - 3. PVC Socket Unions: Construction similar to that of MSS SP-107, except both headpiece and tailpiece shall be PVC with socket ends.
- I. PVC Pipe, Pressure Rated: ASTM D2241, PVC 1120 compound, SDR 21 and SDR 26.
 - 1. PVC Socket Fittings: ASTM D2467, Schedule 80.
 - 2. PVC Socket Unions: Construction similar to that of MSS SP-107, except both headpiece and tailpiece shall be PVC with socket or threaded ends.

2.03 PIPING JOINING MATERIALS

- A. Solvent Cements for Joining PVC Piping: ASTM D2564. Include primer in accordance with ASTM F656.
- B. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

2.04 MANUAL VALVES

- A. Brass Ball Valves:
 - 1. Description:
 - a. Standard: MSS SP-110.
 - b. SWP Rating: 150 psig.
 - c. CWP Rating: 600 psig.
 - d. Body Design: Two piece.
 - e. Body Material: Forged brass.
 - f. Ends: Threaded or solder joint if indicated.
 - g. Seats: PTFE or TFE.
 - h. Stem: Brass.
 - i. Ball: Chrome-plated brass.
 - j. Port: Full.

B. Plastic Ball Valves:

1. Description:

- a. Standard: MSS SP-122.
- b. Pressure Rating: 125 psig minimum 150 psig.
- c. Body Material: PVC.
- d. Type: Union.
- e. End Connections: Socket or threaded.
- f. Port: Full.

2.05 PRESSURE-REDUCING VALVES

A. Water Regulators:

1. Description:

- a. Standard: ASSE 1003.
- b. Body Material: Bronze for NPS 2 and smaller.
- c. Pressure Rating: Initial pressure of 150 psig.
- d. End Connections: Threaded for NPS 2 and smaller.

2. Capacities and Characteristics:

- a. Size: 1-1/2" NPS.
- b. Design Flow Rate: 20 gpm.
- c. Design Inlet Pressure: 60 - 120 psig.
- d. Design Outlet Pressure Setting: 50 psig.

2.06 AUTOMATIC CONTROL VALVES

A. Plastic, Automatic Control Valves:

- 1. Description: Molded-plastic body, normally closed, diaphragm type with manual-flow adjustment, and operated by 24 V ac solenoid.

2.07 TRANSITION FITTINGS

- A. General Requirements: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
- B. Transition Couplings:
 - 1. Description: AWWA C219, metal sleeve-type coupling for underground pressure piping.
- C. Plastic-to-Metal Transition Fittings:
 - 1. Description: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert and one solvent-cement-socket or threaded end.
- D. Plastic-to-Metal Transition Unions:
 - 1. Description: MSS SP-107, PVC four-part union. Include one brass or stainless steel threaded end, one solvent-cement-joint or threaded plastic end, rubber O-ring, and union nut.

2.08 DIELECTRIC FITTINGS

- A. General Requirements: Assembly of copper alloy and ferrous materials or ferrous material body with separating nonconductive insulating material suitable for system fluid, pressure, and temperature.
- B. Dielectric Unions:
 - 1. Description: Factory-fabricated union, NPS 2 and smaller.
 - a. Pressure Rating: 150 psig minimum at 180 deg F.
 - b. End Connections: Solder-joint copper alloy and threaded ferrous; threaded ferrous.
- C. Dielectric Couplings:
 - 1. Description: Galvanized-steel coupling.
 - a. Pressure Rating: 300 psig at 225 deg F.
 - b. End Connections: Female threaded.
 - c. Lining: Inert and noncorrosive, thermoplastic lining.
- D. Dielectric Nipples:

1. Description: Electroplated steel nipple complying with ASTM F1545.

a. Pressure Rating: 300 psig at 225 deg F.

b. End Connections: Male threaded or grooved.

c. Lining: Inert and noncorrosive, propylene.

2.09 MISCELLANEOUS PIPING SPECIALTIES

A. Water Hammer Arresters: ASSE 1010 or PDI WH 201, with bellows or piston-type pressurized cushioning chamber and in sizes complying with PDI WH 201, Sizes A to F.

B. Pressure Gages: ASME B40.1. Include 2-1/2-inch diameter dial, dial range of two times system operating pressure, and bottom outlet.

2.10 SPRINKLERS

A. General Requirements: Designed for uniform coverage over entire spray area indicated at available water pressure.

B. Plastic, Pop-up Spray Sprinklers:

1. Description:

a. Body Material: ABS.

b. Nozzle: ABS.

c. Retraction Spring: Stainless steel.

d. Internal Parts: Corrosion resistant.

e. Pattern: Fixed, with flow adjustment.

2.11 QUICK COUPLERS

A. Description: Factory-fabricated, bronze or brass, two-piece assembly. Include coupler water-seal valve; removable upper body with spring-loaded or weighted, rubber-covered cap; hose swivel with ASME B1.20.7, 3/4-11.5NH threads for garden hose on outlet; and operating key.

2.12 DRIP IRRIGATION SPECIALTIES

A. Freestanding Emitters: Device to deliver water at approximately 20 psig.

1. Body Material: PE or vinyl, with flow control.

2. Riser to Emitter: PE or PVC flexible tubing.

B. Multiple-Outlet Emitter Systems: Emitter with tubing and button-type outlets.

1. Emitter: With multiple outlets to deliver water to remote outlets.

- a. Body Material: Plastic, with flow control.
- b. Outlet Caps: Plastic, for outlets without installed tubing.
- c. Operation: Automatic pressure compensating.
- d. Emitters: Devices to deliver water at approximately 20 psig

C. Drip Tubes with Direct-Attached Emitters:

- 1. Tubing: Flexible PE with plugged end.
- 2. Emitters: Devices to deliver water at approximately 20 psig.
 - a. Body Material: PE or vinyl, with flow control.
 - b. Mounting: Inserted into tubing at set intervals.

D. Drip Tubes with Remote Discharge:

- 1. Tubing: Flexible PE or PVC with plugged end.
- 2. Emitters: Devices to deliver water at approximately 20 psig.
 - a. Body Material: PE or vinyl, with flow control.
 - b. Mounting: Inserted into tubing at set intervals.

E. Application Pressure Regulators: Plastic housing, NPS 3/4, with corrosion-resistant internal parts; capable of controlling outlet pressure to approximately 20 psig.

F. Filter Units: Plastic housing, with corrosion-resistant internal parts; of size and capacity required for devices downstream from unit.

G. Air Relief Valves: Plastic housing, with corrosion-resistant internal parts.

H. Vacuum Relief Valves: Plastic housing, with corrosion-resistant internal parts.

2.13 CONTROLLERS

A. Description:

- 1. Controller Stations for Automatic Control Valves: Each station is variable from approximately 5 to 120 minutes. Include switch for manual or automatic operation of each station.

2. Interior Control Enclosures: NEMA 250, Type 12, dripproof, with locking cover and two matching keys.
 - a. Body Material: Molded plastic.
 - b. Mounting: Surface type for wall.
3. Control Transformer: 24 V secondary, with primary fuse.
4. Timing Device: Adjustable, 24-hour, 14-day clock, with automatic operations to skip operation any day in timer period, to operate every other day, or to operate two or more times daily.
 - a. Manual or Semiautomatic Operation: Allows this mode without disturbing preset automatic operation.
 - b. Nickel-Cadmium Battery and Trickle Charger: Automatically powers timing device during power outages.
 - c. Surge Protection: Metal-oxide-varistor type on each station and primary power.
5. Moisture Sensor: Adjustable from one to seven days, to shut off water flow during rain.
6. Wiring: UL 493, Type UF multiconductor, with solid-copper conductors; insulated cable; suitable for direct burial.
 - a. Feeder-Circuit Cables: No. 12 AWG minimum, between building and controllers.
 - b. Low-Voltage, Branch-Circuit Cables: No. 14 AWG minimum, between controllers and automatic control valves; color-coded different from feeder-circuit-cable jacket color; with jackets of different colors for multiple-cable installation in same trench.
 - c. Splicing Materials: Manufacturer's packaged kit consisting of insulating, spring-type connector or crimped joint and epoxy resin moisture seal; suitable for direct burial.

2.14 BOXES FOR AUTOMATIC CONTROL VALVES

A. Plastic Boxes:

1. Description: Box and cover, with open bottom and openings for piping; designed for installing flush with grade.
 - a. Size: As required for valves and service.

- b. Shape: Round Rectangular.
 - c. Sidewall Material: ABS.
 - d. Cover Material: ABS.
- B. Drainage Backfill: See drawing details.

PART 3 - EXECUTION

3.01 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Section 312000 "Earth Moving."
- B. Install warning tape directly above pressure piping, 12 inches below finished grades, except 6 inches below subgrade under pavement and slabs.
- C. Drain Pockets: Excavate to sizes indicated. Backfill with cleaned gravel or crushed stone, graded from 3/4 to 3 inches, to 12 inches below grade. Cover gravel or crushed stone with sheet of asphalt-saturated felt and backfill remainder with excavated material.
- D. Provide minimum cover over top of underground piping according to the following:
 - 1. Irrigation Main Piping: Minimum depth of 18 inches below finished grade measured to the top of the pipe.
 - 2. Lateral Piping: 12 inches to the top of the pipes.
 - 3. Drain Piping: 12 inches to the top of the pipes.
 - 4. Sleeves: Match the depth of the type of pipe being sleeved.

3.02 PREPARATION

- A. Set stakes to identify locations of proposed irrigation system. Obtain Landscape Architect's approval before excavation.

3.03 INSTALLATION OF PIPING

- A. Location and Arrangement: Drawings indicate location and arrangement of piping systems. Install piping as indicated unless deviations are approved on Coordination Drawings.
- B. Install piping at minimum uniform slope of 0.5 percent down toward drain valves.
- C. Install piping free of sags and bends.
- D. Install groups of pipes parallel to each other, spaced to permit valve servicing.

- E. Install fittings for changes in direction and branch connections.
- F. Install unions adjacent to valves and to final connections to other components with NPS 2 or smaller pipe connection.
- G. Install flanges adjacent to valves and to final connections to other components with NPS 2-1/2 or larger pipe connection.
- H. Install PVC piping in dry weather when temperature is above 40 deg F. Allow joints to cure at least 24 hours at temperatures above 40 deg F before testing.
- I. Install piping in sleeves under parking lots, roadways, and sidewalks.
- J. Install sleeves made of Schedule 40, PVC pipe and socket fittings, and solvent-cemented joints.
- K. Install transition fittings for plastic-to-metal pipe connections according to the following:
 - 1. Underground Piping:
 - a. NPS 1-1/2 and Smaller: Plastic-to-metal transition fittings.
 - b. NPS 2 and Larger: AWWA transition couplings.
 - 2. Aboveground Piping:
 - a. NPS 2 and Smaller: Plastic-to-metal transition fittings.
 - b. NPS 2 and Larger: Use dielectric flange kits with one plastic flange.

3.04 JOINT CONSTRUCTION

- A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- C. Threaded Joints: Thread pipe with tapered pipe threads in accordance with ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - 1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
 - 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- D. PE Piping Fastener Joints: Join with insert fittings and bands or fasteners in accordance with piping manufacturer's written instructions.

- E. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join in accordance with ASTM D2657.
 - 1. Plain-End PE Pipe and Fittings: Use butt fusion.
 - 2. Plain-End PE Pipe and Socket Fittings: Use socket fusion.
- F. PVC Piping Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings in accordance with the following:
 - 1. Comply with ASTM F402 for safe-handling practice of cleaners, primers, and solvent cements.
 - 2. PVC Pressure Piping: Join schedule number, ASTM D1785, PVC pipe and PVC socket fittings in accordance with ASTM D2672. Join other-than-schedule-number PVC pipe and socket fittings in accordance with ASTM D2855.
 - 3. PVC Nonpressure Piping: Join in accordance with ASTM D2855.

3.05 INSTALLATION OF VALVES

- A. Underground Curb Valves: Install in curb-valve casings with tops flush with grade.
- B. Underground Iron Gate Valves, Resilient Seat: Comply with AWWA C600 and AWWA M44. Install in valve casing with top flush with grade.
 - 1. Install valves and PVC pipe with restrained, gasketed joints.
- C. Aboveground Valves: Install as components of connected piping system.
- D. Pressure-Reducing Valves: Install in boxes for automatic control valves or aboveground between shutoff valves.
- E. Throttling Valves: Install in underground piping in boxes for automatic control valves.
- F. Drain Valves: Install in underground piping in boxes for automatic control valves.

3.06 INSTALLATION OF SPRINKLERS

- A. Install sprinklers after hydrostatic test is completed.
- B. Install sprinklers at manufacturer's recommended heights.
- C. Locate part-circle sprinklers to maintain a minimum distance of 4 inches from walls and 2 inches from other boundaries unless otherwise indicated.

3.07 INSTALLATION OF DRIP IRRIGATION SPECIALTIES

- A. Install freestanding emitters on pipe riser to mounting height indicated.

- B. Install manifold emitter systems with tubing to emitters. Plug unused manifold outlets. Install emitters on off-ground supports at height indicated.
- C. Install multiple-outlet emitter systems with tubing to outlets. Plug unused emitter outlets. Install outlets on off-ground supports at height indicated.
- D. Install drip tubes with direct-attached emitters on ground.
- E. Install drip tubes with remote discharge on ground with outlets on off-ground supports at height indicated.
- F. Install off-ground supports of length required for indicated mounted height of device.
- G. Install application pressure regulators and filter units in piping near device being protected, and in control-valve boxes.

3.08 INSTALLATION OF AUTOMATIC IRRIGATION CONTROL SYSTEM

- A. Equipment Mounting, Interior: Install controllers on interior wall.
 - 1. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 2. Install anchor bolts to elevations required for proper attachment to supported equipment.
- B. Equipment Mounting, Exterior: Install exterior freestanding controllers on precast concrete bases.
 - 1. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 2. Install anchor bolts to elevations required for proper attachment to supported equipment.
- C. Install control cable in same trench as irrigation piping and at least beside piping. Provide conductors of size not smaller than recommended by controller manufacturer. Install cable in separate sleeve under paved areas.

3.09 CONNECTIONS

- A. Comply with requirements for piping specified in Section 331415 "Site Water Distribution Piping" for water supply from exterior water service piping, water meters, protective enclosures, and backflow preventers. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment, valves, and devices to allow service and maintenance.

- C. Connect wiring between controllers and automatic control valves.

3.10 IDENTIFICATION

- A. Identify system components. Comply with requirements for identification specified in Section 220553 "Identification for Plumbing Piping and Equipment."
- B. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplates and signs on each automatic controller.
 - 1. Text: In addition to identifying unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
- C. Warning Tapes: Arrange for installation of continuous, underground, detectable warning tapes over underground piping during backfilling of trenches. See Section 312000 "Earth Moving" for warning tapes.

3.11 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Operational Test: After electrical circuitry has been energized, operate controllers and automatic control valves to confirm proper system operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - 4. Irrigation system will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

3.12 STARTUP SERVICE

- A. Perform startup service.
 - 1. Complete installation and startup checks in accordance with manufacturer's written instructions.
 - 2. Verify that controllers are installed and connected in accordance with the Contract Documents.
 - 3. Verify that electrical wiring installation complies with manufacturer's submittal.

3.13 ADJUSTING

- A. Adjust settings of controllers.
- B. Adjust automatic control valves to provide flow rate at rated operating pressure required for each sprinkler circuit.
- C. Adjust sprinklers and devices, except those intended to be mounted aboveground, so they will be flush with, or not more than 1/2 inch above, finish grade.

3.14 CLEANING

- A. Flush dirt and debris from piping before installing sprinklers and other devices.

3.15 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain automatic control valves and controllers.

3.16 PIPING SCHEDULE

- A. Install components having pressure rating equal to or greater than system operating pressure.
- B. Piping in control-valve boxes and aboveground may be joined with flanges or unions instead of joints indicated.
- C. Underground Irrigation Main Piping:
 - 1. NPS 4 and Smaller:
 - a. NPS 4 PE pressure pipe; PE butt, heat-fusion or socket-type fittings; and heat-fusion joints.
 - b. Schedule 40, PVC pipe and socket fittings, and solvent-cemented joints.
 - c. Schedule 80, PVC pipe; Schedule 80, threaded PVC fittings; and threaded joints.
 - d. SDR 21, PVC, pressure-rated pipe; Schedule 80, PVC socket fittings; and solvent-cemented joints.
- D. Lateral Piping:
 - 1. NPS 1 and Smaller:
 - a. DR 9, PE, controlled OD pipe; PE butt, heat-fusion, or PE socket-type fittings; and heat-fusion joints.

- b. Schedule 40, PVC pipe and socket fittings; and solvent-cemented joints.
- E. Underground Branches and Offsets at Sprinklers and Devices: Schedule 80, PVC pipe; threaded PVC fittings; and threaded joints.
 - 1. Option: Plastic swing-joint assemblies, with offsets for flexible joints, manufactured for this application.
- F. Risers to Aboveground Sprinklers and Specialties:
 - 1. Schedule 80, PVC pipe and socket fittings; and solvent-cemented joints.
- G. Drain piping shall be one of the following:
 - 1. SDR 9, 11.5, or 15; PE, controlled ID pipe; insert fittings for PE pipe; and banded or fastener joints.
 - 2. Schedule 40, PVC pipe and socket fittings; and solvent-cemented joints.
 - 3. SDR 21, 26, or 32.5; PVC, pressure-rated pipe; Schedule 40, PVC socket fittings; and solvent-cemented joints.

3.17 VALVE SCHEDULE

- A. Underground, Shutoff-Duty Valves: Use the following:
 - 1. NPS 2 and Smaller: Curb valve, curb-valve casing, and shutoff rod.
- B. Aboveground, Shutoff-Duty Valves:
 - 1. NPS 2 and Smaller:
 - a. Brass ball valve.
- C. Drain Valves:
 - 1. NPS 1/2 and NPS 3/4:
 - a. Brass ball valve.
 - 2. NPS 1 to NPS 2:
 - a. Brass ball valve.

END OF SECTION

SECTION 32 91 13

SOIL PREPARATION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section includes planting soils and layered soil assemblies specified by composition of the mixes.
- B. Related Requirements:
 - 1. Section 329200 "Turf and Grasses" for placing planting soil for turf and grasses.
 - 2. Section 329300 "Plants" for placing planting soil for plantings.

1.03 DEFINITIONS

- A. AAPFCO: Association of American Plant Food Control Officials.
- B. Backfill: The earth used to replace or the act of replacing earth in an excavation. This can be amended or unamended soil as indicated.
- C. CEC: Cation exchange capacity.
- D. Compost: The product resulting from the controlled biological decomposition of organic material that has been sanitized through the generation of heat and stabilized to the point that it is beneficial to plant growth.
- E. Duff Layer: A surface layer of soil, typical of forested areas, that is composed of mostly decayed leaves, twigs, and detritus.
- F. Imported Soil: Soil that is transported to Project site for use.
- G. Layered Soil Assembly: A designed series of planting soils, layered on each other, that together produce an environment for plant growth.
- H. Manufactured Soil: Soil produced by blending soils, sand, stabilized organic soil amendments, and other materials to produce planting soil.

- I. NAPT: North American Proficiency Testing Program. An SSSA program to assist soil-, plant-, and water-testing laboratories through interlaboratory sample exchanges and statistical evaluation of analytical data.
- J. Organic Matter: The total of organic materials in soil exclusive of undecayed plant and animal tissues, their partial decomposition products, and the soil biomass; also called "humus" or "soil organic matter."
- K. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified as specified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.
- L. RCRA Metals: Hazardous metals identified by the EPA under the Resource Conservation and Recovery Act.
- M. SSSA: Soil Science Society of America.
- N. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.
- O. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms.
- P. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil"; but in disturbed areas such as urban environments, the surface soil can be subsoil.
- Q. USCC: U.S. Composting Council.

1.04 PREINSTALLATION MEETINGS

- A. Preinstallation Conference: Conduct conference at Project site.

1.05 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include recommendations for application and use.
 - 2. Include test data substantiating that products comply with requirements.
 - 3. Include sieve analyses for aggregate materials.
 - 4. Material Certificates: For each type of soil amendment and fertilizer before delivery to the site.

1.06 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.07 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent, state-operated, or university-operated laboratory; experienced in soil science, soil testing, and plant nutrition; with the experience and capability to conduct the testing indicated; and that specializes in types of tests to be performed.
 - 1. Multiple Laboratories: At Contractor's option, work may be divided among qualified testing laboratories specializing in physical testing, chemical testing, and fertility testing.

1.08 SOIL-SAMPLING REQUIREMENTS

- A. General: Extract soil samples according to requirements in this article.
- B. Sample Collection and Labeling: Have samples taken and labeled by Contractor in presence of Landscape Architect under the direction of the testing agency.
 - 1. Number and Location of Samples: Minimum of three representative soil samples from varied locations within planting areas shown on the drawings for each soil to be used or amended for landscaping purposes.
 - 2. Procedures and Depth of Samples: According to USDA-NRCS's "Field Book for Describing and Sampling Soils.
 - 3. Division of Samples: Split each sample into two, equal parts. Send half to the testing agency and half to Owner for its their records.
 - 4. Labeling: Label each sample with the date, location keyed to a site plan or other location system, visible soil condition, and sampling depth.

1.09 TESTING REQUIREMENTS

- A. General: Perform tests on soil samples according to requirements in this article.
- B. Physical Testing:
 - 1. Soil Texture: Soil-particle, size-distribution analysis by one of the following methods according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods":
 - a. Sieving Method: Report sand-gradation percentages for very coarse, coarse, medium, fine, and very fine sand; and fragment-gradation (gravel) percentages for fine, medium, and coarse fragments; according to USDA sand and fragment sizes.

- b. Hydrometer Method: Report percentages of sand, silt, and clay.
 - 2. Total Porosity: Calculate using particle density and bulk density according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods."
 - 3. Water Retention: According to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods."
 - 4. Saturated Hydraulic Conductivity: According to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods"; at 85% compaction according to ASTM D698 (Standard Proctor).
- C. Chemical Testing:
- 1. CEC: Analysis by sodium saturation at pH 7 according to SSSA's "Methods of Soil Analysis - Part 3- Chemical Methods."
 - 2. Clay Mineralogy: Analysis and estimated percentage of expandable clay minerals using CEC by ammonium saturation at pH 7 according to SSSA's "Methods of Soil Analysis - Part 1- Physical and Mineralogical Methods."
 - 3. Metals Hazardous to Human Health: Test for presence and quantities of RCRA metals including aluminum, arsenic, barium, copper, cadmium, chromium, cobalt, lead, lithium, and vanadium. If RCRA metals are present, include recommendations for corrective action.
- D. Fertility Testing: Soil-fertility analysis according to standard laboratory protocol of SSSA NAPT WERA-103, including the following:
- 1. Percentage of organic matter.
 - 2. CEC, calcium percent of CEC, and magnesium percent of CEC.
 - 3. Soil reaction (acidity/alkalinity pH value).
 - 4. Buffered acidity or alkalinity.
 - 5. Nitrogen ppm.
 - 6. Phosphorous ppm.
 - 7. Presence and quantities of problem materials including salts and metals cited in the Standard protocol. If such problem materials are present, provide additional recommendations for corrective action.
 - 8. Other deleterious materials, including their characteristics and content of each.
- E. Organic-Matter Content: Analysis using loss-by-ignition method according to SSSA's "Methods of Soil Analysis - Part 3 - Chemical Methods."

F. Recommendations: Based on the test results, state recommendations for soil treatments and soil amendments to be incorporated to produce satisfactory planting soil suitable for healthy, viable plants indicated. Include, at a minimum, recommendations for nitrogen, phosphorous, and potassium fertilization, and for micronutrients.

1. Fertilizers and Soil Amendment Rates: State recommendations in weight per 1000 sq. ft. for 6-inch depth of soil.
2. Soil Reaction: State the recommended liming rates for raising pH or sulfur for lowering pH according to the buffered acidity or buffered alkalinity in weight per 1000 sq. ft. for 6-inch depth of soil.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and compliance with state and Federal laws if applicable.

B. Bulk Materials:

1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Do not move or handle materials when they are wet or frozen.
4. Accompany each delivery of bulk fertilizers and soil amendments with appropriate certificates.

PART 2 - PRODUCTS

2.01 PLANTING SOILS SPECIFIED BY COMPOSITION

A. General: Soil amendments, fertilizers, and rates of application specified in this article are guidelines that may need revision based on testing laboratory's recommendations after preconstruction soil analyses are performed.

B. Planting-Soil Type: Imported, naturally formed soil from off-site sources and consisting of sandy loam soil according to USDA textures; and modified to produce viable planting soil.

1. Sources: Take imported, unamended soil from sources that are naturally well-drained sites where topsoil occurs at least 4 inches deep, not from bogs, or marshes;

and that do not contain undesirable organisms; disease-causing plant pathogens; or obnoxious weeds and invasive plants.

