 - c. Hardware: Type 316 stainless steel.

E. Stem Guides for Stems 2-1/8-inch to 4 inch:

1. Materials:
 - a. Stem Guide: Ductile Iron 65-45-12 with 2-3/4 to 17-1/4 inch adjustment.
 - b. Bushing: Split type, Bronze, NSF 61
 - c. Hardware: Type 316 stainless steel.

2.28 POSITION INDICATORS:

A. Manufacturer:

1. Trumbull Industries.
- B. Provide position indicators installed on all multi-turn valves and quarter turn valves with gear boxes 3 inch and larger.
1. Type: Planetary gear design.
- C. Materials:
1. Provide the sun gear, planet gear, ring gears and scale plate constructed of Delrin.
 2. Housings of carbon steel or aluminum are not acceptable.
 3. Hardware and Fasteners: Type 316 stainless steel.
- D. Position Indicator Design Features:
1. Provide the position indication to show the position of the valve, from fully open to fully closed, identified at ground level.
 2. Movement of the indicating arrow must be visible through a window covering a minimum of 300 degrees of the circumference of the indicator.
 3. Size of the characters and numerals: minimum 3/16-inch.
 4. Provide the top scale plate with markings representing the number of turns, contain the word "CLOSED", and a directional arrow.
 5. Provide permanently recessed, embossed or engraved markings in the scale plate. The use of adhesive labels is not acceptable.
 6. Provide the "OPEN" line marked on a transparent polycarbonate window, field adjusted for the number of turns of each valve size.
 7. Provide the position of the adjustable "OPEN" window secured to the top surface of the scale plate by the outside diameter of three Type 316 stainless button head cap screws.
 8. Provide all adapters to secure the position indicator, for installation in either a valve box, floor box or wall bracket as indicated and required.
 9. Provide the position indicator and adapter with matching flat sides to prevent rotation of the indicator during operation.
- E. Exposed and Submerged Valves:
1. Provide a Type 316 stainless steel extension stem connected to a 2 inch square nut on the valve and extend up through the position indicator, terminating in a 2 inch square nut, operable by a standard waterworks tee-handle wrench.

F. Buried Valves:

1. Provide the position indicator installed in a valve box within 6 inches of grade.

G. Valves Installed Inside a Structure:

1. Provide the position indicator installed in a floor box.
2. Where a floor is not directly over the valve and extension stem, support position indicators with a Type 316 stainless steel wall bracket mounted to a side wall.
3. When installed in a floor, provide the adapter with a bronze bushing to support and center the extension stem with the bronze bushing retained in the cast iron floor adapter by two Type 316 stainless steel screws and drilled to an inside diameter 1/16inch larger than the outside diameter of the extension stem.

2.29 PNEUMATIC ACTUATORS

A. Provide rotary type linear constant torque pneumatic actuators for open / close service with the following features:

1. Adjustable open/close speed control
2. Heavy duty mechanical limit switches for open and close status with output feedback.
3. Visual position indicator.
4. Manual over-ride on solenoids.
5. Dual travel stops.
6. 150,000 in-lb.
7. Stainless steel hardware.
8. Alloy steel drive shaft.
9. Epoxy powder coat finish.
10. Spring Return.

B. Manufacturer

1. Bray
2. Kinetrol
3. Keystone

4. K-TORK

2.30 ELECTRIC MOTOR ACTUATORS:

- A. Provide in accordance with Section 40 23 13.03.

2.31 SHOP PAINTING:

- A. Coat internal and external ferrous surfaces of valve with NSF Certified Epoxy in accordance with ANSI/NSF Std. 61, and in conformance to AWWA D102 Inside System No. 1 for all valves not specified to have a fusion bonded epoxy coating.
- B. Process Valve Color: Match piping system.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Prior to installation, protect stored valves and appurtenances from damage due to exposure to sunlight, heat, dirt, debris, freezing and thawing, vandalism, etc.
- B. Clean all debris, dirt, gravel, etc, from inside of piping before placing valves in place.
- C. Erect and support valves in respective positions free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Clean out debris and foreign material from valve openings and seats, test operating mechanisms to check functioning, and check nuts and bolts for tightness. Repair valves and other equipment which do not operate easily or are otherwise defective at no additional cost to the Owner.
- D. Set plumb and support valves in conformance with instructions of manufacturer. Shim valves mounted on face of concrete vertically and grout in place. Install valves in control piping for access.
- E. Provide bolted split sleeve coupling or flexible type grooved coupling on downstream side of buried valves to assist in valve removal.
- F. Where indicated provide Type 316 stainless steel stem extension to operating floor elevation as shown and provide the bevel gear operator with a fabricated steel floorstand and handwheel.

3.02 GATE VALVES AND KNIFE GATE VALVES:

- A. Install gate valve stem as shown or with stems between vertical and 45 degrees above the horizontal. Valves installed with stems horizontal or below horizontal are not acceptable.

3.03 CHECK VALVES:

- A. Install check valves horizontally in pipelines unless otherwise indicated.

3.04 PLUG VALVES:

- A. Install valves in horizontal piping with shaft horizontal such that in open position the plug is located in upper part of valve body. Orient valves so that in closed position, flow is against the face of the plug.

3.05 FLOORSTAND OPERATORS AND STEM GUIDES:

- A. Set floorstand operators and stem guides so stems run smoothly in true alignment. Anchor guides to walls. Check distances from centerlines of gates to operating level or base of floorstand and adjust if needed to suit actual conditions of installation.

3.06 VALVE BOXES:

- A. Provide valve box for each buried valve and where indicated.
- B. Set box so top is flush with finished surface and so box does not bear on valve or pipe.

3.07 FIELD TESTING:

- A. Pressure test valves with pipeline pressure testing.
- B. Test functions of each valve.
- C. Make all adjustments necessary to place valves in specified working order at time of above tests.
- D. Remove and replace valves and appurtenances at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that valves will perform the service specified, indicated and as submitted and accepted.

3.08 FIELD TOUCH-UP PAINTING:

- A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.09 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 13.03

ELECTRIC MOTOR ACTUATORS AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide 3-phase electric motor actuators and appurtenances as indicated and in compliance with Contract Documents.

- 1. Actuators for all valves, gates, and equipment to be the product of one manufacturer.

1.02 REFERENCES:

- A. ASTM International (ASTM):

- 1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus.
 - 2. B179: Standard Specification for Aluminum Alloys in Ingot and Molten Forms for Castings from All Casting Processes.

- B. FM Global (FM):

- 1. 3615: Explosionproof Electrical Equipment General Requirements.

- C. Institute of Electrical and Electronics Engineers (IEEE):

- 1. 802.15.4: Standard for Information Technology.

1.03 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00:

- 1. Certified shop and erection drawings.
 - a. Drawings shall be in conformance with all other requirements as specified in this specification.
 - 2. Data, regarding actuator and motor characteristics and performance.
 - 3. Actuator and Valve set-up for each application: Position or torque seating
 - 4. Shop drawing data for accessory items.
 - 5. Manufacturer's literature as needed to supplement certified data.
 - 6. Operating and maintenance instructions and parts lists.

7. Listing of reference installations as specified with contact names and telephone numbers.
8. Actuator shop test results.
9. Motor shop test results.
10. Qualifications of field service engineer.
11. Schematic control and power wiring diagrams.
12. Shop and Field inspections reports.
13. Recommended spare parts other than those specified.
14. Recommendations for short and long term storage.
15. Special tools.
16. Shop and field testing procedures and equipment to be used.
17. Torque capability and settings for each actuator.
 - a. Provide a listing of operating torque, safety factor applied and actuator torque capability and actuator safety factor as specified for each valve, gate and equipment.
18. Number of service person days provided and per diem field service rate.
19. Manufacturer's product data and specifications for shop painting including statement of compliance for compatibility with field painting.
20. Provide a listing of the materials recommended for each service specified and indicated.
21. ISO 9001 certification.
22. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.

- b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
 - B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".
 - 1. Failure to include all drawings or a statement application to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
 - C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.
- 1.04 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
 - B. Provide for each actuator
 - 1. A start-up kit comprising installation instruction manual, electrical wiring diagram and two sets of cover screws and seals to make good any site losses during the commissioning period. Provide all actuator commissioning tools required for actuator set up and adjustment during valve/actuator testing and site installation commissioning.
 - 2. Two fuses of each size and type used in the actuator.
 - 3. One set of back-up batteries for display operation
 - C. Provide spare parts that are identical to and interchangeable with similar parts installed.
 - 1. One set of all special tools

1.05 QUALITY ASSURANCE:

- A. Provide in accordance with Section 01 43 00 and as specified herein.
- B. Actuators for all valves, gates and equipment to be the product of one manufacturer.
 - 1. Contractor to coordinate with all valve, gate and equipment suppliers.
- C. Actuators to be manufacturer's standard cataloged product and modified to provide compliance with the specifications and the service conditions specified and indicated.
- D. Shop tests as specified.
- E. Provide Services of Manufacturer's Representative as stated in Section 01 61 00 and as specified herein.
- F. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 - 2. Installation: Inspect setting, alignment, field erection; coordination of, electrical and miscellaneous utility connections:
 - a. 1/2 person-day per actuator.
 - 3. Functional Testing: Calibrate, check the alignment and perform a functional test. Tests to include all items specified.
 - a. 1/2 person-day per actuator.
 - 4. Field Performance Testing: Field performance test equipment specified.
 - a. 1/2 person-day per actuator.
 - 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classrooms sessions.
 - a. 2 person-days, 2 trips.
 - 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 - 7. Any additional time required of the factory trained service engineer to assist in placing the equipment in operation or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

Electric Motor Actuators and Appurtenances
Section No. 40 23 13.03-4

- G. Manufacturer of actuators must have at least five (5) operating installations with actuators of the type and size specified and in the same service as specified operating for not less than five (5) years.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Provide in accordance with Section 01 61 00 and as specified

PART 2 - PRODUCTS

2.01 ELECTRIC ACTUATORS – 3-PHASE:

- A. Provide all actuators suitable for use on a nominal 480 volt, 3-phase, 60 Hz power supply.
- B. Provide all actuators incorporating motor, integral reversing starter, local control facilities and terminals for remote control and indication connections housed within a self-contained, sealed enclosure.
- C. Provide actuators meeting the requirements set out in EN15714-2 and ISA SP96.02 unless otherwise indicated or specified
- D. Provide actuators so that setting of the torque levels, position limits and configuration of the indication contacts etc. must be carried out without the removal of any actuator covers and also possible without main power over an Infrared or Bluetooth® wireless interface.
- E. Provide sufficient commissioning tools with the actuators meeting the enclosure protection and certification levels of the actuators.
 - 1. Provide all commissioning tools not an integral part of the actuator and must be removable for secure storage and authorized release. Provide protection of configured actuator settings by a means independent of access to the commissioning tool. Provide the ability to disable Bluetooth® communications or only allow a Bluetooth® connection initiated by an Infrared command for maximum security.
- F. Manufacturers:
 - 1. AUMA
 - 2. Rotork
 - 3. Limitorque
 - 4. Beck
- G. Actuator Sizing:
 - 1. Provide actuators designed and guarantee to close and open valves, gates and equipment at the specified differential pressure, speed, and temperature.

2. Provide actuators with a safety margin of motor power available for seating and unseating the valve, gate or equipment to ensure torque switch trip at maximum torque with the supply voltage 10% below nominal.
3. Operating speed for linear operating valves and gates: approximately 12 inches per minute unless otherwise specified or indicated.
4. Operating Speed for quarter turn valve: Provide operating time as specified and indicated with the optimal actuator and second stage gearbox combination selected to meet sizing requirements.

H. Enclosures:

1. Provide actuators for indoor and outdoor use with a standard corrosivity category, C4 medium durability in accordance with ISO 12944.
2. Provide actuators capable of functioning in an ambient temperature ranging from -22°F to +158°F, up to 100% relative humidity.
3. Provide actuators for hazardous area applications meeting the area classification, gas group and surface temperature requirements as specified and indicated.
4. Enclosure
 - a. Provide actuators O-ring sealed, watertight to IP66/IP68 to 20 m for 10 days, NEMA 4, 6.
 - b. Provide the motor and all other internal electrical elements of the actuator protected from ingress of moisture and dust when the terminal cover is removed.
 - c. Provide the terminal compartment designed to maintain the same ingress protection rating with the terminal cover removed.
 - d. Provide the actuator enclosure designed to allow for temporary site storage without the need for electrical supply connection.
 - e. Provide all external fasteners of Type 316 stainless steel unless otherwise specified and indicated.

I. Motors:

1. Provide motors as an integral part of the actuator, designed specifically for valve and gate actuator applications.
2. Motor: Low inertia, high torque design and class F insulation with class B temperature rise with a time rating of 15 minutes at 104 deg F at an average load of at least 33% of maximum valve or gate torque.

3. Provide temperature limited by two (2) thermostats embedded in the motor end windings and integrated into the actuator control.
 4. Provide electrical and mechanical disconnection of the motor without draining the lubricant from the actuator gearcase.
 5. Provide the actuator with a device that allows the motor to run with the correct rotation for the required direction of valve or gate travel irrespective of the connection sequence of the power supply.
 6. Provide motor protection as follows:
 - a. Stall: Motor must de-energize within 8 seconds in the event of a stall when attempting to unseat a jammed valve or gate
 - b. Over temperature: Thermostat to cause tripping of the motor and auto-reset on cooling
 - c. Single phasing: Lost phase protection.
- J. Direction: Phase rotation correction
- K. Provide a handwheel for manual and emergency operation.
1. Provide a handwheel operator engaged when the motor is declutched by a lever or similar means. Provide the operator of the drive restored to electrical operation automatically by starting the motor.
 2. Provide the system designed so that the handwheel or selection lever does not move on restoration of motor drive.
 3. Provide a HAND/AUTO selection lever to be locked in both hand and auto positions. Provide the ability to select HAND operation while the actuator is running or start the actuator motor while the HAND/AUTO selection lever is locked in HAND without damage to the drive train.
 4. Provide clockwise operation of the handwheel and clockwise movement of the actuator output drive. Provide the actuator handwheel drive mechanically independent of the motor drive and permit valve or gate operation with a manual force not exceeding 90 lbf through stroke and 180 lbf for seating/unseating of the valve or gate.
 5. Provide manual handwheel operation with a lost-motion hammer-blow feature for unseating the valve or gate
- L. Gearing:

1. Provide the actuator gearing totally enclosed in an oil-filled gearcase suitable for operation at any installation angle. Grease lubrication is not acceptable.
2. Drive Gearing: Provide all components of metal construction and incorporate a lost-motion hammer-blow feature.
3. For rising stem valves and gates: Provide hollow type output shaft to accept a rising stem and incorporate thrust bearings of the ball or roller type at the base of the actuator.
4. Provide the design to allow the opening of the gearcase for inspection or disassembly without releasing the stem thrust or taking the valve or gate out of service.
5. For quarter turn valves provide self-locking drive gearing to prevent the valve or gate back-driving the actuator.

M. Drive Interface:

1. Provide the actuator with a detachable drive coupling, for machining to suit the valve stem, gate stem or gearbox input shaft.
2. Provide the drive coupling positioned in the detachable base of the actuator.
3. Provide thrust bearings sealed for life and the base designed to withstand five (5) times the rated thrust of the actuator.

N. Actuator Torque and Limits:

1. Provide torque and stroke limitation, adjustable as follows:
 - a. Position setting range: multi-turn: 2.5 to 8,000 turns, resolution to 7.5 degrees of actuator output.
 - b. Position setting range: part-turn: 90 degree +/-10 degree, resolution determined by gearbox ratio and stroke
 - c. Torque setting: 40% to 100% rated torque.
2. Position measurement:
 - a. Provide absolute position measurement incorporated within the actuator. Provide the technology capable of reliably measuring position even in the case of a single fault.
 - b. Provide the design with the minimum amount of moving parts, maximum 5. Technologies such as LED's or potentiometers for position measurement are not acceptable.

3. Provide torque measurement from direct measurement of force at the output of the actuator. Methods of determining torque using data derived from the motor such as motor speed, current, flux etc. are not acceptable.
4. Provide a means for automatic torque switch bypass to inhibit torque off during valve unseating and latching to prevent torque switch hammer under maintained or repeated control signals.
5. Provide the electrical circuit diagram of the actuator that does not vary with valve and gate type remaining identical regardless of whether the valve or gate is to open or close on torque or position limit.

O. Integral Starter and Transformer

1. Provide reversing starter, control transformer and local controls integral to the valve actuator and housed to prevent breathing and condensation.
2. Provide the starter suitable for 60 starts per hour and of rating appropriate to motor size.
3. Provide the controls supply transformer fed from two of the incoming three phases and incorporate overload protection. Provide the necessary voltage tapping and rated to provide power for the following functions:
4. Energizing of the contactor coils.
 - a. 24VDC or 120VAC output for remote circuits (maximum 5W/VA)
 - b. Supply for all the internal electrical circuits.
5. As an alternative provide a solid-state motor starter for applications requiring up to 1,200 starts per hour. Provide 24VDC remote controls used in combination with a solid-state starter to maximize response time and facilitate configurable electrical braking functionality.

P. Local Controls:

1. Provide the actuator with integral local controls for OPEN/CLOSE operation and include a LOCAL/STOP/REMOTE selector switch.
2. Provide mode selection lockable in any one of the following three positions: LOCAL control plus STOP only, STOP (no electrical operation), REMOTE control plus STOP only. Provide selection of maintained or non-maintained local control.
3. Provide the local controls arranged so that the direction of valve travel can be reversed without the necessity of stopping the actuator.

4. Provide the local controls and display rotatable through 90 degree increments to suit valve and actuator installation orientation.

Q. Local Position Indication:

1. Provide the actuator display including a dedicated numeric/symbol digital position indicator displaying valve position from fully open to fully close in 0.1% increments.
2. Provide valve or gate closed and open positions indicated by symbols showing valve position in relation to the piping to ensure that valve or gate status is clearly interpreted.
3. With power connected, provide the display backlit to enhance contrast at all ambient light levels and legible from a distance of at least 16 feet. Provide a power save mode available to switch off the display backlight during long periods of inactivity.
4. Provide red, green and yellow LED's corresponding to open, close and intermediate valve, gate or equipment positions on the actuator display when power is switched on. Provide the yellow LED fully programmable for on/off, blinker and fault indication. Provide the digital display maintained and updated during handwheel operation when power to the actuator is isolated.
5. Provide the actuator display with fully configurable dot-matrix display element with a minimum pixel resolution of 168 x 132 to display operational, alarm, configuration and graphical datalogger information.
6. Provide datalogger graphical displays and trend graphs available on the local LCD for the following functions:
 - a. Torque versus Position
 - b. Number of Starts versus Position
 - c. Number of starts per hour
 - d. Dwell Time
 - e. Average temperature
7. Provide the main display configurable with a minimum of four (4) different home screens that include the following information:
 - a. Position and status
 - b. Position and torque (analogue)
 - c. Position and torque (digital)

d. Position and demand (positioning)

8. For all actuators located outdoors provide an environmental cover to protect the display from high levels of UV radiation or abrasive materials and fitted without the need for any special tooling.
9. Provide the local controls and display rotatable through increments of 90 degrees to accommodate actuator installation orientation.

R. Remote Position and Status Indication:

1. Provide four (4) contacts that can be selected to indicate any position of the valve or gate.
2. Provide for the selection of a normally closed (NC) or normally open (NO) contact form.
3. Provide contacts to maintain and update position indication during handwheel operation when all external power to the actuator is isolated.
4. Contacts: Rated for 5mA to 5A, 120VAC, 30VDC.
5. As an alternative to providing valve position indication, provide any of the four contacts configurable to signal one of the following:
 - a. Valve or Gate opening, closing or moving
 - b. Thermostat tripped, lost phase
 - c. Motor tripped on torque in mid travel, motor stalled
 - d. Remote selected, Local selected, Stop selected
 - e. Actuator being operated by handwheel
 - f. Actuator fault
6. Provide the actuator design to support an additional eight (8) contacts with the same configurable functionality.
7. Provide a configurable monitor relay as a standard, which can be used to indicate either Availability or Fault.
8. Relay: Spring return type with a Normally Open (NO) / Normally Closed (NC) contact pre-wired to the terminal block.
9. Provide the monitor (availability or fault) relay, energized from the control transformer and designed to de-energize during any one or more of the following conditions:

- a. Available Mode
 - (1) Loss of main or customer 24VDC power supply
 - (2) Actuator control selected to local or stop
 - (3) Motor thermostat tripped
 - (4) Actuator internal fault
 - b. Fault Mode
 - (1) Loss of main or 24VDC power supply
 - (2) Motor thermostat tripped
 - (3) Actuator internal fault
10. Provide the actuator designed to support the addition of a contactless transmitter to output a 4-20mA analogue signal corresponding to valve, gate or equipment travel and / or torque for remote indication where indicated. Provide the transmitter to auto range to the set limits

S. Remote Control:

- 1. Provide all necessary control, wiring and terminals contained within the actuator enclosure.
- 2. Provide open and close external interlocks available to inhibit local and remote valve opening / closing control. Provide the ability to configure the interlocks to be active in remote control only.
- 3. Provide remote control signals fed from an internal 24VDC or 120VAC supply and/or from an external supply between 20V and 60VDC or 40V and 120VAC, and suitable for any one or more of the following methods of control:
 - a. Open, Close and Stop control
 - b. Open and Close maintained or push to run (inching) control
 - c. Overriding Emergency Shutdown; to close (or open) valve or gate from a normally closed or open contact
 - d. Two-wire control; energize to close (or open), de-energies to open (or close)
- 4. Provide a separate drive enable permissive input to prevent any unwanted electrical operation.

5. Provide the ability to reverse valve or gate travel without the need of stopping the actuator or moving through an intermediate stop control position. Provide the motor starter protected from excessive current surges during rapid travel reversal. Provide the internal circuits associated with the remote control and monitoring functions designed to withstand simulated lightning impulses up to 2kV.

T. Monitoring:

1. Provide the monitoring features as a minimum as standard features of the actuator.
2. Actuator text display indication of the following status/alarms:
 - a. Closed Limit, open limit, moving open, moving closed, stopped
 - b. Torque trip closing, torque trip opening, motor stalled
 - c. ESD active, interlock active
 - d. Thermostat trip, phase lost, 24V supply lost, local control failure
 - e. Configuration error, position sensor failure, torque sensor failure
 - f. Battery low, battery discharged, power loss inhibit
3. Provide integral datalogger to record and store the following operational data:
 - a. Opening last / average torque against position
 - b. Closing last / average torque against position
 - c. Opening motor starts against position
 - d. Closing motor starts against position
 - e. Total open / closed operations
 - f. Maximum recorded opening and closing torque values
 - g. Event recorder logging operational conditions for valve, gate control and actuator
4. Provide the event log to include time and date information for each stored event.
5. Provide the logged data via non-intrusive Bluetooth® communication and also visible on the actuator display.
6. Provide an intrinsically safe portable tool to extract datalogger and actuator configuration files from the actuator. Provide the portable tool Bluetooth® capable

of connection with a PC to perform file transfer. The actuator manufacturer must supply PC software to enable extracted actuator files to be viewed and analyzed.

U. Wiring and Termination:

1. Internal wiring:
 - a. Tropical grade PVC insulated stranded cable of appropriate size for the control and power.
 - b. Provide each wire clearly identified at both ends.
2. Provide the terminals embedded in a terminal block of high tracking resistance compound.
3. Provide the terminal compartment separated from the inner electrical components of the actuator by means of a watertight seal. Provide a minimum of four threaded cable entries with provision for an additional four extra conduit entries to accommodate wiring connections.
4. Provide all wiring supplied as part of the actuator contained within the main enclosure for physical and environmental protection.
5. External conduit connections between components are not acceptable.
6. Provide a terminal identification card showing a plan of terminals attached to the inside of the terminal box cover indicating:
 - a. Serial number
 - b. External voltage values
 - c. Wiring diagram number
 - d. Terminal layout
7. Provide a code card for the contractor to inscribe cable core identification alongside terminal numbers.

V. Local Control Station:

1. Provide a control station device for local control of the actuator for actuators located higher than 6.5 feet above the operating level and up to 328 feet from the installed actuator location.
2. Provide the control station to replicate all of the features and functionality of the actuator HMI and powered solely from the connected host actuator. Provide data extraction from the control station via non-intrusive Bluetooth® communication in the same manner as direct extraction from the actuator HMI. Provide the ability to

enable control arbitration between the control station and the connected host actuator.

3. Provide all electrical components of the control station housed in a double-sealed enclosure with ingress protection rating for outdoor installation and use.
4. Operating temperature range: -58°F to +158°F and 100% relative humidity.
5. For hazardous area applications, provide the enclosure meeting the area classification, gas group and surface temperature requirements specified and indicated.

W. Secondary Gear Boxes:

1. Provide secondary gearing for multi turn or quarter-turn applications where operating times, thrust or torque considerations require.
 - a. Secondary Gearing: Bevel or spur, totally enclosed in a cast iron housing, fully sealed and lubricated for the service indicated and specified.
2. Provide gear assemblies that are a manufacturer's standard selection or combination of as detailed in published product literature.
 - a. Provide each gearbox with a removable output drive coupling sized for the service specified and indicated.
 - b. Provide quarter-turn gearboxes equipped with adjustable mechanical stops (at 0 and 90 degrees +/- 5 percent) to permit limiting open and closed travel during manual operation.
 - c. Factory prime and finish paint all gear boxes with 2 part high solids epoxy or as specified herein for the actuator.

2.02 SHOP TESTS:

A. Actuator Test:

1. Provide each actuator performance tested by the manufacturer. Provide individual test certificates for each actuator at no additional cost to the Owner.
2. Provide the test certificates including:
 - a. Serial number
 - b. Test date
 - c. Manufacturing site address
 - d. Customer

- e. Customer order number (where applicable)
 - f. Actuator size
 - g. Mounting flange
 - h. Enclosure type
 - i. Lubricant
 - j. Paint coating
 - k. Power supply
 - l. Operating speed
 - m. Motor insulation class
 - n. Drive close direction
 - o. Gear ratio for second stage gearbox (where applicable)
 - p. Electrical optional extras
 - q. Catalogue performance
3. Provide the test to simulate a typical valve or gate load and record the following parameters and clearly state on the certificate:
- a. Torque at maximum torque setting in both directions
 - b. Current at maximum torque setting in both directions
 - c. Flash test statement
 - d. Test power supply voltage
 - e. Torque at stall torque in both directions
4. Current at stall torque in both directions
- B. In event that specified tests indicate that actuator will not meet specifications, Engineer has the right to require complete witnessed tests for all motors and actuators at no additional cost to the Owner.
- 1. Repeat tests until specified results are obtained.
 - 2. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

2.03 SHOP PAINTING:

- A. Paint Finish: Baked on polyester powder coating 70 microns thick and must have passed ASTM B117 35 degrees C Salt Spray Test for 1,000 hours.
 - 1. Provide materials for touch-up of all damaged or abraided surfaces due to installation.
 - 2. Ferrous surfaces obviously not to be painted shall be given a shop applied coat of grease or rust resistant coating.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.

3.02 FIELD TESTING:

- A. After installation of equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service engineer, conduct running test for each actuator in presence of Engineer to determine its ability to operate without vibration or jamming and to operate at the speeds specified.
 - 1. During tests, observe and record, motor inputs.
 - 2. Promptly correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results and results acceptable to the Engineer are obtained.
 - 3. Contractor to provide all labor, equipment, and materials necessary for conducting tests.
- B. Make all adjustments necessary to place equipment in specified working order at time of above tests.
- C. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to satisfaction of the Engineer that units will perform the service specified and indicated.

3.03 FIELD TOUCH-UP PAINTING:

- A. After installation and accepted testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT:

- A. Provide submittals in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 13.07

SELF-CONTAINED AUTOMATIC CONTROL VALVES AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test self-contained automatic control valves and appurtenances as indicated and in compliance with Contract Documents. Self-contained automatic control valves specified herein are booster pump control valves.
- B. Control valves specified herein are to be used in drinking water application and shall be NSF 61 for use with potable water.

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. B16.1: Standard for Cast Iron Pipe Flanges and Flanged Fittings, 125 lb.
- B. ASTM International (ASTM):
 - 1. A216: Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High-Temperature Service.
 - 2. A536: Standard Specification for Ductile Iron Castings.
- C. NSF International (NSF):
 - 1. 61: Drinking Water System Components Health Effects.

1.03 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00:
 - 1. Data, regarding valve characteristics and performance including Cv.
 - 2. Shop drawing data for accessory items.
 - 3. Manufacturer's literature as needed to supplement certified data.
 - 4. Operating and maintenance instructions and parts lists.
 - 5. Listing of reference installations as specified with contact names and telephone numbers.
 - 6. Valve shop test results.

7. Qualifications of field service technician.
 8. Shop and Field inspections reports.
 9. List of recommended spare parts other than those specified.
 10. Recommendations for short and long term storage.
 11. Special tools.
 12. Shop and field testing procedures and equipment to be used.
 13. Number of service technician days provided and per diem field service rate.
 14. Manufacturer's product data and specifications for shop painting.
 15. Provide a layout drawing, plan and section showing orientation of valves and nearest obstructions for each valve.
 16. Manufacturer's product data and specifications for shop coating and painting.
 17. NSF 61 certification.
 18. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
 19. The most recent ISO 9000 series certification or quality system plan.
 20. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
 - b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
- B. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

1.04 SPARE PARTS:

- A. Comply with requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Provide enclosures for the area classifications specified and indicated.
- C. Contractor responsible for verifying outside diameter of pipe to be tapped.
- D. Services of Manufacturer's Representative as stated in Section 01 43 00 and specified herein.
- E. Manufacturer of valve shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10 and as specified.

PART 2 – MATERIALS

2.01 BOOSTER PUMP CONTROL VALVES:

- A. Manufacturers:
 1. Model 106-PG-BPC by Singer Valve Inc.
 2. Model 60-BY by Cla-Val
- B. Type: Pilot operated, hydraulically actuated, diaphragm design, automatic valve with built-in check valve.
 1. Body Type: Globe body
 2. Provide valve that utilize line pressure as its operating source.

3. Provide valves with all necessary accessories to provide a complete operating unit.
- C. Provide size and configuration as indicated on the Contract Drawings.
- D. End Connections:
 1. Flanged end connections ANSI standard B16.1 of a class to mate with pipe flanges.
- E. Diameter of Seat Opening: Equal to diameter of pipe size.
- F. Provide valves designed to remove and replace all internal parts without removing the valve body from the pipeline.
- G. Provide replaceable seals designed to prevent metal to metal contact.
- H. Pressures:
 1. Operating pressure rating: 150 psi.
 2. Maximum Pressure Rating: 250 psi
- I. Provide a visual position indicator and limit switch. The limit switch shall be used to complete the pump off cycle. The actuating point of the limit switch shall be adjustable.
- J. Materials:
 1. Valve Body and Covers: ASTM A536 (65-45-12) ductile iron or ASTM A216-WCB cast steel.
 - a. Provide a separate stem cap giving access to the stem for alignment check, spring installation and ease of assembly.
 - (1) Provide main bonnet cover and locating pins to accurately locate the main valve body.
 - b. Internal and External Coating: NSF 61 fusion bonded epoxy.
 - c. Provide two NPT connections on each side of the valve body for external control piping and provide Type 316 stainless steel plugs for all unused ports.
 2. Diaphragm: EPDM or Buna N of the rolling type design.
 3. Stem, Nut, and Spring: Type 316 stainless steel.
 4. Disc: Buna-N Rubber.
 5. Trim, disc guide, seat, and cover bearing: Stainless steel.
 6. External Control Piping, Strainers and Valves: Type 316 stainless steel.

7. Tubing and/or hosing: Stainless steel
 8. All internal wetted components of the main valve shall be stainless steel and the coating shall be NSF 61 approved. All pilot system controls, valves, piping and fittings shall be stainless steel. Supplier shall confirm entire assembled valve is NSF 61 compliant.
- K. A direct factory representative shall provide start-up assistance, inspection, and adjustments. The representative shall provide 2 to 4 hours of assistance for each valve installed on the project.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Prior to installation, protect stored valves and appurtenances from damage due to exposure to sunlight, heat, dirt, debris, freezing and thawing, vandalism, etc.
- B. Clean all debris, dirt, gravel, etc, from inside of piping before placing valves in place.
- C. Erect and support valves in respective positions free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Clean out debris and foreign material from valve openings and seats, test operating mechanisms to check functioning, and check nuts and bolts for tightness. Repair, valves and other equipment which does not operate easily or are otherwise defective at no additional cost to the Owner.
- D. Set plumb and support valves in conformance with instructions of manufacturer. Shim valves mounted on face of concrete vertically and grout in place. Install valves in control piping for access.

3.02 FIELD TESTING:

- A. Pressure test valves with pipeline pressure testing.
- B. Test functions of each valve.
- C. Make all adjustments necessary to place valves in specified working order at time of above tests.
- D. Remove all replace valves and appurtenances at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that valves will perform the service specified, indicated and as submitted and accepted.

3.03 FIELD TOUCH-UP PAINTING:

- A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraded, and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 19.01

PIPE SUPPORTS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Design, and provide a complete system of pipe supports with inserts, bolts, nuts, restraining and hanger rods, washers, miscellaneous steel, sliding Teflon plates, and accessories as indicated and in compliance with Contract Documents. The term pipe support includes hangers, guides, restraints, anchors and saddles.
- B. Provide all support systems and the design of all support systems for all piping as specified herein. The Contractor shall provide pipe support locations, configurations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein.
- C. The Contractor shall be responsible for the proper design, fabrication, location, shop drawings and installation of all pipe supports in accordance with the specified requirements.
- D. Pipe support locations and types for piping 1/2-inch and larger shall be determined by the Contractor using the guidelines for support spacing specified herein and other criteria contained in this pipe support specification. Guidelines for pipe supports may need to be adjusted based upon field coordination, field routing, or other considerations outlined herein such as structural load limits. The Contractor may revise the pipe support locations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein. The Contractor is responsible for the proper design, installation and fabrication of all pipe supports in accordance with the specified requirements. For pipe supports 1/2-inch and larger pipe support shop drawings together with a marked up piping drawing showing support number, location and typical type shall be submitted by the Contractor for acceptance.
 - 1. The Contractor shall be responsible for coordinating all pipe support designs for all trades to ensure compliance with all of the requirements of this specification, including but not limited to the total limitations specified herein.
 - 2. Pipe support details included in plans and specified herein are intended to be guidelines to be used for reference.
- E. Design and provide all temporary pipe supports required during installation and testing.

F. National Association of Expansion Joint Manufacturers: Standards of the Expansion Joint Manufacturers Association, Inc.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20.

Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

2. Pipe support drawings specified herein and including data for accessory items for acceptance prior to fabrication. The Contractor shall submit pipe support coordination drawings including all piping and pipe supports for all trades.
 - a. Detailed drawing of the device with dimensions.
 - b. A table of applied forces and moments.
 - c. A complete bill of materials.
 - d. A unique identification and revision level.
 - e. Seal and signature of a Registered Professional Engineer, registered in the State of Utah, experienced in pipe support design and pipe stress analysis as specified herein.
 - f. Detailed connections to existing structure.
 - g. Indicate all welds, both shop and field, by Standard Units of Measurement as specified in AWS D1.1.
3. Welding Procedure: Submit description required to illustrate each welding procedure to be performed in the specified work.
4. Welding Equipment: Submit descriptive data for welding equipment, including type, voltage and amperage.
5. Qualification for Welders: Provide certification that welders to be employed in work have satisfactorily passed AWS or ASME qualification tests. If recertification of welders is required, retesting is the Contractor's responsibility at no additional cost to the Owner.
6. Pipe support manufacturers' qualifications as specified herein.
 - a. List of at least five (5) successful pipe support projects and current addresses and telephone numbers of persons in charge of representing the owner or the owner of those construction projects during the time of pipe support design, fabrication and installation.
 - b. Qualification of manufacturers' Registered Professional Engineer, registered in the State of Utah, who stamps and seals shop drawings and designs.
7. Coordination drawings for pipe supports shall include as a minimum the following information.

- a. Coordination drawings shall include all pipe supports covered by specifications.
 - b. These coordination drawings will be used by the Contractor to ensure that the pipe supports do not obstruct access, access for equipment operation or removal including all mechanical and electrical equipment, panels, valves, gauges, and instrumentation.
 - c. The Contractor shall be responsible for including and coordinating the work of all subcontractors into the coordination drawings.
 - d. Prepare reproducible coordination drawings, indicating equipment, piping, valves, expansion joints, ductwork, conduit, cable trays, junction boxes, lighting fixtures, sleeves, inserts, embedments, supports, hangers and appurtenances at not less than 1/4-inch scale. Drawings shall show beams, columns, ceiling heights, wall, floors, partitions and structural features as indicated on the contract drawings. Individual pipes and conduit 2-inches or less in diameter that will be field routed need not be shown on coordination drawings.
 - e. Coordination drawings shall include large-scale details as well as cross and longitudinal sections required to fully delineate all conditions. Particular attention shall be given to the location, size, and clearance dimensions of equipment items, shafts, operators and necessary maintenance access.
 - f. Make all minor changes in duct, pipe or conduit routings that do not affect the intended function, but items may not be resized or exposed items relocated without the approval of the Owner. No changes shall be made in any wall locations, ceiling heights, door swings or locations, window or other openings or other features affecting the function or aesthetic effect of the building. If conflicts or interferences cannot be resolved, the Owner shall be notified. Any problems of coordination that require architectural or structural changes of design shall be submitted to the Owner for resolution.
 - g. After the reproducible drawings have been coordinated and all changes have been made, the drawings shall be signed by the Contractor and all subcontractors indicating that all work on that drawing has been coordinated with all associated vendors and subcontractors and all conflicts have been resolved.
 - h. Relocation of any duct, pipe, conduit or other material that has been installed without proper coordination among all trades shall be performed at no additional cost to the Owner.
8. Written notification of any deviations from the requirements of this specification.
9. Support documentation and justification as specified.

10. Certificates of Design signed by a Registered Professional Engineer, registered in the State of Utah, for all pipe supports.
11. Manufacturer's product data and specifications for shop painting.

B. Material Certification:

1. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 QUALITY ASSURANCE:

- A. Provide in accordance with Section 01 43 00 and as specified.

- B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.
- C. Welder Qualifications:
 - 1. Qualify and certify welding procedures, welders, and operators in accordance with ASME Section IX for shop welding and AWS D1.1 for project site welding of piping work.
- D. Pipe supports: All supports and parts shall conform to the latest requirements of the Code for Pressure Piping ASME/ANSI B31.1 and Manufactures Standardization Society (MSS) Standard Practice SP-58, SP-69, SP-89 and SP-90 except as supplemented or modified by the requirements of this specification.
- E. Structural Concrete: Conform to the requirements of Section 03 30 00. Concrete strength: 4,000 PSI unless noted otherwise.
- F. Conform to the requirements of the latest edition of the AISC Manual of Steel Construction for miscellaneous and supplementary steel. Tube steels are ASTM A500 Grade B, structural shapes A36, plates A-572 or equal. Stainless steel structural members shall conform to ASTM requirement Type 316L.
- G. Pipe Support Manufacturer Qualifications:
 - 1. Must possess a written quality assurance program.
 - 2. Have a minimum of 5 years experience in the design and fabrication of pipe supports.
 - 3. Have completed the design and fabrication of at least 5 successful pipe support projects of equal size, complexity, and systems as this project within the past 10 years.
 - 4. Retains the services of a Registered Professional Engineer, registered in the State of Utah, with a minimum of ten years experience in the design of piping systems and pipe supports.
 - 5. Manufacturers' Standardization Society (MSS) Member.
 - 6. Have a field service technician on staff with at least 5 years experience in resolving field installation, interference and interface problems associated with the design, installation and manufacture of pipe supporting components.
- H. Hanger inspections shall be performed in accordance with MSS-SP-89 and ASME B31.1.

1.05 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Provide materials used in pipe supports, which are compatible with the pipes to which they are attached. Provide Type 316L stainless steel supports for all stainless steel piping. Copper plated pipe supports are not acceptable.
- B. Allowable materials: As indicated in ASME/ANSI B31.1 Appendix A and MSS-SP-58 Table 2.
- C. Provide Type 316L stainless steel for pipe supports, hangers, guides, restraints, and anchors that are exterior or interior submerged, in potentially wetted areas in wet wells, channels, screening and grit removal areas and in chemically corrosive atmospheres.
- D. Provide only new material. Previously used and/or scrap material is not acceptable.
- E. Provide tube steels that are ASTM A500 Grade B, Structural shapes A-36, plates A-572 or equal.
- F. Provide sliding Teflon plates. The sliding surfaces shall be a nominal 3/8-inches glass filled Teflon bonded to stainless steel backup plate with a 10 gauge minimum thickness. The bearing pad upper and lower units shall be as follows: Conslide Type CSA elements as manufactured by Con-Serv. Inc., Balco TFE Slide Bearing Plates 10N-cs as manufactured by Balco Inc., or Dynalon Slide Bearings as manufactured by JVI, Inc. or acceptable equivalent product.
 - 1. The blended TFE material used for this bearing shall be composed of virgin (unreprocessed) TFE resin tested per ASTM D1457 and reinforcing agents milled glass fibers. This structural material shall have the following representative mechanical and physical properties:
 - 2. Tensile strength -2,000 psi.
 - 3. Elongation -225 percent
 - 4. Specific Gravity -2.17 to 2.22
 - 5. The coefficient of friction shall average 0.06 under compressive load of 2,000 psi.
 - 6. The compressive creep shall be a minimum of 2 percent at 2,000 psi and 70 degrees F.

7. The elements shall be flat, clean and prepared for installation in the structure. Slots and holes shall be fabricated in the bearing manufacturer's plant.

G. Concrete anchor bolts:

1. Hilti Kwik-Bolt II Stud Anchors.
2. Rawl Bolt.
3. Phillips Wedge Anchors.

2.02 DESIGN, LOCATION, AND TYPE OF PIPE SUPPORTS:

A. Design and provide pipe supports for piping 1/2-inch and larger to include the following loads:

1. Gravity Force: This force includes the weight of pipe, pipe contents (hydro load), valves, in-line equipment, insulation and any other weight imposed on the piping and/or pipe support.
2. Thermal Expansion Force: This force is developed by the restraint of free end displacement of the piping due to thermal growth.
3. Hydrostatic/Dynamic Forces: These forces are developed due to the internal pressure (positive and negative) during operation of the piping system. These forces include the forces due to water hammer, pressure pulses due to rapid valve closure, fluid discharge resulting from pump startup, operation of positive displacement pumps, etc.
4. Wind Loadings: Per Section 01 41 20.
5. Seismic Loading: Per Section 01 41 20 and Section 22 05 48.

B. Provide supports, guides, anchors, flexible couplings and expansion joints in accordance with the coupling and joint manufacturers' specifications and requirements.

C. For all pump suction and discharge nozzles provide an anchor located between the pump nozzles and the nearest expansion joint or non-rigid coupling.

D. Where possible, provide pipe supports, which are the manufacturers' standard products.

1. Provide pipe supports with individual means of adjustment for alignment.
2. Provide pipe supports complete with appurtenances including locking and adjusting nuts.
3. Hanger rods shall be subjected to tension only.

4. Where lateral or axial pipe movement occurs, provide hangers for the necessary swing without exceeding 4 degrees. Provide base supports designed using pipe slides. The bearing surfaces: 0.06 coefficient of friction or less.
 5. Provide concrete inserts capable of supporting the design loads.
 6. Metal framing systems will be acceptable to support piping 2 inch and smaller.
 7. Provide insulated piping supported using rigid load bearing insulation (baton board type) with 16 gauge shields to fit between the insulation and the support. Shields to encompass a minimum 1/3 of the pipe circumference and be 12 inch in length.
 8. Provide load-bearing insulation capable of supporting the load, as a minimum on the bottom 60 degrees of the pipe support. Cope insulation and adjust to avoid interference of steel structures.
 9. Provide supplementary steel as needed.
 10. Do not support pipes from other pipe, conduits or metal stairs.
 11. Chain, strap, T-bar, perforated bar and/or wire hangers are not acceptable.
 12. Contact between piping and dissimilar metals such as hangers, building structural work or equipment subject to galvanic action is not acceptable.
 13. All pipe supports located in fluid flow shall be supplied with double nutting.
- E. Provide thrust anchors to resist thrust where required. Wall pipes may be used as thrust anchors if so designed. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes.
- F. Provide expansion joints where indicated and where required based on Contractor's design of the pipe support system. Indicate expansion joints on submittal drawings.
- G. For piping 2-inch and smaller provide manufacturer's standard supports and standard spacing guidelines
- H. Pipe supports connected to structural framing and slabs are subject to the following limitations:
1. Less than 100 lbs. horizontal load per support.
 2. Vertical loads not to exceed an average of 10 P.S.F. for slabs, with a maximum vertical load per hanger of 150 lbs.
 3. For a maximum of one pipe support per foot of slab width perpendicular to the span.
 4. Vertical loads not to exceed 500 lbs. per column or 250 lbs. per support at walls.

5. Piping not supported from floors by metal framing must meet the limitations as specified above.

- I. All outside above ground supports shall be Type 316L stainless steel as specified herein.
- J. Provide pipe supports that do not overload or over stress the piping, equipment, or structure that they are supporting or to which they are attached. Allowable pipe stress to be within ASME/ANSI B31.1 code allowable.
- K. The Contractor shall provide the services of a field service technician (preferably from the pipe support manufacturer) to field coordinate the locations of supports and resolve interferences and conflicts encountered during installation.
- L. Where indicated on the Drawings, large diameter pipe supports shall be standard product as provided by Piping Technology & Products, Inc., or approved equal. Custom fabricated saddle supports may be submitted but shall be designed and stamped by professional engineer.

2.03 FABRICATION:

- A. Provide pipe supports formed in accordance with paragraph 5.1 of MSS-SP-58.
- B. Providing welding in accordance with Structural Welding Code.
- C. Provide dimensional tolerances as specified in MSS-SP-89.
- D. Provide threading and tapping in accordance with MSS-SP-89.

2.04 SHOP PAINTING:

- A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 96 00.
- B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install items in accordance with manufacturers' printed instructions and as indicated and specified herein.
- B. Perform welding in accordance with Structural Welding Code:

1. Visually inspect welding while the operators are making the welds and again after the work is completed in accordance with AWS D1.1 Section 6.0. After the welding is completed, hand or power wire brush welds, and clean them before the Qualified Inspector makes the check inspection. The Qualified Inspector shall inspect welds with magnifiers under light for surface cracking, porosity, and slag inclusions; excessive roughness; unfilled craters; gas pockets; undercuts; overlaps; size and insufficient throat and concavity. The Qualified Inspector shall inspect the preparation of groove welds for throat opening and for snug positioning for back-up bars.
 2. Nondestructive evaluation of welds connecting structural steel members subjected to critical stresses: Perform in accordance with the weld quality and standards of acceptance in AWS D1.1.
 3. Magnetic Particle Inspection: Perform in accordance with ASTM E709.
 4. Liquid Penetrant Inspection: Perform in accordance with ASTM E165.
 5. For weld areas containing defects exceeding the standards of acceptance in accordance with AWS D1.1, Section 3.7. Provide additional testing of the repaired area at no additional cost to the Owner.
 6. Test Locations: As selected by the Owner.
 7. Correct any deficiencies detected as directed by the Engineer at no additional cost to the Owner.
- C. Proceed with the installation of the pipe supports only after required building structural work has been completed and concrete support structure has reached its 28-day compressive strength as specified in Section 03 30 00.
- D. Install pipe supports to comply with MSS-SP-89. Group parallel runs of horizontal piping to be supported together on trapeze type hangers.
- E. Install pipe supports to provide indicated pipe slopes. Do not exceed maximum pipe deflection allowed by ASME/ANSI B31.1.
- F. For exposed continuous pipe runs, install pipe supports of same type and style as installed for adjacent similar piping.
- G. Install pipe supports to allow controlled movement of piping systems. Permit freedom of movement between pipe anchors, and facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- H. Piping to be free to move when it expands or contracts except where fixed anchors are indicated or required by the Contractor's pipe support systems. Where hanger rod swing length cannot be provided or where pipe movement based on expansion of

1 inch/100 feet, for each 100 degrees F change in temperature exceed 1/2-inch, provide sliding supports.

- I. Prevent contact between dissimilar metals. Where concrete or metal support is used, place 1/8-inch thick Teflon, neoprene rubber, or plastic strip under piping at point of bearing. Cut to fit entire area of contact between pipe and pipe support.
- J. Prevent electrolysis in support of copper tubing by use of pipe supports which are plastic coated. Electrician's tape is not an acceptable isolation method.
- K. Apply an anti-seize compound to nuts and bolts on all pipe supports.
- L. Locate reinforcing steel in concrete structure with x-ray prior to drilling for embedment plates and anchor bolts. Avoid contact or interference with reinforcing steel.

3.02 INSTALLATION OF BUILDING ATTACHMENTS:

- A. Support piping from structural framing, unless otherwise indicated.
- B. Concrete Inserts:
 - 1. Use existing embedded concrete items whenever possible.
 - 2. Use expansion anchors only when existing embedded attachment points are not available or unsuitable. Attach to hardened concrete or completed masonry.

3.03 THRUST ANCHORS AND GUIDES:

- A. Thrust Anchors:
 - 1. Center thrust anchors between expansion joints and between elbows and expansion joints for suspended piping. Anchors must hold pipe rigid to force expansion and contraction movement to take place at expansion joints and/or elbows and to preclude separation of joints.
 - 2. Restraining rod size and number shall be as indicated and adhere to manufacturers recommendations as a minimum.
- B. Pipe guides: Provide adjacent to sliding expansion joints in accordance with recommendations of the National Association of Expansion Joint Manufacturers and the specific joint manufacturer.

3.04 PIPE SUPPORTS:

- A. Where piping of various sizes is to be supported together, space supports for the largest pipe size and install intermediate supports for smaller diameter pipes.
- B. Provide minimum of two pipe supports for each pipe piece.

- C. Where pipe connects to equipment, support pipe independently from the equipment. Do not use equipment to support piping.
- D. Provide pipe supports so that there is no interference with maintenance or removal of equipment.
- E. Unless otherwise indicated or authorized by the Engineer, place piping running parallel to walls approximately 1-1/2 inch out from face of wall and at least 3 inches below ceiling.
- F. Pedestal pipe supports: adjustable with stanchion, saddle, and anchoring flange. Provide grout between baseplate and floor.
- G. Piping supports for vertical piping passing through floor sleeves: use hot dipped galvanized steel riser clamps.
- H. Support piping to prevent strain on valves, fittings, and equipment. Provide pipe supports at changes in direction or elevation, adjacent to flexible couplings, adjacent to non-rigid joints, and where otherwise indicated. Do not install pipe supports in equipment access areas or bridge crane runs.
- I. Stacked horizontal runs of piping along walls may be supported by metal framing system attached to concrete insert channels.
- J. Do not support piping from other piping.
- K. Designs generally accepted as exemplifying good engineering practice, using stock or production parts, shall be utilized whenever possible.
- L. Whenever possible, pipe attachments for horizontal piping shall be pipe clamps.
- M. All rigid rod hangers shall provide a means of vertical adjustment after erection.
- N. Where the piping system is subjected to shock loads, such as disturbances due to pump discharge or thrust due to actuation of safety valves, hanger design shall include provisions for rigid restraints or shock absorbing devices.
- O. Hanger rods shall be subject to tensile loading only. At hanger locations where lateral or axial movement is anticipated suitable linkage shall be provided to permit rod swing.
- P. Hanger spacing shall not exceed the spacing listed below:
 - 1. In the case of concentrated loads the supports shall be placed as close as possible to the load to reduce the bending stress.
 - 2. Where changes in direction of the piping system occur between supports, the total length between supports shall be kept to less than three-fourths of the full span.

When practical, a support shall be placed immediately adjacent to any change in direction of the piping system.

- Q. Where practical, riser piping shall be supported independently of the connected horizontal piping. Pipe support attachments to the riser piping shall be riser clamp shear lugs. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes. If friction is relied upon to support riser piping proper justification and documentation shall be submitted to ensure that enough friction force is provided to resist the applied loading.
- R. Hanger components shall not be used for purposes other than for which they were designed. They shall not be used for rigging and erection purposes.
- S. All threads shall be UNC unless otherwise specified.
- T. TFE slide bearing plates with steel backup plates shall be stitch weld attachments to the structure. A 1/8-inch fillet weld, 1/2-inch long every 3 inches on center each side of an element shall be used unless otherwise indicated or specified by the manufacturers' written recommendations. Bearing elements with slots or holes shall be stitch welded in place for location. The TFE surfaces of the bearings shall be maintained clean and free from grit, dirt or grease.

3.05 INSULATED PIPING:

- A. Attach clamps, including spacers (if any), to piping with clamps projecting through insulation; do not exceed allowable pipe stresses.
- B. Where vapor barriers are indicated on water piping, install coated protective shields.

3.06 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 19.03

STEEL PIPE AND FITTINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Contract shall provide fabrication and installation of steel pipe, specials, and fittings, complete and in place, in accordance with AWWA C200 and as modified herein.
- B. A single pipe manufacturer shall be made responsible for furnishing steel pipe, specials, fittings, and appurtenances such as bolts and gaskets.
- C. A special is defined as any piece of pipe other than a normal full length of straight pipe. This includes, but is not limited to, elbows, manhole sections, short pieces of straight pipe, reducers, tees, and bulk heads.
- D. This specification covers all buried steel pipe 5 feet from Water Treatment Plant and Pump Station but shall include all steel piping within vaults and associated with Clearwell.
- E. Steel pipe, fittings, and specials shall be NSF 61 certified for use with potable water. Certification shall be required for all linings, weld materials, gaskets, and couplings used in conjunction with steel pipelines.

1.02 REFERENCES:

- A. ASTM International (ASTM):
 - 1. A36: Standard Specification for Carbon Structural Steel
 - 2. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless
 - 3. A307: Standard Specification for Carbon Steel Bolts and Studs, 60,000 PSI Tensile
 - 4. A325: Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi minimum Tensile Strength
- B. American Society of Mechanical Engineers (ASME):
 - 1. B1.1: Unified Screw Threads
 - 2. B18.2.2: Square and Hex Nuts
 - 3. Boiler and Pressure Vessel Code Section IX

C. American Water Works Association (AWWA):

1. C200: Standard for Steel Water Pipe, 6 Inches and Larger
2. C205: Standard for Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4-in. and Larger - Shop Applied
3. C206: Standard for Field Welding of Steel Water Pipe
4. C207: Standard for Steel Pipe Flanges for Waterworks Service, sizes 4 in. through 144 in.
5. C208: Standard for Dimensions for Steel Water Pipe Fittings
6. C222: Polyurethane Coatings for the Interior and Exterior of Steel Water Pipe and Fittings
7. C604: Installation of Buried Steel Water Pipe – 4 inches (100 mm) and Larger

D. Structural Steel Painting Council (SSPC):

1. SSPC-SP6: Commercial Blast Cleaning
2. SSPC-SP10: Near-White Metal Blast Cleaning

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.
 - a. Pipe layouts in full detail.
 - b. Location and type of anchors.
 - c. Location of couplings and expansion joints.
 - d. 1/2 inch = 1 foot-0 inches scale details of all wall penetrations and fabricated fittings or special fittings.
 - e. Schedules of pipe, fittings, expansion joints and other appurtenances.
2. Sworn certificates in duplicate of shop tests showing compliance with appropriate standard.
3. Coating and Linings:

- a. Submit catalog cuts and other manufacturer's performance information for products proposed that demonstrate compliance with the Specifications herein described. Provide a copy of approved coating system submittals to the coating applicator. Provide Paint System Data Sheets (PSDS) and/or Material Safety Data Sheets (MSDS) for coating and lining materials.
- b. Quality Control Submittals
 - (1) Applicator's experience with list of references substantiating compliance.
 - (2) If the manufacturer of field-applied coating differs from that of the shop-applied primer, furnish written confirmation from both manufacturers that the 2 coating materials are compatible
- 4. Reports of ASME Section IX welding certifications.
- 5. Catalog cuts of joints, couplings, harnesses, expansion joints, gaskets, fasteners and other accessories.
- 6. Brochures and technical data on coatings and linings and proposed method for application and repair.
- 7. Provide record drawings.
- 8. Provide tag names and numbers for all sections of piping and fittings.
- B. Material Certification:
 - 1. Provide certification from the piping and fittings manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
 - 2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
- C. A copy of the contract mechanical process, civil and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are

required, mark all drawings with “No changes required” or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 QUALITY ASSURANCE:

A. Welder Qualifications:

1. Qualify and certify welding procedures, welders, and operators in accordance with ASME Section IX, for shop welding and AWS D1.1 for project site welding of piping work.
2. Qualification for welders: Welding shall be performed by welders holding current certification for the welding procedures in use.
3. Visually inspect welding while the operators are making the welds and again after the work is completed. After the welding is completed, hand or power wire brush welds and clean them before the inspector makes the check inspection. Inspect welds for defects exceeding tolerances allowed by code under which the weld was made. Repair all defects exceeding tolerance.

B. Job Conditions:

1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps, and other equipment to be installed in piping system.

C. Coating and Linings

1. All inspection for quality assurance shall ultimately be the responsibility of Contractor. Owner retains the right to observe, accept, or reject the work based on

the results of Contractor's inspection or observations by Engineer, at Owner's discretion, in accordance with the specifications.

2. Coating applicator shall have a minimum of 2 years of experience applying the specified coating system and the application supervisor (Certified Applicator) for the coating application personnel shall have a minimum of 5 years practical experience in application of the indicated products.
3. Coating and/or lining manufacturer technical representative shall be present for a minimum of 3 days to furnish technical assistance and instruction at the start of coating and/or lining operations within the shop and at the Site. During these visits, the technical representative shall observe surface preparation and coating application and conduct tests of the coating to ensure conformance with application instructions, recommended methods, and conditions.
4. Coating and/or lining manufacturer shall furnish 8 hours per month of field or shop coating technical support if requested by Engineer.
5. Technical representative shall provide a written report to Engineer for each visit. Report shall include copies of test data collected, description of observations, and recommended corrective actions. Report shall be submitted within 10 working days after the visit. When deemed necessary by Engineer, work will not be permitted to proceed until the recommended corrective actions have been implemented. After corrective recommendations have been implemented; the manufacturer representative shall return and certify that the application complies with the manufacturer's coating application recommendations.
6. Additional visits by the manufacturer's representative shall be made at sufficient intervals during surface preparation and coating or lining as may be required for product application quality assurance and to determine compliance with manufacturer's instructions, and as may be necessary, to resolve problems attributable to or associated with, manufacturer's products furnished for this project.
7. Repair and recoat all runs, overspray, roughness, or any other signs of improper application in accordance with paint manufacturer's instructions and as reviewed by Engineer.
8. Contractor shall notify Owner and minimum of 14 days prior to the commencement of any work. Contractor shall provide the Owner and/or Engineer with full access to facilities and application documentation. Observation by Owner and/or Engineer, or the waiver of inspection of any particular portion of the work, shall not be construed to relieve Contractor of his responsibility to perform the work in accordance with these specifications.

1.05 DELIVERY, STORAGE AND HANDLING:

- A. Provide in accordance with Section 01 66 10.

- B. During loading, transportation and unloading, prevent damage to pipes and coatings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation to protect pipe, lining, and coating.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

- A. Northwest Pipe (Special order required)
- B. American Spiral Weld
- C. Utility Coatings and Fabrication
- D. Mid America

2.02 MINIMUM WALL THICKNESS:

- A. Listed herein are minimum wall thicknesses for steel pipe covered in the section. Minimum wall thicknesses are also shown on Contract Drawings; whichever is greater shall govern.
- B. 36" Transmission Main shall be designed for 200 psi working pressure.
- C. Steel pipe 10-inch to 24-inch: ASTM A53 Type E or S, Grade Bc, Black.

Nominal Pipe Size, inches	Outside Diameter, Inches	Minimum Wall Thickness, inches
12	12.75	0.250 (Sch20)
14	14.00	0.250 (Sch10)
16	16.00	0.250 (Sch10)
18	18.00	0.250 (Sch10)
24	24.00	0.250 (Sch10)

- D. Steel Pipe 36-inch diameter and larger: AWWA C200.

Nominal Pipe Size, in	Outside Diameter, inches	Minimum Wall Thickness, inches
36	36.00	0.250
40	40.00	0.250
42	42.00	0.250
48	48.00	0.250

- E. Interior piping wall thickness: Increase wall thickness to limit combined stress (circumferential longitudinal and localized) to 75 percent of the minimum yield of the steel used.

2.03 PIPE:

- A. Fabricate to sizes, dimensions, and shapes indicated.
- B. Seams:
 - 1. Except for seamless mill type pipe, provide piping fabricated from steel plates rolled into cylinders or sections thereof with longitudinal seams or spiral seams butt welded.
 - 2. Do not use more than two longitudinal seams in piping 72 inch and smaller in size.
 - 3. Butt weld girth seams at least 6 feet apart, except in specials and fittings.

2.04 FITTINGS:

- A. Buried fittings 24 inches and greater shall be dimensioned and fabricated in accordance with AWWA C208. Buried elbows shall have a radius of 2.50 times nominal diameter.
- B. Buried fittings less than 24 inches may be standard wrought fittings per ASME B16.9 or may be dimensions and fabricated per AWWA C208.
- C. Provide fittings shop fabricated from previously hydrostatically tested straight pipe with magnetic particle non-destructive testing of all welds that were not previously tested in the straight pipe.
- D. Provide reinforced tees, laterals, and outlets in accordance with ASME Pressure Vessel Code, Section VIII, Paragraph UG-37 or AWWA M11, Chapter 13.
- E. Provide reducing sections with same shell thicknesses required for larger ends.
- F. Special Sections:
 - 1. Provide fittings and special sections with ends as indicated and fabricated to shapes, sizes, and dimensions indicated.
- G. Small Branch Connections:
 - 1. Provide branch connections 2-1/2 inch and smaller fabricated with welding fittings with threaded outlets.
 - 2. Provide branch connections 3 inch through 12 inch fabricated with pipe nipples or with welding fittings.

3. Provide pipe nipples and welding fittings welded to pipe shell and reinforced to meet working and test pressure requirements.
4. Provide pipe nipples of black steel pipe in accordance with ASTM A53 Type E or S Grade B, minimum thicknesses as listed in the above table.
5. Provide threaded and welded outlets as indicated.
6. Provide small branch connections located so as not to interfere with joints, supports, or other details.

2.05 FIELD JOINTS:

A. Type as indicated:

1. Location and type of joint may be modified to provide for lining, coating and flexibility in field assembly as accepted by the Engineer.

B. Provide pipe end preparation and tolerances in accordance with AWWA C200.

2.06 FLANGES, BOLTS AND NUTS:

A. Provide in accordance with AWWA C207. Flanges shall be Class D.

B. Provide flanged end pipe fitted with slip-on flanges. Provide longitudinal or spiral welds ground flush to accommodate type of flanges provided.

C. Provide flanges attached normal to axis of pipe for alignment.

D. Provide flanges tested, after welding to pipe, for true plane and reface, to bring them within specified tolerances.

E. Blind Flanges: Conforming in diameter, drilling, and thickness to flanges to which they mate and reinforced to produce a watertight joint.

F. All buried flanges bolts, and nuts shall be wax tape coated per Section 33 10 00 Water Utilities.

G. Bolts and Nuts:

1. All flanges, both buried and exposed, shall have stainless steel nuts and bolts as follows: Bolts shall have ASME B1.1, Class 2A threads, and be manufactured of ASTM A193, Grade B8M and conform to ASME B18.2.1, and nuts shall have Class 2A fit, square or hex heavy dimensions in accordance with ASME B18.2.2, and be manufactured of ASTM A194, Grade 8B heavy hex.

H. Gaskets:

1. Provide gaskets per AWWA C207. Gaskets shall be a minimum of 1/8 inch thick and shall be NSF 61 certified.
2. Location:
 - a. Ozonated Water - Between Water Treatment Plant and Clearwell, including inside of Clearwell: Garlock Style Stress Saver XP, no approved equal.
 - b. All other Areas: Gylon Style 3505, Gylon Epix Style 3505 EPX, Multi-Swell Style 3760-U, Durlon 7910, Thermoseal WaterSIL, or Teadit Style 1082SAN.

2.07 WELDED JOINTS:

A. Welds:

1. Sound and free from embedded scale or slag, with tensile strength of weld not less than that of thinner of connected sections. Welds to be watertight.
- B. Field welding of lined pipe is not acceptable unless otherwise indicated.
- C. Field welds of interior piping: Butt welds.
1. Outside back-up bar may be used.
- D. Field welds of buried piping: Bell and spigot lap welds with single weld inside or outside.
- E. Provide field welds, in accordance with AWWA C206.

2.08 BOLTED SLEEVE COUPLING:

- A. Bolted sleeve couplings shall be in accordance with AWWA C219. Ends to be joined by mechanical couplings shall be plain end type in accordance with the governing standard and coupling supplier's requirements. Bolted sleeve coupling shall be NSF 61 certified.
- B. Followers shall be constructed of ASTM A36 and middle rings constructed of ASTM A513, A635, or A675 carbon steel. The coupling shall have track-head bolts and hex heavy nuts constructed of ASTM A193, Grade B8M and ASTM A194, Grade 8 (Type 304) stainless steel, respectively. The sleeve coupling gasket shall be constructed of Grade 42 Buna-N or fluorocarbon (FKM, Viton®).
- C. Bolted sleeve couplings shall be furnished complete with bonding wire and brazing cartridges.
- D. Bolted sleeve couplings shall be capable of dynamic movement during service with an allowable angular deflection of 3-degrees.
- E. Bolted sleeve couplings shall be wax tape coated per Section 33 10 00 Water Utilities.

- F. Bolted sleeve couplings shall be Baker Coupling Company, Style 38 by Dresser Industries, Style 400 by Romac, or Model 411 by Smith-Blair.

2.09 DUAL COUPLING HARNESS ASSEMBLY

- A. Dual coupling harness assembly shall only be provided where shown on the Contract Drawings. Assembly shall consist of bolted sleeve couplings and tie-rod restraint harness. Full assembly shall be coated with wax tape coating system as specified in Section 33 10 00 Water Utilities.
- B. Bolted sleeve couplings for assembly shall be as specified herein.
- C. Restrained Harness:
 - 1. Restraint harness shall be tie-rod-lug & gusset type as shown on the Drawings and as designed per AWWA M11 Appendices B and C.
 - 2. Tie-rods shall be grouped around springline to allow differential settlement. Tie-rod restraint assemblies shall consist of ASTM A36 steel lugs, ASTM A193, Grade B8 (Type 304) stainless steel tie-rods, and ASTM A194, Grade 8 (Type 304) stainless steel hex heavy nuts and washers.
 - 3. The tie-rod lugs shall be fabricated to the dimensions shown on the Drawings, as designed through AWWA M11 Appendices B and C.
 - 4. Restraint Harness shall be manufactured/fabricated by UCF, Romac, Dresser Industries, Trumbull Industries, or approved equal.

2.10 HARNESS LUGS AND TIE ROD ASSEMBLY

- A. Harness lugs and tie rod assemblies shall be provided where shown on the Contract Drawings. Assembly shall consist of rectangular steel harness lugs and tie rods. Full assembly shall be coated with wax tape coating system as specified in Section 33 10 00 Water Utilities.
- B. Harness lugs shall be manufactured from ASTM A36 steel and shall be fusion bonded epoxy coated. Lugs shall be compatible with AWWA Class D flanges.
- C. Tie rods shall be type 304 ASTM A193 Grade B8 and nuts shall be ASTM A194, Grade 8 (Type 304) stainless steel hex heavy nuts. Washers shall be type 304 stainless steel.
- D. Harness lugs and tie rod assemblies shall be Series 490 by Romac, or approved equal.

2.11 LINING AND COATING:

- A. General:

1. Exterior and interior pipe and fitting surfaces shall be prepared and coated in accordance with referenced standards, written directions of the coating or lining manufacturers, and this Section, whichever is more stringent.
2. Pipeline coating or lining materials shall be the products of a single manufacturer. Product substitutions during the project will not be considered or permitted.
3. Coating applicator shall provide a monitoring system approved by the coating manufacturer that constantly records pipe and coating conditions during coating application. Recorded monitoring parameters shall include pipe temperature, line speed, surface preparation, holiday test and other parameters applicable to the type of coating.
4. Coatings and linings will be stored, handled and applied per the manufacturer's written directions.
5. Lining and Coating Schedule:
 - a. All buried steel pipe shall be polyurethane coated and cement mortar lined.
 - b. Exposed steel pipe within vaults shall be epoxy lined and coated.
6. Buried dielectrically coated pipe and fittings passing through a structure wall or floor shall be coated for a minimum of 2-inches beyond the interior wall or floor surface or to the inside face of the first interior flange or fitting. Applicator shall confirm compatibility of coatings systems if overlap is required. Overlapping shall be per manufacturers recommendations.
7. Buried lined pipe shall be lined to the inside face of the first interior flange.
8. Provide lining to the interior of steel pipe, fittings, sleeve couplings and maintenance holes.

B. Polyurethane Coating:

1. General: Plural component, polyurethane coating system (referred to as a polyurethane system) shall be applied in accordance with AWWA C 222 and as required herein.
2. Surface Preparation: SSPC-SP10, Near White Metal Blast, 3.0-mil profile, minimum, or as required by the manufacturer, whichever is greater.
3. Coating: Self-priming, plural component, 100 percent solids, non-extended polyurethane, suitable for burial or immersion, and shall be one of the following products or approved equal:
4. Protec II by Futura Coatings

- a. Durashield 210 by Lifelast, Inc.
 - b. Chemthane 2660 by Chemline, Inc
- 5. Thickness: One coat, 35-mils total dry film thickness, minimum, or as required to meet the holiday and coating defects limits of this Section.
 - 6. Holidays: Not to exceed an average of 1.5 holidays per 100 square feet of surface area per 100 square feet of surface area per joint of pipe. Two or more holidays separated by not more than 4 inches center to center will be counted as a single holiday.
- C. Epoxy Lining:
- 1. All epoxy linings applications shall be NSF 61 certified and shall be per Section 09 96 00 High Performance Coatings.
 - 2. Minimum of two coats providing a total dry film thickness of at least 12 mils of liquid epoxy in accordance with AWWA C210.
- D. Cement Mortar Lining:
- 1. All cement mortar lining (CML) materials and applications shall be NSF 61 certified. Provide in-place lining in accordance with AWWA C205.
 - 2. Clean and cement mortar line steel pipe and fittings in accordance with AWWA C205.
 - 3. Cement shall conform to ASTM C150, Type II. Aggregate shall be silica sand or other aggregate that is not subject to leaching. Conform to ASTM C 33. Water for cement mortar: Clean and free from organic matter, strong alkalis, vegetable matter, and other impurities.
 - 4. Shop applied cement mortar lining shall be uniform in thickness over the full length of the pipe joint.
 - 5. Surface preparation and field lining of pipe joints shall be with the same coating system as the shop-applied lining. Field application shall be performed by qualified personnel trained on the proper application of the coating system. Field coating application requirements shall be the same as the shop-applied coating requirements. Provide heating and/or dehumidification equipment as required to meet the environmental conditions necessary for proper coating application. Pipe supplier shall provide NSF 61 certified CML mix to Contractor for field joint and other lining repairs.
- E. Where sleeve couplings are used, polyurethane coating at pipe ends shall be NSF 61 certified for a distance of 9 inches.

F. EXTERIOR FIELD JOINT COATING

1. Pipe joints shall be field coated after pipe assembly in accordance with AWWA C 216, except as modified herein.
2. Field joint coating shall be compatible with the shop-applied coating system and be provided by the same manufacturer or a manufacturer approved by the pipe coating manufacturer.
3. Field joint coating materials shall be as follows or an equal.
 - a. Heat Shrink Sleeves
 - b. Filler Material: Provide filler material for push-on, flange, and coupling type joints. Filler material shall adhere to pipe and heat shrink sleeves and shall not melt under joint welding temperatures. Size and type shall be as recommended by the sleeve manufacturer for type of pipe and joint.
 - c. Joint Coating: Heat shrink, cross-linked polyolefin wrap or sleeve with an adhesive, backing and sleeve with a total of, 200-mils minimum thickness, suitable for pipeline operating temperature, as recommended by the manufacturer.
 - d. Provide standard recovery sleeve for girth weld or bell and spigot steel pipe joints. High recovery sleeves shall be provided for flange joints, coupling style joints, and ductile iron pipe joints.
 - e. Width of heat shrink sleeves shall be sufficient to overlap existing coating 2 inches minimum. Overlap on tape coated steel pipe shall be based on a sequential 2-inch wide step from outer wrap to middle wrap to inner wrap.
 - f. Consider sleeve shrinkage during installation and joint profile in determining sleeve width required. Overlapping of 2 or more heat shrink sleeves to achieve the necessary width on pipe joints will not be permitted without Owner approval.
 - g. Manufacturers: AquaSleeve by Canusa-CPS, Covalence by Berry CPG, or approved equal.
4. Hand Applied Tape Wrap – Not Allowed.
5. Wax Tape Coating
 - a. Wax tape coatings shall be limited to field application on joints, fittings, or irregular shapes or complex configurations that are not suited for the use of heat shrink or hand-applied tape wrap coating systems.
 - b. Apply coating in accordance with AWWA C217, except as modified herein.

- c. Provide filler material to fill and smooth irregular surfaces, such that no tenting or voids remain under the applied wax tape.
- d. Protect coating from damage and provide special sand backfill protect wax coating from damage.
- e. Coating System
 - (1) Surface Preparation: SP3 Power Tool or SP11 Power Tool to Bare Metal.
 - (2) Primer: Petroleum or petrolatum wax.
 - (3) Filler Material: Filled petroleum or petrolatum wax.
 - (4) Inner Tape: Petroleum or petrolatum wax impregnated fabric, 6-inch width maximum, 40-mils thick.
 - (5) Outer Wrap: PVC or tape suitable for application to inner tape.
- f. Wax tape coating system shall be as manufactured by, or approved equal:
 - (1) Petrolatum Tapes by Denso North American
 - (2) Wax-Tape by Trenton

G. REPAIR OF COATINGS AND LININGS

1. General

- a. Coating or lining repair materials shall be compatible with the shop-applied coating or lining system and shall be approved by the coating or lining manufacturer.
- b. Major repairs on tape wrapped or Polyurethane coatings shall be repaired using heat shrink sleeves as indicated for field joint coating in accordance with AWWA C 216, except as modified herein.
- c. Minor repairs on tape wrapped pipe shall be with heat applied patches.
- d. Coating repairs for polyurethane coating shall be as indicated herein.

2. Coating Repair Materials

- a. Heat Shrink Sleeves (major repair)
- b. Filler Mastic: Provide mastic filler to fill tape void as required.

- c. Full Wrap Coating: Cross-linked polyolefin wrap with a mastic sealant, 85-mil thickness minimum, suitable for pipeline operating temperature, sleeve material recovery as recommended by the manufacturer. Sleeve length shall provide a minimum of 3-inches overlap onto intact pipe coating.
 - d. Manufacturers: AquaSleeve by Canusa-CPS, Covalence by Berry CPG, or approved equal.
- 3. Heat-Applied Patches (minor repair)
 - a. Heat applied adhesive, polyolefin-backed, mastic coated tape, 12-inches maximum size.
 - b. Patch shall provide a minimum of 2-inches overlap onto intact pipe coating.
 - c. Manufacturers: CRP patch by Canusa, PERP patch Berry CPG, or approved equal.
- 4. Polyurethane Coating
 - a. Polyurethane coating system repair shall be in accordance with the coating manufacturer's recommended procedures.
 - b. Pinhole holidays or adhesion test coating repairs shall be with same coating material as for minor repairs or melt stick repairs such as 3M Reactive Adhesive or Canusa Melt Stick.
 - c. Coating material for minor repairs shall be single use kits using syringes or other mix ratio controlled packages of slow set polyurethane coating material similar to the existing coating
 - d. Major repairs will be completed using the same coating material as used for the coating. Surface and adjacent coating shall be abrasively blasted to meet the original coating specifications and to properly roughen the adjacent coating. Coating shall be reapplied using plural component spray equipment by a manufacturer-certified coating applicator.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Handling and Storage: Pipe, specials, and fittings shall be carefully handled and protected against damage to lining and coating/interior and exterior surfaces, and impact shocks and free fall. Pipe, specials, and fittings shall not be placed directly on rough ground but shall be supported in a manner that will protect the pipe against injury whenever stored at the Site or elsewhere. Pipe, specials, and fittings shall be handled and stored at the Site in accordance with the requirements stated in Part 2, above. No pipe shall be installed when

the lining or coating/interior or exterior surfaces show cracks that may be harmful as determined by Engineer. Such damaged lining and coating/interior and exterior surfaces shall be repaired or a new undamaged pipe, special, or fitting shall be provided at no additional cost to Owner.

- B. Pipe damaged prior to Substantial Completion shall be repaired or replaced at no additional cost to Owner.
- C. Repair of Defects: Patching inserts, overlays, or pounding out defects shall not be permitted. Repair of notches or laminations on second ends shall not be permitted. Deformation of pipe ends through mechanical means or other methods to achieve pipe fit up of defective pipe shall not be permitted. Damaged ends shall be removed to a point of uniform, non-damaged cylinder end and properly prepared. Distorted or flattened lengths shall be rejected. Buckled sections shall be removed and replaced with a full pipe cylinder. Contract shall submit a written repair plan and receive favorable review from Owner prior to the start of any repair work.
- D. Contract shall inspect each pipe, special, and fitting for damage. Contract shall remove or smooth out any burrs, gouges, weld splatter, or other small defects prior to laying the pipe, special, or fitting.
- E. Before placement of pipe, specials, or fittings in the trench, each shall be thoroughly cleaned of any foreign substance that may have collected thereon and shall be kept clean thereafter. For this purpose, the openings of pipes, specials, and fittings in the trench shall be closed during any interruption to the project.
- F. Backfilling on pipe, specials, and fittings shall be done in a controlled manner to avoid damage to polyurethane coating. Buckets of backfilling equipment shall be lowered such that backfill material shall be dropped no higher than 12' to top of pipe. Coatings damaged during backfilling shall be repaired by the Contract.
- G. Pipe, specials, and fittings backfilled with CLSM shall be laid directly on moist sandbags or other suitable supports in preparation for the CLSM pipe zone material. Sandbags shall be placed to provide at least 6-inches of CLSM below the bottom of the pipe. Sandbags shall be spaced at a maximum interval of 8-feet and one set shall be placed within 3-feet on both sides of each joint. Contract shall provide additional sandbags as needed to support the pipe on line and grade. Excavation outside the normal trench section shall be made at field joints as needed to permit adequate access to the joints for field connection operations and for application of coating on field joints.
- H. Installation Tolerances: Each section of pipe, special, or fitting shall be laid in the order and position on the laying diagram and in accordance with the following:
 - 1. Each section of pipe, special, or fitting having a nominal diameter less than 48-inches shall be laid to line and grade, within plus or minus 2-inches horizontal deviation and plus or minus 1-inch vertical deviation.

2. Each section of pipe, special, or fitting having nominal diameter 48-inches and larger shall be laid to line and grade, within plus or minus 5 percent of diameter horizontal deviation and plus or minus 2.5 percent of diameter vertical deviation.
 3. In addition to the horizontal and vertical tolerances above, lay the pipe so that no high or low points other than those on the laying diagram are introduced.
 4. After installation, pipe, specials, and fittings shall not show deflection greater than 1.5 percent for mortar-lined and mortar-coated pipe, specials, and fittings; 2.25 percent for mortar-lined and flexible-coated pipe, specials, and fittings; and 3.75 percent for flexible-lined and flexible-coated or bare pipe, specials, and fittings. The allowable deflection shall be based on the design inside diameter.
 5. Contract shall not permit the pipeline to experience a differential settlement after welding of more than 1.5" over 300 feet.
- I. Where necessary to raise or lower the pipe, specials, or fittings due to unforeseen obstructions or other causes, Contract may change the alignment and/or the grades in accordance with the requirements of the Specifications and Contract Drawings. Such change shall be made by the deflection of joints, by the use of bevel adapters, or by the use of additional fittings. However, in no case shall the deflection in a joint exceed 75 percent of the maximum deflection recommended by the pipe manufacturer without prior approval from Engineer. No joint shall be misfit any amount that will be detrimental to the strength and water tightness of the finished joint. In all cases the joint opening, before finishing with the protective mortar inside the pipe, shall be the controlling factor.
 - J. Except for short runs, pipes shall be laid uphill if on grades exceeding 10 percent. Pipe that is laid on a downhill grade shall be blocked and held in place until sufficient support is furnished by the following pipe to prevent movement. Bends shall be installed as indicated.
 - K. Struts in pipe 30-inches diameter and larger shall be left in place until backfilling operations have been completed. Struts in pipe smaller than 30-inches may be removed immediately after laying. Contract shall monitor pipe deflection by measuring pipe inside diameter before struts are removed and 24 hours after struts are removed. Pipe deflection shall not exceed 3 percent 24 hours after the struts are removed. After the backfill has been placed, the struts shall be removed and shall remain the property of Contract. For pipe backfilled with CLSM, struts shall be left in place until the CLSM backfill has obtained a minimum 7-day cure.
 - L. Cold Weather Protection: No pipe, special, or fitting shall be installed upon a foundation into which frost has penetrated or at any time that there is a danger of the formation of ice or penetration of frost at the bottom of the excavation. No pipe, special, or fitting shall be laid unless it can be established that the trench will be backfilled before the formation of ice and frost occurs.
 - M. Pipe, Specials, and Fitting Protection: The openings of pipe, specials, and fittings with shop-applied mortar lining shall be protected with suitable bulkheads to maintain a moist

atmosphere and to prevent unauthorized access by persons, animals, water, or any undesirable substance. The bulkheads shall be so designed to prevent drying out of the interior of the pipe, specials, and fittings. Contract shall introduce water into the pipe to keep the mortar moist if moisture has been lost due to damaged bulkheads.

- N. Flotation: At all times, means shall be provided to prevent the pipe from floating. Take necessary precautions to prevent the pipe from floating due to water entering the trench or from backfilling with CLSM. Contract shall assume full responsibility for any damage due to this cause and shall at its own expense restore and replace the pipe to its specified condition and grade if it is displaced due to floating. Maintain the inside of the pipe free from materials and in a clean and sanitary condition.
- O. Pipe Cleanup: As pipe laying progresses, Contract shall keep the pipe interior free of debris. Contract shall completely clean the interior of the pipe of sand, dirt, mortar splatter, and any other debris following completion of pipe laying, pointing of joints, and any necessary interior repairs prior to testing and disinfecting the completed pipeline. When pipe laying is not in progress and at the end of each day, Contract shall cover the exposed ends of all pipes to prevent animals, dust, dirt and other debris from entering the pipe.

3.02 WELDED JOINTS

- A. General: Field welded joints shall be in accordance with AWWA C206.
- B. Welding Procedures, Welding Qualifications and Testing:
 - 1. Field welding procedures, welders, welding operators, and tackers shall be qualified in accordance with AWS D1.1 and as defined in Section 3 of ANSI/AWWA C 206 or ANSI/AWWA C 200, as applicable. Qualifications shall be in accordance with all position pipe tests as defined in Section 5 of AWS D1.1.
 - 2. For field welding, the welder qualification testing shall be performed at the Site. Previous qualifications will not be accepted. Contract shall obtain the services of an independent testing laboratory to perform the welder qualification on-Site. Copies of test data and certifications shall be provided to Engineer. Costs for welder qualification testing shall be paid by Contract at no increased cost to Owner.
 - 3. Upon completion of each field-welded joint Contract shall provide a record system that traces a welder's work completion to a specific joint as it relates to the pipeline stationing.
 - 4. Field lap welds shall be inspected by magnetic particle or dye penetration methods. Field butt welds shall be inspected in accordance with the requirements of API 1104 by the radiographic method and the acceptance criteria of API 1104. Magnetic particle testing is not required for seal welds.

5. Double welded lap joints and butt strap joints shall be air tested. Repairs and retesting shall be required if any loss of pressure occurs and shall be at no increased cost to Owner.
 6. Personnel performing the visual inspection of welds shall be qualified and currently certified as Certified Welding Inspector (CWI) in accordance with AWS QC1, Standard for Qualification and Certification of Welding Inspectors. Personnel performing nondestructive tests shall be qualified and certified to meet the requirements of SNT-TC-1A.
- C. Where exterior welds are performed, adequate space shall be provided for welding and inspection of the joints.
 - D. Butt straps shall be as indicated. When fitting up the ends of pipe to be welded or fitting butt-strap pieces, jacking or clamping shall not be allowed. Cold working the metal with sledges or localized application of heat and working the metal with sledges shall not be allowed. If field displacement of joints, where butt strap joints are indicated, does not allow proper fit up with the tolerances indicated, special closure butt straps or mitered pieces shall be shop fabricated and installed.
 - E. A heat resistant shield shall be draped over at least 24-inches of coating beyond the holdback on both sides of the weld during welding to avoid damage to the coating by hot weld splatter. Welding grounds shall not be attached to the coated part of the pipe.
 - F. Care shall be exercised during the initial backfilling to prevent movement of the pipe and to prevent any backfill material from being deposited on the joint.
 - G. To control temperature stresses, the unbackfilled joint areas of the pipe shall be shaded from the direct rays of the sun by the use of properly supported awnings, umbrellas, tarpaulins, or other suitable materials for a minimum period of 2 hours prior to the beginning of the welding operation and until the weld has been completed. Shading materials at the joint area shall not rest directly on the pipe but shall be supported to allow air circulation around the pipe. Shading of the pipe joints need not be performed when the ambient air temperature is below 50 deg F as measured in the trench.
 - H. Temperature Control Joints: At intervals not exceeding 250-feet along welded reaches of the pipeline and at the first regular lap-welded field joints outside concrete encasements and structures, the pipe shall be laid with an initial lap of not less than 1-inch greater than the typical lap dimension. The welding of each such temperature control joint shall be performed when the temperature is approximately the lowest during the 24 hour day, after at least 250-feet of pipe have been laid and the joints have been welded ahead of and in back of the shrinkage control joint, and after backfill has been completed to at least 1-foot above the top of the pipe ahead of and in back of the shrinkage control joint. Where temperature control joints occur in a traveled roadway or other inconvenient location, the location of the temperature control joint may be adjusted, as necessary.
 - I. Prior to the beginning of the welding procedure, any tack welds used to position the pipe during laying shall be removed. Any annular space between the faying surfaces of the

bell and spigot shall be equally distributed around the circumference of the joint by shimming, jacking, or other suitable means. The weld shall then be made in accordance with AWWA C 206. Where more than one pass is required, each pass except the first and final ones shall be peened to relieve temperature stresses, and dirt, slag, and flux shall be removed before the succeeding bead is applied.

- J. Prior to butt welding, the pipe and joint shall be properly positioned in the trench using line up clamps so that, in the finished joint, the abutting pipe sections shall not be misaligned more than 1/16-inch.
- K. Unless double fillet welds are indicated, field welded lap joints may, at Contract'S option, be made on either the inside or the outside of the pipe.
- L. Inspection of Field Welded Joints: An independent testing laboratory shall inspect the joints. Inspection shall be as soon as practicable after the welds are completed.
 - 1. Fillet welds shall be tested by the Magnetic Particle Inspection Method in accordance with ASME Section VIII, Division 1, Appendix VI.
 - 2. In addition, double fillet welds on butt strap joints or double welded lap joints shall be air tested by shop drilling and tapping for 1/4-inch national pipe thread in the lap or bell end of the pipe. Apply 40 psi of air or other satisfactory gas into the connection between the 2 fillet welds. Test pressure shall be measured with a 4-inch diameter, minimum, pressure gauge with a range no greater than 0 to 100 psi. The air test shall consist of holding the test pressure undiminished for 5 minutes. If the air test fails, paint the welds with a soap solution and mark any leaks indicated by the escaping gas bubbles. Leaking portions of the welds or defective welds shall be removed and rewelded. The amount of material removed shall be limited to that required to correct the defect. After the repair is made, the joint shall be checked by repeating the original test procedure to verify that there is no leakage at the inside weld. Close the threaded openings with pipe plugs or by welding them.
 - 3. Butt welds shall be inspected by radiographic methods in accordance with API Standard 1104.
- M. Following tests of the joint, the exterior joint spaces shall be coated in accordance with these specifications after which backfilling may be completed.
- N. Repair of Welds: Welds that are defective shall be repaired by Contract to meet the requirements of this Specification. Defects in welds or defective welds shall be removed, and that section of the joint shall then be re-welded. Only sufficient removal of defective material that is necessary to correct the defect is required. After the repair is made, the joint shall be checked by repeating the original test procedure. Welds deficient in size shall be repaired by adding weld metal.

3.03 JOINT COATING AND LINING

- A. General:

1. The interior and exterior joint recesses shall be thoroughly wiped clean and water, loose scale, dirt, and other foreign material shall be removed from the inside surface of the pipe.
2. Every joint will be tested by Contract with an electrical detector capable of at least a 12,000 volt output, furnished by the Supplier. Holiday tests will be conducted in accordance with NACE RP0274. Holidays shall be repaired by Contract at no additional cost to Owner.
3. Joint Lining: After the backfill has been completed to final grade, the interior joint recess shall be filled with grout. The grout shall be tightly packed into the joint recess and troweled flush with the interior surface. Excess shall be removed. At no point shall there be an indentation or projection of the mortar exceeding 1/16-inch. With pipe smaller than 24-inches in diameter, before the spigot is inserted into the bell, the bell shall be daubed with grout. The joint shall be completed and excess mortar on the inside of the joint shall be swabbed out.

B. ENVIRONMENTAL LIMITATIONS

1. General
 - a. Products shall comply with federal, state, and local requirements limiting the emission of volatile organic compounds and worker exposure.
 - b. Do not apply paint in extreme heat, temperatures below 40 degrees F, nor in dust, smoke-laden atmosphere, damp or humid weather.
 - c. Do not perform abrasive blast cleaning whenever relative humidity exceeds 85 percent, nor whenever surface temperature is less than 5 degrees F above dew point of ambient air. Strictly adhere to manufacturer's recommendations.
 - d. Comply with applicable federal, state, and local, air pollution and environmental control regulations for surface preparation, blast cleaning, disposition of spent aggregate and debris, and coating application.
 - e. Do not perform abrasive blast cleaning whenever the relative humidity exceeds 85 percent or whenever surface temperature is less than 5 degrees above the dew point of the ambient air.
 - f. Do not apply coatings when:
 - (1) Surface and ambient temperatures exceed the maximum or minimum temperatures recommended by the coating manufacturer or these specifications.
 - (2) In dust or smoke-laden atmosphere, blowing dust or debris, damp or humid weather, or under conditions that could cause icing on the metal surface.

- (3) When it is expected that surface temperatures would drop below 5 degrees above dew point within 4 hours after application of coating.
- (4) Whenever relative humidity exceeds 85 percent for polyurethane coating application.
- (5) Where weather conditions or project requirements dictate, Contractor shall provide and operate heaters and/or dehumidification equipment to allow pipe surfaces to be abrasive blasted and coated as indicated and in accordance with the manufacturer's coating application recommendations.
- (6) Work activities may be restricted until adequate temperature and humidity controls are in place and functioning within the environmental limits given.
- (7) Coating applicator shall provide a monitoring system approved by the coating manufacturer that constantly records pipe and coating conditions during coating application. Recorded monitoring parameters shall include pipe temperature, line speed, surface preparation, holiday test, and other parameters applicable to the type of coating.

2. Temperature Control

- a. In cold weather or if moisture collects on the pipe, if the temperature of the pipe is less than 45 deg F, preheat the pipe to a temperature of 50 deg F or 5 degrees above dew point, whichever is greater.
- b. When temperatures are above or below the coating manufacturer's recommended application temperatures, Contractor shall provide temperature controls as necessary to permit the work to proceed within the manufacturer's temperature limitations.
- c. Provide tenting, insulating blankets, baffles, or bulkheads as required to zone and control heating or cooling effectiveness.
- d. Heating shall be with indirect propane fired heaters that do not increase humidity levels within the working area. Heaters shall be sized for the area to be heated.

3. Dehumidification

- a. Contractor shall provide dehumidification equipment when necessary for shop or field environmental control during surface preparation and/or coating application. Dehumidification equipment shall be properly sized to maintain dew point temperature 5 degrees or more below surface temperature of metal surfaces to be cleaned and coated.

- b. Cleaned metal surfaces shall be prevented from flash rusting throughout the project duration; condensation or icing shall be prevented throughout surface preparation and coating application.
- c. Equipment size and power requirements shall be designed by personnel trained in the operation and setup of dehumidification equipment based on project requirements and anticipated weather conditions.
- d. Dehumidification equipment shall operate 24 hours per day and continuously throughout surface preparation and coating application.
- e. Contractor shall use personnel properly trained in the operation and maintenance of the dehumidification equipment or provided adequate training by the dehumidification equipment supplier.
- f. Daily maintenance requirements of the equipment shall be documented in writing and posted near the equipment for review if required by Engineer.
- g. Re-blasting of flash rusted metal surfaces or removal of damaged coatings because of equipment malfunction, shutdown, or other events that result in the loss of environmental control, will be at the sole expense of Contractor.

C. OBSERVATION OF WORK

- 1. Contractor shall give Engineer a minimum of 14 days advance notice of the start of any coating work to allow scheduling for shop or field observation. Notify Engineer a minimum 3 days in advance of actual start of surface preparation and coating application Work.
 - a. Provisions shall be made to allow Engineer full access to facilities and appropriate documentation regarding coating application.
 - b. Observation by Engineer or the waiver of observation of any particular portion of the coating work shall not be construed to relieve Contractor of responsibility to perform the coating in accordance with these Specifications.
 - c. Materials shall be subject to observation for suitability as Engineer may determine, prior to or during incorporation into the work.

D. SURFACE PREPARATION

- 1. General
 - a. Inspect and provide substrate surfaces prepared in accordance with these Specifications and the printed directions and recommendations of coating manufacturer whose product is to be applied.

- b. Visible oil, grease, dirt, and contamination shall be removed in accordance with SSPC-SP1, solvent cleaning.
 - c. Surface imperfections such as metal slivers, burrs, weld splatter, gouges, or delaminations in the metal shall be removed by filing or grinding prior to abrasive surface preparation.
 - d. Protect prepared pipe from humidity, moisture, and rain. Flash rust, imperfections, or contamination on cleaned pipe surface shall be removed by reblasting.
 - e. Priming and coating of pipe shall be completed the same day as surface preparation.
2. Weld Surface Preparation
- a. Application
 - (1) Spray applied coating systems do not require weld grinding.
 - (2) Grind welds on tape wrap coated pipe or apply weld stripe tape over the weld, at the pipe fabricator's option, unless otherwise indicated.
 - b. Weld Grinding: Under the weld grinding option, welds taller than 3/32-inch above pipe surface shall be ground to a tolerance of +3/32-inch to zero-inches above the pipe surface as measured on the highest side of the weld.
 - c. Weld Stripe Tape
 - (1) Weld stripe tape shall be applied to primed metal.
 - (2) Tape shall either have no polyethylene backing or be double sided adhesive tape to permit adhesion of the inner corrosion protection layer to the weld stripe tape.
 - (3) Apply tape with a pressure roller to fully conform the tape to the weld surface.
 - (4) Adhesion of the weld stripe tape shall be the same as for the coating system.
3. Steel Surface Preparation
- a. Surface preparation of steel pipe shall be in accordance with SSPC surface preparation standards utilizing the degree of cleanliness appropriate to the coating system to be applied.
 - b. Grit and/or shot abrasive mixture and gradation shall be as required to achieve the degree of cleanliness and coating adhesion required.

- c. Pipe cleaned by abrasive blasting with recyclable steel grit and/or shot or other abrasive shall be cleaned of debris and spent abrasive in an air wash separator.
- d. Preparation of the steel pipe for the Polyurethane coating system shall have a sharp angular surface profile of the minimum depth indicated.
- e. Work shall be performed in a manner that does not permit the cleaned metal surface to rust back or flash rust.
- f. Rust back or flash rust shall be fully removed with the steel surface cleanliness equal to the required metal surface cleanliness prior to rust back or flash rusting. Determination of the equivalent surface cleanliness shall be at Engineer's sole discretion.

E. SHOP-APPLIED COATING SYSTEMS

1. Polyurethane Coating or Lining

- a. Applicator Qualifications
 - (1) Equipment shall be certified by the coating manufacturer to meet the requirements for material mixing, temperature control, application rate, and ratio control for multi-part coatings.
 - (2) Equipment not meeting the written requirements of the coating manufacturer shall be rejected for coating application until repairs or replacement of the equipment is made to the satisfaction of the coating manufacturer and Engineer.
 - (3) Personnel responsible for the application of the coating system shall have certification of attendance at the coating manufacturer's training class within the last 2 years. The application supervisor (certified applicator) shall be present during all coating application Work and shall have responsibility for controlling all aspects of the coating application.
- b. Coating manufacturer shall provide to Engineer a copy of the manufacturer's coating application quality assurance manual prior to beginning coating application. Strict conformance to the requirements of the manual will be required. Deviation from the requirements of the manual will be grounds for rejecting the applied coating. Rejected coating shall be removed to bare metal and reapplied using proper application methods in accordance with the quality assurance manual and this Section.
- c. Pipe surface temperature shall be between 50 and 100 degrees and 5 degrees above dew point, whichever is greater.

- d. Coating application shall be performed in an environmentally controlled shop area that meets or exceeds the written environmental application requirements of the coating manufacturer. Application in outdoor conditions will not be acceptable without adequate environmental shelter, environmental controls, and/or dehumidification.
- e. Coating applied under improper environmental conditions will be rejected. Such coatings shall be removed to bare metal and reapplied under proper environmental conditions.
- f. Coating adhesion and holidays testing shall be tested per this Section.
- g. Perform coating and lining repairs per this Section.

F. EXTERIOR COATING HOLDBACK

- 1. Coating holdbacks shall be straight and cut through the full thickness of the coating.
- 2. Cutbacks shall be completed in a manner that permits field coating of joints in accordance with the manufacturer's recommendations and these requirements.
- 3. Holdbacks shall be as required for proper jointing of pipe, considering joint welding requirements, and be as follows:

Polyurethane or Epoxy coating	
Push-on joint, spigot	Flush with spigot end
Push-on, bell	Flush with bell end
Welded, spigot	3-inches, minimum
Welded, Bell	4-inches, minimum

- 4. Holdback Corrosion Protection
 - a. Holding primer for corrosion protection of cutbacks or holdbacks shall be compatible with the joint coating system, shall prevent corrosion of prepared pipe ends for duration of storage and construction, and be recommended for buried exposures.
 - b. Primer shall be compatible with welding operations and shall not result in running or melting of the coating during welding operations.

- c. Application and thickness of holding primer shall be in accordance with the primer manufacturer's recommendations but shall not impair the clearances required for proper joint installation.
- d. Any corroding holdback areas shall be abrasively blasted to SP10 or power tool cleaned to bare metal in accordance with SP11 prior to applying joint coating.

G. PIPE LINING APPLICATION

1. Shop-Applied Cement Mortar Lining

- a. Place mortar lining used in steel piping and steel plate specials in pipe to thickness below.

Pipe Diameter, Inches	Lining Thickness, Inches	Tolerances, Inches
4 through 10	3/8	-1/16, +1/8
11 through 24	5/16	-1/16, +1/8
24 through 36	3/8	-1/16, +1/8
Greater than 36	1/2	-1/16, +3/16

- 2. Centrifugally line straight sections of pipe. Lining of special pieces or fittings shall be by mechanical, pneumatic, or hand placement. Provide cement mortar lining of uniform thickness. Finish to a smooth dense surface.
 - a. Steel plate specials larger than 16-inches in diameter shall have lining reinforced with 2-inch by 4-inch No. 13-gauge welded steel wire mesh.
 - b. Brace and support pipe during lining application to minimize pipe distortion or vibration. Bracing and supports shall not damage the pipe, coating, or lining.
 - c. Tightly close ends of pipe and fittings with plastic sheet caps within 30 minutes of lining application. Plastic end caps shall be of sufficient thickness and strength to resist shipping, handling, and storage stresses.
 - d. Damage to the cement mortar lining, including disbondment, cracking, or blistering, caused by improper curing, shipping, handling, or installation shall be repaired in accordance with AWWA specifications.
 - e. Other requirements of mortar lining materials and processes are in AWWA C205.

H. FIELD COATING JOINTS

1. General

- a. Remove oil or grease contamination by solvent wiping the pipe and adjacent coating in accordance with SSPC-SP1, Solvent cleaning.
- b. Clean pipe surface and adjacent coating of mud, rust, and other foreign contaminants in accordance with SSPC-SP11, Power Tool Cleaning to Bare Metal or abrasively field blast joints in accordance with SSPC-SP10, near white blast, that exhibit any surface rust. Clean the full circumference of the pipe and a minimum of 6-inches onto the existing coating.
- c. Remove loose or damaged pipe coating at joint and either repair the coating or increase the length of the joint coating, where reasonable and practical.
- d. Complete joint bonding (where shown) of pipe joints before application of joint coating. Joint bonds shall be installed per Section 26 42 00 – Galvanic Cathodic Protection System and Section 26 42 05 – Pipe Bonding and Test Stations. Joint bonds shall be low profile bonds, and gaps and crevices around the bonds shall be filled with mastic sealant.
- e. Contractor shall electrically test completed joint coating for holidays with high voltage spark tester.

2. Post-Welding of Joints:

- a. Post-welded joints are defined as welded pipe joints that are coated prior to completing interior welds.
- b. Post welded joints shall be coated and protected as follows:
 - (1) Joint coating shall be heat shrink joint sleeves only. Tape wrapped joints will not be acceptable.
 - (2) Provide 6-inch wide non-shrinking layer centered over the interior weld location, such as CRP patch by Canusa or PERP by Berry CPG patch materials. Heat resistant tape will not be acceptable.
 - (3) Finished external joint coatings shall be fully buried with a minimum of 12-inches of soil cover, prior to any interior welding.
- c. Contractor shall demonstrate that the joint welding procedures will not significantly damage the coating by fully excavating the first 2 post-welded joints for inspection of the coating condition. Up to 3 additional post-welded joints for excavation by Contractor will be selected for inspection of joint coating condition.

- d. Any damage to the external joint coating system will require the Contractor to modify welding methods and or coating materials until a non-damaged system is attainable. All weld damaged joint coatings shall be removed and replaced with the new suitable system.

3. Heat Shrink Sleeve Joint Coating

- a. Store, handle, and apply field heat shrink sleeve coatings in accordance with AWWA C 216 and these specifications.
- b. Store sleeves in shipping box until use. Keep dry and sheltered from exposure to direct sunlight. Store off the ground or concrete floors and maintain at a temperature between 60 and 100 degrees F as recommended by the sleeve manufacturer.
- c. Metal pipe surface shall be free of dirt, dust, and flash rusting prior to sleeve application. Surface preparation shall be in accordance with the joint coating manufacturer's recommendations. At a minimum, surfaces shall be prepared by abrasive blasting to SSPC-SP10 or by power tool cleaning to bare metal in accordance with SSPC-SP11.
- d. Preheat pipe uniformly as recommended by the sleeve manufacturer. Monitor pipe temperature using a surface temperature gauge, infrared thermometer, or color changing crayons. Protect preheated pipe from rain, snow, frost, or moisture with tenting or shields and do not permit the joint to cool.
- e. Fill cracks, crevices, gaps, and step-downs greater than 1/4- inch with filler mastic in accordance with the manufacturer's recommendations for the full circumference of the pipe.
- f. Apply heat shrink sleeve when it is at a minimum temperature of 60 degrees F and while maintaining the pipe temperature above the preheat temperature above. Apply sleeve in accordance with the manufacturer's instructions and center the sleeve over the joint to provide a minimum 2 inch overlap onto the existing pipe coating.
- g. Completed joint sleeve shall be fully bonded to the pipe and existing coating surface without voids. Mastic beading shall be visible along the full circumference of the sleeve. There shall be no wrinkling or excessive burns on the sleeves. Sleeves that do not meet these requirements shall be removed and the joint recoated. Minor coating repairs may be made using heat applied patch material indicated.
- h. Allow the sleeve to cool before backfilling. In hot climates, provide shading from direct sunlight. Water quenching will be allowed only when permitted by the sleeve manufacturer.

- i. Heat shrink joint coatings which have become wrinkled or disbanded because of prolonged exposure to UV light or thermal cycling shall be removed and replaced.
- j. Double coating of defective or damaged heat shrink coatings will not be permitted. Any double coated heat shrink sleeves shall be immediately rejected and Contractor shall remove and recoat the joint.

I. REPAIR OF COATING AND LININGS

1. General

- a. Areas where holidays are detected or coating is visually damaged, such as blisters, tears, rips, bubbles, wrinkles, cuts, or other defects shall be repaired. Areas where no holidays are detected, but are visually damaged shall also be repaired.
- b. Maximum defects allowable shall be as indicated for the coating system.

2. Polyurethane Coating or Lining Repairs

a. General

- (1) Complete coating repairs in accordance with the coating manufacturer's written instructions and these Specifications, whichever is stricter.
- (2) Major repairs shall not exceed 2 per pipe joint and the combined area shall not be greater than 50 percent of the pipe.
- (3) Pipes exceeding the maximum number or size of coating defects shall be stripped of coating, reblasted, and recoated at the Contractor's expense.
- (4) Pipe arriving in the field with defects or repairs exceeding the maximum number or size of coating defects will be returned to the shop for recoating at Contractor's expense.

b. Defect Size

- (1) Minor repairs - repairs that are less than 4-inches in the greatest dimension.
- (2) Major repairs - repairs that exceed 4-inches in the greatest dimension.

c. Maximum Quantity of Defects Allowed:

- (1) Minor coating repairs on any joint of pipe shall not exceed 1.5 per 100 square feet of surface area.

- (a) Two or more minor repairs within 6-inches diameter will be considered a single repair.
 - (b) Repairs for adhesion testing will not be included in the total number of repairs.
- (2) Major repairs shall not exceed two per pipe joint and the combined area shall not be greater than 40 percent of the pipe.
- (3) Pipes exceeding the maximum number or size of coating defects shall be stripped of coating, reblasted, and recoated.
- (4) Pipe arriving in the field with defects or repairs exceeding the maximum number or size of coating defects will be returned to the shop for recoating at the Contractor's expense.
- d. Minor repairs shall be repaired using coating repair kits.
 - (1) Surface Preparation: Clean and feather the defect by power tool sanding with 80 grit or coarser sandpaper to roughen the existing coat and feather the edges of the defect for a minimum of 2-inches around the defect.
 - (2) Shop Repairs
 - (a) Slow setting parent material polyurethane coating material in syringes or other single use packaging that controls mix ratio.
 - Coating manufacturer's polyurethane coating repair products subject to Engineer's approval.
 - (3) Field Repairs
 - (a) Melt stick coating repair (not acceptable for repairs greater than one-inch diameter); Scotchkote P206, Canusa Melt Stick, or approved equal.
 - (b) Heat-applied coating materials; CRP Patch by Canusa; PERP Patch by Berry CPG, Tyco Adhesives, or approved equal.
 - (c) Coating manufacturer's polyurethane coating repair products subject to Engineer's approval.
 - (d) Apply a single coat of the patch coating material at the indicated coating thickness.
 - (e) Repairs adhesion shall be at least 50 percent of the indicated coating adhesion.

- (4) Major Repairs:
 - (a) Surface Preparation: The metal surface and surrounding coating shall be abrasively blasted in accordance with SSPC-SP10, near white metal, or equal in cleanliness and profile as the original surface. Existing coating shall be feathered and roughened to the equivalent of 40 grit sandpaper.
 - (b) Shop Repairs: Same material as the pipeline coating and shall be applied by using plural component spray equipment.
 - (c) Field Repairs: Same material as the pipeline coating and shall be applied by using plural component spray equipment, Heat shrink sleeves as for pipeline joints. The metal surface and surrounding coating shall be re-blasted to equal cleanliness and profile as the original surface preparation. Existing coating shall be feathered and roughened to the equivalent of coarse sandpaper by abrasive blasting.
- (5) One coat of the original coating material shall be applied over the repaired surface at the indicated thickness.
- (6) Repair adhesion shall be equal to the indicated coating adhesion.

J. INSPECTION AND TESTING

- 1. Inspection
 - a. Applicator shall inspect and test the coating system in accordance with referenced standards and these specifications, whichever is more stringent.
 - b. The frequency of the testing shall be determined by the applicator, but shall not be less than the requirements of this specification.
 - c. Contractor will conduct random independent inspections and tests for the final acceptance or rejection of pipe coating or lining.
- 2. Adhesion Testing, General
 - a. Adhesion testing shall be conducted at the shop prior to shipment. Pipe shipped without adhesion testing will be field-tested. Pipe rejected in the field will be returned to the shop for repair at the sole expense of the Contractor.
 - b. A minimum of 2 pipes will be tested for adhesion from each lot of pipe coated up to 4,000 square feet of pipe. An additional adhesion test will be conducted on every increment up to 3,000 square feet of pipe coated in excess of the first 4,000 square feet of pipe. (i.e., if one workday of production is 8,000 square feet of pipe, 4 adhesion tests will be conducted on the pipe lot.

- c. A pipe lot is defined as the quantity of pipe that is coated by a single crew within a work shift, but not to exceed 12 hours.
- d. The pipe coating applicator shall repair coating damage from adhesion testing.
- e. Adhesion tests will be performed not less than 24 hours after coating application. Tests conducted prior to 24 hours will be acceptable only if the test meets or exceeds the adhesion criterion and the test was requested by the pipe fabricator.
- f. Pipe will be randomly selected for adhesion testing.
- g. If any pipe tested fails the adhesion test, all pipes within the lot will be rejected. Each pipe within the rejected pipe lot will then be individually tested for adhesion and accepted or rejected on a pipe-by-pipe basis.
- h. Rejected pipe shall have the coating fully removed from the pipe and the pipe abrasive blasted and recoated.

3. Adhesion Testing, Polyurethane

- a. Polyurethane coatings shall have an adhesion to steel of 1,750 pounds per square inch, minimum.
- b. Polyurethane coating adhesion to steel substrates shall be tested using pneumatic pull off equipment in accordance with ASTM D 4541 and AWWA C 222, except as modified in this Section.
- c. Adhesion testing records shall include pipe identification, surface tested (interior or exterior), surface temperature, coating thickness, tensile force applied, mode of failure, and percentage of substrate failure relative of dolly surface.
- d. Dollies for adhesion testing shall be glued to the coating surface and allowed to cure for a minimum of 12 hours. Because of high cohesive strength, polyurethane coatings shall be scored around the dolly prior to conducting the adhesion test.
- e. Failure shall be by adhesive and cohesive failure only. Adhesive failure is defined as separation of the coating from the steel substrate. Cohesive failure is defined as failure within the coating, resulting in coating remaining both on the steel substrate and dolly.
- f. Partial substrate and glue failures will be retested if the substrate failure is less than 50 percent relative of the dolly surface area and the applied tension was less than the adhesion criterion. Pipes that have partial substrate failures greater than 50 percent and less than the required adhesion will be rejected as a substrate adhesion failure.

- g. Glue failures in excess of the minimum required tensile adhesion would be accepted as meeting the adhesion requirements.
 - h. Adhesion tests will be conducted all polyurethane pipe coating.
 - i. Repair patches on the polyurethane coating shall be randomly selected for adhesion testing in a manner as described herein and at the discretion of the coating inspector conducting the adhesion tests. Adhesion of repairs shall be as indicated for the type of repair.
- 4. Holiday Testing
 - a. Holiday test the inner layer of tape wrap coatings after application and prior to the subsequent tape layer in accordance with AWWA C 214 and NACE Standard RP 0274.
 - b. Holiday tests on polyurethane coatings shall be conducted on the completed coating after cure or 24-hours, whichever is less, using a high voltage spark test in accordance with NACE Standard RP 0274 and these specifications.
 - c. Coating thickness used for holiday testing shall be the minimum coating thickness.
 - d. Dry Film Thickness Testing
 - (1) Coatings shall be tested for dry film thickness using a properly calibrated magnetic pull off or eddy current equipment.
 - (2) Coating thickness measurements shall be conducted as necessary and without limitation. Testing conformance to the requirements of SSPC PA-2 is specifically excluded from this specification.

K. HANDLING, TRANSPORTATION, AND STORAGE

- 1. Coated pipe shall not be shipped or installed until coating has developed full adhesion and cure.
- 2. During coating application, storage, loading, and transportation, every precaution shall be taken to protect and prevent damage to pipe, lining, and coating. Forklift equipment shall have load-bearing surfaces padded with suitable material. Lift pipe with web slings a minimum of 12-inches wide and of a type that will not damage the coating. Metal chains, cables, tongs, forklifts or other equipment likely to damage the coating will not be permitted. Dragging or skidding of pipe on grade or in the trench will not be permitted.
- 3. Provide transportation vehicles with padded bolsters between each layer of pipe and heavy padding under load ties. Bolsters shall be curved to fit the outside of the pipe and 12-inches wide, minimum. Pipe contact locations shall be heavily padded with

carpet and strips of the outer tape wrap material (adhesive side against the carpet) during shipment to the Site and from the storage yard to the point of installation.

4. Pipe shall not be stored on rocks, gravel, or other hard materials that might damage the coating. Provide padded 12-inch wide skids and chucks, sand bags, select loamy or sand berms, or suspended from cutback ends, where possible, to minimize coating damage. Pipe shall not be laid on asphalt without suitable padding at contact points.
5. Pipe shall be inspected by Contractor at the Site for damage. Any damage to the pipe, lining, or coating shall be repaired if a satisfactory repair can be made; otherwise, the damaged section shall be replaced at the sole expense of Contractor.
6. No metal tools or heavy objects shall be permitted to come into contact unnecessarily with the finished coating. Workers shall not be permitted to walk on the coating except when absolutely necessary. When required, shoes with rubber or composition soles and heels or other suitable footwear that will not damage coating shall be used.
7. Long-term Exposure: Pipe shall either be provided with UV inhibitor for length of above grade exposure or covered to prevent UV degradation of outer wrap. Amount of UV stabilizers required shall depend on the project location, laying schedule, anticipated length of exposure, and type of outer wrap. Coating manufacturer shall be consulted for recommended UV inhibitors requirements or pipe shall be stored under a protective cover. Protective covering can be colored plastic sheeting, canvas, or other UV blocking material. Clear plastic sheets are not acceptable. Areas of coating that display UV degradation shall be removed and repaired at sole cost of Contractor.
8. End Caps: Pipe ends of mortar lined pipe and fittings shall be tightly closed with a plastic wrap to aid in curing and to minimize drying out of and contamination of the lining. Plastic end cap shall consist of a minimum of one 10-mil sheet of polyethylene or other suitable material. End caps shall be substantial enough to resist shipment, handling, and storage loads and to remain firmly attached in place. The plastic end cap shall remain intact and in place until pipe installation. Damaged or missing plastic end caps shall be repaired or replaced.
9. Bracing
 - a. The manufacturer shall install adequate bracing or strutting to keep the pipe from becoming deformed or damage from occurring to the coating or linings. Strut-type bracing shall be installed as soon as possible after application of lining. Struts shall remain in place during handling, storage, transportation, and installation of pipe and fittings until after the pipe zone material is compacted. Adequate strutting shall be provided by pipe manufacturer, so that after completion of backfilling, pipe deflection or elongation shall not exceed one percent of the nominal inside diameter of cement-mortar-lined pipe.

- b. The minimum bracing shall consist of crossed struts (horizontal and vertical). The maximum spacing along the pipe shall be near each end and at the one-third points for each 48-foot section of pipe, with a minimum of 4 sets of struts per 48-foot section of pipe. Random lengths of pipe shall have an equivalent number of sets of struts, with a minimum of one set of struts in a 10-foot section of pipe
- c. The struts shall be installed with pads and wedges in such a manner that the pipe lining will not be damaged and the struts will not be dislodged during shipping and handling of the pipe. If struts are welded, they shall be installed and removed in such a manner to prevent damage to the steel cylinder, lining, or coatings. Damage shall be repaired to the satisfaction of Engineer.

3.04 INSTALLATION OF PIPE APPURTENANCES

- A. Installation of Valves: Valves shall be handled in a manner to prevent any injury or damage to the valve or any part of it. Joints shall be thoroughly cleaned and prepared prior to installation. Contract shall adjust stem packing and operate each valve prior to installation to verify proper operation.
- B. Valves shall be installed so that the valve stems are plumb and in the location indicated.
- C. Buried valves and flanges shall be coated and protected in accordance with Section 09 98 10 - Pipeline Coatings and Linings.
- D. Installation of Flanged Joints: Before the joint is assembled, the flange faces shall be thoroughly cleaned of foreign material with a power wire brush. The gasket shall be centered and the connecting flanges drawn up watertight without unnecessarily stressing the flanges. Bolts shall be tightened in a progressive diametrically opposite sequence and torqued with a suitable calibrated torque wrench. Clamping torque shall be applied to the nuts only.
- E. Insulated Joints: Insulated joints and appurtenant features shall be provided where indicated on the Contract Drawings. Contract shall exercise special care when installing these joints to prevent electrical conductivity across the joint. After the insulated joint is completed, an electrical resistance test shall be performed by Contract. If the resistance test indicates a short circuit, Contract shall remove the insulating units to inspect for damage, replace all damaged portions, and reassemble the insulating joint. The insulated joint shall then be retested to assure proper insulation.
- F. Flexible Coupled Joints: When installing flexible couplings, care shall be taken that the connecting pipe ends, couplings, and gaskets are clean and free of dirt and foreign matter with special attention given to the contact surfaces of the pipe, gaskets, and couplings. The couplings shall be assembled and installed in conformity with the recommendation and instruction of the coupling manufacturer.
- G. Wrenches used in bolting couplings shall be of a type and size recommended by the coupling manufacturer. Coupling bolts shall be tightened so as to secure a uniform annular

space between the follower rings and the body of the pipe. Bolts shall be tightened approximately the same amount. Diametrically opposite bolts shall be tightened progressively and evenly. Final tightening shall be done with a suitable calibrated torque wrench set for the torque recommended by the coupling manufacturer. Clamping torque shall be applied to the nut only.

3.05 CORROSION CONTROL

- A. Joint Bonding/Electrolysis Test Stations: All non-welded pipeline joints shall be bonded as shown on the Drawings.
- B. Cathodic Protection: Corrosion mitigation and testing materials, such as an impressed current cathodic protection system, test stations, pipe bonding, and other associated components shall be provided in accordance with the Contract Drawings and Specifications.

3.06 MARKING TAPE INSTALLATION

- A. Continuously install metallic marking tape along the pipe at the depth and location indicated.
- B. Continuously install plastic marking tape along the pipe at the depth and location indicated.

3.07 PHYSICAL CHECKOUT, FIELD, AND FUNCTIONAL TESTING:

- A. Clean dirt, dust, oil, grease, and other foreign material, before pressure and leakage tests.
- B. Water for testing provided by the Owner. All other temporary facilities for testing shall be provided by the Contractor.
- C. Pressure and Leakage Tests shall be done per C604:
 - 1. Provide temporary testing plugs or caps, pressure pumps, pipe connections, meters, gages, equipment, and labor. Temporary facilities are not shown on the Contract Drawings but shall be provided as required for testing.
 - 2. Test pipelines in sections of accepted length and by pipe material. Steel pipe sections shall be tested separately from ductile iron pipe sections.
 - 3. Fill section of pipe with water and expel air. Leave water in pipeline for 24 hours to allow the CML to absorb as much water as possible.
 - 4. Pressure and leakage test shall consist of pressurizing the section of steel pipe to 250 psi and holding for 2 hours. The minimum allowable test pressure of 250 psi shall be calculated or measured at the highest elevation in the section being tested. The calculated or measured pressure in the section being tested shall be not be greater than 270 psi.

5. Once pressure is achieved it shall be maintained for 2 hours with no allowance for makeup water or test has failed. Any visible leakage shall also indicate a failed test.
 6. If section fails pressure and/or leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, and conduct additional tests and repairs until section passes test at no additional cost and without any time extensions.
- D. Make piping connections to equipment with pipe in a free supported state and without application of vertical or horizontal forces to align piping with the equipment flanges.

3.08 FIELD PAINTING:

- A. Provide in accordance with Section 09 96 00.

3.09 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 19.04

DUCTILE IRON PIPE AND FITTINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test ductile iron pipe, fittings and appurtenances as indicated and in compliance with Contract Documents.
- B. Options:
 - 1. For buried exterior pipelines provide push-on joint pipe.
 - a. Provide restrained push-on pipe as specified.
 - b. Provide either restrained push-on joint fittings as specified and indicated or provide mechanical joint fittings with restraint system as specified herein.
 - 2. For piping exposed as in buildings and galleries, provide flanged pipe and fittings.
 - 3. Cast iron pipe and fittings are not acceptable.
- C. Ductile iron pipe and fittings shall be NSF 61 certified for use with potable water. Certification shall be required for all pipe materials, linings, and gaskets.

1.02 REFERENCES:

- A. ASTM International (ASTM):
 - 1. A193: Standard Specification for Alloy-Steel and Stainless-Steel Bolting Materials for High-Temperature Service
 - 2. A194: Standard Specification for Carbon Steel, Alloy Steel, and Stainless-Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
- B. American Water Works Association (AWWA):
 - 1. C104: Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water
 - 2. C110: Ductile-Iron and Gray-Iron Fittings, 3 in. through 48 in., for Water and Other Liquids
 - 3. C111: Rubber-Gasket Joints for Ductile-Iron and Gray-Iron Pressure Pipe Fittings
 - 4. C115: Flanged Ductile-Iron Pipe with Threaded Flanges

5. C150: Thickness Design of Ductile-Iron Pipe
6. C151: Ductile-Iron Pipe, Centrifugally Cast in Metal Molds, or Sand-Lined Molds, for Water or Other Liquids
7. C153: Ductile-Iron Compact Fittings, 3-in through 16-in. for Water and Other Liquids

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Pipe manufacturer's technical specification and product data.
2. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.
 - a. Pipe layouts in full detail.
 - b. Location of hangers and supports.
 - c. Location and type of anchors.
 - d. Location of couplings and expansion joints.
 - e. 1/2-inch = 1 foot-0 inch scale details of all wall penetrations and special fittings.
 - f. Schedules of pipe, fittings, special castings, couplings, expansion joints and other appurtenances.
3. Certificates: Sworn certificates in duplicate showing compliance with material used and shop tests performed.
4. Catalog cuts and technical data for expansion joints, couplings, gaskets, pipe supports and other accessories.
5. Brochures and technical data on coatings and linings and proposed method of application.
6. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.

B. Material Certification:

1. Provide certification from the pipe and fittings manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and

certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
- C. A copy of the contract mechanical process, civil and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
 2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 QUALITY ASSURANCE:

- A. Provide in accordance with Section 01 43 00 and as specified.
- B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.
- C. Inspect and test at foundry according to applicable standard specifications.
- D. Owner reserves right to inspect and test by independent service at manufacturer's plant or elsewhere at his own expense.
- E. Visually inspect before installation.

F. Job Conditions:

1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps, and equipment to be installed in the piping systems.

1.05 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. During loading, transportation and unloading, prevent damage to pipes and fittings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation.

PART 2 - PRODUCTS

2.01 PIPE:

A. Ductile Iron:

1. Design conforming to AWWA C150.
2. Manufacture conforming to AWWA C115 or AWWA C151.
3. Pipe class, unless otherwise indicated or specified:
 - a. 36-inch Transmission Main:
 - (1) Pressure Class 150, minimum.
 - (2) Flanged pipe shall be Thickness Class 53.
 - b. Pipes less than 36-inch nominal: MJ and flanged pipe - Thickness Class 53.

2.02 PIPE FOR USE WITH COUPLINGS:

- A. As specified above except ends shall be plain.
- B. With bolted split sleeve couplings, ends cast or machined at right angles to axis.

2.03 FITTINGS:

- A. All 36-inch diameter fittings shall be MJ type unless indicated otherwise on the Contract Drawings. Fittings for pipes less than 36-inch diameter shall be MJ type or flanged as shown on the Drawings.
- B. MJ fittings shall be pressure rated 250 fittings conforming to AWWA C110 or AWWA C153.

- C. Flanged fittings shall conform to AWWA C110, AWWA C111, and ANSI B16.1 Class 150(125) and shall have either raised or plain faces and shall have a minimum working pressure rating of 135 psi.

2.04 WALL CASTINGS:

- A. Provide size and type indicated on the Contract Drawings. Minimum thickness shall be Thickness Class 53.
- B. Wall Castings: Conform to requirements of AWWA C110. Fabricated fittings shall not be allowed. Screwed on mechanical or push-on joints are not acceptable.

2.05 SOLIVE SLEEVE-TYPE COUPLINGS:

- A. Solid sleeve-type couplings shall be provided where shown on the Contract Drawings. Coupling shall be of ductile iron and shall be of the size to fit the pipe and fittings shown. Coupling shall be pressure rated 135 psi and comply with AWWA C110. Restraints shall be provided where indicated on the Contract Drawings.
- B. All buried couplings shall be wax tape coated per Section 33 10 00 Water Utilities.

2.06 BOLTED SLEEVE TYPE COUPLINGS:

- A. Sleeve-type couplings shall be provided where shown on the Contract Drawings. Couplings shall be of ductile iron, without pipe stop, and shall be of sizes to fit the pipe and fittings shown. Coating shall be fusion bonded epoxy. Couplings shall be pressure rated for 150 psi and comply with AWWA C219.
- B. All buried couplings shall be wax tape coated per Section 33 10 00 Water Utilities.
- C. Couplings shall be Style 501 or FC1 by EJ Prescott, Style 501 by Romac, or approved equal.

2.07 RESTRAINED BOLTED SLEEVE-TYPE COUPLINGS

- A. Restrained bolted sleeve-type couplings shall be provided where shown on the Contract Drawings. Couplings shall be of ductile iron or ASTM A283 Grade C steel, without pipe stop, and shall be of sizes to fit the pipe and fittings shown.
- B. Coating shall be fusion bond epoxy. Couplings shall be the rated for 150 psi and comply with AWWA C219. Sleeve length shall be 7 inches for pipe diameters 4-inch through 12-inch and 10 inches for pipe diameters 14-inch and larger.
- C. Restraint gland shall be ductile iron meeting the requirements of ASTM A 536.
- D. All buried couplings shall be wax tape coated per Section 33 10 00 Water Utilities.
- E. Couplings shall be Series 470 by Smith-Blair, Style 400RG by Romac, Series 3800 by EBAA Iron, Inc., or approved equal.

2.08 JOINTS:

1. All joints for 36-inch Transmission Main shall be push-on type unless indicated otherwise on the Contract Drawings. Joints shall be restrained when indicated on the Contract Drawings.
2. All joints for piping less than 36-inch nominal shall be restrained MJ type or flanged, as indicated on the Contract Drawings. All joints inside vaults and pump station shall be flanged, unless noted otherwise.
3. Pipe flanges shall be flat faced flanges and gaskets shall be 1/8-inch thick, full faced type.
4. Provide restrained joint on pipe where indicated. Provide restrained joint which is boltless and capable of being deflected after assembly. Designs using set screws or requiring field welding are not acceptable.
5. Manufacturers:
 - a. American Cast Iron Pipe Co. Flex-Ring
 - b. McWane Ductile TR Flex
 - c. U.S. Pipe TR FLEX

2.09 RESTRAINT SYSTEM:

- A. Provide restraint devices for pipe consisting of multiple gripping wedges and tie rods.
 1. Joint restraint shall require conventional tools and installation procedures per AWWA C600, retaining full joint deflection during assembly and allowing joint deflection after assembly.
 2. Provide actuation of the gripping wedges ensured with torque limiting twist off nuts.
- B. All buried restraints shall be wax tape coated per Section 33 10 00 Water Utilities.
- C. Working Pressure Rating:
 1. 16-inch and Smaller: 350 psi
 2. 18-inch thru 36-inch: 250 psi
 3. Minimum safety factor: 2 to 1
- D. Materials:
 1. Gland body, wedges and wedge actuating components: Grade 65-45-12 ductile iron in accordance with ASTM A536.

2. Ductile iron gripping wedges: Heat treated, 370 to 470 BHN.
 3. Coating shall be a minimum of two coats of liquid thermoset epoxy coating with heat cure to follow each coat.
- E. Manufacturer:
1. EBAA Iron MEGALUG Series
 2. Star Pipe Products Series 3000 or Series 3100.
- 2.10 FILLING RINGS:
- A. Provide where necessary.
 - B. Materials, workmanship, facing, and drilling, conforming to 125-lb. ANSI (Class 125).
 - C. Suitable length with nonparallel faces and corresponding drilling, if necessary, for correct assembly of adjoining piping or equipment.
- 2.11 PIPE COATINGS:
- A. The exterior of buried pipe and fittings shall be an asphaltic coating approximately one-mil thick.
 - B. All exposed piping, valves, and fittings including inside vaults and buildings shall be coated as specified in Section 09 96 00 High Performance Coatings. Exposed piping, valves, and fittings to be coated shall be primed by the manufacturer in preparation for coating. Contractor shall provide verification from the finish coating supplier that the field applied coatings are compatible with the manufacturer's prime coat. Pipe to be coated shall not have asphalt emulsion coating.
 - C. Exterior of fittings and pipe within Clearwell or directly concrete encased within Clearwell floor shall have NSF 61 certified coating for ductile iron submerged in potable water per Section 09 96 00 High Performance Coatings.
- 2.12 CEMENT LINING:
- A. Ductile iron pipe and fittings shall be lined with double thickness cement mortar in accordance with the requirements of the AWWA C104 except that the lining thickness shall be not less than 1/8 of an inch. The pipe interior surfaces shall be smooth and free from factures, excessive crazing, and roughness.
 - B. Pipe supplier shall provide cement mortar mix with pipe for field joint repair which shall be NSF 61 certified. As an alternative Hydrakrete-61 by HydraStone may be used for field repairs of joints.

2.13 GASKETS:

- A. Gaskets for push-on type joints or MJ type joints shall be supplied by pipe, fitting, or restraint manufacturer.
- B. Flange gaskets shall be synthetic rubber gaskets for flanged joints in accordance with AWWA C111 and ASME B16.21. Pipe flanges shall be flat faced flanges and gaskets shall be 1/8-inch thick, full faced type. Gaskets shall be Class 250 and shall be Flange-Tyte by U.S. Pipe.

2.14 BOLTS AND NUTS

- A. All flanges, both buried and exposed, shall have stainless steel nuts and bolts as follows: Bolts shall have ASME B1.1, Class 2A threads, and be manufactured of ASTM A193, Grade B8M and conform to ASME B18.2.1, and nuts shall have Class 2A fit, square or hex heavy dimensions in accordance with ASME B18.2.2, and be manufactured of ASTM A194, Grade 8B heavy hex.
- B. Buried bolts and nuts shall be wax tape coated per Section 33 10 00 Water Utilities.

PART 3 - EXECUTION

3.01 HANDLING AND CUTTING:

- A. Mark pipe and fittings "Rejected" and remove from site when cracked or has received a severe blow.
- B. If permitted, cut on sound barrel at a point at least 12 inches from visible limit of crack, at Contractor's expense.
- C. Machine cut with milling type cutters, knives, or saws. Snap cutters, torch, or hammer and chisel NOT ALLOWED. Examine for possible cracks.
- D. Chamfer cut ends if used for push-on joints.

3.02 INSTALLATION:

- A. Visually inspect before installation.
- B. Ensure pipelines parallel to building walls wherever possible. Install piping to accurate lines and grades. Where temporary supports are used, ensure rigidity to prevent shifting or distortion of pipe. Provide for expansion where necessary.
- C. Pitch piping toward low points. Provide for draining low points.
- D. Before assembly, remove dirt and chips from inside pipe and fittings.
- E. Piping Support: Provide in accordance with Section 40 23 19.01.

F. Pipe and Fittings:

1. Remove and replace defective pieces.
2. Clear of all debris and dirt before installing and keep clean until accepted.
3. Lay accurately to lines and grades indicated or required. Provide accurate alignment, both horizontally and vertically.
4. Provide firm bearing along entire length of buried pipelines.

G. Temporary Plugs: When pipe laying not in progress, close open ends of pipe with temporary watertight plugs. If water in trench, do not remove plug until danger of water entering pipe passed.

H. Appurtenances: Set valves, fittings and appurtenances as indicated.

I. Pipelines shall be sealed at the end of every workday to prevent water, dirt, and animal intrusions into the pipe.

J. Pipelines installed for fire service shall be installed per NFPA 24 Standard for the Installation of Private Fire Service Mains and Their Appurtenances.

3.03 JOINTS AND COUPLINGS:

A. Push-on Joints:

1. Insert gasket into groove bell. Apply thin film of nontoxic gasket lubricant over inner surface of gasket in contact with spigot end.
2. Insert chamfered end into gasket. Force pipe past it until it seats against socket bottom.

B. Bolted Joints:

1. Remove rust-preventive coatings from machined surfaces.
2. Clean pipe ends, sockets, sleeves, housings, and gaskets and smooth all burrs and other defects.
3. Use torque wrench to tighten to correct range of torque not to exceed values specified below:

Torque Range Values		
Nominal pipe size, in	Bolt diameter, in	Range of torque, ft-lb
3	5/8	40-60
4-24, incl.	3/4	75-90
30, 36	1	100-120
42, 48	1-1/4	120-150

C. FLANGED JOINTS

1. Flange joints shall be assembled per the gasket manufacturer's instructions and as specified herein. Utilize calibrated bolting equipment capable of applying a measured torque to flange bolts during joining. Bolting patterns, procedures, and bolting equipment data shall be submitted prior to pipe fitting and bolting.
2. Gaskets, bolts, and anti-seize lubricant used in the bolting procedure shall be selected from those specified herein. Submit target torque calculations for each application. Calculations shall identify specific gasket (manufacturer, model, size, configuration, material), bolts (size and material), and anti-seize lubricant. The calculations shall document and take into consideration the pipe service, working and test pressures, pipe diameter, gasket data sheet, bolt material, gasket supplier-recommended assembly stress, and gasket-supplier recommended bolt stress. Calculations shall be stamped by a professional engineer. Target torque calculations shall be used in the assembly of bolted joints.
3. Flange bolts, nuts, and washers shall be visually inspected and cleaned prior to bolting. Lubricate bolts and nuts; if hardened washers are not used, lubricate the flange surface around the bolt holes. This lubricant must be removed by cleaning solvent prior to applying a coating system. Hand-tighten all nuts and bolts then tighten them to 10 to 20 percent of the target torque. The initial torque shall not exceed 20 percent of the target torque. The bolts shall be tightened according to the pattern included in AWWA Manual M11, Figure 12-3.
4. For flanges having 4 to 8 bolts there shall be three rounds of tightening, after hand tightening, to 30 percent, 60 percent and then 100 percent of the target torque. For flanges having 12 or more bolts there shall be four rounds of tightening, after hand tightening, to 20 percent, 40 percent, 80 percent and 100 percent of the target torque. At 100 percent of target torque the flange gap shall be measured at every other bolt to confirm uniformity. The bolts shall be re-tightened to the target torque 24 hours after completion of the initial bolting sequence.

D. Mechanical Joints:

1. Wire brush surfaces in contact with gasket and clean gasket.
2. Lubricate gasket, bell, and spigot with soapy water.
3. Slip gland and gasket over spigot and insert spigot into bell until seated.

4. Seat gasket and press gland firmly against gasket.
5. After bolts inserted and nuts made finger-tight, tighten diametrically opposite nuts progressively and uniformly around joint by torque wrench. Torque bolts to values specified above.

3.04 FIELD TESTING:

- A. Contractor shall provide additional temporary blow-off valves and fittings as required to flush and disinfect new pipelines. Temporary blow-off valves and fittings shall be removed prior to placing pipeline into service.
- B. Source of Water: Contractor shall assume all responsibility to obtain the necessary water supplies for pressure testing of the pipeline.
- C. Testing Procedure:
 1. Pipe shall be tested at a static pressure of 225 psi for 2 hours and in accordance with the AWWA C600 standards. Pipe shall be tested in segments such that the test pressure at the low point of the segment shall be 225 psi, and the minimum pressure at the high point in the segment shall be 200 psi.
 2. In the case of pipelines that fail to pass the leakage test, Contractor shall determine the cause of the excessive leakage, shall take corrective measures necessary to repair the leaks, and shall repeat the pipeline test, all at no additional cost to Owner.
 3. Engineer shall be notified at least 48 hours before the pipeline is to be tested so that Engineer may be present during the test.
- D. Pressure and Leak Test
 1. Contractor shall test all piping either in sections or as a unit. The test shall be made by placing temporary bulkheads as needed in the pipe and filling the line slowly with water. Care shall be taken to see that all air vents are open during the filling. Bulkheads, valves, and connections shall be examined for leaks. If any leaks are found, corrective measures satisfactory to Engineer shall be taken. The test shall consist of holding a minimum pressure as shown on the Contract Drawings in the section being tested for a minimum period of two hours using either pneumatic or hydraulic means to maintain the pressure. Suitable means shall be provided by Contractor for determining the quantity of water lost by leakage under the test pressure. The testing allowance is defined as the quantity of water that must be applied to the pipe section being tested to maintain a pressure within 5 psi of the specified hydrostatic test pressure. The maximum allowable leakage shall be defined as follows:

$$L = SD(P)^{1/2}/148,000$$

L = Testing allowance (makeup water) in gallons per hour of test

S = Length of pipe in feet

D = Nominal diameter of pipe in inches

P = Average Test Pressure in pounds per square inch (gauge)

3.05 DISINFECTING AND FLUSHING:

- A. Provide in accordance with Section 33 13 00 Disinfecting of Water Utility Distribution.

3.06 PAINTING

- A. All exposed piping including inside vaults shall be painted as specified in Section 09 96 00 High Performance Coatings.