2. Additional Properties of Imported Soil before Amending: Soil reaction of pH 6 to 7 and minimum of 4 percent organic-matter content, friable, and with sufficient structure to give good tilth and aeration.
3. Unacceptable Properties: Clean soil of the following:
 - a. Unacceptable Materials: Concrete slurry, concrete layers or chunks, cement, plaster, building debris, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, acid, and other extraneous materials that are harmful to plant growth.
 - b. Unsuitable Materials: Stones, roots, plants, sod, clay lumps, and pockets of coarse sand that exceed a combined maximum of 8 percent by dry weight of the imported soil.
4. Amended Soil Composition: Blend imported, unamended soil with the following soil amendments and fertilizers in the following quantities to produce planting soil:
 - a. Ratio of Loose Compost to Soil: 1:3 by volume.

C. Planting-Soil Type: Manufactured soil consisting of manufacturer's basic topsoil, blended in a manufacturing facility with sand, stabilized organic soil amendments, and other materials to produce viable planting soil.

1. Additional Properties of Manufacturer's Basic Soil before Amending: Soil reaction of pH 6 to 7 and minimum of 4 percent organic-matter content, friable, and with sufficient structure to give good tilth and aeration.
2. Unacceptable Properties: Manufactured soil shall not contain the following:
 - a. Unacceptable Materials: Concrete slurry, concrete layers or chunks, cement, plaster, building debris, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, acid, and other extraneous materials that are harmful to plant growth.
 - b. Unsuitable Materials: Stones, roots, plants, sod, clay lumps, and pockets of coarse sand that exceed a combined maximum of [5] <Insert number> percent by dry weight of the manufactured soil.
3. Blend manufacturer's basic soil with the following soil amendments and fertilizers in the following quantities to produce planting soil:
 - a. Ratio of Loose Compost to Soil: 1:3 by volume.

2.02 INORGANIC SOIL AMENDMENTS

- A. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.
- B. Sand: Clean, washed, natural or manufactured, free of toxic materials, and according to ASTM C33/C33M.

2.03 ORGANIC SOIL AMENDMENTS

- A. Compost: Well-composted, stable, and weed-free organic matter produced by composting feedstock, and bearing USCC's "Seal of Testing Assurance," and as follows:
 - 1. Feedstock: May include sewage sludge.
 - 2. Reaction: 2 pH of 5.5 to 8.
 - 3. Soluble-Salt Concentration: Less than 4 dS/m.
 - 4. Moisture Content: 35 to 55 percent by weight.
 - 5. Organic-Matter Content: 30 to 40 percent of dry weight.
 - 6. Particle Size: Minimum of 98 percent passing through a 1-inch sieve.
- B. Sphagnum Peat: Partially decomposed sphagnum peat moss, finely divided or of granular texture with 100 percent passing through a 1/2-inch sieve, a pH of 3.4 to 4.8, and a soluble-salt content measured by electrical conductivity of maximum 5 dS/m.
- C. Wood Derivatives: Shredded and composted, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.
 - 1. Partially Decomposed Wood Derivatives: In lieu of shredded and composted wood derivatives, mix shredded and partially decomposed wood derivatives with ammonium nitrate at a minimum rate of 0.15 lb/cu. ft. of loose sawdust or ground bark, or with ammonium sulfate at a minimum rate of 0.25 lb/cu. ft. of loose sawdust or ground bark.

2.04 FERTILIZERS

- A. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
 - 1. Composition: 1 lb/1000 sq. ft. of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.
 - 2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified testing agency.

- B. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
 - 1. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified testing agency.
- C. Chelated Iron: Commercial-grade FeEDDHA for dicots and woody plants, and commercial-grade FeDTPA for ornamental grasses and monocots.

PART 3 - EXECUTION

3.01 GENERAL

- A. Place planting soil and fertilizers according to requirements in other Specification Sections.
- B. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in planting soil.
- C. Proceed with placement only after unsatisfactory conditions have been corrected.

3.02 PLACING AND MIXING PLANTING SOIL OVER EXPOSED SUBGRADE

- A. General: Apply and mix unamended soil with amendments on-site to produce required planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
- B. Subgrade Preparation: Till subgrade to a minimum depth of 6 inches Remove stones larger than 1-1/2 inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
 - 1. Apply, add soil amendments, and mix approximately half the thickness of unamended soil over prepared, loosened subgrade according to "Mixing" Paragraph below. Mix thoroughly into top 4 inches of subgrade. Spread remainder of planting soil.
- C. Mixing: Spread unamended soil to total depth of 6 inches, but not less than required to meet finish grades after mixing with amendments and natural settlement. Do not spread if soil or subgrade is frozen, muddy, or excessively wet.
 - 1. Amendments: Apply soil amendments and fertilizer, if required, evenly on surface, and thoroughly blend them with unamended soil to produce planting soil.
 - a. Mix fertilizer with planting soil no more than seven days before planting.

2. Lifts: Apply and mix unamended soil and amendments in lifts not exceeding 8 inches in loose depth for material compacted by compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- D. Finish Grading: Grade planting soil to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.03 PLACING MANUFACTURED PLANTING SOIL OVER EXPOSED SUBGRADE

- A. General: Apply manufactured soil on-site in its final, blended condition. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
- B. Subgrade Preparation: Till subgrade to a minimum depth of 6 inches. Remove stones larger than 1-1/2 inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
1. Apply approximately half the thickness of planting soil over prepared, loosened subgrade. Mix thoroughly into top 4 inches of subgrade. Spread remainder of planting soil.
- C. Application: Spread planting soil to total depth of 6 inches, but not less than required to meet finish grades after natural settlement. Do not spread if soil or subgrade is frozen, muddy, or excessively wet.
1. Lifts: Apply planting soil in lifts not exceeding 8 inches in loose depth for material compacted by compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- D. Finish Grading: Grade planting soil to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.04 BLENDING PLANTING SOIL IN PLACE

- A. General: Mix amendments with in-place, unamended soil to produce required planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
- B. Preparation: Till unamended, existing soil in planting areas to a minimum depth of 6 inches. Remove stones larger than 1-1/2 inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
- C. Mixing: Apply soil amendments and fertilizer, if required, evenly on surface, and thoroughly blend them into full depth of unamended, in-place soil to produce planting soil.
1. Mix fertilizer with planting soil no more than seven days before planting.

- D. Compaction: Compact blended planting soil to 80 percent of maximum Standard Proctor density according to ASTM D698.
- E. Finish Grading: Grade planting soil to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.05 APPLYING COMPOST TO SURFACE OF PLANTING SOIL

- A. Application: Apply compost component of planting-soil to surface of in-place planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.
- B. Finish Grading: Grade surface to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.06 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform the following tests:
 - 1. Compaction: Test planting-soil compaction after placing each lift and at completion using a densitometer or soil-compaction meter calibrated to a reference test value based on laboratory testing according to ASTM D698. Space tests at no less than one for each 1000 sq. ft. of in-place soil or part thereof.
- C. Soil will be considered defective if it does not pass tests.
- D. Prepare test and inspection reports.
- E. Label each sample and test report with the date, location keyed to a site plan or other location system, visible conditions when and where sample was taken, and sampling depth.

3.07 PROTECTION

- A. Protect areas of in-place soil from additional compaction, disturbance, and contamination. Prohibit the following practices within these areas except as required to perform planting operations:
 - 1. Storage of construction materials, debris, or excavated material.
 - 2. Parking vehicles or equipment.
 - 3. Vehicle traffic.
 - 4. Foot traffic.

5. Erection of sheds or structures.
 6. Impoundment of water.
 7. Excavation or other digging unless otherwise indicated.
- B. If planting soil or subgrade is overcompacted, disturbed, or contaminated by foreign or deleterious materials or liquids, remove the planting soil and contamination; restore the subgrade as directed by Landscape Architect and replace contaminated planting soil with new planting soil.
- 3.08 CLEANING
- A. Protect areas adjacent to planting-soil preparation and placement areas from contamination. Keep adjacent paving and construction clean and work area in an orderly condition.
- B. Remove surplus soil and waste material including excess subsoil, unsuitable materials, trash, and debris and legally dispose of them off Owner's property unless otherwise indicated.

END OF SECTION

SECTION 32 92 00
TURF AND GRASSES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

- 1. Seeding.
- 2. Hydroseeding.
- 3. Sodding.

- B. Related Requirements:

- 1. Section 329300 "Plants" for trees, shrubs, ground covers, and other plants as well as border edgings and mow strips.

1.03 DEFINITIONS

- A. Finish Grade: Elevation of finished surface of planting soil.
- B. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. Pesticides include insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. They also include substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.
- C. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. Pests include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.
- D. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth. See Section 329113 "Soil Preparation" and drawing designations for planting soils.
- E. Subgrade: The surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

1.04 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For landscape Installer.
- B. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture, stating the botanical and common name, percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.
 - 1. Certification of each seed mixture for turfgrass sod. Include identification of source and name and telephone number of supplier.
- C. Product Certificates: For fertilizers, from manufacturer.
- D. Pesticides and Herbicides: Product label and manufacturer's application instructions specific to Project.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: Recommended procedures to be established by Owner for maintenance of turf during a calendar year. Submit before expiration of required maintenance periods.

1.06 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful turf establishment.
 - 1. Professional Membership: Installer shall be a member in good standing of either the National Association of Landscape Professionals or American Horticultural Society.
 - 2. Experience: Five years' experience in turf installation in addition to requirements in Section 01 40 00 "Quality Requirements."
 - 3. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
 - 4. Personnel Certifications: Installer's field supervisor shall have certification in one of the following categories from the National Association of Landscape Professionals:
 - a. Landscape Industry Certified Technician - Exterior.
 - b. Landscape Industry Certified Lawn Care Manager.
 - c. Landscape Industry Certified Lawn Care Technician.
 - 5. Pesticide Applicator: State licensed, commercial.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Seed and Other Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws, as applicable.
- B. Sod: Harvest, deliver, store, and handle sod according to requirements in "Specifications for Turfgrass Sod Materials" and "Specifications for Turfgrass Sod Transplanting and Installation" sections in TPI's "Guideline Specifications to Turfgrass Sodding." Deliver sod within 24 hours of harvesting and in time for planting promptly. Protect sod from breakage and drying.
- C. Bulk Materials:
 - 1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
 - 2. Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
 - 3. Accompany each delivery of bulk materials with appropriate certificates.

1.08 FIELD CONDITIONS

- A. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with initial maintenance periods to provide required maintenance from date of planting completion.
 - 1. Spring Planting: March 15th to June 15th.
 - 2. Fall Planting: September 15th to December 15th.
- B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions. No planting shall occur when soil temperatures are below 30° F.

PART 2 - MATERIALS

2.01 SEED

- A. Grass Seed: Fresh, clean, dry, new-crop seed complying with AOSA's "Rules for Testing Seeds" for purity and germination tolerances.
- B. Seed Species:

1. Quality, State Certified: State-certified seed of grass species as listed below for solar exposure.
 2. Full Sun, Cool-Season Grass: Tall Fescue (Festuca arundinacea), a minimum of three cultivars.
- C. Grass-Seed Mix: Proprietary seed mix as follows:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work with include, but are not limited to, the following with approval from the Landscape Architect:
 - a. Granite Seed Company "Triple Play Blend" turfgrass fescue blend.

2.02 TURFGRASS SOD

- A. Turfgrass Sod: Number 1 Quality/Premium, including limitations on thatch, weeds, diseases, and insects, complying with "Specifications for Turfgrass Sod Materials" in TPI's "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture that is strongly rooted and capable of vigorous growth and development when planted.
- B. Turfgrass Species, Warm-Season Grass: Turf-type tall fescue (Festuca arundinacea), shade tolerant blend. There shall be a minimum of three cultivars present.

2.03 FERTILIZERS

- A. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
 1. Composition:
 - a. 1 lb/1000 sq. ft. of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.
 - b. Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

2.04 PESTICIDES

- A. General: Pesticide, registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

- B. Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.
- C. Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

2.05 EROSION-CONTROL MATERIALS

- A. Erosion-Control Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples, 6 inches long.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas to be planted for compliance with requirements and other conditions affecting installation and performance of the Work.
 - 1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
 - 2. Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
 - 3. Uniformly moisten excessively dry soil that is not workable or which is dusty.
 - 4. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.02 PREPARATION

- A. Protect structures; utilities; sidewalks; pavements; and other facilities, trees, shrubs, and plantings from damage caused by planting operations.
 - 1. Protect adjacent and adjoining areas from hydroseeding and hydromulching overspray.
 - 2. Protect grade stakes set by others until directed to remove them.
- B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.03 TURF AREA PREPARATION

- A. General: Prepare planting area for soil placement and mix planting soil according to Section 329113 "Soil Preparation. "Coordinate "Placing Planting Soil" Paragraph below with Section 329113 "Soil Preparation".
- B. Placing Planting Soil: Place and mix planting soil in place over exposed subgrade.
 - 1. Reduce elevation of planting soil to allow for soil thickness of sod.
- C. Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.
- D. Before planting, obtain Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.04 HYDROSEEDING

- A. Hydroseeding: Mix specified seed, commercial fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogeneous slurry suitable for hydraulic application.
 - 1. Mix slurry with fiber-mulch manufacturer's recommended tackifier.
 - 2. Spray-apply slurry uniformly to all areas to be seeded in a one-step process. Apply slurry at a rate so that mulch component is deposited at not less than 1500-lb/acre dry weight, and seed component is deposited at not less than the specified seed-sowing rate.

3.05 SODDING

- A. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.
- B. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to soil or sod during installation. Tamp and roll lightly to ensure contact with soil, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.
 - 1. Lay sod across slopes exceeding 1:3.
- C. Saturate sod with fine water spray within two hours of planting. During first week after planting, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.06 TURF MAINTENANCE

- A. General: Maintain and establish turf by watering, fertilizing, weeding, mowing, trimming, replanting, and performing other operations as required to establish healthy, viable turf. Roll, regrade, and replant bare or eroded areas and remulch to produce a uniformly smooth turf. Provide materials and installation the same as those used in the original installation.
 - 1. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and turf damaged or lost in areas of subsidence.
 - 2. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.
 - 3. Apply treatments as required to keep turf and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.
- B. Watering: Install and maintain temporary piping, hoses, and turf-watering equipment to convey water from sources and to keep turf uniformly moist to a depth of 4 inches.
 - 1. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
 - 2. Water turf with fine spray at a minimum rate of 1 inch per week unless rainfall precipitation is adequate.
- C. Mow turf as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than one-third of grass height. Remove no more than one-third of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowings to maintain the following grass height:
 - 1. Mow turf-type tall fescue to a height of 2 to 3 inches.
- D. Turf Postfertilization: Apply commercial fertilizer after initial mowing and when grass is dry.
 - 1. Use fertilizer that provides actual nitrogen of at least 1 lb/1000 sq. ft. to turf area.

3.07 SATISFACTORY TURF

- A. Turf installations shall meet the following criteria as determined by Architect:
 - 1. Satisfactory Seeded Turf: At end of maintenance period, a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 sq. ft. and bare spots not exceeding 5 by 5 inches.

2. Satisfactory Sodded Turf: At end of maintenance period, a healthy, well-rooted, even-colored, viable turf has been established, free of weeds, open joints, bare areas, and surface irregularities.
 3. Satisfactory Plugged Turf: At end of maintenance period, the required number of plugs has been established as well-rooted, viable patches of grass, and areas between plugs are free of weeds and other undesirable vegetation.
 4. Satisfactory Sprigged Turf: At end of maintenance period, the required number of sprigs has been established as well-rooted, viable plants, and areas between sprigs are free of weeds and other undesirable vegetation.
- B. Use specified materials to reestablish turf that does not comply with requirements and continue maintenance until turf is satisfactory.

3.08 PESTICIDE APPLICATION

- A. Apply pesticides and other chemical products and biological control agents according to requirements of authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.
- B. Post-Emergent Herbicides (Selective and Nonselective): Apply only as necessary to treat already-germinated weeds and according to manufacturer's written recommendations.

3.09 CLEANUP AND PROTECTION

- A. Promptly remove soil and debris created by turf work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.
- B. Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of them off Owner's property.
- C. Erect temporary fencing or barricades and warning signs as required to protect newly planted areas from traffic. Maintain fencing and barricades throughout initial maintenance period and remove after plantings are established.
- D. Remove nondegradable erosion-control measures after grass establishment period.

3.10 MAINTENANCE SERVICE

- A. Turf Maintenance Service: Provide full maintenance by skilled employees of landscape Installer. Maintain as required in "Turf Maintenance" Article. Begin maintenance immediately after each area is planted and continue until acceptable turf is established, but for not less than the following periods:
1. Seeded Turf: 60 days from date of planting completion.

- a. When initial maintenance period has not elapsed before end of planting season, or if turf is not fully established, continue maintenance during next planting season.
2. Sodded Turf: 30 days from date of planting completion.

END OF SECTION

SECTION 32 93 00

PLANTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Plant materials.
2. Fertilizers.
3. Weed-control barriers.
4. Mulches.
5. Herbicides and pesticides.
6. Tree-stabilization materials.
7. Landscape edgings.
8. Tree grates.
9. Tree-watering devices.

B. Related Requirements:

1.02 INFORMATIONAL SUBMITTALS

A. Field Quality-Control Reports: Percolation tests for tree pits. Include the following:

1. Tree identification number matching the plans.
2. Date of test.
3. Time when water was added to tree pit to start percolation test.
4. Time with photo documentation showing increments of testing with water level in tree pit.
5. Identification of tester.

B. Qualification Statements: For landscape Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include

project names, addresses, and year completed, and include names and addresses of owners' contact persons.

- C. Product Certificates: For each type of manufactured product, from manufacturer, and complying with manufacturer's certified analysis of standard products.
- D. Pesticides and Herbicides: Product label and manufacturer's written application instructions specific to Project.
- E. Plants: Submit list of suppliers that will be used for the project to ensure that plant materials supplied are available in sufficient quantity and quality.

1.03 CLOSEOUT SUBMITTALS

- A. Maintenance Data: Recommended procedures to be established by Owner for maintenance of plants during a calendar year. Submit before expiration of required maintenance periods.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful establishment of plants.
 - 1. Professional Membership: Member in good standing of either the National Association of Landscape Professionals or American Horticultural Society.
 - 2. Experience: Five years' experience in landscape installation in addition to requirements in Section 014000 "Quality Requirements."
 - 3. Installer's Field Supervision: Maintain an experienced full-time supervisor on Project site when work is in progress.
 - 4. Personnel Certification: Installer's field supervisor certified in at least one of the following categories from the National Association of Landscape Professionals:
 - a. Landscape Industry Certified Technician - Exterior.
 - b. Landscape Industry Certified Horticultural Technician.
 - 5. Pesticide Applicator: State licensed, commercial.
- B. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.
- C. Measurements: Measure in accordance with ANSI Z60.1. Do not prune to obtain required sizes.
 - 1. Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-

grown stock and container-grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 6 inches above the root flare for trees up to 4-inch caliper size, and 12 inches above the root flare for larger sizes.

2. Other Plants: Measure with stems, petioles, and foliage in their normal position.

D. Plant Material Observation: Landscape Architect may observe plant material either at place of growth or at site before planting for compliance with requirements for genus, species, variety, cultivar, size, and quality. Landscape Architect may also observe trees and shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and may reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from Project site.

1. Notify Landscape Architect of sources of planting materials ten days in advance of delivery to site.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws if applicable.

B. Bulk Materials:

1. Do not dump or store bulk materials near structures, utilities, or walkways and pavements, or on existing turf areas or plants.

2. Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.

3. Accompany each delivery of bulk materials with appropriate certificates.

C. Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.

D. Handle planting stock by root ball.

E. Store bulbs, corms, and tubers in a dry place at 60° to 65° F until planting.

F. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.

G. Deliver plants after preparations for planting have been completed and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.

1. Set balled and burlap stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
2. Do not remove container-grown stock from containers before time of planting.
3. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly wet condition.

1.06 FIELD CONDITIONS

A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.

B. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion.

1. Spring Planting: March 15th to June 15th.
2. Fall Planting: September 15th to December 15th.

C. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions in accordance with manufacturer's written instructions and warranty requirements. No planting shall occur when soil temperatures are below 30° F.

1.07 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.

1. Failures include, but are not limited to, the following:
 - a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner.
 - b. Structural failures, including plantings falling or blowing over.
 - c. Faulty performance of tree stabilization.

2. Warranty Periods: Twelve months from the time of landscape project completion and acceptance.
 - a. Trees, Shrubs, Vines, and Ornamental Grasses: 12 months.
 - b. Ground Covers, Biennials, Perennials, and Other Plants: 12 months.
3. Include the following remedial actions as a minimum:
 - a. Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
 - b. Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
 - c. Provide extended warranty for period equal to original warranty period, for replaced plant material.

PART 2 - PRODUCTS

2.01 PLANT MATERIALS

- A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant List, Plant Schedule, or Plant Legend indicated on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
 1. Trees with damaged, crooked, or multiple leaders; with tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); with crossing trunks; with cut-off limbs more than 5/8 inch in diameter; or with stem girdling roots are unacceptable.
 2. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.
- B. Provide plants of sizes, grades, and ball or container sizes complying with ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Landscape Architect, with a proportionate increase in size of roots or balls.
- C. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which begins at root flare in accordance with ANSI Z60.1.
- D. Labeling: Label at least 30% of the plants of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific

name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for plant.

- E. Annuals and Biennials: Provide healthy, disease-free plants of species and variety shown or listed, with well-established root systems reaching to sides of the container to maintain a firm ball, but not with excessive root growth encircling the container. Provide only plants that are acclimated to outdoor conditions before delivery.

2.02 FERTILIZERS

- A. Granular Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:

- 1. Composition:

- a. Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.
- B. Mycorrhizal Fungi: Dry, granular inoculant containing at least 5300 spores per pound of vesicular-arbuscular mycorrhizal fungi and 95 million spores per pound of ectomycorrhizal fungi, 33 percent hydrogel, and maximum of 5.5 percent inert material.

2.03 WEED-CONTROL BARRIERS

- A. Composite Fabric: Woven, needle-punched polypropylene substrate bonded to a nonwoven polypropylene fabric, 4.8 oz./sq. yd.

2.04 2.4 MULCHES

- A. Compost Mulch: Well-composted, stable, and weed-free organic matter, pH of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through a 1-inch sieve; soluble-salt content of 3 dS/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

- 1. Organic Matter Content: 50 percent of dry weight minimum.
- 2. Feedstock: Agricultural, or food; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

- B. Mineral Mulch: Hard, durable stone, washed free of loam, sand, clay, and other foreign substances, of the following type, size range, and color:

- 1. Type: (See design drawings)
- 2. Size Range: (See design drawings)
- 3. Color: (See design drawings)

2.05 HERBICIDES AND PESTICIDES

- A. Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.
- B. Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.
- C. Pesticides: Registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended in writing by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

2.06 TREE-STABILIZATION MATERIALS

A. Trunk-Stabilization Materials:

- 1. Upright and Guy Stakes: Rough-sawn, sound, new softwood with pressure-preservative treatment, free of knots, holes, cross grain, and other defects.
- 2. Flexible Ties: Wide rubber or elastic bands or straps of length required to reach stakes or upright posts.
- 3. Guys and Tie Wires: ASTM A641/A641M, Class 1, galvanized-steel wire, two-strand, twisted, 0.106 inch in diameter.
- 4. Tree-Tie Webbing: UV-resistant polypropylene or nylon webbing with brass grommets.
- 5. Guy Cables: Five-strand, 3/16-inch-diameter, galvanized-steel cable, with zinc-coated turnbuckles, a minimum of 3 inches long, with two 3/8-inch galvanized eyebolts.
- 6. Flags: Standard surveyor's plastic flagging tape, white, 6 inches long.

B. Root-Ball Stabilization Materials:

- 1. Upright Stakes and Horizontal Hold-Down: Rough-sawn, sound, new hardwood or softwood, free of knots, holes, cross grain, and other defects, 2-by-2-inch nominal by length indicated; stakes pointed at one end.
- 2. Wood Screws: ASME B18.6.1.

2.07 LANDSCAPE EDGINGS

- A. Aluminum Edging: Standard-profile extruded-aluminum edging, ASTM B221, Alloy 6063-T6, fabricated in standard lengths with interlocking sections with loops stamped from face of sections to receive stakes.

1. Edging Size: 3/16 inch thick by 5-1/2 inches deep.
2. Stakes: Aluminum, ASTM B221, Alloy 6061-T6, approximately 1-1/2 inches wide by 12 inches long.
3. Finish: Manufacturer's standard.
 - a. Paint Color: Brown.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas to receive plants, with Installer present, for compliance with requirements and conditions affecting installation and performance of the Work.
 1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
 2. Verify that plants and vehicles loaded with plants can travel to planting locations with adequate overhead clearance.
 3. Suspend planting operations during periods of excessive soil moisture until moisture content reaches acceptable levels to attain required results.
 4. Uniformly moisten excessively dry soil that is not workable, or which is dusty.
- B. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove soil and contamination as directed by Landscape Architect and replace with new planting soil.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.
- B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.
- C. Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Landscape Architect's acceptance of layout before excavating or planting. Make minor adjustments as required.

3.03 PLANTING AREA ESTABLISHMENT

- A. General: Prepare planting area for soil placement and mix planting soil in accordance with Section 329113 "Soil Preparation."
- B. Placing Planting Soil: Place and mix planting soil in-place over exposed subgrade.
- C. Before planting, obtain Landscape Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.
- D. Application of Mycorrhizal Fungi: At time directed by Landscape Architect, broadcast dry product uniformly over prepared soil at application rate in accordance with manufacturer's written instructions.

3.04 EXCAVATION FOR TREES AND SHRUBS

- A. Planting Pits and Trenches: Excavate circular planting pits.
 - 1. Excavate planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are unacceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
 - 2. Excavate approximately two times as wide as ball diameter for balled and burlapped stock.
 - 3. Do not excavate deeper than depth of root ball, measured from the root flare to the bottom of root ball.
 - 4. If area under the plant was initially dug too deep, add soil to raise it to correct level and thoroughly tamp the added soil to prevent settling.
 - 5. Maintain angles of repose of adjacent materials to ensure stability. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
 - 6. Maintain supervision of excavations during working hours.
 - 7. Keep excavations covered or otherwise protected when unattended by Installer's personnel.
- B. Backfill Soil: Subsoil and topsoil removed from excavations may be used as backfill soil unless otherwise indicated. Backfill soil shall be treated as described in the drawing details.

- C. Obstructions: Notify Landscape Architect if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
- D. Drainage: Notify Landscape Architect if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.
- E. Fill excavations with water and allow to percolate away before positioning trees and shrubs.

3.05 TREE, SHRUB, AND VINE PLANTING

- A. Inspection: At time of planting, verify that root flare is visible at top of root ball in accordance with ANSI Z60.1. If root flare is not visible, remove soil in a level manner from root ball to where the top-most root emerges from the trunk. After soil removal to expose root flare, verify that root ball still meets size requirements.
- B. Roots: Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.
- C. Balled and Burlapped Stock: Set each plant plumb and in center of planting pit or trench with root flare 2 inches above adjacent finish grades.
 - 1. Backfill: Planting drawing details 99-L704.
 - 2. After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
 - 3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
 - 4. Distribute fertilizer around each planting pit when pit is approximately one-half filled. Do not place in bottom of the hole.
 - a. Quantity: Per manufacturer guidelines.
 - 5. Continue backfilling process. Water again after placing and tamping final layer of soil.
- D. Container-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 1 inch above adjacent finish grades.
 - 1. Backfill: Planting drawing details 99-L704.
 - 2. Carefully remove root ball from container without damaging root ball or plant.

3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
 4. Distribute granular fertilizer around each planting pit when pit is approximately one-half filled. Do not place in bottom of the hole.
 5. Continue backfilling process. Water again after placing and tamping final layer of soil.
- E. Fabric Bag-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 1 inch above adjacent finish grades.
1. Backfill: Planting drawing details 99-L704.
 2. Carefully remove root ball from fabric bag without damaging root ball or plant. Do not use planting stock if root ball is cracked or broken before or during planting operation.
 3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
 4. Distribute granular fertilizer around each planting pit when pit is approximately one-half filled. Do not place in bottom of the hole.
 5. Continue backfilling process. Water again after placing and tamping final layer of soil.
- F. Slopes: When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of root ball.
- 3.06 TREE, SHRUB, AND VINE PRUNING
- A. Prune, thin, and shape trees, shrubs, and vines in accordance with standard professional horticultural and arboricultural practices. Unless otherwise indicated by Landscape Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.
 - B. Do not apply pruning paint to wounds.
- 3.07 INSTALLATION OF TREE-STABILIZATION MATERIALS
- A. Trunk Stabilization by Upright Staking and Tying: Install trunk stabilization as follows unless otherwise indicated:
 1. Upright Staking and Tying:

- a. Stake trees with two stakes for trees up to 12 ft high and 2-1/2 inches or less in caliper; three stakes for trees less than 14 ft. high and up to 4 inches in caliper. Space stakes equally around trees.
2. Support trees with bands of flexible ties at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.
3. Support trees with two strands of tie wire, connected to the brass grommets of tree-tie webbing at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.
4. Site-Fabricated, Staking-and-Guying Method: Install no fewer than three guys spaced equally around tree.
 - a. Support trees with bands of flexible ties at contact points with tree trunk and reaching to turnbuckle. Allow enough slack to avoid rigid restraint of tree.
 - b. Support trees with guy cable or multiple strands of tie wire, connected to brass grommets of tree-tie webbing at contact points with tree trunk and reaching to turnbuckle. Allow enough slack to avoid rigid restraint of tree.
 - c. Attach flags to each guy wire, 30 inches above finish grade.
5. Proprietary Staking and Guying Device: Install staking and guying system sized and positioned as recommended by manufacturer unless otherwise indicated and in accordance with manufacturer's written instructions.

3.08 GROUND COVER AND PLANT PLANTING

- A. Set out and space ground cover and plants other than trees, shrubs, and vines 24 inches apart in even rows with triangular spacing.
- B. Dig holes large enough to allow spreading of roots.
- C. For rooted cutting plants supplied in flats, plant each in a manner that minimally disturbs the root system but to depth not less than two nodes.
- D. Work soil around roots to eliminate air pockets and leave slight saucer indentation around plants to hold water.
- E. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.
- F. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.09 INSTALLATION OF MULCHES

- A. Install weed-control barriers before mulching in accordance with manufacturer's written instructions. Completely cover area to be mulched, overlapping edges minimum of 6 inches, and secure seams with galvanized pins.
- B. Mulch backfilled surfaces of planting areas and other areas indicated.
 - 1. Mineral Mulch in Planting Areas: Apply 3-inch average thickness of mineral mulch over whole surface of planting area, and finish level with adjacent finish grades. Do not place mulch within 6 inches of trunks or stems.

3.10 INSTALLATION OF LANDSCAPE EDGINGS

- A. Aluminum Edging: Install aluminum edging where indicated in accordance with manufacturer's written instructions. Anchor with aluminum stakes spaced approximately 36 inches apart, driven below top elevation of edging.

3.11 APPLICATION OF HERBICIDES AND PESTICIDES

- A. Pre-Emergent Herbicides (Selective and Nonselective): Apply to tree, shrub, and ground-cover areas in accordance with manufacturer's written instructions. Do not apply to seeded areas.
- B. Post-Emergent Herbicides (Selective and Nonselective): Apply only as necessary to treat already-germinated weeds and in accordance with manufacturer's written instructions.
- C. Apply pesticides and other chemical products and biological control agents according to authorities having jurisdiction and in accordance with manufacturer's written instructions. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

3.12 PLANT MAINTENANCE

- A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing tree-stabilization devices, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings.
- B. Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.
- C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices when possible to minimize use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

3.13 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Perform tree pit percolation tests.
2. Tree pit construction will be considered defective if it does not pass percolation tests and inspections.
3. Do not proceed with planting in tree pits until satisfactory percolation is demonstrated.

B. Prepare test and inspection reports.

3.14 REPAIR AND REPLACEMENT

A. Repair or replace existing or new trees and other plants that are damaged by construction operations, in a manner approved by Landscape Architect.

1. Submit details of proposed pruning and repairs.
2. Perform repairs of damaged trunks, branches, and roots within 24 hours, if approved.
3. Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by Landscape Architect.

B. Remove and replace trees that are more than 25 percent dead or in unhealthy condition or are damaged during construction operations that Landscape Architect determines are incapable of restoring to normal growth pattern.

1. Provide new trees of same size as those being replaced for each tree of 4 inches or smaller in caliper size.
2. Species of Replacement Trees: Same species being replaced.

3.15 CLEANING AND PROTECTION

A. During planting, keep adjacent paving and construction clean and work area in an orderly condition. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.

C. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

- D. After installation and before [**Substantial Completion**] <Insert time>, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and Project site.

END OF SECTION

SECTION 33 10 00

WATER UTILITIES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide water utilities beyond 5 feet from buildings as indicated and in compliance with Contract Documents.
- B. Section includes:
 - 1. Pipe and fittings for the Provo River Water Treatment Plant and associated water utilities including raw water delivery and finished water in the transmission system, fire water line, fire hydrant and piping, and domestic water line.
- C. Excluded from this section are:
 - 1. Water utilities within 5 feet from buildings and within vaults. Refer to Division 22 for plumbing piping and Division 40 for process mechanical piping.
 - 2. Ductile Iron Water Pipe and Fittings refer to Section 40 23 19.04.
 - 3. AWWA C200 Fabricated Steel Pipe and Fittings refer to Section 40 23 19.03.
- D. All pipe, fittings, valves, couplings, and accessories specified herein shall be NSF 61 certified for use with water systems.

1. 2017 Manual of Standard Plans and Specifications

1.03 DEFINITIONS:

- A. Appurtenances: Additional piping items as required to provide a complete piping system suitable to convey water as specified and intended. These items may or may not be specified but are necessary to complete the piping system.

1.04 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 1. Pipe materials
 2. Pipe fittings

3. Pipe couplings
 4. Pipe thrust restraint
 5. Valves
 6. Fire Hydrants
 7. Accessories including, but not limited to, nuts, bolts, and gaskets.
 8. Appurtenances
 9. NSF 61 certifications
- B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.
 - C. Instructions: Provide manufacturer's installation instructions for pipe, hydrants, valves joint restraints, and meters.
 - D. Tapping Contractor qualifications and experience documentation.
 - E. Field Test Reports: Provide results for hydrostatic and bacteriological tests.
 - F. Project Record Documents: Provide actual locations of piping mains, valves, connections, thrust restraints, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.
- 1.05 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
- 1.06 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
 - B. Perform Work in accordance with 2017 APWA Utah Chapter Manual of Standard Plans and Specifications as modified by Provo City 2023 Standard Drawing Details.
 - C. Valves: Manufacturer's name, UL/FM and pressure rating marked on valve body.
 - D. Materials used for fire line shall be UL listed and approved by Factory Mutual.
 - E. NSF Certification: Material used in manufacture of items specified herein shall be certified to NSF 14 and 61, as applicable. Certified items shall bear the NSF label.
- 1.07 DELIVERY STORAGE AND HANDLING
- A. Comply with the requirements specified in Section 01 66 10.

- B. Deliver and store valves in shipping containers with labeling in place.

1.08 WARRANTY:

- A. Provide standard product warranties for piping materials and as required by 2017 APWA Utah Chapter Manual of Standard Plans and Specifications as modified by Provo City 2023 Standard Drawing Details.

1.09 TAPPING CONTRACTOR QUALIFICATIONS:

- A. Tapping Contractor shall have performed successful pressure taps on ductile iron pipe (DIP) and polyvinyl chloride (PVC) water mains and shall have been engaged in tapping installation for a minimum of 3 years, with at least 5 projects in the last 3 years of similar size and type.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

- A. Water Pipe (Copper):
 - 1. Mueller Streamline
 - 2. Cerro Flow Products
 - 3. Great Lakes Copper
- B. Water Pipe (HDPE C906)
 - 1. JM Eagle
 - 2. WL Plastics
 - 3. Independent Pipe Products
 - 4. Performance Pipe
- C. Water Pipe (Steel)
 - 1. See Section 40 23 19.03
- D. Water Pipe (Ductile Iron)
 - 1. See Section 40 23 19.04
- E. Gate Valves:
 - a. Mueller Co.

- b. American Flow Control
 - c. Kennedy Valve Co.
- F. Butterfly Valves:
 - 1. Av-Tek
 - 2. VAG
 - 3. American AVK
- G. Corporation Stops: Mueller H-15000, Ford F600
- H. Fire Hydrants – Provide fire hydrants manufactured by the following:
 - 1. Mueller A-423.
 - 2. American AVK 2780 Nostalgic.
 - 3. Waterous WB-67.
- I. Structures – Provide structures manufactured by the following:
 - 1. Valve Boxes: Tyler 6850, D&L M-9042.
- J. Tapping Sleeves:
 - 1. JCM Industries Model #432
 - 2. Ford Meter Box Company, Inc.
 - 3. Smith-Blair
 - 4. Romac Industries Model SST
- K. Flange Coupling Adapters:
 - 1. Dresser
 - 2. Baker
 - 3. Viking Johnson
 - 4. Romac
- 2.02 WATER PIPE:
 - A. Copper Tubing: ASTM B 88, Type K, annealed.

1. Fittings: ASME B16.18, cast copper, or ASME B16.22, wrought copper.
2. Joints: Compression connection or AWS A5.8, BCuP silver braze.
3. Only lead-free solder shall be used.
4. Working Pressure: Minimum of 100 psi (690 kPa).

2.03 SAFETY TAPE FOR BURIED PIPELINES:

- A. Safety tape shall be a minimum of 3-inch wide by 5.0 mil overall thickness, with no less than a 0.35-gauge solid aluminum foil core. It shall be Safety Blue in color per American Public Works Association (APWA) National Color Code and shall be clearly labeled with the words "CAUTION POTABLE WATER LINE BELOW" or similar wording approved by ENGINEER. Safety tape shall be MagnaTec by Empire Level Mfg Corp or approved equal.

2.04 TRACER WIRE FOR BURIED PIPELINES:

- A. All piping (including service lines) shall be installed with #14 UF-G direct bury blue tracer wire for pipeline location purposes by means of an electronic line tracer. The wires must be installed along the entire length of the pipe on the top of the pipe and be held in place with poly tape at all pipe joints and at 5 foot intervals. Sections of wire shall be spliced together using approved splice caps and waterproof seals. Twisting the wires together is not acceptable.

2.05 VALVES:

- A. Gate Valves:
 1. 150 psi working pressure. AWWA C515, Iron body, bronze trim, non-rising stem with square nut, single wedge, resilient seat, flanged x flanged ends or flanged x mechanical joint ends (as indicated on the Contract Drawings).
 2. Protective coatings per AWWA C550.
 3. UL Listed/FM Approved.
 4. Provide one operating wrench of length to operate deepest valve.

2.06 DOUBLE OFFSET BUTTERFLY VALVES – LIQUID SERVICE (AWWA):

- A. Double Offset Butterfly valves shall have a double offset disc design whereby the centerline of the disc is horizontally and vertically offset from the body seat and where the elastomeric seat release compression only after a few degrees of the opening to reduce torque and seat wear, also known as a double eccentric type. Valves shall be designed, manufacturer and tested in accordance with AWWA C504, except as modified herein.

- B. Double Offset Butterfly valves shall be rated for working pressures of no less than 250 psi and shall provide zero leakage at full rated pressure on both sides of the disc.
- C. Provide valves that conform to NSF Standard 61 and NSF 372.
- D. Disc body shall conform to ASTM A536 65-45-12 or 60-40-18 for non-submerged valves and shall be Type 316 stainless-steel for submerged valves and shall be pinned used 2205 Duplex stainless steel pin. Disc seat shall be elastomeric and shall be secured to the disc with Type 316 stainless steel hardware. Disc seat shall be EPDM unless manufacturer recommends alternative which demonstrates better resistance to abrasion. The disc shall be a flow through design to reduce head loss.
- E. Body seat shall be 316L stainless steel and shall be applied through a high alloy weld double overlay process with a minimum thickness of 5 mm.
- F. Valve Stems shall be Type 431 stain steel for Class 150B and 17-4 PH stainless steel for Class 250 valves. Valve stems shall be dry stem design with O-rings.
- G. The valves shall have a heavy-duty ductile iron body conforming to ASTM A 536 65-45-12. Maximum flow velocity shall be less than 16 fps for cold water service.
- H. Valve End Connections:
 - 1. Exposed or submerged service: Flanged fully faced and drilled per ANSI B16.1 Class 150B
 - 2. Buried service: Mechanical joint.
- I. Valve Seats:
 - 1. Potable Water Service: EPDM.
 - 2. The rubber seat shall be clamped or mechanically secured in the valve disc with a continuous Type 316 stainless steel ring with Type 316 stainless steel fasteners. The rubber seat shall be a continuous uninterrupted sealing surface.
 - 3. Resilient seats shall be field replaceable without the use of special tools or epoxy.
- J. The resilient seat mating surface shall be a continuous uninterrupted Type 316 stainless steel ring mounted in the valve body.
- K. Plated or sprayed on mating surface material not acceptable.
- L. Bearings:
 - 1. The bearings shall be corrosion resistant, self-lubricating sleeve type, made from bronze or PTFE impregnated copper with steel backing.
 - 2. Thrust bearings shall be provided and shall be adjustable.

- M. The valve disc shall be rigidly connected to the stem by two pins for each shaft plus one backup safety key. The pins shall be protected for water and corrosion by O-ring seals.
- N. All bolting and hardware shall be stainless steel AISI grade 316.
- O. Shaft: Type 316 or 2205 duplex stainless steel. Either one piece extending completely through disc or stub shafts inserted into valve disc stubs.
- P. Shaft seal of the split-V type or O-ring type. Seal replaceable without disassembly of valve.
- Q. The valve shall have a fusion bonded epoxy protective coating inside and outside with a minimum DFT of no less than 14 mils. Coating shall meet AWWA C550 and shall be non-toxic and impart no taste to water. There shall be no exposed, uncoated iron in the interior or exterior of the valve.
- R. Provide gear operator with operating nut and valve box. Gear operator to be totally enclosed with gasketed Type 316 stainless steel covers with Type 316 stainless steel fasteners for access to valve packing.

2.07 MANUAL OPERATORS:

A. General:

1. Operator force not to exceed 40 lbf under any operating condition, including initial breakaway. Gear reduction operator when force exceeds 40 lbf.
2. Operator to be self-locking type or be equipped with self-locking device.
3. Provide position indicator on quarter-turn valves.
4. Worm and gear operators to be one-piece design worm-gears of gear bronze material. Worm hardened alloy steel with thread ground and polished. Traveling nut type operators to have threaded steel reach rods with internally threaded bronze or ductile iron nut.

B. Buried Operator:

1. Buried service operators shall have a 2-inch AWWA operating nut. Enclose moving parts of valve and operator in housing to prevent contact with the soil.
2. Design buried service operators for quarter-turn valves to withstand 450 lbf-ft of input torque at the FULLY OPEN or FULLY CLOSED positions, grease packed and gasketed to withstand a submersion in water to 10 psi.
3. Buried valves shall have extension stems, bonnets, and valve boxes.

C. Submerged Operator

1. Submerged service operators shall be design for continuously submerged service and be NSF 61 certified.
2. Submerged service operators shall have a 2-inch AWWA operating nut. Enclose moving parts of valve and operator in housing to prevent contact with the water.
3. Design submerged service operators for quarter-turn valves to withstand 450 lbf-ft of input torque at the FULLY OPEN or FULLY CLOSED positions, food grade grease packed and gasketed to withstand a submersion in water to 12 psi.
4. Submerged valves shall have Type 316 stainless-steel extension stems and stem guides from the valve operator to the Clearwell roof deck as shown on the Contract Drawings, bonnets, and sealed Type 316 stainless steel valve (floor) boxes by Trumbull Manufacturing or approved equal.

2.08 VALVE BOXES:

- A. General: Provide cast-iron valve boxes, rated for vehicular traffic.
- B. Cast-Iron Boxes: Extension type with screw-type adjustment, flared base and 3/16-inch minimum thickness of metal.
- C. Cast the word "WATER" in cover. Adapt box length, without full extension, to depth of cover required over pipe at valve location.

2.09 FIRE HYDRANTS:

- A. AWWA C502, UL 246, dry barrel type compression hydrant with O-ring seals; counterclockwise rotation to open. Protective interior coating per AWWA C550. Hydrants to be factory painted red.
- B. Equip with a 4-1/2 inch valve opening, 6-inch mechanical joint shoe, two 2-1/2 inch hose nozzles, and one 4 inch nozzle breakaway flange and stem coupling.
- C. Provide threads on nozzles in conformance with National Standard firehose coupling screw-thread dimensions. Nozzles shall be replaceable.
- D. Working Pressure: 350 psi.
- E. Provide 1 repair kit.
- F. UL Listed/FM Approved.

2.10 BEDDING AND COVER MATERIALS:

- A. As specified in Section 31 23 33.

2.11 DISMANTLING JOINTS:

- A. Provide dismantling joint were shown on the Contract Drawings. CONTRACTOR will not be allowed to substitute any other type of dismantling joint unless approved by ENGINEER. The dismantling joint shall be rated as indicated on the Contract Drawings.
- B. Dismantling joint bodies shall be fabricated from steel, ASTM A512 or A 513 or Ductile Iron ASTM A536, without pipe stop. The body shall not be less than 1/4-inch thick or at least the same wall thickness as the pipe to which the dismantling joint is connected. If the strength of the body material is less than the strength of the pipe material, the thickness of the middle ring shall be increased to have the same strength as the pipe. The follower ring shall be fabricated from steel, ASTM A576 or A36.
- C. For dismantling joints installed in piping systems rated for positive pressure, the joint shall be restrained with harness bolts or tie rods. Other means of restraining the joint such as set screws will not be accepted. Harnesses shall be designed in accordance with AWWA Manual 11, or as indicated. Harness sets shall be designed for the maximum test pressure of the pipe in which they are installed.
- D. Gaskets shall be composed of a rubber-compound material that will not deteriorate from age or exposure to air under normal storage or use conditions.
- E. Dismantling joint shall be Model 975 by Smith-Blair, Model 309 by JCM, Model DJ400 by Romac, or approved equal.

2.12 RESTRAINED FLANGE COUPLING ADAPTERS:

- A. Materials:
 - 1. Flanged Spool: AWWA Class D steel ring flange compatible with ANSI class 125 and 150 bolt circles, ASTM A36 steel or ASTM A283C steel.
 - 2. End Ring and Body: ASTM A36 steel or ASTM A283C steel
 - 3. Gaskets: SBR suitable for wastewater service
 - 4. Bolts and Nuts: HSLA carbon steel
 - 5. Restrained gland and wedges: ASTM A536 grade 65-45-12
- B. Assembly Tolerance: 3 inches
- C. Coating: Fusion bonded epoxy
- D. Pressure Rating: 150 psi working pressure
- E. NSF 61 certified

F. Manufacturers

1. Dresser
2. Baker
3. Viking Johnson
4. Romac
5. Smith Blair

2.13 TAPPING SLEEVES:

- A. Stainless steel split-sleeve type with flanged outlet, bolts, follower rings and gaskets on each end of sleeve suitable for maximum working pressure of 150 psi. Bolts shall have square heads and hexagonal nuts. Longitudinal gaskets shall be as recommended by manufacturer of sleeve.
- B. Flange shall be ductile iron meeting ASTM A536 grade 65-45-12.
- C. Sidebars and lugs: Type 304 stainless steel, heavy gauge.
- D. Test Ports and Test Plug: Type 304 stainless steel, Test port shall be 3/4-inch FNPT. Plug shall be coated to prevent galling.
- E. Bolts and nuts shall be Type 304 stainless steel. Nuts shall be coated to prevent galling.
- F. Gasket shall SBR and shall provide seal around full circumference of pipe. Reinforced ring at outlet provides hydrodynamic seal.
- G. Tapping Valves: Provide tapping valves that conform to gate valves, specified herein. Provide tapping valves suitable for installation with tapping sleeves and pipe used, designed for minimum water working pressure of 150 psi, and have clear waterway equal to full nominal diameter of valve.

2.14 COLD-APPLIED WAX TAPE COATING

- A. All buried appurtenances such as flanges, bolts, nuts, valves, actuators, restrained harnesses, couplings, and all metallic appurtenances shall be wax tape coated as specified herein.
- B. Primer: Primer shall be a blend of petrolatums, plasticizers, and corrosion inhibitors having a paste-like consistency. The primer shall have the following properties:
 1. Pour Point 100°F to 110°F
 2. Flash Point 350°F

3. Coverage 1 gallon/100 square feet
 4. Manufacturer Trenton Wax Tape Primer, Denso Paste Primer, or approved equal.
- C. Mastic: Mastic shall be a moldable filled petroleum or petrolatum wax. Mastic shall be Treton Fill-pro PM-GP, Densyl Mastic, or approved equal.
- D. Wax Tape: Wax tape shall consist of a synthetic-fiber felt, saturated with a blend of microcrystalline wax, petrolatums, plasticizers, and corrosion inhibitors, forming a tape coating that is easily formable over irregular surfaces. The tape shall have the following properties:
1. Saturant Pour Point 115°F to 120°F
 2. Thickness 50 to 70 mils
 3. Tape Width 6 inches
 4. Dielectric Strength 100 volts/mil
 5. Manufacturer Trenton No. 1 Wax Tape, Denso "Densyl Tape", or approved equal.
- E. Outer Wrap: Outer wrap shall be a polyvinylidene chloride plastic with three 50-gaugeplies wound together as a single sheet. The wrap shall have the following properties:
1. Thickness 1.5 mils
 2. Tape Width 6 inches
 3. Manufacturer Trenton Poly-Ply, Denso Tape PVC Self-Adhesive, or approved equal.