3.07 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 19.05

PROCESS PIPING AND APPUTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide process piping and apprtuenances inside and within 5 feet from buildings and structures. Provide and test process piping and appurtenances as indicated and in compliance with Contract Documents.
- B. Options:
 - 1. For buried exterior pipelines provide push-on joint pipe.
 - a. Provide restrained push-on pipe as specified
 - b. Provide either restrained push-on joint fittings as specified and indicated or provide mechanical joint fittings with restraint system as specified herein
 - 2. For piping exposed as in buildings and galleries, provide flanged or rigid-joint, grooved-coupled pipe and fittings.
 - 3. Cast iron pipe and fittings are not acceptable

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Pipe manufacturer's technical specification and product data.
2. Submit manufacturer's certificates of conformance.
3. Submit certified copies of test reports.
4. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.
 - a. Pipe layouts in full detail.
 - b. Location of hangers and supports.
 - c. Location and type of anchors.
 - d. Location of couplings and expansion joints.
 - e. 1/2-inch = 1 foot-0 inches scale details of all wall penetrations and fabricated fittings or special fittings.
 - f. Schedules of pipe, fittings, special castings, couplings, expansion joints and other appurtenances.
5. Catalog cuts and technical data of joints, couplings, harnesses, expansion joints, gaskets, pipe supports, fasteners and other accessories.
6. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.
7. Certificates: Sworn certificates in duplicate showing compliance with material used and shop tests performed with appropriate standard.
8. Reports of ASME Section IX welding certifications.
9. Brochures and technical data on coatings and linings and proposed method for application and repair.
10. Provide record drawings.
11. Provide tag names and numbers for all sections of piping and fittings.

B. Grooved joint couplings and fittings: Provide product submittals with products specifically identified by the manufacturer's style or series designation.

1. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.
2. Shop drawing data for accessory items.
3. Manufacturer's literature as needed to supplement certified data.
4. Operating and maintenance instructions and parts lists.
5. Schematic control and power wiring diagrams.
6. Shop and Field inspections reports.
7. List of recommended spare parts other than those specified.
8. Recommendations for short and long term storage.
9. Special tools.
10. Shop and field testing procedures and equipment to be used.
11. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.
12. The latest ISO 9001 series certification or quality system plan.

C. Material Certification:

1. Provide certification from the piping and equipment manufacturers that the materials of construction specified are recommended and suitable for the service conditions specified and as indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

D. A copy of the contract mechanical process, civil, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

1. Failure to include all drawings applicable to the equipment specified in this section will result in submittal return without review.

- E. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
 - 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

1.04 QUALITY ASSURANCE:

- A. Provide in accordance with Section 01 43 00 and as specified.
- B. Provide manufacturer's certification in writing that materials meet or exceed minimum requirements as specified.
- C. Inspect and test at foundry according to applicable standard specifications.
- D. Owner reserves right to inspect and test by independent service at manufacturer's plant or elsewhere at Owner's expense.
- E. Visually inspect before installation.
- F. Welder Qualifications:
 - 1. Qualify and certify welding procedures, welders, and operators in accordance with ASME Section IX for shop welding and AWS D1.1 for project site welding of piping work.
 - 2. Qualification for welders: Welding shall be performed by welders holding current certification for the welding procedures in use.
 - 3. Visually inspect welding while the operators are making the welds and again after the work is completed. After the welding is completed, hand or power wire brush welds and clean them before the inspector makes the check inspection. Inspect welds for defects exceeding tolerances allowed by code under which the weld was made. Repair all defects exceeding tolerance.
- G. Provide all grooved joint couplings, fittings, valves, and specialties to be the products of a single manufacturer. Grooving tools used must be of the same manufacturer as the grooved components.
 - 1. Provide all castings used for coupling housings, fittings, and valve bodies date stamped for quality assurance and traceability.

H. Job Conditions:

1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps, and other equipment to be installed in piping system.

1.05 DELIVERY, STORAGE AND HANDLING:

- A. Provide in accordance with Section 01 66 10.
- B. During loading, transportation and unloading, prevent damage to pipes and coatings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation to protect pipe, lining, and coating.

PART 2 - PRODUCTS

2.1 ALL PIPES AND FITTINGS:

- A. Provide pipe and fittings with the NSF/ANSI 61 seal of approval for potable water applications as required.

2.2 DUCTILE IRON PIPE AND FITTINGS:

- A. Provide in accordance with Section 40 23 19.04.

2.3 STAINLESS STEEL PIPE AND FITTINGS 2-1/2-INCH AND LARGER:

A. Manufacturers:

1. Douglas Brothers
2. Felker
3. J.F. Ahern
4. Dixie Southern
5. Alaskan Copper and Brass Company
6. Merit Brass

B. Material:

1. Type 316L sheet and plate per ASTM A240.
2. Maximum carbon content of 316L material limited to 0.03 percent.

C. Finish:

1. 2D

D. Fabrication:

1. Fabricate in accordance with ASTM A778 in NPS sizes shown with dimensional tolerances per ASTM A530.
2. Perform welding by qualified welders conforming to standard procedures. Weld piping with wall thickness up to 11 gauge, 0.125-inch, with the TIG (GTAW) process. Properly bevel heavier walls and use a root pass with the TIG (GTAW) process followed by subsequent passes with the TIG (GTAW), MIG (GMAW), or Metallic Arc (SMAW) process.
3. Add filler wire of ELC grades to all welds to provide a cross section at the weld equal to or greater than the parent metal. Distribute smooth and evenly weld deposit and provide a crown of no more than 1/16-inch on the I.D. and 3/32 inch on the O.D. of the piping.
4. Concavity, undercut, cracks or crevices are not acceptable.
5. Butt Welds: Full penetration to the interior surface, with inert gas shielding provided to the interior and exterior of the joint.
6. Remove excessive weld deposits, slag, spatter, and projections by grinding.
7. Continuously weld angle face rings on both sides to the pipe or fitting.
8. Grind all welds on gasket surfaces smooth.
9. Contour pipe branches, taps and bosses to the radius of the main pipe run and bevel and weld with full penetration. No projections to the inside of the branch or main run are acceptable. Provide a smooth transition from ID of run to ID of branch.
10. Wire-brush inside and outside weld areas with brushes of stainless steel that are specifically designed to be used only on stainless steel.
11. After manufacture, passivate stainless steel pipe, fittings, and appurtenances by immersion in a pickling solution of 6 percent nitric acid and 3 percent hydrofluoric acid. Temperature and detention time to be sufficient for removal of oxidation and ferrous contamination without more than superficial etch of surface. Perform a complete neutralizing operation by immersion in a trisodium phosphate rinse followed by clean water wash. Perform in accordance with ASTM A380.
12. After fabrication, either passivate by immersion (see above paragraph) or scrub interior and exterior of welds with same solution or pickling paste and stainless steel wire brushes to remove weld discoloration and then neutralize and wash clean. Perform in accordance with ASTM A380.
13. Perform all welding in the shop. Field welding is not acceptable.

- a. If field welding is allowed for certain circumstances, the Contractor shall submit the welders qualifications and an acceptable method of cleaning the pipe and fittings for review prior to start of any field welding.
14. Fittings: Butt weld type manufactured in accordance with ASTM A774 of the same raw material and in the same thicknesses as the pipe. Socket weld fittings are not acceptable.
 - a. Elbows up to 24-inch diameter: Provide smooth flow-die formed, long radius; with centerline to end of elbow equal to 1.5 times the nominal pipe size.
 - b. All short radius, special radius, and reducing elbows and long radius elbows greater than 24-inch diameter: Fabricate with pieces in accordance with the following table with dimensions in accordance with AWWA C208:

Bend, degrees	Number of Pieces
0 to 22.5	2
23 to 45	3
46 to 67.5	4
68 to 90	5

15. Fabricate tees and branch connections true and square with wall thickness same as pipe.
16. Reducers evenly tapered with tangent ends for butt weld connection.
 - a. Reducers may be straight tapered cone construction.
17. Secure flanges to pipe ends and plug openings prior to shipment.

E. Design:

1. Stainless steel pipe: Nominal pipe size diameter pipe fabricated of stainless steel sheets having the following Schedule, U.S.S. gauges and plate thickness:

Nominal Pipe Size inches	Actual O.D. inches	Schedule/Gauge/Plate	Nominal Wall Thickness inches
2.5	2.875	SCH 5S or 10S	0.083
3	3.500	SCH 5S or 10S	0.083
4	4.500	SCH 5S or 10S	0.083
6	6.625	SCH 5S or 10S	0.109
8	8.625	SCH 5S or 10S	0.109
10	10.750	12 Ga. Sheet	0.109
12	12.750	12 Ga. Sheet	0.109
14	14.000	11 Ga. Sheet	0.125
16	16.000	11 Ga. Sheet	0.125
18	18.000	11 Ga. Sheet	0.125

Nominal Pipe Size inches	Actual O.D. inches	Schedule/Gauge/Plate	Nominal Wall Thickness inches
20	20.000	10 Ga. Sheet	0.140
24	24.000	3/16 inch Plate	0.188
28	28.000	3/16 inch Plate	0.188
30	30.000	3/16 inch Plate	0.188
36	36.000	3/16 inch Plate	0.188
42	42.000	1/4 inch Plate	0.250
48	48.000	1/4 inch Plate	0.250
54	54.000	5/16 inch Plate	0.312
60	60.000	5/16 inch Plate	0.312
66	66.000	1/2 inch Plate	0.500
72	72.000	1/2 inch Plate	0.500
84	84.000	1/2 inch Plate	0.500

2. For buried piping use a minimum SCH 10S or as indicated in the Process Piping Schedule.
3. Joints: Flanged or, bolted split sleeve type couplings as indicated and specified. Split couplings requiring cut or roll grooving of the pipe not allowed unless specifically called for.
4. Flanged Joints: Van Stone back-up flange type, ANSI Class 150 lb. (PN10).
5. Provide stainless steel back-up flanges of the grade of pipe specified with the following thickness. Galvanized steel and ductile iron flanges are not acceptable.

Pipe Size, inches	Flange Thickness, inches
2.5, 3 and 4	0.375
6 and 8	0.500
10 to 18	0.750
20 and 24	0.750
28	0.875
30	0.875
36	1.000
40	1.125
42	1.125
48	1.250
54	1.375
60	1.500
66	1.625
72	1.625

6. Hardware: Type 316 stainless steel.

7. Fabricate flanged joint face rings fabricated of rolled stainless steel angles.
8. Use angle face rings with thickness equal to or greater than the wall of the pipe or fitting to which it is welded. Continuously weld on both sides to the pipe or fitting. Fabricate angle legs so as not to interfere with the flange bolt holes.
9. Isolate stainless steel flanges from all other ferrous metal connections at valves, flanges and equipment with flange insulating kit.
 - a. Pipe Flange Insulating Kit:
 - (1) Flange gasket: Type E, 1/8-inch thick NEMA Grade G-10 reinforced epoxy retainer with two seals of the following material:
 - (a) Potable Water: Teflon or EPDM, NSF61 certified.
 - (b) Wastewater and Residuals: Nitrile.
 - (c) Aeration Systems: EPDM.
 - (2) Insulating sleeves: 1/32-inch thick NEMA Grade G-10, full length, one for each flange bolt.
 - (3) Insulating washers: 1/8-inch thick NEMA Grade G-10, two for each flange bolt.
 - (4) Mechanical washers: 1/8-inch thick Type 316 stainless steel, two for each flange bolt.
 - (5) Manufacturers:
 - (a) Trojan Insulating Gasket Advance Products and Systems.
 - (b) Or equal.

2.4 STAINLESS STEEL PIPE AND FITTINGS 1/2-INCH TO 2-INCH:

- A. Provide either Pressfit, grooved or a socket welded system.
 1. Provide a sufficient number of unions for Vic-Press and socket welded systems to allow removal of all valves and inline devices.
 2. Provide threaded connections only where required.
- B. Vic-Press Schedule 10S System:
 1. Vic-Press system, 1/2-inch through 2-inch Schedule 10S comprised of stainless steel Vic-Press fittings, couplings and pipe.

2. Type 316 stainless steel Pressfit couplings and fittings and Type 316 stainless steel Pressfit pipe UL classified to ANSI/NSF 61 for cold +86 degrees F and hot +180 degrees F potable water service.
 - a. Maximum working pressure of 500 psi for water, oil, gas, chemical, air and vacuum services.
3. Couplings, Fittings: Pressfit products formed of Type 316/316L stainless steel tubing including a self-contained o-ring seals molded of synthetic HNBR rubber suitable for water operating temperatures to +210 degrees F.
4. Valves 1/2-inch through 2-inch ball valves with Type 316 stainless steel plain ends for Pressfit assembly. Victaulic Series 569.
 - a. Pressure Rating: 300 PSI.
 - b. CF8M stainless steel body and ball
 - c. Type 316 stainless steel stem
 - d. PTFE seats.
5. Pipe: Type 316/316L ASTM A312 stainless steel
 - a. Schedule 10S.

C. Socket Welded System:

1. Schedule 40 Type 316L stainless steel pipe and fittings with socket welded connections.

D. Grooved System:

1. Schedule 10S type 316L stainless steel pipe and fittings with Type 316 stainless steel grooved end connections and couplings.
2. Fittings: ASTM A403 or be factory fabricated from ASTM A312 stainless steel pipe.
3. Provide couplings consisting of ductile iron or stainless steel housings, with pressure responsive elastomer gasket.
 - a. Rigid Type: Victaulic Style 489 (SS) or equal.
 - b. Flexible Type: Victaulic Style 77S (SS) or equal.
 - c. Installation-Ready, for sizes through 4 inches, with ductile iron housings. Victaulic Style 107H (rigid) and Style 177 (flexible) or equal.
 - d. 14-inch and Larger: AGS Series, with lead-in chamfer on housing key and wide width FlushSeal gasket. Victaulic Style W89 (rigid) or equal.

2.5 SEAMLESS COPPER TUBE

A. Materials:

1. Pipe, fittings, and solder shall be lead-free and certified to NSF 61 and NSF 372. Letters of conformance to lead-free standards will not be acceptable.
2. Seamless copper water tube ¼-inch to 4-inch diameter shall be furnished in wall thickness Type L (blue marking) or K (green marking), as scheduled or shown on the Drawings, and meet the material and dimensional requirements included in ASTM B88.
3. Seamless Alloy HWT copper water tube, shall have the H58 drawn temper suitable for use with wrought copper soldered-joint, brazing cup fittings, pressfit and grooved-joint fittings. This tube shall be furnished in straight lengths and shall not be installed by bending.
4. Seamless Alloy OWT copper water tube shall be furnished in rolls, or straight-lengths and have the O50 light-annealed temper for use with wrought solder-joint, brazed, flared and compression fittings.

B. Fittings:

1. Cast copper soldered (sweat)-joint fittings for copper tube shall be manufactured in accordance with ASME B16.18. Cast fittings shall be manufactured of the same material as the connecting pipe.

C. Solder:

1. Alloy Sn96 solder shall be 96 percent Tin and 4 percent Silver and lead free. Alloy Sn96 shall meet all of the requirements of the latest revision of the US-EPA Safe Drinking Water Act. Alloy Sn96 solder shall be used with lead free tinning flux paste containing 95 percent Tin/5 percent Antimony solder powder. The flux shall be approved for use with Sb5 solder metal alloy specified herein. The temperature range for this flux shall be 400 to 700 degrees F. Flux and solder shall be NSF 61 and 372 certified.

2.6 SEAMLESS RED BRASS PIPE

A. Materials:

1. Pipe, fittings, and solder shall be lead-free and certified to NSF 61 and NSF 372. Letters of conformance to lead-free standards will not be acceptable.
2. Seamless Alloy 230 red brass pipe, ¼- to 4-inch diameter, Class 125 (strong) and Class 250 (extra-strong), shall meet the dimensions, weight and tolerances included in ASTM B43. Seamless Alloy 230 pipe shall be furnished in the O61 annealed temper.
3. Pipe shall be furnished in straight lengths, suitable for threading and use with cast bronze threaded fittings. Threaded ends of nipples shall be in conformance with ASME B1.20.1.

4. Threaded nipples shall conform to ASME B1.20.1.

B. Fittings:

1. Cast Threaded Joint Fittings: Cast bronze per ASTM B62, ASME B16.15. Threads adhering to ASME B1.20.1.
2. Unions: Brass bodies per ASTM B16

2.7 CPVC PIPE AND FITTINGS:

A. Schedule 80.

B. Material: Type IV, Grade I Chlorinated Polyvinyl Chloride (CPVC) compound with a Cell Classification of 23447 per ASTM D1784.

C. Provide pipe and fittings manufactured in compliance to ASTM F441 meeting the Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.

D. Provide pipe and fittings produced in the USA using domestic materials, by an ISO 9002 certified manufacturer, and shall be stored indoors after production, at the manufacturing site, until shipped from factory.

E. Joining:

1. Solvent cementing process.
2. Use only Weld-On 724 for all sodium hypochlorite services.
3. Provide flanges at valves pumps and equipment only or as indicated and specified.
4. Threaded connections are not acceptable.
5. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochlorite use titanium.

2.8 PVC PIPE AND FITTINGS:

A. Schedule 80

B. Material: Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.

C. Provide pipe and fittings manufactured in compliance to ASTM D1785 meeting and/or exceeding the Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.

- D. Provide pipe and fittings manufactured in the USA, using domestic materials, by an ISO 9002 certified manufacturer. Store all pipe shall be stored indoors after production at the manufacturing site until shipped from factory.
- E. Provide standard lengths of pipe sizes 10-inch and larger beveled each end by the pipe manufacturer.
- F. Joining:
 - 1. Solvent cementing process.
 - 2. Provide flanges at valves, pumps and equipment only or as indicated and specified.
 - 3. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochlorite use titanium.

2.9 PVC CLEAR PIPE AND FITTINGS:

- A. Schedule 80 Clear pipe
- B. Material: Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.
- C. Provide pipe and fittings manufactured in compliance to ASTM D1785, consistently meeting and/or exceeding the applicable Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.
- D. Provide pipe and fittings manufactured in the USA by an ISO 9002 certified manufacturer.
- E. Provide all Clear PVC pipe and fittings packaged immediately after its manufacture to prevent damage, and stored indoors at the manufacturing site until shipped from factory.
- F. Joining:
 - 1. Solvent cementing process. Use a clear, medium-bodied, fast-setting cement in conjunction with a clear primer for optimum joint integrity, such as IPS Weld-on 705 Clear cement and IPS Weld-On P-70 Clear primer or acceptable equivalent product.
 - 2. Clear female threaded transition fittings, incorporating a Type 316 stainless steel retaining ring. Provide all threaded joints with three wraps of tape in the direction of the threads on the male end, followed by one to two turns beyond finger tight.
 - 3. Standard rigid thermoplastic pipe fittings with flanges, molded grooved coupling adapters and unions.
 - 4. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochlorite use titanium.

2.10 STEEL PIPE AND FITTINGS 10-INCH AND SMALLER:

- A. Materials: Carbon steel, ASTM A53, Schedule 40, 80 or 120 black or galvanized as indicated in the Process Piping Schedule.
- B. Joints:
 - 1. Pipe 2-1/2 inch and smaller: Screwed joints using malleable-iron fittings, black or galvanized, to match pipe.
 - 2. Pipe 3-inch and larger: Welded joints and butt-weld steel fittings.
 - 3. Pipe 2-inch and larger: Grooved joints and fittings.
 - 4. Provide flanged connections to equipment and valves with 150-lb. (Class 150) weld neck flat faced flanges.
 - 5. Welding of pipe within classified areas in operation is not acceptable. Provide shop fabricated sub-assemblies and install with flanges or grooved-couplings as specified and indicated.
- C. Fittings:
 - 1. 2-1/2-inch and smaller: Screwed type, 150-lb. (Class 150) malleable iron, black or galvanized to match the pipe, ASTM A197 or A47, conforming to ASME B16.3. Unions of 150-lb. (Class 150) malleable iron with brass to iron seat.
 - 2. 3-inch and larger: Butt welded carbon steel to match pipe wall thickness, ASTM A234, conforming to ASME B16.9 standards.
 - 3. 2-inch and larger: Grooved end fittings; Ductile iron ASTM A536 Grade 65-45-12; Wrought steel ASTM A234 Grade WPB; or Factory-fabricated from steel pipe conforming to ASTM A53.
- D. Grooved Joint Couplings: Provide couplings consisting of two ductile iron housing segments to ASTM A536, pressure responsive gasket to ASTM D2000, and Type 316 stainless steel bolts and nuts. Provide couplings complying with ASTM F1476 Standard Specification for the Performance of Gasketed Mechanical Couplings for Use In Piping Applications.
 - 1. Rigid Type: Provide coupling housings cast with offsetting angle-pattern bolt pads to provide joint rigidity and support and hanging in accordance with ASME B31.1 and B31.9 or equal.
 - a. Victaulic Style 107H, Installation-Ready, for direct stab installation without field disassembly, with grade EHP gasket, suitable for water service to +250 degrees F.
 - b. Victaulic Style 07 "Zero-Flex" or equal

2. Flexible Type: For use in locations where vibration attenuation and stress relief are required, and for the elimination of flexible connectors. Victaulic Installation-Ready Style 177 or Style 77 or equal.
3. 14-inch and Larger: AGS Series, with lead-in chamfer on housing key and wide width FlushSeal gasket. Victaulic Style W07 (rigid) and Style W77 (flexible) or equal.

E. Branch Connections:

1. 2-inch and smaller connections to welded pipe: Screwed, forged carbon steel, ASTM A105, 3,000-lb. half-couplings or welding saddle with threaded outlet.
2. 2-1/2-inch and larger pipe connections: Tees or reducing tees. Butt welded carbon steel to match pipe wall thickness, ASTM A181 GR1 or A105 GR1, conforming to ASME B16.1 standards.

F. Flanges: Forged steel, ASTM A181.

1. Slip-on or welding neck type as specified and indicated.
2. Provide 150-lb. (Class 150) flanges drilled and faced.
3. Raised face type: 1/16-inch raised faced in accordance with ASME B16.5.
4. Flat-face, welding neck type: ASME B16.1 Standard for all connections to valves and equipment.
5. Gaskets: For flanged joints, 1/16 inch thick suitable for the service specified and indicated.
6. Flange Adapters: Flat face, ductile iron housing with elastomer pressure responsive gasket, suitable for direct connection to ANSI Class 125 or 150 flanged components. Victaulic Style 741 / W741 or equal.

2.11 STEEL PIPE AND FITTINGS 12-INCH AND LARGER:

1. Provide in accordance with Section 40 23 19.03.

2.12 HDPE PIPE AND FITTINGS:

A. Manufacturers:

1. Independent Pipe Products
2. JM Eagle
3. WL Plastics
4. Performance Pipe

B. Provide iron pipe size high density polyethylene pipe and fittings.

1. Size range: 4-inch to 42-inch.
2. Working Pressure: 50 psi.
3. DR: see schedule
4. Joints:
 - a. Butt heat fusion.
 - b. Flanged: Provide at all equipment, valves, tanks and wall penetrations.
5. Flanged Connections: Van Stone type with HDPE flange and bolt ring as specified.
 - a. Bolt Torque: Install in accordance with Plastic Pipe Institute, Inc Technical Note #38.
6. Fittings:
 - a. 90 Degree Bends: Provide 5 piece HDPE segmented elbows.
 - b. 45 Degree Bends: Provide 3 piece HDPE segmented elbows.
 - c. Concentric Reducers: HDPE three section traditional type design, compact reducers are not acceptable.
 - d. For pump suction eccentric reducers provide flanged glass lined ductile iron or flanged Type 316L stainless steel as indicated.
 - e. Provide stiffeners where required.

C. Materials:

1. Pipe and Fittings: Material designation PE4710 in accordance with ASTM D3035 or PE3048 in accordance with ASTM D3350.
2. Bolt Rings: Type 316 stainless steel ASTM A531 Grade CF8M.
3. Hardware: Type 316 stainless steel.

2.13 CHEMICAL TUBING AND FITTINGS – BRAIDED PVC:

A. Manufacturers:

1. Accuflex
2. Dura-Pure

B. Tubing:

1. Provide braided reinforced flexible PVC tubing resistant to the chemical specified.
2. Tubing to allow tight compression fittings for leak proof connections.
3. Tubing to comply with FDA standards.
4. Tubing to handle a maximum of 130 psi at 70 degrees F.

C. Fittings:

1. Provide no flow restriction compression fittings when connecting pieces is required.
2. Provide transition connections as detailed on the drawings.

2.14 CHEMICAL TUBING – POLYETHYLENE TUBING:

A. Construction:

1. Provide polyethylene tubing resistant to the chemical specified in accordance with AWWA C901. Provide hoses that are suitable for suction and discharge applications.
2. Tubing to allow tight compression fittings for leak proof connections.
3. All tubing and fittings shall be designed for a working pressure of 150 psi at 70 degrees F.
4. All tubing and accessories shall be new materials in first-class condition. Used or recycled materials will not be allowed, regardless of condition.
5. Tubing shall include markings for manufacturer and trademark, manufacturing data code, nominal size and DR ratio, pressure class and certifications.

B. Fittings:

1. Parker Fast Tite, or approved equal
2. Provide no flow restriction compression fittings when connecting pieces is required.
3. Provide transition connections as detailed on the drawings.

C. Leak Detection:

1. For double contained pipe, provide above ground leak detection stations as indicated on drawings or as specified. At a minimum provide one leak detection station at each piping low point. Slope pipe to leak detection stations.

D. Materials:

1. Tube: Type T (FEP) Teflon with crosslinked polyethylene backing.
2. Reinforcement: Synthetic textile with steel helix.
3. Cover: EPDM.

E. Sizes:

1. 3/4-inch through 2 inch: 200 psi.
2. 2.5 and 3 inch: 150 psi.
3. 4 inch 125 psi.
4. 3/4 inch through 4 inch: 30 in Hg vacuum.

F. Coupling: Provide type and materials as recommended by the hose manufacturer for the service conditions specified and indicated.

1. For sodium hypochlorite provide flanged connection.

2.15 CHEMICAL DIFFUSERS:

- A. 2-inch Schedule 80 PVC, in accordance with Paragraph 2.06.
- B. 5/16-inch diameter holes at 9-inch on center. Refer to drawings for construction.

2.16 PRESSURE GAUGES:

A. Gauges:

1. Non-liquid filled type.
2. Helical wound bourdon tube, Inconel X-750.
3. Welded parts: Type 316 stainless steel.
4. Bearings: Precision Sapphire Type.
5. 1/2-inch NPT bottom male thread connection.
6. Accuracy: 1/2 percent of scale range.
7. 4-1/2-inch diameter with ABS plastic case.
8. Provide external adjustment.
9. Pipe and Fittings: Schedule 5 Pressfit or Schedule 40 threaded or socket welded, Type 316L stainless steel.

10. Pump Suction Gauges: Provide gauges with range to cover both the normal operating range and the range of pressures that will result from flushing.
 11. Pump Discharge Gauges: Provide gauges with range to cover the normal operating range, above the pump shutoff head and the range of pressures that will result from flushing.
 12. Seal Water Gauges: Provide gauges with range to cover both the normal operating range and the range of pressures that will result from flushing.
 13. Double Wall Stainless Steel Expansion Joint Gauges: Provide gauges with ranges to suit process line pressure as specified and indicated for the service specified in the Process Piping Schedule.
- B. Pipe and fittings: Type 316L stainless steel, provide as specified herein.
- C. Ball valves: General service stainless steel ball valves in accordance with Section 40 23 13.01.
- D. Pressure Sensor Rings:
1. 1-inch and Larger: Provide sensor/isolators that fit inside the bolt circle of 150-lb (Class 150) or 300-lb (Class 300) ANSI flanges as required.
 2. 3/4-inch and Smaller: Provide sensor/isolators full flange or threaded as specified and indicated. For chemical system provide full flange, threaded connections are not acceptable.
 3. Face to face length of the sensor: Conform to Specification MSS-SP67.
 4. Type: Flow through design with flexible sleeve around full circumference. The center section shall have a cavity behind the sleeve filled with silicone fluid to transfer pressure to the gauge.
 5. Rigidly support all pressure instruments by a post at least 7/8 inch diameter welded to the isolator. On sensor rings with more than one instrument, provide all connections 1/2-inch NPT as a minimum, 1/4-inch NPT fittings are not acceptable.
 6. Provide sensor/isolator rings that do not have any fill plugs or valves that can be inadvertently removed with the resultant loss of fill fluid. Pressure sensor/isolators using valves are not acceptable.
 7. Provide liquid filled sensor/isolators permanently vacuum sealed at the factory with a modular seal consisting of a membrane and needle fitting to allow removal and replacement of pressure instruments without compromising the vacuum fill. Sensor/isolators using valves are not acceptable.
 8. Provide the needle fitting with both 1/4-inch NPT(F) threads and 1/2-inch NPT(M) threads.

9. Provide the pressure sensor/isolator capable of operating under pressure with all pressure instruments removed with no loss of fill fluid. Provide an intergral block valve, separate isolation valves are not acceptable.
10. Attach pressure instruments to the isolator with a hand tightened lock ring.
11. It shall be possible to remove or attach pressure instruments to the isolator without requiring the use of any tools.
12. Permanently fill the pressure sensor with high viscosity silicone instrument oil to damp out surges or pressure spikes without the requirement for a separate snubber.
13. Pressure rating: 200 psi minimum for all lines tested at 150 psi or less and 600 psi minimum per lines tested above 150 psi.
14. Provide gauges as specified herein. Provide all other types of instruments indicated and specified in accordance with Section 40 90 00.
15. Materials:
 - a. Pressure sensor/isolator rings: Provide materials suitable for the service conditions specified and indicated, as a minimum provide the following

Service	Body & Plates	Sleeve
Water	Type 316L Stainless Steel	Natural Rubber
Wastewater	Type 316L Stainless Steel	Natural Rubber
Sludge	Type 316L Stainless Steel	Natural Rubber
Scum	Type 316L Stainless Steel	Natural Rubber
Septage	Type 316L Stainless Steel	Natural Rubber
Grit	Type 316L Stainless Steel	Natural Rubber
Sodium Hypochlorite	Titanium	EPDM
Sodium Bisulfite	Type 316L Stainless Steel	EPDM
Sodium Hydroxide	Type 316L Stainless Steel	EPDM
Ferric Chloride	Kynar Coated Steel	EPDM
Potassium Permanganate	Type 316L Stainless Steel	Natural Rubber
Lime	Type 316L Stainless Steel	Natural Rubber
Polymer	Type 316L Stainless Steel	Viton
Bioxide	Type 316L Stainless Steel	Buna-N
Methanol	Type 316L, Stainless Steel	Viton Type F

2.17 PRESSURE AND FLOW INSTRUMENTATION:

- A. Provide Pressure Instrumentation in accordance with Section 40 73 00.
- B. Provide Flow Instrumentation in accordance with Section 40 71 00.

2.18 WATER PRESSURE REGULATORS 1/2-INCH THROUGH 1-INCH:

- A. Provide in accordance with Section 40 23 13.01.

2.19 COUPLINGS-SLEEVE TYPE:

- A. Manufacturers:

- 1. Romac
- 2. Smith Blair
- 3. Viking Johnson
- 4. Dresser

- B. Provide couplings meeting AWWA C219

- C. Couplings 12-inch and smaller:

- 1. End rings and center rings: ASTM A536 ductile iron, fusion bonded epoxy coated
- 2. Gaskets: Buna-N, NSF/ANSI 61 approved
- 3. Hardware: Type 316 stainless steel

- D. Couplings 14-inch (350 mm) and larger:

- 1. End rings and center rings: ASTM A36 steel, fusion bonded epoxy coated
- 2. Gaskets: Buna-N, NSF/ANSI 61 approved
- 3. Hardware: Type 316 stainless steel

- E. Bridles and tierods: Minimum 3/4-inch diameter, except where tierods replace flange bolts of smaller size, in which case fit with nut on each side of pair of flanges.

- 1. Provide as indicated

- F. Provide middle ring of each mechanical coupling with a thickness at least equal to that specified for size of pipe on which coupling is to be used and not less than 10 inch long for pipe 30 inch and larger and not less than 7 inch long for pipe under 30 inch in diameter.

- 1. Omit pipe stop from inner surface of middle rings of couplings to permit removal of valves, flow meters, and other installed equipment.
- 2. Provide pipe stops in other couplings.

- G. Provide cleaning and shop priming with manufacturer's standard rust inhibitive primer.

H. Where noted or indicated, provide mechanically coupled steel pipe joints anchored to steel pipe with harness bolts. Weld harness lugs to steel pipe prior to application of lining.

1. Joint harness bolts: Provide harness lugs placed and provide harness bolts of length such that coupling can be slipped at least in one direction to clear joint. Provide harnesses designed per AWWA M11 to withstand test pressure indicated in Process Pipe Schedule.

2.20 COUPLINGS-BOLTED SPLIT SLEEVE TYPE:

A. Manufacturers:

1. Victaulic Depend-O-Lok

B. Type: Bolted, split-sleeve type coupling consisting of four basic components; one piece housing, gaskets assembly, bolts and nuts, and restraint rings as required for restraint.

1. Provide split-sleeve with a double arch cross section closing around pipe ends that are smooth for expansion or contraction requirements or pipe ends with end rings affixed for pipe end restraint requirements. As the coupling housing closes, it confines the elastomeric gasket beneath the arches of the sleeve to create the radial seal. The axial seal is affected by the sealing plate at the closure plates as the bolts pull the coupling housing snug around the pipe.
2. Provide sealing members comprised of two "O" ring gaskets and an elastomer sealing pad bonded to the integral sealing plate.

C. Provide couplings designed for the type, size, and working pressure of the piping system as indicated in the Process Piping Schedule and specified.

D. Materials:

1. Split-sleeve:

- a. Carbon Steel and Ductile Iron pipelines: ASTM A36 Carbon Steel.
- b. Stainless steel pipelines, ASTM A240 Type 316L stainless steel.
- c. Provide stainless steel couplings where there is a transition for ductile iron to stainless steel piping.

2. Gaskets:

- a. Material: Elastomers in accordance with ASTM D2000.
 - (1) Air Service: Silicone conforming to ASTM D2000 for air service up to 240 degrees F with intermittent exposure to 280 degrees F.
 - (2) Liquid Service: Isoprene or Buna-N conforming to ASTM D2000 for service within the temperature range of -20 degrees F to 180 degrees F.

3. Bolts and Nuts:
 - a. Bolts: Stainless steel conforming to ASTM F593 Type 316, minimum tensile strength 85,000 psi, (or threaded studs to ASTM A193, Class 2 Grade B8M Type 316)
 - b. Nuts: ASTM F593 Type 316.
4. End Restraint Rings:
 - a. Provide restraint rings of the same material as the coupling housing.
 - b. Non-restrained (ExE) type couplings allows for up to 4 degree deflection. Provides for coupling joint where restraint is not required. If restraint is required, it must be provided independent of the coupling.
 - c. Fixed x Expansion (FxE) type couplings: Allows for thermal expansion and contraction at the pipe joint. Provide one or two restraint rings fixed to one end of the pipe to keep coupling in the proper location. Where split sleeve coupling FxE for expansion is used provide the expansion side of the coupling with a combination of fixed and sliding supports for thermal movement.
 - d. Fixed x Fixed (FxF) type couplings: Provides a fully restrained pipe joint. Provide one restraint ring welded to each of the pipe ends fitting beneath the coupling to prevent the pipe joint from pulling apart.
 - e. Provide type as indicated and specified.
 - f. Follow manufacturer's written recommendations and instructions for location dimensions and welding detail required to attach the restraint rings.
- E. Provide a Type 316 stainless steel nameplate welded to each coupling with the following data:
 1. Manufacturer and date fabricated.
 2. Type of Coupling (ExE, FxE, FxF).
 3. Working Pressure in psi.
 4. Test Pressure in psi.
 5. Materials for coupling, hardware and gaskets.
- F. Protective Coating: Prior to installation, couplings shall be coated on the I.D. and O.D. in accordance with Section 09 96 00.
- G. Couplings installed underground: Provide bitumastic coating or joint tape wrap.
- H. Installation of couplings shall be in accordance with manufacturer's recommendation.

1. The coupling housing shall be assembled pulling the closure plates together with the bolts tightened to assure snug coupling housing contact with the pipe OD. Follow the manufacturer's recommendation regarding the installation and tightening of the bolts.

2.21 EXPANSION JOINTS-ELASTOMERIC FLEXIBLE CONNECTION:

- A. General: Provide flexible connectors as indicated, specified and as required for ductile iron, HDPE, steel and stainless steel piping

1. At equipment connection: To eliminate vibration and stress on equipment.
2. Elsewhere: Designed for expansion/contraction.
 - a. Hot Water Systems: 1.25 inch per 100 feet.
 - b. All other Piping Systems: 0.5 inch per 100 feet.

- B. Manufacturers:

1. Mercer Rubber Co.
2. General Rubber Co.
3. Garlock, Inc.
4. Proco.

- C. Products:

1. Straight-through or tapered design as required.
2. Filled arch type for wastewater, sludge and scum applications
3. Furnish control rods for test pressures as indicated or required.
4. Materials: Suitable for service specified and indicated.
5. At expansion joints, provide guide supports located per manufacturer's recommendations.
6. Flanges: 125 lb (Class 125) drilling.
7. Provide Type 316 stainless steel retaining rings.

- D. Install joints in their neutral position.

2.22 EXPANSION JOINTS-STAINLESS STEEL:

- A. Manufacturers:

1. Pathway
2. Flexonic
3. Adsko
4. Victaulic Omni-Flex

B. Design Criteria:

1. Liquid: Service as indicated in the Process Pump Schedule.
2. Liquid Temperature: As indicated in the Process Pump Schedule.
3. Minimum Pressure Rating: 150 psi minimum or as indicated in the Process Piping Schedule.
4. Minimum Lateral Movement: 0.125-inch.
5. Minimum Axial Movement: 0.4-inch.
6. For expansion joints used on pump discharge nozzles the Contractor shall coordinate the rod size and movement allowable with the pump manufacturer and provide a statement from the pump manufacturer that the expansion joint and rod size is acceptable for the pump provided.

C. Products:

1. Provide bellows of two ply construction formed from concentric tubes having only longitudinal seams.
2. For two ply construction, each ply shall be capable of retaining the rated pressure at the specified temperature independently.
3. For two ply construction, seal weld both plies so that no gas or liquid leaks out at the ends.
4. For two-ply construction, provide a pressure monitoring connection with pressure gauge and pressure switch as specified herein for the annular space.
5. Provide control rods for test pressure.
6. Provide minimum two lifting lugs on each joint. Each lug shall be designed to carry the entire weight of the assembly.
7. Provide each joint with a liner and mark a flow arrow on the outside to indicate direction of flow.

8. Provide each expansion joint with a Type 316 stainless steel nameplate indicating size, bellows material, pressure and temperature rating, lateral and axial limits on movement, date of manufacturer, and the manufacturer.

D. Materials:

1. Bellows:
 - a. Inner Ply: Inconel alloy 625, minimum 0.048-inch thick.
 - b. Outer Ply: Inconel alloy 625, minimum 0.048-inch thick.
 - c. Fully annealed stainless steel, Type 316 or 321; to ASTM A240.
2. Liner: Type 316L stainless steel, minimum 0.1875-inch thick.
3. Flanges: Type 316L stainless steel, Class 150.
4. End Preparation: Stainless steel; suitable for installation with Victaulic Depend-O-Lok couplings.
5. Limit Rods/Nuts and Hardware: Type 316 stainless steel.

E. Install joints in their neutral position.

2.23 EXPANSION JOINTS-CHEMICAL SERVICE:

A. Service Conditions:

1. 12.5% sodium hypochlorite solution.
 - a. Temperature: 70 degrees F.
 - b. pH: 11 to 13.5.
2. 50% citric acid solution.
 - a. Temperature: 70 degrees F
 - b. pH: 1.7
3. 38% Sodium Bisulfite solution
 - a. Temperature: 70 degrees F
 - b. pH: 3.8 to 5.2
4. 40% aluminum chlorohydrate solution

- a. Temperature: 70 degrees F
 - b. pH: 3.5 to 4.5
- 5. Working Pressure: 150 psi.
- 6. Mating Pipe: SCH 80 CPVC, SCH 80 PVC, Kynar lined steel, titanium or stainless steel as indicated in the Process Piping Schedule.
- B. Type: Bellows
 - 1. Capable of angular, parallel and rotary misalignment at maximum extended and minimum retracted length when mechanically limited by restraints.
 - 2. Joints, as specified, must be manufacturer's standard cataloged product.
- C. Materials:
 - 1. Convolute Components: Pure white virgin PTFE-Fluorocarbon resin conforming to ASTM D1457 without pigments, lubricants or additives of any kind and suitable for the service specified. Provide a written recommendation from the expansion joint manufacturer.
 - a. Wall thickness: Suitable for the service specified or indicated and as recommended by the joint manufacturer.
 - 2. Reinforcing rings:
 - a. Type 316 stainless steel for caustic service.
 - b. Titanium or Kynar coated for sodium hypochlorite service.
 - 3. Flanges: Drilled and tapped to 150-lb ANSI (Class 150) standard.
 - a. Type 316 stainless steel for caustic service.
 - b. Titanium or Kynar coated for sodium hypochlorite service.
 - 4. Hardware:
 - a. Type 316 stainless steel for caustic service.
 - b. Titanium for sodium hypochlorite service.
- D. Joint Testing:
 - 1. Leak free after 100,000 cycles at maximum rated travel 10 cycles per minute at 70 degrees F.

2. Test at 75 psi.
3. Provide high intensity light test to detect any imperfections or inclusions.
4. Provide a 10,000 volt spark test, no arcing is acceptable.

2.24 SAFETY SHIELDS-CHEMICAL SERVICE:

- A. Provide shield type and materials for the service specified. Provide a written recommendation from the safety shield manufacturer.
- B. Material: Non-porous teflon-impregnated glass cloth with a 5 mil thickness and sewn with 100 percent teflon thread and velcor closures and folded in a trifold design with an 0.82 mil teflon cord inserted on the sides to act as a draw string tying on the flange neck. Provide for use with 150 lb ANSI flanges.
- C. Draw string or cord: 100 percent virgin unbleached teflon fiber.
- D. Provide a clear leak indicating window with a pH paper insert that will change color to indicate a leak.
- E. Provide shields with a working temperature rating of 200 degrees F and a working pressure rating of 200 psi.
- F. Install safety shield for the following:
 1. Expansion joints chemical services.
 2. Flanged connections on chemical system pipe and fittings.

2.25 FLOW RATE INDICATORS:

- A. Type: Rotometer with integral flow control valve.
- B. Materials:
 1. Polysulfone body with threaded ends,
 2. Type 316 stainless steel float and guide.
- C. Calibrate in gpm.
- D. Accuracy +2 percent of full scale reading over 10:1 range.
- E. Capacities as indicated. For pump seal water services provide with range as recommended by the pumping equipment manufacturer.
- F. Working Pressure Rating: 150 psi.

2.26 HOSE, HOSE FITTINGS AND ACCESSORIES:

A. Hose Manufacturers:

1. Goodrich, HPD Industries
2. Goodyear
3. United Rubber Supply
4. Goodall

B. Hose: 1-inch:

1. Provide 4-ply rubber-lined and rubber-covered water hose for 150 psi working pressure.
2. Nozzle:
 - a. Shatter proof and UV resistant Lexan constant flow nozzle with bumper.

C. Hose Reels:

1. Type 316 stainless steel, mill finish.
2. Heavy duty square tubing frame.
3. Spring rewind with declutching arbor.
4. Stainless steel ball bearing swivel joint.
5. 1-inch female NPT.
6. 50 feet of hose.
7. Provide a flexible connector between the inlet pipe and inlet swivel joint.
8. Manufacturer: Hannay Model SS800 or acceptable equivalent product.

2.27 Y-PATTERN STRAINERS-CLEAR NON METALLIC:

A. Sizes: 1/2-inch through 2-inch

B. Materials:

1. Body and Cap: Clear Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.
2. Seals: Viton
3. Screen: PVC with 1/32-inch perforations

- C. Ends: Socket
- D. Pressure Rating: 150 psi at 70 degrees F.

2.28 BASKET STRAINERS-CHEMICAL SERVICE:

- A. Service Conditions:
 - 1. Provide strainers suitable for the chemical service as indicated in the equipment schedules.
 - 2. Provide size and type, simplex and duplex, as indicated.
- B. Materials:
 - 1. Body and Cover: CPVC
 - 2. Valves for duplex strainers: CPVC
 - 3. O-rings: EPDM or suitable for the service specified and indicated.
 - 4. Baskets: CPVC with 1/16-inch perforations
- C. Covers: Threaded with hand operable vent.
- D. Body:
 - 1. Provide with and operable drain.
- E. Provide with integral flat mounting base.
- F. Ball Valves for duplex strainers: Provide a 3-way ball valve at the inlet and outlet, mechanically connected with true-union connections.
- G. Pressure Rating: 150 psi.
- H. End Connections: Flanged 150 psi ANSI (Class 150) standard.
- I. Duplex Strainer Configuration: Provide configuration as indicated.

2.29 INLINE SELF-CLEANING STRAINERS:

- A. Type: Peripheral inflow design, self cleaning with cylindrical straining screens.
- B. Straining Screens:
 - 1. Media Type:
 - a. Wedge-Wire; Type and size as indicated in Contract Documents.

2. Material: Type 316 stainless steel.
3. Provide rigid scraper bars mounted adjacent to the screens.

C. Strainer Body: Cast Iron ASTM A278 Class 30:

1. Provide body with inline inlet and outlet, flanged, 150-lb (Class 150).
2. Provide factory hydrostatic testing of body at 150 percent of the maximum working pressure of the strainer.
3. Provide rigid scraper bars mounted adjacent to the screens.
4. Provide an inspection port and cover for access to the scraper bars for inspection and adjustment without disassembly or removal the strainer from the pipeline.
5. Provide a sump for solids removed from the flow stream.
6. Reject Valves:
 - a. Provide a 120 Volt, 60 Hertz, NEMA 4X electric motor operated ball valve operated by the control logic to flush solids from the strainer during the cleaning sequence.
 - b. Provide valves in accordance with Section 40 23 13.01.
 - c. Provide valve actuators in accordance with Section 40 23 13.03.

D. Motors:

1. Provide in accordance with Section 26 20 00 and as specified.
2. Service Factor: 1.15.
3. Insulation: Class F.

E. Provide a differential pressure device for strainer backwash control.

2.30 WALL AND FLOOR SLEEVES:

A. Materials:

1. Schedule 40 Type 316L stainless steel with 2-inch waterstop welded both sides to prevent thrust movement and provide positive water sealing.
2. Schedule 40 carbon steel with 2-inch waterstop welded both sides to prevent thrust movement and provide positive water sealing. Model GPWSW manufactured by Advance Products & Systems, Inc., or Equal

3. HDPE, 2-inch thru 24-inch and only where indicated and specified.
- B. Water Stops: Provide waterstops welded on both sides. Provide waterstops 1/4-inch thick and 2-inch high and centered on the wall thickness.
- C. Provide modular, mechanical type seals, consisting of inter-locking synthetic rubber links shaped to continuously fill the annular space between the pipe and the wall opening.
 1. Manufacturer:
 - a. APS (Innerlynx)
 - b. CCI Piping Systems
 - c. Or equal.
- D. Provide the elastomeric elements sized and selected per manufacturer's recommendations and have the following properties as designated by ASTM. Coloration shall be throughout elastomer for positive field inspection. Each link shall have a permanent identification of the size and manufacturer's name molded into it.
- E. Temperature Range: -40 to +250 degrees F.
 1. Material: EPDM, ATSM D2000 M3 BA510
 2. Color: Black
- F. Modular seal pressure plates: Molded of glass reinforced Nylon Polymer with the following properties:
 1. Izod Impact – Notched: 2.05ft-lb/in. per ASTM D256
 2. Flexural Strength @ Yield: 30,750 psi per ASTM D790
 3. Flexural Modulus: 1,124,000 psi per ASTM D790
 4. Elongation Break: 11.07 percent per ASTM D638
 5. Specific Gravity: 1.38 per ASTM D792
- G. Hardware: Type 316 stainless steel.
- H. Pipe Flange Insulating Kit:
 1. Flange gasket: Type E, 1/8-inch thick NEMA Grade G-10 reinforced epoxy retainer with two seals of the following material:
 - a. Potable Water: Teflon or EPDM, NSF61 certified.

- b. Insulating sleeves: 1/32-inch thick NEMA Grade G-10, full length, one for each flange bolt.
 - c. Insulating washers: 1/8-inch thick NEMA Grade G-10, two for each flange bolt.
 - d. Mechanical washers: 1/8-inch thick Type 316 stainless steel, two for each flange bolt.
- 2. Manufacturers:
 - a. Trojan Insulating Gasket Advance Products and Systems.
 - b. Or equal.

2.31 TRANSITION COUPLINGS:

- A. Provide coupling in accordance with AWWA C219 as specified herein
- B. Sizes: 2-inch through 24-inch.
- C. Materials:
 - 1. End rings and center rings: Ductile iron ASTM A536.
 - 2. Gaskets: Virgin Styrene Butadiene Rubber (SBR) suitable for potable water and wastewater service, ASTM D2000 MBA 710.
 - 3. Provide 5/8-inch, Type 316 Stainless steel bolts and nuts
- D. Working Pressure: 250 psi.
- E. Lining and Coating: Fusion bonded epoxy in accordance with AWWA C213.

2.32 DISMANTLING JOINTS:

- A. Materials:
 - 1. Flanged Spool: AWWA Class D steel ring flange compatible with ANSI class 125 and 150 bolt circles. Provide pipe of ASTM A36 plate 1 percent cold expanded to size.
 - 2. End Ring and Body: ASTM A36 steel
 - 3. Gaskets: ASTM 2000 Virgin NBR suitable for wastewater service
 - 4. Bolts and Nuts: Type 316 stainless steel
 - 5. Tie Rods: Type 316 stainless steel
- B. Assembly Tolerance: 3 inches

C. Coating: Fusion bonded epoxy, NSF/ANSI 61 certified

D. Pressure Rating: 150 psi working pressure

E. Manufacturers

1. Romac

2. Viking Johnson

2.33 RESTRAINED FLANGE COUPLING ADAPTERS:

A. Materials:

1. Flanged Spool: AWWA Class D steel ring flange compatible with ANSI class 125 and 150 bolt circles, ASTM A36 steel or ASTM A283C steel.

2. End Ring and Body: ASTM A36 steel or ASTM A283C steel.

3. Gaskets: SBR suitable for wastewater service

4. Bolts and Nuts: HSLA carbon steel

5. Restrained gland and wedges: ASTM A536 grade 65-45-12.

B. Assembly Tolerance: 3 inches

C. Coating: Fusion bonded epoxy.

D. Pressure Rating: 150 psi working pressure

E. NSF 61 certified.

F. Manufacturers

1. Romac

2. Smith-Blair

3. Dresser

4. Baker

5. Viking Johnson

2.34 INSULATION:

A. General:

1. Provide insulation where specified and indicated.

2. Provide pre-molded or pre-formed pipe insulation.
 3. Provide insulation with a flame spread index of less than 25, and a smoke-developed index of less than 50 when tested in accordance with ASTM E84.
 4. Provide insulation with a maximum thermal conductivity of 0.7 Btu-in/h-ft²-degrees F at 75 degrees F mean temperature when tested in accordance with ASTM C177.
- B. Insulation for systems with an operating temperature of 60 degrees F or higher:
1. Type:
 - a. Pre-Molded Fiberglass.
 - b. Provide All Service Jacket (ASJ) consisting of white draft paper bonded to aluminum foil with fiberglass reinforcement in accordance with ASTM C1136 Type 1.
 - c. Provide self sealing lap.
 - d. Provide insulation thickness as indicated on the Process Pipe Schedule.
 2. Manufacturers:
 - a. Knauf Insulation.
 3. Accessories:
 - a. Butt Strips: Provide self adhesive butt strips for sealing circumferential joints between insulation sections. Provide strips manufactured from white kraft paper bonded to aluminum foil with fiberglass reinforcement in accordance with ASTM C1136 Type 1.
 - b. PVC Fitting Covers: Provide pre-molded, insulated, white glass finish, suitable for inside and outside use. Provide fitting covers manufactured from PVC material having a flame spread index of less than 25, and a smoke-developed index of less than 50 when tested in accordance with ASTM E84, PVC material shall meet the requirements of ASTM D1784.
 - c. Vinyl Tape: Provide white, adhesive backed vinyl tape, minimum 1-inch wide for sealing PVC fitting covers to insulation.
 - d. Tacks: Provide white coated, stainless steel, barbed tacks.
 - e. Aluminum Protective Jacketing: Provide 0.020 inch Stucco Embossed Aluminum Jacketing.

- f. Sound Barrier Jacketing: Provide a composite sound attenuating system comprised of an acoustic decoupler material laminated to 0.020 inch Stucco Embossed Aluminum Jacketing.
 - g. Stainless Steel Strapping: Provide Type 316 stainless steel strapping and wing seals. Provide strapping 1.2-inch wide or greater with a minimum thickness of 0.015-inch. Provide wing seals 1/2-inch wide or greater with a minimum thickness of 0.032 inches.
 - h. Sheet Metal Screws: Provide Type 316 stainless steel sheet metal screws.
- C. Insulation for systems with an operating temperature below 60 degrees F.
- 1. Type: Pre-molded, Flexible Closed Cell Elastomeric Foam.
 - 2. Provide self sealing lap for pipe sizes 6-inch and smaller. For pipe sizes above 6-inch and equipment provide Closed Cell Elastomeric Foam Sheets.
 - 3. Manufacturers:
 - a. Armacell Engineered Foams, AP Armaflex SS and AP Armaflex.
 - 4. Accessories:
 - a. Adhesive: Provide contact adhesive specifically designed for use with the insulation supplied.
 - b. Pipe support inserts: Provide a pre-fabricated insert designed to prevent damage to the insulation at the pipe support attachment point.
 - c. Provide an aluminum or stainless steel outer jacket, a foam inner core with plastic support and self sealing closure, or acceptable equivalent product.

2.35 STAINLESS STEEL HOSE AND FITTINGS:

- A. Manufacturers:
 - 1. Anamet, Inc Series 616
- B. Provide corrugated stainless steel hose
- C. Pressure Rating:
 - 1. Maximum working pressure: Unbraided type
 - a. 3/8-inch and smaller: 250 psi
 - b. 1/2-inch: 60 psi

- c. 3/4-inch to 1-inch: 40 psi
 - d. 1-1/4-inch: 20 psi
 - e. 1-1/2-inch: 15 psi
 - f. 2-inch to 3-inch: 10 psi
- 2. Maximum working pressure: Single braided type
 - a. 1/2-inch and smaller: 1000 psi
 - b. 3/4-inch to 2-inch: 450 psi
 - c. 2-1/2-inch to 4-inch: 300 psi
- 3. Safety Factor: 4:1
- D. Material:
 - 1. Core: Type 316
 - 2. Braid: Type 316L stainless steel
 - 3. Ends: Type 316L stainless steel
- E. Ends: Provide type as indicated
 - 1. 3/4 -inch to 3-inch: 150-lb (Class 150) welded female union end
 - 2. 3/4-inch and larger: 150-lb (Class 150) flat faced floating flanged

2.36 SAMPLING TAPS:

- A. Provide sampling locations as indicated on contract drawings. Coordinate location and arrangement with Engineer prior to installation. Additional sampling locations required by the Owner during construction shall be installed at Contractors expense.
- B. Sample taps shall be smooth nosed without interior or exterior threads and not be of the petcock type.

2.37 DIELECTRIC UNIONS

- A. Dielectric unions shall be Class 3000 O-ring type with thermos-baked polymer coating insulating type capable of insulating against galvanic corrosion and electrical current flow. Unions shall have material ends matching the joining pipe to which they are connecting, e.g., copper to copper or stainless steel to stainless steel. Zinc plated carbon steel connections shall not be used.

B. Dielectric coating shall be NSF 61 approved. O-ring shall be made from NSF 61 approved virgin EPM. Copper Alloy materials shall be certified lead-free.

C. Manufacturers:

1. Hart
2. Approved equal

2.38 SHOP PAINTING:

A. Provide in accordance with Section 09 96 00.

2.39 PIPE SUPPORTS:

- A. Provide in accordance with Section 40 23 19.01.
- B. Proceed with installation of pipe supports only after required building structural work has been completed and concrete has reached its 28 day compressive strength.
- C. Support piping to prevent forces applied on valves and equipment.

2.40 MECHANICAL SEALS

A. Manufacturers:

1. Garlock/Link-Seal
2. APS/Innerlynx

B. Materials:

1. Seal element: EPDM
2. Pressure Plate: Composite
3. Nuts and Bolts: Stainless Steel

2.41 FLANGE BOLTS AND NUTS

A. Flanges shall have stainless steel nuts and bolts as follows: Bolts shall have ASME B1.1, Class 2A threads, and be manufactured of ASTM A193, Grade B8M and conform to ASME B18.2.1, and nuts shall have Class 2A fit, square or hex heavy dimensions in accordance with ASME B18.2.2, and be manufactured of ASTM A194, Grade 8B heavy hex.

PART 3 - EXECUTION

3.01 HANDLING AND CUTTING:

- A. Mark pipe and fittings "Rejected" and remove from site when cracked or has received a severe blow.
- B. If permitted, cut on sound barrel at a point at least 12 inch from visible limit of crack, at Contractor's expense.
- C. Machine cut with milling type cutters, knives, or saws. Snap cutters, torch, or hammer and chisel are NOT ALLOWED. Examine for possible cracks.
- D. Chamfer cut ends if used for push-on joints.
- E. Do not cut glass lined pipes.

3.02 INSTALLATION OF PIPE:

- A. Install pipelines parallel to building walls wherever possible. Install piping to lines and grades indicated and support. Where temporary supports are used, provide temporary supports as specified in Section 40 23 19.01 to prevent shifting or distortion of pipe. Provide for expansion.
- B. Slope piping toward low points and provide for draining at low points.
- C. Before assembly, remove debris from inside of pipes and fittings.
- D. Before flanges pieces are assembled, remove rust resistant coating from machined surfaces, clean gaskets and smooth burrs. Make up flanged joints tight, and prevent strain upon valves or other pieces of equipment. Make flanged joints with bolts; bolt studs with nut on each end; or studs with nuts where one flange is tapped.
 - 1. Except as otherwise specified, provide number and size of bolts conforming to same ANSI standards.
 - 2. Provide Type 316 stainless steel hardware.
 - 3. Provide ring gaskets of materials designed for the service specified and indicated, 1/16-inch thick gaskets.
 - 4. Make up flanged joints tight with care being taken to prevent undue strain upon valves or other pieces of equipment.
 - 5. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.
 - 6. Provide insulating kits as specified herein.
- E. Install grooved joints in accordance with the manufacturer's written recommendations.

1. Grooved ends: Clean and free from indentations, projections, or roll marks.
 2. Gaskets: Molded and produced by the coupling manufacturer of an elastomer suitable for the service specified and indicated.
 3. The coupling manufacturer's factory trained representative shall provide on-site training for the contractor's field personnel in the use of grooving tools and installation of product. The representative shall periodically visit the job site to ensure best practices in grooved product installation are being followed.
- F. Install tierods, pipe clamps or bridles when sleeve type couplings or fittings are used in piping system as indicated, and at changes in direction or other places to prevent joints from pulling apart under pressures indicated in the Process Pipe Schedule.
- G. Examine pieces for damage. Do not install pieces that are damaged according to Engineer. If any damaged piece should be discovered after having been installed, remove and replace with a sound piece at no additional cost to the Authority.
- H. Handle pipe with equipment such as nylon slings and padded skids, designed to prevent damage to the coating. Repair abrasions and injuries to the coating prior to the application of insulation or prior to the application of final field coating.
- I. Support piping laid in trenches in trench on bed of selected backfill material which maintains desired line and grade.
- J. Use dielectric bushings or unions when ferrous pipes join nonferrous pipes carrying liquid either underground or elsewhere.
- K. Welding in accordance with ASME Section IX and AWS D1.1.
- L. Ductile Iron Pipe and Fittings:
1. Remove and replace defective pieces.
 2. Clear of all debris and dirt before installing and keep clean until accepted.
 3. Lay accurately to lines and grades indicated or required. Provide accurate alignment, both horizontally and vertically.
 4. Provide firm bearing along entire length of buried pipelines.
- M. Appurtenances: Set valves, fittings and appurtenances as indicated.

3.03 INSTALLATION OF LINING AND COATING:

- A. After installation of pipe, fittings, and specials, clean, prime, line, and coat as specified for pipe adjacent to weld unlined or uncoated ends adjacent to field welded joints, including weld proper. Repair any damage to lining in accordance with lining manufacturers written recommendations.

- B. Preparation of surfaces to be lined and coated after installation of pipe for shop application of coal tar epoxy, except remove foreign matter, including all damaged lining or coating materials, by scraping, chipping, or brushing, and surfaces cleaned to bright metal free of all rust, slag, and scale by means of wire brushing or sand blasting.
- C. Use open ends or access manholes for entry for application of interior linings to unlined ends.
- D. Pour holes are not allowed.
- E. After installation of pipe, fittings, and specials, shop coat on exterior shall be touched up followed by a field coat prior to encasing in concrete.

3.04 INSTALLATION OF FLANGED COUPLING ADAPTERS:

- A. Install flange coupling adapters in strict accordance with coupling manufacturer's recommendations.

3.05 WALL SLEEVE SEALS:

- A. Expand rubber against pipe and sleeve by tightening bolts when assembled around pipe and inserted in wall.

3.06 TEMPORARY PLUGS:

- A. Close open ends of pipe with temporary plugs or caps when pipe installation is not in progress. Use watertight plugs for exterior, buried piping and if water or debris is in trench when work is resumed, do not remove until adequate provision has been made to prevent any water or debris entering pipe even if it necessitates dewatering trench.

3.07 JOINTS AND COUPLINGS:

A. Push-on Joints:

1. Insert gasket into groove bell. Apply thin film of nontoxic gasket lubricant over inner surface of gasket in contact with spigot end.
2. Insert chamfered end into gasket. Force pipe past it until it seats against socket bottom.

B. Bolted Joints:

1. Remove rust-preventive coatings from machined surfaces.
2. Clean pipe ends, sockets, sleeves, housings, and gaskets and smooth all burrs and other defects.
3. Use torque wrench to tighten to correct range of torque not to exceed values specified below:

TORQUE RANGE VALUES		
Nominal pipe size, in	Bolt diameter, in	Range of torque, ft-lb
3	5/8	40-60
4-24, incl.	3/4	75-90
30, 36	1	100-120
42, 48	1-1/4	120-150

C. Flanged Joint:

1. Make up tight.
2. Do not put strain on nozzles, valves, and other equipment.
3. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

D. Mechanical Joints:

1. Wire brush surfaces in contact with gasket and clean gasket.
2. Lubricate gasket, bell, and spigot with soapy water.
3. Slip gland and gasket over spigot, and insert spigot into bell until seated.
4. Seat gasket and press gland firmly against gasket.
5. After bolts inserted and nuts made finger-tight, tighten diametrically opposite nuts progressively and uniformly around joint by torque wrench. Torque bolts to values specified above.

E. Flexible Joints:

1. Clean and dry before assembly.
2. Place gaskets, rings, glands and followers in position in back of spigot ball.
3. Coat ball and socket with thin film of lubricant conforming to joint manufacturer's standards.
4. Insert ball and seat in socket. Seat gasket against ball.
5. Boltless joints:
 - a. Assemble retainer rings and glands conforming to manufacturer's standard.
 - b. Lock in place with lead strips.

F. Grooved Couplings:

1. Clean grooves and other parts.
2. Coat ends of pipe and outside of gasket with soft soap or silicone and slip gasket over one pipe end.
3. Bring pipes to correct position and center gasket over pipe ends with lips against pipe.
4. Place housing sections, insert bolts and tighten nuts until housing sections in metal-to-metal contact.
5. After assembly and inspection and before backfilling, coat exterior surfaces of buried couplings, including bolts and nuts, with heavy-bodied bituminous mastic.

G. Tapped Connection:

1. Drill and tap normal to longitudinal axis.
2. Drilled by skilled mechanics using proper tools.
3. Use only tapered threads.

H. Electrical Conductors:

1. Install pipes so terminal strips are aligned.
2. Install jumper strips and tighten bolts.

3.08 VIO-B POLYETHYLENE ENCASEMENT

- A. Provide Vio-B polyethylene encasement for use with ductile iron pipe in accordance with ANSI/AWWA C105/ A21.5, Polyethylene Encasement for Ductile Iron Pipe Systems.
- B. Provide the Vio-B polyethylene encasement for use with ductile iron pipe systems consisting of three layers of co-extruded linear low density polyethylene (LLDPE), fused into a single thickness of not less than eight mils.
- C. Provide the inside surface of the polyethylene wrap in contact with the pipe exterior infused with a blend of antimicrobial compound to mitigate microbiologically influenced corrosion and a volatile corrosion inhibitor to control galvanic corrosion.
- D. Install ductile iron pipe and the polyethylene encasement in accordance with AWWA C600 and ANSI/AWWA C105/A21.5 and also in accordance with all recommendations and practices of the AWWA M41, Manual of Water Supply Practices – Ductile Iron Pipe and Fittings.
- E. Overlap the wrap one foot in each direction at joints and secure in place around the pipe. Provide any wrap at tap locations taped tightly prior to tapping and inspected for any repairs following the tap and repair as required.

3.09 PHYSICAL CHECKOUT, FIELD AND FUNCTIONAL TESTING:

- A. Clean dirt, dust, oil, grease and other foreign material, before pressure and leakage tests.
- B. Water for testing provided by the Contractor.
- C. Pressure and Leakage Tests:
 - 1. Provide temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, meters, gages, equipment, and labor.
 - 2. Test pipelines in sections of acceptable length.
 - 3. Test when desired and comply with specifications.
 - 4. Test pipelines in excavation or embedded in concrete before backfill or placing of concrete and test exposed piping before field painting.
 - 5. Fill section of pipe with water and expel air. If hydrants or blowoffs are not available at high points for releasing air, make necessary taps and plug after test completion.
 - 6. Maintain section full of water for 24 hours before conducting combined pressure and leakage test.
 - 7. Pressure and leakage test consists of first raising pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to test pressures indicated in the Process Pipe Schedule.
 - 8. No visible leakage in joint is acceptable.
 - 9. If unable to achieve and maintain specified pressure for one hour with no additional pumping, section has failed to pass test.
 - 10. If section fails pressure and leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, and conduct additional tests and repairs until section passes test at no additional cost and without any time extensions.
- D. Make piping connections to equipment with pipe in a free supported state and without application of vertical or horizontal forces to align piping with the equipment flanges.
- E. Do not cover joints in underground piping with backfill material until piping has successfully passed pressure test.
- F. Test pressures as indicated in Process Pipe Schedule.
- G. Repair faulty joints even to extent of disassembling and remaking joint, remove defective pipe and fittings and replace in manner satisfactory to the Owner.

3.10 DISINFECTING AND FLUSHING:

- A. Disinfect potable water lines using procedures and materials conforming to AWWA C651.
- B. Dosage to produce minimum 10 ppm after minimum of 24 hour contact period.
- C. After treatment, flush with clean water until residual chlorine content less than 0.2 ppm.
- D. Prevent contamination of water in existing water mains. Neutralize chlorine content of water used in disinfecting and flushing accordance with AWWA C651.

3.11 FIELD PAINTING:

- A. Provide in accordance with Section 09 96 00.

3.12 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 61 13

PROCESS CONTROL SYSTEM GENERAL PROVISIONS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide process control system general provisions as indicated and in compliance with Contract Documents.

1.02 REQUIREMENTS OF WORK

- A. Supply, install, commission and provide warranty for a complete and fully documented instrumentation and control (I&C) system as shown on the drawings and specified herein. The I&C system will form a subsystem of the overall plant control system and contains vendor component subsystems specified in this and other sections of the specification.
- B. Programming and configuring all non-vendor-provided PLCs, network enclosures and equipment, and operator interface units.
- C. Component subsystems of the I&C system will include, but are not limited to, the following:
 - 1. Primary elements and transmitters.
 - 2. Final control elements.
 - 3. I&C field devices.
 - 4. I&C junction boxes, local control panels, and marshalling panels.
 - 5. Instrumentation cabling.
 - 6. Communication Network Cabling.
 - 7. Instrumentation power supplies.
 - 8. Conduit and cable tray.
 - 9. Programmable logic controller (PLC) based control system.
 - 10. Human Machine Interfaces (HMI).
- D. The Contractor's responsibility also includes receiving, un-crating, examining for shortages or damage, assembling, field fitting, installing, mounting, wiring and testing of vendor supplied component subsystems including all loose supplied components of the vendor package.