2.15 MECHANICAL SEALS

- A. Manufacturers:
1. Garlock/Link-Seal
 2. APS/Innerlynx
- B. Materials:
1. Seal element: EPDM
 2. Pressure Plate: Composite
 3. Nuts and Bolts: Stainless Steel

2.16 BOLTS AND NUTS

- A. All flanges, both buried and exposed, shall have stainless steel nuts and bolts as follows: Bolts shall have ASME B1.1, Class 2A threads, and be manufactured of ASTM A193, Grade B8M and conform to ASME B18.2.1, and nuts shall have Class 2A fit, square or hex heavy dimensions in accordance with ASME B18.2.2, and be manufactured of ASTM A194, Grade 8B heavy hex.

2.17 INSULATING FLANGE KIT

- A. Insulating flange kits shall be dielectric type with a rating equal to or higher than that of the joint and pipeline. All materials shall be resistant for the intended exposure, operating, temperatures and products in the pipeline.
- B. Manufacturers:
 - 1. Linebacker by GPT
 - 2. Flange Isolating Gasket Kit by APS
- C. Gasket materials shall be resistant to intended chemical exposure, operating temperatures, and pressure in the pipeline. Gaskets shall be full face Type E with O-ring seal.
- D. Insulating washers and full-length sleeves shall be fiberglass reinforced epoxy (NEMA G-10 grade). Insulating washers shall have a dielectric strength of 400 to 500-volts/mil. Insulating washers shall be installed with metallic backing washers to prevent damage to the epoxy-glasswasher during bolting. The metallic washers shall be constructed of the same material as the bolts. Contactor may use molded sleeve washers as an alternate to separate washers and sleeves, as long as the material of construction has equivalent properties to those above.

2.18 SHOP TESTING:

- A. Test pipes, valves, hydrants, and applicable accessories per manufacturer requirements, and as required by referenced Standards.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verify existing conditions.
- B. Verify building service connections and municipal utility water main sizes, locations and inverts are as indicated.

3.02 PREPARATION:

- A. Ream pipe and tube ends and remove burrs.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare pipe connections to equipment with flanges or unions.
- D. Excavate pipe trench in accordance with Section 31 23 23 for work of this Section. Hand trim excavation for accurate placement of pipe to elevations indicated.

3.03 WATER PIPE INSTALLATION:

- A. Maintain separation of water main from sewer as follows:

1. Parallel Installation

- a. Under normal conditions water mains shall be laid at least 10 feet horizontally from a sewer or sewer manhole. The distance shall be measured edge-to-edge.
- b. Under unusual conditions when local conditions prevent a horizontal separation of 10 feet the water main may be laid closer to a sewer or sewer manhole provided that:
 - (1) The bottom (invert) of the water main shall be at least 18 inches above the top (crown) of the sewer,
 - (2) Where this vertical separation cannot be obtained, the sewer shall be constructed of AWWA approved water pipe, pressure tested in place without leakage prior to backfilling, and
 - (3) The sewer manhole shall be of watertight construction and tested in place.

2. Crossing

- a. Under normal conditions water lines crossing sewers shall be laid to provide a separation of at least 18 inches between the bottom of the water line and the top of the sewer whenever possible.
- b. Under unusual conditions when local conditions prevent a vertical separation described, the following construction shall be used:
 - (1) Sewers passing over or under water mains shall be constructed of AWWA approved water pipe, pressure tested in place without leakage prior to backfilling,

- (2) Water lines passing under sewers shall, in addition, be protected by providing:
 - (a) A vertical separation of at least 18 inches between the bottom of the sewer and the top of the water line,
 - (b) Adequate structural support for the sewers to prevent excessive deflection of the joints and the settling on and breaking of the waterline; and
 - (c) That the length of the water line be centered at the point of the crossing so that joints shall equidistant and as far as possible from the sewer.
 - (3) No water pipes shall pass through or come in contact with any part of a sewer manhole.
 - B. Install pipes and structures to within tolerance of 1/2-inch of indicated elevations.
 - C. Install fire service piping according to NFPA 24.
 - D. Install joint restraint per manufacturer's instructions. Submit instructions to Engineer.
 - E. Establish elevations of buried piping to ensure not less than 52 inches of cover underneath traffic areas.
 - F. Install trace wire continuous over top of pipe, coordinate with Section 31 23 33. Extend wire into valve boxes and adjacent to hydrants for connection to location equipment.
 - G. Backfill trench in accordance with Section 31 23 33
- 3.04 VALVES AND HYDRANTS INSTALLATION:
- A. Set valves on solid bearing.
 - B. Center and plumb valve box over valve. Set box cover flush with finished grade.
 - C. Set hydrants plumb and locate pumper nozzle perpendicular to roadway.
 - D. Provide at least one (1) cubic yard of drain rock around drain hole at base of hydrant spool. Wrap geotextile around drain rock and tape geotextile to hydrant spool to prevent sitting of sewer rock. Apply non-oxide grease to all buried metal surface. Wrap with polyethylene sheet and tape wrap. Provide 12 inches sand bedding around all piping. Notify fire department at (801) 852-6300 as soon as hydrant is placed in service.
 - E. Perform tapping of water mains by qualified personnel. Maintain a minimum of 36 inches between taps, and a minimum of 24 inches clear from pipe joints. Install tapping saddles in accordance with manufacturers requirements. Keep trench open at tap until

branch line has been placed in service so tap can be inspected for leakage. Following disinfection procedures per Section 33 13 00.

- F. Install valves according to applicable AWWA Standards and NFPA 24.

3.05 DISINFECTION OF DOMESTIC WATER PIPING SYSTEM:

- A. Refer to Section 33 13 00.

3.06 SERVICE CONNECTIONS:

- A. Provide water service including service saddle, corporation stop, and polyethylene pipe.

3.07 REPAIR/RESTORATION:

- A. Repair any existing utilities, structures, or features damaged during installation of water utilities to Owner's satisfaction, and at no cost to Owner.

3.08 FIELD TESTING:

- A. Perform field-testing under provisions of Section 01 45 23 and according to NFPA 24.
- B. Hydrostatically test newly laid pipeline and valved section thereof in accordance with AWWA C600 and NFPA 24.
- C. Bacteriological testing shall be in accordance with Section 33 13 00.

3.09 FIELD PAINTING/COATINGS:

- A. Repair any shop painting/coatings damaged during storage or installation to Owner's satisfaction.

3.10 COLD-APPLIED WAX TAPE COATING APPLICATION

- A. Surfaces shall be clean and free of all dirt, grease, water, and other foreign material prior to the application of the primer and wax tape.
- B. Apply primer by hand or brush to all surfaces of the pipefitting or valve. Work the primer into all crevices and completely cover all exposed metal surfaces.
- C. For larger voids or irregular shaped surfaces fill spaces with a moldable mastic.
- D. Apply the wax tape immediately after the primer application. Work the tape into the crevices around fittings. Wrap the wax tape spirally around the pipe and across the fitting. Use a minimum overlap of 55 percent of the tape width.
- E. Work the tape into the crevices and contours of irregularly shaped surfaces and smooth out so that there is a continuous protective layer with no voids or spaces under the tape.

- F. Overwrap the completed wax tape installation with the plastic wrapping material. Wrap spirally around the pipe and across the fitting. Use a minimum overlap of 55 percent of the tape width and apply two layers or applications of overwrap. Secure plastic wrapper to pipe with adhesive tape.

3.11 ADJUSTING:

- A. Coordinate with Engineer for any field adjustments. The Engineer and Owner reserves the right to reject any field adjustments.

3.12 PROTECTION:

- A. Protect installed water utilities from damage throughout storage, installation, testing, and final approval.

3.13 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 13 00

DISINFECTING OF WATER UTILITY DISTRIBUTION

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide disinfecting of water utility distribution systems, water treatment plant, and Clearwell as indicated and in compliance with Contract Documents.
- B. Section Includes:
 - 1. Disinfection of water pipelines in accordance with AWWA C651, water storage facility in accordance with AWWA C652, and water treatment plants in accordance with AWWA C653; except as modified below.

1.02 REFERENCES:

- A. American Water Works Association (AWWA):
 - 1. C651: Disinfecting Water Mains.
 - 2. C652: Disinfection of Water-Storage Facilities.
 - 3. C653: Disinfection of Water Treatment Plants.

1.03 SEQUENCING:

- A. Basic procedure for disinfecting water mains:
 - 1. Inspecting materials to be used to ensure their integrity.
 - 2. Preventing contaminating materials from entering the water main during storage, construction, or repair and noting potential contamination at the construction site.
 - 3. Removing, by flushing or other means, those materials that may have entered the water main.
 - 4. Chlorinating any residual contamination that may remain and flushing the chlorinated water from the main.
 - 5. Protecting the existing distribution system from backflow caused by hydrostatic pressure test and disinfection procedures.
 - 6. Documenting that an adequate level of chlorine contacted each pipe to provide disinfection.

7. Determining the bacteriological quality by laboratory test after disinfection.
8. Final connection of the accepted new water main to the active distribution system.

1.04 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 1. Supervisor qualifications
 2. Equipment list

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Regulatory Requirements:
 1. Disinfection work shall be acceptable to the Owner and the Utah Division of Drinking Water (DDW). If requirements of this section are in conflict with requirements of regulatory agencies, the most strict requirement shall govern.
- C. Source Quality Assurance:
 1. Perform Work in connection with disinfection under direction of experienced supervisor.
 2. Use equipment in proper working condition and adequate for specified Work.
- D. Prior to starting disinfection work, furnish detailed outline of proposed sequence of operation, manner of filling and flushing units, source, and quality of water to be used, and disposal of wasted water.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.07 PROJECT CONDITIONS:

- A. Discharge of chlorinated water into watercourses or surface waters is regulated by the National Pollutant Discharge Elimination System (NPDES). Disposal of the chlorinated disinfection water and the flushing water is the Contractor's responsibility. Dechlorinate the disinfection water such that the chlorine residual does not exceed 0.019 ppm prior to discharging.
- B. Schedule the rate of flow and locations of discharges in advance to permit review and coordination with Owner and the DDW. The allowable location of discharge is the Mill Race Canal which discharges into the Provo River.

PART 2 - PRODUCTS

2.01 OWNER-SUPPLIED PRODUCTS:

- A. The Owner will provide potable water for the first disinfection effort. Submit request for use of water from waterlines of Owner 48 hours in advance. If bacteriological testing shows that the first disinfection effort was not successful, the Contractor will be charged at the Owner's current rates, the cost of additional water for subsequent disinfection efforts.

2.02 MATERIALS:

- A. Water: Use potable water for cleaning and disinfection.
- B. Chlorine: Provide in accordance with AWWA C652.
 - 1. Liquid Chlorine: Inject with a solution feed chlorinator and a water booster pump. Follow the instructions of the chlorinator manufacturer.
 - 2. Calcium Hypochlorite (Dry): Dissolve in water to a known concentration in a drum and pump into the pipeline at a metered rate. Tablet form calcium hypochlorite may be used only for water mains up to 12 inches in diameter and less than 2,500 feet in length.
 - 3. Sodium Hypochlorite (Solution): Further dilute in water to desired concentration and pump into the pipeline at a metered rate.

2.03 EQUIPMENT:

- A. Submit list of equipment used for disinfecting work. Makeup tanks and pumps proposed shall not have previously been used in conjunction with sanitary sewer or storm drain work.

2.04 ACCESSORIES:

- A. Chlorine Residual Test Kit: For measuring chlorine concentration, supply and use a medium range, drop count, DPD drop dilution method kit per AWWA C651, Appendix A.1. Maintain kits in good working order available for immediate test of residuals at point of sampling.

PART 3 - EXECUTION

3.01 PREPARATION:

- A. Isolate new work being disinfected from system to avoid possibility of contaminating materials entering distribution system.

B. Water Storage Facilities:

1. Remove debris and material not part of structural or operating facilities of tank.
2. Clean using high pressure water jet or other equally effective means to remove dirt and foreign material.
3. Cleaning shall:
 - a. Remove deposits of foreign nature.
 - b. Remove growths.
 - c. Broom walls, floor, and ceiling.
 - d. Avoid damage to structure.
 - e. Avoid contamination by workers and equipment.
4. Remove water, dirt, and foreign material and dispose.
5. Water used in cleaning the water storage facilities shall be wasted before adding chlorinating agent to facilities.

C. Method of disinfection for water containment devices and piping systems shall conform to AWWA C651.

D. Contractor shall be responsible for damages arising from direct contact of granular calcium hypochlorite with solvent welding materials used to join PVC pipe.

3.02 CHLORINE PREPARATION:

A. Liquid Chlorine:

1. Apply chlorine gas-water solution by means of solution feed chlorinating device or, if accepted by Engineer, dry gas may be fed directly through proper devices for regulating rate of flow and providing effective diffusion of gas into water within unit being treated.
2. Provide chlorinating devices for feeding solutions of chlorine gas that prevent backflow of water into chlorine cylinder.

B. Calcium Hypochlorite:

1. Prepare granular calcium hypochlorite as water mixture before introduction into unit. Make dry powder into paste and thin to approximately 1 percent chlorine solution.

2. To prepare chlorine solution, add 1 lb of calcium hypochlorite (65 to 70 percent available chlorine) to 8-1/3 gallons of water.

3.03 PIPELINE PREPARATION:

- A. After pressure and leakage tests complete, flush units thoroughly to remove foreign material.
- B. Release entrapped air at high points and fill units with disinfecting agent and water to allow disinfecting agent to come in contact with interior surfaces.
- C. If complete venting cannot be accomplished through available outlets, provide necessary corporation cocks and vent piping.

3.04 APPLICATION OF DISINFECTANT:

A. Point of Application:

1. Apply chlorinating agent at supply end of unit being disinfected.
2. For pipes, apply disinfectant through corporation cock installed in top of pipe.
3. Place tablets in accordance with AWWA C651.

B. Rate of Application:

1. Introduce water at controlled rate in order to regulate chlorine dosage.
2. Proportion rate of chlorine mixture flow to rate of water entering unit so chlorine dose applied produces at least 25 mg/L chlorine residual after period of 24 hours.
3. Method of determining rate of flow of water into unit being disinfected shall be accepted by Engineer.

C. Isolating Systems:

1. Keep chlorine gas-water disinfecting solution and contaminated water from flowing into units previously chlorinated and flushed.

D. Quality:

1. Retain chlorinated water in unit long enough to destroy non-spore forming bacteria.
2. Minimum retention period shall be 24 hours with chlorine residual at end of this period of not less than 25 mg/L (ppm).

E. Disinfecting Valves:

1. Operate valves and appurtenances while line or unit is being disinfected to ensure surfaces of valves are disinfected.

F. Swabbing:

1. Flush and swab pipe, fittings or valves that must be placed in service immediately with 5 percent solution of calcium hypochlorite immediately prior to assembly.
2. Secure acceptance from Engineer before using this method of disinfection.

G. Valve Operation: Performed by Owner.

3.05 DISINFECTING METHODS:

A. Continuous Feed Method:

1. Introduce potable water into the pipeline at a constant measured rate. Feed the chlorine solution into the same water at a measured rate. Proportion the two rates so that the chlorine concentration in the pipeline is maintained at a minimum concentration of 25 mg/L. Check the concentration at points downstream during the filling to ascertain that sufficient chlorine is being added.

B. Slug Method:

1. Introduce the water in the pipeline at a constant measured rate. At the start of the test section, feed the chlorine solution into the pipeline at a measured rate so that the chlorine concentration created in the pipeline is 300 mg/L. Feed the chlorine for a sufficient period to develop a solid column or "slug" of chlorinated water that will, as it passes along the line, expose all interior surfaces to a concentration of at least 300 mg/L for at least three hours.

C. Disinfection of Valves, Blind Flanges, and Appurtenances:

1. During the period that the chlorine solution or slug is in the section of pipeline, open and close valves to obtain a chlorine residual at hydrants and other pipeline appurtenances. Swab exposed faces of valves and blind flanges prior to bolting flanges in place with a 1 percent sodium hypochlorite solution.

D. Disinfection of Connections to Existing Pipelines

1. Disinfect isolation valves, pipe, and appurtenances in accordance with AWWA C651, Section 4.7. Flush with potable water until discolored water, mud, and debris are eliminated. Swab interior of pipe and fittings with a 1 percent sodium hypochlorite solution. After disinfection, flush with potable water again until water is free of chlorine odor.

E. Disinfection of Tapping Sleeves and Line Stopping:

1. Flush exterior of pipe with potable water after removal of existing coating. Swab exterior of pipe with a 1 percent sodium hypochlorite solution. Disinfect per AWWA C651, Section 4.8. After completion of tapping and line stopping, swab interior of pipe, valves, and faces of flanges to be connected to bypass piping with a 1 percent sodium hypochlorite solution.

F. Confirmation of Residual:

1. After the chlorine solution applied by the continuous feed method has been retained in the pipeline for 24 hours, confirm that a chlorine residual of **25 mg/L** minimum exists along the pipeline by sampling at air valves and other points of access.
2. With the slug method, confirm by sampling as the slug passes each access point and as it leaves the pipeline that the chlorine concentration in the slug is at least 50 mg/L.

3.06 FINAL FLUSHING AND TEST:

- A. Following chlorination, flush unit or system until replacement water in system is proven to be comparable in quality to water which will enter unit or system.
- B. Above acceptable condition of water delivered by each unit or system shall continue for at least 2 days, as demonstrated by laboratory examination of samples. Laboratory tests shall show chlorine residual, after final flushing, of less than 0.3 mg/L (ppm).
- C. Repetition of Flushing and Testing:
 1. If initial treatment results in unsatisfactory bacterial test, repeat disinfection until satisfactory results obtained.
- D. Prevent entry of contaminated water into previously disinfected units or systems.

3.07 DISINFECTING CLEARWELLS:

- A. Contractor shall disinfect the Clearwells in accordance with the latest revision of AWWA C652 "DISINFECTION OF WATER-STORAGE FACILITIES". Only AWWA approved methods, i.e., chlorination of the full storage, or spraying or painting of surfaces, will be allowed.
- B. Contractor shall submit to Engineer a proposed plan for disinfecting the Clearwells. The plan shall include a method of disposing of any high concentrations of chlorine solution.
- C. After the chlorination procedure is completed, and before the Clearwells are placed in service, water from the full facility shall be sampled and tested by OWNER for coliform

organisms in accordance with the latest edition of "Standard Method for the Examination of Water and Wastewater".

- D. Test for Odor. The water in the full facility will also be tested to assure that no offensive odor exists due to chlorine reactions or excess chlorine residual.
- E. Results of Testing. If the test for coliform organism is negative, then the Clearwells may be placed in service after obtaining and Operating Permit from the Utah Division of Drinking Water. If the test shows the presence of coliform bacteria, then the situation shall be evaluated by a qualified Engineer. In any event, repeat samples shall be taken until two consecutive samples are negative, or the storage facility shall again be subjected to disinfection at no additional cost to OWNER.
- F. Cost of water and chlorine for re-chlorination of the Clearwells if first attempt does not test safely shall be Contractor's responsibility.

3.08 DISINFECTING WATER TREATMENT PLANTS:

A. Disinfection of tanks and storage facilities

- 1. Tanks and similar receptacles shall be disinfected using one of the methods described in AWWA C652, including application methods, chlorine solution strengths, retention times, disposal of highly chlorinated water, and bacteriological sampling and testing.
- 2. Disinfect the following tanks:
 - a. UF Filtrate Backwash Storage Tank
 - b. CIP tanks
 - c. Backwash recycle tanks

B. Disinfection of UF filters

- 1. After all work is completed, disinfect the UF system by chlorination.
- 2. Disinfection of the UF system can be accomplished by conducting a maintenance clean procedure with a chlorine residual of no less than 25 mg/L.
- 3. Allow chlorinated water to soak in the filters for up to 12 hours, or as recommended by the UF system manufacturer to avoid oxidation damage to the system.
- 4. If the total coliform test is positive after disinfection, repeat until acceptable results are obtained.

C. Disinfection of piping

1. Perform flushing and disinfection of piping as specified previously in this section.
2. Flushing requirements
 - a. Flush new mains, including fire service mains and lead-in connections to fire system risers, thoroughly before connection is made to system piping in order to remove foreign materials that might have entered the main during the course of the installation.
 - b. Flushing shall be of sufficient magnitude and duration to flush all foreign material out of the lines, valves, and hydrants. The flushing velocity shall be a minimum of 2.5 feet per second (ft/s) for non-fire protection lines. Where the main supplies a fire protection system the velocity shall meet the NFPA 24 requirement of 10 ft/s.
 - c. All valves and hydrants shall be fully opened and closed under water pressure to ensure proper operations during flushing and to dislodge foreign material. All valves on fire protection lines (except curb box valves) shall be sealed with a plastic seal in the normal position (opened or closed) at the conclusion of testing. During flushing operations, all valves or connections to existing systems shall be closed and backflow preventers or other approved equipment installed at the source to prevent contamination of existing systems.
3. Disinfection requirements
 - a. Disinfect all piping on the project except the following:
 - (1) Storm sewers, sanitary sewers, and roof drainage piping.
 - (2) Other site drainage piping including overflows.
 - (3) Sanitary vents and sump pump discharge piping.
 - (4) Chlorine gas and sodium hypochlorite piping.
 - (5) Piping associated with the chlorine gas scrubber
 - (6) Tank vent piping
 - (7) Ozone off-gas air piping.
 - b. Piping associated with the ozone system shall be disinfected prior to conducting the special cleaning requirements specified in Section 46 31 53.

3.09 BACTERIOLOGIC TESTS:

- A. Owner will collect two sets of samples per AWWA C651, Section 5.1, deliver to a certified laboratory within six hours of obtaining the samples, and obtain a bacteriologic

Disinfecting of Water Utility Distribution
Section No. 33 13 00-9

quality test to demonstrate the absence of coliform organisms in each separate section of the pipeline and in each structure after chlorination and refilling. Collect at least one set of samples from every 1,200 feet of the new water line and line stopping insertion point, plus one set from the end of the line and at least one set from each branch. At each connection to an existing pipeline, take two additional samples.

- B. Repetition of Procedure: If the initial chlorination fails to produce required residuals and bacteriologic tests, repeat the chlorination and retesting until satisfactory results are obtained.
- C. Test Facility Removal: After satisfactory disinfection, disinfect and replace air valves, restore the pipe coating, and complete the pipeline where temporary disinfection or test facilities were installed.

3.10 FIELD QUALITY CONTROL:

- A. Owner will obtain samples for and submit to laboratory for analysis before the WTP facilities are placed in service.
- B. If safe samples not obtained using above procedure, Contractor shall add additional chlorine in amounts necessary to obtain safe samples.

3.11 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 30 00

SANITARY SEWERAGE UTILITIES

PART 1 - GENERAL

1.01 SUMMARY:

A. Excluded from this section are:

1. Yard process piping between structures for water treatment plants. Refer to Division 46 for yard process piping.
2. Water utilities within 5 feet from buildings. Refer to Division 22 for plumbing piping.
3. Precast concrete manholes, rings and covers and manhole steps. Refer to Section 33 95 15.

1.02 DESCRIPTION:

- A. Provide gravity sanitary sewers beyond 5 feet from buildings to municipal sewers or other discharge system as indicated and in compliance with Contract Documents.
- B. Section includes gravity sanitary sewers.

1.03 REFERENCES:

A. ASTM International (ASTM):

 2. B6: Recommended Practice for Low-Pressure Air Testing of Installed Sewer Pipe; UNI-Bell PVC Pipe Association

1.04 DEFINITIONS:

- A. Appurtenances: Additional piping items to provide a complete piping system suitable to convey wastewater as specified and intended. These items may or may not be specified but are necessary to complete the piping system.
- B. Standard Specifications: “Manual of Standard Plans and Specification – APWA Utah Chapter and Specifications as modified by Provo City 2023 Standard Drawing Details.

1.05 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 - 1. Pipe materials
 - 2. Pipe fittings
 - 3. Pipe couplings
 - 4. Accessories including, but not limited to, nuts, bolts, and gaskets.
 - 5. Appurtenances
- B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.
- C. Instructions: Provide manufacturer's installation instructions for pipe, valves, appurtenances, and manholes.
- D. Field Test Reports: Provide results for all testing performed as indicated in Subparagraph – Field Testing.
- E. Project Record Documents: Provide marked-up set of drawings showing actual locations of piping, valves, connections, thrust restraints, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Perform Work in accordance with the “Manual of Standard Plans and Specification – APWA Utah Chapter and Specifications as modified by Provo City 2023 Standard Drawing Details.

1.07 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.08 WARRANTY:

- A. Comply with the requirements specified in Section 01 78 36.
- B. Provide standard product warranties for piping materials and as required by 2017 APWA Utah Chapter Manual of Standard Plans and Specifications as modified by Provo City 2023 Standard Drawing Details.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

- A. Reinforced Concrete Pipe:
 - 1. Geneva Pipe and Precast
 - 2. Oldcastle Infrastructure
- B. Plastic Pipe (PVC):
 - 1. JM Eagle
 - 2. Vinyltech
 - 3. Diamond Plastics Corporation

2.02 GRAVITY SANITARY SEWER PIPE:

- A. Reinforced Concrete Pipe:
 - 1. Pipe: ASTM C76, minimum Class IV unless noted otherwise; nominal inside diameter as indicated.
 - 2. End Joints: Bell and spigot for pipes 12-inch diameter through 48-inch diameter. Tongue and groove for pipes 60-inch diameter and larger.
 - 3. Joint Device:
 - a. Watertight: ASTM C443, rubber compression gasket.
- B. Polyvinyl Chloride (PVC) Pipe:
 - 1. Pipe (4-inch through 15-inch diameter): ASTM D3034, Type PSM PVC material; minimum SDR35, nominal inside diameter as indicated.
 - 2. Pipe (18-inch through 48-inch diameter): ASTM F679, Type PSM PVC material; minimum pipe stiffness 46 psi, nominal inside diameter as indicated.

- 3. End Joints: Bell and spigot per ASTM D3212.
- 4. Joint Device: Gasket Flexible elastomeric locked-in gasket per ASTM F477.
- 2.03 PRECAST CONCRETE MANHOLES:
 - A. Precast concrete manholes shall be in accordance with Section 33 95 15.
 - B. Manhole steps shall be in accordance with Section 33 95 15.
- 2.04 MANHOLE FRAME AND COVERS:
 - A. Frame and Cover: In accordance with section 33 95 15. Cover provided with embossed lettering saying "SANITARY SEWER" cast into cover.
- 2.05 BEDDING AND COVER MATERIALS:
 - A. As specified in Section 31 23 33.
- 2.06 ACCESSORIES:
 - A. Flexible Couplings: Sleeve type elastomeric polyvinyl chloride held firmly to pipe ends by screw-tightened bands. Bands and screws Type 304 stainless steel.
- 2.07 APPURTENANCES:
 - A. Provide all necessary appurtenances for a full and complete piping system suitable for operation, and in conformance with Project Documents.
- 2.08 SHOP PAINTING/COATINGS:
 - A. Unless otherwise specified or indicated, provide standard manufacturer paint and coatings for all piping to prevent corrosion for the life of the component.
- 2.09 SHOP TESTING:
 - A. Test all pipes per manufacturer requirements, and as required by pertinent Standards.
 - B. Provide notice to the Engineer and Owner in advance of the proposed test and requirements for the test including measurements to be taken, submittal requirements, etc.

PART 3 - EXECUTION

- 3.01 EXAMINATION:
 - A. Verify that trench cut is ready to receive work and excavations, dimensions, and elevations are as indicated for sanitary sewer pipe. Verify excavation for manholes to proper depth and proper placement of bedding material.

3.02 PREPARATION:

- A. Sanitary sewer pipe: Hand trim excavations to required elevations. Correct over excavation with stabilization material. Remove large stones or other hard matter which could damage pipe or impede consistent backfilling or compaction.
- B. Manholes: Coordinate placement of inlet and outlet pipe sleeves. Seal exterior surface of sanitary sewer manholes with minimum 14-mil-thick coal tar coating.

3.03 SANITARY SEWER PIPE INSTALLATION:

- A. Maintain separation of sanitary sewers pipe and water mains as indicated in Specification Section 33 10 00.
- B. Install pipe, fittings, and accessories in accordance with ASTM D2321 and manufacturer's instructions. Seal joints watertight.
- C. Lay pipe to slope indicated; with maximum variation from true slope of 1/8-inch in 10 feet. Lay pipe upgrade, with spigot ends pointing in direction of flow. Lay pipe to form a close concentric joint with adjoining section and to prevent sudden offsets in flow line.
- D. Install bedding to depths and dimensions as indicated.
- E. Backfill each section of pipe as it is laid, as specified in Section 31 23 33, and as indicated at least up to centerline, before next joint is made. Do not completely conceal or bury pipe prior to being tested for water tightness and prior to being accepted by the Engineer. Do not displace or damage pipe when compacting.
- F. Clear the interior of the pipe of dirt and superfluous materials as the work progresses. Keep a suitable swab or drag in the pipe and pull it forward past each joint immediately after the jointing has been completed.
- G. Keep trenches and other excavations free of water until final inspection. Do not lay pipe in water. Do not allow water to rise over the work until concrete or grout has had ample time to set.
- H. Close open ends of pipe and fittings in a manner acceptable to the Engineer when the work is not in progress so that trench water, earth and other substances will not enter the pipe or fittings.
- I. Handle pipe and fittings to avoid damage. Carefully inspect pipe and fittings for defects before lowering into the trench.
- J. Where necessary deflect pipelines to avoid obstructions or where long-radius curves are indicated. Do not exceed the maximum deflection recommended by pipe manufacturer. Provide short sections of pipe as necessary to maintain required line.

- K. Connect different types of pipe and accessories with flexible couplings or pipe and accessories with flexible couplings or accepted transition fittings. Provide insulation fittings where ferrous pipe connects to nonferrous metallic pipe.
 - L. Verify invert of each existing pipe prior to commencing work. Prevent debris from entering the pipelines.
 - M. Repair linings, coatings and coverings damaged during construction with accepted materials equal to and compatible with original lining, coating, or covering. Repair damaged galvanizing with zinc-rich paint.
 - N. Connect to building sanitary sewer outlets as indicated on the Contract Drawings.
- 3.04 PRECAST CONCRETE MANHOLE INSTALLATION:
- A. Install precast concrete manholes in accordance with Section 33 95 15.
 - B. Maintain separation of sanitary sewer precast concrete manholes and water mains as indicated in Specification Section 33 10 00.
 - C. Place precast manhole sections plumb and level, adjust to correct elevation. Provide bedding material as indicated and to APWA Utah Chapter standard.
 - D. After manhole assembly, plug lift holes with non-shrink grout.
- 3.05 REPAIR/RESTORATION:
- A. Repair any existing utilities, structures, or features damaged during installation of sanitary sewerage utilities to Owner's satisfaction, and at no cost to Owner.
- 3.06 FIELD TESTING:
- A. General:
 - 1. Perform field-testing under provisions of Section 01 45 23.
 - 2. Request inspection by Owner's Representative prior to and immediately after placing bedding.
 - B. Cleaning and Testing:
 - 1. Test for Displacement of Buried Sanitary Sewers: After trench has been backfilled and compacted, after cover over pipeline has been brought to finished grade, and after debris and silt has been removed, pipelines will be tested by the Engineer, as follows: Light will be flashed between manholes, or, if manholes have not yet been constructed, between locations of manholes, by means of flashlight or by reflecting sunlight with mirror. Correct poor alignment, displaced pipe, and other defects indicated by the Engineer.

2. Test for Deflection of PVC Sanitary Sewers
3. Measure pipelines for vertical ring deflection within 15 days after completion of backfill and at least 4 months after installation, but no later than 30 days before substantial completion of the project. Limit maximum ring deflection of pipeline under load to 5 percent of vertical internal pipe diameter. Relay or replace pipe exceeding this deflection and retest.
4. Use deflectometer that produces continuous record of pipe deflection or pull mandrel, sphere, or pin-type go/no-go device through the pipeline. Make diameter of the go/no-go device 95 percent of undeflected inside diameter of pipe.
5. Testing of Sanitary Sewers: At such times as Engineer may direct, prove watertightness of buried sanitary sewer or portions thereof by one of the following tests. Conduct tests under supervision of the Engineer. Furnish materials, labor, and equipment required for tests and repair system until test results are satisfactory.
6. Infiltration: When, in opinion of the Engineer, trench or excavation is sufficiently saturated by groundwater or rain, tests may be made on basis of infiltration. Infiltration tests will only be allowed when hydrostatic head outside pipe is minimum of 4 feet above crown of pipe for entire length of pipe being tested. Measure flow of water at nearest downgrade manhole. Make three series of measurements at intervals of not less than 1 hour, and average results. Using this average, calculate infiltration rate for 24-hour period. Infiltration rate: Not greater than 100 gallons per inch of pipe diameter per mile per day in any section of system including manholes.
7. Exfiltration: When conditions are not suitable for infiltration test, subject pipe to hydrostatic head of at least 4 feet above pipe crown. Fill line until appropriate water level is obtained at selected upstream manhole. Observe rate of drop at this manhole for 1 hour. Leakage rate: Not to exceed maximum rate allowed for infiltration.
8. Air Test: At Contractor's option, low-pressure air test may be used instead of exfiltration test for vitrified clay, PVC, and concrete pipelines 12-inches and smaller. Perform tests in accordance with ASTM C828 for vitrified clay pipelines, UNI B6 for PVC pipelines, and ASTM C924 for concrete and ductile iron pipelines.
9. Vacuum test: For precast concrete manholes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between manhole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 30 00-1			
	Manhole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec	75 sec	90 sec
10.01-15	75 sec	90 sec	105 sec
15.01-25	90 sec	105 sec	120 sec

10. If manhole fails the test, make necessary repairs, and repeat the vacuum test and repairs until manhole passes test. Submit test results.

3.07 FIELD PAINTING/COATINGS:

- A. Repair any shop painting/coatings damaged during storage or installation to Owner's satisfaction.

3.08 VIDEO INSPECTION:

- A. Immediately after cleaning and testing, video the gravity sewer pipeline to document the condition of the line. Notify the Engineer 24 hours in advance of any video inspection so that the Engineer may observe inspection operations.
- B. Survey video inspection DVDs shall be continuous for pipe segments between manholes. Do not leave gaps in the videotaping of a segment between manholes and do not show a single segment on more than one DVD.
- C. Do not pull or propel the video camera through the line at a speed greater than 30 feet per minute.

3.09 ADJUSTING:

- A. Coordinate with Engineer for any field adjustments. The Engineer reserves the right to reject any field adjustments.

3.10 PROTECTION:

- A. Protect sanitary sewerage utilities from damage throughout storage, installation, testing, and final acceptance.

3.11 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 39 15

PRECAST MANHOLES AND STRUCTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide precast concrete manholes and structures as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Concrete Institute (ACI):
 - 1. 318: Building Code Requirements for Structural Concrete
- B. ASTM International (ASTM):
 - 1. A48: Standard Specification for Gray Iron Castings
 - 2. A123: Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
 - 3. A615: Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
 - 4. C478: Standard Specification for Precast Reinforced Concrete Manhole Sections
 - 5. C877: Standard Specification for External Sealing Bands for Concrete Pipe, Manholes, and Precast Box Sections
 - 6. C913: Standard Specification for Precast Concrete Water and Wastewater Structures
 - 7. C923: Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals
 - 8. C990: Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants

1.03 DESIGN REQUIREMENTS:

- A. Equivalent Strength: Based on structural design of reinforced concrete as outlined in ACI 318.
- B. Design of Lifting Devices for Precast Components: In accordance with ASTM C913.

- C. Design of Joints for Precast Components: In accordance with ASTM C913; maximum leakage of 0.025 gallons per hour per foot of joint at 3 feet of head.
- D. Design and install precast concrete manhole and structure to withstand hydrostatic uplift caused by a groundwater elevation at 10 feet below grade level. Use only the weight of the precast manhole and structure and hold-down slab to resist hydrostatic uplift with a minimum safety factor of 1.15. Do not include side friction of soils on walls.

1.04 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. Shop Drawings: Indicate precast manhole and structure locations, elevations, piping, and conduit, sizes, and elevations of penetrations.
 - 2. Product Data: Submit cover and frame construction, features, configuration, dimensions.
 - 3. One copy of results of tests and certification reports with each shipment of materials.
 - 4. If manufacturer's test data is inadequate or unavailable, Engineer reserves right to require cores drilled for compressive strength tests.
 - 5. Reinforcing Steel: Certificate of compliance with specifications.
 - 6. Cement: Certificate of compliance with specifications.
 - 7. Aggregates: Certificate of compliance with specifications.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Perform work in accordance with 2017 American Public Works Association (APWA) Standard Plans and Specifications as modified by Provo City 2023 Standard Drawing Details.
- C. Maintain one copy of each document on-site.
- D. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years documented experience.
- E. Inspection by Engineer:
 - 1. At site of work after delivery.
 - 2. Reject precast concrete manholes and structures at any time if it fails to meet specified requirements, even if accepted at plant.

3. Immediately remove rejected precast concrete manholes and structures from site.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Comply with precast concrete manufacturer's instructions for unloading, storing, and moving precast manholes and structures.
- C. Store precast concrete manholes and structures to prevent damage to Owner's property or other public or private property. Repair property damaged from materials storage.
- D. Mark each precast manhole and structure by indentation or waterproof paint showing date of manufacture, manufacturer, and identifying symbols and numbers shown on Contract Drawings to indicate its intended use.

1.07 PROJECT/SITE CONDITIONS:

- A. Maintain materials and surrounding air temperatures to minimum 50 degrees F prior to, during, and 48 hours after completion of masonry work.
- B. Cold Weather Requirements: ACI 530.

PART 2 - PRODUCTS

2.01 PRECAST CONCRETE MANHOLES AND STRUCTURES:

- A. Manufacturers:
 1. Geneva Pipe and Precast, Inc.
 2. Oldcastle Infrastructure, Inc.
- B. Precast manhole and Structure Sections: Reinforced precast concrete in accordance with ASTM C478 with butyl-rubber sealants, Conseal CS-102 or Ram-Nek RN101 in accordance with ASTM C990. Wrap exterior section joints with membrane waterproofing and exterior joint wrap meeting the requirements of ASTM C877, Type III, Marmac, Conseal CS212, or Press-Seal Corp EA-Wrap.
- C. Pipe Connections: Barrel section to pipe connections shall be sealed with resilient connectors, Kor-N-Seal by Trelleborg, complying with ASTM C923. Mechanical devices shall be stainless steel.

2.02 FRAMES AND COVERS:

- A. Manufacturers:
 1. D&L Supply Company

2. East Jordan Company

3. Neenah Foundry

- B. Product Description: Shall be non-rocking conforming to ASTM A48, Class 30B cast iron construction or ASTM A536, Grade 60-40-18 ductile iron construction. Machined flat bearing surface, removable lid; rated for AASHTO HS-20 loading, unless noted otherwise. Unless noted otherwise, covers and frames shall be 30-inches in diameter, non-vented, machined flat bearing surface, removable lid; with embossed lettering saying "STORM DRAIN" or "SANITARY SEWER" or "IRRIGATION" as applicable cast into cover.
- C. Precast manhole and Structure Steps: ASTM C478. Precast manhole steps shall have a 1/2-inch ASTM A615 grade 60 steel reinforcement rod encased in polypropylene copolymer plastic. Steps shall have a tread width of 14-inches (nominal), contoured to fit the hand for comfort, and a sure grip sturdy tread design with side molded slip-resistant wings. Steps shall be manufactured by American Step Company, Inc., or M.A. Industries.
- D. Base Pad: Cast-in-place concrete of type specified in Section 03 30 00, leveled top surface or precast concrete base section.

2.03 CONFIGURATION:

- A. Shaft Construction: Concentric with eccentric cone or flat top section; lipped male/female dry joints; sleeved to receive pipe and conduit sections.
- B. Shape: Cylindrical, Square, or Rectangular, as indicated on the Contract Drawings.
- C. Clear Inside Dimensions: As indicated on Contract Drawings.
- D. Design Depth: As indicated on Contract Drawings.
- E. Clear Cover Opening: 30 inches diameter minimum or as indicated on Contract Drawings.
- F. Pipe and/or Conduit Entry: Furnish openings as indicated on the Contract Drawings. Barrel section to pipe connections shall be sealed with resilient connectors, Kor-N-Seal by Trelleborg; Press-Seal Corporation; or A-Lok Products, Inc., complying with ASTM C923. Mechanical devices shall be stainless steel.
- G. Steps: 14 inches wide, 12 inches on center vertically, set into precast manhole and structure wall.

2.04 BEDDING AND COVER MATERIALS:

- A. Bedding: Fill Type as specified in Section 31 23 00.
- B. Cover: Fill Type, as specified in Section 31 23 00.

- C. Soil Backfill from Above Pipe to Finish Grade: Soil Type, as specified in Section 31 23 00. Subsoil with no rocks over 6 inches in diameter, frozen earth, or foreign matter.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verification of existing conditions before starting work.
- B. Verify items provided by other sections of Work are properly sized and located.
- C. Verify built-in items are in proper location, and ready for roughing into Work.
- D. Verify correct size of precast manhole and structure excavation.

3.02 PREPARATION:

- A. Coordinate placement of inlet and outlet pipe or duct sleeves required by other sections.
- B. Do not install structures where site conditions induce loads exceeding structural capacity of structures.
- C. Inspect precast concrete structures immediately prior to placement in excavation to verify structures are internally clean and free from damage. Remove and replace damaged units.

3.03 INSTALLATION:

- A. Excavation and Backfill:
 - 1. Excavate for precast manholes and structures in accordance with Section 31 23 00 in location and to depth shown. Provide clearance around sidewalls of structure for construction operations.
 - 2. When groundwater is encountered, prevent accumulation of water in excavations. Place precast manholes and structures in dry trench.
 - 3. Where possibility exists of watertight structure becoming buoyant in flooded excavation, anchor structure to avoid flotation.
- B. Place base pad, trowel top surface level.
- C. Place precast manhole and structure sections plumb and level, trim to correct elevations, anchor to base pad.
- D. Backfill excavations for precast manholes and structures in accordance with Section 31 23 00.

- E. Grout base of shaft sections to achieve slope to exit piping. Trowel smooth. Contour to form continuous drainage channel as indicated on the Contract Drawings.
- F. Set cover frames and covers level without tipping, to correct elevations.
- G. Coordinate with other sections of Work to provide correct size, shape, and location.

3.04 PRECAST CONCRETE MANHOLE AND STRUCTURE INSTALLATION:

- A. Lift precast components at lifting points designated by manufacturer.
- B. When lowering precast manhole and structures into excavations and joining pipe to units, take precautions to ensure interior of pipeline and structure remains clean.
- C. Set precast structures bearing firmly and fully on crushed stone bedding, compacted in accordance with provisions of Section 31 23 00 or on other support system shown on the Contract Drawings.
- D. Assemble multi-section structures by lowering each section into excavation. Lower, set level, and firmly position base section before placing additional sections.
- E. Remove foreign materials from joint surfaces and verify sealing materials are placed properly. Maintain alignment between sections by using guide devices affixed to lower section.
- F. Joint sealing materials may be installed on site or at manufacturer's plant.
- G. Verify precast manholes and structures installed satisfy required alignment and grade.
- H. Remove knockouts or cut structure to receive piping without creating openings larger than required to receive pipe. Fill annular space with mortar.
- I. Cut pipe to finish flush with interior of structure.
- J. Install exterior joint wrap per manufacturer's written installation instructions. Wrap shall extend 12 inches above and 12 inches below the joint.
- K. Shape inverts through precast manhole and structures as shown on the Contract Drawings.

3.05 CAST-IN-PLACE CONCRETE STRUCTURE INSTALLATION:

- A. Prepare crushed stone bedding or other support system shown on the Contract Drawings, to receive base slab as specified for the structures.
- B. Erect and brace forms against movement in accordance with Section 03 10 00.
- C. Install reinforcing steel as indicated on the Contract Drawings and in accordance with Section 03 21 00.

- D. Place and cure concrete in accordance with Section 03 30 00.

3.06 FRAME AND COVER INSTALLATION:

- A. Set frames using precast concrete grade rings. Maximum height of grades rings shall be 12 inches.
- B. Set frame and cover 2 inches above finished grade for precast manholes and structures with covers located within unpaved areas to allow area to be graded away from cover beginning 1 inch below top surface of frame.

3.07 FIELD QUALITY CONTROL:

- A. Section 01 43 00: Field inspecting, testing, adjusting, and balancing.
- B. Test cast-in-place concrete in accordance with Section 03 30 00.
- C. Vertical Adjustment of Existing Precast Manholes and Structures:
 - 1. Where required, adjust top elevation of existing precast manholes and structures to finished grades shown on the Contract Drawings.
 - 2. Reset existing frames, grates and covers, carefully removed, cleaned of mortar fragments, to required elevation in accordance with requirements specified for installation of castings.
 - 3. Remove concrete without damaging existing vertical reinforcing bars when removal of existing concrete wall is required. Clean vertical bars of concrete and bend into new concrete top slab or splice to required vertical reinforcement, as indicated on the Contract Drawings.
 - 4. Clean and apply sand-cement bonding compound on existing concrete surfaces to receive cast-in-place concrete in accordance with Section 03 30 00.
- D. Precast Concrete Precast Manhole Test:
 - 1. Vacuum test: For precast concrete precast manholes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between precast manhole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 39 15-1			
	Precast manhole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec.	75 sec.	90 sec.
10.01-15	75 sec.	90 sec.	105 sec.
15.01-25	90 sec.	105 sec.	120 sec.

2. If precast manhole fails the test, make necessary repairs, and repeat the vacuum test and repairs until precast manhole passes test. Submit test results.

3.08 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 40 00

STORM DRAINAGE UTILITIES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide storm drainage utilities as indicated and in compliance with Contract Documents.
- B. This section specifies storm drainage systems from 5 feet outside the building and excludes interceptors, storm separators, or sub-drainage.
- C. Section includes:
 - 1. Storm drainage piping, fittings, and accessories.
 - 2. Storm drainage catch basins, inlets, area drains, manholes or other structures.

1.02 REFERENCES:

- A. American Association of State Highway and Transportation Officials (AASHTO):

16. F477: Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe
17. F679: Standard Specification for Poly(Vinyl Chloride) (PVC) Large-Diameter Plastic Gravity Sewer Pipe and Fittings
18. F1417: Standard Practice for Installation Acceptance of Plastic Non-pressure Sewer Lines Using Low-Pressure Air

1.03 DEFINITIONS:

- A. Catch Basin or Catchbasin: A special type of inlet structure designed to retain sediment and debris transported by stormwater into the storm drainage system.

1.04 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00.
 1. Shop Drawings:
 - a. Precast Concrete Structures: Indicate locations, dimensions, configuration, thicknesses, elevations, sizes, and penetration elevations.
 2. Product Data:
 - a. Pipe: Material, pipe accessories, and manufacturer's installation instructions.

3. Certificates: Manufacturer's certificate stating that product meets or exceeds specified requirements.
4. Project Record Documents: Provide record drawings of actual pipe run locations, connections, structures, and invert elevations.
5. Testing results.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Perform work in accordance with the "Manual of Standard Plans and Specification – APWA Utah Chapter and Specifications as modified by Provo City 2023 Standard Drawing Details.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PIPE MATERIALS:

- A. Reinforced Concrete Pipe (RCP):
 1. Pipe: ASTM C76, minimum Class III, unless noted otherwise; nominal inside diameter as indicated.
 2. End Joints: Bell and spigot for pipes 12-inch diameter through 48-inch diameter. Tongue and groove for pipes 60-inch diameter and larger.
 3. Joint Device:
 - a. Watertight: ASTM C443, rubber compression gasket.
 - b. Manufacturer or approved equal:
 - (1) Geneva Pipe and Precast
 - (2) Oldcastle Infrastructure
- B. Plastic Pipe (PVC):
 1. Pipe (4-inch through 15-inch diameter): ASTM D3034, Type PSM PVC material; minimum SDR35, nominal inside diameter as indicated.

2. Pipe (18-inch through 48-inch diameter): ASTM F679, Type PSM PVC material; minimum pipe stiffness 46 psi, nominal inside diameter as indicated.
3. End Joints: Bell and spigot per ASTM D3212.
4. Joint Device: Gasket Flexible elastomeric locked-in gasket per ASTM F477.
5. Manufacturer:
 - a. JM Eagle
 - b. Vinyltech
 - c. Diamond Plastics Corporation

2.02 CATCH BASINS:

- A. Cast-in-place drainage structure per APWA Plan 315.1.
- B. Minimum sump depth is 12 inches, unless noted otherwise.
- C. Steps: None.
- D. Grating: Per APWA Plan 308. Bicycle friendly, gray iron ASTM A48 Class 35B grate for H-20 traffic loading with asphalt-based coating.
 1. Manufacturer:
 - a. D&L Supply
 - b. East Jordan
 - c. Neenah Foundry

2.03 CLEANOUT BOXES:

- A. Cast-in-place drainage structure per APWA Plan 331.2, Type B.
- B. Minimum sump depth is 12 inches, unless noted otherwise.
- C. Steps: Required in boxes greater than 4 feet deep.
- D. Ring and Cover: 30-inch per APWA Plan 302.1.