- E. Where packaged, stand-alone control systems are supplied under other divisions of this specification, provide installation and cabling to connect to the required remote monitoring and/or controllers and all loose supplied components of the vendor package. Provide end-to-end commissioning and ensure the correct functionality of any equipment supplied under other divisions of this specification.
1. Control panel shop drawings shall be drawn to scale using manufacturer's CAD drawings for panel components and instruments.
 2. Provide catalog cut sheets with proposed items and options clearly identified.
 3. Scale the drawings to show proper location and dimensions of all panel mounted devices, doors, louvers, and subpanels.
 4. Provide panel legends and an accurate Bill of Materials.
 5. Provide ladder diagrams with rung numbers, wire numbers, and terminal numbers.
 6. Show point-to-point and terminal-to-terminal wiring within panels.
- F. Documentation provided by the Contractor shall include as a minimum:
1. Equipment descriptive data.
 2. Equipment installation instructions, service manuals, operation and maintenance (O&M) manuals, bills of materials, and recommended spare parts lists.
 3. Schematics and interconnection wiring diagrams sealed by a Professional Engineer registered in the State of Texas.
 4. Records of conductor identification, field terminals, cable lists, changes, etc.
 5. I&C panel Shop Drawings, face layouts, schematics, and point-to-point wiring diagrams sealed by a Professional Engineer registered in the State of Texas.
 6. Records of as-built information for the complete instrumentation system.
 7. For the programmable logic controller (PLC) based control system, the Contractor shall provide detailed documentation of the system hardware and software. Minimum software documentation shall include a detailed operating description, flow charts that describe the functionality of the PLC program, a memory map, and the PLC program documentation. This information shall be submitted at the Shop Drawing stage.
 8. For the HMI based control system, the Contractor shall provide detailed documentation of the system hardware and software.

G. Documentation provided by the Contractor shall be formatted as follows:

1. Process and Instrumentation Diagrams (P&IDs) – Depict the general design intent of the process and control systems.
2. Instrument List – A tabular index of the detailed information for control system devices shown on the P&IDs. The list shows the appropriate support documentation for the specified devices' supply and installation.
3. Input/Output List – A tabular index of the control system I/O points shown on the P&IDs, providing a description of the application and function together with references to supporting documentation.
4. Instrument Specification Sheets – Detail the relevant technical data for the supply of devices.
5. Instrument Loop Diagrams (ILDs) – Show typical interconnections and hook-up of devices and control circuits. The Contractor is to produce an ILD for each device and record all relevant information on each sheet for submission at the completion of the work. Fill in all terminal and wiring numbers etc. from the reviewed shop drawings as they become available. A set of 'B' size (11" x 17") ACAD drawings and associated files will be made available to the successful bidder. Where an ILD is not shown for wiring of simple devices provide a legible sketch for as-built information.
6. Location Drawings – Indicate in plan and/or elevation views where the instrument elements are physically located. These drawings are provided to assist the Contractor in estimating the amount of wire, cable, cable tray and ducting required.
7. Standard Details – Provide a reference for installation, operation, and other instructions pertinent to a particular device. Where standard details are not provided, The contractor shall follow manufacturers recommended installation details.
8. Detailed Specification - Lists qualifications, quality of materials and workmanship, and supplementary information.

H. Related Work:

1. Process: Division 40
2. Mechanical: Division 23
3. Electrical: Division 26

I. Codes, Rules, Permits and Fees:

1. Comply with all laws, ordinances, rules, regulations, codes, and orders of all authorities having jurisdiction relating to this work.

2. Comply with all rules of the electrical Safety Act of the State, National Fire Protection Association (NFPA), Underwriters Laboratories (UL) and the applicable building codes, whether specifically shown on drawings or not.
3. Give all required notices, submit drawings, obtain all permits, licenses, and certificates, and pay all fees required for this work.
4. Furnish a certificate of final inspection and approvals from inspection authorities to the Engineer.

J. Qualifications:

1. The instrumentation subcontractor shall be a firm normally engaged and fully competent in the type of work described in this section of the specification. The firm shall have been continuously and successfully engaged in this business for at least five (5) years.
2. Submit with the bid a list of similar projects recently completed and resumes of the personnel proposed for the project.
3. The instrumentation subcontractor shall be experienced in the process and instrument requirements of this contract.
4. The instrumentation subcontractor shall show that it maintains a fully equipped and qualified organization, capable of performing the present work and of providing warranty service to the system after installation.
5. Qualified journeyman instrument mechanics that are familiar with the devices being installed shall perform all instrument hook-ups, calibrations and checkouts.
6. Qualified journeyman electricians shall perform all control wiring installation and connections.

K. Standards of Workmanship:

1. Execute all work in a manner which will result in the completed installation presenting an acceptable appearance, to a level of quality defined in the general conditions of this specification.
2. Employ a competent supervisor and all necessary licensed tradesmen to complete the work in the required time.
3. Arrange and install products to fit properly into designated building spaces.
4. Install products in accordance with the recommendations and ratings of the product manufacturers.

5. Supply and execute installation of all instrumentation control tubing in accordance with Division 40.

L. Contract Drawings and Specifications:

1. Refer to Division 1.
2. Supply and install all items and accessories specified by the drawings or the specification in the quality and quantity required. Perform all operations as designated by the specifications according to the methods prescribed, complete with all necessary labor and incidentals.
3. Treat any item or subject omitted from this division's Specifications or drawings, but which is mentioned or reasonably specified in other divisions' specifications or drawings and pertains to the I&C system, as being integral to the overall system. Provide such specified items or subjects.
4. Provide all minor items and work not shown or specified but which are reasonably necessary to complete the work.
5. If discrepancies or omissions in the drawings or specifications are found, or if intent or meaning is not clear, consult the Engineer for clarification before submitting the bid response.
6. The responsibility to determine which division provides various products and work rests with the Contractor. Additional compensation will not be considered because of differences in interpretation of specifications.

1.04 SUBMITTALS

A. Submit the following shop drawings in accordance with Section 01 33 00:

1. Sustainable Design Submittals.

B. Tender submittals:

1. Submit an equipment list indicating the type and make of all equipment and materials proposed for this project within 10 business days of award of contract.

C. Receiving, storing, and protection of components during construction:

1. Examine each component upon delivery to site. Report all damage noted to the Engineer prior to accepting or rejecting delivery. All instrumentation primary elements, control components, panels, etc. shall be placed in a secure, dry, heated storage building. Maintain the space temperature above 50 degrees Fahrenheit and the space relative humidity below 50%.

2. Perform a preliminary examination upon delivery to ensure that:

a. All I&C components supplied for this project under this section of the specifications comply with the requirements stated in the instrument specification sheets.

b. All I&C components supplied under other sections of these specifications, to be connected to I&C components supplied under this section of the specifications, comply with the requirements stated in the contract documents.

c. Itemize all non-conformities noted above and forward them to the Engineer. Any delays in construction resulting from the delivery to site of non-conforming I&C components shall be borne by the Contractor.

d. Do not install primary elements or other sensitive equipment until construction is sufficiently completed to provide an "operating condition" environment. Notify the Engineer prior to installing any equipment of this type.

e. Ensure that covers where required are properly installed on all equipment. Provide all covers, padding, guards, etc. as required to guard any equipment against damage.

f. Follow the manufacturer's recommendation for the storage of all I&C components.

3. Take all necessary precautions to ensure that equipment is supplied free of damage. If deemed necessary by the Engineer, damaged equipment shall be replaced with new Product. The Contractor shall bear any costs due to construction delays resulting from the delay in delivery of acceptable equipment.
- D. Submit a schedule within 30 days of award of contract to the Engineer showing projected ordering and delivery dates of all products to meet the required construction schedule. Provide all necessary information regarding ordering and delivery dates for those product whose delivery effects the construction schedule.
- E. Submit shop drawings for all products supplied by this Division. Submit shop drawings for review prior to purchase of any products or equipment and sufficiently in advance to allow ample time for checking.
1. Provide PDF versions with electronic bookmarks.
 2. Provide with a copy of the specification section with exceptions noted including explanation.
 3. Control, PLC, and Network cabinet shop drawings
 - a. Provide interior and exterior dimensioned layouts of all panels.
 - b. All interior components shall be shown using actual equipment manufacturer CAD drawings and blocks. Generic rectangles for terminals, PLCs, or other equipment shall are not acceptable in Shop Drawings.
 - c. Shop drawings shall show all wire tags and terminal block tags.
- F. Contractor to review, modify, and approve the shop drawings prior to submitting shop drawings to the Engineer for review. Contractor approval of a drawing indicates the following:
1. The drawing has been checked by the person making the approval.
 2. The equipment or material complies in all respects with the requirements of the specifications and drawings.
 3. The quantities indicated are correct.
 4. The physical dimensions of the components are such that they can be installed without interference with the building structure or other equipment, and after installation, there are sufficient clearances on all sides for maintenance, servicing and operation of the equipment.
 5. The points of attachment are clearly indicated, i.e. TOP, BOTTOM, SIDE, etc.
 6. The arrangement and location are properly oriented.

7. The product is suitable for its intended use.
 8. The submission consists of sufficient information to adequately convey the scope of supply and the specific product to be supplied is highlighted.
 9. The submission contains sufficient information to install the equipment or systems.
- G. Stamp and sign the shop drawing to show approval, indicating the above has been complied with. If Contractor revisions are too extensive, return the submission to the manufacturer for revision, then repeat the shop drawing approval process before submitting to the Engineer.
- H. Manufacture of products shall conform to shop drawings marked as reviewed by the Engineer and returned to the Contractor.
- I. Keep one complete, maintained set of shop drawings at the job site during the construction period. Record site modifications.
- J. Refer to Division 01 for further information on Shop Drawing submittals.
- K. Operation & Maintenance Manuals
1. Refer to Section 01 78 23 for O&M manual submittal information.
 2. In addition to the requirements specified in Division 1, provide the following information:
 - a. Table of Contents – Arrange contents sequentially by systems under section numbers. Label tabs of dividers between each to match section numbers in the Table of Contents.
 - b. Systems Descriptions – A brief synopsis of each system typed and inserted at the beginning of each section. Include sketches and diagrams where appropriate.
 - c. O&M instructions of all equipment and controls – These operating instructions need not be manufacturer's data but may be typewritten instructions in simple language to guide the District in the proper O&M of this installation.
 - d. A copy of all wiring diagrams complete with wiring coding.
 - e. Include type and accuracy of instruments used.
 - f. Set of final reviewed Shop Drawings.
 - g. Provide a tabulated list of all consumables utilized (fuses, lamps, etc.) indicating where used, type, rating and reorder details.

L. Record Drawings:

1. Maintain on-site a complete set of as-built drawings as listed in Division 1 of this specification.
2. In addition to the requirements as stated in Division 1, record on the drawings the following information:
 - a. all changes alterations or additions
 - b. all instrumentation cable and control tubing
 - c. all changes to the numbers and location of outlets, motors, panels and end devices that may occur during the course of the work.
3. Before requesting the final completion certificate make any necessary final corrections to the drawings, sign each print as a certification of accuracy and deliver all sets to the Engineer for approval.

1.05 SPARE PARTS:

- A. Comply with requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. The I&C Subcontractor shall be:
 1. APCO Inc., North Salt Lake, UT, 801-519-9500
 - a. The point of contact is Cory Topham, Senior Control Engineer, 801-718-6672
 2. No other I&C Subcontractor will be considered.

1.07 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.08 PROJECT/SITE CONDITIONS:

- A. Classification of Plant Areas:
 1. Refer to Division 26

PART 2 - PRODUCTS

2.01 GENERAL

- A. Refer to the requirements of Division 01.
- B. Selected Products:
 - 1. Provide products and materials that are new and free from all defects.
 - 2. Products and materials called for on the drawings or in the specifications by trade names, manufacturer's name and catalogue reference are to be used as the basis for the bid submission.
 - 3. The design has been based on the use of the first named product where multiple products have been listed.
- C. Quality of Products:
 - 1. All Products provided to be NEC and UL approved where applicable.
 - 2. If Products specified are not NEC and UL approved, obtain approval of the relevant State regulatory authority. Pay all applicable charges levied and make all modifications required for approval.
 - 3. Refer to Division 1 of this specification for further information.
- D. Uniformity of Manufacture:
 - 1. Unless otherwise specifically called for in the specification, uniformity of manufacture to be maintained for similar products throughout the work.
- E. Product Finishes:
 - 1. Contractor to specify proposed finishes to be used for Engineer's review.
- F. Use of Products During Construction:
 - 1. Any equipment used for temporary or construction purposes is to be approved by the Engineer and in accordance with Division 1 of this specification. Clean and restore to "as new" condition all equipment prior to the time of substantial completion.

2.02 INSTRUMENTATION:

- A. General:
 - 1. Instruments are to be suitable for the environmental conditions in which they are to be installed.

2. Determine where injurious conditions may be expected to occur and make proper provision to protect the instruments to ensure their proper and reliable operation.
3. Provide power surge protection, heating cables, and devices to protect instruments, equipment, and lines from being functionally impaired or damaged by power surges or environmental conditions such as moisture or freezing.

B. Identification:

1. Refer to Division 26 for general identification requirements. Provide lamacoid nameplates with 0.25 inch black lettering on white background. Identify the loop tag number (where applicable) and the device name, function, and instrument range or setpoint value on the nameplate.
2. For field instrument components, provide the component with a stainless steel metal tag firmly wired to the device and identified with the equipment code, process code, process function/loop number, unit number, and differentiation letter (if applicable).
 - a. All field instrument component tags and control panel tags shall contain the division and facility WW8000 as a prefix to the rest of the tag. Refer to the Instrument List and Network Architecture Diagram for additional details.
3. Identify all wires where they terminate at the marshalling panels, junction boxes, control panels, and field devices with a heat shrink sleeve with machine printed labelling.
4. Clearly mark all panels, pull boxes, junction boxes, etc. to indicate the nature of service.
5. Provide neatly typed circuit directories for panel power distribution systems to indicate loops or devices powered by the circuit and the fuse size.
6. Identify all exposed control conduits at all pull box locations, where the conduits enter or leave a room, and 40 feet on center throughout the room. This shall apply to conduits above removable ceilings. Refer to Division 26 for conduit identification.
7. For direct current wiring use black for positive and white for negative.
8. For thermistor wiring to motors use red and blue colored insulated wire.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Refer to the requirements of Division 01.

- B. No additional compensation will be given for extra work due to existing conditions which a site examination prior to tender should have disclosed.

3.02 COORDINATION WITH OTHER DIVISIONS:

- A. Examine the drawings and specifications of all divisions and become fully familiar with the work. Before commencing work, obtain a ruling from the Engineer on any conflicting issues between divisions. No compensation will be made for any costs arising from conflict not identified before work has commenced.
- B. Coordinate the work to be performed under this section of the specification with all divisions installing equipment to ensure that there are no conflicts.
- C. Install anchors, bolts, pipe sleeves, hanger inserts, etc. required in ample time to prevent delays to other divisions' installation work.
- D. Lay out the work and equipment with due regard to architectural, structural, and mechanical features. Architectural and structural drawings take precedence over electrical drawings regarding locations of walls, doors, and equipment.
- E. Structural members shall not be cut without prior approval of the Engineer.
- F. Examine previously constructed work and notify the Engineer of any conditions which prejudice the proper completion of this work.

3.03 PRODUCT HANDLING:

- A. Use all means necessary to protect the products included in this division before, during and after installation, and to protect products and installed work of all other trades.
- B. Any damage to the products and/or installed work shall be repaired or replaced to the approval of the Engineer by the Contractor at no additional cost to the District.
- C. Remove advertising labels from all products installed that have such labels attached. Identification, NEC, and UL labels are not to be removed.
- D. Remove dirt, rubbish, grease, etc. resulting from work performed under this section of the contract from all surfaces.

3.04 SEPARATION OF SERVICES:

- A. Maintain separation between the electrical wiring system, piping, ductwork and the instrumentation cables so that each system is isolated (except at approved connections to such systems) to prevent galvanic corrosion. In particular, contact between dissimilar metals, such as copper and aluminum, in damp or wet locations is unacceptable.

B. Do not support wiring from pipes, ductwork, etc. Hangers for suspended ceilings may be used for the support of wiring only when approval is obtained from the Engineer and the ceiling installer, and only if approved clips or hangers are used.

C. Classifications of Circuits:

1. The circuit categorization shall of first priority follow National Electric Code (NEC, NFPA 70) with respect to separation for electrical safety and the following shall apply with respect to electro-magnetic compatibility:

Very Noisy	High voltage circuits and their associated grounding
	High current (>200A) LV circuits.
	Harmonic-rich LV circuits.
	DC circuits: un-suppressed or above 50V.
Noisy	Low current class two (2) circuits.
	Medium power pulsed or radio frequency circuits.
Indifferent	ELV digital status circuits.
	Intrinsically safe circuits.
	Telecommunications circuits.
	Fire alarm and emergency lighting circuits (note that some fire alarm circuits may fall into the category of signal circuits).
	Any other emergency, shutdown, or high integrity circuit (e.g. toxic gas alarm).
Sensitive	Analogue signal circuits.
	Data communication circuits.
Very Sensitive	Low level voltage and current signals (e.g. from instrument sensors).

D. Separation of Circuits:

1. This section relates to the running of cables carrying differing types of circuit in close proximity to one another and to other services. Sensitive circuits shall normally be run in overall shielded cable. Very sensitive circuits shall normally be run in individually twisted pair shielded cable.
2. For cables sharing the same support/containment system, the following shall provide guidance to minimize extraneous interference.

Segregation between Circuits	Very Noisy	Noisy	Indifferent	Sensitive	Very Sensitive
Very Noisy	Thermal grouping as per NEC.	6 inches	12 inches	12 inches	12 inches
Noisy	6 inches	Thermal grouping as per NEC Code.	6 inches	6 inches	6 inches

Segregation between Circuits	Very Noisy	Noisy	Indifferent	Sensitive	Very Sensitive
Indifferent	12 inches	6 inches	Separation of circuit types.	4 inches	4 inches
Sensitive	12 inches	6 inches	4 inches	Touching	2 inches
Very Sensitive	12 inches	6 inches	4 inches	2 inches	Touching

3.05 WIRE AND CABLE:

- A. Refer to Section 26 05 20 “Electric Wires and Cables”.

3.06 EQUIPMENT CONNECTIONS:

- A. Prior to the connection of signal wiring to process control and instrumentation devices, check the device voltage rating and polarity for compatibility with the corresponding loop and/or schematic diagram. Where device and circuit characteristics are found to be incompatible, the connections are not to be made. Report the condition immediately to the Engineer.
- B. All control wiring diagrams illustrate typical control circuits applicable to the type of equipment specified. Control circuits may vary with different manufacturers’ equipment. Verify all control circuits with the manufacturers of the equipment and make any corrections to the control wiring diagrams that may be required.
- C. Provide power disconnect terminals in marshalling panels for all devices and PLC inputs/outputs sourced from the panel. Provide local power disconnect switches for all 120VAC power instruments. Mount adjacent the instrument.
- D. Provide a disconnecting means in the cable connecting each ultrasonic transponder to the transmitter. This disconnect shall consist of a terminal strip in a local water proof junction box.

3.07 WIRING TO EQUIPMENT SUPPLIED BY OTHERS:

- A. Equipment supplied by others, that have loose supplied external or field mount control devices, are to be installed, wired and commissioned by this division.

3.08 ACCESS PANELS

- A. Provide access panels where I&C system junction boxes are concealed. Panels to be of adequate size for servicing of the concealed junction box and complete with necessary frames and hinged doors held closed with captive fasteners.

- B. In removable ceiling areas provide markers on ceiling tile to locate equipment requiring access. Use a 1 inch diameter blue circle painted on the access panel to indicate that it is for instrumentation and control system access.

3.09 INSTRUMENT MOUNTING STANDS:

- A. Supply and install instrumentation mounting stands as required. Stands are to be either floor or wall mounted. The mounting stands are to be fabricated from aluminum or galvanized steel. Stands shall be galvanized after fabrication.
- B. Supply and install protective drip shields for any exterior stand-mounted instrumentation equipment. The drip shield is to extend 2 inches at the top and sides from the front face of the equipment. The drip shield is to be fabricated from aluminum.

3.10 SEALING OF WALL AND FLOOR OPENINGS:

- A. Seal all conduit and cable entries passing through outside walls of buildings, through partition walls separating electrical rooms from other areas, through fire separations, and through floors above grade.
- B. Seal openings after all wiring entries have been completed.
- C. Sealing material shall be fire resistant and not contain any compounds which will chemically affect the wiring jacket or insulating material. Cable penetrations through fire separations, if required, are to be sealed in accordance with Division 26 Electrical.
- D. Provide sleeves of galvanized steel pipe with machine cut ends of ample size to accommodate conduits passing through walls, partitions, ceilings, floors, etc.
- E. For wall partitions and ceilings the ends shall be flush with the finish on both sides. For floors, the ends shall extend 4 inches above finished floor level.
- F. Fill the space between the sleeve and the conduit with fire stop material and caulk around the top and bottom with approved permanently resilient, non-flammable and weatherproof silicone base compound. Ensure that the seal is compatible with the floor and ceiling finishes.
- G. Locate the sleeves and position exactly prior to construction of the walls and floors.
- H. Failure to comply with the above requirements shall be remedied at the Contractor's expense.

3.11 CONNECTIONS TO MECHANICAL, ELECTRICAL AND EXISTING SYSTEMS:

- A. Refer to Division 26 for the required tie-in procedures.

3.12 TAGGING STANDARDS FOR DEVICES AND WIRING:

- A. Tag all devices, wires, and I/O using the assigned loop, equipment, or device tag name. Where tag naming and numbering is not defined the Engineer will provide naming and numbering.

3.13 TESTING OF INSTRUMENTATION LOOPS:

- A. After all devices within a loop have been connected, check the loop for correct functioning and interaction with other loops, where applicable. Provide written notice to the Owner and Engineer when the loops are going to be tested so that the tests may be witnessed at the Engineer's discretion.
- B. Check the operation of final control elements such as solenoid valves, actuators, etc. by manual control before checking with automatic control.
- C. Check and simulate all alarms and shutdown functions.
- D. Verify the status of all points connected or accessible to the plant control and monitoring system.
- E. Where applicable, test all tubing for leaks in compliance with ISA RP7.1. Isolate all instruments when tubing is being tested to protect against over pressure.
- F. Perform tests and record results on the test data forms that are included in this section. Develop additional and/or more detailed test forms as necessary to suit more complex instrumentation.
- G. Sign and date all test reports. Submit the test reports to the Engineer within five (5) working days of testing.

3.14 CALIBRATION:

- A. Instruments are to be factory pre-calibrated. Verify calibration “in situ” after installation. Provide a printed record of the factory calibration and as constructed parameters for “smart” devices. Include device tag numbers and serial numbers in the calibration records.
- B. Instruments are to be set up and calibrated by an accredited instrument technician working under the approval of the instrument manufacturer.
- C. Calibrate all instruments to the accuracy specified in in Section 40 70 00, or to the manufacturer’s stated accuracy of the instrument when required accuracy is not specified.
- D. Prior to instrument installation perform the following applicable calibration for each instrument and its associated signal conditioning equipment:
 - 1. Calibrate all inline flow meters by a draw-down test.
 - 2. Calibrate all density meters by lab samples.

3. Calibrate all vacuum and pressure instruments by manometer or certified calibration standard.
4. Calibrate gas detectors using standard gas samples.
5. Calibrate temperature instruments against a standard lab thermometer or certified calibration standard.

3.15 INSTALLATION AND PERFORMANCE TESTING:

- A. Refer to the requirements of Section 01 78 25 for additional requirements.
- B. Inspections
 1. Provide two (2) weeks written notice to the Owner and Engineer prior to energizing any system to allow for inspection by the Owner and Engineer of the following:
 - a. Proper mounting.
 - b. Proper connections.
- C. During commissioning, demonstrate to the Engineer proper calibration and correct operation of instruments and gauges.
- D. Commissioning of the I&C system is to include but not be limited to the following:
 1. Verify installation of components, wiring connections, and piping connections.
 2. Supervise wiring continuity and pipe leak tests.
 3. Verify instrument calibration “in situ” and provide written reports.
 4. Function check and adjust the I&C equipment under operational conditions.
 5. Coordinate I&C equipment supplier’s service personnel as required for complete system testing.
 6. Instruct plant personnel in correct method of I&C equipment operation.
 7. Direct plant personnel at hand-over as to final adjustment of the system for correct operation of plant.
 8. Ensure that the I&C equipment suppliers cooperate to complete the Work of this section.
 9. Verify signal levels and wiring connections to all I&C equipment.

10. Coordinate and cooperate with District staff and the Engineer to commission the interface between the existing Plant supervisory control and data acquisition (SCADA) system and the new PLC based control systems.

3.16 TRAINING:

- A. Provide training, described in detail in Section 01 78 25, as required by the plant's personnel to become fully competent in the proper operation and maintenance of all control devices, control valves, and ancillary instrumentation described under this section of the specifications.
- B. For the PLC based control systems, the Contractor shall provide maintenance training that includes a review of the PLC program, system troubleshooting, and identification of programmed system variables such as set-points, alarms, and statuses.
- C. Training shall be provided for the City's Operations and Maintenance personnel in customized classes for Operations staff and customized classes for Maintenance staff. Before any classes are schedule, provide outlines and training plans for approval, for proposed personnel
 1. Operations
 - a. All activities required for proper day-to-day operations of the Process Control System equipment provided under division 40.
 - b. Provide one four hour Operations class at the site and coordinate attendees with the Owner.
 2. Maintenance
 - a. All maintenance activities required for continued proper operation of the Process Control System equipment including daily, weekly, monthly, and yearly maintenance activities for all Process Control System equipment.
 - b. Provide one four hour Operations class at the site and coordinate attendees with the Owner.

3.17 CLOSEOUT ACTIVITIES:

- A. Provide in accordance with Section 01 77 00.

3.18 SCHEDULES:

- A. Instrument Test Report (ITR).
- B. Loop Check Report (LCR).

SECTION 40 61 21

PROCESS CONTROL SYSTEM TESTING

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide Control System Site Acceptance Testing as specified in this section and in compliance with the Contract Documents. The purpose of the site acceptance testing is to demonstrate the performance of the process control system by testing all components and functions of the system. The test will be conducted in three phases:
 - 1. Component testing: Demonstrate in manual mode that each connected component of the control system functions in accordance with specifications and manufacturer requirements. Demonstrate that field device inputs and outputs for the control system are functioning properly with correct polarity and scaling.
 - 2. PLC Area Acceptance Testing: Demonstrate the key data acquisition, control strategies, interlocks, and alarm functions for each process area in manual, semi-automatic, and automatic control modes as applicable. Coordinate and cooperate with other divisions and simulate and/or force key process variables as required to facilitate testing activities.
 - 3. Overall Integrated System Performance Testing: In cooperation with other divisions, participate in the Overall Integrated Performance Tests specified in the process and mechanical divisions.

1.02 REFERENCES:

 - 8. S75: Control Valve Design, Specification and Testing

- 9. S96: Valve Actuators
- 10. S99: Control System Cyber Security
- 11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. Process methodology statement stating how and what will be done by the Contractor during the acceptance testing. The methodology statement will be prepared by the Contractor with the Engineer providing reviews and input and must be approved before implementation.
 - 2. Test schedule for each Component, Process Unit, and Process Area.
 - 3. Process control system component test procedures.
 - 4. Process Area control strategy test procedures.
 - 5. Integrated System Performance Test procedures.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Within two (2) weeks following completion of any acceptance tests, submit acceptance test report to the Engineer.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.07 PROJECT/SITE CONDITIONS:

- A. Coordinate all work of this Section with the Other Contractors responsible for the construction of the related work, with plant operations and the Engineer.

1.08 WARRANTY:

- A. As specified in Division 01.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Provide any and all software, tools, testing equipment, temporary configuration programs, cables, wiring, terminals and other accessories required to fully test and verify the proper connection and operation the process control system.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Meet the following conditions prior to the start of any acceptance testing.
 - 1. Correct deficiencies noted during installation prior to commencement of testing.
 - 2. Have on site, documentation pertinent to the equipment being tested. Provide a detailed description of the testing methodology to be used to ensure satisfactory performance of the process control system equipment.
 - 3. Keep on site, labelled, and properly stored spare parts, expendables and test equipment pertinent to the equipment being tested.
 - 4. Have the Engineer review acceptance test schedules and acceptance test procedures.
 - 5. Perform the acceptance testing on a per Process Area basis. Test no more than one Process Area at any given time unless other arrangements are made with the Engineer.
 - 6. Obtain approval from the Engineer prior to conducting any testing which may affect existing operations.
 - 7. Schedule any testing which affects the system operation through the Engineer daily.

3.02 FIELD TESTING:

- A. Organize acceptance testing sequentially by Process Area and in line with the master schedule. Include testing of all inputs/outputs (I/Os), PLC functions and communications for each Process Area and vendor-supplied equipment components.
- B. Check each Process Area against drawings and database lists. Test each PLC and corresponding data communication links.
- C. Check all I/O from the field components to the process control system. Include instruments, control devices, panels, termination cabinets, input/output cards, and other devices in the I/O to ensure proper operation. The applicable Other Contractor will be in attendance during I/O field checks.

D. Document the component testing and submit to the Engineer. Include the following:

1. I/O name.
2. I/O description.
3. Drawing reference.
4. Type of test(s) performed.
5. Date tested.
6. Signature of tester and date.
7. Signature of Engineer and date.

E. Test the process control system equipment as follows:

1. Check equipment against inventory lists.
2. Certify that the equipment has been installed properly.
3. Power up the process control system equipment and run diagnostics to verify proper operation.
4. Load the application system software from backup media.
5. Verify peripheral operation and peripheral failure operation.
6. Check polling of remotes.
7. Verify that data is not lost on failover from the primary to the backup communication path.
8. Verify that operating data is not lost on failover from the primary to the standby processor.
9. Verify historical data is not lost if the system server is down for less than 72 hours.
10. Test input/output, display, control, and report generation software.
11. Test historical data collection capabilities.
12. Test trending functions.
13. Certify that the system is ready for performance testing.
14. Test operation of the Local Area Network associated with the process control system equipment.

15. Test all alarm functions and alarm history files.
 16. Test system automatic backup and restore procedures.
- F. Document the process control system area testing and submit to the Engineer. Include the following:
1. Description of functions tested.
 2. Tests performed.
 3. Copies of messages, displays, reports, and trends which verify operation.
 4. Signature of tester and date.
 5. Signature of the Engineer and date.
 6. Problem description, if any.
 7. Performance Verification.
- G. After Process Area Testing and component testing have been completed, perform an Integrated System Performance Test to verify the system performance. Provide onsite personnel for the Integrated System Performance Test duration.
- 3.03 DEMONSTRATION:
- A. Use the communications statistics to verify and demonstrate that the average process control system equipment to PLC communications availability is greater than 99.99%. Failure of data communication equipment will not count as downtime.
- B. Demonstrate an availability of 99.99% or better for the entire process control system. Availability is defined as:
1. $\text{Availability} = (\text{Test Duration} - \text{Downtime}) / \text{Test Duration}$.
- C. The system is down if a PLC cannot be accessed from the operator station because of a hardware/software failure, an operational PLC is not polled, alarm and event reporting functions are lost, trend or historical data is lost, or operator commands cannot be carried out because of a hardware/software failure.
- D. Failover to a backup device will not be counted as downtime provided the backup device assumed proper operation.
- E. Demonstrate the historical logging and reporting functions of the system.
- F. Demonstrate system response times for operator displays and data update to or from other process areas and remote sites. Perform test reruns the Engineer may deem necessary.

3.04 PROTECTION:

- A. Operate control system equipment only in areas where construction is sufficiently completed and with environmental controls in place and operational such that the manufacturer's environmental requirements are not compromised.
- B. Provide dust and moisture protection for control system equipment overnight and when not in use to protect against unanticipated construction activities, painting, cleaning, etc.
- C. Maintain daily backups of all program and configuration files for all control system components on removeable media. Backup files may be stored off-site or on-site provided that they are physically separated from the respective control system equipment.

3.05 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 61 93

PROCESS CONTROL SYSTEM INPUT/OUTPUT LIST

PART 1 - GENERAL

1.01 DESCRIPTION

- A. The control system I/O indices included in this section have been provided for reference and includes all the control system input and output points shown on the P&ID drawings and the mechanical system schematics. The control system I/O indices will be used by the control system programmers and integrators to develop the control system PLC application programs, server and historian computer configurations, and Human-Machine Interface graphics.

1.02 REFERENCES

- A. International Society of Automation (ISA):
 - 1. S5.1: P&IDs and Tagging
 - 2. S5.4: Instrument Loop Diagrams
 - 3. S7: Instrument Air
 - 4. S12: Electrical Equipment for Hazardous Locations
 - 5. S18.2: Alarm Management
 - 6. S20: Instrument Specifications
 - 7. S50: Electrical Control Signals
 - 8. S75: Control Valve Design, Specification and Testing
 - 9. S96: Valve Actuators
 - 10. S99: Control System Cyber Security
 - 11. 101: Human-Machine Interfaces

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. The Input/Output indices provided in this section shall be updated by the contractor based on the finalized Input/Output requirements for each packaged system and piece of equipment obtained from the approved shop drawings.

2. Submit finalized For Construction Input/Output indices for the process control system when all shop drawings have been reviewed.
3. Submit As-Constructed Input/Output indices for the entire control system for review when construction and commission is completed.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 GENERAL

- A. Update Input/Output indices provided in this section based on the finalized Input/Output requirements for each packaged system and piece of equipment obtained from the approved shop drawings.
- B. Use only updated and reviewed Input/Output lists in the development of the control system PLC application programs, server and historian computer configurations, and Human-Machine Interface graphics.
- C. Submit the As-Constructed Input/Output indices for review by the Engineer and include copies in the project O&M manuals in both printed and soft copies on removable media.

3.02 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00.

SECTION 40 61 96

PROCESS CONTROL DESCRIPTIONS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide control system programming and configuration services to achieve the operational functionality generally as described in the control descriptions provided in this section and in compliance with the P&IDs and other Contract Documents.
 - 1. This Section outlines the proposed operation and control strategies for the proposed equipment for the Provo River Water Treatment Plant.
 - 2. It should be noted that these control descriptions are provided as a guide to the intent of the main control strategies and do not purport to describe every detail and nuance of the completed programs. The I&C Subcontractor and Contractor must study contract documents and take into consideration the Provo City Water Resources standard practices for PLC program design, graphics objects characteristics, screen layouts, and operator interface features as detailed in subsequent sections.
 - 3. All aspects of the new control sequences, operator interface, and remote monitoring must be thoroughly tested in cooperation with the Owner and the Engineer to demonstrate correct functioning of all control system features and to verify that all interlocks and alarms are functioning properly.

1.03 QUALITY ASSURANCE

A. Comply with the requirements specified in Section 01 43 00.

PART 2 PROCESS CONTROL DESCRIPTIONS

2.01 RIVER INTAKE

A. Loop 0101 Raw Water Diversion Wet Well

1. P25-SCR-0101-1 Intake Screen Brush Cleaning System

- a. The operator may select between local operation of the screen in the field or remote operation by the SCADA system.
- b. When in remote operation by the SCADA system, the screen operates on a differential level calculated by upstream and downstream level indicating transmitters P25-LIT-0101-1A (upstream) and P25-LIT-0101-1B (downstream).
- c. Hydraulic motor running and motor overload are monitored and displayed.
- d. Travel motor running and motor overload are monitored and displayed.

2. P25-PMP-0101-2 Intake Screen Washdown Pump

- a. The operator may select between local operation of the washdown system pump in the field or remote operation by the SCADA system. When in remote operation the pump shall operate on an operator-selectable timer, initially set at once every 24 hours.
- b. Upon operating the pump sends water from a 48" diameter manhole to the spray connection on the intake screen for washing sediment built-up in front of the screen.
- c. Pump motor running and motor overload are monitored and displayed.

3. P25-RDG-0101-3 Intake Screen Bypass Radial Gate

- a. The operator may select between local operation of the radial gate in the field or remote operation by the SCADA system.

- b. If needed, the operator may locally or remotely open or close the motor-actuated radial gate to adjust the diversion of raw water flow around the intake screen and back into the river.
 - c. Gate percentage open, fully open, and fully closed limit switches are displayed.
 - d. If the slide gate motor actuator fails, an alarm is generated.
- 4. P25-SDG-0101-1A Wet Well Effluent Slide Gate
 - a. The operator may select between local operation of the slide gate in the field or remote operation by the SCADA system.
 - b. If needed, the operator may locally or remotely open or close the motor-actuated slide gate to adjust the flow of raw water into the diversion box.
 - c. Gate percentage open, fully open, and fully closed limit switches are displayed.
 - d. If the slide gate motor actuator fails, an alarm is generated.
 - e. Effluent flow from the Raw Water Diversion Wet Well to the Diversion Box is measured by ultrasonic flow meter P25-FE/FIT-0101-1. The operator shall set a flow rate that is maintained by opening or closing the slide gate.
- 5. Raw Water Quality
 - a. Incoming raw water quality is analyzed in the raw water diversion wet well by two water quality analyzers P25-AIT-0101-1A and P25-AIT-0101-1B. P25-AIT-0101-1A, upstream of the intake screen, analyzes the raw water for BOD, COD, DOC, TOC, UV254, and NO3. P25-AIT-0101-1B, downstream of the intake screen inside the diversion wet well, analyzes turbidity. If turbidity reaches a high level, determined during start-up and commissioning, an alarm is generated.

2.02 PLANT INTAKE

A. Loop 0102 Diversion Box

1. Diversion Box Level

- a. Raw water level in the diversion box is measured by P25-LIT-0102-1. If the level in the box reaches an operator-defined maximum level, an alarm is generated. If the level in the box reaches an operator-defined minimum level, an alarm is generated and any UF Feed Pumps shall trip offline.

2. P25-SDG-0102-1A Diversion Box Slide Gate to In-Line Flash Reactor

- a. The operator may select between local operation of the slide gate in the field or remote operation by the SCADA system.
 - b. If needed, the operator may locally or remotely open or close the motor-actuated slide gate to adjust the flow of raw water into the water treatment plant in-line flash reactor.
 - c. Gate percentage open, fully open, and fully closed limit switches are displayed.
 - d. If the slide gate motor actuator fails, an alarm is generated. If there is a high turbidity alarm, this slide gate closes and gate P25-SDG-0102-1B opens.
- 3. P25-SDG-0102-1B Diversion Box Slide Gate to Mill Race Canal
 - a. The operator may select between local operation of the slide gate in the field or remote operation by the SCADA system.
 - b. If needed, the operator may locally or remotely open or close the motor-actuated slide gate to adjust the flow of raw water to the Mill Race Canal.
 - c. Gate percentage open, fully open, and fully closed limit switches are displayed.
 - d. If the slide gate motor actuator fails, an alarm is generated.
- 4. Irrigation Pump System
 - a. Raw water flow taken by the irrigation system is measured by electromagnetic flow meter P25-FE/FIT-0102-2.

2.03 RAW WATER PLANT INFLUENT

A. Loop 0303 Plant Water Influent

- 1. Raw Water Plant Influent Flow
 - a. Influent flow to the plant, downstream from the in-line flash reactor, is measured by an electromagnetic flow meter P25-FE/FIT-0303-1.
- 2. Raw Water Plant Influent Water Quality Analyzers
 - a. Influent raw water turbidity is measured by an analyzer P25-AIT-0303-1A. If the turbidity value exceeds an operator-defined limit for acceptable influent water quality, an alarm is generated.
 - b. Influent raw water pH is measured by an analyzer P25-AIT-0303-1B. If the pH value falls outside an operator-defined range for acceptable influent water quality, an alarm is generated.

3. Raw Water Influent Pressure

- a. Influent raw water pressure, downstream of the point of emergency chlorine solution injection, is measured by P25-PIT-0303-1.

2.04 ULTRAFILTRATION

A. Loop 0200 UF Skids Main Control Panel

- 1. The Ultrafiltration system will operate a set number of UF skids based on an operator setpoint. The operator will also select the lead, lag, lag-lag, etc. order of UF skids. The controlling setpoint for starting and stopping of skids is the level in the clear well cells.
- 2. P25-MCP-0200-1
 - a. The subsequent UF Skid and CIP Skid local vendor control panels are connected via Ethernet to a master vendor control panel. The following points at a minimum are monitored and displayed for each UF skid:
 - (1) Status of skid including production mode, backwash (and sequence of backwash step), maintenance clean, CIP, integrity test, standby, and offline.
 - (2) General UF Skid Alarm
 - (3) Feed pressure, filtrate pressure, and Transmembrane Pressure (TMP)
 - (4) Control valve positions
 - (5) Water temperature
 - (6) Normalized permeability
 - (7) Normalized membrane flux
 - (8) Air system pressure
 - (9) Filtrate Flow
 - (10) Filtrate Turbidity
 - b. The Manufacturer's MCP automatically controls:
 - (1) UF skids start-up
 - (2) sequencing of increasing or decreasing the number of operating UF skids

- (3) sequencing skid backwashing
- (4) sequencing membrane integrity testing
- (5) filter effluent output to maintain a clearwell level set point received from SCADA
- (6) UF skid clean-in-place systems and sequencing maintenance cleans

B. Loop 0201 UF Skid 1 (Typical of thirteen total UF Skids)

1. P25-PMP-0201-1

- a. UF Skid 1 is fed by a vertical turbine feed pump. The operator is able to assign the pump into and out of service as necessary.
- b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback are monitored for the feed pump. VFD fail generates an alarm.
- c. In automatic, the UF main control panel will request start and stop of the corresponding UF feed pump and adjust VFD speed based on the pressure required to maintain the membrane flux.
- d. The pump may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed will be maintained.
- e. If the pump local emergency stop is engaged, the pump will trip offline and an alarm will be generated.
- f. Suction pressure to the feed pump will be monitored by pressure switch P25-PSL-0201-1. If the pressure in the influent pipe drops below the acceptable limit for the feed pump, an alarm will be generated, and the pump will trip offline.

2. P25-STR-0201-2

- a. The discharge of UF Feed Pump 1 will be pumped through an electrically cleaned strainer.
- b. Strainer motor running, in remote, and overload will be monitored by the SCADA system.
- c. Differential pressure across the strainer will be measured by P25-DPSH-0201-2. When the setpoint of this differential pressure switch is reached, the

SCADA system will initiate a strainer backwash cycle consisting of the following:

- (1) Open BWW outlet valve
 - (2) Start strainer motor
 - (3) Run for time setpoint (adjustable from 10 to 120 seconds)
 - (4) Stop strainer motor
 - (5) Close BWW outlet valve
- d. When a high-high differential pressure setpoint value is reached, an alarm is generated in the SCADA system and a stop command is sent to UF skid 1.
 - e. The operator may start the strainer motor from the SCADA system while in remote. If the strainer motor is in local, the strainer cleaning motor may be started at the motor control center located in the electrical room.
 - f. Pressure may be locally viewed on the upstream and downstream side of the strainer by P25-PI-0201-2A and P25-PI-0201-2B, respectively.
3. P25-SK-0201-3 & P25-LCP-0201-3 UF Skid 1 Local Control Panel
 - a. UF Skid 1 will be equipped with a local vendor control panel to monitor and control the dedicated feed pump and UF skid including monitor and control of all pneumatic control valves, pressure transmitters, flow meters, temperature monitors, pH analyzers, turbidimeters, and all related skid-mounted instrumentation. Refer to specification Section 46 61 33 for additional details, requirements, and control descriptions.

2.05 ULTRAFILTRATION CLEAN-IN-PLACE SKIDS

A. Loop 0221 Clean-In-Place Skid 1

1. UF CIP Skid 1 will be equipped with a local vendor control panel to monitor and control the CIP Tank and Skid operation including control of the CIP pump and monitoring of tank water level, pH, temperature, chlorine residual, and status of UF skid receiving a clean. Refer to specification Section 46 61 33 for additional details, requirements, and control descriptions.
2. P25-LCP-0221-1 UF CIP Skid 1 Local Control Panel
 - a. The local vendor control panel will be connected via Ethernet to the UF Skid main vendor control panel P25-MCP-0200-1. The following points at a minimum will be monitored and displayed for the CIP skid:
 - (1) CIP Pump 1 run status

- (2) CIP Pump 1 VFD speed
- (3) CIP Pump 1 Alarm
- (4) CIP Tank 1 heater run status
- (5) CIP Tank 1 heater alarm
- (6) CIP Tank 1 pH
- (7) CIP Tank 1 free chlorine residual
- (8) CIP Tank 1 water temperature
- (9) CIP Tank 1 high temperature alarm
- (10) CIP Tank 1 water level
- (11) CIP Tank 1 high water level alarm

B. Loop 0222 Clean-in-Place Skid 2

- 1. UF CIP Skid 2 will be equipped with a local vendor control panel to monitor and control the CIP Tank and Skid, as well as monitor and control all pneumatic supply and control valves and all related skid-mounted instrumentation. Refer to specification Section 46 61 33 for additional details, requirements, and control descriptions.
- 2. P25-LCP-0222-1 UF CIP Skid 2 Local Control Panel
 - a. The local vendor control panel will be connected via Ethernet to the UF Skid main vendor control panel P25-MCP-0200-1. The following points at a minimum will be monitored and displayed for the CIP skid:
 - (1) CIP Pump 2 run status
 - (2) CIP Pump 2 VFD speed
 - (3) CIP Pump 2 Alarm
 - (4) CIP Tank 2 heater run status
 - (5) CIP Tank 2 heater alarm
 - (6) CIP Tank 2 pH
 - (7) CIP Tank 2 free chlorine residual
 - (8) CIP Tank 2 water temperature

- (9) CIP Tank 2 high temperature alarm
- (10) CIP Tank 2 water level
- (11) CIP Tank 2 high water level alarm

2.06 BACKWASH WASTE

A. Loop 0250 Backwash Waste Tank Cells

1. In automatic mode, the backwash waste tank will function in a rotational batch configuration utilizing level-based control. At any one time, one cell will be filling, one cell will be setting, and one cell will be decanting. While filling, the cell will have inlet valves open and outlet valves closed. While settling, all inlet and outlet valves associated with the cell are closed. While decanting, the cell outlet valves are open with corresponding recycle and sludge pumps running, as described in subsequent sections.
2. Backwash Waste Tank Cell 1 Influent Valves P25-FV-0250-1A through P25-FV-0250-1D
 - a. Backwash waste from the strainers, UF skids, and air purge lines from the UF skids are drained to the backwash tank.
 - b. The operator may select between local operation of the influent valves in the field or remote operation by the SCADA system.
 - c. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of backwash into the backwash tank cell.
 - d. Valve position fully open and fully closed limit switches will be displayed.
 - e. If a valve motor actuator fails, an alarm is generated.
3. Backwash Cell 1 Decanter P25-DEC-0250-1 and Effluent Valves P25-FV-0250-1E and P25-FV-0250-1F
 - a. Liquid effluent from the backwash tank cell passes through a floating decanter and a corresponding effluent valve is opened to permit flow of the backwash to the backwash recycle pumps.
 - b. Sludge effluent from the backwash tank cell collects at the bottom of the backwash tank cells and a corresponding effluent valve is opened to permit flow of the sludge to the backwash sludge pumps.
 - c. The operator may select between local operation of the effluent valves in the field or remote operation by the SCADA system.

- d. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of backwash effluent to the backwash recycle pumps or backwash sludge pumps.
 - e. Valve position fully open and fully closed limit switches are monitored and displayed.
 - f. If a valve motor actuator fails, an alarm is generated.
4. Backwash Tank Cell 1 Level
- a. Liquid level in the tank cell is measured by P25-LE-0250-1. If the level in the cell reaches an operator-defined maximum level, and alarm is generated.
 - b. If maximum level in the tank is reached during an active backwash cycle, as measured by P25-LSH-0250-1, backwash influent flow will be diverted to the next available cell in the backwash tank.
5. Backwash Cell 2 Influent Valves P25-FV-0250-2A through P25-FV-0250-2D
- a. Backwash waste from the UF feed pump skid strainers, UF skids, and UF CIP skids as well as air purge lines from the UF skids are drained to the backwash tank. When a backwash cycle is initiated by the operator, the corresponding valves are opened to permit influent of the backwash to the tank.
 - b. The operator may select between local operation of the influent valves in the field or remote operation by the SCADA system.
 - c. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of backwash into the backwash tank cell.
 - d. Valve position fully open and fully closed limit switches will be displayed.
 - e. If a valve motor actuator fails, an alarm is generated.
6. Backwash Cell 2 Decanter P25-DEC-0250-2 and Effluent Valves P25-FV-0250-2E and P25-FV-0250-2F
- a. Liquid effluent from the backwash tank cell passes through a floating decanter and a corresponding effluent valve is opened to permit flow of the backwash to the backwash recycle pumps.
 - b. Sludge effluent from the backwash tank cell collects at the bottom of the backwash tank cells and a corresponding effluent valve is opened to permit flow of the sludge to the backwash sludge pumps.
 - c. The operator may select between local operation of the effluent valves in the field or remote operation by the SCADA system.

- d. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of backwash effluent to the backwash recycle pumps or backwash sludge pumps.
 - e. Valve position fully open and fully closed limit switches are monitored and displayed.
 - f. If a valve motor actuator fails, an alarm is generated.
7. Backwash Tank Cell 2 Level
- a. Liquid level in the tank cell is measured by P25-LE-0250-2. If the level in the cell reaches an operator-defined maximum level, an alarm is generated.
 - b. If maximum level in the tank is reached during an active backwash cycle, as measured by P25-LSH-0250-2, backwash influent flow will be diverted to the next available cell in the backwash tank.
8. Backwash Cell 3 Influent Valves P25-FV-0250-3A through P25-FV-0250-3D
- a. Backwash waste from the UF feed pump skid strainers, UF skids, and UF CIP skids as well as air purge lines from the UF skids are drained to the backwash tank. When a backwash cycle is initiated by the operator, the corresponding valves are opened to permit influent of the backwash to the tank.
 - b. The operator may select between local operation of the influent valves in the field or remote operation by the SCADA system.
 - c. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of backwash into the backwash tank cell.
 - d. Valve position fully open and fully closed limit switches will be displayed.
 - e. If a valve motor actuator fails, an alarm is generated.
9. Backwash Cell 3 Decanter P25-DEC-0250-3 and Effluent Valve P25-FV-0250-3E and P25-FV-0250-3F
- a. Liquid effluent from the backwash tank cell passes through a floating decanter and a corresponding effluent valve is opened to permit flow of the backwash to the backwash recycle pumps.
 - b. Sludge effluent from the backwash tank cell collects at the bottom of the backwash tank cells and a corresponding effluent valve is opened to permit flow of the sludge to the backwash sludge pumps.
 - c. The operator may select between local operation of the effluent valves in the field or remote operation by the SCADA system.

- d. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of backwash effluent to the backwash recycle pumps.
 - e. Valve position fully open and fully closed limit switches are monitored and displayed.
 - f. If a valve motor actuator fails, an alarm is generated.
10. Backwash Tank Cell 3 Level
- a. Liquid level in the tank cell is measured by P25-LE-0250-3. If the level in the cell reaches an operator-defined maximum level, an alarm is generated.
 - b. If maximum level in the tank is reached during an active backwash cycle, as measured by P25-LSH-0250-3, backwash influent flow will be diverted to the next available cell in the backwash tank.

B. Loop 0251 Backwash Recycle Pumping

- 1. Liquid effluent through the backwash tank cell decanters flow to the backwash recycle pump header. Each backwash recycle pump sends water to the raw water influent pipe at the head of the plant. Backwash recycle shall not exceed 10% of total raw water plant influent, are measured by P25-FE/FIT-0251-1.
- 2. P25-PMP-0251-1, P25-PMP-0251-2, P25-PMP-0251-3, P25-PMP-0251-4
 - a. Each backwash recycle pump is equipped with a VFD. The operator can assign the pumps into and out of service as necessary.
 - b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for each pump. VFD fail generates an alarm.
 - c. In automatic, the SCADA system will start and stop the recycle pumps based on the level in the backwash tank cells and the required quantity of UF Skids required to maintain the high service pump station outlet pressure.
 - d. Each pump may be placed in remote manual mode at the VFD. In this mode, the operator may turn the pumps on or off and set the speed of the pump accordingly. If a pump is running and it is placed into or out of remote manual mode, the pump run status and running speed will be maintained.
 - e. If a pump local emergency stop is engaged or the corresponding suction pressure switch low P25-PSL-0251-1 through P25-PSL-0251-4 actuates, the corresponding pump trips offline and an alarm is generated.

- f. Local indication of pump discharge pressure is provided by P25-PI-0251-1 through P25-PI-0251-4.

C. Loop 0252 Backwash Sludge Pumping

- 1. Coagulated solids are collected at the bottom of each backwash tank cell. Each tank cell is equipped with a motor-operated discharge valve to permit solids effluent flow to the backwash sludge pump header and backwash sludge pumps. Solids effluent through the backwash tank cells flows to the backwash recycle pump header. Each backwash sludge pump sends sludge from the header pipe to the site sanitary sewer.
- 2. P25-PMP-0252-1 and P25-PMP-0252-2
 - a. Each backwash sludge pump can be assigned into and out of service as necessary by the operator.
 - b. Pump running, pump emergency stop status, pump in remote status, and motor overload is monitored for each pump. Motor overload generates an alarm.
 - c. In automatic, the SCADA system starts and stops the sludge pumps when one cell is settling and decanting. After filling is complete of a cell, and an operator selected timer setpoint, the corresponding cell sludge valve opens and a sludge pumps starts. The sludge pump runs throughout the settling phase and decant phase. The pump shuts off, after an operator selected timer setpoint, before the decant phase is complete
 - d. If a pump local emergency stop is engaged, the corresponding pump trips offline and an alarm is generated.
 - e. Local indication of pump discharge pressure is provided by P25-PI-0252-1 and P25-PI-0252-2.

2.07 CHEMICAL WASTE

A. Loop 0253 Chemical Waste Tank and Pumping

- 1. Chemical waste is collected from the CIP skids and chlorine gas scrubber. The chemical waste tank is equipped with two downstream pumps to send chemical waste to the site sanitary sewer.
- 2. Chemical Waste Tank Level
 - a. Liquid level in the chemical waste tank is measured by P25-LIT-0253-1. If the level in the tank reaches an operator-defined maximum level, and alarm is generated.
- 3. P25-PMP-0253-1 and P25-PMP-0253-2

- a. The operator can assign the chemical waste pumps into and out of service as necessary.
 - b. Pump running, pump emergency stop status, pump in remote status, and motor overload is monitored for each pump. Motor overload generates an alarm.
 - c. In automatic, the SCADA system will start and stop the chemical waste pumps based on the level in the chemical waste tank. The pumps alternate on each pump cycle or after an operator defined runtime setpoint.
 - d. If a pump local emergency stop is engaged, the corresponding pump trips offline and an alarm is generated.
 - e. Local indication of pump discharge pressure is provided by P25-PI-0253-1 and P25-PI-0253-2.
4. P25-FV-0253-1A
- a. Discharge flow from the chemical waste pumps is controlled by a motor-operated valve.
 - b. The operator may select between local operation of the discharge valve in the field or remote operation by the SCADA system.
 - c. If needed, the operator may locally or remotely open or close the motor-actuated valve to adjust the flow of chemical waste discharge to the site sanitary sewer.
 - d. Valve position fully open and fully closed limit switches are monitored and displayed.
 - e. If a valve motor actuator fails, an alarm is generated.
5. Backwash Sludge Discharge Flow
- a. Backwash sludge pumped from the backwash sludge pumps to the sump is measured by electromagnetic flow meter P25-FE/FIT-0253-3.
6. Chemical Waste Discharge Analyzers
- a. pH and ORP of the sump discharge to the site sanitary sewer is measured by P25-AIT-0254-1 and P25-AIT-0254-2. If discharge pH or ORP exceeds an operator-programmable maximum setpoint, an alarm is generated.

2.08 HIGH PRESSURE AIR SYSTEM

A. Loop 0231 Air Compression, Drying, and Storage

1. The compressed air system will be supplied by the UF system vendor. Each compressor will be equipped with a local control panel to monitor and control the compressors. The Main UF control panel will monitor and control all pneumatic supply, dryers, filters, and air receivers, as well as all control valves and all related skid-mounted instrumentation. Refer to specification Section 46 61 33 for additional details, requirements, and control descriptions.

2.09 CHLORINE GAS STORAGE AND INJECTION

A. Loop 0301 Chlorine Storage and Distribution

1. Chlorine gas is stored in three 2000 lb chlorine gas cylinders. A vacuum is induced when water passes through four downstream chlorinator injectors, which causes the chlorine gas in the in-service cylinder to be drawn out and into the four chlorinators. The chlorinators send the chlorine gas to the injectors and monitor the vacuum pressure, gas temperature, and other process variables to ensure uniform injection of chlorine gas.
2. P25-RGL-0301-1 & CGC-0301-1
 - a. Chlorine gas is stored in a 2000 lb cylinder mounted to a scale system equipped with a weight scale P25-WIT-0301-1. The weight scale is displayed on SCADA and is visually displayed on a remote-mounted monitoring panel device P25-WI-0301-1. When the weight scale reaches an operator-defined low setpoint an alarm is generated. The SCADA trending shall report the pounds of chlorine fed per day to each application point (process water and UF cleaning system water).
 - b. The cylinder vacuum regulator is equipped with high- and low-pressure switches that control the opening and closing of the regulator to permit or restrict the flow of gas in the presence or absence of a vacuum in the gas feed piping. A temperature-switch controlled heater is provided in the event that the ambient temperature drops below an operator-defined setpoint.
 - c. When the cylinder is in service and reaches its minimum level, the vacuum regulator of the other cylinder not in service automatically changes state in the presence of the vacuum to take over chlorine gas dispensing.
3. P25-RGL-0301-2 & CGC-0301-2
 - a. Chlorine gas is stored in a 2000 lb cylinder mounted to a scale system equipped with a weight scale P25-WIT-0301-2. The weight scale is displayed on SCADA and is visually displayed on a remote-mounted monitoring panel device P25-WI-0301-2. When the weight scale reaches an operator-defined low setpoint an alarm is generated. The SCADA trending shall report the pounds of chlorine fed per day to each application point (process water and UF cleaning system water).

- b. The cylinder vacuum regulator is equipped with high- and low-pressure switches that control the opening and closing of the regulator to permit or restrict the flow of gas in the presence or absence of a vacuum in the gas feed piping. A temperature-switch controlled heater is provided in the event that the ambient temperature drops below an operator-defined setpoint.
 - c. When the cylinder is in service and reaches its minimum level, the vacuum regulator of the other cylinder not in service automatically changes state in the presence of the vacuum to take over chlorine gas dispensing.
- 4. P25-RGL-0301-3 & CGC-0301-3
 - a. Chlorine gas is stored in a 2000 lb cylinder mounted to a scale system equipped with a weight scale P25-WIT-0301-3. The weight scale is displayed on SCADA and is visually displayed on a remote-mounted monitoring panel device P25-WI-0301-2. When the weight scale reaches an operator-defined low setpoint an alarm is generated. The SCADA trending shall report the pounds of chlorine fed per day to each application point (process water and UF cleaning system water).
 - b. The cylinder vacuum regulator is equipped with high- and low-pressure switches that control the opening and closing of the regulator to permit or restrict the flow of gas in the presence or absence of a vacuum in the gas feed piping. A temperature-switch controlled heater is provided in the event that the ambient temperature drops below an operator-defined setpoint.
 - c. When the cylinder is in service and reaches its minimum level, the vacuum regulator of the other cylinder not in service automatically changes state in the presence of the vacuum to take over chlorine gas dispensing.
- 5. P25-PE/PSH-0301-3
 - a. The presence of a vacuum in the chlorine gas feed pipe is monitored by an externally mounted pressure element and switch.
 - b. If the vacuum is disturbed for any reason, or the vacuum is lost, the pressure switch actuates and generated an alarm in the SCADA system and an externally-mounted alarm horn sounds.
- 6. P25-AE/AIT-0300-1 & P25-AE/AIR-0300-2
 - a. The presence of chlorine gas in the chlorine storage room is monitored by externally mounted analyzers and analyzer indicating transmitters.
 - b. Continuous real-time reading of the quantity of chlorine in the air is measured and subsequently displayed by SCADA. If the chlorine gas content in the room rises above a safe level, an alarm is generated and the emergency scrubber system engages.

7. P25-CL-0301-3, P25-CL-0301-4, P25-CL-0301-5 & P25-CL-0301-6
 - a. Four chlorinators monitor and control the flow of chlorine gas from the header pipe to the chlorine injectors.
 - b. Each chlorinator is monitored and controlled by a separately mounted local control device P25-AIT-0301-3, P25-AIT-0301-4, P25-AIT-0301-5, P25-AIT-0301-6. Each controller monitors the remote/local status of its corresponding chlorinator as well as the position of the chlorine gas discharge valve. The SCADA system monitors local control device status in remote and chlorinator discharge valve position for each chlorinator.
 - c. When a chlorinator is in automatic, an operator-defined chlorine gas dosing setpoint in the SCADA system is used to calculate corresponding open and close commands to the local control device to adjust the chlorinator discharge valve position.
 - d. When the chlorinator is in local, the operator may manually adjust the discharge valve position to adjust dosing of chlorine gas to the chlorine injectors.
 - e. Local indicator of chlorine gas flow through each chlorinator is provided by P25-FI-0301-3, P25-FI-0301-4, P25-FI-0301-5 and P25-FI-0301-6.
8. P25-PMP-0301-8 & P25-PMP-0301-9
 - a. UF filtrate is fed to the chlorinator booster pump header pipe as a source of motive water. Chlorine booster pumps 1 and 2 pump UF filtrate to chlorinator injectors 1 and 2 through an electromagnetic flow meter and motor-operated discharge valve.
 - b. These two pumps are dedicated to the UF cleaning system chlorine supply and configured in duty / standby. The operator can assign the pumps into and out of service as necessary.
 - c. Pump running, pump emergency stop status, pump in remote status, and motor overload is monitored for each pump. Motor overload generates an alarm.
 - d. In automatic, the SCADA system will start and stop the chlorinator booster pumps based on the status of the UF CIP skids calling for chlorinated water. .
 - e. If a pump local emergency stop is engaged, the corresponding pump trips offline and an alarm is generated.
 - f. Chlorinator booster pump discharge flow is measured by electromagnetic flow meter P25-FE/FIT-0301-8.

- g. Local pressure indication on the suction and discharge sides of injector P25-INJ-0301-12 is provided by P25-PI-0301-12A and P-25-PI-0301-12B, respectively.
 - h. Local pressure indication on the suction and discharge sides of injector P25-INJ-0301-13 is provided by P25-PI-0301-13A and P-25-PI-0301-13B, respectively.
9. P25-PMP-0301-10 & P25-PMP-0301-11
- a. UF filtrate is fed to the chlorinator booster pump header pipe as a source of motive water. Chlorine booster pumps 3 and 4 pump UF filtrate to chlorinator injectors 3 and 4 through an electromagnetic flow meter and motor-operated discharge valve.
 - b. The operator can assign the pumps into and out of service as necessary. These two pumps are dedicated to the process water with and chlorine can also be fed to the following application points:
 - (1) Clearwell cells 1 and two after ozone contact – normal operation
 - (2) Upstream of clearwell – optional feed when ozone is offline
 - (3) High service pump suction header – emergency use only when finished water chlorine residual is low
 - (4) Raw water – emergency use only as needed
 - c. Pump running, pump emergency stop status, pump in remote status, and motor overload is monitored for each pump. Motor overload generates an alarm.
 - d. In automatic, the SCADA system will start the selected chlorinator booster pump when the water plant is running and shut off the booster pump when the plant is off-line.
 - e. If a pump local emergency stop is engaged, the corresponding pump trips offline and an alarm is generated.
 - f. Chlorinator booster pump discharge flow is measured by electromagnetic flow meter P25-FE/FIT-0302-10.
 - g. Local pressure indication on the suction and discharge sides of injector P25-INJ-0301-14 is provided by P25-PI-0301-14A and P-25-PI-0301-14B, respectively.
 - h. Local pressure indication on the suction and discharge sides of injector P25-INJ-0301-15 is provided by P25-PI-0301-15A and P-25-PI-0301-15B, respectively.

10. Chlorine Gas Scrubber System P25-SK-0301-16

- a. In the event of a chlorine gas header pipe leak or other discharge of chlorine gas into the chlorine room, the chlorine emergency dry scrubber initiates and draws air out of the chlorine room through dry media and discharges it to atmosphere.
- b. The chlorine gas scrubber system is equipped with a vendor control panel that monitors and controls all instrumentation and equipment associated with the scrubber system. The scrubber local control panel is connected to the SCADA system and monitors scrubber in remote status, scrubber running, and scrubber blower motor overload.
- c. When the scrubber system starts or if the scrubber blower motor trips offline on a motor overload condition, an alarm is generated.

2.10 COAGULANT STORAGE AND INJECTION

A. Loop 0302 Coagulant Storage, Metering Pumps, and Flash Mix Pumps

1. P25-TNK-0302-1 & P25-TNK-0302-2

- a. Neat coagulant is stored in above ground storage tanks in the coagulant storage and pump room. Analog level in the first tank is measured by P25-LIT-0302-1 and a redundant level switch P25-LSH-0302-1 is provided for backup high level alarm condition. Analog level in the second tank is measured by P25-LIT-0302-2 and a redundant level switch P25-LSH-0302-2 is provided for backup high level alarm condition. When the level in a given tank reaches an operator-defined low level, an alarm is generated to indicate the need for refilling of the tank.
- b. In the event of a leak of coagulant in the coagulant storage and pump room, a sump with a level switch is provided. If the sump level switch actuates, an alarm is generated.
- c. Filling of the coagulant tanks is done manually at the outside truck fill connections. An audible horn sounds when a tank reaches full level as indicated by the coagulant tank level switches. External viewing of the tank levels and tank level switches is provided by P25-LI-0302-1/P25-LI-0302-2 and P25-YL-0302-1/P25-YL-0302-2.

2. P25-PMP-0302-3, P25-PMP-0302-4, & P25-PMP-0302-5

- a. The coagulant metering pumps are equipped with on-board VFDs.
- b. Pump running, pump emergency stop status, pump in remote, pump fail, pump tubing fail/leak, and pump speed feedback will be monitored for each pump. Pump fail and pump tubing fail/leak each generate an alarm.

- c. Operator setpoints include: coagulant dosage (mg/L as chemical), coagulant concentration (%), coagulant specific gravity (SG) (unitless)
- d. In automatic, the SCADA system will start, stop, and adjust the speed of the in-service metering pump based on the raw water flow into the plant and operator set dosage. Chemical flow rate, in gallons per hour, for metering pump speed pacing is calculated by the following equation:

$$\text{Chem Flow} = (\text{Process Flow} * \text{Dosage}) / (\text{Concentration} * \text{SG} * 24)$$

Where process flow is in MGD, dosage is mg/L as chemical, and concentration is % expressed as a decimal.

- e. The pumps may be placed remote manual mode at the pumps. In this mode, the operator may turn the pumps on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed will be maintained.
- f. If an operating pump fails, in automatic, the standby pump will start automatically and match the previous speed of the formerly operating pump.
- g. Local pressure indication is provided for each pump in the form of P25-PI-0302-3 and P25-PI-0302-4, respectively.

3. P25-PMP-0302-5 & P25-PMP-0302-6

- a. Redundant coagulant flash mix pumps are provided with VFDs. Pumps will run when coagulant is being fed by the coagulant metering pumps.
- b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for each pump. VFD fail generates an alarm.
- c. In automatic, the SCADA system will start, stop, and adjust the speed of one flash mix pump based on the influent flow of raw water from the river intake structure. Under normal operations, one flash mix pump is offline in standby.
- d. The pumps may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed will be maintained.
- e. If the pump local emergency stop is engaged, or suction pressure switch P25-PSL-0302-5 or PSL-0302-5 actuate, the pump will trip offline and an alarm will be generated.
- f. If one coagulant flash mix pump trips offline or otherwise fails, in automatic the SCADA system will start the standby pump and resume operating at the last speed of the previously operating pump.

2.11 SODIUM BISULFITE STORAGE AND INJECTION

A. Loop 0303 Sodium Bisulfite Storage and Metering Pumps

1. P25-TNK-0303-1

- a. High concentration sodium bisulfite solution is stored in an above ground storage tank in the sodium bisulfite storage and pump room. Analog level in the tank is measured by P25-LIT-0303-1 and a redundant level switch P25-LSH-0303-1 is provided for additional level feedback. When the level in the tank reaches an operator-defined low level, an alarm is generated to indicate the need for refilling of the tank.
- b. In the event of a leak of sodium bisulfite solution in the sodium bisulfite storage and pump room, a sump with a level switch is provided. If the sump level switch actuates, an alarm is generated.
- c. Filling of the sodium bisulfite tank is done manually at the outside truck fill connection. An audible horn sounds when the tank reaches full level as indicated by the sodium bisulfite tank level switch. External viewing of the tank level and tank level switch is provided by LI-0302-1 and YL-0302-1.