2.04 AREA DRAINS:

- A. Precast drainage structure per ASTM C858 or ASTM C913.
- B. Loading: H-20 traffic loading.

C. Grating: Steel frame to be cast into concrete riser or base. Bicycle friendly, gray iron ASTM A48 Class 35B grate for H-20 traffic loading with asphalt-based coating.

1. Manufacturer:

- a. D&L Supply
- b. East Jordan
- c. Neenah Foundry

D. Minimum sump depth is 12 inches, unless noted otherwise.

E. Steps: None.

F. Manufacturer:

- 1. Harper Precast, Inc.
- 2. Geneve Pipe and Precast, Inc.
- 3. Oldcastle Infrastructure, Inc.

2.05 PRECAST MANHOLES:

A. Manhole Sections: Circular reinforced precast concrete in accordance with ASTM C478. Manhole diameter shall be as indicated on the Contract Drawings. Axial length of barrel sections shall be selected to provide the correct total height with the fewest joints. Conical sections shall be designed to support cast iron frames and covers under H-20 loading, unless noted otherwise.

1. Manufacturer:

- a. Geneva Pipe and Precast, Inc.
- b. Oldcastle Infrastructure, Inc.

B. Pipe Connections: Barrel section to pipe connections shall be sealed with resilient connectors, Kor-N-Seal by Trelleborg, complying with ASTM C923. Mechanical devices shall be stainless steel.

C. Joints: Water-tight joints shall be sealed with butyl-rubber sealants, ConSeal CS-102 or Ram-Nek RN101 conforming to ASTM C990.

D. Per Section 33 95 15.

2.06 CAST-IN-PLACE STRUCTURES:

A. Materials:

1. Concrete: Section 03 30 00, minimum compressive strength of 4,000 psi.
2. Portland Cement: ASTM C150, Type II.
3. Hydrated Lime: ASTM C207, Type S.
4. Sand: ASTM C33, Fine Aggregate, except all passes No. 8 sieve.
5. Water: Potable, not detrimental to concrete.

2.07 MIXES:

- A. Mortar for Plugging Lift Holes: Mix Portland cement and sand, 1 part cement to 1/2-part sand with sufficient water to make mortar damp without "balling".

2.08 COMPONENTS:

- A. Frame and Cover: Shall be non-rocking conforming to ASTM A48, Class 30B cast iron construction or ASTM A536, Grade 60-40-18 ductile iron construction. Machined flat bearing surface, removable lid; rated for AASHTO HS-20 loading, unless noted otherwise. Unless noted otherwise, covers and frames shall be 30-inches in diameter, non-vented, machined flat bearing surface, removable lid; with embossed lettering saying "STORM DRAIN" or "IRRIGATION" cast into cover.

1. Manufacturer:

- a. D&L Supply Company
- b. East Jordan Company
- c. Neenah Foundry

2. Castings shall be as follows:

- a. Free from scale, lumps, blisters, and sandholes.
- b. Machine contact surfaces to prevent rocking.
- c. Thoroughly clean and hammer inspect.

- B. Manhole Steps: ASTM C478. Manhole steps shall have a 1/2-inch ASTM A615 grade 60 steel reinforcement rod encased in polypropylene copolymer plastic. Steps shall have a tread width of 14-inches (nominal), contoured to fit the hand for comfort, and a sure grip sturdy tread design with side molded slip-resistant wings. Steps shall be manufactured by American Step Company, Inc., or M.A. Industries.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verify items provided by other sections of Work are properly sized and located.
- B. Verify built-in items are in proper location, and ready for roughing into Work.
- C. Verify correct size of manhole and structure excavation.

3.02 PREPARATION:

- A. Do not install structures where site conditions induce loads exceeding structural capacity of structures.
- B. Inspect precast concrete structures immediately prior to placement in excavation to verify structures are internally clean and free from damage. Remove and replace damaged units.

3.03 TRENCHING:

- A. See Section 31 23 23 for additional requirements.
- B. Hand trim excavation for accurate placement of pipe to indicated elevations.

3.04 CATCH BASINS AND CLEANOUTS:

- A. Form bottom of excavation, clean and smooth and to correct elevation.
- B. Provide bedding in accordance with Section 31 23 00.
- C. Place structure plumb and level on prepared bedding.
- D. Orient structure for pipe connections.
- E. Form and place cast-in-place concrete base pad.
- F. Level the top surface of base pad and sleeve concrete shaft sections to receive storm drainage pipe sections.
- G. Establish elevations and pipe inverts as indicated.
- H. Establish top elevation and mount frame and cover.
- I. Mount frame level in grout, secured to top cone section.

3.05 PRECAST STRUCTURES:

- A. Provide bedding according to Section 31 23 00.

- B. Lift precast components at lifting points designated by the manufacturer.
- C. Assemble multi-section structures by lowering each section into excavation. Lower, set level, and firmly position base section before placing additional sections.
- D. Remove foreign materials from joint surfaces and verify sealing materials are placed properly. Maintain alignment between sections by using guide devices affixed to lower section.
- E. Joint sealing materials may be installed on site or at manufacturer's plant.
- F. Verify manholes installed plumb and level and satisfy required alignment and grade.
- G. Remove knockouts or cut structure to receive piping without creating openings larger than required to receive pipe or flexible connector.
- H. Steps shall be installed 12-inches on centers vertically not more than 1/2-inch out of plumb. The top step shall not be more than 12-inches below the manhole cover. Prior to backfilling, fill all cracks and voids in the manholes or vaults with non-shrink grout, polyurethane sealant, or both.

3.06 FIELD QUALITY CONTROL:

- A. Remove work that does not pass tests; replace and retest until successful installation is achieved.
- B. General:
 - 1. Perform field-testing under provisions of Section 01 45 33.
 - 2. Request inspection by Engineer prior to placing bedding.
- C. Displacement Test:
 - 1. After trench has been backfilled and compacted, after cover over pipeline has been brought to finished grade, and after debris and silt has been removed Engineer will visually inspect pipe. Pipes that do not present a uniform bore due to displacement and misalignment shall be replaced.
- D. Deflection Test:
 - 1. Test pipes for vertical ring deflection within 15 days after completion of backfill and again at least 4 months after installation but not later than 30 days before estimated substantial completion.
 - 2. Maximum allowable ring deflection is 5 percent of vertical internal pipe diameter.
 - 3. Replace pipe exceeding this allowable deflection.

- E. Make deflection tests with deflectometer which produces a continuous record of pipe deflection by pulling mandrel, sphere, or pin-type go/no-go device through pipe. Make the diameter of go/no-go device to be 95 percent of the undeflected inside pipe diameter.
- F. Vertical Adjustment of Existing Manholes and Structures:
1. Where required, adjust top elevation of manholes and structures to finished grades shown on Contract Drawings.
 2. Reset existing frames, grates and covers, carefully removed, cleaned of mortar fragments, to required elevation in accordance with requirements specified for installation of castings.
- G. Cleaning and Testing:
1. Testing of Storm Drainage Utilities: At such times as Engineer may direct, prove watertightness of buried storm drainage utilities or portions thereof by one of the following tests. Conduct tests under supervision of the Engineer. Furnish materials, labor, and equipment required for tests and repair system until test results are satisfactory.
 2. Infiltration: When, in opinion of the Engineer, trench or excavation is sufficiently saturated by groundwater or rain, tests may be made on basis of infiltration. Infiltration tests will only be allowed when hydrostatic head outside pipe is minimum of 4 feet above crown of pipe for entire length of pipe being tested. Measure flow of water at nearest downgrade manhole. Make three series of measurements at intervals of not less than 1 hour, and average results. Using this average, calculate infiltration rate for 24-hour period. Infiltration rate: Not greater than 100 gallons per inch of pipe diameter per mile of pipe per day in any section of system including manholes.
 3. Exfiltration: When conditions are not suitable for infiltration test, subject pipe to hydrostatic head of at least 4 feet above pipe crown. Fill line until appropriate water level is obtained at selected upstream manhole. Observe rate of drop at this manhole for 1 hour. Leakage rate: Not to exceed maximum rate allowed for infiltration.
 4. Air Pressure Test:
 - a. Air testing for sections of pipe shall be limited to lines less than 36-inch average inside diameter.
 - b. Lines 36-inch average inside diameter and larger shall be "joint" tested at each joint. The minimum allowable for the pressure drop from 3.5 psig to 2.5 psig during a joint test shall be 10 seconds, regardless of pipe size. Joint test shall be conducted as follows:
 - (1) Each joint shall be tested successfully.

- (2) Joint tester shall be set over joint to be tested so that the two inflation tubes straddle the joint.
 - (3) Inflate tubes to 25 psig to seal off joint to be tested.
 - (4) Apply air pressure into void between inflation tubes until pressure reaches 4 psig.
 - (5) After pressure has stabilized, bleed air pressure back to 3.5 psig.
 - (6) Record time required for pressure to drop from 3.5 psig to 2.5 psig.
 - (7) If the time in seconds for the air pressure to decrease from 3.5 psig to 2.5 psig is greater than 10 seconds, the joint shall be presumed to be free from defect. When the time is less than 10 seconds pipe breakage, joint leakage, or leaking testing seals are indicated and an inspection must be made to determine the cause. The Contractor shall affect such repairs as may be required to accomplish a successful air joint test.
- c. For pipe sections less than 36-inch average inside diameter:
- (1) Determine the groundwater level.
 - (2) Plug both ends of the pipe. For concrete pipe, flood pipe and allow 2 hours to saturate concrete. Then drain and plug pipe.
 - (3) After a manhole-to-manhole section of pipe has been sliplined and prior to any services lines being connected to new liner, plug liner at each manhole with pneumatic plugs.
 - (4) Pressurize pipe to 4.0 psig. Increase pressure 1.0 psi for each 2.3 feet of ground water over highest point in the system. Allow pressure to stabilize for 2 to 4 minutes. Adjust pressure to start at 3.5 psig (plus adjustment for ground water table). See Table 33 40 00-2 at the end of this Section.
 - (5) To determine air loss, measure the time interval for pressure to drop to 2.5 psig. The time must exceed that listed in the Table 33 40 00-2 at the end of this Section for pipe diameter and length. For sliplining, use diameter of carrier pipe.
- d. The test of the pipe and service laterals shall be conducted in the presence of the Engineer. Testing of pipe, regardless of the pipe material, shall be performed in accordance with ASTM C828 or ASTM F1417, as applicable.
- e. Any section of pipe which fails to meet requirements shall be repaired and retested.

5. Vacuum test: For precast concrete manholes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between manhole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 40 00-1			
	Manhole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec.	75 sec.	90 sec.
10.01-15	75 sec.	90 sec.	105 sec.
15.01-25	90 sec.	105 sec.	120 sec.

6. If manhole fails the test, make necessary repairs, and repeat the vacuum test and repairs until manhole passes test. Submit test results.

3.07 VIDEO INSPECTION:

- A. Immediately after cleaning and testing, video the storm drainage pipeline to document the condition of the line. Notify the Engineer 24 hours in advance of any video inspection so that the Engineer may observe inspection operations.
- B. Survey video inspection DVDs shall be continuous for pipe segments between manholes. Do not leave gaps in the videotaping of a segment between manholes and do not show a single segment on more than one DVD.
- C. Do not pull or propel the video camera through the line at a speed greater than 30 feet per minute.

3.08 ALIGNMENT AND GRADE TEST:

- A. Line and grade of pipe may not vary more than 1/2 inch in 10 feet and not more than 1-inch variance from true line at any location.
- B. Grade of pipe may not vary more than 1/4 inch in 10 feet for all design grades less than or equal to 1 percent and not more the 1/2-inch total variance from true grade at any location. Also, grade of pipe may not vary more than 1/2 inch in 10 feet for all design grades greater than 1 percent and not more than 1-inch total variance from true grade at any location. These tolerances shall be acceptable provided that such variation does not result in a level or reverse sloping invert.
- C. The variation in the invert elevation between adjoining ends of pipe due to eccentricity of joining surface and pipe interior surfaces shall not exceed 1/64 inch per inch of pipe diameter, or 1/4 inch maximum.

3.09 PROTECTION:

- A. Protect pipe and bedding from damage or displacement until backfilling operation is completed.

3.10 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

TABLE 33 40 00-2												
Pipe Diameter (inch)	Minimum Time (min:sec)	Length for Minimum Time (ft)	Time for Longer Length (sec/ft)	Specification Time for Length (L) Shown (min:sec)								
				100 ft	150 ft	200 ft	250 ft	300 ft	350 ft	400 ft	450 ft	500 ft

SECTION 40 05 90.02

STAINLESS STEEL SLIDE GATES AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide and test stainless steel slide gates and appurtenances as indicated and in compliance with Contract Documents.
- B. Gates and appurtenances installed inside the Clearwell shall be NSF 61 certified.

1.02 REFERENCES

- A. ASTM International (ASTM):
 - 1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
 - 2. A276: Standard Specifications for Stainless Steel Bars and Shapes.
 - 3. B584: Standard Specification for Copper Alloy Sand Castings for General Applications.
 - 4. D2000: Standard Classification System for Rubber Products in Automotive Applications.
 - 5. D4020: Standard Specification for Ultra-High-Molecular-Weight Polyethylene Molding and Extrusion Materials
- B. American Welding Society Code.
- C. American Water Works Association (AWWA):
 - 1. C561: Fabricated Stainless Steel Slide Gates
- D. NSF International (NSF):
 - 1. 61: Drinking water system components Health effects

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00:
 - 1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified.

2. Data for gate and actuator characteristics and performance.
3. Complete description of all materials, material thicknesses of all components.
4. Maximum bending stress and deflection of the slide under design head specified and indicated.
5. Installation drawings showing the details required for installation, dimensions, clearances, and anchor bolt locations.
6. Shop drawing data for accessory items.
7. Certified setting plans, with tolerances, for anchor bolts.
8. Manufacturer's literature as needed to supplement certified data.
9. Operating and maintenance instructions and parts lists.
10. For manufacturers not named provide a listing of reference installations as specified with contact names and telephone numbers.
11. Certified results of gate shop testing, including shop leakage test results of each gate at the design unseating head specified and indicated.
12. Certified results of actuator shop testing from the actuator manufacturer.
13. List of recommended spare parts other than those specified.
14. Shop and field inspection reports.
15. Qualifications of field service engineer.
16. Recommendations for short and long-term storage.
17. Shop and field testing procedures and set up
18. Special tools.
19. Manufacturer's product data, specifications, and color charts for shop painting.
20. Motor shop test results.
21. The latest ISO 9001 series certification or quality system plan.
22. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are

proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

- b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
 - B. A copy of the contract mechanical process, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
 - 1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
 - C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.
- 1.04 SPARE PARTS
- A. Comply with the requirements specified in Section 01 61 00.
 - 1. One set of all special tools.
- 1.05 QUALITY ASSURANCE
- A. Comply with the requirements specified in Section 01 43 00.
 - B. Gates shall be the product of one manufacturer.

- C. Gates shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.
- D. Slide gates and appurtenances must be fabricated, assembled, and tested in the United States of America or Canada.
- E. Welding: In accordance with latest applicable American Welding Society Code, ASME Welding Code, or equivalent.
- F. Shop tests as specified, including shop leakage testing of each gate at the design unseating head to confirm compliance with the leakage rate specified and indicated.
- G. The Contractor shall obtain the gates, actuators, and appurtenances from the gate manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.
- H. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.
- I. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 - 2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical connection:
 - a. 1 person-days.
 - 3. Functional Testing: Calibrate, check alignment, and perform a functional test. Tests to include all items specified.
 - a. 1 person-days.
 - 4. Field Performance Testing: Field performance test equipment specified.
 - a. 1 person-days.
 - 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts, and preparation to lead and teach classroom sessions.
 - a. 0.5 person-days.
 - 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
 - J. Manufacturer of gates shall have a minimum of five (5) operating installations with gates of the size specified and in the same service as specified operating for not less than five (5) years or manufacturer of gates shall utilize a Project Manager that is experienced in stainless steel gate design and construction. The Project Manager shall be an employee of the gate manufacturer and shall have designed a minimum of five (5) operating installations with gates of the size specified and in the same service as specified operating for not less than five (5) years.
- 1.06 DELIVERY, STORAGE AND HANDLING
- A. Comply with the requirements specified in Section 01 66 10.
 - B. Ship electric actuators separate from the gate assembly.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION

- A. Gate sizes and operating data are indicated on the Contract Drawings.

2.02 MANUFACTURERS

- A. Stainless Steel Slide Gates:
 1. Whipps, Inc. Series 900
 2. Waterman Valve (McWane) SS-250 Series
 3. Fresno Valves and Castings, Inc. Series 8200
 4. Golden Harvest, Inc. (for Diversion Box only)
 5. RW Gate Co.
 6. Acceptable Equivalent Product with unitized single piece frame.
 - a. Provide in accordance with Section 01 25 00.

2.03 SEISMIC DESIGN REQUIREMENTS

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.
- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.04 SLIDE GATE CONSTRUCTION

- A. Provide all gates produced by a single manufacturer and designed for installation in the channels and structures as specified and indicated. Gates installed in the Clearwell shall be NSF 61 certified.
- B. Gate Configuration: As indicated on the Contract Drawings.
- C. Provide all gates in conformance with AWWA C561 and as specified.
- D. Self-contained, rising, or non-rising stem, flush bottom type with self-adjusting seals.
- E. Gates with adjustable wedges or wedging devices are not acceptable.
- F. Provide all structural components 1/4-inch minimum thickness.
- G. Gate assemblies shall be media blasted or mechanically descaled by grinding and passivated in accordance with ASTM A380 prior to shipment to remove all mill scale, weld splatter, discoloration, or other surface imperfections.
- H. Leakage Rate:
 - 1. Seating head and unseating head conditions: Leakage not to exceed 0.05 gpm per foot of seating perimeter.
- I. Assembly to consist of the following:
 - 1. Frame.
 - 2. Slide.
 - 3. Stem.
 - 4. Seals.
 - 5. Benchstand with operator type as indicated on the Contract Drawings.

J. Materials:

1. Frame Assembly and Retainers: ASTM A240 Type 316L stainless steel.
2. Slides and Stiffeners: ASTM A240 Type 316L stainless steel.
 - a. 1/4-inch minimum thickness.
3. Seat, Seals and Facing: ASTM D4020 UHMW (Ultra-high Molecular Weight Polyethylene
4. Invert Seal for upward acting gates only: ASTM D2000 Neoprene or EPDM
5. Stems: ASTM A276 Type 316 stainless steel.
 - a. Minimum diameter: 1-1/2-inch.
6. Lift Nuts: ASTM B584 Bronze
7. Floorstand and Wall Brackets: ASTM A276 Type 316L stainless steel
8. Gear Operator Housing: Cast aluminum, cast iron, or ductile iron.
9. Hardware, studs, and nuts: ASTM A276 Type 316 stainless steel.
10. Anchor bolts: Type 316 stainless steel. Minimum diameter of 1/2-inch.

K. Slide:

1. Slide and reinforcing stiffeners welded to the slide.
 - a. Stainless steel plate, minimum 1/4-inch.
 - b. Reinforcement: Provide a minimum of two horizontal stiffeners welded to the slide and two vertical stiffeners welded to outside of the horizontal stiffeners.
 - c. Provide slide to engage the guide a minimum of 1 inch on each side and have a minimum material thickness of a 1/4 inch,
 - (1) Gates with the width of the gate opening x maximum design head is 80 ft² or greater, provide the portion of the slide that engages the guide members either 1/4-, 3/8-, or 1/2-inch-thick edge design where it engages the guide.
 - (2) Gates with the width of the gate opening x maximum design head is 120 ft² or greater, provide the portion of the slide that engages the guide members 3-inch-thick edge design where it engages the guide or provide standard design with supporting calculation.

- d. Provide the stem connector constructed of two angles or plates welded to the slide. Provide a minimum of two bolts connecting the stem to the stem connector.
2. Deflection: Maximum of $1/720$ of the span or $1/16$ inch whichever is smaller, under design head specified.

L. Seals:

1. Provide a self-adjusting seal system suitable for the leakage, frequent cycling and velocities specified herein, and mounted such that there is no obstruction to the specified gate opening size.
2. Provide gates equipped with UHMW polyethylene seat/seals to restrict leakage and to prevent metal to metal contact between the frame and slide.
3. Extend the seat/seals to accommodate the $1.50 \times$ the slide height with the gate in the fully open or fully closed position.
4. Provide all upward opening gates with a resilient flush bottom seal for sealing the invert of the gate.
5. Provide all downward opening weir gates with self-adjusting UHMW seat/seals across the invert member.
6. Provide all seals mechanically fastened to the frame or slide, force fit seals or seals attached with adhesive are not acceptable.
7. Provide all seats and seals to be field replaceable without the need to remove grout or concrete and without the need to remove the frame from the wall or wall thimble.
8. Gates using "J" or "P" seals are not acceptable.

M. Frames:

1. Provide frame assembly including guide members, invert members and yoke members constructed of formed stainless steel plate with a minimum thickness of $1/4$ -inch.
2. Provide gussets to support the guide members for unseating gates as required by the design head specified and indicated.
 - a. Provide gussets extended to support the outer portion of the guide assembly and positioned to transfer the load to the anchor bolts or the wall thimble studs.
3. Provide frames for mounting type as indicated on the Contract Drawings.
 - a. Embedded

- b. Wall mounted with stainless steel anchor bolts and non-shrink, non-metallic grout or EPDM gasket.
 - c. Thimble mounted with stainless steel mounting studs and mastic gasket.
- 4. Provide all wall mounted and thimble mounted gates with a flanged frame. Flat frame gates are not acceptable.
- 5. Provide all wall mounted and wall thimble mounted frames with a minimum guide weight of 11 lbs/ft and a minimum guide extension weight of 6.5 lbs/ft.
- 6. Provide guide extensions constructed of C-channel shape or similar. Angles are acceptable guide extensions.
- 7. Frame Guides and Invert Members: Provide frames as a unitized, fully welded assembly.
 - a. Bolt-on yokes are acceptable when necessary to facilitate slide removal.
 - b. Frames that require field assembly are not acceptable unless the overall frame size exceeds a size suitable for shipment on a standard flatbed truck.
- 8. Provide the frame guides extending to accommodate the entire height of the slide when the slide is in the fully opened position on upward opening slide gates or downward opening weir gates.
- 9. For self-contained gates, provide a yoke across the top of the frame guides with the yoke formed by two structural members fixed to the top of the guides to provide a one-piece rigid frame.
 - a. Provide the yoke designed to allow removal of the slide.
- 10. Provide a rigid stainless steel invert member across the bottom of the opening.
 - a. Invert member: Flush bottom type on upward opening gates with a minimum weight as specified
- 11. Provide a rigid stainless steel top seal member across the top of the opening on gates designed to cover submerged openings.
- 12. Provide a rigid stainless steel member across the invert of the opening on downward opening weir gates.

N. Stems:

- 1. Provide a threaded operating stem to connect the operating mechanism to the slide.
- 2. For rising stem gates provide the threaded portion engaging the operating nut in the manual operator or motor actuator.

3. For non-rising stem gates provide the threaded portion engaging the nut on the slide.
4. Minimum stem outside diameter of 1-1/2 inches.
5. Stem extension pipes are not acceptable.
6. Provide the stem constructed of solid stainless-steel bar for the entire length.
7. Tensile strength: Not less than 60,000 psi for stems.
8. Provide the stem threaded to allow full travel of the slide unless otherwise specified or indicated.
9. L/R: Not to exceed 200.
10. Provide the stem in accordance with AWWA C561, to withstand in tension the loads caused by an 80 pound effort on the manual crank or handwheel without exceeding 25 percent of the ultimate tensile strength of the stem material.
11. Motor Operators: Design stems to withstand in compression 1.30 x stalled output.
12. Provide the stem, in tension, designed to withstand a load caused by a 40-pound effort on the crank or handwheel without exceeding 1/5 of the ultimate tensile strength of the stem material.
13. Provide the threaded portion of the stem machined rolled or cut full depth ACME type threads with 16 micro-inch or better finish. Stub threads are not acceptable.
14. Provide stems of more than one piece joined by bronze or stainless-steel couplings with the coupling bolted to the stem.
15. Provide dual stems for upward opening gates wider than 60-inch when the opening width is 2 x greater or more than the height of the slide. Provide dual stems for downward opening gates wider than 48 inches when the opening width is 2 x greater or more than the height of the slide.
16. Provide stems on manually operated gates with an adjustable stop collar to prevent over closing of the gate.
17. For rising stem gates, provide clear plastic covers with 1-inch graduations. Provide vent holes to prevent condensation.

2.05 2.05 STEM GUIDES

- A. Provide stem guides where required to maintain L/R of 200 or less for the unsupported length of the stem
- B. Provide stem guides and brackets of Type 316L stainless steel.

1. Adjustable in two directions
2. Minimum Thickness: 1/4-inch.
3. Bushings: UHMW or bronze

2.06 WALL THIMBLES

- A. Provide where indicated on the Contract Drawings.
 1. Provide “F” thimbles for all systems not connected to piping systems.
 2. Provide “E” thimbles for all gates connected to piping systems.
 3. Provide MJ thimbles where indicated.
- B. Provide “E” thimble depth equal to the thickness of the concrete wall in which the thimble is to be mounted.
- C. For “F” thimbles in walls 36 inch thick and smaller provide thimble depth equal to the thickness of the concrete wall in which the thimble is to be mounted. For walls 36 inches thick and larger provide a minimum of 36-inch deep “F” thimble.
- D. Provide a water stop continuously welded or stitch welded and sealed on both sides around the periphery of the thimble.
- E. Provide wall thimbles of fabricated Type 316L stainless steel construction of adequate section to withstand all operational and installation stresses.
 1. Minimum thickness including front face: 1/4-inch.
- F. Provide the thimble square and plumb and the front face sufficiently flat to provide a mounting surface for the gate frame to achieve the specified leakage rate.
- G. Provide the face of the wall thimble machined if recommended by the gate manufacturer. If the wall thimble is to be machined provide the front face with a minimum thickness of 1/4-inch after machining.
- H. Provide a gasket or mastic to seal between the gate frame and the wall thimble.
- I. For mounting to existing cast iron and ductile iron thimbles provide new slide gates suitable for bolting to existing thimbles. Contractor to verify thimble dimensions and bolting pattern and submit with shop drawings.
 1. Clean existing thimbles and provide 1/4-inch thick elastomeric gasket.

2.07 MANUAL OPERATORS

- A. Provide a manual gate operator for each gate so specified.

1. Provide all gates with slides 24 inches tall or taller with a gearbox operator suitable for use with a portable operator.
- B. Type of operator as indicated on the Contract Drawings.
- C. Manually operated floorstands and benchstands:
1. Handwheel or crank operated floorstand or benchstand as indicated on the Contract Drawings.
 - a. Handwheel: No gear reduction.
 - b. Handwheel or Crank Gearbox Operator: Single or double gear reduction.
 - c. Material: Cast ductile iron housing
 2. Provide a threaded cast bronze lift nut to engage operating stem.
 3. Provide roller bearings above and below a flange on the operating nut to support both opening and closing thrusts.
 4. Operate gates under the operating head and design head, as specified and indicated, with no greater than a 40 pound effort on the crank or handwheel.
 5. Gears, where required, steel with machined cut teeth designed for smooth operation.
 6. Provide Type 304 or 400 Series stainless steel pinion shafts on crank operated benchstands and floorstands supported on tapered roller bearing or ball bearings with all components totally enclosed in a weatherproof housing with a removable cover.
 - a. Design bearing arrangement for use with portable operators specified herein.
 7. Provide mechanical seals on the operating nut and the pinion shafts to exclude moisture and dirt and prevent leakage of lubricant out of the hoist mechanism.
 8. Provide lubricating fittings for the lubrication of all gears and bearings.
 9. Floorstands: Provide a Type 316L stainless steel pedestal, constructed of minimum Schedule 40 tube and 3/8-inch thick base plates, designed to position the input shaft or crank operator or handwheel approximately 36-inch above the operating level.
 10. Benchstands: Provide with a rectangular cast ductile iron base machined and drilled for mounting purposes. Provide all adaptor plates of Type 316L stainless steel.
 11. Permanently attach or cast an arrow with the word "OPEN" on the floorstand, benchstand or handwheel indicating the direction of rotation to open the gate.
 12. Handwheels: Minimum 15 inches, maximum 24 inches diameter and removable.

13. Cranks: Cast aluminum or stainless steel with revolving nylon grip and removable.
14. Provide two gearboxes for all upward opening gates 60 inch wide and larger and with opening widths greater than 2 x gate height. Provide two gearboxes for all downward-opening gates wider than 48 inch wide and larger and with opening widths greater than 2 x gate height.
 - a. Provide Type 316 stainless steel interconnecting shaft.
 - b. Provide flexible couplings at each end of the interconnecting shaft.
 - c. Provide a handwheel or crank mounted on the pinion shaft of one of the gear boxes.
 - d. Interconnecting shaft shall have stainless steel or aluminum shroud to cover the shaft driven by electric motor operator.

D. Extended Operators

1. Provide an extended operator system to bring the pinion shaft to 36 inches above the operating level utilizing chain and sprockets when the centerline of the handwheel on a non-gear operator is located 48 inches or more above the operating level.
2. Chainwheels are not acceptable.
3. Provide a removable Type 316L stainless steel cover to enclose the chain and sprockets.
4. If the centerline of the pinion shaft is 60 inches or less above the operating level a handwheel may be used with a gearbox in lieu of the extended operator system specified above.

E. Operating Nut

1. When indicated or specified provide 2 inch square operating nut and with a non-rising stem.
 - a. Nut Material: Bronze.
 - b. Where indicated and specified provide a Type 316L stainless steel or cast-iron floor box be set in the concrete floor above the gate as indicated.
 - c. Provide one Type 316L stainless steel T-handle wrench for operation.

F. Floorstands and Wall Brackets

1. Provide Type 316L stainless steel floorstands of a height such that the handwheel or crank operated pinion shaft is located 36 inches above the operating level.

2. Provide Type 316L stainless steel wall brackets to support floorstands.
 - a. Provide wall brackets reinforced to withstand in compression a minimum of 2 x rated output of the operator with an 80-pound effort on the crank or handwheel.

2.08 ELECTRIC MOTOR ACTUATORS

- A. Provide in accordance with Section 40 23 13.03.

2.09 SHOP PAINTING

- A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces; high solids epoxy in accordance with Section 09 96 00.
- B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.10 SHOP TESTING

- A. Comply with the requirements specified in Section 01 75 13 and as specified herein.
- B. Provide motor shop testing in accordance with Section 26 20 10.
- C. Assemble each gate and inspect for proper seating.
 1. Check clearance between frame and disc seating surfaces.
- D. Fully open and close each gate in guide system to ensure gates operate freely as recommended by the gate manufacturer.
- E. Conduct a shop leakage test at the design unseating head on each gate to confirm leakage as specified and indicated for Field Testing.
- F. Operate floorstands and benchstands to insure proper assembly and operation.
- G. Repeat tests until specified results are obtained.
- H. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install items in accordance with shop drawings, manufacturer's printed instructions and as indicated.
- B. Clean debris, dirt, and gravel, from inside of gates and channels before placing gates.
- C. Install slide gates in completely assembled condition.
- D. Erect and support slide gates in positions free from distortion and strain on appurtenances during handling and installation.
- E. Inspect material for defects in workmanship and material.
- F. Clean out debris and foreign material from gate opening and seats, test operating mechanisms to check proper functioning, and check nuts and bolts for tightness. Repair gates and other equipment which do not operate easily or are otherwise defective.
- G. Set floorstand operators and stem guides so stems run smoothly in true alignment. Anchor guides firmly to walls. Check distances from centerlines of gates to operating level or base of floorstand and adjust if necessary to suit actual conditions of installation.

3.02 FIELD TESTING

- A. Comply with the requirements specified in Section 01 75 13 and as specified herein.
- B. Field testing will not be conducted without a procedure accepted by the Engineer calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Division 1 for checklist.
- C. After installation of gates, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct operating and leakage test for each gate in presence of the Engineer to determine its ability to operate as specified, and to operate smoothly without jamming under specified conditions.
- D. Test all operators.
- E. Leakage Test: Leakage not to exceed 0.05 gpm per foot of seal perimeter.
 - 1. Conduct tests at design heads of unseating/seating heads as follows:
 - a. SDG-0401-1C and SDG-0402-1C: 25 feet/25 feet
 - b. SDG-0102-1A and SDG-0102-1B: 10 feet/10 feet
- F. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

- G. Repeat tests until specified results are obtained.
- H. Contractor to provide all water labor, piping, testing equipment for conducting tests.
- I. Make all adjustments necessary to place equipment in specified working order at time of above tests.
- J. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

3.03 FIELD TOUCH-UP PAINTING

- A. After installation and testing accepted by the Engineer, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 13.01

PROCESS VALVES AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and process valves and appurtenances as indicated and in compliance with Contract Documents.
 - 1. Provide sizes and capacities as indicated or specified.
- B. Where 2 or more valves or equipment of the same type and size are required, the valves shall be furnished by the same manufacturer.
- C. Contractor shall verify that flanges on pipe match the bolt hole pattern of the flanges on the valves and mechanical appurtenances.
- D. All appurtenances shall be NSF 61 certified if used in potable water systems.
- E. Unless noted otherwise below or on the Contract Drawings, all system components shall be rated for the maximum system pressure or higher.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Data regarding valve characteristics and performance including Cv.
2. Shop drawing data for accessory items.
3. Manufacturer's literature as needed to supplement certified data.
4. Operating and maintenance instructions and parts lists.
5. Listing of reference installations as specified with contact names and telephone numbers.
6. Valve shop test results.
7. Qualifications of field service technician.
8. Shop and Field inspections reports.
9. List of recommended spare parts other than those specified.
10. Recommendations for short-term and long-term storage.
11. Special tools.
12. Shop and field testing procedures and equipment to be used.
13. Number of service technician days provided and per diem field service rate.
14. Manufacturer's product data and specifications for shop painting.
15. Provide a layout drawing, plan and section showing orientation of plug, gate, check, ball valves and actuators and nearest obstructions for each valve.
16. Manufacturer's product data and specifications for shop painting.

17. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
 18. The latest ISO 9001 series certification or quality system plan.
 19. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
 - b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
- B. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
1. If deviations and clarifications from the specifications are indicated, and are therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 2. Failure to include a copy of the marked-up specification sections and/or the detailed justifications for any requested deviation or clarification will result in submittal return without review until a marked-up specification and justification are resubmitted with the entire package.

1.04 SPARE PARTS:

- A. Comply with requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Provide enclosures for the area classifications specified and indicated.
- C. Contractor is responsible for verifying outside diameter of pipe to be tapped.
- D. Services of Manufacturer's Representative as stated in Section 01 43 00 and specified herein.

- E. Manufacturer of valve shall have a minimum of five (5) operating installations with valves of the size specified and in the same service as specified operating for not less than five (5) years.
- F. If equipment proposed is heavier, taller, different laying length or requires more operating space than specified and indicated, provide all structural, architectural, mechanical, electrical, and plumbing revisions at no additional cost to the Owner.
 - 1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10 and as specified herein.

PART 2 - PRODUCTS

2.01 RESILIENT SEAT GATE VALVES 12-INCH AND SMALLER:

A. Resilient Seat Gate Valves:

- 1. Manufacturers, or approved equal of NRS Type Valves:
 - a. J&S Valve
 - b. Kennedy Valve
 - c. American Flow Control
 - d. Mueller Company

B. General:

- 1. Provide valves that conform to NSF Standard 61.
- 2. Non-potable water service: Provide resilient seat gate valves for all sizes indicated. If resilient seat valves are not available provide solid wedge gate valves.
- 3. Potable water service: Provide resilient seat gate valves for all sizes indicated.
- 4. Provide resilient seated valves conforming to AWWA C509 or AWWA C515 except as modified herein.

C. Materials:

- 1. Body and Bonnet: ASTM A536 ductile iron.
- 2. Wedge: ASTM A536 ductile iron encapsulated with EPDM.

3. Provide all other materials as specified in AWWA C509 or C515. Working water pressure:

Pressure Rating	
inch	psi
3 to 16	250
18 & Larger	150

4. Exposed Valves: Flanged NRS valves with handwheel. Face-to-face dimensions to comply with ANSI B16.10, flanges to comply with ANSI B16.1.
5. Buried Valves: Mechanical joint ends, non-rising stem valves with operating nut in lieu of hand wheel. Provide gate boxes, steel extension stems or universal-joint operating rods with 2-in square operating nuts at upper end with coupling connected to valve stem to bring to operating nut to within 6 inches of ground surface.
6. Provide counterclockwise rotation to open valves.
7. Provide handwheels with arrow and word "open" to indicate open direction.
8. Provide geared operators where indicated. Gearing shall be steel with enclosed cases.
- Provide spur gears for buried valves with stems vertical
 - Provide bevel gears where required by position of valve.
 - Provide buried valves with totally enclosed gear cases to enclose both the gears and valve stuffing box and provide gasketed Type 316 stainless steel removable cover plates with Type 316 stainless steel fasteners to allow access to the stuffing box.
9. Chainwheels: Provide where required as specified herein. Provide beveled gear operator to mount chainwheel in vertical position. Provide valve mounted so that the arrow indicator will be visible from the floor level.
10. Provide conventional packing or double O rings in non-rising stem valves.
11. Valves capable of being repacked or O ring replaceable while under pressure.
12. Provide Type 316 stainless steel bolts and bronze nuts for stuffing box follower.
- D. Provide all gate valves with all internal and external wetted parts coated with a fusion bonded epoxy in accordance with ANSI/AWWA C550.

2.02 ECCENTRIC PLUG VALVES:

A. Manufacturers:

- DeZurik.

2. Val-Matic.
- B. Type: Non-lubricated, eccentric.
- C. Body Working Pressure:
1. Cast Iron, ASTM A126 Class B or Ductile Iron, ASTM A536, Grade 64-45-12.
 - a. Valves 4-inch through 12-inch: 175 psi.
 - b. Valves 14-inch and larger: 150 psi.
- D. Ends:
1. Grooved: ANSI/AWWA C606 for ductile iron valves.
 2. Flanged: ANSI B16.1 Class 125 pound for cast iron valves.
 3. Buried Valves: Mechanical joint.
- E. Valve Ports:
1. Provide rectangular ported valves only, circular ports are not acceptable.
 2. All valves 100% port area, reduced port valves are not acceptable.
- F. Valve Seats:
1. Coat plug with seat material specified. Bolted systems are not acceptable.
 - a. Seat Material:
 - (1) Neoprene or Buna-N synthetic rubber.
 2. Provide valves with one piece coated plugs with mating seats of 90 percent, minimum, pure nickel 1/8-inch welded into the body of valves.
 3. Provide valves with seats clamped to valve with mating seat of 90 percent, minimum, pure nickel welded to the valve body.
- G. Upper and Lower Plug Journal Bearings:
1. Removable, permanently lubricated stainless steel bushings for valves 20-inch and smaller.
 2. Bronze bearings with Type 316 stainless steel bushings for valves 24-inch and larger.
 3. Provide grit seals for upper and lower plug shafts for all valves.

H. Stem Seals:

1. Adjustable multiple V-packing.
2. Replaceable and adjustable without valve disassembly.
3. Provide valves with two sets of packing rated for vacuum service for all pump suction isolation service and for services where a vacuum is specified and indicated.

I. Operators for Valves 4-inch and larger:

1. Manual Operators:

- a. Gear operated with handwheels, levers are not acceptable.
 - b. Provide gear operators rated for bi-directional shutoff at the valve working pressure rating as specified herein.
 - c. Gear operators: Totally enclosed worm gear, traveling nut type is not acceptable. Provide permanent lubrication, watertight and dustproof, with adjustable open and closed stops and plug position indicator.
 - d. Provide all work gears designed and certified to withstand input loads up to 300-foot-pounds minimum at the stops without damage.
 - e. Chainwheels: Provide where required as specified herein.
 - f. Where indicated provide Type 316 stainless steel stem extension to operating floor elevation as shown and provide the bevel gear operator with a fabricated steel floorstand and handwheel.
2. Electric Motor Actuators: Provide where indicated and provide in accordance with Section 40 23 13.03.

J. Shop Testing:

1. Provide all plug valves tested and certified bubble tight in both directions at the full rated working pressure as specified herein.

K. Shop Painting:

1. Provide epoxy painting as specified herein.

2.03 BUTTERFLY VALVES – LIQUID SERVICE (AWWA):

A. Manufacturers or approved equal:

1. American AVK

2. DeZurik
 3. Val-Matic
- B. Provide valves that conform to NSF Standard 61.
- C. Provide valves conforming to AWWA Standard C504 for Rubber Seated Butterfly Valves except as modified herein.
- D. Valves utilizing: Continuous rubber lining on the internal body surfaces and extending over the flanges, or a disk which sits at an angle to the axis of the pipe are acceptable.
- E. Valve Bearings: Self-lubricating, nonmetallic material to effectively isolate the disc-shaft assembly from the valve body. Cast or ductile iron thrust or journal bearing surfaces are NOT acceptable.
- F. Class 150B valves except as specified or indicated.
- G. Valve Body: ASTM A126 Class B cast iron or ductile iron.
1. Exposed or submerged service: Flanged short body valve.
 2. Buried service: Mechanical joint body.
 3. Wafer, lug wafer or tapped wafer valves may be used only as specified or indicated.
- H. Valve Seats:
1. Potable Water Service: Molded new natural rubber or synthetic rubber.
 2. Wastewater or Sludge Service: Molded neoprene, Buna-N or other synthetic elastomer resistant to oil and grease.
 3. Provide seat mounted on disc or in body.
 4. Provide seats offset from shaft and field replaceable for all valves 24-inch and larger.
 5. Provide seats mounted on disc, mechanically fastened to disc with Type 316 stainless steel hex head screws. Provide rubber seat reinforced with stainless steel retaining ring. Seats vulcanized or bonded to the disc are not acceptable.
- I. For valves with seats mounted on body provide the seats clamped or mechanically secured with Type 316 stainless steel fasteners.
- J. Mating surfaces for valve with seat in body: Type 316 stainless steel or plasma applied nickel-chromium material containing 80 percent nickel, 20 percent chrome.
- K. Plated or sprayed on mating surface material not acceptable.

L. Seat Placement:

1. If seat on disc provide disc of ASTM A126 Class B cast iron or ductile iron.
2. If seat in body, provide disc of ASTM A126 Class B cast iron, ductile iron or Type 316 stainless steel. Type 316 Stainless steel edge on cast or ductile-iron discs secured with Type 316 stainless steel threaded fasteners, heat shrunk on disc, a welded-on overlay, or a plasma applied nickel-chrome material.

M. Shaft: Type 316 stainless steel. Either one piece extending completely through disc or stub shafts inserted into valve disc stubs.

N. Shaft seal of the split-V type or O-ring type. Seal replaceable without disassembly of valve.

O. Manual Operators:

1. Operator capable of valve operation at rated pressure with a maximum 80 lb. pull on actuator. Operator to be self-locking.
2. Valves 8-inch and smaller, provide lever operator, 18-inch maximum length.
3. Valves 10-inch and larger, or where chain wheels are required, provide traveling nut operator. Provide position indicator.
4. Chainwheels: Provide where required as specified herein.

P. Buried or submerged valves: Provide gear operator with operating nut and valve box or handwheel operated floorstand as shown. Gear operator to be totally enclosed with gasketed Type 316 stainless steel covers with Type 316 stainless steel fasteners for access to valve packing.

Q. Electric Motor Operator: Provide in accordance with Section 40 23 13.03.

2.04 DOUBLE OFFSET BUTTERFLY VALVES – LIQUID SERVICE (AWWA):

A. Manufacturers or approved equal:

1. Av-Tek
2. VAG
3. American AVK

B. Double Offset Butterfly valves shall have a double offset disc design whereby the centerline of the disc is horizontally and vertically offset from the body seat and where the elastomeric seat release compression only after a few degrees of the opening to reduce torque and seat wear, also known as a double eccentric type. Valves shall be designed, manufacturer and tested in accordance with AWWA C504, except as modified herein.

- C. Double Offset Butterfly valves shall be rated for working pressures of no less than 250 psi and shall provide zero leakage at full rated pressure on both sides of the disc.
- D. Provide valves that conform to NSF Standard 61 and NSF 372. Valves to be submerged within Clearwell tanks shall be NSF 61 certified for submerged conditions.
- E. Disc body shall conform to ASTM A536 65-45-12 or 60-40-18 and shall be pinned used 2205 Duplex stainless steel pin. Disc seat shall be EPDM (for use with ozonated water) and shall be secured to the disc with Type 316 stainless steel hardware. Disc seat shall be EPDM for use with ozonated water. The disc shall be a flow through design to reduce head loss.
- F. Body seat shall be 316L stainless steel and shall be applied through a high alloy weld double overlay process with a minimum thickness of 5 mm.
- G. Valve Stems shall be Type 431 stainless steel for Class 150B and 17-4 PH stainless steel for Class 250 valves. Valve stems shall be dry stem design with O-rings.
- H. In submerged conditions:
 - 1. Extensions stems shall be comprised of 1-1/4" Sch40 Type 316 stainless steel pipe and shall be equipped with universal joints.
 - 2. Couplers shall be Type 316 stainless steel.
 - 3. Gearboxes shall be packed with food grade grease.
- I. The valves shall have a heavy-duty ductile iron body conforming to ASTM A 536 65-45-12. Maximum flow velocity shall be less than 16 fps for cold water service.
- J. Valve End Connections:
 - 1. Exposed or submerged service: Flanged fully faced and drilled per ANSI B16.1 Class 150B
 - 2. Buried service: Mechanical joint.
- K. Valve Seats:
 - 1. Potable Water Service: EPDM.
 - 2. The rubber seat shall be clamped or mechanically secured in the valve disc with a continuous Type 316 stainless steel ring with Type 316 stainless steel fasteners. The rubber seat shall be a continuous uninterrupted sealing surface.
 - 3. Resilient seats shall be field replaceable without the use of special tools or epoxy.
- L. The resilient seat mating surface shall be a continuous uninterrupted Type 316 stainless steel ring mounted in the valve body.

M. Plated or sprayed on mating surface material not acceptable.

N. Bearings:

1. The bearings shall be corrosion resistant, self-lubricating sleeve type, made from bronze or PTFE impregnated copper with steel backing.
2. Thrust bearings shall be provided and shall be adjustable

O. The valve disc shall be rigidly connected to the stem by two pins for each shaft plus one backup safety key. The pins shall be protected for water and corrosion by O-ring seals.

P. All bolting and hardware shall be stainless steel AISI grade 316.

Q. Shaft: Type 316 or 2205 duplex stainless steel. Either one piece extending completely through disc or stub shafts inserted into valve disc stubs.

R. Shaft seal of the split-V type or O-ring type. Seal replaceable without disassembly of valve.

S. Manual Operators:

1. Operator capable of valve operation at rated pressure with a maximum 80 lb pull on actuator. Operator to be self-locking.
2. Valves 8-inch and smaller, provide lever operator, 18-inch maximum length.
3. Valves 10-inch and larger, or where chain wheels are required, provide traveling nut operator with handwheel. Provide position indicator.
4. Chainwheels: Provide where required as specified herein.

T. The valve shall have a fusion bonded epoxy protective coating inside and outside with a minimum DFT of no less than 14 mils. Coating shall meet AWWA C550 and shall be non-toxic and impart no taste to water. There shall be no exposed, uncoated iron in the interior or exterior of the valve.

U. Buried or submerged valves: Provide gear operator with operating nut and valve box or handwheel operated floorstand as shown. Gear operator to be totally enclosed with gasketed Type 316 stainless steel covers with Type 316 stainless steel fasteners for access to valve packing.

V. Electric Motor Operator: Where shown on the Contract Drawings provide electric motor operator in accordance with Section 40 23 13.03.

2.05 BUTTERFLY VALVES - CHEMICAL SERVICE-LINED:

A. Manufacturers:

1. American

2. DeZurik

B. Materials:

1. Body: Ductile Iron ASTM A395

2. Stem: Type 316L stainless steel

3. Liner: Virgin PTFE

4. Elastomer: Hypalon

C. Working Pressure: 150 psi

D. Body Style: Lug, 150 pound (Class 150)

E. Provide sealing system using belleville springs

F. Operator:

1. 6-inch and smaller: Lever handle, locking type

2. 8-inch and larger: Gear with handwheel

3. Electric: Provide in accordance with Section 40 23 13.03.

2.06 BALL VALVES – GENERAL SERVICE:

A. Manufacturers:

1. Jamesbury

2. KF

3. Inline

4. Kitz

5. FNW

6. Watts

7. Apollo

8. NIBCO

B. Valves 1/2-inch through 4-inch

1. Materials:

- a. Body and End Cap: Three piece, ASTM A351 Grade CF8M.
 - b. Body Seal: PTFE.
 - c. Seat: RTFE.
 - d. Ball: Type 316 stainless steel.
 - e. Stem: Type 316 stainless steel.
 - 2. Pressure Rating:
 - a. 1/2-inch through 2-inch: 1000 psi at 100 degrees F
 - b. 2-1/2-inch through 4-inch: 800 psi at 100 degrees F
 - 3. Ends:
 - a. 2-inch and Smaller: Screwed or flanged.
 - b. 3-inch and larger: Flanged.
- C. Valves 4-inch through 12-inch.
- 1. Materials:
 - a. Body and Adaptor: Two piece, ASTM A351 Grade CF8M.
 - b. Seat: TFE.
 - c. Ball: Type 316 stainless steel.
 - d. Stem: Type 316 stainless steel.
 - 2. Pressure Rating: ANSI Class 150.
 - 3. Ends: Flanged.
- D. Actuators:
- 1. Manual:
 - a. 4-inch and Smaller: Lever.
 - b. 6-inch and Larger: Gear operator.
 - c. Provide chainwheels where required as specified herein.
 - 2. Electric Motor Actuators: Provide in accordance with Section 40 23 13.03.