2. Sodium Bisulfite Chemical Injection Skid P25-SK-0303-3

- a. Redundant sodium bisulfite metering pumps are equipped with on-board VFDs.
- b. Pump running, pump emergency stop status, pump in remote, pump fail, pump tubing fail/leak, and pump speed feedback will be monitored for each pump. Pump fail and pump tubing fail/leak each generate an alarm.
- c. In automatic, the SCADA system will start, stop, and adjust the speed of the in-service metering pump based on the level in the chemical waste tank and the discharge flow of the chemical waste pumps to the sanitary sewer to maintain an operator-selected regulatory pH setpoint.
- d. The pumps may be placed remote manual mode at the pumps. In this mode, the operator may turn the pumps on or off and set the speed of the pumps accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed will be maintained.
- e. If an operating pump fails, in automatic, the standby pump will start automatically and match the previous speed of the formerly operating pump.
- f. Local pressure indication is provided for each pump.

3. Sodium Bisulfite Chemical Injection Skid P25-SK-0303-5

- a. Redundant sodium bisulfite metering are equipped with on-board VFDs.
- b. Pump running, pump emergency stop status, pump in remote, pump fail, pump tubing fail/leak, and pump speed feedback will be monitored for each pump. Pump fail and pump tubing fail/leak each generate an alarm.
- c. In automatic, the SCADA system will start, stop, and adjust the speed of the in-service metering pump based on the level in the clearwells.
- d. The pumps may be placed in remote manual mode at the pumps. In this mode, the operator may turn the pumps on or off and set the speed of the pumps accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed will be maintained.
- e. If an operating pump fails, in automatic, the standby pump will start automatically and match the previous speed of the formerly operating pump.
- f. Local pressure indication is provided for each pump.

2.12 CITRIC ACID STORAGE AND INJECTION

A. Loop 0304 Citric Acid Storage Totes and Metering Pumps

1. P25-TNK-0304-1 & P25-TNK-0304-2

- a. Citric acid is stored in two manually connected storage totes. Only one storage tote may be connected to the citric acid pumping system at a time.

2. P25-PMP-0304-1, P25-PMP-0304-2, P25-SV-0304-1A, & P25-SV-0304-2A

- a. Two air diaphragm citric acid metering pumps are provided. These pumps have no electrical or controls interface and work strictly on compressed air.
- b. Compressed air supply to each pump is provided through electrically actuated solenoid valves at each pump.
- c. The operator may operate the valve locally in the field or remote operation by the SCADA system.
- d. When in operation by the SCADA system, the position of the air valves is determined by the call for citric acid from the UF CIP skids.
- e. If needed, the operator may locally or remotely open or close the electrically actuated solenoid valve to permit or stop the flow of air to the in-service citric acid metering pump.

3. P25-SV-0304-3A & P25-SV-0304-3B

- a. Effluent citric acid through the citric acid metering pumps is controlled by electrically actuated solenoid valves that permit flow of citric acid to the UF CIP Skids.
- b. The operator may operate the valves locally in the field or remote operation by the SCADA system.
- c. When in operation by the SCADA system, the position of the citric acid pump discharge valves will be determined by the call for citric acid from the UF CIP skids.
- d. If needed, the operator may locally or remotely open or close the electrically actuated solenoid valve to permit or stop the flow of citric acid to each respective UF CIP Skid.

2.13 SODIUM HYPOCHLORITE STORAGE AND INJECTION

A. Loop 0310 Sodium Hypochlorite Storage Totes and Metering Pumps

1. P25-TNK-0310-1 & P25-TNK-0310-2

- a. Sodium hypochlorite is stored in two manually connected storage totes. Only one storage tote may be connected to the citric acid pumping system at a time.

2. P25-PMP-0310-1, P25-PMP-0310-2, P25-SV-0310-1A, & P25-SV-0310-2A

- a. Two air diaphragm sodium hypochlorite metering pumps are provided. These pumps have no electrical or controls interface and work strictly on compressed air.
- b. Compressed air supply to each pump is provided through electrically actuated solenoid valves at each pump.
- c. The operator may select between local operation of the valve in the field or remote operation by the SCADA system.
- d. When in operation by the SCADA system, the position of the air valves is determined by the call for sodium hypochlorite from the UF CIP skids.
- e. If needed, the operator may locally or remotely open or close the electrically actuated solenoid valves to permit or stop the flow of air to the in-service sodium hypochlorite metering pump.

3. P25-SV-0310-3A & P25-SV-0310-3B

- a. Effluent sodium hypochlorite through the sodium hypochlorite metering pumps is controlled by electrically actuated solenoid valves that permit flow of sodium hypochlorite to the UF CIP Skids.

- b. The operator may select between local operation of the valves in the field or remote operation by the SCADA system.
- c. When in operation by the SCADA system, the position of the sodium hypochlorite pump discharge valves will be determined by the call for sodium hypochlorite from the UF CIP skids.
- d. If needed, the operator may locally or remotely open or close the electrically actuated solenoid valve to permit or stop the flow of sodium hypochlorite to each respective UF CIP Skid.

2.14 BACKWASH SUPPLY

A. Loop 0240 Backwash Supply Tank Cells

1. Backwash Supply Tank Cell 1 Influent Modulating Valves P25-FV-0240-1A and P25-FV-0240-1B
 - a. Filtrate effluent from the UF skids is continuously sent to the backwash supply tank to maintain an operator-selectable level setpoint.
 - b. The operator may select between local operation of the influent valves in the field or remote operation by the SCADA system.
 - c. If needed, the operator may locally or remotely open or close the motor-actuated valves to adjust the flow of effluent filtrate into the backwash supply tank cell.
 - d. Valve position, valve fully open and valve fully closed limit switches are displayed.
 - e. If a valve motor actuator fails, an alarm is generated.
 - f. Level in the backwash supply tank cell is monitored by P25-LIT-0241-6A. As the level in the cell increases, the influent modulating valve is closed to maintain the operator-selectable level setpoint. If the level in the cell reaches an operator-defined maximum setpoint, an alarm is generated. If an operator-defined minimum level setpoint is reached, an alarm is generated. Level switch P25-LSH-0240-1 is provided for redundant maximum level monitoring in the cell.
2. Backwash Supply Tank Cell 2 Influent Modulating Valves P25-FV-0240-2A and P25-FV-0240-2B
 - a. Filtrate effluent from the UF skids is continuously sent to the backwash supply tank to maintain an operator-selectable level setpoint.

- b. The operator may select between local operation of the influent valves in the field or remote operation by the SCADA system.
 - c. If needed, the operator may locally or remotely open or close the motor-actuated valve to adjust the flow of effluent filtrate into the backwash supply tank cell.
 - d. Valve position, valve fully open and valve fully closed limit switches is displayed.
 - e. If a valve motor actuator fails, an alarm is generated.
 - f. Level in the backwash supply tank cell is monitored by P25-LIT-0241-6B. As the level in the cell increases, the influent modulating valve is closed to maintain the operator-selectable level setpoint. If the level in the cell reaches an operator-defined maximum setpoint, an alarm is generated. If an operator-defined minimum level setpoint is reached, an alarm is generated. Level switch P25-LSH-0240-2 is provided for redundant maximum level monitoring in the cell.
3. UF Backwash Pumps P25-PMP-0241-1, P25-PMP-0241-2, P25-PMP-0241-3
- a. Each UF backwash pump is equipped with a VFD. The pumps are provided in a lead, lag, and standby configuration with the roles of each pump rotating automatically after each backwash cycle. The operator can assign the pumps into and out of service as necessary.
 - b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for each pump. VFD fail generates an alarm.
 - c. In automatic, the SCADA system will start and stop the UF backwash pumps based on the levels in the backwash supply tank cells and the quantity of UF Skids calling for a backwash cycle. The first pump starts and ramps up speed to produce the required flow. Once the lead pump reaches full speed and subsequent additional flow is required, the lag pump starts at minimum speed and the first pump matches speed. The speed of both pumps is then increased until maximum flow is reached when both pumps are at full speed.
 - d. Each pump may be placed in remote manual mode at the VFD. In this mode, the operator may turn the pumps on or off and set the speed of the pump accordingly. If a pump is running and it is placed into or out of remote manual mode, the pump run status and running speed is maintained.
 - e. If a pump local emergency stop is engaged, or if suction pressure switches P25-PSL-0241-1/2/3 actuate, respectively, the corresponding pump trips offline and an alarm is generated.

- f. Local indication of pump discharge pressure is provided by P25-PI-0241-1 through P25-PI-0241-3.

2.15 OXYGEN STORAGE & OZONE GENERATION AND INJECTION

A. Loop 0305 Ozone Generation & Liquid Oxygen Storage

1. P25-MCP-0305-1

- a. The subsequent liquid oxygen storage skid local vendor control panel will be connected via Ethernet to the ozone main vendor control panel. All other skids associated with the ozone system will be hard-wired to the ozone main vendor control panel. The following points at a minimum will be monitored and displayed for the ozone system via the ozone system main vendor control panel:

- (1) Ozone System Running
- (2) Ozone System General Trouble Alarm
- (3) Ozone Generating Room Ozone Level Warning
- (4) Ozone Generating Room Ozone Level Alarm
- (5) Ozone Generating Room Oxygen Level Warning
- (6) Ozone Generating Room Oxygen Level Alarm
- (7) Nitrogen Storage Tank Pressure Alarm High
- (8) Nitrogen Storage Tank Pressure Alarm Low
- (9) Ozone Generator 1 Running
- (10) Ozone Generator 2 Running
- (11) Ozone Generator 3 Running
- (12) Ozone Generator 4 Running

- b. The Manufacturer's MCP will automatically control:

- (1) Ozone generation system start-up and shutdown
- (2) sequencing of increasing or decreasing the quantity of ozone generated and injected

- 2. The liquid oxygen storage skid will be equipped with a local vendor control panel to monitor and control the storage tank and vaporizers, as well as monitor and

control all control valves and all related skid-mounted instrumentation. Refer to specification Section 46 31 53 for additional details, requirements, and control descriptions.

3. P25-LCP-0305-1 Liquid Oxygen Storage Local Control Panel

- a. The local vendor control panel will be connected via Ethernet to the Ozone main vendor control panel P25-MCP-0305-1. The following points at a minimum will be monitored and displayed for the liquid oxygen storage skid:

- (1) Liquid Oxygen Storage Tank Level
- (2) Liquid Oxygen Storage Tank Pressure
- (3) Liquid Oxygen System Trouble Alarm

B. Loop 0306 GOX Regulating Manifold

1. The GOX regulating manifold skid heats and filters the vaporized oxygen before it is combined with nitrogen. All equipment, control valves, and skid-mounted instrumentation will be monitored and controlled by the ozone main vendor control panel P25-MCP-0305-1. Refer to specification Section 46 31 53 for additional details, requirements, and control descriptions.

C. Loop 0307 Nitrogen Boost Compressor System Skid

1. The nitrogen boost compressor system skid stores, filters, and vaporizes nitrogen before it is combined with oxygen at the GOX regulating manifold. All equipment, control valves, and skid-mounted instrumentation will be monitored and controlled by the ozone main vendor control panel P25-MCP-0305-1. Refer to specification Section 46 31 53 for additional details, requirements, and control descriptions.

D. Loop 0308 Ozone Generators

1. Each ozone generator receives GOX from the GOX regulating manifold and produces ozone. Each ozone generator is equipped with a local control panel. All equipment, control valves, and skid-mounted instrumentation will be monitored and controlled by the local control panels, which are monitored and controlled by the ozone main vendor control panel P25-MCP-0305-1. Refer to specification Section 46 31 53 for additional details, requirements, and control descriptions.

E. Loop 0309 Cooling Water System

1. Ozone chillers are provided to chill the ozone produced by the ozone generators before it is sent to the ozone injection skid. All equipment, control valves, and skid-mounted instrumentation for each ozone chiller will be monitored and controlled by the ozone main vendor control panel P25-MCP-0305-1. Refer to specification Section 46 31 53 for additional details, requirements, and control descriptions.

F. Loop 0310 Ozone Injection Pump Skid

1. Chilled ozone from the ozone generators is sent to the ozone injection pump skid where it is combined with UF skid filtrate water before being pumped to the clearwells. The ozone injection pump skid is provided with two peristaltic metering pumps each equipped with an on-board VFD.
2. All equipment, control valves, and skid-mounted instrumentation will be monitored and controlled by the ozone main vendor control panel P25-MCP-0305-1. Refer to specification Section 46 31 53 for additional details, requirements, and control descriptions.
3. Influent filtrate water to the ozone injection pump skid is monitored and measured by electromagnetic flow meter P25-FE/FIT-0306-9.

2.16 TREATED WATER CLEARWELL

A. Loop 0401 Clearwell East Cell

1. Level in the clearwell east cell is provided by P25-LIT-0401-1.
2. Roof access hatches are monitored by position switches P25-ZSC-0401-1, P25-ZSC-0401-2, P25-ZSC-0401-3.
3. P25-PMP-0401-4 & P25-AE/AIT-0401-1A Clearwell Sampling
 - a. Ozonated water is drawn out of the clearwell by a sample pump.
 - b. Sample pump motor running, in remote, and overload is monitored by the SCADA system. In remote, the SCADA system can start and stop the sample pump.
 - c. Sample water passes through an ORP analyzer to monitor and measure the oxidation-reduction potential of the ozonated water. If the ORP of the sample water is outside of an operator-defined range, an alarm is generated.
4. P25-PMP-0401-5 & P25-AE/AIT-0401-1B Clearwell Sampling
 - a. Ozonated water is drawn out of the clearwell by a fractional horsepower sample pump.
 - b. Sample pump motor running, in remote, and overload is monitored by the SCADA system. In remote, the SCADA system can start and stop the sample pump.
 - c. Sample water passes through an ORP analyzer to monitor and measure the oxidation-reduction potential of the ozonated water. If the ORP of the sample water is outside of an operator-defined range, an alarm is generated.

5. Emergency Overflow Trough
 - a. The presence of water in the overflow trough is monitored by P25-LSH-0401-1. If this level switch actuates an alarm is generated.
- B. Loop 0402 Clearwell West Cell
 1. Level in the clearwell east cell is provided by P25-LIT-0402-1.
 2. Roof access hatches are monitored by position switches P25-ZSC-0402-1, P25-ZSC-0402-2, P25-ZSC-0402-3.
 3. P25-PMP-0402-4 & P25-AE/AIT-0402-1A Clearwell Sampling
 - a. Ozonated water is drawn out of the clearwell by a fractional horsepower sample pump.
 - b. Sample pump motor running, in remote, and overload is monitored by the SCADA system. In remote, the SCADA system can start and stop the sample pump.
 - c. Sample water passes through an ORP analyzer to monitor and measure the oxidation-reduction potential of the ozonated water. If the ORP of the sample water is outside of an operator-defined range, an alarm is generated.
 4. P25-PMP-0402-5 & P25-AE/AIT-0402-1B Clearwell Sampling
 - a. Ozonated water is drawn out of the clearwell by a fractional horsepower sample pump.
 - b. Sample pump motor running, in remote, and overload is monitored by the SCADA system. In remote, the SCADA system can start and stop the sample pump.
 - c. Sample water passes through an ORP analyzer to monitor and measure the oxidation-reduction potential of the ozonated water. If the ORP of the sample water is outside of an operator-defined range, an alarm is generated.
- C. Loop 0403 Clearwell Drain Vault
 1. P25-PMP-0403-1 & P25-LCP-0403-1 Clearwell Drain Pump
 - a. Manual drain valves may be opened to drain each clearwell cell to the drain vault. The drain vault is supplied with a small sump pump.
 - b. Pressure in each drain line to the suction side of drain pump P25-PMP-0403-1 is monitored by P25-PIT-0403-1A and P25-0403-1B.

- c. The sump pump is provided with a local control panel that is operated in manual when clearwell draining is required.
 - d. The sump pump pumps water to the emergency overflow box which diverts water to the Mill Race Canal.
- 2. P25-PMP-0403-2 Clearwell Drain Vault Sump Pump
 - a. P25-PMP-0403-2 is equipped with an on-board level switch that turns the pump on and off based on the level of water in the drain vault.
 - b. P25-LSHH-0403-1 is provided in the drain vault if P25-PMP-0403-2 malfunctions. If the level switch actuates, an alarm is generated.
- 3. Total residual chlorine discharged to the Mill Race Canal from the Drain Pump is measured by P25-AE/AIT-0403-1. If the Cl₂ level reaches above an operator set point, an alarm is generated.
- 4. P25-ZSO-0403-1 and P25-ZSO-0403-2 monitor the drain vault access hatches.

2.17 HIGH SERVICE PUMP STATION

- A. Finished water from the clearwell is pumped to the distribution system by five vertical turbine pumps. High Service Pumps 1 and 2 are sized at smaller capacity than High Service Pumps 3, 4, and 5. Upon start-up of the plant, one low capacity high service pump starts and begins to increase in speed. Upon reaching full speed, if the discharge pressure setpoint is not reached, the second low capacity high service pump starts at minimum speed and the initial low capacity pump matches speed. Both pumps increase in speed until full speed is reached. This cycle is repeated with the three large capacity pumps until all four pumps are operating at full capacity for a total of 30 MGD. If the level in the East or West clearwell drops below an operator defined setpoint as measured by LIT-0401-1 and LIT-0402-1, all pumps shall trip offline.
- B. Loop 0411 High Service Pump 1
 - 1. P25-PMP-0411-1
 - a. High Service Pump 1 is equipped with a VFD. The operator can assign the pump into and out of service as necessary.
 - b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for the pump. VFD fail generates an alarm.
 - c. In automatic, the SCADA system can start, stop, and adjust the speed of the high service pump based on an operator-defined setpoint to maintain discharge pressure in the distribution system as described above.

- d. The pump may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed is maintained.
- e. If the pump local emergency stop is engaged, the pump trips offline and an alarm is generated.
- f. Motor winding and motor bearing RTD's P25-TE-0411-1A through P25-TE-0411-1H are provided for temperature monitoring of the pump/motor assembly. Vibration monitoring is also provided by P25-VE-0411-1.
- g. Pump discharge valve P25-FCV-0411-1 is interlocked with the start-up and shutdown sequence of the pump. Upon start-up of the pump, the valve will begin opening upon actuation of discharge pressure switch P25-PSH-0411-1. When the discharge pressure setpoint is reached, an operator-defined timer begins. At the conclusion of this timer setpoint, coordinated with the pump vendor during start-up and commissioning, if the discharge valve has not reached 100% open position, as measured by a valve-mounted limit switch, the pump trips offline and an alarm is generated. The valve is also supplied with a 100% closed limit switch and a 95% closed limit switch. During a shutdown sequence of the pump, the pump trips offline when the discharge valve reaches 95% closed.

C. Loop 0412 High Service Pump 2

1. P25-PMP-0412-1

- a. High Service Pump 2 is equipped with a VFD. The operator can assign the pump into and out of service as necessary.
- b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for the pump. VFD fail generates an alarm.
- c. In automatic, the SCADA system can start, stop, and adjust the speed of the high service pump based on an operator-defined setpoint to maintain discharge pressure in the distribution system as described above.
- d. The pump may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed is maintained.
- e. If the pump local emergency stop is engaged, the pump trips offline and an alarm is generated.

- f. Motor winding and motor bearing RTD's P25-TE-0412-1A through P25-TE-0412-1H are provided for temperature monitoring of the pump/motor assembly. Vibration monitoring is also provided by P25-VE-0412-1.
- g. Pump discharge valve P25-FCV-0412-1 is interlocked with the start-up and shutdown sequence of the pump. Upon start-up of the pump, the valve will begin opening upon actuation of discharge pressure switch P25-PSH-0412-1. When the discharge pressure setpoint is reached, an operator-defined timer begins. At the conclusion of this timer setpoint, coordinated with the pump vendor during start-up and commissioning, if the discharge valve as not reached 100% open position, as measured by a valve-mounted limit switch, the pump trips offline and an alarm is generated. The valve is also supplied with a 100% closed limit switch and a 95% closed limit switch. During a shutdown sequence of the pump, the pump trips offline when the discharge valve reaches 95% closed.

D. Loop 0413 High Service Pump 3

1. P25-PMP-0413-1

- a. High Service Pump 3 is equipped with a VFD. The operator can assign the pump into and out of service as necessary.
- b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for the pump. VFD fail generates an alarm.
- c. In automatic, the SCADA system can start, stop, and adjust the speed of the high service pump based on an operator-defined setpoint to maintain discharge pressure in the distribution system as described above.
- d. The pump may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed is maintained.
- e. If the pump local emergency stop is engaged, the pump trips offline and an alarm is generated.
- f. Motor winding and motor bearing RTD's P25-TE-0413-1A through P25-TE-0413-1H are provided for temperature monitoring of the pump/motor assembly. Vibration monitoring is also provided by P25-VE-0413-1.
- g. Pump discharge valve P25-FCV-0413-1 is interlocked with the start-up and shutdown sequence of the pump. Upon start-up of the pump, the valve will begin opening upon actuation of discharge pressure switch P25-PSH-0413-1. When the discharge pressure setpoint is reached, an operator-defined timer begins. At the conclusion of this timer setpoint, coordinated with the pump vendor during start-up and commissioning, if the discharge valve as not

reached 100% open position, as measured by a valve-mounted limit switch, the pump trips offline and an alarm is generated. The valve is also supplied with a 100% closed limit switch and a 95% closed limit switch. During a shutdown sequence of the pump, the pump trips offline when the discharge valve reaches 95% closed.

E. Loop 0414 High Service Pump 4

1. P25-PMP-0414-1

- a. High Service Pump 4 is equipped with a VFD. The operator can assign the pump into and out of service as necessary.
- b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for the pump. VFD fail generates an alarm.
- c. In automatic, the SCADA system can start, stop, and adjust the speed of the high service pump based on an operator-defined setpoint to maintain discharge pressure in the distribution system as described above.
- d. The pump may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed is maintained.
- e. If the pump local emergency stop is engaged, the pump trips offline and an alarm is generated.
- f. Motor winding and motor bearing RTD's P25-TE-0414-1A through P25-TE-0414-1H are provided for temperature monitoring of the pump/motor assembly. Vibration monitoring is also provided by P25-VE-0414-1.
- g. Pump discharge valve P25-FCV-0414-1 is interlocked with the start-up and shutdown sequence of the pump. Upon start-up of the pump, the valve will begin opening upon actuation of discharge pressure switch P25-PSH-0414-1. When the discharge pressure setpoint is reached, an operator-defined timer begins. At the conclusion of this timer setpoint, coordinated with the pump vendor during start-up and commissioning, if the discharge valve as not reached 100% open position, as measured by a valve-mounted limit switch, the pump trips offline and an alarm is generated. The valve is also supplied with a 100% closed limit switch and a 95% closed limit switch. During a shutdown sequence of the pump, the pump trips offline when the discharge valve reaches 95% closed.

F. Loop 0415 High Service Pump 5

1. P25-PMP-0415-1

- a. High Service Pump 5 is equipped with a VFD. The operator can assign the pump into and out of service as necessary.
- b. Pump running, pump emergency stop status, VFD in remote, VFD fail, and VFD speed feedback is monitored for the pump. VFD fail generates an alarm.
- c. In automatic, the SCADA system can start, stop, and adjust the speed of the high service pump based on an operator-defined setpoint to maintain discharge pressure in the distribution system as described above.
- d. The pump may be placed remote manual mode at the VFD. In this mode, the operator may turn the pump on or off and set the speed of the pump accordingly. If the pump is running and it is placed into or out of remote manual mode, the pump run status and running speed is maintained.
- e. If the pump local emergency stop is engaged, the pump trips offline and an alarm is generated.
- f. Motor winding and motor bearing RTD's P25-TE-0415-1A through P25-TE-0415-1H are provided for temperature monitoring of the pump/motor assembly. Vibration monitoring is also provided by P25-VE-0415-1.
- g. Pump discharge valve P25-FCV-0415-1 is interlocked with the start-up and shutdown sequence of the pump. Upon start-up of the pump, the valve will begin opening upon actuation of discharge pressure switch P25-PSH-0415-1. When the discharge pressure setpoint is reached, an operator-defined timer begins. At the conclusion of this timer setpoint, coordinated with the pump vendor during start-up and commissioning, if the discharge valve as not reached 100% open position, as measured by a valve-mounted limit switch, the pump trips offline and an alarm is generated. The valve is also supplied with a 100% closed limit switch and a 95% closed limit switch. During a shutdown sequence of the pump, the pump trips offline when the discharge valve reaches 95% closed.

G. Loop 0416 High Service Pumps Suction Header

1. P25-PSL-0416-1

- a. Pressure of the finished water high service pumps suction header from the clearwell is monitored by a pipe-mounted pressure switch.
- b. If the pressure in the header pipe drops below the setpoint of the pressure switch, an alarm is generated and all operating high service pumps trip offline.

H. Loop 0417 High Service Pumps Discharge Header

1. P25-FE/FIT-0417-1 & P25-PI/PT-0417-1

- a. Flow through the finished water high service pumps discharge header is monitored by an electromagnetic flow meter. If no flow is measured when one or more pumps is running, an alarm is generated and all operating pumps trip offline.
- b. Pressure of the finished water high service pumps discharge header is monitored by pipe-mounted pressure transmitter. Local pressure indication is provided by a pressure indicator.
- c. P25-PMP-PMP-0417-1 is equipped with an on-board level switch to pump water out of the pump suction header
- d. Surge Bladders TNK-0417-1 and TNK-0417-2 are equipped with differential pressure indicating transmitters to monitor the pressures inside each tank.

I. Loop 0418 Finished Water Analyzers

1. P25-TIT-0418-1A & P25-AE/AIT-0418-1B

- a. Finished water from the high service pumps is sampled off the discharge header through a pressure control valve. The sampled water is analyzed for temperature and pH. If temperature falls above an operator-defined range setpoint, an alarm is generated. If pH falls outside the limits of an operator-defined acceptable range, an alarm is generated.

2.18 OZONE DESTRUCTION

- A. Ozone off gas from the two clearwell cells is first sent through one of two demister units P25-SK-0401-1 and P25-0402-1. Demister inlet pressure is monitored by pressure transmitters on the suction side of the demisters and differential pressure across each demister is monitored. An alarm is generated when differential pressure switch actuates.
- B. Demisted ozone is sent to ozone destruct units that are equipped with vendor-provided local control panels. Blowers in the ozone destruction units operate continuously to blow off residual gas to atmosphere. Ozone analyzers are provided at the outlet of the ozone destruction units to monitor the quantity of ozone. If the ozone in the blowoff air reaches a maximum operator-defined setpoint, an alarm is generated.

PART 3 EXECUTION

3.01 FIELD TESTING

- A. Comply with the requirements specified in Section 40 61 21.

3.02 DEMONSTRATION

- A. Comply with the requirements specified in Section 40 61 21.

3.03 CLOSEOUT ACTIVITIES

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 62 43

PROGRAMMABLE LOGIC CONTROLLERS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide materials and installation of programmable logic controllers as indicated and in compliance with Contract Documents.

1.02 REFERENCES

- A. International Society of Automation (ISA):
 - 1. S5.1: P&IDs and Tagging.
 - 2. S5.4: Instrument Loop Diagrams.

 - 3. 1059: Safety Terminal Blocks.

4. 1449: Surge Protective Devices.

1.03 SUBMITTALS

- A. Submit the following in accordance with Section 01 33 00.
 1. Manufacturer's descriptive data, technical literature, and detailed specifications for product. Data shall include complete lists of all required options, parts, and supplies with current unit prices and source of supply.
 2. Dimensioned outline(s).
 3. Installation instructions and detail(s).
 4. Operation and Maintenance Manual containing the Supplier's operating and maintenance instructions for the instrument in accordance with the Statement of Work.
 5. Electrical wiring schematic(s).

PART 2 - PRODUCTS

2.01 COMMON REQUIREMENTS

- A. Total minimum I/O interface capability as specified and shown on Drawings and the I/O List.
 1. Wire all spare I/O points to field terminal blocks in the same enclosure the PLC resides in.
 2. Provide 25 percent or 3 spare backplane slots, whichever is greater, in all racks containing I/O.
- B. Provide additional racks within PLC-0000-1, RIO-0000-1, and PLC-0000-2 as necessary.
- C. Expandable.
- D. Modular.
- E. Accept discrete and analog input signals.
- F. Control discrete and analog output signals.
- G. Monitor signal status of input and output devices.
- H. Mounting hardware and interconnecting cables.
- I. Include status and fault monitoring.

2.02 COMMON PROCESSOR WITH MEMORY REQUIREMENTS

- A. Internal diagnostics shall be available to user for troubleshooting.
- B. Halt if any of following occur:
 - 1. Memory error.
 - 2. Communications error between CPU and I/O modules.
 - 3. Detection of application error.
- C. Battery backup or EEPROM to prevent program loss on power failure.
- D. Features/Functions:
 - 1. Contact/coil status.
 - 2. Latching/unlatch.
 - 3. Force I/O.
 - 4. Data transfer.
 - 5. Four function math.
 - 6. Counting.
 - 7. Timing.
 - 8. Self-monitoring diagnostics.
 - 9. Shift registers.
 - 10. Transitional coils.
 - 11. Master control relay.
 - 12. Subroutines.
 - 13. Matrix operations.
 - 14. Data comparisons.
 - 15. Internal diagnostics available to user.
 - 16. PID control.
 - 17. Network capabilities.

2.03 COMMON POWER SUPPLY REQUIREMENTS

- A. 24 V DC power input.
- B. Fused input.
- C. 0.2% load regulation.
- D. Sized for minimum of 125% of load.

2.04 COMMON PROGRAMMING SOFTWARE REQUIREMENTS

- A. Manufacturer's software compatible with programmable logic controllers and PC hardware and software specified.
- B. PLC Programming Software shall provide capability to:
 - 1. Program PLC features/functions off-line.
 - 2. Display on-line status of I/O and registers.
 - 3. Symbols similar to conventional relay logic symbols.
 - 4. Search function.
 - 5. Edit program.
 - 6. Display error code registers.
 - 7. Connect programming PC to PLC through network.
 - 8. Security via user-defined password.
 - 9. Printout program.
 - 10. Programming annotation.
 - 11. Load and record contents of memory.

2.05 MEDIUM PLCS

- A. Manufacturers:
 - 1. Allen Bradley, 5069-L320E or higher.
 - 2. No substitution is permitted.
- B. Additional Design Requirements:
 - 1. Capable of:

- a. Operating in temperatures of 0°C to 60°C.
- b. Operating in humidity of 5% to 95%, non-condensing.

C. Chassis:

- 1. Modular.
- 2. Integral or remote power supply.
- 3. Capability to accept:
 - a. Processor.
 - b. Memory.
 - c. I/O modules.
 - d. Communications modules installed in chassis backplane
 - e. Modbus/TCP & Ethernet/IP Module: Allen-Bradley 1756-EN2T.
- 4. Minimum of 12 slots per chassis.

D. Additional Processor With Memory Requirements:

- 1. Size memory with reserve capacity of 50%.
- 2. Additional Features/Functions:
 - a. Clock and Calendar.
 - b. Multiple network capabilities.
 - c. Multiple independent asynchronous scans.
 - d. On line programming.
 - e. Symbolic addressing.
 - f. Ladder and function block diagram programming languages.
 - g. Multiple processors can share common input data.
 - h. Pre-emptive multi-tasking operating system.
 - i. Advanced instruction set including file handling, sequencer, diagnostic, shift register, program control, ASCII, function blocks, and motion control instructions.

E. Additional Power Supply Requirements:

1. Short circuit current limit protection.
2. Crowbar over-voltage protection.

F. I/O Modules:

1. General:

- a. Shield against electrical noise and RF.
- b. Provide optical isolation to give 1,500 vdc isolation from wiring on other I/O modules.
- c. Provide I/O wiring screw terminals:
 - (1) I/O wiring screw terminals shall be removable so as not to disturb user wiring when replacing defective module.
- d. Design modules to be installed or removed while chassis power is applied.
- e. Front of module LED for module status and alarm indication:
 - (1) Point level status and alarm on discrete I/O modules.
- f. Configure modules through software.
- g. Point level fusing on discrete I/O modules.
- h. Program retrievable module identification.

2. Analog Input Modules:

- a. Accept 1-5 vdc or 4-20 mAdc analog signals.
- b. Resolution: 16 bit.
 - (1) Current Resolution: 1 microamp per bit.
 - (2) Voltage Resolution: 1 microvolts per bit.
- c. Open circuit detection.
- d. Point to point isolation.
- e. Over voltage protection.
- f. Noise rejection.

- g. Each channel can individually have HART enabled or disabled.
 - 3. Analog Output Modules:
 - a. Output 1-5 vdc or 4-20 mAdc analog signals.
 - b. Resolution: 13 bit.
 - c. Point to point isolation.
 - d. Over voltage protection.
 - e. Short circuit protection.
 - 4. Discrete Input Modules:
 - a. Monitor contact openings and closures from panel and field devices.
 - b. Individually isolated 24 V DC type.
 - c. LED lights for each input to indicate status.
 - 5. Discrete Output Modules:
 - a. Provide contact openings and closures to panel and field devices.
 - b. Each output to have indicator light to show output status.
 - c. Individually isolated.
 - d. 24 V DC output.
 - G. Additional Programming Software Requirements:
 - 1. Program PLC functions on-line and off-line.
 - 2. Upload and download contents of memory.
 - 3. Symbolic, function block, free form ladder, drag and drop editors, and text editor.
- 2.06 LARGE PLCS:
- A. Manufacturers:
 - 1. Allen Bradley, ControlLogix model 1756-L83E or higher.
 - 2. No substitution is permitted.

B. Additional Design Requirements:

1. Capable of:
 - a. Operating in temperatures of 0°C to 60°C.
 - b. Operating in humidity of 5% to 95%, non-condensing.

C. Chassis:

1. Modular.
2. Integral or remote power supply.
3. Capability to accept:
 - a. Processor.
 - b. Memory.
 - c. I/O modules.
 - d. Communications modules installed in chassis backplane
 - e. Modbus/TCP & Ethernet/IP Module: Allen-Bradley 1756-EN2T.
4. Minimum of 10 slots per chassis.

D. Additional Processor With Memory Requirements:

1. Size memory with reserve capacity of 50%.
2. Additional Features/Functions:
 - a. Clock and Calendar.
 - b. Multiple network capabilities.
 - c. Multiple independent asynchronous scans.
 - d. On line programming.
 - e. Symbolic addressing.
 - f. Ladder and function block diagram programming languages.
 - g. Multiple processors can share common input data.
 - h. Pre-emptive multi-tasking operating system.

- i. Advanced instruction set including file handling, sequencer, diagnostic, shift register, program control, ASCII, function blocks, and motion control instructions.
- E. Additional Power Supply Requirements:
 - 1. Short circuit current limit protection.
 - 2. Crowbar over-voltage protection.
- F. I/O Modules:
 - 1. General:
 - a. Shield against electrical noise and RF.
 - b. Provide optical isolation to give 1,500 vdc isolation from wiring on other I/O modules.
 - c. Provide I/O wiring screw terminals:
 - (1) I/O wiring screw terminals shall be removable so as not to disturb user wiring when replacing defective module.
 - d. Design modules to be installed or removed while chassis power is applied.
 - e. Front of module LED for module status and alarm indication:
 - (1) Point level status and alarm on discrete I/O modules.
 - f. Configure modules through software.
 - g. Point level fusing on discrete I/O modules.
 - h. Program retrievable module identification.
 - 2. Analog Input Modules 1756-IF8H:
 - a. Accept 1-5 vdc or 4-20 mAdc analog signals.
 - b. Resolution: 16 bit.
 - (1) Current Resolution: 1 microamp per bit.
 - (2) Voltage Resolution: 1 microvolts per bit.
 - c. Open circuit detection.
 - d. Point to point isolation.

- e. Over voltage protection.
 - f. Noise rejection.
 - g. Each channel can individually have HART enabled or disabled.
- 3. Analog Output Modules 1756-OF8I:
 - a. Output 1-5 vdc or 4-20 mAdc analog signals.
 - b. Resolution: 13 bit.
 - c. Point to point isolation.
 - d. Over voltage protection.
 - e. Short circuit protection.
- 4. Discrete Input Modules 1756-IA16:
 - a. Monitor contact openings and closures from panel and field devices.
 - b. Individually isolated 24 V DC type.
 - c. LED lights for each input to indicate status.
- 5. Discrete Output Modules 1756-OA16:
 - a. Provide contact openings and closures to panel and field devices.
 - b. Each output to have indicator light to show output status.
 - c. Individually isolated.
 - d. 24 V DC output.

G. Additional Programming Software Requirements:

- 1. Program PLC functions on-line and off-line.
- 2. Upload and download contents of memory.
- 3. Symbolic, function block, free form ladder, drag and drop editors, and text editor.

2.07 OIT EQUIPMENT

A. Manufacturers:

- 1. Allen Bradley, 2711P-T15 PanelView Plus 7 Performance.

2. No substitution is permitted.
 - B. The display shall be 15 inch capable of color graphics.
 - C. 24 VDC power supply with internal battery backup.
 - D. NEMA 4X environmental protection with hazardous area rating if required.
 - E. Program the HMI unit with latest version of FactoryTalk programming software.
 - F. The HMI shall be programmed to provide for the monitoring and control of all input and output points, loops and systems through graphic display screens. Additionally, the HMI programming shall include:
 1. Process parameter displays.
 2. Alarm management.
 3. Trending of key process variables.
 - G. Provide all necessary data files so that the control system can be integrated into the plant SCADA.
 - H. For all PLCs provided, provide all program files for end user modification and programs shall not be proprietary or require vendor for accessibility.
 - I. Provide all run-time licenses necessary for the operation of the new PLC and HMI installations.
- 2.08 CABLES
- A. Interconnecting cables.
 - B. Serial cable to connect programming PC to PLC's.
- 2.09 COMMUNICATIONS HARDWARE
- A. Provide communication protocols as specified.
 - B. Provide 500 vdc isolation between communication circuits.
- 2.10 SOURCE QUALITY CONTROL
- A. UL, CUL, and CSA approved. CE compliant for all applicable directives.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install and wire in accordance with manufacturer's written instructions and approved submittals.
- B. Program PLCs in Ladder Logic.

3.02 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 66 00

NETWORK AND COMMUNICATION EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide network and communication equipment as indicated and in compliance with Contract Documents.

1.02 REFERENCES

- A. American Society for Testing and Materials (ASTM).
- B. Institute of Electrical and Electronic Engineers (IEEE)
- C. International Standards Organization/International Electrotechnical Commission (ISO/IEC):
 - 1. 11801: Information Technology – Generic cabling for customer premises.
- D. National Electrical Manufacturers Association (NEMA).
- E. National Electric Code (NEC).
- F. Telecommunications Industry Association / Electronic Industries Association (TIA/EIA):
 - 1. 568B: Commercial Building Telecommunications Cabling Standards.
 - 2. 569B: Commercial Building Standard for Telecommunications Pathways and Spaces.
- G. Underwriters Laboratories Inc. (UL).

1.03 DEFINITIONS

- A. The following definitions may be used throughout this section and subsections:
 - 1. CTC: Communications termination cabinet
 - 2. HMI: Human machine interface
 - 3. LAN: Local area network.
 - 4. LCP: Local control panel.
 - 5. IP: Internet Protocol

6. MIMO: Multiple-input and multiple-output
7. OIT: Operator interface terminal
8. OSP: Outside Plant
9. PC: Personal computer
10. PLC: Programmable logic controller
11. PoE: Power over Ethernet
12. SCADA: Supervisory control and data acquisition
13. SCS: Structured Cabling System
14. UPS: Uninterruptible power supply
15. VOIP: Voice over IP
16. WAN: Wide area network
17. WAP: Wireless Access Point

1.04 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 1. For each network cabinet supplied.
- B. Submit on product data for each type of product in accordance with Section 01 33 00.
- C. Submit network drawings for physical connections between all network hardware.
- D. Informational Submittals:
 1. Field quality-control reports.

1.05 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.
- B. Hardware and software to be furnished under this section shall be the product of firms regularly engaged in the design and manufacturing of this type of equipment. Manufacturer shall assume responsibility for, and guarantee performance of, equipment

furnished. However, this shall not be construed as relieving the Contractor from responsibility for the proper installation and functionality of the work.

- C. Examine the Contract Documents and verify that network and communications equipment and software being provided is compatible with the requirements. Provide all necessary accessories for a complete and operable system.

1.07 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

1.08 PROJECT/SITE CONDITIONS

- A. Classification of Plant Areas:

- 1. Refer to Division 26.

1.09 WARRANTY

- A. The Contractor shall provide a three (3) year warranty on structured cabling systems. This includes all copper and fiber cabling, patch panels, patch cables and CTC assemblies (excluding UPS and other electronic devices).

PART 2 - PRODUCTS

2.01 GENERAL

- A. Refer to the requirements of Division 01.

- B. Selected Products:

- 1. Provide products and materials that are new and free from all defects.
 - 2. Products and materials called for on the drawings or in the specifications by trade names, manufacturer's name and catalogue reference are to be used as the basis for the bid submission.
 - 3. The design has been based on the use of the first named product where multiple products have been listed.

- C. Quality of Products:

- 1. All Products provided to be NEC and UL approved where applicable.
 - 2. If Products specified are not NEC and UL approved, obtain approval of the relevant State regulatory authority. Pay all applicable charges levied and make all modifications required for approval.

3. Refer to Division 01 of this specification for further information.

D. Uniformity of Manufacture:

1. Unless otherwise specifically called for in the specification, uniformity of manufacture to be maintained for similar products throughout the work.

E. Product Finishes:

1. Contractor to specify proposed finishes to be used for Engineer's review.

F. Use of Products During Construction:

1. Any equipment used for temporary or construction purposes is to be approved by the Engineer and in accordance with Division 01 of this specification. Clean and restore to "as new" condition all equipment prior to the time of substantial completion.

2.02 NETWORK SWITCHES

A. Manufacturers:

1. Within NET-0000-1, NET-0000-3:
 - a. Rack mounted, 48-port.
 - b. Provided by the Owner for installation by the Contractor in Contractor-supplied enclosures.
2. Within new process control network cabinets:
 - a. Panel mounted.
 - b. Cisco, IE-4000-16T4G-E, or approved equal.

B. Panel Mounted Switches:

1. The switch shall be built for harsh environments and temperature ranges (40 degrees C to +75 degrees C)
2. Fanless, convection-cooled with no moving parts.
3. Hardened for vibration, shock and surge, and electrical noise immunity.
4. Switch shall have all Gigabit ports with 2 Gigabit Small Form-Factor Pluggable (SFP) uplinks plus 8x1 Gigabit copper RJ45 downlink ports in a small form-factor base system.

5. Expandable to 26 ports of Gigabit Ethernet by attaching one of 7 compatible modules (copper, PoE, fiber options).
6. Supports multiple rings and redundant ring topologies for new network configurations.
7. Cisco Network Essentials operating system.
8. Redundant 24VDC Power Supplies.
9. Device management with web user interface, over-the-air access via Bluetooth and Command-Line Interface (CLI).
10. All fiber connections shall occur at the managed switch level utilizing SFP ports and modules

C. Switch Accessories:

1. Small Form Pluggable (SFP) modules for switches:
 - a. For 10Gbps fiber links, provide the Cisco SFP-10G-LR (for rack-mount switches) and the Cisco SFP-10G-LRX (for industrial switches).
 - b. For 1Gbps fiber links, provide the Cisco GLC-LH-SM (for rack-mounted switches) and the Cisco GLC-LH-SMD (for industrial switches).
 - c. For 1Gbps copper links, provide the Cisco GLC-T (for rack-mounted switches) and the Cisco GLC-TE (for industrial switches).

2.03 NETWORK CABINETS

- A. Refer to Section 27 11 16 “Communications Racks, Frames, and Enclosures”.

2.04 NETWORK CABINETS HVAC EQUIPMENT

- A. All network cabinets shall be properly designed to maintain the inner temperatures of the enclosure within the 60 to 80 degrees F.
- B. Any HVAC equipment shall maintain the NEMA rating of the network cabinet assembly.
- C. Preferably, fans, air-to-air exchangers and AC units are mounted on the top of each network cabinet in unconditioned areas.

2.05 FIBER PATCH PANELS

- A. Provide 19 inch rack-mount fiber optic patch panels for network cabinets and wall-mount patch panels for industrial control panels.

- B. Provide patch panel adapter plates with duplex LC connectors for single mode fiber. Each plate shall accommodate six duplex connectors.
- C. Ensure that the number of fiber ports is as required per the network architecture diagram drawing.
- D. The patch panel shall provide protection for all fiber terminations and cable strain relief. The patch panel shall protect and conceal patch cord connections.
- E. Fiber patch panels shall be the Panduit FMD series for 19 inch racks and the FWME series for wall-mounted panels or approved equal.

2.06 UNINTERRUPTIBLE POWER SUPPLY (UPS)

- A. Each network cabinet shall have a 1500VA UPS installed in it for surge protection and battery backup of critical network equipment. The UPS shall be 19 inch rack mountable and shall be mounted with sliding rails where possible. The UPS shall be a double-conversion system.
- B. Each UPS shall be capable of running the connected load for a minimum of 30 minutes.
- C. UPS Electrical Input Specifications
 - 1. Nominal Voltage: 120VAC
 - 2. Voltage Range: 80-144VAC
 - 3. Input Power Factor: > 0.95
 - 4. Frequency: 60 Hertz +/- 3 Hertz.
- D. UPS Electrical Output Specifications
 - 1. Voltage Regulation: +/- 3 percent of Nominal
 - 2. Efficiency: > 85 percent
 - 3. Frequency Regulation: +/- 3 Hertz on utility, +/- 1 Hertz on battery
- E. UPS Communications Specifications:
 - 1. A USB port shall be available for monitoring and configuring the UPS. An appropriate cable shall be supplied to connect to the UPS with a PC.
 - 2. An Ethernet port shall be available with the ability to monitor the UPS utilizing the SNMP protocol.

F. UPS Battery Specifications:

1. All batteries shall be sealed, lead-acid batteries and shall be maintenance free. Batteries shall be hot-swappable. The UPS will indicate when the battery is weak and needs to be replaced.
2. The UPS shall be able to accept additional battery modules to extend the runtime of the UPS.

G. Acceptable Manufacturers:

1. Eaton Tripp Lite.
2. Eaton 9PX.

H. Each UPS shall have a Liebert Micropod bypass switch.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Refer to the requirements of Division 01.

3.02 COORDINATION WITH OTHER DIVISIONS

- A. Examine the drawings and specifications of all divisions and become fully familiar with the work. Before commencing work, obtain a ruling from the Engineer on any conflicting issues between divisions. No compensation will be made for any costs arising from conflict not identified before work has commenced.
- B. Coordinate the work to be performed under this section of the specification with all divisions installing equipment to ensure that there are no conflicts.
- C. Lay out the work and equipment with due regard to architectural, structural, and mechanical features. Architectural and structural drawings take precedence over electrical drawings regarding locations of walls, doors, and equipment.
- D. Examine previously constructed work and notify the Engineer of any conditions which prejudice the proper completion of this work.

3.03 PRODUCT HANDLING

- A. Use all means necessary to protect the products included in this division before, during and after installation, and to protect products and installed work of all other trades.
- B. Any damage to the products and/or installed work shall be repaired or replaced to the approval of the Engineer by the Contractor at no additional cost to the Owner.

- C. Remove advertising labels from all products installed that have such labels attached. Identification, NEC, and UL labels are not to be removed.
- D. Remove dirt, rubbish, grease, etc. resulting from work performed under this section of the contract from all surfaces.

3.04 NETWORK PROGRAMMING

- A. Provide configuration and programming for all network switches and PLCs for integration with the existing City-wide SCADA network. Programming for vendor supplied network switches shall be performed by the vendor.
- B. Refer to specification Section 40 68 00 for additional requirements and details.

3.05 INSTALLATION

- A. Refer to the requirements of Division 01 for additional requirements.
- B. The Contractor shall utilize personnel to accomplish, or supervise the physical installation of all elements, components, accessories, or assemblies which it provides. The Contractor shall employ installers who are skilled and experienced in the installation and connection of all elements, components, accessories, and assemblies it provides.
- C. All components of the SCS shall be the installation responsibility of the Contractor unless specifically noted otherwise. After the installation of the SCS is completed, the installation shall be inspected jointly by the Contractor and the Equipment Manufacturer's representatives. Any problems shall be corrected, and when both are satisfied with the installation, a written certification of the installation shall be delivered to the Engineer. The certification shall state that all cabling and terminations have been inspected and are installed in accordance with the manufacturer's guidelines.
- D. Miscellaneous Equipment. The Contractor shall provide any necessary screws, anchors, clamps, tie wraps, distribution rings, wire molding, and support hardware, etc., necessary to facilitate the installation of the network cabinets within the SCS. All metal fasteners and straps in corrosive or wet areas shall be 316SS.
- E. Special Equipment and Tools. It shall be the responsibility of the Contractor to furnish any special installation equipment or tools necessary to properly complete the SCS. This may include, but is not limited to, tools for terminating cables, testing and splicing equipment for copper/fiber cables, communication devices, jack stands for cable reels, or cable wrenches.
- F. Penetrations of Walls, Floors, and Ceilings. The Contractor shall make no penetration of existing walls, floors and/or ceilings without the prior consent of the Owner. Where penetrations through acoustical walls, fire-rated doors or other walls for cableways are to be installed, such penetrations shall be sealed by the Contractor in compliance with applicable code requirements.

- G. The network cabinets and all components of the system shall be installed in a neat, workmanlike manner. Wiring color codes shall be strictly observed and terminations shall be uniform throughout the system. Identification markings and systems shall be uniform. TIA/EIA 568B wiring codes as shown on the drawings shall standardize all SCS wiring. The CTC shall be level and plumb.

3.06 COMMISSIONING

- A. Commissioning of network and communication systems is to include but not be limited to the following:
 - 1. Verify installation of components, power and network connections.
 - 2. Supervise network cable testing.

3.07 TRAINING

- A. Provide training, described in detail in Section 01 78 25, as required by the plant's personnel to become fully competent in the proper operation and maintenance of all network and communication equipment described under this section of the specifications.

3.08 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 67 00

CONTROL SYSTEM EQUIPMENT PANELS AND RACKS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide control system equipment panels and racks as indicated and in compliance with Contract Documents.
- B. Local control stations shall be supplied to house local control switches, push buttons and indicator lights associated with field devices (valves, drives, etc.) as indicated on the P&ID drawings. The control stations shall be located in close proximity to their associated devices. Where a group of devices are located within close proximity to each other, the local controls may be combined into a single common local control panel. Line of site must be maintained between all devices and the respective local controls.

1.02 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.

1.03 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.04 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.05 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Unless otherwise specified, provide outside finishes on all enclosures in ANSI 61 Grey.
- B. The enclosures must be suitable for carrying the weight of the equipment mounted inside the panel and on the doors without any warpage.
- C. Control panels and enclosures shall be UL508A listed.

2.02 ENCLOSURES

- A. Provide NEMA Type 1A gasketed enclosures in ordinary locations.
- B. Provide NEMA Type 4X (Type 316 stainless steel) enclosures for Category 1 and 2 wet and corrosive locations and all outdoor locations. Where installed outside, provide enclosures with a sunshield cover to completely protect and enclose the control panel.
- C. Enclosures located in electrically hazardous classified areas shall bear appropriate hazardous area ratings based on the area classifications identified by Division 26.
- D. Enclosures for mounting field control indicator lamps and switches in unclassified areas to be heavy duty die cast enclosures.

2.03 PANEL ENCLOSURES

- A. Fabricate panel enclosures from minimum 11 gauge steel panels complete with necessary stiffening to form a rigid free-standing line up. The structures must be suitable for carrying the weight of the equipment mounted inside the panel and on the doors. Provide removable top and bottom cable entry plates.
- B. Minimum enclosure outer dimensions shall be 60" high by 48" wide by 12" deep. PLC-0000-1 shall be floor mounted on a 4" housekeeping concrete pad. RIO-0000-1 and PLC-0000-2 shall be wall-mounted.
- C. Provide panels with front access only. Doors shall be pad lockable and fitted with 3 point heavy duty latching assemblies. Provide a continuous piano hinge and a pneumatic hold open device or door stop kit on each door.
- D. Finish the interior of the enclosure with white paint. Provide a switched light fixture and 120 VAC duplex convenience receptacle inside the enclosure.

2.04 MARSHALING, CONTROL, AND PLC PANELS

- A. Supply, fabricate, checkout, layout, document and deliver to Site fully equipped and functional panels.
- B. Supply all components contained on or within the panels fully wired under this Section of the Specification.
- C. The selection of all accessories, materials and methods for fabrication not covered by this Specification, but which are necessary to complete the fabrication of the control panels, is the responsibility of the panel fabricator.
- D. Fans and filters shall be installed to pressurize all control panels in non-hazardous areas thus discouraging dust accumulation and providing air purging for temperature and corrosion control.

- E. Marshalling and control panels shall be adequately sized to facilitate a professional, uncluttered arrangement. Provide adequate internal and external space to accommodate a 20 percent increase in each type of component used.
- F. Marshalling, control, and PLC layouts and wiring diagrams are to be provided by the Contractor as Shop Drawings.

2.05 WIRING AND ACCESSORIES

- A. Provide wiring inside the panels according to the following Specifications:
 - 1. Control wiring to be a minimum of #16 AWG tinned stranded copper; insulation rated at 600 V.
 - 2. Wiring for power distribution shall be a minimum of #14 AWG tinned stranded copper; insulation rated at 600 V.
 - 3. Install cables in accordance with the requirements of Division 26.
- B. Tag each wire at both ends with a heat shrink sleeve that is machine printed. Allow approximately 1 inch of wire insulation between the tag and the bare wire.
- C. Wiring systems with different voltage levels or types shall be suitably segregated within the panel, according to relevant electrical codes.
 - 1. Proper insulation and separation between 120VAC/24VDC and 480VAC circuits, equipment, and wiring shall be provided to maximize personnel safety.
- D. Run all wiring in enclosed plastic wire troughs such as Panduit. Size all wire troughs so that the total cross sectional area of the insulated wire and cable does not exceed 40 percent of the cross sectional area of the wire way.
- E. Provide a minimum clearance of 2 inches between wire trough and any point of wire termination.
- F. Terminate all wiring, incoming and outgoing, at dedicated terminal strips mounted inside the panels. Identify each terminal strip with a terminal strip number, defined as follows:
 - 1. Wire identification to use the connected field device tag name with the wire's corresponding end device terminal number appended to it.
 - 2. Identify every joint and/or terminal of the above wire run with the same identifier until the wire meets another tagged device, at which point the wire identifier will change to use the new device name and terminal number.
 - 3. Identify spare wires by using the cable tag, wire number and an “-SP” suffix.

4. Arrange wiring on terminal blocks such that all internal panel wiring terminates on the inboard side of the terminal blocks and all external wiring terminates on the outboard side.
- G. Provide a 120 VAC panel power distribution system and 24 VDC and other DC power distribution systems as required in each panel to accommodate all instrumentation systems fed from the panel. Provide a thermal magnetic circuit breaker and surge suppression on each main power circuit and a fused terminal block for each branched circuit off the main.
- H. Provide disconnect type terminal blocks to isolate field wiring that is powered sourced from the panel. Provide a dedicated fused disconnect type terminal block to isolate each individual PLC input and output.
- I. All PLC discrete inputs and outputs shall be provided with interposing relays. Interposing relays shall be as specified in Section 40 78 00 and shall be used to isolate all field wiring from PLC terminals.
- J. Provide sufficient terminals so that not more than two wires are connected under the same terminal. Provide 20 percent spare terminal capacity at each terminal block assembly.
- K. Terminals shall be color coded as follows:
 1. Grey: Positive 24 VDC.
 2. Grey: Analog signal plus.
 3. Grey: Analog signal common and VAC neutral.
 4. Grey: 120 VAC.
 5. Green: Ground.
- L. Surge suppression shall be provided on all analog signals. Refer to Section 40 78 00 for specific equipment and requirements.
- M. Provide nameplates for each device on or within the panels and enclosures. Nameplates shall be white laminated plastic with black lettering, a minimum of 1 inch x 3 inches in size with up to three lines of 0.25 inch lettering. Securely fasten nameplates in and situate them in a visible location. All nameplates shall include the prefix P25-.

2.06 INTRINSICALLY SAFE BARRIERS

- A. Intrinsically safe relays and devices shall be provided for all signals that originate, terminate, or otherwise interface in, hazardous and classified areas. Refer to Section 40 78 00 for specific equipment and requirements.

2.07 PANEL POWER SUPPLY

- A. Each PLC panel, or control panel, shall have a 1500VA UPS installed in it for surge protection and battery backup of critical equipment. When a PLC is co-located with network equipment, the UPS shall be sized to carry all equipment. The UPS shall be 19-inch rack mountable and shall be mounted with sliding rails where possible. The UPS shall be a double-conversion system.
- B. Each UPS shall be capable of running the connected load for a minimum of 30 minutes.
- C. UPS Electrical Input Specifications
 - 1. Nominal Voltage: 120VAC
 - 2. Voltage Range: 80-144VAC
 - 3. Input Power Factor: > 0.95
 - 4. Frequency: 60 Hertz +/- 3 Hertz.
- D. UPS Electrical Output Specifications
 - 1. Voltage Regulation: +/- 3 percent of Nominal
 - 2. Efficiency: > 85 percent
 - 3. Frequency Regulation: +/- 3 Hertz on utility, +/- 1 Hertz on battery
- E. UPS Communications Specifications:
 - 1. A USB port shall be available for monitoring and configuring the UPS. An appropriate cable shall be supplied to connect to the UPS with a PC.
 - 2. An Ethernet port shall be available with the ability to monitor the UPS utilizing the SNMP protocol.
- F. UPS Battery Specifications:
 - 1. All batteries shall be sealed, lead-acid batteries and shall be maintenance free. Batteries shall be hot-swappable. The UPS will indicate when the battery is weak and needs to be replaced.
 - 2. The UPS shall be able to accept additional battery modules to extend the runtime of the UPS.
- G. Acceptable Manufacturers:
 - 1. Powerware 5 or 9 Series.

2. Liebert GTX Series.

3. APC Smart-UPS Series.

H. Each UPS shall have a Liebert Micropod bypass switch and relay outputs to allow monitoring of hardwired I/O points.

2.08 PANEL GROUNDING

A. Provide a ground system for the instrumentation circuits, isolated from the main power system ground to each marshaling panel.

B. Provide grounding lugs for each panel, suitable for termination of up to #2 AWG copper grounding conductor.

C. Provide in each marshaling panel an isolated grounding bus bar 0.25 x 1 x 24 inch, equipped with necessary lugs for accepting two (2) #2 AWG grounding conductors.

D. Firmly bond all panel-mounted devices on or within the panels to ground. Provide supplementary bonding conductors for backpanels and doors. Attach a separate bonding conductor to all devices that are not firmly fastened to the panels with screws for such devices as case mounted instruments, meters, etc.

PART 3 - EXECUTION

3.01 MOUNTING HEIGHTS

A. Unless otherwise specified or a conflict exists, mount all control panels:

1. 48 inches or taller such that the top of the control panel is at 78 inches above the finished floor.

2. Less than 48 inches such that the panel is centered at 48 inches above the finished floor.

3.02 CORROSION INHIBITION

A. All control panels shall be provided with corrosion inhibiting vapor capsules.

3.03 CLOSEOUT ACTIVITIES

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 68 00

PROCESS CONTROL SOFTWARE

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide Process Control Software as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. International Society of Automation (ISA):
 - 1. S5.1: P&IDs and Tagging
 - 2. S18.2: Alarm Management
 - 3. S99: Control System Cyber Security
 - 4. 101: Human-Machine Interfaces

1.03 DEFINITIONS:

- A. FAT: Factory acceptance test
- B. HMI: Human machine interface
- C. I&C: Instrumentation and control for process systems
- D. IS: Instrumentation supplier
- E. LAN: Local area network
- F. LCP: Local control panel
- G. NC: Normally closed
- H. NO: Normally open
- I. OIT: Operator interface terminal
- J. OSI: Owner's System Integrator
- K. PC: Personal computer
- L. PID: Control action, proportional plus integral plus derivative

- M. PLC: Programmable logic controller
- N. P&ID: Process and instrumentation diagram
- O. RIO: Remote input/output
- P. SCADA: Supervisory control and data acquisition
- Q. VCP: Vendor control panel

1.04 SUBMITTALS:

- A. Submittals shall meet the requirements of Section 01 33 00.
- B. A minimum of four weeks prior to factory acceptance testing, submit programming files for review.
- C. After program development but prior to start-up and commissioning, provide a list of system points for alarming for review by the Owner and Engineer.
- D. After satisfactory review of all hardware submittals by the Engineer, the I&C Subcontractor shall submit a copy of all color display screens reflecting all process areas, including vendor sub-systems. This submittal shall include the following for each process area:
 - 1. System Graphics.
 - 2. Trends and data graphs.
 - 3. Alphanumeric displays.
 - 4. Alarm system display.
 - 5. Each graphical display shall have a unique title:
 - a. Clearly identify where process data is to be displayed using simulated data or placeholder variables with a reference list.
 - b. All equipment and instruments shall be identified with tag number as shown on the Contract Drawings. Their operation change shall be described therein including:
 - (1) Start/Stop
 - (2) Open/Close
 - (3) In Hand/Remote
 - (4) Other changes in state or position as required.

6. All standard and customizable reports for all processes including vendor sub-systems.
 - a. Clearly label all process data using simulated data or placeholder variables with a reference list.

E. Operations Manual

1. The I&C Subcontractor shall prepare and submit an Operations Manual. The manual shall be provided in both electronic and hard copy format. The electronic manual shall be provided in PDF format with appropriate section bookmarks. The hard copy format shall be provided in a three-ring binder with appropriate section bookmarks. The manual shall include but not be limited to the following:
 - a. Table of Contents
 - b. All Operator Interface Displays:
 - (1) Process Flow Graphics
 - (2) Trending
 - (3) Reporting
 - (4) Alarms
 - c. A summary list of all operator inputs including operator-adjustable setpoints for all process areas including vendor sub-systems.
 - d. Instructions for printing screens, reports, and trends.
 - e. Summary of security clearances and where they apply throughout the facility.
 - f. Process Flow Diagram and Network Architecture Diagram.
2. A copy of this manual shall be provided to every operator during training. Training shall encompass a review of the manual and the contents therein.

F. All the following shall be submitted and approved prior to commissioning activities:

1. Program manuals supplied by manufactures with software packages.
2. All software programs for all supplied PLCs including vendor-supplied subsystems.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

- B. The I&C Subcontractor shall schedule the following meetings at the indicated milestones, at a minimum, with the General Contractor, Engineer, and Owner:
 - 1. Graphics, Alarms, and Reports Initial Submittal
 - 2. Graphics, Alarms, and Reports Revision Submittal
 - 3. Accepted Graphics, Alarms, and Reports prior to I&C Subcontractor mobilizing to the site for any field programming activities.
- C. The I&C Subcontractor shall provide upon request a formal documented quality assurance and quality control program applying to all engineering, fabrication, construction, programming, start-up, and commissioning of the process control software to be provided herein.
- D. Refer to Section 40 61 21 for process control system testing requirements.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

1.07 SYSTEM DESCRIPTION

- A. Provo City Water Resources has standardized around Rockwell Automation Allen-Bradley PLC hardware, RSLogix software, the Rockwell Automation PanelView Plus hardware, and Rockwell Automation FactoryTalk HMI software. If a piece of equipment has been approved and is being supplied with PLC hardware, OIT hardware or HMI software that is different than these standards, the Contractor shall provide all licenses associated with the hardware or software. These licenses shall be in the Owner's name and shall provide full functionality with the equipment or software that has been provided.
- B. The SCADA system equipment nodes to be provided by the I&C Subcontractor under this Contract includes field PLC hardware and Operator Workstations (OWS). Process Control System Software required for complete operation of all nodes and integration with SCADA network shall be provided. Refer to the Network Architecture Diagram 00-I601 for additional details.
- C. SCADA Interfacing Node Types:
 - 1. Field PLC Hardware: Provide field PLC hardware to interface with field instrumentation, motor controllers, rotating machines, etc.
 - 2. Operator Workstation: Provide all graphic display and related software for interacting with the SCADA system data. OWS shall be provided with software for the viewing of real time SCADA system data, alarms, etc. They shall be equipped with drivers for interfacing with all existing and proposed field devices, historical data, and provide data for the existing Historian located off-site. SCADA displays

shall operate on data maintained by the OWS in the Administration Building. Capabilities to include but not be limited to the following:

- a. All process systems displays including vendor sub-systems.
- b. Control of all necessary process variables and inputs including vendor sub-systems.
- c. Historical and real-time trend data for all process systems and vendor sub-systems.
- d. Current and historical alarm data.
- e. System utilities.

PART 2 - PRODUCTS

2.01 SCADA HMI APPLICATION

- A. Rockwell Automation FactoryTalk View SE
- B. No equal.

2.02 WORKSTATIONS

- A. Workstations shall be supplied by the Owner. The I&C Subcontractor shall be responsible for providing all software listed herein and configuring the workstations as required for a fully functional and operational system.
- B. The following software shall be provided on the specific operator workstations:
 - 1. Administration Building Control Room Normal and Standby Operator Workstations
 - a. Windows 10 Operating System
 - b. FactoryTalk View SE Client
 - c. FactoryTalk Historian Client
 - d. Rockwell Automation Plant PAX Virtual Machines
 - e. Plant FactoryTalk View SE Data & I/O Virtual Server
 - f. FactoryTalk View SE Client.
 - g. Virtual Domain Controller
 - h. Kepware

- i. RS Linx
- 2. Administration Building Plant Manager and Operator Workstations
 - a. Windows 10 Operating System
 - b. FactoryTalk View SE Client
 - c. FactoryTalk Historian Client

2.03 GENERAL PROGRAMMING REQUIREMENTS:

- A. SCADA system software to be used for application software development, existing system expansion, and real time operation of the SCADA system.
- B. Software provided under this Contract represents a complete and operating control software system. Achieve the functionality specified in this and other sections through a combination of standard control system software and application software developed specifically for this Project.
- C. The software listed in this specification is not intended to represent the comprehensive list of software necessary to implement the functional and operation systems and requirements of the Contract Documents. Provide all ancillary necessary supplemental components, drivers, utility software, and application software required to meet the requirements of the Contract Documents.
- D. Control Loops. A control loop is a single piece of equipment or a group of equipment that performs a specific function. Each control loop will have an associated loop number and description. Process Equipment and programming shall be divided into loops based upon their corresponding function. This allows the process to be neatly broken down into parts that are simple and logical. Multiple pieces of equipment should not have the same loop number.
- E. Loop Numbers. Each control loop shall be assigned a unique number to set itself apart from all other loops.
- F. Control Strategies. Each control loop shall have or be part of an associated control strategy. The control strategy is used to describe the function of each control loop in detail. Refer to Section 40 61 96 for the control strategies for this project.
- G. Equipment and Instrumentation Tagging:
 - 1. Equipment and instrumentation shall be tagged as shown on the P&IDs in the Contract Drawings. Instrumentation tagging follows the ISA-5.1-2009 standard where the tag has a functional identification letter code and then the loop number. The functional identification letter code should follow what is shown on P&ID drawing 00-X602.

2. The functional identification of an instrument or its functional equivalent consists of letters from the table on 00-X602 and includes one first-letter (designating the measured or initiating variable) and one or more succeeding letters (identifying the functions performed).
 3. The functional identification of an instrument is made according to the function and not according to the construction. Thus, a differential pressure transmitter used for flow measurement would be identified by FT and not PDT.
 4. The succeeding letters of the functional identification designate one or more readout or passive functions and/or output functions. A modifying letter may be used, if required, in addition to one or more other succeeding letters. Modifying letters may modify either a first letter or succeeding letters, as applicable. Thus, TDAL contains two modifiers. The letter D changes the measured value T into a new variable, "differential temperature." The letter L restricts the readout function A, alarm, to represent a low alarm only.
 5. The sequence of identification letters begins with a first letter selected according to the table below. Readout or passive functional letters follow in any order, and output functional letters follow these in any sequence, except that output letter C (control) precedes output letter V (valve), e.g., PCV, a self-actuated control valve. However, modifying letters, if used, are interposed so that they are placed immediately following the letters they modify.
 6. The number of functional letters grouped for one instrument should be kept to a minimum according to the judgment of the user. The total number of letters within one group should not exceed four. All functional letters groups shall be reviewed by the Owner and Engineer for approval.
 7. Refer to drawing 00-X602 for specific letter combinations that are not defined in ISA-5.1-2009 Table 4.1.
- H. Process and Instrumentation Diagrams (P&IDs). P&IDs for the project are found in the Contract Drawings and should be used as a basis for developing the programming for the system.
- 2.04 PLC PROGRAMMING REQUIREMENTS:
- A. Vendor systems with PLCs shall be programmed by the vendor and factory tested prior to delivery to the site. Vendors shall become familiar with the requirements of this section.
 - B. Contractor furnished PLCs (not as part of a vendor package) shall be programmed by I&C Subcontractor.
 - C. PLC Configuration. Each PLC shall be programmed with its own project within Unity. The project name shall be the name of the PLC as shown on the Contract Documents.

1. PLC Hardware Configuration. The PLC Hardware Configuration shall be setup by showing the modules that have been designed for each slot of each rack. The arrangement of the modules shall be in an orderly fashion with space for future expansion. Redundant controllers consist of two identical racks with redundant power supplies, processors and Ethernet communication modules.
2. Additional racks shall be installed when additional I/O modules are required.

2.05 OIT PROGRAMMING REQUIREMENTS:

- A. Operator Interface Terminals (OITs) shall be provided at the machine level where a local interface is required in the process area. When an OIT is required it shall be programmed as follows:
 1. Develop a main page with system status, alarm status and navigation. The main page shall include the date and time and have a button to allow the operator to update the date and time.
 2. The OIT shall have user security with viewer, operator and supervisor usernames and passwords. When logged in as viewer (default), the user may see all the pages but does not have any control. When logged in as operator, the user may be able to control the system and change set points that are commonly changed. When logged in as supervisor, the user may control the system and change all set points.
 3. The OIT shall have an alarm page that shows current alarms. Alarms may be acknowledged and reset from this screen. The screen shall be synced with the plant HMI system so that alarm acknowledgement may occur at either location and reflect the acknowledgement on both systems. A separate page shall show an alarm history.
 4. The OIT shall have additional pages for the process and equipment for which the OIT is monitoring and controlling.
 5. Fonts – The font shall typically be Arial size 13 except for titles that may have larger font.

2.06 HMI PROGRAMMING REQUIREMENTS:

- A. All HMI programming will be performed by the I&C Subcontractor.
- B. General. The SCADA system shall be developed based upon the Rockwell Automation FactoryTalk View SE software platform. The core of the system shall consist of two proposed main and backup workstations that shall run the SCADA system for the facility. These workstations shall host the database, historian, and I/O drivers for gathering the tags from the PLC's throughout the facility. The workstations shall also act as SCADA historians, which collect data from selected tags and records that data to a historical database. That data is then used for generating trends and reports. All SCADA clients are launched from a network connection established to offsite SCADA servers.

C. Network Configuration.

1. Only workstations connected to the SCADA network shall be allowed to launch SCADA clients. The SCADA program shall be located in the redundant Control Room Operator Work Stations in the Control Room of the Administration Building and provided with dedicated, redundant connections between each other. The SCADA network IP address assignment should be coordinated with the Owner and Engineer for proposed PLCs, vendor-supplied subsystem PLCs, the new operator workstation, and additional supervisory layer SCADA hardware.

D. Redundancy Configuration.

1. Configure the workstations such that one shall operate as a main workstation and one shall operate as a fully functional standby workstation as indicated. If the main workstation goes down or is otherwise disconnected the standby shall automatically take over. Then when the main workstation is back online it will take over again as the main.

E. SCADA System Security.

1. Each workstation setup shall have security installed to prevent unauthorized users to access the system. The system shall have an audit log setup that records all user transactions to SQL Server. Security shall be setup so that users may be granted access to areas with varying security levels. coordinate with the Owner for security clearance levels, range of permissions, and inactivity log-out timers.

F. Alarm Configuration.

1. The SCADA System shall be setup to provide an alarm alerting system that alerts and displays to operators any new or acknowledged alarms. In addition, an alarm history shall allow the operator to see alarms from any chosen previous date and time. Alarms shall be categorized by area or process like the above described security areas.

G. I/O Drivers. Workstations shall be provided with applicable software for connecting to devices such as PLC's to monitor and control those devices. Each device shall be strategically named and shall be setup for tag name queries. Associated with each PLC shall be a scan class for that device that determines how often the device is polled for data.

H. Tag Database Development:

1. General. SCADA System tags shall be well organized into folders for each process control loop. Parent folders shall contain the facility and process area, location or PLC. Often folders are preceded by a number so that the folders are in process order. Each control loop folder should contain all the tags necessary to monitor and control that loop.

2. Data Types. So that similar tags are consistently the same from one loop to another, Data Types shall be utilized. A Data Type is a tag structure that may consist of one or more individual tags. They will include all the necessary tags from the DFB plus additional internal tags that assist in the monitoring and control of the control loop.
3. Client Tags. Client tags are used for functions that are unique to each FactoryTalk client. Uses include custom user settings, screen settings and security settings.
4. System Tags. System tags are used to show information about the SCADA software. Use these tags to show status of the system, including communications to devices, redundancy health, system date and time, system performance, database connectivity and alarm status.

I. SCADA Screens

1. Development:
 - a. To maintain consistency throughout the facility's SCADA screens, new screens shall be developed using templates from the existing screens. Symbols for blocks such as pumps, valves, pipes, process equipment, discrete displays, numeric displays, control buttons, numeric set points, etc. shall match the existing screens. A copy of the existing system screens can be provided upon request to the Owner.
2. Windows:
 - a. Top Menu – Across the top of the screen shall be a top menu. This menu is always visible to the operator.
 - b. Overview Screen – When the FactoryTalk View Client is launched, and the operator logs in for the first time, the Menu, Navigation Tree and main Overview Screen should always be displayed.
 - c. Standard Windows:
 - (1) Alarms – The alarms screen is where the operator goes to look at current and past alarms. The screen should be capable of indicating active alarms, alarm history, disabled alarms, suppressed alarms, and equipment taken out of service:
 - (2) Trending – The trending screen allows operators to view custom and/or saved trends for the facility.
 - (3) Communications – The communications screen allows operators to view the architecture of the SCADA system. All devices that are connected to the SCADA system with a communications link (typically an Ethernet link) shall be shown on this screen. Status of the communication of each device is shown and alarms are triggered if

communications are lost with each of the devices. PLC's shall show their current state (running, stopped or faulted) and system clock.

- (4) Logs – The logs screen is a location for operators to view various logs that are being kept through the SCADA software as well as give the operator the ability to enter their own logs. The logs screen shall have a set of tabs for each log that has been configured.
 - (5) Reports – The Reports screen is where the operator goes to setup, view, print and/or obtain data related to the facility's process.
- d. Project Windows – The project windows allow the operator to see how each control loop within each process of the facility is functioning and provides access to control loop popups which allow the operator to make control and set point changes. The screens shall be designed in a 2-dimensional process flow diagram manner. When developing project windows, the programmer shall hold screen development workshops with the Owner and Engineer. In the initial workshop the programmer shall present his or her ideas on how the project windows should look and obtain input from the Owner and Engineer. Then the programmer will develop the first draft of all project windows as which point a subsequent workshop will be held and the screens presented. Final modifications will be implemented and then a final workshop should be held. In the final workshop the screens should be presented in a fully functional FactoryTalk client with simulated data.
 - e. Popups – The programmer shall develop popups for the project so that monitoring and control of each control loop throughout the system is properly achieved. Popups may be unique or may be templates that are interchangeable. Popups shall follow the District's HMI Standards as shown in Attachment A to this specification section.

PART 3 - EXECUTION

3.01 PREPARATION

- A. The Contractor is responsible for all factory testing in accordance with Section 40 61 13 and Section 40 61 21.

3.02 INSTALLATION:

- A. Provide in accordance with Section 40 61 13.

3.03 FIELD TESTING:

- A. Provide in accordance with Section 40 61 21.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 70 00

INSTRUMENTATION FOR PROCESS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide Instrumentation for Process Systems as specified in this section and in compliance with related detailed instrumentation specification sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES

- A. International Society of Automation (ISA):

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. Sustainable Design Submittals.

2. Prepare and submit Instrument Data Sheets for each instrument supplied for this project in accordance with the ISA S20 standard. Clearly indicate all pertinent data for the respective instrument on the data sheets and clearly indicate any deviations from specified requirements. The completed Instrument Data Sheets shall be submitted together with and form an integral part of the instrumentation shop drawings specified in this division.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.
- B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10
- B. All instrumentation shall be stored according to the manufacturer's instructions.

1.07 WARRANTY

- A. As specified in Section 01 78 36.
- B. Instruments shall be provided with a minimum 1-year manufacturer's warranty.
- C. In the event a component or instrument fails to perform as specified or is proven defective during the warranty period, the manufacturer shall promptly repair or replace the defective part at no cost to the Owner.

PART 2 - PRODUCTS

2.01 INSTRUMENTATION LIST

- A. The table provided in this section is an itemized list of instrumentation to be supplied for this project. The instrumentation list provides detailed information for the tagged instrumentation devices shown on the Piping & Instrumentation Diagrams.
- B. The Instrumentation List also provides references to the P&ID drawing, instrumentation specification section, responsible party for supplying, standard details, and location drawings.

PART 3 - EXECUTION

3.01 INSTRUMENT LIST

- A. Contractor shall update the Instrument List to reflect all changes in the work, and as required based on shop drawings that have been returned from the Engineer with a “Reviewed Only” or “Reviewed as Noted” status.
- B. The as-constructed Instrument List shall be included in the O&M manual submittal.

3.02 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

PROVO RIVER WATER TREATMENT PLANT
PROVO CITY WATER RESOURCES
PROVO, UT

Instrument List

AECOM PROJECT NO.: 60670884
ISSUE DATE: 06/28/2023
REVISION: ISSUED FOR BID - REV 1

SECTION 40 71 00
FLOW MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide flow measurement instrumentation as specified in this section and in compliance with section 40 70 00 and other related sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES

- A. International Society of Automation (ISA):
 - 1. S5.1: P&IDs and Tagging.
 - 2. S5.4: Instrument Loop Diagrams.
 - 3. S7: Instrument Air.
 - 4. S12: Electrical Equipment for Hazardous Locations.
 - 5. S18.2: Alarm Management.
 - 6. S20: Instrument Specifications.
 - 7. S50: Electrical Control Signals.
 - 8. S75: Control Valve Design, Specification and Testing.
 - 9. S96: Valve Actuators
 - 10. S99: Control System Cyber Security.
 - 11. 101: Human-Machine Interfaces.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.

- B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

- 1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.
- B. Sustainability Standards Certifications.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

1.07 WARRANTY

- A. As specified in Division 1.

PART 2 - PRODUCTS

2.01 MAGNETIC IN-LINE FLOW METERS

- A. Magnetic in-line flow meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
 - 1. Each magnetic flow meter and signal converter/transmitter shall be tagged in accordance with the Instrumentation List and as shown on the P&ID drawings.
 - 2. Flow tubes shall be flanged and lined full-lay-length flow tube suitably rated for the respective process piping pressure rating.
 - 3. Flow tube sizes shall generally be as shown on the contract drawings. Notify the Engineer if the proposed flow meter size will result in flow velocity lower than 1 ft/sec or greater than 16 ft/sec during normal operation.
 - 4. Liner material shall be selected for compatibility with the process application chemical characteristics and operating temperature range.
 - 5. Measuring electrodes and built-in grounding electrodes shall be 316SS bullet-nose unless an alternate material is required for application specific chemical resistance.

6. Line size 316SS grounding/protection rings shall be provided for applications with abrasive slurries and where the process piping system is non-conductive or has a non-conductive liner.
 7. Signal converters/transmitters shall be suitable 120 VAC power supply or as otherwise specified and shall have an accuracy of 0.5 percent of calibrated span or better. Outputs shall include 4-20maDC analog and a Totalizer Pulse output as a minimum.
 8. Provide remote wall mounted signal converters with pre-terminated power and signal cables to facilitate installation of the signal converter at 5.5 ft above finished floor. The signal converter may be mounted directly to the flow tube where the installed height of the signal converter display is between 4 ft – 6 ft above finished floor.
- B. The flow tube, signal converter, and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the flow tube or signal converter environmental rating be less than NEMA 4X.
- C. Suitable manufacturers of magnetic flow meters include;
1. Siemens
 2. Endress + Hauser
 3. Rosemount

2.02 FLOW INDICATING ROTAMETER

- A. Flow indicating rotameters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
- B. Each rotameter shall be tagged in accordance with the Instrumentation List and as shown on the P&ID drawings.
- C. Requirements
1. Polysulfone body
 2. Full scale accuracy +/- 4%
 3. Flow range: 0.1 – 10 GPM
 4. Operates under pressures up to 175 PSI
 5. Maximum fluid temperature 212°F
 6. Float and Guide Rod: 316SS

D. Suitable manufacturers include:

1. Blue-White, F-450
2. Approved Equal

PART 3 - EXECUTION

3.01 QUALIFICATIONS

- A. Flow meters are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION

- A. Install primary flow elements and signal converters in accordance with manufacturer's installation instructions.
1. For magnetic flow meters, flow tubes shall be installed in a designated "meter run" comprising a minimum upstream straight pipe length of 5D and downstream straight pipe length of 3D of the nominal pipe diameter. There shall be no valves, bends, tees, process taps, chemical injectors or other flow disturbing fittings located within the Meter Run. The Meter Run piping shall be the same size as the meter.

3.03 CALIBRATION

- A. Flow meters shall be factory pre-calibrated and calibration shall be verified on site.
- B. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.
1. In line liquid flow meter calibrations shall be verified in-situ using volumetric draw down or similar test approved by the Engineer.
- C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

 - 8. S75: Control Valve Design, Specification and testing.
 - 9. S96: Valve Actuators
 - 10. S99: Control System Cyber Security.
 - 11. 101: Human-Machine Interfaces.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.

- B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

- 1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

1.07 WARRANTY

- A. Comply with the requirements specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 RADAR LEVEL TRANSMITTERS

- A. Radar level meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

- 1. Each radar level transmitter and corresponding antenna shall be tagged in accordance with the Instrumentation List and as shown on the P&ID drawings.
 - 2. Level transmitters shall be pulsed radar type and shall have an accuracy of plus or minus 0.1 percent of calibrated span or better.
 - 3. Level transmitters shall accept 120 VAC nominal power supply from an external dedicated circuit.
 - 4. The transmitter shall be a smart programmable type with local display and programming keypad.
 - 5. Outputs shall include 4-20maDC analog and three programmable relay outputs as a minimum.
 - 6. The antenna model shall be selected for optimum performance at the required measurement range and process vessel configuration for each application. The antenna shall include a quick-disconnect feature to facilitate maintenance.

7. Provide antenna with pre-terminated signal cable of adequate length to facilitate installation of the transmitter at 5.5 feet above finished floor and with enough slack to facilitate sensor removal and inspection without requiring cable disconnection. Supply a minimum cable length of 15 feet.
 8. Design the antenna mounting bracket(s) and/or stilling well to ensure that the sensor is mounted at least 300 mm above the maximum possible liquid level. Where potential sensor flooding is anticipated, provide the sensor with a flood proof hood.
 9. Provide a 316SS stilling well for the transducer in accordance with the manufacturers recommendations where the process vessel has turbulent liquid surface conditions, floating foam, floating debris, or when there are stationary objects in the transducer beam path. Stilling wells shall have flanged transducer mounting to facilitate transducer maintenance activities.
 10. Orient the antenna rotationally such that non liquid and indirect reflections are minimized.
- B. The transmitter, antenna, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, transducer, or cabling environmental rating be less than NEMA 4X.
- C. Suitable manufacturers of radar level meters include:
1. Siemens, LR100/LR110/LR120
 2. Endress + Hauser, Micropilot M
 3. Ametek Drexelbrook, DR7000
- 2.02 ULTRASONIC AND CAPACITANCE TYPE SWITCHES AND TRANSMITTERS:
- A. Device output shall be impervious to material build-up on sensor.
 - B. Sensor coatings, if any, shall be as specified on the instrument data sheets. Sensor coatings shall be compatible with the process fluids.
 - C. Rigid sensors shall be heavy duty.
 - D. Flexible sensors shall be held vertically straight using a weight attached to the end of the sensor, or a turnbuckle tensioning system attached between the sensor and the tank or bin bottom.
 - E. Enclosures shall meet the appropriate NEMA rating as specified on the instrument data sheets.
 - F. Continuous level measurement systems shall have 2-wire 4-20 mA outputs.

G. On-off level measurement systems shall have DPDT action, with voltage and current ratings as specified on the instrument data sheets. Switches shall have sealed isolated dry contacts. For vendor supplied equipment packages, switches shall be rated for the requirements of the equipment.

H. Suitable manufacturers of Ultrasonic and Capacitance Type Switches and Transmitters:

1. Siemens
2. Endress + Hauser
3. Ametek Drexelbrook

2.03 LEVEL SWITCHES

A. Float level switches provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Float switches shall have SPDT output contacts rated for pilot duty. Switches shall be mercury-free.
2. Provide polypropylene float casing with pre-terminated signal cable. Float switch density shall be selected for optimal performance in the specified process liquid.
3. Extension cable shall be 3 conductor 50 foot length minimum with cable length determined in the field based on application and depth of vessel.

B. The level switch, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, or cabling environmental rating be less than NEMA 4X.

C. Suitable manufacturers of level switches include:

1. Flygt ENM-10.
2. ITT Centripro A2N Series.
3. Approved equal

PART 3 - EXECUTION

3.01 QUALIFICATIONS

A. Flow meters are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION

- A. Install primary level sensors and transmitters in accordance with manufacturer's installation instructions and as described herein.
 - 1. Where possible, locate instruments near an access hatch or manway to facilitate testing and maintenance activities.
 - 2. Stilling wells where indicated shall be fabricated from a continuous length of 316SS pipe with no seams or joints. The stilling well diameter shall be selected to accommodate the level sensor OD and manufacturer's recommendations.
 - 3. Stilling wells shall have a flanged sensor mounting 1 foot above vessel cover or finished floor level, 1 inch vent hole located above the maximum liquid level, and a flat-cut bottom, refer to standard details for additional detail.
 - 4. Where radar sensors are used in round process vessels, the sensor shall be located at 1/3 of the tank diameter away from the tank wall unless indicated otherwise.
 - 5. Level switches shall be suspended from mounting brackets fabricated from 316SS. Suspend floats from the mounting brackets using J hooks and float manufacturer's cable grips. Provide anti-sway rings for all float cables longer than 6 feet. Maximum spacing of anti-sway rings is 6 feet.

3.03 CALIBRATION

- A. Level meters shall be factory pre-calibrated and calibration shall be verified on site.
- B. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.
 - 1. In line liquid flow meter calibrations shall be verified in-situ using volumetric draw down or similar test approved by the Engineer.
 - 2. Level meters shall be verified in-situ by adjusting the actual liquid level and verifying the measurement against a manual level measurement to a known structural or other fixed reference point such as the vessel bottom or top of access cover.
 - 3. Level switches shall be verified in-situ by adjusting the actual liquid level and verifying the trip point against a manual level measurement to a known structural or other fixed reference point such as the vessel bottom or top of access cover
- C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

SECTION 40 73 00

PRESSURE, STRAIN, AND FORCE MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide pressure, strain, and force measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES

 - 11. 101: Human-Machine Interfaces.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.
 - 1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

1.07 WARRANTY

- A. As specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 PRESSURE AND DIFFERENTIAL PRESSURE GAUGES

- A. Pressure gauges provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
 - 1. Each pressure gauge shall be tagged in accordance with the Instrumentation List and as shown on the P&ID and HVAC Schematic drawings.
 - 2. Liquid filled type.
 - 3. Helical wound bourdon tube, Inconel X-750.
 - 4. Welded parts: Type 316 stainless steel.
 - 5. Bearings: Precision Sapphire Type.
 - 6. 1/2-inch NPT bottom male thread connection.

7. Accuracy: 1/2 percent of scale range. Provide gauges with operating pressure at the midpoint of the scale range.
 8. 4-1/2-inch diameter with ABS plastic case.
 9. Provide external adjustment.
 10. Pipe and Fittings: Schedule 5 Pressfit or Schedule 40 threaded or socket welded, Type 316L stainless steel.
 11. Pump Suction Gauges: Provide gauges with range to cover both the normal operating range and the range of pressures that will result from flushing.
 12. Pump Discharge Gauges: Provide liquid-filled gauges with range to cover the normal operating range, above the pump shutoff head and the range of pressures that will result from flushing.
 13. Seal Water Gauges: Provide gauges with range to cover both the normal operating range and the range of pressures that will result from flushing.
 14. Double Wall Stainless Steel Expansion Joint Gauges: Provide gauges with ranges to suit process line pressure as specified and indicated for the service specified in the Process Piping Schedule.
- B. Pipe and fittings: Type 316L stainless steel, provide as specified herein.
- C. Ball valves: General service stainless steel ball valves in accordance with Section 40 23 13.01.
- D. Pressure Sensor Rings:
1. 1-inch and Larger: Provide sensor/isolators that fit inside the bolt circle of 150-lb (Class 150) or 300-lb (Class 300) ANSI flanges as required.
 2. 3/4-inch and Smaller: Provide sensor/isolators full flange or threaded as specified and indicated. For chemical system provide full flange, threaded connections are not acceptable.
 3. Face to face length of the sensor: Conform to Specification MSS-SP67.
 4. Type: Flow through design with flexible sleeve around full circumference. The center section shall have a cavity behind the sleeve filled with silicone fluid to transfer pressure to the gauge.
 5. Rigidly support all pressure instruments by a post at least 7/8 inch diameter welded to the isolator. On sensor rings with more than one instrument, provide all connections 1/2-inch NPT as a minimum, 1/4-inch NPT fittings are not acceptable.

6. Provide sensor/isolator rings that do not have any fill plugs or valves that can be inadvertently removed with the resultant loss of fill fluid. Pressure sensor/isolators using valves are not acceptable.
7. Provide liquid filled sensor/isolators permanently vacuum sealed at the factory with a modular seal consisting of a membrane and needle fitting to allow removal and replacement of pressure instruments without compromising the vacuum fill. Sensor/isolators using valves are not acceptable.
8. Provide the needle fitting with both 1/4-inch NPT(F) threads and 1/2-inch NPT(M) threads.
9. Provide the pressure sensor/isolator capable of operating under pressure with all pressure instruments removed with no loss of fill fluid. Provide an integral block valve, separate isolation valves are not acceptable.
10. Attach pressure instruments to the isolator with a hand tightened lock ring.
11. It shall be possible to remove or attach pressure instruments to the isolator without requiring the use of any tools.
12. Permanently fill the pressure sensor with high viscosity silicone instrument oil to damp out surges or pressure spikes without the requirement for a separate snubber.
13. Pressure rating: 200 psi minimum for all lines tested at 150 psi or less and 600 psi minimum per lines tested above 150 psi.
14. Materials:
 - a. Pressure sensor/isolator rings: Provide materials suitable for the service conditions specified and indicated, at a minimum provide the following:

Service	Body & Plates	Sleeve
Water	Type 316L Stainless Steel	Natural Rubber
Wastewater	Type 316L Stainless Steel	Natural Rubber
Sludge	Type 316L Stainless Steel	Natural Rubber
Scum	Type 316L Stainless Steel	Natural Rubber
Septage	Type 316L Stainless Steel	Natural Rubber
Grit	Type 316L Stainless Steel	Natural Rubber
Sodium Hypochlorite	Titanium	EPDM
Sodium Bisulfite	Type 316L Stainless Steel	EPDM
Sodium Hydroxide	Type 316L Stainless Steel	EPDM
Ferric Chloride	Kynar Coated Steel	EPDM
Potassium Permanganate	Type 316L Stainless Steel	Natural Rubber
Lime	Type 316L Stainless Steel	Natural Rubber
Polymer	Type 316L Stainless Steel	Viton
Bioxide	Type 316L Stainless Steel	Buna-N
Methanol	Type 316L, Stainless Steel	Viton Type F

E. Suitable manufacturers of pressure gauges and accessories, include:

1. Ashcroft.
2. U.S. Gauge, Division of Ametek, Inc.
3. Wika.

2.02 GAUGE PRESSURE TRANSMITTERS

A. Gauge pressure transmitters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each gauge pressure transmitter shall be tagged in accordance with the Instrumentation List and as shown on the P&ID and HVAC Schematic drawings.
2. Gauge pressure transmitters shall be suitable for 24VDC loop power supply and shall have an accuracy of plus or minus 0.5 percent of calibrated span or better.
3. The transmitter shall have a local display scaled in engineering units.
4. Output shall include 4-20maDC loop powered analog.
5. All gauge pressure transmitters shall be supplied with specified process connections and/or valve manifold to facilitate the measurement, maintenance and calibration activities.
6. Provide diaphragm seals where indicated and fit for the process being measured.

B. The transmitter, and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter environmental rating be less than NEMA 4X.

C. Suitable manufacturers of gauge pressure transmitters include:

1. Siemens
2. Endress+Hauser
3. Rosemount

2.03 DIFFERENTIAL PRESSURE TRANSMITTERS

A. Differential pressure transmitters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each differential pressure transmitter shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Differential pressure transmitters shall be suitable for 24VDC loop power supply and shall have an accuracy of plus or minus 0.5 percent of calibrated span or better.
 3. The transmitter shall have a local display scaled in engineering units.
 4. Output shall include 4-20maDC loop powered analog.
 5. All differential pressure transmitters shall be supplied with specified process connections and/or valve manifold to facilitate the measurement, maintenance and calibration activities.
- B. The transmitter, and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter environmental rating be less than NEMA 4X.
- C. Suitable manufacturers of differential pressure transmitters include:
1. Siemens
 2. Endress+Hauser
 3. Rosemount

2.04 PRESSURE AND DIFFERENTIAL PRESSURE SWITCHES

- A. Pressure and differential pressure switches provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
1. Each pressure and differential pressure switch shall be tagged in accordance with the Instrumentation List and as shown on the P&ID and HVAC Schematic drawings.
 2. Pressure and differential pressure switches shall have a setting accuracy of plus or minus 0.5 percent of calibrated range or better.
 3. Deadband shall be 10 percent of set point or less.
 4. Select switch adjustable range such that the maximum process pressure is 1/2 to 2/3 of maximum range.
 5. Pressure and differential pressure switches shall have SPDT contacts rated 3A @ 120 VAC. Switches shall also be rated for 24 VDC where indicated and applicable.
 6. Pressure switches shall have 1/2 inch NPT stem mounting.
 7. Wetted parts and movement shall be 316SS with a corrosion resistant case.
 8. Provide pressure gauges with factory assembled and filled diaphragm seals or line size pressure sensors where specified.

9. All pressure switches, with or without diaphragm seals shall be supplied with a 316SS block and bleed manifold to facilitate maintenance and calibration activities.
 - B. The switch enclosure, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the switch, or cabling environmental rating be less than NEMA 4X.
 - C. Suitable manufacturers of pressure switches include:
 1. Ashcroft, B Series Type 400
 2. United Electric, 400 Series
 3. ASCO, S-Series
- 2.05 DIFFERENTIAL PRESSURE GAGE AND SWITCH
- A. Service: Air and non-combustible compatible gases.
 - B. Combination differential pressure gage and switch, diaphragm type.
 - C. The differential pressure gage and switch shall be tagged in accordance with the Instrumentation List and as shown on the P&ID.
 - D. Design:
 1. Temperature Rating (-40°F to 200°F).
 2. Include weatherproof housing, NEMA 4X or greater.
 3. Silver or tantalum diaphragms or approved-equal.
 4. Liquid fluorocarbon oil filling.
 5. 0-inch to 25-inch W.C. pressure rating.
 6. Low setpoint at 1 1/2-inch W.C.
 7. Pressure Switch SPDT contacts rated 1A @ 120 VAC and pressure switch shall be rated for 30 VDC where indicated and applicable.
 8. Electrical Connections shall be 1/2-inch NPT.
 - E. Acceptable manufacturers of differential pressure gage and switches include:
 1. Dwyer
 2. Approved equal

2.06 DIAPHRAGM SEALS AND LINE SIZE PRESSURE SENSORS

- A. Diaphragm seals provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
 - 1. Diaphragm seals shall be constructed of 316SS with an elastomeric diaphragm and fill fluid to provide chemical seal from the process fluid.
 - 2. The elastomer sensing element and fill fluid shall be selected for chemical and temperature resistance to the process fluid.
 - 3. Acceptable manufacturers for diaphragm seals include:
 - a. Ashcroft: Diaphragm Seal Type 200
 - b. Wika
 - c. Approved equal
- B. Line size pressure sensors provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
 - 1. Line size pressure sensors shall be constructed of 316SS with an elastomer sensing element providing 360 degree line-size non-clogging pressure sensing.
 - 2. The elastomer sensing element and fill fluid shall be selected for chemical and temperature resistance to the process fluid.
 - 3. Acceptable manufacturers for line size pressure sensors include:
 - a. Red Valve: Red Valve Pressure Sensor Series 40/42
 - b. Wika Type 918
 - c. Approved equal
- C. All diaphragm chemical seals and line size pressure sensors shall be factory filled and assembled with specified gauges, switches, and/or transmitters.

2.07 PRESSURE INSTRUMENT MANIFOLDS

- A. Pressure instrument Block and Bleed, 3 Valve, and 5 Valve manifolds provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
 - 1. Where specified, manifolds for pressure instrument impulse lines shall be constructed of 316SS.

2. Block and bleed style manifolds shall be used where specified for pressure gauges, pressure switches, gauge pressure transmitters, and absolute pressure transmitters.
3. 3 Valve, or 5 Valve manifolds shall be used where specified for differential pressure transmitters.
4. Acceptable manufacturers for instrument manifolds include:
 - a. Siemens
 - b. Endress + Hauser
 - c. Rosemount
 - d. Anderson Greenwood

PART 3 - EXECUTION

3.01 QUALIFICATIONS

- A. Pressure instruments and sensors are to be installed, set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION

- A. Install primary pressure gauges, sensors, and transmitters in accordance with manufacturer's installation instructions and as described herein.
 1. Dials and readouts shall be located and positioned where the dial or readout can be easily read from adjacent walkway or platform to facilitate operation, testing, and maintenance activities.
 2. Locate sensors and instruments as close as possible to the measurement point to minimize the use of impulse tubing.
 3. Where impulse tubing is required, impulse tubing shall be 1/4 inch 316SS with Swagelok tube fittings.
 4. For air or gas applications, the impulse line shall generally be sloped down to the process tap location to prevent condensate buildup in the impulse line. Where this is not possible, provide a condensate drip pot with manual drain valve at the low point in the impulse line.
 5. For liquid applications, the impulse line shall generally be sloped up to the process tap location to prevent air buildup in the impulse line. Where this is not possible, provide an automatic air release valve at the high point in the impulse line.

6. Install impulse tubing with a continuous slope from the instrument to the process tapping and avoid high or low spots in the tubing run.
7. Impulse tubing shall be continuously supported for mechanical protection and to prevent sagging.

3.03 CALIBRATION

- A. Pressure instruments shall be factory pre-calibrated and calibration shall be verified in-situ.
- B. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.
 1. Pressure gauges shall be verified on site using a certified test gauge, pressure calibrator, or equivalent test approved by the Engineer.
 2. Pressure transmitters shall be verified in-situ using a certified pressure calibrator.
- C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 74 00

TEMPERATURE MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide temperature measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.
- D. This specification covers process temperature measurement. For HVAC temperature measurement refer to Division 23.

1.02 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Operation and Maintenance Data:
 - 1. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.
 - 2. Comply with requirements of Section 01 78 23.

1.03 SPARE PARTS

- A. Comply with requirements specified in Section 01 61 00.
- B. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

1.04 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.05 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

1.06 WARRANTY

- A. As specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 RTD SENSOR

- A. RTD sensors provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.
 - 1. Each RTD sensor and temperature indicating transmitter shall be tagged in accordance with the Instrumentation List and as shown on the P&ID and HVAC drawings.
 - 2. The RTD sensor as installed shall 100-ohm platinum and be capable of measuring between 32°C and 120°C with an accuracy of plus or minus 0.5 percent of the installed span.
 - 3. Each RTD shall have a 316 SS thermowell.
 - a. RTD shall be spring loaded in the thermowell to maintain sufficient contact with the thermowell tip.
 - b. Provide weld-o-lets as needed
 - c. Thermowells mounted on process piping shall be sized to extend to the center of the pipe.
 - d. Thermowells mounted on tanks shall be sized to extend 4 inches into the liquid beyond the inside of the tank wall.
 - 4. Indicating transmitters shall be rated NEMA 4X and have an LCD or LED display scaled in engineering units.
 - 5. RTD sensor shall be loop powered with a 4 20 mA output rated for a 500 Ohm load.
 - 6. Where local transmitter displays are not viewable from a standing position without the use of a ladder or a lift, provide a remote mounted indicating transmitter on the wall or separate instrument stand. Coordinate with Engineer for location.
- B. Suitable manufacturers include:
 - 1. Thermo Sensors
 - 2. Endress + Hauser

2.02 DIGITAL TEMPERATURE TRANSMITTER

A. Function: Provide analog output signal directly proportional to sensed temperature.

B. Performance Specifications:

1. Adjustable Range: See Schedules
2. Number of Switches and Setpoints: One.
3. Setpoint Accuracy: 0.5% of full range span.
4. Power Supply: 10-36Vdc loop-power.
5. Outputs:
 - a. Analog: 4-20mA_{dc} isolated.
 - b. Discrete: SPST solid state rated for 600mA @ 120VAC

C. Required Features:

1. Repeatability: 0.1% of full range span.
2. Programmable response time delay: 2 seconds minimum.
3. Programmable for automatic or manual reset.
4. Field adjustable setpoint over full range by means of external touchpad.
5. Display: 0.5" 4-digit (minimum), LCD.
6. Screw type terminals.
7. ½" NPT female process connection.
8. ½" NPT female electrical connection.
9. Temperature sensor element shall be 316SS.
10. NEMA 4X epoxy-coated aluminum enclosure.
11. Programming and data shall be protected by non-volatile EEPROM.
12. Sensor: Provide local sensor unless indicated otherwise on the Drawings.

D. Manufacturers:

1. Endress + Hauser

2. Siemens
3. Emerson Rosemount

PART 3 - EXECUTION

3.01 QUALIFICATIONS

- A. Temperature sensors are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION

- A. Install temperature elements and signal converters in accordance with manufacturer's installation instructions.
- B. Thermowells installed in tanks shall be horizontally mounted at a depth to ensure continuous submergence in the fluid.

3.03 FIELD TESTING

- A. Validate the PLC scaling and alarming by injecting a 4-20 mA signal into the PLC terminals with the temperature sensor disconnected.

3.04 TRAINING

- A. Comply with the requirements in Section 01 78 25.
- B. Provide field operation and maintenance instruction.
- C. Coordinate training time with the Engineer and Owner.

3.05 CALIBRATION

- A. Refer to the Schedule 1 for instrument operating conditions, ranges, setpoints, and alarms.
- B. Temperature sensors shall be calibrated on site.
- C. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.
 1. Calibrations shall be verified in-situ using a separate thermal sensor with equal or higher accuracy or similar test approved by the Engineer.
- D. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.06 ADJUSTING

- A. Adjust the calibrated and scaled range for each temperature transmitter as requested during commissioning.

3.07 DEMONSTRATION

- A. Demonstrate RTD accuracy by removing from the installation and applying varying amounts of heat to the probe. Verify the temperature reading with a separate thermal sensor with equal or higher accuracy.

3.08 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

PROCESS LIQUID ANALYTICAL MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide process liquid analytical measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.
 - 1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 PROCESS LIQUID ANALYTICAL INSTRUMENTATION

- A. pH/ORP (Oxidation Reduction Potential) Analyzers
 - 1. Description: Three electrode (process, reference, and ground) differential pH/ORP probe and a microprocessor-based analyzer/transmitter designed to measure pH/ORP of the sample and produce a proportional output signal linear to the pH/ORP.
 - 2. Analyzer
 - a. Number of Sensors: 4
 - b. Number of Analog Outputs: 4
 - c. Display: 4" minimum, color.
 - d. Power: 120V
 - e. Output: 4-20 mA
 - f. Enclosure: NEMA 4X
 - g. Maximum Dimensions: 11" x 13" x 6" (W x H x D)
 - h. Note: Where possible combine multiple sensors/probes on a single analyzer/transmitter.
 - 3. pH Probe
 - a. Type: W-type rod membrane, pH electrode
 - b. Measured: pH
 - c. Probe range: 0 – 14 s.u.
 - d. Slope: 95 – 102%

- e. Stability: < -0.01 s.u. per hour (without calibration)
- f. Reproducibility: < 0.01 s.u
- g. Working electrode: Gold cathode
- h. Counter electrode: SST anode
- i. Reference electrode: silver/silver halide
- j. Temperature range: 41 to 113 degrees F
- k. pH Range: 4-9 s.u.
- l. First polarization time: 120 minutes
- m. Re-polarization time: 30 minutes
- n. Calibration: Manual using DPD
- o. Housing Material: PVC
- 4. Accessories:
 - a. Flow cell: Provide a polycarbonate flow cell and backplate. Provide dual flow cell in instances where two probes are required. Mount using 304 SST hardware.
- 5. Materials
 - a. Sensor
 - 1) Body and salt bridge: PEEK.
 - 2) Junction: Kynar.
 - 3) Process electrode: Glass (pH), glass and platinum (ORP).
 - 4) Ground electrode: Titanium.
 - 5) O-ring seals: Viton.
 - b. Analyzer/Transmitter Enclosure: NEMA 4X.
 - c. Insertion Mounting Assembly: Stainless steel, type 316.
- 6. Ratings and Performance
 - a. Sensor
 - 1) Range: 0 to 14 pH; -1500 to +1500 mV ORP.
 - 2) Sensitivity: +/- 0.01 pH; +/- 0.5 mV ORP.
 - 3) Stability: 0.03 pH; 2mV ORP per 24 hours, non cumulative.
 - 4) Operating temperature: 23 to 158 degrees F.
 - 5) Maximum pressure: 100 psi at 158 degrees.
 - 6) Maximum flow rate: 10 fps.
 - b. Analyzer/Transmitter
 - 1) Repeatability: 0.05% of span.
 - 2) Stability: 0.05% of span for 24 hours, non-cumulative.
 - 3) Analog outputs: 4 to 20 mA isolated.
 - 4) Ambient temperature range: -4 to 104 deg F.
 - 5) Relative humidity: 0 to 95% non-condensing.
 - 6) Input power: 120 V a. c., 35W maximum.
 - 7) Output contacts: 120 V a. c., 5 Amp resistive maximum.
 - 8) Analog outputs: 500 Ohms maximum impedance.
- 7. Product and Manufacturer
 - a. Kuntze Krypton Multi water monitoring system.
 - b. No substitutions

B. Turbidity Analyzer

- 1. Description: Analyzer to monitor turbidity of potable water.

2. Analyzer/Probe
 - a. Number of Sensors: 1
 - b. Number of Analog Outputs: 1
 - c. Power: 120V
 - d. Output: 4-20 mA
 - e. Enclosure: NEMA 4X FRP
 - f. Measured: Turbidity (NTU)
 - g. Probe range: 0-100 NTU
 - h. Accuracy: $\pm 2\%$ of Reading or ± 0.02 NTU from 0 to 40 NTU
 - i. Cycle Time: 5 – 9999 minutes
 - j. Response Time: 15 Seconds from change in turbidity
 - k. Temperature range: 41 to 75 degrees F
 - l. Construction: All non-corrosive materials
 - m. Mounting: Wall or floor stand
3. Accessories:
 - a. Reagents: Provide a sufficient amount of VMO reagent suitable for 12 months of operation at a 5 minute sample cycle. Provide reagent line priming package, reagent and cleaning solution bottle with connection lines, and reagent rack.
4. Other Requirements:
 - a. All wetted parts must be suitable for the intended service conditions.
 - b. Provide field replaceable sensor.
 - c. Supply each probe with 50 feet of cable, with a weatherproof plug on each end for connection to the transmitter. Provide a cover permanently attached to protect the probe when not in use.
 - d. The manufacturer of the analyzer shall furnish initial startup and calibration services when notified by the Contractor that all units are installed, powered and ready for operation.
 - e. Services shall be furnished by the manufacturer to provide instruction to the operating personnel in the operation and maintenance of the analyzer.
 - f. Furnish spare parts for one year of operation including electrolyte, membranes, and junctions.
 - g. Provide suitable 120 VAC sample pump and sample filter.
 - h. Provide one year's supply of calibration solution. Assume weekly calibration.
5. Product and Manufacturer:
 - a. Hach TU5300sc with sc200 controller Or Equal

C. TSS (Total Suspended Solids) Analyzers

1. Particle counter for monitoring 2 to 750 micron diameter particles in water.
2. Performance Requirements
 - a. Particle detection range: 2 to 750 micrometer diameter
 - b. Number of discrete bin sizes: 32

- c. Count limits: 9,999,999 totalized count, updated at end of each count cycle, maximum
 - d. Sample/hold time: 1 second to 24 hours
 - e. Internal light transmittance: 99.0 percent, minimum
3. Certifications
- a. Safety: UL/CSA approved 100-115 V, 50/60 Hz external wall-style power supply or 100-240 V, 50/60 Hz external NEMA-enclosed power supply certified with the instrument to EN 61010-1 (IEC1010-1).
 - b. Immunity: EN 50081-2: 1992 (Generic Immunity Standard) per 89/336/EEC EMC
 - c. Emissions: EN 50081-2 (Generic Emissions Standard) per 89/336/EEC EMC
4. Environmental Requirements
- a. Operational Criteria
 - (1) Sample flow rate: 100 mL/minute
 - (2) Operating temperature: 0 to 50 degrees C (32 to 122 degrees F)
 - (3) Pressure: 65 psig, not more than 1 minute; 55 psig, continuous
5. Equipment Requirements
- a. 100-115 Vac, 60 Hz, power.
 - b. Operates in cumulative/differential counting/transmitting modes.
 - c. Capable of self-timing and can operate as an independent device.
 - d. The sensor, 750 by 750 micrometers, is volumetric and the sensing area is the entire cross-section of the sample flow path.
 - e. Cleaning of the sensor for maintenance can be performed without opening the enclosure.
 - f. Equipped with a field replaceable flow cell that can be installed without special tools.
 - g. Sensors are calibrated per ASTM F 658, using NIST traceable PSL spheres from Duke Scientific and have size resolution of better than 10% at 10 micrometers (per USP 788).

- h. Indicators are provided for power, counting display (6-digit capacity), clean sensor, and alarm.
 - i. 12-bit A/D resolution.
 - j. Sensor/counters can communicate to a data collection system using 4-20mA analog output signals and RS485 serial communications. Particle counts are transmitted in raw, total counts (not normalized to counts/mL).
 - k. Can accept up to eight analog input signals from other measurement devices.
- 6. Standard Components
 - a. Sensor/counter
 - b. Spare sensor cell
 - c. Power supply
 - d. Manual
 - e. Connectors (inlet and outlet): quick disconnect to 1/4-inch OD tubing.
- 7. Accessories
 - a. Flow control: active and passive/manual control devices.
 - b. Analog input/output card.
 - c. Software for filter performance, report generation, communication for standalone operation of direct connection to SCADA system.
 - d. Grab sampling instrument
 - e. Junction box for permanent installation.
- 8. Manufacturers
 - a. Hach 2200 PCX Particle Counter or Equal

D. Residual Chlorine Analyzer

- 1. Description: Amperometric chlorine probe for reagentless free chlorine measurement.
- 2. Analyzer
 - a. Number of Sensors: Up to four (4)

- b. Number of Analog Outputs: Up to four (4)
 - c. Display: 4" minimum, color.
 - d. Power: 120V
 - e. Output: 4-20mA
 - f. Enclosure: NEMA 4X FRP
 - g. Maximum Dimensions: 11" x 13" x 6" (W x H x D)
 - h. Note: Where possible combine multiple sensors/probes on a single analyzer/transmitter.
3. Probe
- a. Type: Membrane covered amperometric three-electrode system
 - b. Measured: Free residual chlorine
 - c. Probe range: 0.05-5 mg/L
 - d. Resolution: 0.01 mg/L
 - e. Reproduction: +/- 5%
 - f. Stability: -1% per month (without calibration)
 - g. Working electrode: Gold cathode
 - h. Counter electrode: SST anode
 - i. Reference electrode: Silver/silver halide
 - j. Temperature range: 41 to 113 degrees F
 - k. pH Range: 4-9 s.u.
 - l. First polarization time: 120 minutes
 - m. Re-polarization time: 30 minutes
 - n. Calibration: Manual using DPD
 - o. Housing Material: PVC
4. Accessories:

- a. Flow cell: Provide a polycarbonate flow cell and backplate. Provide dual flow cell in instances where two probes are required. Mount using 304 SST hardware.
- 5. Spare Parts:
 - a. Two (2) membrane caps per chlorine sensor.
- 6. Product and Manufacturer:
 - a. Kuntze Krypton Multi water monitoring system.
 - b. No substitutions

PART 3 - EXECUTION

3.01 QUALIFICATIONS

- A. Process liquid analytical analyzer/transmitters are to be set up, configured, and calibrated by Journeyman Instrumentation Technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

- A. Install primary analytical sensors and analyzer/transmitters in accordance with manufacturer's installation instructions. and standard installation details provided for this project.
 - 1. Refer to location diagrams and standard installation details provided for this project.

3.03 CALIBRATION:

- A. Provide printed calibration reports of the factory calibration and settings.
- B. Verify calibration check and output scaling in-situ and record all as-commissioned data including all smart device configuration parameters.
- C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 76 00

PROCESS GAS ANALYTICAL MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide process gas analytical measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES

- A. International Society of Automation (ISA):
 - 1. S5.1: P&IDs and Tagging.
 - 2. S5.4: Instrument Loop Diagrams.
 - 3. S7: Instrument Air.
 - 4. S12: Electrical Equipment for Hazardous Locations.
 - 5. S18.2: Alarm Management.
 - 6. S20: Instrument Specifications.
 - 7. S50: Electrical Control Signals.
 - 8. S75: Control Valve Design, Specification and Testing.
 - 9. S96: Valve Actuators
 - 10. S99: Control System Cyber Security.
 - 11. 101: Human-Machine Interfaces.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
 - 1. Sustainable Design Submittals.
- B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.
 - 1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.06 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 CHLORINE GAS LEAK DETECTORS

- A. Refer to Section 46 31 11.01 "Chlorine Gas Feed Equipment and Appurtenances".

2.02 AMBIENT OXYGEN MONITOR

- A. Refer to Section 46 31 53 "Ozone Generating and Feed Equipment".

2.03 AMBIENT AIR OZONE DETECTOR

- A. Refer to Section 46 31 53 "Ozone Generating and Feed Equipment".

PART 3 - EXECUTION

3.01 QUALIFICATIONS

- A. Process gas analytical transmitters are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION

- A. Install primary sensors and transmitters in accordance with manufacturer's installation instructions and in accordance with this specification.
 - 1. Refer to location diagrams and standard installation details provided for this project.

3.03 CALIBRATION

- A. Provide printed calibration reports of the factory calibration and settings.
- B. Verify calibration and output scaling in-situ and record all as-commissioned data including all smart device configuration parameters.
- C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 78 00

PANEL MOUNTED INSTRUMENTS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide panel mounted instruments and devices as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.
- B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.
- C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES

- A. International Society of Automation (ISA):
 - 1. S5.1: P&IDs and Tagging.
 - 2. S5.4: Instrument Loop Diagrams.

 - 4. S12: Electrical Equipment for Hazardous Locations.
 - 5. S18.2: Alarm Management.
 - 6. S20: Instrument Specifications.
 - 7. S50: Electrical Control Signals.
 - 8. S75: Control Valve Design, Specification and Testing.
 - 9. S96: Valve Actuators
 - 10. S99: Control System Cyber Security.
 - 11. 101: Human-Machine Interfaces.

1.03 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.

- B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

- 1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.
- B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 INDICATORS AND METERS

- A. Features:
 - 1. LED display.
 - 2. 0.56 in. digit height minimum.
 - 3. 4-1/2 digit.
 - 4. Selectable decimal point.
 - 5. Scaled in engineering units.
- B. Input: 4 – 20 mAdc isolated.
- C. Signal Termination: Ungrounded.
- D. Input impedance: 10 ohms maximum.
- E. Accuracy: 0.1% of span.
- F. Power: 120 vac, $\pm 10\%$, 60 Hz.
- G. Construction: NEMA 4 unless indicated otherwise.

H. Mounting: Flush panel, 2.1-in. height, 4-in. wide, 6.75-in. depth.

I. Manufacturers

1. Siemens, RD200

2. Precision Digital

2.02 INDICATING LIGHTS

A. The quality and type of switches and pushbuttons shall be based on industrial grade types generally as described below.

B. All control indicator lamps in ordinary locations to be heavy duty oil tight such as Allen Bradley 800T or 800E or equivalent.

C. All control indicator lamps in classified or Category 1 & 2 areas, or outdoors to be heavy duty weatherproof such as Allen Bradley 800H or equivalent.

D. All control indicator lamps shall be LED push-to-test type.

2.03 SWITCHES AND PUSHBUTTON

A. The quality and type of switches and pushbuttons shall be based on industrial grade types generally as described below with contact rated for connected loads.

1. All control pushbutton switches, and selector switches in ordinary locations to be heavy duty oil tight such as Allen Bradley 800T or 800E.

2. All pushbutton switches, and selector switches in classified or Category 1 & 2 areas, or outdoors to be heavy duty weatherproof such as Allen Bradley 800H.

2.04 RELAYS

A. The quality and type of relays shall be based on industrial grade types generally as described below with contact rated for connected loads.

1. 120 VAC relays to be 4PDT, plug-in, complete with test button and operation indicator, and surge suppressor.

2. 24 VDC relays to be 2PDT plug-in, complete with test button and operation indicator, and surge suppressor diode.

3. Time delay relays for behind panel mounting to be Model 2PDT, plug-in, and programmable for sixteen (16) time ranges and four (4) operation modes.

4. Time delay relays for flush panel mounting and operator accessible timing range modifications to be SPDT, screw terminals, programmable for five (5) timing ranges

and eight (8) operation modes, complete with digital display, module for time settings and flexible protective cover.

5. Where the contact ratings of the relays listed are insufficient for the application select an appropriate type from an approved Manufacturer with the same quantity of contacts as was originally specified.
6. Provide relay plug-in sockets for DIN mounting complete with stacked screw clamp terminals.

2.05 ANALOG LOOP CURRENT ISOLATOR

A. The quality and type of analog loop current isolators shall be based on industrial grade types generally as described below.

1. Provide current loop signal isolators as required to provide isolation of milliampere transmission signals to prevent “ground loop” signal errors caused by mismatched transmitters and receivers.
2. Isolators are to be located in control panels and shall be Din rail mounted.
3. Analog loop current isolators shall be loop powered.
4. Isolator input and output signals to be 4-20 mA, with an error not exceeding 0.1 percent of span. Input resistance will not exceed 550 ohms with an output load of 250 ohms.

B. Manufacturers

1. Moore Industries
2. Phoenix Contact

2.06 INTRINSIC SAFETY BARRIERS AND RELAYS

A. The quality and type of analog loop current isolators shall be based on industrial grade types generally as described below.

1. Provide intrinsic safety barriers where required for two-wire transmitters of the active, isolating, loop powered type.

a. Manufacturers:

- (1) MTL
- (2) Phoenix
- (3) Stahl

- (4) P+F
- 2. Provide dual type intrinsic safety barriers for process switches.
 - a. Manufacturers:
 - (1) MTL
 - (2) Phoenix
 - (3) Stahl
 - (4) P+F
- 3. Intrinsic safety relays.
 - a. Manufacturers:
 - (1) MTL
 - (2) Phoenix
 - (3) Stahl
 - (4) P+F

2.07 SURGE SUPPRESSORS

- A. Provide on instrumentation and control signals whose source or destination is outside any building or structure.
- B. Provide on phone lines and copper data network connections located outside building.
- C. Provide on 120 vac power feeds.
- D. For 120 VAC and 24 VDC power circuits
 - 1. Phoenix Contact PLT-SEC-T3-120-FM or approved equal
- E. For analog circuits:
 - 1. Phoenix Contact TT-2PE-24DC or approved equal

PART 3 - EXECUTION

3.01 QUALIFICATIONS

- A. Panel mounted instruments and related operator devices are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION

- A. Install panel mounted instruments and related operator devices in accordance with manufacturer's installation instructions and in accordance with this specification.
- B. Review the process area classification and panel environmental ratings and install instruments and operator devices with environmental and hazardous area ratings equal to or better than the area requirements.
- C. Use normally closed contacts for alarm actuation. The contacts open to initiate the alarm.
- D. Use normally open contacts to control equipment. The contacts close to start the equipment.
- E. Contacts monitored by solid state equipment to be hermetically sealed and adequately rated for the connected load.
- F. Contacts monitored by electro-magnetic devices such as mechanical relays to be rated NEMA ICS 2, designation B300.
- G. Provide double barriers between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.
- H. Switch electrical enclosures to be rated EEMAC 4, minimum.
- I. 120 VAC switches to have a 4 A rating.

3.03 CALIBRATION

- A. Provide printed calibration reports of the factory calibration and settings.
- B. Verify calibration and output scaling in-situ and record all as-commissioned data including all smart device configuration parameters.
- C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 99 90

PACKAGE CONTROL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide a complete operating control system including the design, documentation, supply, delivery, installation, tuning, testing, commissioning, and warranty.
- B. Assemble panels and install panel instruments and wiring in equipment manufacturer's factory.
- C. Test panels and panel assemblies for proper operation prior to shipment from equipment manufacturer's factory.

1.02 SUBMITTALS

- A. Submit the following shop drawings in accordance with Section 01 33 00.
- B. Shop drawings shall include:
 - 1. Bill of materials
 - 2. Network interface drawings
 - 3. Electrical schematic and wiring diagrams
 - 4. Cause and Effect Diagram or Shutdown Key
 - 5. Electrical ladder diagrams
 - 6. Interconnection diagrams
 - 7. External Interface diagrams
 - 8. Control Panel Arrangement Drawings
 - 9. I/O Lists
 - 10. MODBUS TCP/IP Address List, if applicable
 - 11. ISA Style Instrument Datasheets
 - 12. Instrument Alarm, Range and Setpoint List

13. Configuration/parameter sheets including switch settings, parameter settings, and addresses. Show factory default settings and proposed settings
14. Diagram showing dip switches complete with proposed settings.
15. Control Narrative covering all logic and sequences of operation
16. PLC program documentation

C. Operation and Maintenance Data:

1. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.
2. Comply with requirements of Section 01 78 23.

1.03 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.
- B. Provide spare parts that are identical to and interchangeable with similar parts installed.
 1. Selector Switch, Pushbutton, and Pilot Light: one of each type used.
 2. Light Bulb: one of each type used.
 3. Fuse: two of each type and rating used.
 4. Surge Suppressors: one of each type used.
- C. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

1.04 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.

1.05 DELIVERY STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10.

1.06 WARRANTY

- A. As specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 CONTROL PANELS

- A. Refer to Section 26 27 17 and Section 40 67 00 “Control System Equipment Panels and Racks”.

2.02 CONTROL PANEL COMPONENTS

- A. Refer to Section 40 78 00, Section 40 66 00, and Section 40 67 00 “Control System Equipment Panels and Racks”.
- B. The following pilot device colors shall be used:
 - 1. Running Status Light: Red
 - 2. Stopped Status Light: Green
 - 3. Position Open Status Light: Red
 - 4. Position Closed Status Light: Green
 - 5. Alarm Status Light – Major or Safety: Red
 - 6. Warning or Minor Alarm Status Light: Amber
 - 7. Ready Status Light: Blue
 - 8. Operating Mode – Normal Mode: Blue
 - 9. Operating Mode – Alternate Mode: Amber
 - 10. Start Pushbutton: Black
 - 11. Stop Pushbutton: Black
 - 12. Test Pushbutton: Black
 - 13. Reset Pushbutton: Black
 - 14. E-Stop Pushbutton: Red push-pull with mushroom
 - 15. Overload Reset Pushbutton: Blue with White “R”
 - 16. Selector Switch: Black with White Insert
 - 17. Legend Plate: Black with White Lettering

- C. Where a PLC or similar logic controller is used, provide an Ethernet/IP communication module for connection to the Plant SCADA System.
- D. As a minimum, data exchange shall include:
 - 1. Equipment status (running, off, local/remote mode, PLC AUTO/PLC MANUAL mode).
 - 2. Alarm/Fail condition of machine.
 - 3. Operating modes.
 - 4. Operating status values; discrete and analog.
 - 5. All other data points required for the safe and reliable operation of the equipment.
- E. Develop a data exchange table/map. Data table shall include:
 - 1. For each data point, its name, register location, and tag number.
 - 2. Group data by type; e.g., discrete inputs, discrete outputs, analog inputs, analog outputs.
- F. Programmable Logic Controller
 - 1. Preferred PLC equipment is based on Rockwell Automation Allen-Bradley ControlLogix family of products, and shall be programmed with RSLogix 5000 software, latest revision.
 - a. Refer to Section 26 27 17 “Control Panels” for Allen-Bradley components.
 - 2. Each new PLC panel assembly is to include a constant voltage regulating transformer suitably sized for the panel load equal to Sola Hevi-Duty MCR series and incoming power transient surge suppression equal to Sola Hevi-Duty STV100K series. Connect the surge suppressor dry contacts to a PLC input at each panel and notify the control system integrator/programmer.
- G. OIT Equipment:
 - 1. Provide a Rockwell Automation PanelView Plus color touchscreen OIT unit flush mounted in the control panel.
 - 2. The display shall be 14 inch TFT LCD.
 - 3. 24 VDC power supply with internal battery backup.
 - 4. NEMA 4X environmental protection with hazardous area rating if required.
 - 5. Program the HMI unit with latest version of HMI programming software.

6. The HMI shall be programmed to provide for the monitoring and control of all input and output points, loops and systems through graphic display screens. Additionally, the HMI programming shall include:
 - a. Process parameter displays.
 - b. Alarm management.
 - c. Trending of key process variables.
 - H. For all PLCs provided, provide all program files for end user modification and programs shall not be proprietary or require vendor for accessibility.
 - I. Provide all run-time licenses necessary for the operation of the new PLC and HMI installations.
 - J. Network Cabling:
 1. Provide interconnection cabling of all Ethernet devices internal to the panel. Provide CAT6A shielded patch cables: factory made, ruggedized with a protective connector boot.
 2. Interconnectivity cabling for the Ethernet network external to the panel will be provided by the installing Contractor.
- 2.03 INSTRUMENTATION
- A. Instrumentation supplied as part of a pre-manufactured system shall be the manufacturer's standard equipment. Instruments shall be industrial grade and suitable for the conditions in which they will be installed.
 - B. Instrumentation shipped loose shall meet the requirements of the following sections:
 1. Flow devices: Section 40 71 00.
 2. Level devices: Section 40 72 00.
 3. Pressure, strain, and force devices: Section 40 73 00.
 4. Temperature devices: Section 40 74 00.
 5. Process liquid analytical devices: Section 40 75 00.
 6. Process gas analytical devices: Section 40 76 00.
 - C. All instrumentation shipped loose shall be industrial grade and suitable for the conditions in which they will be installed.

2.04 EQUIPMENT IDENTIFICATION

A. Identify electrical and automation equipment with nameplates.

1. Refer to Section 26 05 53 for requirements, wording on nameplates to be approved by Engineer prior to manufacture.
2. All instrumentation and panel nameplates shall include the prefix P25-.

2.05 PROGRAMMING TOOLS AND ACCESSORIES

A. Provide the following as minimum:

1. Programming tools for each different type of programmable equipment:
 - a. Software program complete with interconnecting cable, signal converter, instruction manual and equipment documentation; or
 - b. Programming keypad and accessories.
2. Backup Copies of Application Software:
 - a. One copy for each unique version of software program or data.
 - b. Machine-readable backup software copy in the form of USB Memory Stick.

PART 3 - EXECUTION

3.01 SIGNAL CHARACTERISTICS

A. Analog Signals:

1. 4 to 20 mA dc, in accordance with compatibility requirements of ISA S50.1.
2. Unless otherwise specified or shown, use Type 2, two-wire circuits.
3. Transmitters: Load resistance capability conforming to Class L.
4. Fully isolate input and output signals of transmitters and receivers.

B. Discrete Output Signals (from vendor panel perspective):

1. Two-state logic signals.
2. Provide voltage free contacts for 24V DC signals to the local plant PLC. Minimum switching current to be lower than the PLC input current consumption. Provide interposing relays to isolate discrete outputs from field wiring.

3. Normal status signals shall be normally open, close to activate isolated contacts.
 4. Fault signals shall be normally closed, open to activate isolated contacts.
- C. Discrete Input Signals (from vendor panel perspective):
1. Two-state logic signals.
 2. Provide interface for 24V DC wet signals from the PCS.

3.02 ELECTRICAL POWER AND SIGNAL WIRING

- A. Restrain control and signal wiring in control panels by plastic ties or ducts. Secure hinge wiring at each end so bending or twisting will occur around the longitudinal axis of wire. Protect bend area with a sleeve.
- B. Arrange wiring neatly, cut to proper length, and remove surplus wire. Install abrasion protection for wire bundles passing through holes or across edges of sheet metal.
- C. Use manufacturer's recommended tool with sized anvil for crimp terminations. No more than one wire may be terminated in a single crimp lug. No more than two lugs may be installed on a single screw terminal.
- D. Do not splice or tap wiring except at device terminals or terminal blocks.
- E. All wires and cables inside the control panels shall be identified on both ends.
- F. Route power cabling separate and spaced out (so that there is no derating factors applied to the cabling). Cable shall be routed to allow for maintenance of systems, and shall not impede access in the room or present obstructions.

3.03 STARTUP AND TESTING

- A. Comply with the requirements specified in Section 01 78 25.
- B. See system specification for startup and testing requirements.

3.04 FIELD TESTING

- A. Instruments and circuits shall be field testing and calibrated prior to commissioning.

3.05 TRAINING

- A. Comply with the requirements specified in Section 01 78 25.
- B. See system specification for startup and testing requirements.

3.06 CONTRACT CLOSEOUT

- A. Provide in accordance with Section 01 70 00 “Execution and Closeout Requirements”.

END OF SECTION

SECTION 41 22 13.13

BRIDGE CRANES AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test bridge cranes, hoists, motors, gear reducers, controls and appurtenances as indicated and in compliance with Contract Documents.
 - 1. Rail and supporting beams included in building structure, refer to structural drawings.
 - 2. Hoist capacities and operating data are indicated in the Bridge Crane Schedule.

1.02 REFERENCES:

- A. American Bearing Manufacturers Association (ABMA):
 - 1. 9: Load Ratings and Fatigue Life for Ball Bearings.

- J. International Building Code (IBC):
 - 1. 2018 IBC

1.03 SUBMITTALS:

- A. Comply with requirements specified in Section 01 33 00. Data regarding bridge crane characteristics and performance.
 - 15. Certified setting plans, with tolerances, for anchor bolts.
 - 16. Manufacturer's literature as needed to supplement certified data.
 - 17. Operating and maintenance instructions and parts lists.
 - 18. Listing of reference installations as specified with contact names and telephone numbers.
 - 19. List of recommended spare parts other than those specified.
 - 20. Shop and field inspection reports.
 - 21. Motor shop test results.
 - 22. Qualifications of field service engineer.
 - 23. Recommendations for short and long-term storage.
 - 24. Shop and field testing procedures, equipment to be used.
 - 25. Special tools.
 - 26. Number of service person-days provided and per diem field service rate.
 - 27. Manufacturer's product data, specifications and color charts for shop painting.
 - 28. The latest ISO 9001 series certification.
 - 29. Provide Certificate of Responsibility. See Section 01 33 00 for Certificate form.

30. Provide sealed drawing height and weight of equipment serviced by the hoisting equipment including hook height and travel dimensions.
31. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
 - b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
- D. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.
 1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
- E. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.
- 1.04 SPARE PARTS:
 - A. Comply with the requirements specified in Section 01 61 00.
 - B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1.07 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Overhead bridge cranes to be in conformance with CMAA Specification No. 74 and as specified and indicated.
- C. Permanently mark the capacity of the hoist and trolley on each hoist and crane, in easy to read letters and in a prominent position.
- D. Provide only safety type hooks.
- E. Provide hoists so that hook can reach the floor at the lowest level of the lift.
- F. Do not use bridge crane for construction purposes of any nature.
- G. Cranes shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.
- H. Welding: In accordance with American Welding Society Code D1.1.
- I. Provide shop tests as specified.
- J. Crane manufacturer shall provide beams, hoists, motors, gear reducers, switches, and controls regardless of manufacturer as a complete integrated package to ensure coordination, compatibility and operation of the systems.
- K. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.
- L. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 - 2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping and electrical:
 - a. 1 person-days.
 - 3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.
 - a. 1 person-days.
 - 4. Performance Testing: Field performance test equipment specified.

- a. 1 person-days.
 - 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
 - a. 1 person-days.
 - 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 - 7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
 - M. Crane manufacturer shall have a minimum of five (5) operating installations with cranes of the size specified and in the same service as specified operating for not less than five (5) years.
- 1.08 DELIVERY, STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- A. Crane capacities and operating data are indicated in the Bridge Crane Schedule.

2.02 CRANE MANUFACTURERS:

- A. American Crane & Equipment.
- B. Konecranes
- C. Iron Mountain Crane & Hoist.

2.03 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.04 BRIDGE:

- A. Top running or under running type crane bridge as indicated in the Bridge Crane Schedule.
 - 1. Provide top running cranes designed to resist all vertical, lateral and torsional forces combined as specified in CMAA-70 and 74.
 - 2. Provide under running cranes in accordance with CMAA-74.
- C. Provide girders connected with end trucks.
- D. Provide connections in both vertical and horizontal planes to keep entire bridge structure square and aligned under conditions specified and indicated and during shipping and installation.
- E. Bridge and truck: Welded steel construction. Provide rigid structure and trucks attached to bridge girders with turned bolts.
- F. Provide bridge with holes drilled and reamed for matched fit before final assembly and welding.
- G. End trucks: minimum wheel base 1/8 of crane span.
 - 1. Provide bridge trucks with ball or roller bearings and medium or high carbon steel or high strength alloy steel fixed or rotating type steel axles.
 - 2. Provide trucks to prevent drop in excess of 1-inch in the event of wheel or axle failure.
 - 3. Provide entire truck machine as a factory assembled unit to provide perfect alignment.
- H. Truck Wheels: double flanged rolled bridge type forged or cast steel with hardened treads.
 - 1. Wheels to carry maximum wheel load under normal operating conditions. Diameter not less than that shown for maximum load in CMMA-74.
- I. Provide driving mechanism such that travel will be steady and free from vibration or racking in any part of structure while traveling under maximum load at all speeds. Prevent any tendency for crane structure to get out of line while traveling along runway under any operating condition.

2.05 ELECTRIC HOISTS:

- A. Electric Hoists: Spur-gear driven antifriction bearings throughout. Provide a load side holding hoist motor brake and a separate electrically operated non-load brake. Design brake with capability of supporting the full load at any point when the motor is stopped. Holding brake shall be externally adjustable, electrically operated friction disk brake that shall apply automatically when the power is off. The brake shall hold 150 percent of the rated load and 125 percent of the rated load at any operating speed. Design shafts of motor, drum, and drum pinion to run in grease-lubricated ball or roller bearings. Design the and gear train and bearings to be oil-bath lubricated.
- B. Provide hoist with right angle mounting with H-wheel trolley, motorized as specified and indicated.
- C. Hoist: Standard type.
- D. Design drum with machine-cut grooves and guarded flanges and with capacity to take entire run of cable in one layer with no overlapping.
- E. Provide hoist with an upper and lower geared limit switch with automatic reset control circuit to prevent overtravel. Settings to be field adjustable in accordance with OSHA 29 CFR 1910.179.
- F. Supply sufficient hoisting cable with hoists for two-part single and to accommodate not only the maximum lift but two additional wraps on drum. Make cable flexible high-strength plowsteel cable with a load safety factor of at least 5 to 1.
- G. Make load block of rugged construction containing a ball-bearing sheave and a high-grade forged-steel swivel hook with antifriction bearings.
- H. Provide control equipment in an enclosed compartment which forms an integral part of hoist and include a transformer for a 120-volt control circuit.

2.06 TROLLEYS:

- A. Plain Trolleys: Push type with a hole for attaching suspension hook.
- B. Army Type Hoists: Close headroom type, integrally built into a 4-wheel plain or geared trolley.
- C. Provide trolley operating wheels with chain guides, and make chains for each of sufficient length to hang 3 feet above operating floor.
- D. Motor-Driven Trolleys: Four-wheel type consisting of a fully enclosed electric motor equipped with a magnetic brake, a geared transmission completely enclosed in an oiltight housing and suspended on flanged driving wheels with power to two wheels. Use ball or roller bearings throughout.

- F. Make trolleys designed for operation on beam or rail indicated on drawings. Trolleys to be provided by the hoist manufacturer.

2.07 SAFETY STOPS:

- A. Provide safety stops on all open ends of track (or where indicated) to prevent trolley from running off ends or damaging building or striking process piping. Provide stops with capability of withstanding impact imposed by motion of fully loaded hoist and trolley.

2.08 TRACK:

- C. Monorail Track: Standard beam of sizes indicated on drawings.
- D. Shop fabricate all curves for either track or switches to radius indicated.
- E. Erect track level throughout, with section ends machined fitted and spliced with web-type or other designed couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.

2.09 CABLE REELS:

- A. Manufacturers:
 - 1. Gleason Reel Div.
 - 2. Aero-Motive Mfg. Co.
 - 3. Liftech. Feed cable reel for electric current supply for all electric hoists with trolleys, except as otherwise indicated, through a single flexible, multi-conductor power cable from a self-winding spring-operated reel located near mid-point of trolley travel or where indicated on drawings.
- C. Furnish junction box to connect cable reel to power supply circuit with hoist.