2.07 BALL VALVES,COPPER-ALLOY – GENERAL SERVICE:

A. Manufacturers:

1. Kitz
2. FNW
3. Watts
4. Apollo
5. NIBCO

B. Valves 1/2-inch through 4-inch

1. Materials:

- a. Body and End Cap: “Lead-free” copper alloys including bronze and brass
- b. Seat: PTFE
- c. Ball: “Lead-free” copper alloys including bronze and brass
- d. Stem: “Lead-free” copper alloys including bronze and brass
- e. NSF 61 and NSF 372 certified

2. Pressure Rating:

- a. 1/2-inch through 2-inch: 600 psi cold working pressure
- b. 2-1/2-inch through 4-inch: 400 psi cold working pressure

3. Ends:

- a. 4” and Smaller: Threaded or flanged.

C. Actuators:

1. Manual:

- a. 4-inch and Smaller: Lever

2.08 BALL VALVES - NON-METALLIC:

A. Manufacturers:

1. Spears

2. ASAHI
3. NIBCO/Chemtrol
4. Hayward

B. Materials:

1. Body: Material as specified or indicated.
 - a. PVC: ASTM D-1784, Type 1, Grade 1, Class 12454B.
 - b. CPVC: ASTM D-1784, Type 4, Grade 1 with hydrostatic designs stress of 1600 psi at 73.4 degrees F.
 - c. Polypropylene: ASTM D-2146, Type 1 with tensile strength of 4977 psi at 77 degrees F.
 - d. PVDF: Minimum tensile strength of 5000 to 7000 psi at 77 degrees F.
2. Ball: Same material as valve body.
3. Seats: Teflon, concave design to absorb expansion.
 - a. Triangular seat design is not acceptable.
 - b. Provide viton or EPDM back up cushions to absorb expansion.
4. Seals: Viton, all Viton shall contain a minimum of 55 percent Viton.
5. Provide vented ball valves for sodium hypochlorite and caustic services.

C. Ends: Type as specified or indicated:

1. Provide ends flanged in accordance with ANSI B16.1 Class 150 lb. standard drilling.
2. True union design with integral union nuts on both ends of valve.
 - a. Threads between union nuts and valve body: Provide Buttress threads to protect against pipeline expansion and water hammer stresses.

D. Machine the following to final tolerances:

1. Exterior of ball
2. Interior of socket and threaded connections
3. Teflon seat recesses

4. Stem
 5. Neck I.D.
 6. Both end connectors
 7. Both carriers
- E. Valve Port:
1. 2-inch and smaller valves: full port.
 2. 3-inch and 4-inch valves: maximum of one pipe size reduction.
 3. 6-inch valves: Venturi design.
- F. Valve Ratings:
1. PVC: 150 psi at 120 degrees F.
 2. CPVC: 85 psi at 175 degrees F.
 3. Polypropylene: 85 psi at 175 degrees F.
 4. PVDF: 85 psi at 210 degrees F.
 5. All valves rated for 29.92 inch mercury vacuum.
- G. Physical Properties:
1. Tensile stress, psi; per ASTM D638 Test Method:
 - a. PVC: 7800
 - b. CPVC: 9200
 - c. PP: 5000
 - d. PVDF: 7800
 2. Flexural Stress, psi; per ASTM D790 Test Method:
 - a. PVC: 15650
 - b. CPVC: 17060
 - c. PP: 9240
 - d. PVDF: 14930

3. Compressive Strength, psi; per ASTM D695 Test Method:
 - a. PVC: 14220
 - b. CPVC: 15650
 - c. PP: 9950
 - d. PVDF: 14220
4. Hardness, Rockwell R, per ASTM D785 Test Method:
 - a. PVC: 115
 - b. CPVC: 118
 - c. PP: 95
 - d. PVDF: 110
5. Water Absorption, percent, 24 hr., 1/8-inch thickness, per ASTM D570 Test Method:
 - a. PVC: 0.07 percent
 - b. CPVC: 0.15 percent
 - c. PP: 0.01 percent
 - d. PVDF: 0.03 percent

H. Operators:

1. Lever, with retaining screw.
2. Electric Motor Actuators:
 - a. Provide 120V single phase actuators in accordance with Section 40 23 13.03.
 - b. Enclosure:
 - (1) NEMA 7 explosion proof for classified areas
 - (2) NEMA 4 or 4X for non-classified areas.

2.09 BALL VALVES – CHEMICAL SERVICE-LINED:

A. Manufacturers:

1. Technova

2. Richter
3. Flowserve

B. Valves 4-inch through 12-inch:

1. Materials:
 - a. Body and Adaptor: Two piece, ASTM A395 ductile iron PFA lined
 - b. Seat Rings: PTFE
 - c. Ball and Stem:
 - (1) 1/2-inch through 2-inch: Type 316 stainless steel PFA lined.
 - (2) 3-inch through 6-inch: Type 316 stainless steel stem and integral steel ball PFA lined.
2. Pressure Rating: 200 psi.
3. Ends: Flanged

C. Actuators:

1. Manual: Provide level operator
 - a. Provide chainwheels where required as specified herein.
2. Electric Motor Actuators: Provide in accordance with Section 40 23 13.03.

2.10 SWING CHECK VALVES – 3-INCH AND LARGER:

A. Valves 3-inch and larger:

1. Manufacturers:
 - a. Golden Anderson
 - b. APCO
 - c. Val-Matic
2. Working pressure:

Size	Pressure
3 to 12-inch	175 psi
14-inch and larger	150 psi

3. Valve Body:
 - a. ASTM A126 Class B cast iron with integral flanges, faced and drilled per ANSI B16.1 Class 125.
 - b. Provide full waterway type body with a net flow area not less than the nominal inlet pipe size when swung open a maximum of 25 degrees. When closed, the valve shall seat drop tight.
 - c. Provide a replaceable Type 316 stainless steel body seat.
4. Valve Disc:
 - a. ASTM A126 Class B cast iron. Provide disc faced with a renewable resilient seat ring of a material suitable for the service specified and indicated. Provide Type 316 stainless follower ring and hardware.
5. Disc Arm:
 - a. Ductile iron or steel, suspended from and keyed to an austenitic stainless steel shaft located entirely above the waterway and supported at each end by bronze bushings.
 - b. Provide shaft to rotate freely without the need for external lubrication.
 - c. Provide the shaft sealed where it passes through the body by a stuffing box and adjustable packing. O-ring type shaft seals are not acceptable.
 - d. Provide valves with an outside lever and adjustable counterweight to initiate valve closure. Provide final closure dampened by means of a single, side-mounted bronze air-cushion assembly directly mounted to the valve body on machined pads.
 - e. Provide an adjustable amount of cushioning without the need for pre-charged air chambers. Commercial air cylinders which pivot and/or are attached with fabricated brackets are not acceptable.
6. If indicated on Contract Documents, provide an adjustable limit switch to indicate when the valve is closed. Provide one normally open and one normally closed contact. Enclosure: NEMA 6P for all non-hazardous area and NEMA 7 for hazardous areas.

2.11 SWING CHECK VALVES – 3-INCH AND SMALLER:

- A. Valves 1/2-inch to 2-inch:
 1. Working Pressure: 200 psi
 2. Type: Y-Pattern
 3. Ends: Threaded ASME 1.20.1

4. Materials:
 - a. Body, Cap Disc and Hinge Arm: ASTM A351 CF8M
 - b. Hinge Pin, Disc Nut Disc Washer and Plug: ASTM A276 Type 316 stainless steel
 - c. Seal and Gaskets: PTFE

B. Valves 1/2-inch to 3-inch:

1. Working Pressure: ANSI Class 150
2. Type: Swing check with bolted cover
3. Ends:
 - a. 1/2-inch through 2-inch: Threaded ASME 1.20.1
 - b. 1/2-inch thru 3-inch: Flanged
4. Materials:
 - a. Body, Cap Disc and Hinge Arm: ASTM A351 CF8M
 - b. Hinge Pin and Plug: ASTM A276 Type 316 stainless steel
 - c. Plug Seals and Gaskets: PTFE

2.12 GLOBE VALVES

A. Manufacturer

1. Apollo
2. VAG GA
3. Equal

B. Valves 2-inch and smaller:

1. Working Pressure: 200 psi.
2. Rising stem with plug type disc.
3. Ends: Threaded ASME 1.20.1.
4. Materials:
 - a. Body and Bonnet: ASTM A351 CF8M.

- b. Disc, Stem and Gland: ASTM A276 Type 316 stainless steel.
- c. Packing and Gaskets: PTFE.
- d. Handwheel: ASTM A536.

C. Valves 2-1/2-inch to 3-inch:

- 1. Working Pressure: ANSI Class 150.
- 2. OS&Y, bolted bonnet, solid or flexible wedge disc type.
- 3. Ends: Flanged ANSI B16.5.
- 4. Materials:
 - a. Body, Bonnet, Gland Flange and Disc: ASTM A351 CF8M.
 - b. Stem and Disc Nut: ASTM A276 Type 316 stainless steel.
 - c. Gland: ASTM A276 Type 304 stainless steel.
 - d. Packing and Gaskets: PTFE.

D. Valves larger than 3-inch

- 1. Working pressure: ANSI Class 150
- 2. Full port
- 3. Ends: Flanged ANSI B16.5
- 4. Materials
 - a. Body and disc material: Cast iron ASTM A-126
 - b. Seat ring and seal ring material: Cast Bronze ASTM B-62
 - c. Guide spindle, stem, and packing gland material: Brass ASTM B-16
 - d. Check screw, disc cover, stud, nut, and bonnet material: Carbon Steel ASTM A-307B.

2.13 SOLENOID VALVES:

A. Manufacturers:

- 1. JD Gould.
- 2. ASCO.

3. Berkert.

B. Type:

1. Size: 1/8-inch to 2-inch.
2. Globe type.
3. 2-way, internal piston pilot operated.
4. Energize to open.
5. Operating Pressure Differential: 150 psi.

C. Materials:

1. Body: Type 316 stainless steel.
2. Seat Discs: PTFE.
3. Piston Assembly: Type 316 stainless steel.
4. Pilot Assembly: Type 316 stainless steel jacket welded on steel core.

D. Coil: Class F.

E. Electrical: 120 Volt, 1 phase, 60 Hertz.

F. Ends: Threaded.

G. Enclosure: NEMA 4X for locations in non-classified areas and NEMA 7 for use in classified areas.

2.14 SOLENOID VALVES – COPPER ALLOY:

A. Manufacturers:

1. ASCO.
2. AGB Industries.
3. ODE.

B. Type:

1. Size: 1/8-inch to 2-inch.
2. Guided pilot diaphragm
3. 2-way, internal piston pilot operated.

4. Energize to open or close, as shown on Contract Documents.
5. Operating Pressure Differential: 150 psi.

C. Materials:

1. Body: Lead Free Brass
2. Seat Discs: FPM
3. Piston Assembly: Type 316 stainless steel.
4. Pilot Assembly: Type 316 stainless steel jacket welded on steel core.

D. Coil: Class F.

E. Electrical: 120 Volt, 1 phase, 60 Hertz.

F. Ends: Threaded.

G. Enclosure: NEMA 4X for locations in non-classified areas and NEMA 7 for use in classified areas.

2.15 SOLENOID VALVES – NON METALLIC:

A. Manufacturers:

1. Hayward Industrial products.

B. Type:

1. Size: 1/4-inch to 1-inch.
2. Globe type.
3. 2-way.
4. Energize to open.
5. Operating Pressure Differential: 120 psi.

C. Materials:

1. Body: CPVC.
2. End Connectors: CPVC.
3. Seals and O-rings: EPDM.
4. Seal Cartridge: CPVC.

5. Union Nut and Bonnet Nut: CPVC.

D. Coil: Class F.

E. Electrical: 120 Volt, 1 phase, 60 Hertz.

F. Ends: True Union or Flanged as indicated.

G. Enclosure: NEMA 4X for locations in non-classified areas and NEMA 7 for use in classified areas.

2.16 INJECTION QUILLS – CHEMICAL SERVICE:

A. Type: Standard Service Retractable Injection Quill

B. General:

1. All materials of construction for injection quills shall be compatible with the service chemicals being injected.

C. Safety Rating: 150 PSI

D. Process Connection Size: 1-inch

E. Manufacturers:

1. SAF-T-FLO Water Services, Inc.
2. Engineer-Approved Equal

F. Provide assemblies consisting of the following components:

1. Type 316 stainless steel corporation stop with safety device to prevent release of solution tube under line pressure of Type 316 stainless steel ball valve.
2. Type 316 stainless steel flange tapped to accept the corporation stop or ball valve.
3. Solution tube of 1/3 diameter or greater of the pipe in which the chemical is injected into with a locking device to prevent release of the tube under line pressure.
 - a. Solution Tube Material:
 - (1) 10-inch or less: PVC
 - (2) 12-inch and greater: Alloy
 - b. Ball check valve as specified in Section 40 23 13.03.
 - c. Type 316 stainless steel chain.

4. Standard configuration injector tip.
5. Chemical line connection to the assembly:
 - a. Provide a section of polyethylene chemical tubing suitable for the service conditions in accordance with Section 40 23 19.05.
 - b. Isolation valve, PVC check valve, with an EPDM or FKM seal.

2.17 WATER PRESSURE REGULATORS:

A. Manufacturers:

1. Cascho
2. Watts

B. Provide water pressure regulators as specified and indicated.

1. Provide sizes and flow rates as specified and indicated.

C. Provide self-contained units operated by internal spring loaded diaphragms or pistons.

1. Provide regulators of spring-opposed bronze piston type where not available in diaphragm configuration.

D. Materials:

1. Body and spring chambers: Type 316 stainless steel.
2. Steel body seat: Type 316 Stainless.
3. Seat disk: Buna-N.
4. Diaphragms: Buna-N reinforced.

E. End Connection: NPT Female

F. Provide regulators constructed such that all repairs may be performed with valve in-line.

G. Provide regulators with top adjusting screw to set downstream pressure.

H. Provide regulators sized for required flows with inlet pressure and outlet pressure as indicated.

I. Pressure variation at outlet of greater than 15 psig at maximum required flows is not acceptable.

2.18 COMBINATION AIR VALVE (CAV)

A. Manufacturers:

1. DeZurik (APCO)
2. GA
3. Crispin
4. Val-Matic
5. Vent-O-Mat

B. Valves: Provide combination air/vacuum valve designed to allow large quantities of air to escape out of the orifice when filling a pipeline and to close watertight when the liquid enters the valve, and shall be equipped with a small air release orifice to allow small pockets of air to escape automatically and independently of the large orifice. The Air/Vacuum valve shall also permit large quantities of air to enter through the orifice when the pipeline is being drained to break the vacuum. The discharge orifice area shall be equal or greater than the inlet of the valve.

C. Provide valves manufactured and tested in accordance with AWWA C512.

D. The valve shall consist of a body, cover, baffle, float and seat. The baffle will be designed to protect the float from direct contact of the rushing air and water to prevent the float from closing prematurely. The seat shall be fastened into the valve cover without distortion and shall be easily removed, if necessary. The float shall be stainless steel and shall be center guided into the seat.

E. Provide low-durometer seats for low pressure applications where indicated on the Drawings.

F. End Connection: NPT Threaded

G. Materials of Construction

1. Body and Cover:
 - a. ASTM A126 Gr. B Cast Iron or ASTM A536 Gr 65-45-12 Ductile Iron.
2. Float
 - a. 304 Stainless Steel
3. Seat:
 - a. Buna-N

H. Rated Pressure: 175 psi

- I. Unless shown otherwise on the Drawings, all CAVs shall include a stainless-steel ball valve for isolation. Contractor shall field route drain piping for CAV to nearest floor or trench drain. Piping from host pipe to CAV shall be stainless steel. Pipe from CAV to drain shall be schedule 80 PVC.

2.19 BARREL TYPE COMBINATION AIR VALVE (BAV)

A. Manufacturers:

- 1. Vent-O-Mat Series RBX Model 1931 by RF Valves, Inc.
- 2. Proposed alternatives shall consider limited headroom in vaults.

- B. Combination air-vacuum valves shall have four functions of uninterrupted discharge of air/gas during filling, continuous discharge of dis-entrained pressurized air/gas, unrestricted vacuum break, and pipeline surge protection in a single chamber.

- C. Valves shall be anti-surge and anti-shock air release and vacuum break valves.

- D. Valves shall have studded wafer style inlet connection and t-outlet with bias flanged discharge outlet. Valve shall be rated for 276psi working pressure.

E. Materials for valve construction shall be as follows:

- 1. Floats: Solid HDPE with EPDM O-ring seals
- 2. Barrel: 304 Stainless Steel
- 3. Tie Rods and Fasteners: 304 Stainless Steel
- 4. Nozzle: 316 Stainless Steel
- 5. Flanges: Fusion bonded epoxy coated ductile iron

- F. Valve shall be NSF 61 certified. Valve shall have a 10 year in-service warranty for all internal components.

2.20 AIR RELEASE VALVES – CLEAN WATER SERVICE:

A. Manufacturers:

- 1. Val-Matic
- 2. APCO

- B. Valves: Provide air release valves of the automatic float operated type designed to release accumulated air from a piping system while the system is in operation and under pressure.

- C. Provide valves manufactured and tested in accordance with AWWA C512.

- D. Provide valves used in potable water service certified to ANSI/NSF 61 Drinking Water System Components - Health Effects.
- E. Valve manufacturer must have a quality management system that is certified to ISO 9001:2000 by an accredited, certifying body.
- F. Provide valves with the cover bolted to the valve body and sealed with a flat gasket.
- G. Provide replaceable resilient seats.
- H. Provide drop tight shut off to the full valve pressure rating.
- I. Provide floats guaranteed against failure including pressure surges.
- J. Mechanical linkage to provide sufficient mechanical advantage so that the valve will open under full operating pressure.
 - 1. Simple lever designs: Provide valves consisting of a single pivot arm and a resilient orifice button.
 - 2. Compound lever designs: Provide valves consisting of two levers and an adjustable threaded resilient orifice button.
- K. Provide valve body with threaded NPT inlets and outlets.
 - 1. Inlet Connection: Provide hexagonal for a wrench connection.
 - 2. Refer to Valve Schedule for working pressure requirements.
 - 3. Provide valves with two (2) additional NPT connections with ball valves as specified herein, one connection with a plug and one with a hose coupling for the gauges, testing, and draining.
 - 4. Provide a vacuum check on the outlet to prevent air from re-entering the system during negative pressure conditions.
- L. For valves in vaults, provide valves with an inflow preventer to prevent the introduction of contaminated water through the air valve outlet.
 - 1. Provide the inflow preventer to allow the admittance and exhausting of air while preventing contaminated water from entering during normal operating conditions.
 - a. Provide the inflow preventer flow tested by an independent testing lab approved by the American Society of Sanitary Engineers.
- M. Materials:
 - 1. Valve Body, Cover and Baffle:

- a. ASTM A126 Class B cast iron for working pressures up to 300 psig.
 - b. ASTM A536 Grade 65-45-12 Cast Ductile Iron for working pressures 300 psig and greater.
 - c. ASTM A216 Grade WCB cast steel.
 - d. ASTM A351 Grade CF8M stainless steel.
 - e. ASTM B584 Alloy C83600 cast bronze.
- 2. Floats, Orifice and linkage: Type 316 stainless steel, non-metallic components are not acceptable.
 - 3. Orifice Button: Viton for simple lever valves and Buna-N for compound lever designs.
 - 4. Hardware: Type 316 stainless steel.
 - 5. Screened Hood: Type 316 stainless steel.

N. Testing:

- 1. Test valves at 1.5 times the rated working pressure.

2.21 REDUCED PRESSURE ZONE ASSEMBLY

- A. Reduced Pressure Zone Assembly shall consist of a pressure differential relief valve located between two positive seating check valves assemblies and the entire assembly shall be NSF 61 listed and shall be lead free certified.
- B. Isolation valves shall not be supplied with this assembly but shall be as scheduled on the Drawings.
- C. Back siphonage protection shall include provision to admit air directly into the reduced pressure zone via a separate channel from the water discharge channel.
- D. Manufacturer:
 - 1. Series LF909 by Watts

2.22 CHAINWHEEL OPERATORS – STAINLESS STEEL

- A. Provide chainwheels with chain and chain guides. For all valves with handwheels or gear operators higher than 6.5 feet above operating floor level.
- B. Provide chain that reaches to within 3 feet of the operating floor level.
- C. For valves with gear operator mount with chainwheel in the vertical position.

D. Provide secondary safety restraint system.

E. Manufacturer:

1. Trumbull.

F. Materials:

1. Chainwheels: Pocket type wheel, Type 316 stainless steel.
2. Chain: Type 316 stainless steel straight link machine chain.
3. Hardware and Attachments: Type 316 stainless steel.
4. Safety Restraint Cables and Hardware: Type 316 stainless steel.

G. Materials:

1. Chainwheels: Sprocket type wheel, ductile iron.
2. Chain: Galvanized steel connecting link chain.
3. Hardware and Attachments: Galvanized steel.
4. Safety Restraint Cables and Hardware: Type 316 stainless steel.

2.23 FLOORSTANDS-NRS INDICATING TYPE:

A. Type: Non-Rising Stem (NRS), Indicating.

B. Materials:

1. Pedestal: Cast Type 316 stainless steel with a vertical indicating slot.
2. Indicator: Bronze. Provide indicator that travels on a threaded stem to indicate the position of the valve.
3. Handwheel: Type 316 stainless steel, 12-inch diameter.
4. Couplings: Type 316 stainless steel.

C. Provide the word “OPEN” cast in the pedestal at the top of the indicating slot and provide a “CLOSED” tag mounted to the pedestal, to indicate the closed position of the valve.

D. Floorstands fabricated by welding flanges to pipe are not acceptable.

2.24 EXTENSION STEMS:

A. Provide where indicated and required for operation of all valves

B. Material:

1. Stems: Type 316L solid stainless steel bar or Schedule 40 Type 316L pipe
 - a. Minimum Size: 1.25 inch diameter, Slenderness ratio <200
2. Connectors, thrust relief assemblies, torque tube assemblies, universal joints and operating nuts: Type 316 or Type 316L stainless steel
3. Miter gears: Cast iron with 2 part epoxy coating

2.25 FLOOR BOXES-CAST IRON

A. Manufacturer:

1. Trumbull Industries.

B. Provide floor boxes where indicated to provide support for extension stems for non-rising stem valves and a cover for the operating nut.

C. Floor Box Depth: 6 inches and capable of use in thicker floors with a 2 1/2 inch or 3 inch schedule 40 steel pipe nipple

D. Materials:

1. Body and Cover: Cast Iron ASTM A126
2. Bushing: Bronze, NSF 61
3. Hardware: Type 316 stainless steel

2.26 FLOOR BOXES-STAINLESS STEEL WITH PACKING

A. Manufacturer:

1. Trumbull Industries.

B. Provide floor boxes where indicated to provide support for extension stems for non-rising stem valves and a cover for the operating nut.

C. Floor Box Depth: 6 inches and capable of use in thicker floors with a 4 inch schedule 80 Type 316L stainless steel pipe nipple.

D. Provide system capable of a maximum 2 inch shaft extension.

E. Provide a water stop welded to the body

F. Provide cover with O-ring seal and six (6) stainless steel socket screws

G. Materials:

1. Body: 6 inch schedule 40 Type 316L stainless steel
2. Cover: Type 316L stainless steel
3. Packing Gland: Bronze, NSF 61
4. Packing: Viton A
5. Hardware: Type 316 stainless steel

H. Where indicated provide floor boxes with stuffing box with bronze, NSF61, glands, Type 316 stainless steel hardware and non-asbestos fiber packing

2.27 STEM GUIDES:

A. Manufacturer:

1. Trumbull Industries.
2. Troy Valve.

B. Provide valve stem guides where indicated and as required by the valves manufacturer.

C. Stem Guide Spacing: 6 to 8 feet, maximum slenderness ratio of 200.

D. Stem Guides for Stems 2-inch and Smaller:

1. Materials:
 - a. Stem Guide: Cast Type 316 stainless steel with 2 to 36 inch adjustment.
 - b. Bushing: Bronze, NSF 61