2.10 ELECTRICAL CONTROLS:

- A. Supply complete integral electrical control system with the electric hoisting equipment (by hoist manufacturer) consisting of starters, circuit breakers, overload relays, limit switches, control transformer for a 120-volt control circuit, control relays, and controlling devices.
- B. Furnish magnetic controls for motors. Design controls to permit "inching" in both forward and reverse directions under full load, automatically regulated acceleration, and rapid brake response.
- C. Provide each hoist with limit switches of automatic-reset control circuit type to prevent overtravel in both raising and lowering directions.

- D. Compliance: Make all electrical equipment including motors, controls, resistors, brakes plus all conduit, wiring, panels, and enclosures with applicable requirements for materials, workmanship, construction, and installation of latest NEMA and National Electrical Code Standards.

2.12 MOTORS:

- A. Provide in accordance with Section 26 20 00 and as specified herein.
- B. Motors for Hoists and Trolley: Totally enclosed, reversible, induction motors especially adapted to hoist service.
 - 1. Enclosure: NEMA 4X.
 - 2. Insulation: Minimum Class "F" with Class "B" temperature rise, 40 degrees C ambient unless otherwise indicated or specified.
 - 3. Service Factor: 1.15.
 - 4. Provide capacity to start and operate hoists at maximum speed rated capacity indicated without exceeding nameplate ratings for current and power and without operating in the service factor.
 - 5. Provide ball or roller bearings, in accordance with ABMA Standard 9 and Standard 11; minimum L-10 life of 100,000 hours.
 - 6. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.
 - 7. Rating: 460V, 3-phase, 60 Hertz.

2.13 PUSHBUTTON CONTROL:

- A. Provide pendent pushbutton control station with sufficient pushbuttons to control all operations of hoists and trolley. Clearly mark each pushbutton to indicate its function. Make cable long enough to reach within 4 feet (1.2 meter) of operating floor or platform level with a supporting chain. If necessary, attach an arm to hoist so that pendent cable and pushbutton controls will hang vertically and be readily accessible from operating positions.

2.14 CONDUCTORS AND COLLECTORS:

- A. Manufacturers:
 - 1. Insul-8-Bar Protected Conductors made by Insul-8-Corp.
 - 2. Safety-T-Bar Conductor Systems made by Howell Corp.

3. Duct-O-Bar Conductor System made by Duct-O-Wire Co. Use equipment and accessories approved by Underwriter's Laboratories (UL).

- C. For conductor for electric current supply provide safety type in which conductor is shielded by a molded-plastic cover that surrounds conductor except for a slotted opening shaped to contour of collector head. Provide separate conductor for each phase. (Dual conductors in a single insulating shield are not acceptable.) Make conductor of plated steel or copper designed for carrying maximum anticipated current. Make molded-plastic shield of high dielectric strength, rigid yet sufficiently flexible to permit bending to radius of curves or switches, and resistant to corrosion and deterioration from sunlight or weather. Space insulated supports not over 5 feet on straight track and 3 feet on curves.
- D. Provide weather shield for exterior conductors.
- E. Provide collectors of sliding shoe type with an adjustable spring-load arm capable of horizontal or vertical movement to automatically adapt to irregularities of conductor. Set shoe in a molded-plastic head that will prevent external contact with shoe when it is running on conductor. There shall be no exposed bare current-carrying surfaces or wires in collector or arm where shoe is in contact with conductor.

2.17 SHOP PAINTING:

- A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 96 00.
- B. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions and as specified.
- C. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- D. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.
- B. Check horizontal and vertical alignment of track and rails.
- C. Erect rack level throughout, with section ends machined fitted and spliced with web-type couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.

- D. Do not use cast fittings.

3.02 FIELD TESTING:

- A. Provide as specified herein. Perform all tests with instrumentation controls and motor controls. Perform testing in accordance with OSHA 29 CFR 1910.179 and as specified herein.
- B. After installation of hoist equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service technician, conduct test for each hoist in presence of the Engineer to determine its ability to operate at rated speeds and capacity under conditions specified and indicated. During tests, observe and record, capacity and motor inputs. Promptly correct or replace all equipment not conforming to the requirements of this section revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results are obtained. Contractor to provide all labor, weights and materials for conducting tests.
 - 1. Provide a 60 minute test for each hoist.
 - 2. Running test shall consist of moving hoist and trolley through two complete cycles. The first cycle will be with no load. For the second cycle, the unit will be loaded with 100 percent of the specified load rating.
 - 3. Test and simulate all limit switches, locking and safety devices.
- C. Make all adjustments to place equipment in specified working order at time of above tests.
- D. After three (3) unsuccessful testing attempts, remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated.

3.03 FIELD TOUCH-UP PAINTING:

- A. After installation and testing, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 41 22 23.19
HOISTING EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test hoisting equipment, motors, gear reducers, controls and appurtenances as indicated and in compliance with Contract Documents.
 - 1. Rail and supporting beams included in building structure, refer to structural drawings.
 - 2. Hoist capacities and operating data are indicated in the Hoisting Schedule in Paragraph 3.06.

1.02 REFERENCES:

- A. American Bearing Manufacturers Association (ABMA):

1.03 SUBMITTALS:

2. Data regarding hoisting equipment characteristics and performance:
4. Certified setting plans, with tolerances, for anchor bolts.
5. Manufacturer's literature as needed to supplement certified data.
6. Operating and maintenance instructions and parts lists.
7. Listing of reference installations as specified with contact names and telephone numbers.
8. List of recommended spare parts other than those specified.
9. Shop and field inspection reports.
10. Motor shop test results.
11. Qualifications of field service engineer.
12. Recommendations for short and long-term storage.
13. Shop and field testing procedures, equipment to be used.
14. Special tools.
15. Number of service person-days provided and per diem field service rate.
16. Manufacturer's product data, specifications and color charts for shop painting.
17. The latest ISO 9001 series certification.
18. Provide Certificate of Responsibility. See Section 01 33 00 for Certificate form.
19. Provide scaled drawing height and weight of equipment serviced by the hoisting equipment including hook height and travel dimensions.
20. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified

are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

- b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.
 - E. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.
 - 1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
 - F. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.
- 1.04 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
 - B. Provide spare parts that are identical to and interchangeable with similar parts installed.
- 1.06 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
 - B. Permanently mark the capacity of the hoist and trolley on each hoist, in easy to read letters and in a prominent position.

- C. Provide only safety type hooks.
- D. Provide hoists so that hook can reach the floor at the lowest level of the lift.
- E. Do not use hoists for construction purposes of any nature.
- F. Hoists shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.
- G. Welding: In accordance with American Welding Society Code D1.1.
- H. Provide shop tests as specified.
- I. Hoisting equipment manufacturer shall provide hoists, motors, gear reducers, switches, and controls regardless of manufacturer as a complete integrated package to ensure coordination, compatibility and operation of the systems.
- J. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.
- K. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 - 2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping and electrical:
 - a. 1.0 person-day.
 - 3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.
 - a. 1.0 person-day.
 - 4. Field Testing: Field performance test equipment specified.
 - a. 1.0 person-day.
 - 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
 - a. 1.0 person-day.

- 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 - 7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
 - L. Manufacturer of hoisting equipment shall have a minimum of five (5) operating installations with hoists of the size specified and in the same service as specified operating for not less than five (5) years.
- 1.07 DELIVERY, STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- A. Hoisting equipment capacities and operating data are indicated in the Hoist Schedule.

2.02 HOIST AND TROLLEY MANUFACTURERS:

- A. Dresser Industries.
- B. ACCO-Wright.
- C. Columbus McKinnon Corporation.
 - 1. Yale Hoisting Equipment Division.
 - 2. Shaw Box.

2.03 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.
- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were

performed and that all components have been sized for the seismic forces specified and indicated.

2.04 ELECTRIC HOISTS:

- A. Electric Hoists: Spur-gear driven antifriction bearings throughout, a mechanical load brake, and a separate electrically operated motor brake. Design mechanical load brake with capability of supporting the full load at any point when the motor is stopped. Motor brake shall be externally adjustable, electrically operated friction disk brake that shall apply automatically when the power is off. The brake shall hold 150 percent of the rated load and 125 percent of the rated load at any operating speed. Design shafts of motor, drum, and drum pinion to run in grease-lubricated ball or roller bearings. Design the mechanical-load brake and gear train and bearings to be oil-bath lubricated. Helical-gear driven hoists may also be accepted.
- B. Arrange hoist for parallel lug mounting from a 4-wheel geared trolley.
- C. Hoist: Standard type.
- D. Design drum with machine-cut grooves and guarded flanges and with capacity to take entire run of cable in one layer with no overlapping.
- E. Provide hoist with an upper and lower geared limit switch with automatic reset control circuit to prevent overtravel. Settings to be field adjustable in accordance with OSHA 29 CFR 1910.179.
- F. Supply sufficient hoisting cable with hoists for two-part single reeving and to accommodate not only the maximum lift but two additional wraps on drum. Make cable flexible high-strength plowsteel cable with a load safety factor of at least 5 to 1.
- G. Make load block of rugged construction containing a ball-bearing sheave and a high-grade forged-steel swivel hook with antifriction bearings.
- H. Provide control equipment in an enclosed compartment which forms an integral part of hoist and include a transformer for a 120-volt control circuit.

2.05 MANUAL HOISTS:

- A. Manual hoists shall be trolley supported, fully enclosed high-speed, spur-gear, ball or roller bearing, hand-operated, chain type conforming to ASME HST-2. Hoist shall be supplied with a clutch designed to limit the chain pull to not more than 150 percent of that required to lift the rated load capacity of the hoist. Hoist shall have a Weston-type automatic brake for positive load control.
- B. Provide with chain guides with chain of sufficient length to hang 3-ft above operating level and a chain bucket to collect the load chain and arranged not to interfere with the smooth operation of the hoist. Hoist shall be provided with a clevis connection or suspension hook to connect to the trolley.

- C. The hoisting machinery shall consist of a chain sprocket, driven through suitable gear reductions by a chainwheel operator, respectively, load blocks, hooks, chain, sheaves, and hoist braking. The chain sprocket and its surrounding members shall be constructed so as to minimize abrasion, crushing or jamming of the hoist chain. Chain hoists shall have chain storage adequate for storing the full lift of chain and shall be designed and located to avoid chain interference while hoisting.
- D. Hoist shall have automatic overload protection via load limiter.

2.06 TROLLEYS:

- A. Provide trolley operating wheels with chain guides and make chains for each of sufficient length to hang 3 feet above operating floor.
- B. Make trolleys designed for operation on beam or rail indicated on drawings. Trolleys to be provided by the hoist manufacturer.
- C. Motor-Driven Trolleys: Four-wheel type consisting of a fully enclosed electric motor equipped with a magnetic brake, a geared transmission completely enclosed in an oiltight housing and suspended on flanged driving wheels with power to two wheels. Use ball or roller bearings throughout.
- E. Manual Trolleys: Shall be designed for the Service Class 1 where the trolley operates a maximum of 12.5 percent of working hours with loads frequently approaching rated load.
 - 1. Wheel axles shall be made of alloy steel, accurately machined and ground to receive inner bearing races. Provisions shall be made to prevent a drop of more than 1 inch in case of axle failure.
 - 2. Trolleys shall be chain-driven trolleys via a chain sprocket linked to a trolley drive wheel that engages the monorail track. The chain sprocket shall be designed to accept the chain and shall attach to the trolley in such a manner that the driving chain does not interfere with normal hoist operation. The driving chain loop height shall be between 4 and 5 feet above the operating floor level.
 - 3. Wheels shall be forged steel with treads and flanges heat treated. All clearances, wheel loads, and manufacturing tolerances shall be in accordance with MMA MH27.1. Wheels on manual trolleys shall be geared and designed to operate on the standard monorail track as shown on the Drawings.
 - 4. Bearings shall be combination radial and thrust type, double-row, angular contact special ball bearings, either prelubricated and sealed, or fitted for pressure lubrication. They shall be prelubricated and sealed and have a minimum B10 bearing life of 3,000 hours. All pressure lubrication fittings shall be located in accessible locations for ease of maintenance.

2.07 SWITCHES AND SWING-OUT SECTIONS:

A. Manufacturers:

1. American Monorail Co.
2. Richards-Wilcox Mfg.
3. ACCO-Louden.Switches: Glide or sliding type, manually operated. Design transfer mechanisms and locking devices capable of positioning switch to maintain true vertical and horizontal alignment of track and conductors and prevent switch operation when any part of trolley is in switch.

C. Furnish swing-out sections at roll-up doors as indicated on drawings.

2.08 SAFETY STOPS:

- A. Provide safety stops on all open ends of track (or where indicated) to prevent trolley from running off ends or damaging building. Provide stops with capability of withstanding impact imposed by motion of fully loaded hoist and trolley.
- B. Provide hoist equipped with smart feature controls. The intelligent control should include sway control, snag prevention, adaptive speed control, and definable protected areas. The defined protected areas much create a virtual wall where the crane in not allowed to enter.

2.09 TRACK:

- A. Monorail Track: Standard beam of sizes indicated on drawings.
- B. Shop fabricate all curves for either track or switches to radius indicated.
- C. Erect track level throughout, with section ends machined fitted and spliced with web-type or other designed couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.

2.10 CHLORINE CYLINDER GRAB:

A. Models and Manufacturers:

1. American Chain & Cable Co.
2. Bushman Equipment Co.
3. B.E. Wallace Products Corp.Chlorine Cylinder Grab: Make suitable for handling standard 1-ton containers weighing 3,500 lb. when full.

C. Make cylinder grab of structural channels at least 5-inch deep and about 80 inch long welded back-to-back but held apart sufficiently to mount heavy swing hooks between

them at each end. Make hooks of heavy steel plate or bars shaped to contour ends of chlorine cylinders to swing freely on steel hinge bolts or pins firmly secured to both channels near each end.

- D. Locate lifting eye centrally lengthwise of channels.
- E. Total height from the top of the hole in lifting eye to inside of hook in lift position on cylinder not to exceed 13-inch.

2.11 PALLET LIFTER:

- A. Manufacturers:
 - 1. Cady Metal Fabrication, Inc.
 - 2. Lewis-Shepard Co., a subsidiary of Hyster Co.
 - 3. Heppenstall Co., Material Handling Div. Pallet Lifter: C-shaped welded box frame with two heavy alloy-steel forks, a lifting eye, a counterweight, and guiding handles.
- C. Design pallet lifter with a lifting capacity as indicated at least 48 inch and be no wider than 25 inch.

2.12 PORTABLE GANTRY:

- A. Manufacturers:
 - 1. Spanco, Inc.
 - 2. Konecranes
- B. Portable Gantry: Four-leg rolling-type gantry with capacity as indicated. Horizontal standard aluminum beam suspended at each end by pipe legs adjustable for both height and span at floor, adequately braced, with locking swivel casters for each leg.
- C. Position legs and span by pins provided with springs and a locking device to fit matching holes in telescoping pipe members.
- D. Fit casters with ball bearings and wheels of rubber plastic treads designed for rated capacity of gantry.
- E. Provide stops at ends of beam to prevent trolley rolloff.
- F. Design Factors: Gentries shall be designed for a factor of
 - 1. 15 percent of the rated capacity for hoist and trolley weight, and
 - 2. 25 percent of the rated capacity.

2.13 CABLE REELS:

A. Manufacturers:

1. Gleason Reel Div.
2. Aero-Motive Mfg. Co.
3. Liftech. Feed cable reel for electric current supply for all electric hoists with trolleys, except as otherwise indicated, through a single flexible, multi-conductor power cable from a self-winding spring-operated reel located near mid-point of trolley travel or where indicated on drawings.
 1. The cable shall have at least four conductors.
 2. The reel shall have a swivel base.
 3. The reel shall have an explosion-proof Class 1, Division 1 or 2, Group C/D enclosure based on the rating of the space where the equipment is located.
 4. The reel shall have a weatherproof enclosure when located outdoors.

C. Furnish junction box to connect cable reel to power supply circuit with hoist.

2.14 ELECTRICAL CONTROLS:

- A. Provide in accordance with Division 40 and as specified herein.
- B. Supply complete integral electrical control system with the electric hoisting equipment (by hoist manufacturer) consisting of starters, circuit breakers, overload relays, limit switches, control transformer for a 120-volt control circuit, control relays, and controlling devices.
- C. Furnish magnetic controls for motors. Design controls to permit "inching" in both forward and reverse directions under full load, automatically regulated acceleration, and rapid brake response.
- D. Provide each hoist with limit switches of automatic-reset control circuit type to prevent overtravel in both raising and lowering directions.
- E. Compliance: Make all electrical equipment including motors, controls, resistors, brakes plus all conduit, wiring, panels, and enclosures with applicable requirements for materials, workmanship, construction, and installation of latest NEMA and National Electrical Code Standards.

2.15 MOTORS:

- A. Provide in accordance with Section 26 20 00 and as specified herein.

B. Motors for Hoists and Trolley: Totally enclosed, reversible, induction motors especially adapted to hoist service.

1. Enclosure: As indicated in the Hoist Schedule.
2. Insulation: Minimum Class "F" with Class "B" temperature rise, 104 degrees F ambient unless otherwise indicated or specified.
3. Service Factor: 1.15.
4. Provide capacity to start and operate hoists at maximum speed rated capacity indicated without exceeding nameplate ratings for current and power and without operating in the service factor.
6. Provide ball or roller bearings, in accordance with ABMA Standard 9 and Standard 11; minimum L-10 life of 100,000 hours.
7. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.
8. Rating: 460V, 3-phase, 60 Hertz.

2.16 PUSHBUTTON CONTROL:

- E. Provide pendent pushbutton control station with sufficient pushbuttons to control all operations of hoists and trolley. Clearly mark each pushbutton to indicate its function. Make cable long enough to reach within 4 feet of operating floor or platform level with a supporting chain. If necessary, attach an arm to hoist so that pendent cable and pushbutton controls will hang vertically and be readily accessible from operating positions.
- F. Controls for Wound-Rotor Motors: Five-step, full magnetic type. Design all other controls to be designed for single-speed motors.
- G. Provide hoist control as indicated in Hoist Schedule.
- H. Provide hoist with an upper limit switch of automatic reset control circuit type to prevent overtravel.

2.17 CONDUCTORS AND COLLECTORS:

A. Manufacturers:

1. Insul-8-Bar Protected Conductors made by Insul-8-Corp.
2. Safety-T-Bar Conductor Systems made by Howell Corp.
3. Duct-O-Bar Conductor System made by Duct-O-Wire Co. Use equipment and accessories approved by Underwriter's Laboratories (UL).

- C. For conductor for electric current supply use safety type in which conductor is shielded by a molded-plastic cover that surrounds conductor except for a slotted opening shaped to contour of collector head. Provide separate conductor for each phase. (Dual conductors in a single insulating shield are not acceptable.) Make conductor of plated steel or copper designed for carrying maximum anticipated current. Make molded-plastic shield of high dielectric strength, rigid yet sufficiently flexible to permit bending to radius of curves or switches, and resistant to corrosion and deterioration from sunlight or weather. Space insulated supports not over 5 feet on straight track and 3 feet on curves.
- D. Provide weather shield for exterior conductors.
- E. Use collectors of sliding shoe type with an adjustable spring-load arm capable of horizontal or vertical movement to automatically adapt to irregularities of conductor. Set shoe in a molded-plastic head that will prevent external contact with shoe when it is running on conductor. There shall be no exposed bare current-carrying surfaces or wires in collector or arm where shoe is in contact with conductor.

2.20 SHOP PAINTING:

- A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 96 00.
- B. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer's printed instructions and as specified.
- C. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- D. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 TRAINING:

- A. Provide training in accordance with specification Section 01 78 25.

3.02 INSTALLATION:

- A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.
- B. Check horizontal and vertical alignment of track and rails.

- C. Erect rack level throughout, with section ends machined fitted and spliced with web-type couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.
- D. Do not use cast fittings.

3.03 FIELD TESTING:

- A. Provide in accordance with Section 01 78 25.
- B. Perform all tests with instrumentation controls and motor controls. Perform testing in accordance with OSHA 29 CFR 1910.179 and as specified herein.
- C. After installation of hoist equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service technician, conduct test for each hoist in presence of the Engineer to determine its ability to operate at rated speeds and capacity under conditions specified and indicated. During tests, observe and record, capacity and motor inputs. Promptly correct or replace all equipment not conforming to the requirements of this section revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results are obtained. Contractor to provide all labor, weights and materials for conducting tests.
 - 1. Provide a 60 minute test for each hoist.
 - 2. Running test shall consist of moving hoist and trolley through two complete cycles. The first cycle will be with no load. For the second cycle, the unit will be loaded with 100 percent of the specified load rating.
 - 3. Test and simulate all limit switches, locking and safety devices.
- D. Make all adjustments to place equipment in specified working order at time of above tests.
- E. After three (3) unsuccessful testing attempts, remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated.

3.04 FIELD TOUCH-UP PAINTING:

- A. After installation and testing, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.05 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

3.06 HOISTING SCHEDULE

Hoist Type	Service
------------	---------

Wire Rope Monorail Hoist and Trolley	Chlorine Gas
--------------------------------------	--------------

A. Performance and Design Requirements

1. Chlorine Gas

- a. Type: Wire Rope Monorail Hoist and Trolley
- b. Hoist Suspension Type: Underhung Motorized Trolley
- c. Design Capacity: 2.5 tons
- d. Max Unit Weight: 750 lbs
- e. Drive: Variable Frequency Drive (VFD)
- f. Lift: 20 ft
- g. Beam Flange: 4-inches
- h. Hoist Control Type: Two-Speed
- i. Trolley Control Type: Two-Speed
- j. Operating Voltage: 460 V, 3 phase, 60 Hz
- k. Hoist and trolley to include a control pendent.

END OF SECTION

SECTION 43 21 00.23

PROCESS PUMPS AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test process pumps, motors, drives, and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- B. American National Standards Institute (ANSI):

- 1. S1.11: Standard Octave-Band and Fractional-Octave-Band and Digital Filters.

- C. ASTM International (ASTM):

- 1. A36/A36M: Standard Specification for Carbon Structural Steel.
 - 2. A48/A48M: Standard Specification for Gray Iron Castings.
 - 3. A108: Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished
 - 4. B584: Standard Specification for Copper Alloy Sand Castings for General Applications

- D. Hydraulic Institute (HI):

- 1. Current Standards.
 - 2. 14.6: Rotodynamic Pumps for Hydraulic Performance Acceptance Tests

- E. National Electrical Manufacturers Association (NEMA):

- 1. MG1: Motors and Generators.

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00:

- 1. Data regarding pump and motor characteristics and performance:
 - a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, efficiency and NPSHr.

- (1) For units of same size and type, provide curves for a single unit only.
 - b. Performance curves shall include maximum pump speed indicated and specified for each service showing maximum and minimum impeller diameters available, acceptable operating range (AOR) and preferred operating range (POR).
2. Characteristic curves for variable speed pumps. Identify curves by speed and provide all curves on one sheet. Provide NPSH_r curve for each speed.
3. Shop drawing data for accessory items.
4. Certified setting plans, with tolerances, for anchor bolts.
5. Manufacturer's literature as needed to supplement certified data.
6. Operating and maintenance instructions and parts lists.
7. Bearing temperature operating range for the service conditions specified.
8. List of recommended spare parts other than those specified.
9. Shop and field inspection reports.
10. Bearing Life: Certified by the pump manufacturer. Include design data.
11. Recommendations for short and long-term storage.
12. Number of service person-days provided and per diem field service rate.
13. NSF certification.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.
- B. Provide spare parts that are identical to and interchangeable with similar parts installed as follows:
 1. One complete set of gaskets and O-rings for every pump as applicable.
 2. For pumps with packing, one complete set of spare packing for each pump of differing style and capacity. Include lantern ring for each packing set.
 3. For pumps with mechanical seals:
 - a. One mechanical seal repair kit and restriction brushing for each pump of differing style and capacity.

b. One spare mechanical seal for each pump of differing style and capacity.

4. One set of any special tools required for maintenance of each pump style

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

B. Pumps of the same type shall be the product of one manufacturer.

C. Pumps shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. The Contractor shall obtain the pumps, motors, and appurtenances from the pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. Variable frequency motor controllers can be supplied by the Contractor or the pump manufacturer at the Contractor's option. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.

a. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

b. Provide variable frequency motor controllers in accordance with Section 26 29 23.

F. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.

G. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:
 - a. All pumps not listed below: 1 person-days.
 - (1) Sample pumps: Not required
 - (2) Chemical drum transfer pumps: Not required
 3. Functional Testing, Performance Testing, and Owner Training: Calibrate, check alignment and perform a functional test with water. Perform field performance. Provide Training to Owner personnel.
 - a. End suction centrifugal pumps: 3 person-days
 - b. Screw centrifugal pumps: 2 person-days.
 - c. Dry pit submersible pumps: 1 person-days
 - d. Vertical inline pumps: 1 person-days
 - e. Magnetic drive pumps: 2 person-days
 - f. Sample pumps: Not required.
 - g. Chemical drum transfer pumps: Not required.
 4. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 5. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
- H. Manufacturer of pumps shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- B. Pump capacities and operating data are indicated in the Process Pump Schedule.
- C. Pumps normally operate with a flooded suction except that pumps will be subject to a suction lift if indicated in the Process Pump Schedule.

2.02 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.
- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.03 PUMP CONSTRUCTION – GENERAL:

- A. All wetted pump materials, including mechanical seals must be NSF 61 approved.
- B. Pumps: Provide type, arrangement and drive as indicated in the Process Pump Schedule.
- C. Design and proportion all parts of pump specially adapted for the service specified and indicated.
- D. Pump Mounting:

1. Horizontal Pumps:

- a. Mount each pump and drive on a common base.
 - (1) Material: ASTM A36/A36M fabricated structural steel.
 - (2) Provide structural steel shape bases for pumps 4-inch and larger and bent form bases for pumps smaller than 4-inch unless otherwise specified.
 - (3) Provide bases with provisions for grouting and for anchor bolts.
 - (4) Design baseplates to support pump and driver.

- (5) Provide planed surfaces of bearing pads for pumps and drives.
- E. Design casings for removal of rotating parts without disconnecting suction and/or discharge piping.
- F. Provide lifting devices on pump casings for handling.
- G. Provide ribs or reinforcing required to withstand the specified hydrostatic test pressure, to prevent deflection caused by hydraulic thrust and to support the motor.
- H. Provide components with machined registered concentric shoulder fits for precision alignment. Equipment without registered fits is not acceptable.
- I. Seals:
 - 1. Provide split mechanical seals for all direct coupled pumps unless otherwise specified.
 - 2. Split mechanical seal:
 - a. Manufacturer: Chesterton Style 442.
 - b. Materials:
 - (1) Gland: Type 316 stainless steel.
 - (2) Rotary Holder: Type 316 stainless steel.
 - (3) Hardware: Type 316 stainless steel.
 - (4) Springs: Hastelloy C or Elgiloy.
 - (5) Rotating Faces: Silicon Carbide.
 - (6) Stationary Faces: Silicon Carbide.
 - (7) Elastomers: Viton.
 - (8) Restriction Bushing: Split type, glass filled teflon.
 - c. For pumps specified and indicated not requiring seal water, provide Enviroseal Spiraltrac bushing version D, type A.
 - (1) For vertically mounted pumps provide seal vent as indicated and in accordance with API Plan 13.
 - d. For pumps specified and indicated requiring seal water, provide seals with flushing water from a clean external source.

J. Couplings:

1. Non lubricated, polyurethane flex material type.
2. Split design.
3. Spacer type.
4. Manufacturer: Rexnord Omega or acceptable equivalent product.
5. Provide guards for protection for personnel, conforming to OSHA requirements.
 - a. Guards and Hardware: Type 316 stainless steel.

2.04 HORIZONTAL END SUCTION CENTRIFUGAL PUMPS:

A. Manufacturers:

1. Aurora
2. Cornell
3. FlowserveType: Non-overloading, single stage volute centrifugal pumps. Direct coupled to motor.

C. Materials of construction

1. Casing, Bearing Frame and Seal Plate: ASTM A48/A48M Class 30 cast iron.
2. Impeller: Type 316 stainless steel.
 - a. Enclosed, dynamically balanced.
3. Shaft: Steel ASTM A108-C1141.
4. Sleeves: Type 316 stainless steel.
5. Bearing: Grease lubricated ball bearings.

D. Mechanical Seals:

1. Provide as specified herein.

E. Motors: Provide as specified herein and in Section 26 20 00.

F. Couplings: Provide as specified herein.

G. Baseplates: Provide as specified herein.

2.05 MAGNETIC DRIVE PUMPS FOR CHEMICAL SERVICE:

A. Manufacturers:

1. March Pump
2. Sundyne Ansimag
3. Iwaki America
4. Finish Thompson

B. Type: Pumps shall be a self-priming, seal-less magnetic drive unit with isolated housing container and suitable for the chemical being pumped. Chemical shall be pumped without direct connection with the motor. Pump shall be suitable for the application shown on the Drawings and specified.

C. Materials must be selected by the pump manufacturer based on compatibility with a 3,000 mg/l solution of sodium hypochlorite as well as a 5,000 mg/l solution of citric acid

D. Motors: Provide as specified herein and Section 26 20 00.

E. Baseplates: Provide as specified herein.

2.06 VERTICAL MULTISTAGE PUMPS:

A. Manufacturers:

1. Aurora
2. GrundfosType: Non-overloading, vertical multistage centrifugal pumps. Direct coupled to motor.

C. Materials:

1. Impellers, Shaft, Diffuser Chambers and Sleeve: Type 316 stainless steel
2. Suction and Discharge: Type 316 Stainless Steel
3. Bearings: Ceramic
4. Bearing Ring: Tungsten Carbide
5. O-Rings: EPDM
6. Wear Ring: Teflon
7. Motor Bracket: ASTM A48/A48M Class 30 cast iron

- 8. Hardware: Type 316 stainless steel
 - 9. Mechanical Seals: Tungsten carbide x tungsten carbide, EPDM elastomers and Type 316 stainless steel metallic components
 - D. Motors: Provide as specified herein and in Section 26 20 00.
- 2.07 SAMPLE PUMPS
- A. Manufacturers
 - 1. Grundfos Scala 2 Variable Speed Booster Pump
 - 2. Approved Equal.
 - B. Capable of self-priming no less than 20 feet.
 - C. Integral control touchpad.
 - D. Materials: Specified manufacturer standard materials.
- 2.08 SOLIDS HANDLING SCREW CENTRIFUGAL PUMPS
- A. Manufacturers
 - 1. Hidrostal
 - 2. Vaughn
 - 3. KSB
 - B. Type: Solids handling single-single stage horizontal screw centrifugal pumps
 - C. Pump Casing
 - 1. Material:
 - a. Cast Iron ASTM A48 Class 40
 - 2. Provide high point of casing with an air vent and low point with a drain.
 - 3. Provide pump casing with a replaceable suction piece or suction liner.
 - a. Liner or Suction Piece Material
 - (1) Cast Iron ASTM A48 Class 40
 - b. Provide with internal straight sides allowing even axial adjustment of the impeller clearance

- c. Provide with spiral grooves providing a cutting action with impeller vane.
- d. Provide external adjustment of impeller clearance without the need to drain the pump casing or suction piping.

D. Bearing Frame

- 1. Cast Iron ASTM A48 Class 40
- 2. Fit to casing with machined registered joints.
- 3. Provide main frame designed to resist without distortion, all stresses due to impeller thrust and bearing loads.
- 4. Provide main frame designed to support shaft and impeller and to contain stuffing box and bearings.

E. Bearings:

- 1. Grease lubricated anti-friction type
- 2. Outboard bearing to be combination thrust and radial type; inboard bearing radial type
- 3. Provide bearings in a dust and moisture proof enclosures
- 4. Provide means in bearing housing, such as removable plug diametrically opposite grease fitting, to prevent over greasing of bearing.
- 5. Provide bearings with a minimum B-10 life rating of 100,000 hours at specified operating conditions and 40,000 hours minimum at 25 percent of the BEP at highest speed, based on latest ABMA and ANSI Standards.

F. Pump Shaft

- 1. ASTM A276 Type 420 stainless steel
- 2. Protect shaft from wear at stuffing box and from contact with pumped liquid by removable and replaceable sleeve.
- 3. Sleeves
 - a. Extend sleeves through stuffing box
 - b. For pumps equipped with mechanical seals: Type 316 stainless steel or ASTM A743 Grade CA-15 stainless steel, 300-350 BHN.

G. Impeller

1. Type: Screw type solids handling single suction combining the action of a positive displacement screw and single vane centrifugal impeller
2. Provide spiral grooves or pump out vanes on the impeller flange.
3. Material
 - a. High Chrome Iron ASTM A532 Type III A, 450 BHN
4. Provide impeller leading edges hardened to a minimum 450 brinell hardness (Rc47) for high chrome impellers.
5. Provide tapered fit and streamlined bolt capable of holding in event of motor reversal under full torque.
 - a. Impeller Bolt: Type 4120 stainless steel
 - b. Impeller fasteners: Type 416 stainless steel
6. Statically and dynamically balance each impeller.

H. Seals: As specified herein.

I. Couplings

1. Non lubricated, polyurethane flex material type.
2. Split design.
3. Spacer type.
4. Manufacturer: Rexnord Omega or acceptable equivalent product.
5. Provide guards for protection for personnel, conforming to OSHA requirements.
 - a. Guards and Hardware: Type 316 stainless steel

J. Motors

1. Provide as specified herein and Section 26 20 00.

2.09 DRY PIT SUBMERSIBLE PUMPS

A. Manufacturers

1. Pentair (Fairbanks) 5730 Series
2. Flowserve MSX Series

3. Flygt N-Pump Series
4. ABS (Sulzer) XFP Series

B. Pump Construction

1. Major pump components shall be of grey cast iron, ASTM A-48, Class 35B, with smooth surfaces devoid of blow holes or other irregularities. All exposed nuts or bolts shall be of stainless steel construction.
2. Sealing design shall incorporate metal-to-metal contact between machined surfaces. Critical mating surfaces where watertight sealing is required shall be machined and fitted with Nitrile or Viton rubber O-rings.

C. Configuration

1. Pump shall be capable of operating in a continuous non submerged condition in the vertical position in a dry pit installation.
2. Pump shall be permanently connected to inlet and outlet pipes.
3. Pump shall be of submersible construction and shall continue to operate satisfactorily should the dry pit be subjected to flooding.

D. Impeller

1. Gray cast iron, ASTM A-48 Class 35, dynamically balanced, non-clog design.
2. Provide a semi-austenitic CrNi Stainless Steel VG 434 (A890 Grade 5A) impeller wear ring.

E. Shaft

1. Stainless steel ASTM A-479 S43100-T or ASTM A-276 Type 420 Stainless Steel.
2. Pump and motor shaft to be same unit, with pump shaft an extension of the motor shaft.
3. Shaft sleeves must be Stainless Steel ASTM A-276 Type 420 Stainless Steel.

F. Volute / Suction Cover

1. Single piece gray cast iron, ASTM A-48, Class 35B, nonconcentric design with smooth passages of sufficient size to pass any 1-inch solids that may enter the impeller.

G. Bearings

1. Pump shaft to rotate on two bearings.

2. Sealed and permanently grease lubricated with high temperature grease.
3. Upper bearing: Two row angular contact ball bearing.
4. Lower bearing: Two row angular contact bearing to compensate for axial thrust and radial forces.
5. The minimum B-10 bearing life shall be 50,000 hours at any useable portion of the pump curve.

H. Mechanical Seals

1. As specified herein.

I. Motors

1. Provide as specified herein and Section 26 20 00.

2.10 CHEMICAL DRUM TRANSFER PUMPS

A. Manufacturers

1. Lutz Drum Pump
2. Approved Equal

B. Provide 10-feet of 1-inch PVC tubing with each pump.

C. Must be compatible with 12.5% sodium hypochlorite and 50% citric acid solutions.

D. 120V single phase drive with integral extension cord and plug.

2.11 MOTORS:

A. Provide in accordance with Section 26 20 00 and as specified and indicated.

B. Horsepower rating of motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.

C. Motor enclosure and motor speed: As indicated in the Process Pump Schedule.

D. For flex-coupled pumps, provide motors with base supports with machined registered joints for mounting on pump motor support.

E. Provide motors for horizontal pumps with mounts for bolting to baseplate.

F. In addition to the requirements for bearings specified under Electric Motors in Section 26 20 00, provide pump motors for pumps of 10 HP and more with ball or roller

bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours.

- G. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with variable frequency motor controllers.
- H. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.
- I. Site Altitude: 4,635 feet above sea level.
- J. Provide Inpro/Seal bearing isolators.

2.12 DRAIN AND VENT PIPING:

- A. Provide drains from stuffing box, air release valves, and casing vent and drain piping and valves to discharge into floor drains or sumps.
- B. Provide pipe and fittings in accordance with Section 40 23 19.05 and as indicated.

2.13 GAUGES:

- A. Provide gauges assemblies for suction and discharge of each pump in accordance with Section 40 23 19.05 and as indicated.

2.14 SHOP PAINTING:

- A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 96 00.
- B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.
- B. Install pumping units on a concrete pad and align thereon.
 - 1. Coupling halves must be disconnected and only reconnected after alignment.
 - 2. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.

- C. Horizontal pumps: Dowel pump and drive to baseplate after alignment in field to facilitate realignment after disassembly.
 - D. Final Coupling Alignment:
 - 1. Perform only after base is installed and piping is connected and pump nozzle connections tested in accordance with paragraph 3.02.
 - 2. If realignment is required piping must be disconnected prior to alignment, piping reconnected and alignment checked prior to connecting coupling halves.
 - E. After alignment is correct, grout using high grade non-shrink grout.
 - 1. For horizontal pumps fill entire base and leave no gaps or voids.
 - 2. Do not imbed leveling nuts in grout.
 - F. Provide 316 SST wall mounted bracket for hanging each chemical drum transfer pump adjacent to their respective chemicals.
- 3.02 FIELD TESTING:
- A. Comply with the requirements specified in Section 01 78 25 and as specified herein.
 - B. Test piping connections to prove the pump nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles. This must be performed and the piping acceptable prior to any field performance testing.
 - C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.
 - 1. During tests, observe and record head, capacity, pump bearing housings and motor bearing temperature, noise and vibration and motor inputs.
 - 1. Bearing Temperature: Bearing temperature not to exceed 180 degrees F.
 - 2. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.
 - 2. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
 - 3. Repeat tests until specified results are obtained.

4. Contractor to provide all water, labor, temporary piping, and equipment for conducting tests.

1. Contractor is responsible for delivery and disposal of water used for testing.

- D. Make all adjustments necessary to place equipment in specified working order at time of above tests.
- E. Test pump on product only. If product is not available, test with water.
- F. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

3.03 FIELD TOUCH-UP PAINTING:

- A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

3.05 PUMP SCHEDULE

- A. Chlorination Motive Water Booster Pumps – CIP Tanks Chlorine Supply

1. Number of pumps: 2
2. Type: Vertical Multistage
3. Design Capacity: 15 gpm at 200 ft TDH
4. Drive: Full Voltage Non-Reversing (FVNR)
5. Minimum hydraulic efficiency at max capacity: 60%
6. Connections: 1-inch suction and discharge
7. Power: 1.5 HP maximum, 3 phase, 480 V, 60 Hz
8. Speed: 3600 RPM maximum.

- B. Chlorination Booster Pumps – Disinfection and Emergency Use

1. Number of pumps: 2

2. Type: Vertical Multistage
3. Design Capacity: 30 gpm at 310 ft TDH
4. Drive: Full Voltage Non-Reversing (FVNR)
5. Minimum hydraulic efficiency at max capacity: 60%
6. Connections: 1 1/4-inch suction and discharge
7. Power: 5 HP maximum, 3 phase, 460 V, 60 Hz
8. Speed: 3600 RPM maximum.

C. Backwash Sludge Pumps

1. Number of pumps: 2
2. Type: Screw Centrifugal
3. Design Capacity: 300 gpm at 35 ft TDH
4. Drive: VFD
5. Minimum hydraulic efficiency at design point: 70%
6. Power: 5 HP maximum, 3 phase, 460 V, 60 Hz
7. Speed: 3600 RPM maximum

D. CIP Chemical Waste Pumps

1. Number of pumps: 2
2. Type: Magnetic Drive End Suction
3. Design Capacity: 60 gpm at 50 ft TDH (S.G. 1.02)
4. Drive: FVNR
5. Horsepower: 3 HP maximum, 3 phase, 460 V, 60 Hz
6. Speed: 3600 rpm

E. Backwash Recycle Pumps

1. Number of pumps: 4
2. Type: Horizontal End Suction Centrifugal

3. Design Capacity: 695 gpm at 20 ft TDH
4. Drive: VFD
5. Minimum hydraulic efficiency at design point: 75%
6. Horsepower: 10 HP Maximum
7. Maximum operating speed at rated head: 1800 rpm

F. Coagulant Flash Mix Pumps

1. Number of pumps: 2
2. Type: Horizontal End Suction Centrifugal
3. Design Capacity: 2090 gpm at 30 ft TDH
4. Drive: VFD
5. Minimum hydraulic efficiency at design point: 75%
6. Horsepower: 25 HP maximum
7. Speed: 1800 rpm maximum

G. Sample Pumps

1. Number of Pumps: 5
 1. Ozone Sample Pump 1
 2. Ozone Sample Pump 2
 3. Ozone Sample Pump 3
 4. Ozone Sample Pump 4
 5. Spare Sample Pump 5
2. Type: As specified under “Sample Pump” section.
3. Design Capacity: 1-10 gpm. Adjustable discharge head
4. Power: Fractional HP, 120 V single phase 60 Hz

H. Chemical Drum Transfer Pumps

1. Number of Pumps: 2

2. Pumping application:
 1. 50% strength citric acid transfer
 2. 12.5% strength sodium hypochlorite transfer
 3. Design conditions:
 1. Maximum flow: 21 gpm
 2. Maximum head: 56 feet
 4. Connection: 1" hose barb
 5. Power: Fractional HP, 120 V single phase with power cord.
- I. UF Backwash Supply Pumps (supplied by UF system manufacturer)
1. Number of pumps: 3
 2. Type: Horizontal end suction
 3. Design point as determined by UF system manufacturer.
 4. Drive: VFD
 5. Power: 75 HP maximum, 460 V, 3 phase, 60 Hz
- J. UF CIP System Pumps (supplied by UF system manufacturer)
1. Number of pumps: 2
 2. Type: Horizontal end suction or vertical multistage
 3. Design point as determined by the UF system manufacturer
 4. Drive: VFD
 5. Power: 20 HP maximum, 460 V, 3 phase, 60 Hz
- K. Ozone Injection Water Pumps
1. Number of Pumps: 2
 2. Type: Horizontal end suction or vertical multistage
 3. Design point as determined by the Ozone System Manufacturer
 4. Drive: VFD

5. Power: 40 HP maximum, 460 V, 3 phase 60 Hz

L. Clearwell Drain Pump

1. Number of Pumps: 1

2. Type: Dry pit submersible

3. Design Capacity: 1,000 GPM at 24 feet of head.

4. Minimum hydraulic efficiency at design point: 75%

5. Drive: Constant speed

6. Power: 10 HP maximum, 480V, 3 phase, 60 Hz

7. Speed: 1,200 rpm maximum

END OF SECTION

SECTION 43 21 13

VERTICAL TURBINE PUMPS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Work of this section includes vertical turbine type pumps for thirteen (13) Ultrafiltration (UF) Feed Pumps and five (5) High Service Pumps.
- B. Each pump shall be complete with motor, pump column assembly, shafting, bearings, sole plate, discharge head, bowl assembly, anchor bolts, and all other appurtenances specified or required for proper operation. Pumps shall have open line shaft design with water lubricated bearings.
- C. Equipment furnished and installed under this section shall be assembled, erected, and placed in proper operating condition in full compliance with drawings, specifications, engineering data, instructions, and recommendations of the equipment manufacturer unless exceptions are noted by the engineer.

1.02 REFERENCES:

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to Division 01 General Requirements.

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00
- B. Product Data
 - 1. Catalog cut sheets and written description of each item describing its operation.
 - 2. Construction materials.
 - 3. Performance curves for entire range of pump for capacity, total dynamic head, brake horsepower, efficiency, and net positive suction head required. Indicate specified conditions.
 - 4. FEA Analysis results as required below.
 - 5. Motor and electrical data.
 - 6. Mechanical seals.
 - 7. Proposed nameplate size, material, and printed information.

C. Shop Drawings

1. Detailed dimensional drawings indicating overall dimensions, elevations, weights, sizes and required clearances.
2. Cross section drawings labeling all interior parts including bearings, seals, and other mechanical parts.
3. Diagrams indicating oil compartments and cooling mechanism.
4. Anchoring and mounting details.

D. Bearing life calculations and certified pump and motor test data as described within this specification.

E. Verification: Submit verification submittal of performance requirements and testing for each pump. Submit verification submittal after initial submittal is approved by the Engineer. Pumping equipment shall not be shipped from the manufacturer until the verification submittal is approved by the Engineer. Verification submittal shall include:

1. The actual performance curves from shutoff to the maximum manufacturer's recommended flow rate of the pump for capacity, total dynamic head, brake horsepower, efficiency, and net positive suction head required.
2. Required test results, motor serial numbers, location, and date of test.

F. Operation and Maintenance Manual: Provide Operation and Maintenance Manuals in accordance with Division 01.

G. The complete pump assembly shall be certified to NSF/ANSI standard 61 and certification must be provided with the submittal. This certification shall cover all wetted components of the pump, including but not limited to the bowl assembly, column assembly, discharge head assembly & suction barrel (when applicable). Manufacturers without NSF61 certification will not be considered.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Spare parts shall be of the same manufacture and quality as those provided with the equipment. Spare parts shall be suitable packaged in accordance with the Manufacturer's recommendations, with labels indicating the contents of each package. Spare parts shall be delivered to the Owner with the equipment of this section.

C. Provide the following spare parts for each pump:

1. One mechanical seal assembly for each pump with mechanical seals.
2. One set of spare packing for each pump with packed glands.

3. One complete set of gaskets
4. One set of wearing rings

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Manufacturer's Qualifications
 1. The pump manufacturer shall have been engaged in the production of the type of equipment being provided for the past 10 years for similar types of applications.
 2. The pump manufacturer shall have provided similar equipment on a minimum of 5 installations of similar type and size in the past 5 years.
- C. Reference Standards: Except as modified or supplemented herein, vertical turbine pumps shall conform to the applicable requirements of ANSI/AWWA E103 and the Hydraulic Institute Standards, current edition.
- D. Testing
 1. Required tests shall be performed for all vertical turbine pumps specified under this section.
 2. Provide for all equipment necessary to perform the tests.
 3. Testing procedures shall be in accordance with HI 14.6 Grade 1U.
 4. Performance test shall be conducted using the pump with its respective driver provided for this project.
 5. Tests shall be conducted by the manufacturer or a manufacturer's certified representative.
 6. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.
 7. Factory Performance Tests
 - a. The pump manufacturer shall afford the opportunity to the Engineer to Factory Witness Test any pump test. Manufacturer shall provide written notice to the Engineer no less than 30 days prior to the start of the factory test period. Travel and per diem costs for Factory Witness Testing will be at the expense of the Engineer.
 - b. Demonstrate that the pumping equipment satisfies the performance requirements of Part 2 of this specification section.

- c. Develop the actual performance curve from shutoff to the maximum flow rate of the pump using a minimum of five points. Actual performance curves shall include the pump full rotation speed and three additional VFD curves at reduced rotation speeds specified by the Engineer during shop drawing review. Use of affinity laws to develop reduced speed curves for the final pump curves is not acceptable.
 - d. Test tolerances: At the specified head the capacity shall be within 10% above the specified capacity and 0% below.
- 8. Factory Hydrostatic Tests
 - a. Test each part of the assembled pump containing fluid under pressure.
 - b. Test pressure: The greater of the following:
 - (1) 150% of the maximum safe working pressure of the flanges.
 - (2) 125% of the head at shutoff.
 - c. Test duration: 30 minutes.
 - d. Zero leakage of fluid shall be evident.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. The pumping equipment shall be completely factory assembled, aligned, and securely crated for shipment. When received at the site, the pumping equipment shall be stored in its shipping container until ready for installation. The pumping equipment shall be stored in a clean, dry, place, and indoors until ready for installation. Equipment shall not be allowed to freeze.

1.07 WARRANTY:

- A. The supplier shall guarantee in writing that the equipment furnished is appropriate for the intended service and shall be free of manufacturing and fabrication defects in material and workmanship for a period of 1 year after the equipment is satisfactorily placed in service.

PART 2 PRODUCTS

2.01 PERFORMANCE AND DESIGN REQUIREMENTS:

- A. Ultrafiltration Feed Pumps
 - 1. Number of pumps: 13

2. Configuration: Parallel operation
3. Design Capacity: 1,800 gpm at 130 ft
4. Drive: Variable frequency drive
5. Minimum hydraulic efficiency at maximum capacity: 80%
6. Max operating speed at rated head: 1800 rpm
7. Horsepower: 75 maximum
8. 10-inch column (0.279-inch thick wall) with 1.5-inch minimum shaft
9. 10-inch discharge

B. High Service Pumps

1. Pumps PMP-0411-2 and PMP-0411-2
 - a. Number of pumps: 2
 - b. Configuration: Parallel operation
 - c. Design Capacity: 3,475 gpm at 245 ft
 - d. Drive: Variable frequency drive.
 - e. Minimum hydraulic efficiency at maximum capacity: 80%.
 - f. Max operating speed at rated head: 1800 rpm.
 - g. Horsepower: 300 maximum
 - h. 12-inch column (0.375-inch wall) with 2.44-inch minimum shaft
 - i. 12-inch discharge.
2. Pumps PMP-0411-3, PMP-0411-4, and PMP-0411-5
 - a. Number of pumps: 3
 - b. Configuration: Parallel operation
 - c. Design Capacity: 6,950 gpm at 245 ft
 - d. Drive: Variable frequency drive.
 - e. Minimum hydraulic efficiency at maximum capacity: 80%.

- f. Max operating speed at rated head: 1800 rpm.
 - g. Horsepower: 600 maximum
 - h. 16-inch column (0.375-inch wall) with 2.44-inch minimum shaft
 - i. 16-inch discharge
- C. Pumps shall be non-overloading for all points on the pump maximum speed curve.
- D. Performance of each pump shall be stable and free from damaging cavitation, vibration, and noise in the operating head range.

2.02 MANUFACTURERS:

- A. Vertical Turbine Pumps:
 - 1. Flowserve
 - 2. Floway
 - 3. National Pump Company
 - 4. American Marsh (WILO USA)

2.03 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, supports, and foundations designed in accordance with the seismic requirements indicated and specified.
- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.04 PUMP CONSTRUCTION:

- A. Pump Discharge Head
 - 1. Fabricated steel, machined on top, diameter equal to the driving motor diameter (BD) with a register fit for locating the driving motor, and bottom suitable for connecting to the bowl and column assembly. Lifting lugs of sufficient strength to support the weight of the complete unit shall be provided.

2. Fabricated steel housing with a bronze throttle bushing and suitably bored to receive mechanical seal.
 3. Drain tap and seal flush line return tap, vent tap, and vent to can
 4. Ultrafiltration Feed Pumps shall have integral suction and discharge flanges, flat face type, for ANSI Class 150 lbs. 16" suction, 10" discharge.
 5. High Service Pumps shall have integral discharge flange, flat face type, ANSI Class 150 lbs, 12-inch or 16-inch discharge as noted above (suction shall be on Suction Can as specified below).
 6. Upper head shaft Type 416 SS with SS threaded coupling
- B. Suction Can: Provide a suction can of carbon steel with barrel wall of at least 0.375-inch thickness. Top of Suction Can shall act as seat for the base of the pump discharge head and drilled to match ANSI class drilling rated for maximum suction pressure. Provide a gasket O-ring between the can and discharge head base to facilitate seal as recommended by the manufacturer. Can top plate shall be of overall square dimension with 4 anchor bolt holes at the corners for anchorage to a concrete base, with grout allowance. Size as recommended by pump manufacturer. Provide anti-vortex vanes at the bottom and sides of the suction can in accordance with ANSI/HI 9.8.
1. The Suction Can shall be provided with a suction flange connection for a working pressure of 150 psi and shall be sized to match the specified system. Suction flange connection shall be on the same side as the discharge flange.
- C. Column Assembly: Shall be supplied with ASTM A 53 Grade B steel pipe flanged or threaded with bronze bearing retainer equipped with suitable lineshaft bearings for the application. Column bearing spacing shall be such that shaft first critical frequency shall be safely above or below the operating resonant frequency.
- D. Lineshaft
1. Lineshaft and coupling: AISI type 416 stainless steel, with 304 stainless steel couplings.
 2. Size to conform to ANSI B58.1.
 3. Shaft diameter: Size as recommended by manufacturer.
 4. Nominal individual section lengths shall not exceed 5 feet on the Intermediate Pumps Only.
 5. Couplings shall be machined with left-hand thread.
 6. Lineshaft bearings: Cutlass rubber, spaced not more than 5 feet apart and mounted in bronze bearing retainers threaded into the column couplings.

- E. Mechanical Seal: Provide pump with a Chesterton Type 155 Flowserve ISC2-PX-61, with silicon carbide vs. silicon carbide rotary and stationary seal faces in a 316 SS gland and rotary holder with EPR elastomers. The housing shall have a lower bronze throttle bushing. The housing seal chamber shall accommodate a single sleeved balanced mechanical seal suitable for the maximum pressure developed by the pump and temperature of 100-degree F maximum. Seal materials shall be suitable for potable water and ANSI/NSF 61 certified. A balanced seal shall be mounted on a shaft sleeve. The shaft supplied shall be a one-piece bowl, line, and head shaft where practical of 416 stainless steel material Extend SS flushing line tubing from the seal to return to wet well or nearest drain.
- F. Pump Bowl Assembly
1. Bowl: Pump bowl castings shall be of close-grained cast iron ASTM A48 Class 30 or ASTM A536 ductile iron Class 60-40-18 where required to meet the hydrostatic pressure criteria listed above. The water passages shall be free of blowholes, sand holes, and other detrimental defects, shall be lined with porcelain enamel, and shall be accurately machined and fitted. The finished bowls shall be capable of withstanding a hydrostatic pressure equal to twice the head at rated capacity or 1-1/2 times the shut-off head, whichever is greater. The bowl wear rings shall be hardened 17-4 stainless steel with a Rockwell C-Scale Hardness number of 40.
 2. Impeller: The impellers shall be Type 315 stainless steel, enclosed type, and shall be dynamically balanced, and shall be fastened securely to the impeller shaft with taper split bushings of steel. Impellers shall be adjustable vertically by an external means from top of drives. Impeller skirt and series case throat area shall be thick enough to allow for machining and wearing at the time of repair.
 3. Pump Shaft: The pump shaft shall be of A582 Grade 416 Stainless Steel turned, ground and polished with chromium content less than 12%. It shall be supported by bronze bearings of ASTM B505 alloy C84400 above and below each impeller. The suction case bearing shall be grease lubricated and protected by a bronze sand collar of ASTM B584 alloy C83800. The size of the shaft shall be no less than that determined by AWWA E 103, Section A4.4 Paragraph 4.4.2.2.
 4. Bolts and hardware: Stainless steel.
- G. Strainer: Stainless steel basket-type with a net water passage area of at least 4 times pipe size. Strainers are not required for the High Service Pumps.
- H. Analysis (Required for High Service Pumps Only)
1. In order to ensure that neither harmful nor damaging vibrations occur to the pump structure at any speed within the specified operating range, the following analysis shall be required:
 - a. Pump manufacturer shall perform a structural frequency analysis of the above ground structural components utilizing a FEA method to ensure that no

structural natural frequencies are excited to a degree that would cause measured vibration amplitudes at the top of the discharge head to exceed the requirements of ANSI/HI 9.6.4-2009. When deemed necessary by the experience of the manufacturer, the below ground structural components shall also be included in the analysis.

- b. The FEA method should include the use of ProE/Mechanica or an equivalent software. All pump assembly components, including the motor, shall be represented as solid elements, and if idealizations are used in place of solid elements, then a complete description of method for the idealization shall be included in the report. The analysis shall also include all modes of interest and pictorially represent each mode shape. Modes of interest are defined as those structural frequencies that exist below 120% of the maximum operating speed. When significant modifications are required to lower the system's natural frequency, the pump structure's stresses and deflections shall also be reviewed. Analysis reports shall conclude acceptable operation at the analyzed operating speeds. The design critical frequency shall be at least 20% above or below the operating range of the pump.
- 2. Manufacturer to provide documentation of the analysis ensuring that the specified requirements have been met, and that documentation should be signed and stamped by the professionally licensed engineer who performed the analysis work.
- 3. When measured in the direction of maximum amplitude on the pump and motor bearing housings, shall not exceed limits given in the latest ANSI/HI nomograph for the applicable pump type.

2.05 MOTORS:

- A. Provide in accordance with Section 26 20 00 and as specified and indicated.
- B. The electric motors shall be WP-1, 460 volt, 3 phase, 60 Hz, inverter-duty rated vertical solid shaft motors with non-reversing ratchet. Provide a steady bushing on the head shaft at the lower motor end.
- C. Premium efficiency, NEMA Design: B, Code: G, Ambient Temperature: 40 deg C, Service Factor: 1.0 for use with VFD (all pumps). type, roller, or ball, for grease or turbine oil lubrication as recommended by the motor manufacturer. Thrust bearing shall be chosen to handle the continuous down-thrust as specified by the pump manufacturer with an AFMBA B-10 bearing life of 12,320 hours, an L-10 bearing life of 17,500 hours, and an L-50 bearing life of 61,600 hours. Provisions shall be made for momentary up-thrust equal to 30% of rated down-thrust. The thrust value shall be calculated at curve points 75% to 125% of specified, full speed, flow rate.
- D. The motor primary thrust bearing shall incorporate a shield or isolator to prevent damage from VFD harmonics and/or stray electrical currents.

- E. The motor rating shall be such that at design it will not be loaded beyond nameplate rating and at no place on the pump curve shall the loading exceed the service factor.
- F. The motor temperature shall be rated no higher than the allowable operating temperature of the motor thrust and radial bearings and in no case shall it exceed the temperature rating of the insulation class used to wind the motor.
- G. Motors less than 200 hp, provide winding temperature detectors per section 26 20 00. Pump motors shall be provided with a built-in 500-watt, 120 VAC condensate heater. Heater shall operate when motor is not running to reduce condensate.
- H. Motors 200 hp or overs shall be provided with a vibration switch. Switch rating 120 VAC, 2 amps minimum.
- I. Motors 200 hp or over shall have over temperature protection, which shall consist of a minimum of six RTD's embedded in the motor windings and two RTD's at the two bearings. Wiring to an external junction box shall be provided. RTD's shall be 100-ohm platinum three wire elements.
- J. Nameplate: Corrosion-resistant metal. Include connection diagram, voltage, full load amperes, locked rotor amperes, Design B, efficiency, manufacturer name, and date.
- K. Manufacturer: General Electric, US Motors, or equal.

2.06 COATINGS:

- A. Bowl assembly exterior, column piping (interior and exterior), discharge head interior, and all steel and iron wetted surfaces shall receive surface prep and be primed and coated with an NSF 61 certified epoxy system suitable for potable water contact.
- B. All pumping equipment and drive units or motors shall be cleaned and painted at the point of manufacturer with a primer compatible with the field paint to be used.
- C. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces and interior of column and discharge head, NSF 61 high solids epoxy in accordance with Section 09 96 00.
- D. The standard factory coating system is suitable for the motor.

2.07 PROTECTIVE DEVICES:

- A. Provide suitable non-rotating metal guards for all exposed rotating parts. Provide suitable non-rotating guards for all rotating shaft ends, which are exposed and protrude more than 1/2 times the shaft diameter.

2.08 DISCHARGE HEAD DIELECTRIC ISOLATION

- A. Where shown on the Contract Drawings, vertical turbine pumps shall be equipped with flange dielectric isolation kits.

- B. EPDM washers/gasket on underside of sole plate shall be cut from NSF-61 certified material.
- C. Flange gasket shall be Type E, 1/8-inch thick NEMA Grade G-10 reinforced epoxy retainer with two seals of either Teflon or EPDM, NSF61 certified.
- D. Insulating sleeves: 1/32-inch thick NEMA Grade G-10, full length, one for each flange bolt.
- E. Insulating washers: 1/8-inch thick NEMA Grade G-10, two for each flange bolt.
- F. Mechanical washers: 1/8-inch thick Type 316 stainless steel, two for each flange bolt.
- G. Manufacturers:
 - 1. Trojan Insulating Gasket Advance Products and Systems.
 - 2. Or equal.

2.09 SPECIAL TOOLS:

- A. Provide special tools necessary for maintenance of pumps and motors including but not limited to tools required for maintenance of bearings and seals.

2.10 SPARE PARTS:

- A. Provide (1) one set of manufacturer recommended spare parts for each pump unit.

2.11 ANCHOR BOLTS:

- A. The Contractor shall provide the required number and size of anchor bolts and nuts for each pump. Anchor bolts and nuts shall be Type 304 stainless steel. Apply an anti-seizing agent to the threads of the anchor bolts prior to installation of the nuts.

2.12 NAMEPLATES:

- A. All equipment shall have a 24 gauge (minimum) stainless steel nameplate with all typical "nameplate" information.
 - 1. Tag number.
 - 2. Voltage.
 - 3. Full load amperes.
 - 4. Locked rotor amperes.
 - 5. Design.

6. Efficiency.
7. Connection Diagram.
8. Manufacturer name and date.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install as shown on the Contract Drawings, approved shop drawings, and as recommended by the Manufacturer. Each pump shall be aligned and connected to the suction and discharge piping and the concrete base. The sole plate shall be grouted in place with non-shrink grout.
- B. Check condition of bearings in pump and motor. Add lubricant according to manufacturer's recommendations. Provide copper tubing from the pump drains to nearest floor drain. Shimming between machined surfaces is not permitted.

3.02 MANUFACTURER'S SERVICES:

- A. Comply with requirements specified in Section 01 43 00.
- B. A manufacturer's representative for the equipment specified herein shall be present at the jobsite for the minimum person-days listed for the services hereunder, travel time excluded:
 1. 2 person-days for the Intermediate Pumps and 1 person-day for the High Service Pumps for installation assistance, inspection, and certification of the installation and 1 person-day for function testing and Owner Training.
- C. After installation supervision and testing services by the manufacturer, the Contractor shall submit to the Engineer, a certification letter on the manufacturer's letterhead and signed by the manufacturer certifying that the equipment was installed per the manufacturer's recommendations. Training of Owner's personnel shall be at such times as requested by the Owner. Additional time required to perform these services shall be at no additional cost to the Owner.

3.03 FIELD TESTING

- A. Comply with the requirements specified in Section 01 78 25 and as specified herein.
- B. After initial startup under the supervision of a qualified representative of the pump manufacturer, a preliminary running-in period will be provided to make field tests and necessary adjustments. The Owner will then operate the pumps for a period of fourteen consecutive calendar days.

- C. At the end of the specified period of operation, the pumps will be accepted if, in the opinion of the Engineer, the pumps have operated satisfactorily without excessive power input, wear, lubrication, or undue attention required for this operation, and if all rotating parts operate without excessive vibration or noise at any operating head, including shutoff.

3.04 FIELD TOUCH-UP PAINTING

- A. After installation and testing, apply touch-up paint to all scratched, abraded, and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.05 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 43 41 16

BLADDER TYPE SURGE TANKS AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test bladder type surge tanks, controls, and appurtenances as indicated and in compliance with Contract Documents.
- B. Bladder type surge tanks specified herein are to be used with finished drinking water and all wetted surfaces, linings, and materials shall be certified NSF 61 for use with potable water.

1.02 REFERENCES:

- A. American Society of Mechanical Engineers (ASME):
 - 1. Boiler and Pressure Vessel Code (BPVC) Section VIII, Division 1, Rules for Construction of Pressure Vessels
- B. ASTM International (ASTM):
 - 1. A36/A36M: Standard Specification for Carbon Structural Steel.
 - 2. A285/A285M: Specification for Pressure Vessel Plates, Carbon Steel, Low- and Intermediate- Tensile Strength.

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00:
 - 1. Complete transient analysis of the system clearly showing transient pressures with and without the surge tank incorporated into the system:
 - 2. Shop drawing data for accessory items.
 - 3. Certified setting plans, with tolerances for anchor bolts, tank weights, full and empty.
 - 4. Manufacturer's literature as needed to supplement certified data.
 - 5. Operating and maintenance instructions and parts lists.
 - 6. Listing of reference installations as specified with contact names and telephone numbers.

7. Certified results of hydrostatic testing.
 8. List of recommended spare parts other than those specified.
 9. Shop and field inspection reports.
 10. Shop test results.
 11. Qualifications of field service engineer.
 12. Recommendations for short and long-term storage.
 13. Special tools.
 14. Number of service person-days provided and per diem field service rate.
 15. Results of field testing.
 16. Manufacturer's product data, specifications, and color charts for shop painting.
 17. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.
 18. Provide a scaled drawing for each system showing the tanks and piping including equipment weights, lifting attachments, slings and clearances for equipment removal and maintenance.
 19. Structural design and analysis report for surge tank, anchors, bases, and supports.
 20. Material Certification:
 - a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of ten (10) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
 - b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
- B. A copy of the contract mechanical process, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification

section. If no changes are required, mark all drawings with “No changes required” or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
- C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.
- 1.04 SPARE PARTS:
- A. Comply with the requirements specified in Section 01 61 00.
 - B. One set of all special tools.
- 1.05 QUALITY ASSURANCE:
- A. Comply with the requirements specified in Section 01 43 00.
 - B. Tanks shall be the product of one manufacturer.
 - C. Tanks shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.
 - D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.
 - E. Shop tests as specified.
 - F. The Contractor shall obtain the tanks, controls and appurtenances from a surge system manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.
 - G. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.

- H. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.
 2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 3. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:
 - a. 1/2 person-days.
 4. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.
 - a. 1 person-days.
 5. Field Performance Testing: Field performance test equipment specified.
 - a. 1 person-days.
 6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
 - a. 1/2 person-days.
 7. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
- I. Manufacturer of surge systems and tanks shall have a minimum of ten (10) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.
- J. If equipment proposed is heavier or taller, different nozzle arrangement than specified and indicated; provide all structural, mechanical, and electrical revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- A. Surge tank capacities and operating data are indicated herein.
- B. Service
 1. Finished Drinking Water from pumping system.
- C. System consists of (2) tanks, bladders, and valve assemblies.

2.02 MANUFACTURERS:

- A. Bladder Type Surge Tanks:
 1. Charlotte America
 2. Pulsco Inc.
 3. Young Engineering Manufacturing Inc.

2.03 SEISMIC DESIGN REQUIREMENTS:

- A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.
- B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.
- C. Provide all equipment bases, anchorage, bolts, supports and foundations designed in accordance with the seismic requirements indicated and specified.
- D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.04 SURGE TANK CONSTRUCTION:

- A. Type: Inverted bladder-type vessel suitable for use specified and indicated.
 - 1. Configuration: Vertical
- B. Provide surge tanks constructed of carbon steel for a maximum allowable working pressure as specified and indicated in accordance with the ASME Pressure Vessel Code, Section VIII.
- C. Provide shop fabrication and inspection in compliance with Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code with only the plate steels in Table UCS-23 of said code being used.
 - 1. Provide a corrosion allowance of 1/16-inch or 1/6 of the calculated plate thickness at design pressure whichever is greater.
- D. Provide ASME code stamp, National Board Registration number and pressure rating on tank.
- E. Hydrostatic test surge tanks in accordance with ASME Code for Unfired Pressure Vessels .
 - 1. Provide Form U-1A "Manufacturers' Data Report for Unfired Pressure Vessels" prepared by the tank manufacturer to certify that the tank was built in accordance with ASME Code Rules for the Construction of Unfired Pressure Vessels and inspected by a certified inspector.
 - 2. Test pressure: 225 percent of the design pressure of the tank
- F. Provide the surge tanks with a flanged line connection, supports, lifting lugs, davit for lifting access cover and couplings for a drain and level control system.
- G. Provide the surge tanks with a minimum 18-inch diameter access port.
- H. Provide the structural design and supports including the tank, supports, and anchor bolts based upon local building codes in addition to the following criteria:
 - 1. Design for a hydrostatic operating pressure and test pressure as specified herein with no reactive load permitted through the inlet/outlet piping.
 - 2. Support tank by four (4) support legs for attaching to concrete foundation.
 - a. Weld the support legs to the tank.
 - 3. Material: ASTM A36/A36M or ASTM A285/A285M, Grade C.
 - 4. Seismic Design Parameters as specified and indicated

5. No wind design required.
- I. Provide a 1/2-inch (13 mm) threaded connection at the top of the tank with a gas charging valve and pressure gauge assembly.
- J. Tank shell: Construct of deep drawn carbon steel double welded domes and side shells with double welded seams.
- K. Provide tanks equipped with an inverted heavy duty rubber bladder with protective coating for aggressive water.
 1. Bladder material: Butyl, Neoprene, Natural Rubber
 2. Provide NSF 61 approved bladder material.
- L. The precharge pressure will be located inside the bladder. Provide the top manhole removable to allow inspection and maintenance of the bladder.
- M. Provide the bladder sized to conform to the inner shape of the vessel.
- N. Provide OSHA access ladder, cage, and platform with handrail on top of tank for access to gas filling valve and bladder, provide components of aluminum in accordance with Section 05 50 00.
- O. Provide davit for lifting top access port.

2.05 SURGE TANK SCHEDULE:

Surge Tank Service	Finished Drinking Water
Number of Tanks	2
Tag Number:	20-SBT-01 & 20-SBT-02
Tank volume, cubic feet	350
Nominal Tank Diameter, inch	96
Nominal Overall Height, inch	132
Pressure:	
Operating Pressure psi	150
Test Pressure, psi	225
Tank Configuration:	Vertical
Number of Support Legs:	4
Tank Inlet/Outlet Pipe Size:	12-inch, flanged Class 150
Drain Size:	2-inch flanged Class 150

2.06 LEVEL MONITORING

- A. Level monitoring shall be via pressure differential transmitter. Pressure differential transmitter shall be Rosemount Model 3051 digital pressure transmitter. Transmitter shall be two-wire, capacitance (DP/GP) or piezoresistive (AP/GP), high performance differential/gage/absolute/level/flow pressure transmitter with HART® based fieldbus

Bladder Type Surge Tanks and Appurtenances
Section No. 43 41 16-7

based digital communication capabilities. Pressure transmitter shall be NEC 501-5, NEMA code ICS6 and FM certified and have 4-20 mA output signal. Pressure differential transmitter shall be hard mounted on the tank and shall be set for a differential pressure range of -250 to 250 inH₂O. Pressure transmitter shall be NSF 61 certified.

2.07 SHOP PAINTING:

- A. Primer and Finish Paint: Shop apply to all tank interior and exterior ferrous surfaces, high solids epoxy in accordance with Section 09 96 00 High Performance Coatings. Any coatings in contact with finished water shall be NSF 61 certified for drinking water applications.
- B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.08 SHOP TESTING:

- A. Comply with the requirements specified in Section 01 75 13 and as specified herein.
- B. Tank Tests:
 - 1. Hydrostatically test tanks as specified.
 - 2. In the event that specified tests indicate that tanks will not meet specifications, Engineer has the right to require additional complete witnessed tests for all tanks at no additional cost to the Owner.
 - 3. Repeat tests until specified results are obtained.
 - 4. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.
- B. Install tanks and supports on a concrete pad and align thereon.
 - 1. Install as indicated.

3.02 FIELD TESTING:

- A. Comply with the requirements specified in Section 01 75 13 and as specified herein.
- B. Test piping connections to prove the tank nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with tank nozzles. This must be performed and the piping acceptable prior to any field performance testing.
- C. Field testing will not be conducted without an accepted procedure, calibration certificates for all testing equipment, gauges, and flow meters and a completed and signed pretesting check list. See Division 1 for checklist.
- D. After installation of surge system, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each system in presence of the Engineer to determine its ability to operate within the limits specified, and to function under specified conditions.
 - 1. Provide testing consisting of functional test of the level control system and a simulated power failure when pumps are running at maximum operating flow conditions prior to actual operational testing with pump field performance testing.
 - a. Test Duration: Determined by the Engineer, but not less than three hours of continuous operation at each condition specified and indicated.
 - 2. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.
 - 3. Repeat tests until specified results are obtained.
 - 4. Contractor to provide all water labor, piping, testing equipment, equipment, flow meters and test gauges for conducting tests.
 - a. Contractor shall provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.
 - b. All calibrations must be within 30 days of the field testing.
 - c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted.
 - d. Contractor is responsible for delivery and disposal of water used for testing.
- E. Make all adjustments necessary to place equipment in specified working order at time of above tests.

- F. Test on product only. If product is not available, test with water. Water for testing furnished by Contractor.
- G. Remove all replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

3.03 FIELD TOUCH-UP PAINTING:

- A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 43 41 43

POLYETHYLENE STORAGE TANKS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Work of this Section includes, but is not limited to:
 - 1. Polyethylene chemical storage tanks and appurtenances.
 - 2. Accessories: Bolts, anchor bolts, washers, supports, hold down lugs, ladder as required.
 - 3. The tanks will be used to store chemical solutions as specified in this Specification, paragraph 2.2 Schedule.
 - 4. Provide chemical storage system complete in details and before acceptance each chemical system shall be fully operational and ready for use by the Owner.
- B. The Contractor shall furnish and install as outlined in the Specification Polyethylene Upright Storage Tanks with integrally molded flanged outlet, and accessories complete in place, as shown on the Drawings and as specified herein.
- C. Storage Tanks shall be rotationally molded conform to ASTM D1998 and shall be classified according to the resin
 - 1. All Chemical Tanks: Cross Linked Polyethylene (XLPE).

1.02 REFERENCES:

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to Division 01 General Requirements.
- B. American Society of Mechanical Engineers (ASME):
 - 1. B-16.5: Pipe Flanges and Flanged Fittings
- C. ASTM International (ASTM):
 - 1. D638: Standard Test Method for Tensile Properties of Plastics
 - 2. D648: Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position
 - 3. D790: Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials

4. D883: Standard Terminology Relating to Plastics
5. D1505: Standard Test Method for Density of Plastics by the Density-Gradient Technique
6. D1693: Standard Test Method for Environmental Stress-Cracking of Ethylene Plastics
7. D1998: Standard Specification for Polyethylene Upright Storage Tanks

4. 29 CFR Part 1926.501 Fall Protection
5. 29 CFR Part 1926.502 Fall Protection

1.03 SUBMITTALS:

- A. Provide in accordance with Section 01 33 00.
- B. All submittals shall conform with the requirements of the Contract Documents.
- C. Drawings and Data: The manufacturer's shop drawings shall be approved by the Engineer prior to the manufacturing of the tank(s). Data and specifications for the equipment shall include, but shall not be limited to:
 1. Resin Manufacturer Data sheet

2. Layouts and assembly schedules for each tank identifying dimensions, nozzle size, location, fitting material, rating, and type.
3. Details of inlet and molded outlet fitting, manways, flexible connections, and vents.
4. Gasket style and material, bolt material.
5. Details of all clips and lugs for pipe brackets, anchor bolts, hold down lugs.
6. Details of structural support members. Tank restraint, the drawings and calculations for the system are to be provided and stamped by the supplier.
7. Tank capacity (gallons), weight, empty and filled with product.
8. Maximum design specific gravity.
9. Statement the fabrication shall be in accordance with ASTM D1998, where applicable.
10. Certification that the equipment supplied is manufactured from materials suitable for the intended storage service.
11. Prior to the manufacture of the tanks, the designed wall thickness shall be supplied based upon 600 psi hoop stress (ASTM D1998) at 100-degrees F.
12. Factory Test Report: Upon completion of the tank the manufacturer's inspection report is to be supplied for each tank:
 - a. Verification of wall thickness
 - b. Impact test
 - c. Degree of Crosslinking Test (%Gel -Type I Resin Only), ASTM D2765 Method C
 - d. Verification of fitting placement
 - e. Hydrostatic Test
 - f. Visual inspection
 - g. Verification of materials
13. Manufacturer's Warranty
14. Supporting documentation of Manufacturer's certification to NSF/ANSI 61
15. Manufacturer's unloading procedure

16. Manufacturer's installation instructions

1.04 QUALITY ASSURANCE:

- A. Manufacturer's Qualifications: Manufacturer shall be ISO 9001 certified. The items specified under this Section shall be furnished by manufacturers who have been regularly engaged in the design and manufacturing of integrally molded flanged outlets of rotationally molded chemical storage tanks based upon ASTM D 1998 using XLPE and LPE and shall have a record of successful installations for the past 10 years. All products shall be suitable for the use noted on the Drawings.
- B. Tanks shall be manufactured from virgin materials. Tanks shall be manufactured from materials certified to NSF/ANSI Standard 61 for chemical storage and submit form from NSF supporting chemical certification.
- C. Tolerances:
 - 1. The tolerance for the outside diameter, including out of roundness, shall be per ASTM D1998.
 - 2. The tolerance for fitting placements shall be +/- 0.5 inches in elevation and 2-degrees radial at ambient temperature.
- D. Conform to the requirements of the manufacturer's field services paragraph 1.5 of the Quality Control Section.
- E. Provide components of manufacturers' latest and proven design. Clean tanks internally prior to shipping. Provide a polyethylene shrink wrap on tank prior to shipment.
- F. Reference Standards
 - 1. ASTM D618 Conditioning Plastics and Electrical Insulating Materials for Testing
 - 2. ASTM D638 Test Method for Tensile Properties of Plastics.
 - 3. ASTM D695 Test Method For Compressive Properties of Rigid Plastics.
 - 4. ASTM D790 Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulation Material.
 - 5. ASTM D883 Definitions of Terms Relating to Plastics.
 - 6. ASTM D1505 Density of Plastics by the Density-Gradient Technique
 - 7. ASTM D1525 Test Method for Vicat Softening Temperature of Plastics
 - 8. ASTM D1693 Test Method for Environmental Stress-Cracking of Ethylene Plastics
 - 9. ASTM D1998 Standard Specification for Polyethylene Upright Storage Tanks

10. ASTM D 2583 Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impresser.
11. ASTM D2765 Degree of Crosslinking in Crosslinked Ethylene Plastics as Determined by solvent Extraction
12. ASTM D2837 Method for Obtaining Hydrostatic Design Basis for Thermoplastic Pipe Materials
13. ASTM D3892 Practice for Packaging/Packing of Plastics
14. ASTM F412 Definitions of Terms Relating to Plastic Piping Systems
15. ARM (Association of Rotational Molders) Standards: Low Temperature Impact Resistance (Falling Dart Test Procedure)
16. ANSI Standards B16.5 Pipe Flanges and Flanged Fittings
17. OSHA Standards: 29 SFR 1910.106 Occupational Safety and Health Administration, Flammable and Combustible Liquids
18. NSF/ANSI Standard 61- Drinking Water system Components (Type II resin)
19. ANSI B16.5: Pipe Flanges and Flanged Fittings
20. IBC 2012

1.05 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.
- B. Handling, delivery, and storage of the equipment of this Section shall be in accordance with the manufacturer's recommendations.

1.06 WARRANTY:

- A. The supplier shall guarantee in writing that the equipment furnished is appropriate for the intended service and shall be free of manufacturing and fabrication defects in material and workmanship for a period of 5 years from the date of shipment.

PART 2 - PRODUCTS

2.01 POLYETHYLENE STORAGE TANKS

- A. Manufacturers: PolyProcessing, Assmann Corporation of America, or Snyder Industries Inc.

- B. Reference Standard: Tank shall be constructed in conformance with ASTM D1998. Tanks shall be rotationally-molded, crosslinked polyethylene (XLPE) one-piece seamless construction, cylindrical in cross-section and vertical with flat / sloping bottoms in axis.
- C. The material used shall be virgin polyethylene resin as compounded and certified by the manufacturer. Crosslinked polyethylene (XLPE) resin shall be as manufactured by ExxonMobil chemical, or resin of equal physical and chemical properties.
- D. Tanks shall be adequately vented as prescribed per manufacturer recommendation, Venting-Design for ACFM (air cubic feet per minute). Vents must comply with OSJA 1910.106 (f) (2) (iii). All tanks must be vented for atmospheric pressure as well as any pressure created by filling and emptying the tank. All U-vents shall be equipped with mesh insect screening. All U-vents shall be constructed of PVC SCH 80.
- E. Where indicated, tanks shall be provided with ancillary mechanical fittings and accessories. Tanks shall be marked to identify the manufacturer; date of manufacture and serial numbers must be permanently embossed into the tank.
- F. Type: Above ground, upright, cylindrical, flat bottom, capable of containing chemicals at atmospheric pressure and standard delivery temperatures.
- G. Construction:

- 1. Mechanical Properties of crosslinked polyethylene (XLPE), for all storage and day tanks, except the Sodium Hypochlorite storage and day tanks.

Property	ASTM	Value
Density (resin),	D1505	0.938-0946 g/cc
Tensile Strength, Ultimate psi, 2-inch/min	D638	2,830-3000 psi
Elongation at Break , % (2-inch/min)	D638	700-800%
ESCR (100% Igepal, Cond A, F50)	D1693	>1000 hours
Vicat Softening Degrees F Temp	D1525	250 deg F
Flexural Modulus	D790	87,000-110,000 psi

- H. All polyethylene resin material shall contain a minimum of a U.V. 8 stabilizer as compounded by the resin manufacturer. Pigments shall not exceed 0.25% (dry blended) of the total weight.
- I. The minimum required wall thickness for a given hoop stress is to be calculated in accordance with ASTM D1998. Tanks shall be designed using a hoop stress no greater than 600 psi. In NO cases shall the tank thickness be less than design requirements per ASTM D1998.
 - 1. The wall thickness of any cylindrical portion at any fluid level shall be determined by the following equation.

$$T = P \times OD / 2SD = 0.433 \times SG \times H \times OD / 2SD$$

where,

T= wall thickness

SD= hydrostatic design stress, PSI

P= pressure (.433 x SG x H), PSI

H= fluid head, ft

SG= specific gravity, g/cm³

OD= outside diameter, in.

- a. The minimum wall thickness shall be sufficient to support its own weight in an upright position without external support but shall not be less than 0.187" thick.
 - b. The hydrostatic design stress shall be determined by multiplying the hydrostatic design basis, determined by ASTM D2837 using rotationally molded samples, with a service factor selected for the application. The hydrostatic design stress is 600 psi at 73 deg F.
2. The minimum required wall thickness for the cylinder straight shell must be sufficient to support its own weight in an upright position without any external support.
 3. The top head shall be integrally molded with the cylinder shell. The minimum thickness of the top head shall be equal to the thickness of the straight wall.
 4. The bottom head shall be integrally molded with the cylindrical wall. Knuckle radius shall be:

Tank Diameter, ft	Min. Knuckle Radius, inch
Less than or equal to 6	1
Greater than 6	1-1/2

- J. Tanks with 2000 or more gallons of capacity shall have a minimum of 3 lifting lugs integrally molded into the top head. The lifting lugs shall be designed to allow erection of an empty tank.
- K. All dimensions shall be taken with the tank in the vertical position, unfilled. Tank dimensions shall represent exterior measurements.
- L. The top head must be integrally molded with the cylinder shell. The minimum thickness of the top head shall be equal to the top of the straight wall. The top head of tanks with 2000 or more gallons capacity shall be designed to provide a minimum of 1300 square inches of flat area for fitting locations. Each Bulk Storage Tank shall be equipped with following accessories:
 1. 24-inch top access round air-tight manway with gasketed cover.

2. Provide 2-inch flanged ball dome bulkhead fitting for fill line connection
3. Provide 6-inch flanged ball dome for vent line connection
4. Provide 4-inch NPT vertical swivel-type bulkhead for level probe
5. Provide 4-inch flanged fitting for overflow pipe equipped with pipe support brackets on side of tank.
6. Provide 4-inch flanged outlet on the sidewall at the bottom of the tank for tank drain/pump suction connection.
7. Provide FRP ladder located between the manway access and the level probe.
8. Identification signs.

M. Material of Construction:

1. Fittings: All fittings shall be bolted double flange with 150 lb. flanges in accordance with ANSI/ASTM B 16.5 standards.
2. Gaskets shall be min of 1/4-inch thickness, constructed of 40-50 EPDM or 60-70 Viton material based on the chemical compound stored, refer to the table below.
3. Bolts shall be encapsulated in the same material used in the tank construction. The encapsulation shall prevent metal exposure to the liquid in the tank and prevent bolt rotation during installation. The encapsulation shall fully cover the bolt head and a minimum of 1/4-inch of the threads closest to the bolt head. Each encapsulated bolt shall have a gasket to provide a bolt-sealing surface against the inner flange. Bolts shall be constructed of the materials as provided in the table below.

Chemical	Concentration, S.G.	Resin	Design	Fitting Material	Gasket Material	Bolt Material
Aluminum Chlorohydrate	38%, 1.3-1.35	XLPE	1.9/600	PVC SCH 80	EPDM	316 SS
Sodium Bisulfite (NaHSO ₃)	38%, 1.32	XLPE	1.9/600	PVC SCH 80 / PP	EPDM	Titanium

2.02 TANK SYSTEM ACCESSORIES:

- A. Restraints:** The tanks shall be provided with necessary structural support members, including tank restraints. Design shall conform to the most recent edition of the IBC code for seismic winds and loads, as required in the architectural and structural code classifications.
1. Conform to the seismic requirements indicated on the structural drawings.

2. Provide all equipment bases, anchorage, supports, and foundation designed in accordance with the seismic requirements indicated.
- B. Fittings: The bolted double flange fittings shall be constructed with 2ea. 150 lb. flange gaskets in accordance with ANSI/ASME B-16.5. The flanges shall be constructed of PVC type 1, Grade I.
 - C. All tank fitting attachments shall be equipped with flexible couplers. Tank piping flexible couplers shall be designed to allow 4% design movement and shall be attached as close as possible to the tank to reduce stress. The flexible connection shall have 150 lb. flange connection to allow for attachment to the tank and the piping system. The flexible connection shall be manufactured of the same material as the tank or a compatible material approved by the Engineer.
 - D. Tank drain: The Storage Tank drain fitting shall utilize molded outlet and shall be an integral part of the tank, providing completed drainage of liquid through the sidewall of a flat bottom container without the use of special support structure or concrete pad. The standard outlet provided shall be a PVC socket which allows solvent weld PVC at the tank pad level.
 - E. Reverse Float Level Gage: Constructed of flexible clear PE or PVC tubing to allow for tank contraction and expansion due to loading and temperature changes. The level gage shall be connected to the top of the tank (no sidewall penetration). Internal float weighted for specific chemical. Polypropylene rope. Calibration tape for volume in gallons.
 - F. Connection for Ultrasonic or Radar Level Indicator.
 - G. Bolted Sealed Top Manway: The sealed manway shall be constructed of polyethylene material. The bolts shall be polypropylene or other specified material. The gaskets shall be closed cell, crosslinked polyethylene foam and Viton o-rings to seal the bolts.
 - H. Fill Pipe: All down pipes and fill pipes shall be supported at 5 ft. maximum intervals with support structures. Standard support structure design shall utilize bulkhead fitting tank attachments or welded attachments on Type II tanks.
 1. Provide anti-siphon vent on all fill pipes.
 - I. Ladder: Ladders shall be constructed of FRP. All ladders shall be designed to meet applicable OSHA standards. Reference: OSHA 2206; 1910.27; fixed ladders. Ladders must be mounted to the tank to allow for tank expansion and contraction due to temperature and loading changes. All top ladder mounts shall be connected to integrally molded in attachment lugs that allow for tank movement due to temperature and loading changes.
 - J. Overflow pipe and vent pipes.

2.03 POLYETHYLENE TANK SCHEDULE:

A. General requirements for all tanks.

1. All fittings shall be flanged, sizes and locations as shown on the drawings.
2. Provide numbered calibrations for visual inspection of tank level.
3. Provide a minimum of 6-inch freeboard.
4. The dimensions listed in the schedule below shall be taken as approximate tank volumes and dimensions, and alternate dimensions may be approvable for an equal or greater tank storage volume. However, tank manufacturer and contractor must verify that an alternate size tank will fit in the designated space. Alternate size bulk tanks must consider available overhead clearances, containment area widths, and necessary clearances from other equipment. Alternate size day tanks must correspond to sizes of scales being furnished.

B. Aluminum Chlorohydrate

1. Two bulk tanks: 3,000 gallon tank (sealed); 7'-1" diameter x 12' tall.

C. Sodium Bisulfite

1. One bulk tank: 4,925 gallon tank (sealed): 9'-0" diameter x 12'-3" tall.

D. The General Contractor shall provide all bolts, anchor bolts, nuts, washers, and supports as required for all the tanks specified in this Section, and in accordance with the requirements of the manufacturers of the tanks. All bolts, anchor bolts, washers, hold down lugs, and supports required in connection with the tanks provided under the Section shall be of Type 316 stainless steel, if not otherwise noted.

2.04 SAFETY SIGNS:

- ### A.
- Each tank shall be clearly marked with the name of the chemical stored, printed in large block letters and mounted directly adjacent to the tank outlet and tank inlet. Each entry manway shall be provided with a sign ("DANGER—CONFINED SPACE—HAZARDOUS ATMOSPHERE").

PART 3 - EXECUTION

3.01 INSTALLATION

- ### A.
- All tanks shall be installed on level concrete pads per the manufacturer's instructions. All pipes and equipment connecting to the tanks shall be firmly supported to avoid stresses on the tank.

- B. Prepare tank pads to support total weight of tank and contents. Cutouts are required in concrete pads for full drain nozzles. Check with fabricator for cut out dimensions. Cut outs in pads shall be grouted under full drain after installation.
- C. Tanks shall be installed according to fabricator's recommendations. Fabricator's unloading and handling instructions shall accompany the tank during shipping. Bottoms and full drains shall be fully supported.
- D. During installation of the tanks, care shall be taken to prevent contamination of the tank interior. Nozzles and manways shall be covered except when connecting pipes or other equipment.
- E. Closed top tanks are considered a confined space. A confined space entry permit shall be obtained, and all Contractor confined space entry procedures shall be followed.
- F. Entry into the tanks shall be minimized. Entry into a tank shall require written permission from the Contractor. When working in the tanks, care shall be taken not to damage the interior surfaces. The floor shall be covered with plastic sheeting or similar protection. Any workers entering a tank shall wear soft-soled shoes and wear clean room shoe covers. If ladders are placed in the tank, protection shall be provided between the tank surface and the ladder.
- G. Installation certificate: Contractor shall provide shall certify that the tank system has been installed according to the tank manufacturer's Guidelines for Use and Installation.

3.02 WORKMANSHIP:

- A. The finished tanks shall be free of visual defects such as foreign inclusions air bubbles, pinholes, pimples, crazing, cracking, and delaminations that will impair the serviceability of the vessel.
- B. All cut edges where openings are cut into the tanks shall be trimmed smooth.

3.03 FIELD INSPECTION:

- A. Perform a 72-hour hydro test for each tank to check for leaks on field erected tanks. Hydrotest shall be performed in conjunction with the chemical feed system hydrotest. Following the hydrotest, the tanks shall be drained and dried. Clean, dechlorinated water shall be used for the hydrotest.

3.04 MANUFACTURER'S SERVICES:

- A. Conform to the requirements of Specification Section 01 43 00.
- B. The EQUIPMENT SUPPLIER shall provide a factory trained representative to be retained for a period of not less than 16 hours (up to 2 trips) to inspect equipment installation, piping and wiring to ensure proper installation of each component in accordance with approved submittals.

- C. Startup services and training of Owner's personnel shall be at such times as requested by the Owner.
- D. Additional time required to perform these services shall be at no additional cost to the Owner. The Owner shall be credited for the unused portion of startup services.

3.05 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 44 40 40

EMERGENCY DRY TYPE CHLORINE SCRUBBER SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test emergency dry type chlorine scrubber system equipment and appurtenances, as indicated and in compliance with Contract Documents.
- B. Provide emergency dry type chlorine scrubber system complete. And before acceptance make the system fully operational and ready for use by the Owner.
- C. Mechanical testing of system to be conducted by the Contractor.
- D. Dry media samples and chlorine gas for testing to be conducted by the Supplier. Results of removal of chlorine gas using dry media to be reported to Owner prior to system installation.
- E. Emergency dry type chlorine system to meet:
 - 1. The Utah Department of Environmental Quality, "R309-200. Monitoring and Water Quality: Drinking Water Standards" (Latest Revisions).
 - 2. The Utah Department of Environmental Quality, "R309-520. Disinfection" (Latest Revisions).
 - 3. The Utah Department of Environmental Quality, "R309-520. Facility Design and Operation: Disinfection" (Latest Revisions).

1. Article 80

- U. Standard Fire Code.
 - V. Building Officials and Code Administration of America (BOCA).
 - W. International Building Code (IBC).
- 1.03 SUBMITTALS:
- A. Submit the following shop drawings in accordance with Section 01 33 00:
 - 1. Prior to initial submittal, arrange conference in Engineer's office with Engineering Representatives of equipment vendor who are familiar with specification to discuss overall job concept.
 - 2. When the Contractor proposes equipment which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing necessary changes and embodying special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.
 - 3. Certified shop and working drawings which include plan, elevation, and sectional views, materials of construction, ductwork, anchor bolt details, electrical, and controls.
 - 4. Certified setting plans, with tolerances, for anchor bolts.
 - 5. Operating and maintenance instructions and parts lists.
 - 6. Shop drawings details for accessory items.
 - 7. Number and identify components to correspond with terminology on drawings. Use these numbers on all submittal sheets and shop drawings.
 - B. Submit the following product data within 60 calendar days after the Contractor has received the Owner's Notice to Proceed:
 - 1. Materials list of items proposed to be provided under this section.
 - 2. Manufacturer's specifications and other data needed to prove compliance with the specified requirements.
 - 3. Certified design calculations substantiating design criteria.
 - 4. Control details and wiring diagrams.
 - 5. Equipment performance data, motor data, curves, etc.

- C. Provide complete design calculations for the emergency dry type chlorine scrubber system to confirm the following:
1. The system design calculations must demonstrate a minimum overall system removal efficiency of 99.99%.
 2. The pressure in the chlorine storage room must never exceed ambient atmospheric pressure from the beginning of the design leak event to the time the scrubber system shuts off.
 3. The system shall be capable of withstanding the imposed seismic and wind loads in accordance with Section 01 41 20. Certified design calculations shall be stamped by a registered professional engineer. Calculations shall include, but not be limited to, the following:
 - a. Dead loads
 - b. Live loads
 - c. Seismic loading per IBC code
 - d. Anchor lug attachment to the shell
 - e. Wind loads
 4. The system contains a minimum amount of dry chemical media required to scrub the total amount of chlorine during the leak event. Calculations shall include ventilation rate, system pressure, chlorine flow and weight from the beginning to the end of the scrub cycle.
 5. The percentage decrease in the dry chemical media during a test cycle of 5 minutes every month assuming no chlorine is absorbed.
 6. The exhaust fans are each capable of handling the minimum required air flow from the chlorine storage room including the resistance of all ductwork, fittings, and system components.
- D. Recommendations for short and long term use.
1. Sales bulletins or other general publications are not acceptable as submittals for review except where necessary to provide supplemental technical data.
- E. Provide Operation and Maintenance manuals in accordance with Section 01 78 23. Manuals may be in one or more volumes but shall include, as a minimum, complete sections covering all equipment specified in this section and spare parts lists.
- F. ISO 9001 certification or other quality control manual demonstrating a complete system for quality management.

- G. Emergency dry type chlorine scrubber system equipment manufacturer must be capable of providing a list of customers using at least five (5) similar system for at least ten (10) years.
- H. Material Certification:
 - 1. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.
 - 2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
- I. Certified results of factory tests.
- J. Provide Affidavit from the system supplier stating that the complete emergency dry type chlorine scrubber system has been properly installed, tested, and is ready for full-time operation.
- K. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".
 - 1. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.
- L. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
 - 1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

1.04 SPARE PARTS:

- A. Provide in accordance with Section 01 61 00 and as specified herein.
- B. Furnish spare parts, identical and interchangeable with similar parts installed in work:
 - 1. Two sets of belts for the fan/motor assembly per fan.
- C. Package in one container all spare parts and clearly identify on the outside what the unit is for.
 - 1. Seal tightly and protect for long term storage.
 - 2. Deliver to the Engineer for transmittal to the Owner.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00
- B. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes. Provide systems and items of equipment that conform to applicable safety standards including those for safety of personnel.
- C. Furnish the emergency dry type chlorine scrubber system by one equipment supplier who shall provide all the equipment and appurtenances specified in this section, regardless of manufacturer, and be responsible to the Contractor for the complete and satisfactory operation of the entire system.
 - 1. Substitutions of functions specified will not be acceptable.
 - 2. Experience:
 - a. Certify to no less than ten identical type installations presently in service for one or more years.
 - b. A minimum of ten years of experience in the design, fabrication, and testing of systems that are efficient in converting chlorine gas to non-toxic solids with less than 5 ppb at discharge.
 - c. Certified to ISO-9001 standards.
 - 3. Evidence of manufacturing capability including description of facilities, the number and qualifications of personnel, and quality control practices. The alternate equipment supplier shall identify major outside fabricators for the purpose of determining experience.
 - 4. Evidence of technical capability to design and check the alternate system fully, including modifications required to building and other systems.

5. Evidence of full-scale testing of the scrubber designed by an independent testing laboratory, as outlined in Paragraph 3.02.
 6. A complete listing of changes which will be required in the contract plans and specifications to accommodate the alternate equipment.
- D. Provide components to manufacturer's standard for service specified and indicated unless otherwise required.
- E. Provide equipment of manufacturers' latest and proven design. Unit to be a standard cataloged product and modified as specified and indicated.
- F. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.
- G. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.
 2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 3. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:
 - a. 1 person-day.
 4. Startup, Commissioning, and Testing: Calibrate, check alignment and perform a functional test of mechanical equipment. Perform equipment startups and field performance tests to include all items specified. Failure of any testing shall be corrected without additional expense to the Owner. At the conclusion of commissioning and testing, the manufacturer shall Certify installation and operation.
 - a. 2 person-days.
 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.
 - a. 1 person-day.
 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- A. Systems:

1. Provide emergency dry type chlorine scrubber system equipment for the following:

Tag No.	Application Point	Capacity (cfm)
SK-0301-16	Emergency Chlorine Dry Scrubber	Minimum 5,000

- B. DESIGN PARAMETERS

1. Chlorine Treatment Capacity: 4,700 lbs (2, 1-ton containers)
2. Chlorine Gas Release Rate: 437 lbs/min (2,380 scfm)
3. Treated Air Capacity: Minimum 5,000 cfm
 - a. Or better as required by US Uniform Fire Code with local amendments (Article 80, Hazardous Materials), Uniform Building Code, the latest NIOSH guidelines, and all rules/regulations of authorities having jurisdiction over the work specified herein.
4. Maximum Chlorine Concentration in Treated Air: 5 ppb
5. Max Chlorine Gas Temperature: 160°F
6. Max/Min Scrubber Tank Temperature: 200°F / -40°F
7. Provide sufficient draft to overcome the resistance of ductwork, fittings, dampers, and silencers to maintain a negative pressure in the room to prevent atmosphere leakage of vapor.

- a. Standard Pressure up to scrubber inlet (for duct losses): 1 1/2-inch to 2-Inch W.C.

2.02 MANUFACTURERS:

- A. De Nora Water Technologies, LLC.
- B. Purafil Filtration Group ®.
- C. PureAir Filtration
- D. Engineer-Approved Equivalent.
- E. The basis of design for this system is De Nora Water Technologies, LCC. Alternative manufactures listed above are acceptable, but any deviations from the De Nora Design, such as fan horsepower requirements, air duct sizes, scrubber dimensions, etc., must be included in the cost of the bid.

2.03 DRY MEDIA HOLDING TANK

- A. Vertical, 120-Inch diameter, fabricated filament wound Fiberglass Reinforced Plastic (FRP)
 - 1. Acceptable Main Layer Resin Manufacturers (Premium Vinyl Ester):
 - a. Ashland, Trade Name: Hetron 922
 - b. INEOS, Trade Name: Derakane 411-400
 - c. Reichold, Trade Name: Atlac 580
 - d. Dow, Trade Name: Kerakane 411
 - e. Interplastic, Trade name: VE8300
 - f. Other premium resins may be considered if a certified letter of suitability for the service is presented to the Engineer.
 - 2. Exterior Resin Layer
 - a. An exterior resin layer applied shall be applied using the same premium resin used as the main layer with a methyl ethyl ketone peroxide (MEKP) cure.
 - 3. Interior Corrosion Barrier
 - a. An interior resin layer, 10 millimeters to 20 millimeters in thickness, shall be applied using the same premium resin used as the main layer.

- b. Layer shall be composed of reinforced non-continuous glass fiber strands applied in two plies of chopped strand mat equivalent to three ounces per foot.
 - (1) Acceptable Materials:
 - (a) Nexus Veil corrosion barrier
 - (b) Engineer-Approved Equal
 - (2) The inner layer shall not exceed 10% +/- 15% "C" glass by weight.
- 4. Filament wound laminates shall have an average glass concentration of 50% - 55% by weight.
- 5. Fabricate hand lay-up laminates when used on the vessels and equipment shall meet the physical properties in accordance with PS 15-69 product standard.
- 6. The tank shall be manufactured in accordance with ASTM D-3299 standard specifications for filament wound construction or for custom contact-molded construction in accordance with NBS PS 15-69 product standard and ASTM D-4097.
- 7. Tank resin shall be suitable for continuous exposure to a wet chlorine/air mixture with a maximum operating temperature of 200°F.
- 8. Barcol hardness shall confirm with the resin supplier's minimum value.
- B. All exterior FRP surfaces shall have a pigmented resin for UV protection.
- C. The tank shall be designed for the shut-off vacuum.
- D. Press molded or compression mold flange nozzles are acceptable up to and including 6-Inch nominal size.
- E. Reinforce all cut-walls as required by ASTM D-3299 and PS 15-69.
- F. Tank shall be completed with a side-mounted 1 1/2-Inch drain connection.
 - 1. Arrange drain connection as indicated on drawings
- G. The media bed support system shall be constructed of materials resistant to the service conditions specified for corrosion and exposure to wet chlorine in air at 200°F for up to 10 hours.
- H. Media shall be supported by a 1-Inch thick FRP grating with 1-Inch by 4-Inch openings.
- I. Grating shall be supported along its circumference by a support shelf integrally bonded to the tank walls.

- J. The span of the grating shall be supported by three (3) uniformly spaced rectangular beams, each with a 4-Inch by 6-Inch cross section.
1. Each beam will be midway supported by a 4-Inch by 6-Inch vertical pillar from the tank bottom.
 - a. Beams shall be integrally bonded to the tank sidewall for maximum support.
- K. Tank Connections:
1. One (1) 30-Inch diameter flanged nozzle covered access opening shall be provided for media addition.
 2. One (1) 30-Inch diameter flanged side covered access opening shall be provided for media removal.
 3. One (1) 20-Inch diameter flanged nozzle, 4-Inches long shall be provided for gas inlet.
 4. One (1) 18-Inch diameter flanged side, 4-Inches long shall be provided for treated exhaust air outlet.
 5. Five (5) 1 1/2-Inch diameter side-mounted, sample ports with PVC ball valves.
 6. One (1) 2-Inch diameter flanged side shall be provided as a drain for treated scrubber effluent waste drainage.
 7. Six (6) 1-Inch tie-down/support lugs
 - a. The tie down/support lugs shall be designed to be able to anchor the tower and contents against seismic and wind loading requirements in accordance with Section 01 41 20.
 8. Three (3) 1-Inch lifting lugs
 - a. The lifting lugs should be permanently attached and suitable for lifting and transporting the empty tank without structural damage.
 9. All connections shall be fabricated of the same material as the tank wall and shall have the same inner corrosion barrier as the tank wall.
 - a. Connections shall be as indicated on drawings.
 10. The flanges shall be connected to ductwork and lids using 18/8 stainless steel flange hardware.
- L. The dry media holding tank should not be lifted with the media packed inside the tank.

- M. The Contractor shall place the dry media in the tank after the tank is installed at the job-site.
- N. All gas connections shall conform to Table 2 of PS 15-69.
- O. FRP Ladder
 - 1. An OSHA-rated FRP access ladder with cage system shall be permanently clipped to the tank top.
 - 2. FRP ladder to be in accordance with Section 06 60 10.
- P. The tank top shall have a non-skid surface and toe kick.
- Q. The tank top shall include a clipped-up FRP safety handrail along the entire rim of the tank top.
 - 1. FRP handrail to be in accordance with Section 06 60 10.
- R. Neoprene Pad: A 1/4-inch thick, 60 durometer neoprene rubber sheet shall be placed underneath the dry media holding tank.

2.04 DRY MEDIA

- A. Chemically impregnated activated alumina (alumina oxide) media
 - 1. Quantity: Media to treat 4,700 lbs of chlorine gas.
 - 2. MANUFACTURERS:
 - a. De Nora Water Technologies, LLC.
 - b. Purafil Filtration Group ®
 - c. PureAir Filtration
 - 3. Media shall have a powdered alumina oxide (alumina) substrate and other powdered materials suitably impregnated with chemicals capable of removing chlorine throughout the entire media bed, be spherical in shape (pellets), porous, non-flammable, and will not support combustion.
 - a. Impregnates during media formation shall be uniformly distributed throughout the pellet volume.
 - 4. Media with carbon in the substrate will not be accepted.
 - 5. CHARACTERISTICS:

- a. Average Crush Strength: 17 lbs on a representative sized media bed; 35% minimum – 70% maximum
 - (1) Average Density: 45 lbs/ft³ to 50 lbs/ft³
 - b. Average Media Diameter: 1/8-Inch to 3/16-Inch
 - c. Media will not dissociate in water
 - d. Media contains no activated carbon
 - e. Media shall be UL Fire Class 1 Non-flammable
 - f. Media shall neutralize 99.99% chlorine gas at the maximum chlorine inlet gas rate by chemically reacting with the chlorine to produce solid products within the media.
 - g. Moisture Content: 35% maximum
 - h. Average Abrasion: 4.5 maximum
6. The pressure drop of air at 70°F when flowing through 12-Inch deep packed media bed shall not exceed:

Superficial Velocity (fpm)	Pressure Drop (inch W.C.)
50	0.45
100	1.85

7. Media when subjected to auto ignition test method ASTM D-3466-76 (1998) shall demonstrate auto ignition temperature of no less than 300°C.

B. Support Media

- 1. Media support gravel shall be provided to support the activated alumina media.

2.05 EQUIPMENT

A. Exhaust Scrubber Fans

- 1. FAN DATA:

Tag No.	Operation	Minimum Capacity (cfm)
BLR-0301-17	LEAD	5,000

BLR-0301-18	LAG	5,000
-------------	-----	-------

2. TYPE:
 - a. Centrifugal type, FRP construction
 - b. Backward inclined or radial blade
 - c. Fan shall have a AMCA seal.
3. MANUFACTURER:
 - a. New York Blower
 - b. Hartzell
 - c. Engineer-Approved Equal
4. Electrical Requirements:
 - a. Power: 25 HP
 - b. Voltage: 480 VAC, 3 phase
 - c. Frequency: 60 Hz
 - d. Motor Type: Totally Enclosed Fan-Cooled (TEFC) high efficiency motor
 - e. Motor Speed: 1800 rpm
 - f. Service Factor: 1.15
5. Fan wheel shall be statically and dynamically balanced.
6. Fiberglass construction shall conform to PS 15-69 product standards.
 - a. Fan resin shall be suitable for exposure to the specific service conditions.
7. Fan housing shall be constructed of fiberglass and reinforced with rigid bracing to increase structural integrity.
 - a. Bearing support brackets shall be positioned to directly oppose belt tension forces.
8. Fan housing shall be a curved scroll design with a 1-Inch NPT drain connection at the bottom of the fan scroll.

9. Fan outlets shall have flanged connections.
10. The fan shaft shall be epoxy coated steel.
11. The fan shall have self-aligning grease-packed bearings, with neoprene shaft seals and OSHA approved weatherproof motor/drive cover.
12. Contractor shall include a duct transition piece with flex connector between blower and connecting intake FRP ductwork.
 - a. The flexible connector shall be resistant to UV degradation.
13. Contractor to provide FRP ductwork from exhaust fan to stack hood including 316L stainless steel straps.

B. Control Panel

1. NEMA 4X, 316 Stainless Steel control panel
 - a. The control panel shall have a transformer
 - (1) 480 / 120 VAC, 300 VA
 - b. The control panel shall have a hinged front door
 - c. The control panel shall have exhaust fan motor starters
 - d. The control panel shall have wall mounting.
 - e. The control panel shall have alarm contacts
 - (1) Scrubber Running
 - (2) Blower fault/system alarm
 - f. The control panel shall have relay controls
2. Minimum requirements:
 - a. A power ON light
 - b. Fan running lights
 - c. Chlorine Leak Light (connected to chlorine gas detector)
 - d. Cabinet disconnect switch
 - e. Scrubber fan ON indicating light

- f. Fan Lead/Lag Selector switch
 - g. Fan HAND-OFF-AUTO selector switches with push button
 - h. Pushbutton for RESET
 - i. 20% spare terminals
 - j. Power: 480 VAC, 3 phase, 60 Hz, 40 amps
3. Include the following I/O in the form of dry contacts:
- a. Input: Chlorine detector alarm from chlorine gas storage room (starts LEAD fan).
 - b. Input: Differential pressure switch activated (below low-level set point shuts off LEAD fan and turns on LAG fan).
 - c. Input: Chlorine detector alarm from emergency dry scrubber (stops LEAD/LAG fan)
 - d. Input: RESET push button shuts off LEAD/LAG fan.
 - e. Output: Stop ventilation fan(s) in chlorine storage room.
 - f. Output: Control panel in AUTO (provide for remote indication).
 - g. Output: Scrubber fan running (provide for remote indication).
 - h. Output: Scrubber fail to run on command (provide for remote indication).
 - i. Output: Scrubber shut down by alarm (provide for remote indication).
4. Labeling:
- a. Early identifying label all panel devices.
 - b. Provide engraved white laminated labels with black lettering.
 - c. Attach with stainless steel screws.
5. Motor Starters:
- a. Provide for each motor a NEMA rated magnetic motor starter.
 - (1) Manufacturer:
 - (a) Allen Bradley, Square D (Class 8606)

- (b) Engineer-Approved Equal
 - (2) Equip with undervoltage release and overload protection on all three phases.
 - (3) Furnish motor starter contacts that can be easily replaced without removing the motor's starter from its mounted position.
 - (4) Use manual reset overload relays and do not provide means for converting to automatic reset.
 - b. Provide open frame, reduced voltage, non-reversing, autotransformer, closed transition type.
6. Components:
- a. Provide thermal magnetic air circuit breaking having a minimum symmetrical RMS interrupting rating of 14,00 amperes at 480V.
 - (1) Provide a pad lockable operating mechanism on each motor circuit breaker.
 - (2) Type:
 - (a) Square D
 - (b) General Electric
 - (c) Engineer-Approved Equal
 - b. Hand-Off-Auto Switches:
 - (1) Provide UL rated, heavy duty, 600 VAC, NEMA 4X, oil-tight switches.
 - (a) Manufacturer:
 - Allen Bradley Series 800H
 - Square D Class 9001 SK
 - Engineer-Approved Equal
 - (2) "Hand" position not to override motor overload shutdown.
 - c. Provide lighting arrestor
 - (1) Type:

- (a) Delta Type “LA”
 - (b) Engineer Approved-Equal
 - d. Control Relays:
 - (1) Provide heavy-duty industrial grade plug-in relays
 - (a) Type:
 - Allen Bradley, Bulletin 700, Type H
 - Square D, Class 8501, Type K
 - (2) Provide appropriate sockets for din rail mounting.
- 7. Indicator Lamps:
 - a. Type:
 - (1) Allen Bradley Series 800H
 - (2) Square D Class 9001 SK
 - (3) Engineer-Approved Equal
- 8. Control Relays:
 - a. Provide heavy-duty industrial grade relays.
 - (1) Type:
 - (a) Allen Bradley, Bulletin 700, Type H
 - (b) Square D, Class 8501, Type K with silver cadmium oxide contacts and LED indicator.
- 9. Electrical Schematic:
 - a. Provide a number indexed laminated electrical schematic diagram of the panel controls including terminal board connections.
 - b. Permanently mount on the inside of the enclosure door.
- 10. Attachment screws shall all be stainless steel.
- 11. Wiring:
 - a. Unit to be completely factory wired except for power supply.

- (1) Comply with applicable standards of National Electric Code.
 - (2) Color code and number as indicated on factory wiring diagram.
 - (3) Control wire to be MTW 90EC #14 AWG.
 - b. Electrically ground all components to a common ground screw.
 - c. Provide printed wire markers for each wire termination point.
 - d. Neatly route all internal wiring in enclosure:
 - (1) Plastic Wireway with cover
 - (2) Panduit
 - (3) Engineer-Approved Equal
 - e. Provide continuous internal wiring between termination points with no splices.
 - f. Protect looped wiring between control panel interior and front panel from abrasion by using plastic spiral wrap or braided polyester sheath.
 - g. Provide forked spade type wire lugs where used.
12. Control Panel Functional Operation:
- a. HAND-OFF-AUTO selector switch settings (per fan)
 - b. In AUTO mode, the LEAD fan will start by chlorine gas detector signals (two total). The LEAD fan will run until the RESET button is pushed or is shut off by the differential pressure switch activating. The LAG fan will run until the RESET button is pushed if activated by the differential pressure switch.
 - c. In HAND mode, the fan will run while HAND position remains selected.
 - d. In OFF mode, the fan is disabled.
13. Upon alarm signal from the chlorine gas detectors (from remote chlorine detector dry contacts):
- a. Illuminate chlorine leak lamp.
 - b. Start LEAD fan immediately.
 - c. Illuminate fan running lamp.

14. The LEAD fan will run until the control panel RESET push button is depressed and the chlorine detector alarm is cleared or if deactivated by the differential pressure switch.
15. The LAG fan will run after the differential switch is activated and until the control panel RESET push button is depressed and the chlorine detector alarm is cleared.
16. Upon RESET, if the chlorine detector alarm is cleared, the fan will stop. With the HAND-OFF-AUTO selector switch remaining in AUTO position the fan will remain in a ready mode and will restart automatically upon another chlorine detector alarm.
17. IF the scrubber is running, in HAND or AUTO, stop the operation of the ventilation fan(s).
18. Provide signal to plant SCADA to indicate scrubber run status.

2.06 DUCTWORK:

A. General:

1. Refer in accordance with Section 23 31 16.
2. Ductwork passing through walls or floors of chlorine storage area caulked gas tight as specified for plumbing work.
3. The Contractor shall supply and arrange the FRP suction and discharge ductwork at the points of application as indicated on drawings. Sizes and capacities not specified herein are indicated on drawings.

B. Chlorine gas and treated exhaust air:

1. No Loss Dilution Exhaust Stack
 - a. FRP construction, flanged
 - b. The exhaust stack shall be the “No Loss” induced dilution air design.
 - c. The stack shall include a 300 series stainless steel bird screen and rain cap/hood
 - (1) The bird screen shall not cause excessive head loss to the fan.
 - d. Size: 20-inch
 - (1) The plain end of the inner duct section shall be covered with a 1 1/2-Inch square bird screen.

1. 1 1/2-Inch SCH 40 PVC

2. 1-Inch SCH 40 PVC

2.09 PVC VALVES

A. Media Sample Ports:

1. 1 1/2-Inch PVC ball valves.

2.10 DAMPER VALVES

A. Treated exhaust air:

1. 20-Inch round control type FRP damper.

B. MANUFACTURER:

1. Ruskin.

2. Engineer-Approved Equal.

2.11 DUCTWORK FITTINGS:

A. Refer to Section 23 31 16.

B. Chlorine gas:

1. Material to be the same as the dry media scrubber.

2.12 FITTINGS:

A. Chlorine gas and treated exhaust air:

1. Refer to Section 23 31 16.

2. .

3. 1/2-Inch FRP flanged joint fittings.

B. Treated scrubber and fan effluent drainage waste:

1. 1 1/2-Inch SCH 40 PVC fittings.

2. 1-Inch SCH 40 PVC fittings.

2.13 DIFFERENTIAL PRESSURE GAGE AND SWITCH:

A. Differential pressure gage and switch shall be in accordance with Section 40 73 00.

- B. The differential pressure switch shall activate if the differential pressure falls below 10-inch W.C.
- C. The differential pressure gage and switch shall be mounted on the dry media tank per guidance of tank manufacturer.
- D. Route associated tubing to measure the pressure differential across the media bed.

2.14 RESIDUAL CHLORINE GAS DETECTOR AND TRANSMITTER

- A. Schedule: AE 0301-16 / AIT 0301-16.
- B. Type: Chlorine gas monitor and transmitter.
 - 1. Power: 5 W, 30 VDC
 - 2. SPDT contacts rated at 220VAC, 5 A.
 - 3. Signal output at 4 mA to 20 mA.
- C. Solid state type consisting of attached sensing unit (probe) and electronic control and transmitter unit (NEMA 4X housing).
- D. Mount sensor with sensing probe protruding into top FRP duct and sensor and transmitter remaining outside of duct as shown in the engineer drawings and per manufacturer's installation instructions for ductwork mounting.
- E. Sensor will detect up to 5 PPM (by volume of air) with 0.1 PPM resolution. Two additional sets of relay contacts (unpowered) to permit operation of external alarms and other equipment
 - 1. The alarm setpoint shall be greater than 0 PPM (by volume of air).
- F. Upon detection of gas at the alarm setpoint, control unit to send signal to shut off emergency dry gas scrubber.
- G. MANUFACTURERS:
 - 1. MSA Safety
 - 2. Approved-Equal

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install all emergency dry type chlorine scrubber system and connecting ductwork in accordance with manufacturer's instructions and as indicated.

- B. Anchor with 316 stainless steel hardware.
- C. Block and shim tank and fans as necessary to place at proper elevation plumb and level.
- D. Grout in place using non-shrink grout in accordance with Section 03 60 00.
- E. Snug and anchor bolt nuts as necessary.
- F. Erect system in the field in accordance with the manufacturer's installation drawings.
- G. Installation shall encompass the total emergency dry type chlorine scrubber system.
- H. Wiring to be in accordance with Section 26 05 20.
- I. Prior to testing and start-up, inspect the installation to verify the system is ready for complete testing and calibration of equipment.
- J. The dry media holding tank shall be mounted on a neoprene rubber mounting pad, 1/4-inch thick as specified by the tank vendor. Field route all piping connecting to the dry media holding tank with suitable deflection to accommodate the mounting pad.

3.02 FIELD QUALITY CONTROL: (CALIBRATION AND ACCEPTANCE TESTING)

- A. No form of energy shall be turned on to any part of the system prior to receipt by Engineer of certified statement of approval of installation from Contractor containing his supplier's authorization to energize system, except that supplier's servicemen may do so for purposes of check-out.
- B. After installation, and in presence of the Engineer, test system for a minimum of four (4) hours
- C. Perform an acceptance test to verify the satisfactory operation of the system and the design performance requirements of the specification. As a minimum, the test shall include but not be limited to the following:
 - 1. Conduct test in a representative section of the full-scale scrubber, at full scale media bed depth, and equivalent chlorine gas loads.
 - 2. The chlorine load rate, to test the system, shall be as a minimum, represent full scale operation of 400 lbs/min. for one minute, followed by 80 lbs/min. for the balance of the test at a full-scale load of 4,700 lbs.
 - 3. Replace dry media after testing.
 - 4. Test Data shall include:
 - a. Media temperature
 - b. Air discharge temperature

- c. Combined chlorine gas and air volume flow rate at scrubber inlet throughout the test run.
 - d. Continuous recording of scrubber discharge chlorine gas concentration, measured to +/- 5 ppb accuracy.
 - 5. Conduct further tests to verify that the proposed scrubber system will perform as specified with media at a start-up temperature as low as -40°F without the requirement for supplemental heating.
 - 6. Test shall demonstrate a continuous air discharge containing less than 5 ppb.
 - 7. Test results shall demonstrate a continuous air discharge containing less than 5 ppb chlorine concentration throughout the equivalent design load (4,7000 lbs) portion of the test.
 - D. At the time of the tests make all adjustments necessary to place equipment in satisfactory working order.
 - E. Repair or replace as necessary and retest all items failing to pass required tests at no additional cost to Owner.
- 3.03 FIELD TOUCH-UP PAINTING:
- A. Field painting to be in accordance with Section 09 96 00.
 - B. No protective coating shall be applied to improperly prepared surfaces.
 - C. Application of prime coats shall be accomplished immediately after any area has been prepared.
 - 1. No discoloration of the cleaned areas may have occurred prior to the application of the prime coat.
 - D. Color of ductwork, stack, and media tank as selected by owner.
 - E. After installation and acceptance testing by the Engineer apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.
- 3.04 CONTRACT CLOSEOUT:
- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 44 42 13.03

FLOATING SUPERNATANT DECANter

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide and test three (3) floating decaners to extract supernatant from the backwash waste holding tanks. Decanter will feed pump suction for backwash recycling.
- B. The decanter shall be designed to be capable of withdrawing the effluent at an average rate of 2083 gallons per minute.
- C. Provide decaners, supports, and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

- A. American Society for Testing and Materials (ASTM):
 - 1. A240: Specification for Heat Resisting Chromium and Chromium-Nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels.
 - 2. A295: Standard Specification for High-Carbon Anti-Friction Bearing Steel
 - 3. A530: Specification for General Requirements for Specialized Carbon and Alloy Steel Pipe.
 - 4. A554: Standard Specification for Welded Stainless Steel Mechanical Tubing

1.03 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00:
 - 1. Certified shop and erection drawings.
 - 2. Shop drawing data for accessory items.
 - 3. Manufacturer's literature as needed to supplement certified data.
 - 4. Operating and maintenance instructions and parts lists.
 - 5. Listing of reference installations as specified with contact names and telephone numbers.
 - 6. Shop and Field inspections reports.

7. Recommended spare parts.
8. Recommendations for short and long term storage.
9. Special tools.
10. Shop and field testing procedures and equipment to be used.
11. Manufacturer's product data and specifications for shop painting.
12. Provide a listing of the materials recommended for each service specified and indicated.
13. The latest ISO 9001 series certification or quality system plan.
14. Catalog cuts and technical data for expansion joints, couplings, gaskets, pipe supports and other accessories.

B. Material Certification:

1. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.
2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
3. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.
4. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.
 - a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 - b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in

submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 SPARE PARTS:

- A. Comply with requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

- A. Provide in accordance with Section 01 43 00 and as specified herein.
- B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 60 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Parkson
- B. Evoqua.
- C. Sanitaire
- D. Or, pre-approved equal

2.02 DECANTER MATERIALS AND FABRICATION:

- A. Decanters:
 - 1. Fixed decanters will not be acceptable
 - 2. Each decanter shall consist of a withdrawal manifold with orifices, a single foam filled float, and shall be capable of intermittent operation.
 - 3. The decanter assembly shall be constructed of machine filament wound, fiberglass reinforced, thermosetting resin pipe fabricated in strict accordance with ASTM Specification D-2996-01.
 - 4. Each orifice shall allow equal flow into the draw tube. The hydraulic differential provided shall be a maximum of 2.0 feet (plus pipe friction losses) determined as the differential head, under flowing conditions, between backwash waste tank bottom water level and backwash recycle pump suction.

5. The draw tube, containing the orifices for removal of supernatant shall be integrally attached to the foam filled float such that the float remains level throughout the full range of operation, and to maintain submergence of the orifices of the main body will be connected to the effluent piping by means of an 12" flanged stub.
6. The effluent pipe shall include a "knee" joint to allow vertical movement. The "knee" joint shall be wire reinforced rubber hose with a flange at each end, and include a support mechanism that allows vertical articulation, but precludes lateral or twisting movement.
7. Hose shall be suitable for abrasive materials, and shall be rated at 30 inches mercury vacuum and 15 PSI working pressure.
8. The effluent pipe shall be provided with a flanged connection for mounting the decanter system to the installed pipe through the basin wall.
9. Flange connection shall be in accordance with ANSI standard 150-pound bolt pattern. Hardware at this flanged connection interface shall be furnished by the contractor.
10. Decanters shall include assembly joints as necessary to fit through a 48"x72" access hatch should removal/installation of the decanter through the hatch be required.

B. Supports:

1. All necessary supports for the decanter mechanism shall be provided. Supports shall be constructed of 304 Stainless Steel
2. The supports will be located on the basin floor, and will support the decanter mechanism when the basin is dewatered
3. The supports shall consist of a support plate welded to a supporting base. The base shall be anchored with anchor bolts and grouted in place, if necessary. Fastening hardware shall be Type 18-8 stainless steel.

2.03 SHOP PAINTING:

- A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 96 00.
- B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.
- C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment is accepted.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Before assembly, remove dirt and chips from inside pipe and fittings.
- B. Install all items in accordance with manufacturer's printed instructions and as shown and specified.

3.02 FIELD TOUCH-UP PAINTING:

- A. After installation and testing witnessed by the Engineer, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.03 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 46 21 24

SELF-CLEANING STRAINERS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. Provide and install thirteen (13) motorized automatic self-cleaning strainers and appurtenances for straining surface water prior to feeding ultrafiltration membrane equipment.
- B. Motorized automatic backwashing strainers shall be complete with all accessories and appurtenances (including, but not necessarily limited to electric motor, shafting, and safety guard). The starters will be provided by the Electrical Contractor in a smart MCC allowing communication and control over the plant network. The actuated valves and programming will be performed by the OEM. The General Contractor will provide all other valves.

1.02 REFERENCES:

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to Division 01 General Requirements.
- B. Refer to Section 40 23 19.05 for Process Piping and Appurtenances requirements.
- C. Refer to Section 40 23 13.01 for Process Valves and Appurtenances requirements, including pneumatic actuators.

1.03 SUBMITTALS:

- A. Comply with the requirements specified in Section 01 33 00.
- B. Shop Drawings and Product Data
 - 1. Make, model, weight and horsepower of each equipment assembly.
 - 2. Manufacturer's catalog information, descriptive literature, specifications and identification of materials of construction.
 - 3. External utility requirements such as air, water, power, drain. etc., for each component.
 - 4. Functional description of internal, external instrumentation and controls to be supplied including list of parameters monitored, controlled, or alarmed.
 - 5. Control panel arrangement drawings.
 - 6. Power and control wiring diagrams, including terminals and numbers.

7. Shop and field painting systems proposed: Include manufacturer's descriptive technical catalog literature and specifications.

- C. Operation and Maintenance Manual: Provide Operation and Maintenance Manuals in accordance with Section 01 78 23.

1.04 SPARE PARTS:

- A. Comply with requirements specified in Section 01 61 00.
- B. Provide the following spare parts:
 1. Three sets of retaining rings, inspection cover gasket, cover o-ring, packing set, and drum seal ring
 2. Two bearing sets.
 3. One complete set of any special tools required to maintain or dismantle the strainer.
- C. All spare parts shall be packed for long-term storage in containers that are clearly identified with indelible markings.
- D. Parts shall be of the same manufacturer and quality as those provided with the equipment.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Quality Control Submittals
 1. Written certification that the factory-applied coating system(s) is identical to the requirements specified.
 2. Special shipping, storage and protection, and handling instructions.
 3. Manufacturer's written/printed installation instructions.
 4. Routine maintenance requirements prior to plant startup.
 5. Manufacturer's Certificate of Authorization from ASME and ISO 9001.
 6. Shop Test Reports of motor run test, hydrostatic pressure test and dimensional verification.
 7. Operation and maintenance manuals.
- C. Installer's Qualifications: The installer shall be approved by the strainer manufacturer, with final installation inspected and approved by a representative of the strainer manufacturer.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10 and as specified herein.
- B. Handling, delivery, and storage of the strainer equipment shall be in compliance with the manufacturer's written instructions. All equipment items shall be properly protected so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and such equipment is ready for operation.
- C. All equipment and parts shall be properly protected against any damage during storage at the site. Factory-assembled parts and components shall not be dismantled for shipment unless permission is received in writing from the Engineer.
- D. Finished iron or steel surfaces not painted shall be properly protected to prevent rust and corrosion. Strainer and motors shall be stored in a dry sheltered environment, protected from weather.

1.07 WARRANTY:

- A. The supplier shall guarantee in writing that the equipment furnished is appropriate for the intended service and shall be free of manufacturing and fabrication defects in material and workmanship for a period of 1 year after the equipment is satisfactorily placed in service.

PART 2 - PRODUCTS

2.01 SHOP PAINTING

- A. Furnish manufacturer's standard baked enamel finish. Color as selected by Owner from available colors.

2.02 AUTOMATIC STRAINERS FOR SURFACE WATER:

A. General

- 1. Fluid: Surface water from the Provo River.
- 2. Use: Potable water, all materials must be NSF approved.
- 3. Design Pressure: 150 psi.
- 4. Operating Pressure (inlet): 15 to 50 psi.
- 5. Fluid Temperature: 34 deg F minimum, 90 deg F maximum.

B. Sizing Information

- 1. Strainer Quantity: 13

2. Design flow: 2,500 gpm minimum rating per strainer
3. Maximum clean differential pressure loss: 3 psi at 1,800 gpm per strainer.
4. Process Connection: 10-inch flanges, faced and drilled, 150-pound. ANSI B16.5.
5. Straining element rating: 200 micron

C. Strainer Construction

1. Body: Fabricated carbon steel or cast iron, epoxy-lined.
2. Cover: Fabricated carbon steel or cast iron, epoxy coated.
3. Shaft: Carbon steel, ceramic coated at packing area.
4. Straining Element: 304 stainless steel, reinforced.
5. Backwash shoe: cast iron
6. Clear inspection window over backwash shoe.
7. Internal Fasteners: 316L stainless steel
8. Retaining Rings: Delrin.
9. Packing: Chevron pressure seal

D. Motors: Maximum 1 HP each, 460 volts, 3-phase, 60 Hz, TEFC.

E. Manufacturer

1. S.P. Kinney.
2. Bollfilter.
3. Eaton.

2.03 CONTROLS:

- A. OEM shall supply a control system for the initiation of backwashes. These can be initiated automatically by high differential pressure condition, timed operation, initiated manually by the operator.
- B. See full control description and I/O requirements in division 40 specifications.

2.04 APPURTENANCES:

- A. Backwash Monitoring and Control Devices

1. Provide a differential pressure switch with visual indication of differential pressure for measurement of differential pressure across the strainer and initiation of backwash cycle. Provide valves for isolation and flushing of the instrument.
 2. Mount differential pressure switches, and valves on each unit using stainless steel tubing and fittings.
- B. Lifting Lugs: Provide suitably attached for all equipment assemblies and components weighing over 100 pounds.
- C. Equipment Anchor Bolts: Type 316 stainless steel sized by equipment manufacturer at least 1/2 inch in diameter, or as shown.
- D. Equipment Identification Plates: Provide 16-gauge Type 316 stainless steel identification plate securely mounted on each separate equipment component and control panel(s) in a readily visible location. Plate shall bare 3/8-inch-high engraved block type black enamel filled equipment identification number and letters.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Follow the manufacturer's recommended procedures for testing, adjusting, and placing of equipment into proper operation.
- B. Install as shown on the drawings, approved shop drawings, and as recommended by the manufacturer.
- C. Route the backwash outlet piping to the waste tanks as shown on the drawings.
- D. Provide all necessary power and signal wiring for operation of the strainers and backwash control valves.
- E. Check condition of bearings in strainer. Add lubricant according to manufacturer's recommendations.
- F. Check for proper motor rotation.

3.02 MANUFACTURER'S SERVICES:

- A. Comply with requirements specified in Section 01 43 00.
- B. The OEM shall provide at least one (1) qualified field representatives to be on-site to coordinate and supervise the installation (1 day), startup and testing (3 days) of the strainers.
- C. Provide 4 hours of on-site Owner training following commissioning of the strainers, which shall be provided in one session

- D. Startup services and training of Owner's personnel shall be at such times as requested by the Owner.
- E. Additional time required to perform these services shall be at no additional cost to the Owner. The Owner shall be credited for the unused portion of startup services.

3.03 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 46 31 11.01

CHLORINE GAS FEED EQUIPMENT AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Provide and test chlorination equipment and appurtenances, as indicated and in compliance with Contract Documents.
- B. Provide chlorination system complete. And before acceptance make each system fully operational and ready for use by the Owner.
- C. Chlorine for testing to be supplied by the Owner. After testing is completed, chlorine is to be left for use by the Owner.
- D. Chlorination systems to meet the following regulatory requirements:
 - 1. The Utah Department of Environmental Quality, "R309-200. Monitoring and Water Quality: Drinking Water Standards" (Latest Revisions).
 - 2. The Utah Department of Environmental Quality, "R309-520. Disinfection" (Latest Revisions).

1.02 REFERENCES:

- K. Utah Department of Environmental Quality (UDEQ)
 1. R309-200: Monitoring and Water Quality: Drinking Water Standards
 2. R309-520: Disinfection
- 1.03 SUBMITTALS:
 - A. Submit the following shop drawings in accordance with Section 01 33 00:
 1. Prior to initial submittal, arrange conference in Engineer's office with Engineering Representatives of equipment vendor who are familiar with specification to discuss overall job concept.
 2. When the Contractor proposes equipment which requires an arrangement differing from that indicated on the drawings or specified, prepare and submit for review detailed structural, mechanical, and electrical drawings and equipment lists, utilities consumption schedule and operating instructions, showing necessary changes and embodying special features of the equipment he proposes to furnish. Make changes, if accepted at no additional cost to Owner.

3. Provide calculations for chlorine ejector/injector.
 4. Provide ejector/injector curve with operating point indicated.
 5. Certified shop and working drawings.
 6. Certified setting plans, with tolerances, for anchor bolts.
 7. Operating and maintenance instructions and parts lists.
 8. Shop drawings details for accessory items.
 9. Number and identify components to correspond with terminology on drawings. Use these numbers on all submittal sheets and shop drawings.
 10. Recommendations for short and long term storage.
 11. Sales bulletins or other general publications are not acceptable as submittals for review except where necessary to provide supplemental technical data.
 12. ISO 9001 certification or other quality control manual demonstrating a complete system for quality management.
 13. Chlorination equipment manufacturer must be capable of providing a list of customers using at least five (5) similar system for at least ten (10) years.
 14. Material Certification:
 - a. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.
 - b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.
 15. Certified results of factory tests.
- B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

1. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.
- C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.
1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.
 2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

1.04 SPARE PARTS:

- A. Provide in accordance with Section 01 61 00 and as specified herein.
- B. Furnish spare parts, identical and interchangeable with similar parts installed in work:
1. Three sets of spare gaskets.
 2. Two spare auxiliary tank valves for ton containers.
 3. 20 spare feet of drain hose and 20 spare feed of chlorine gas tubing.
 4. Two chlorine header-to-cylinder whips transfer hoses.
 5. Two spare switches for high/low vacuum alarm complete with diaphragm seals.
 6. One chlorine pressure gauge complete with diaphragm seal.
 7. One emergency repair kit for ton containers.
 8. Three vacuum regulators for 1-ton containers
- C. Provide all other manufacturer's recommended spare parts necessary to maintain each piece of equipment for period of one year.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00
- B. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes. Provide systems and items of equipment that conform to applicable safety standards including those for safety of personnel.

- C. Provide components to manufacturer's standard for service specified and indicated unless otherwise required.
 - D. Provide equipment of manufacturers' latest and proven design. Unit to be a standard cataloged product and modified as specified and indicated.
 - E. Services of Manufacturer's Representative as stated in Section 01 43 00 and as specified herein.
 - F. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:
 - 1. Service Technician must have a minimum of five (5) years of experience, all within the last seven (7) years, on the type and size of equipment.
 - 2. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.
 - 3. Installation: Inspect system arrangement, interconnecting tubing and piping, and certify proper installation has been performed:
 - a. 1 person-day.
 - 4. Functional Testing and Field Testing: Calibrate, check alignment and perform a functional test to include all items specified. Perform field performance testing of equipment specified.
 - a. 2 person-days.
 - 5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials and preparation to lead and training.
 - a. 1 person-day.
 - 6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.
 - 7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.
- 1.06 DELIVERY, STORAGE AND HANDLING:
- A. Comply with the requirements specified in Section 01 66 10.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- A. Provide a complete chlorine gas system as shown on the drawings and as specified herein. System includes cylinder scales and trunnions, vacuum regulators and automatic switchover equipment, chlorinators, injectors, gas and liquid piping / tubing and valves, gauges and analyzers, leak detection and alarm equipment, safety equipment, and other accessories for a complete functional and operable system. 1-ton chlorine gas cylinders will be provided by the Owner.

2.02 MANUFACTURERS:

- A. Pre-qualified chlorination system equipment manufacturers are listed below. Miscellaneous components of the system that are not a product of the selected manufacturer may be provided by the Contractor or the Manufacturer. Manufacturer and Contractor to coordinate their scopes of supplier prior to bid.

- 1. Wallace & Tiernan (Evoqua Water Technologies, LLC).

2.03 PIPING:

A. General:

- 1. Piping in accordance with Section 40 23 19.05.
 - 2. Cold bending of pipe NOT ACCEPTABLE.
 - 3. Piping passing through walls or floors of chlorine storage area and chlorinator room caulked gas tight as specified for plumbing work.
 - 4. Arrange piping at the points of application as indicated on drawings. Sizes and capacities not specified herein are indicated on drawings.

B. Liquid chlorine and chlorine gas under pressure:

- 1. Schedule 80 seamless steel pipe.
 - 2. Conform to ASTM A53/A53M.
 - 3. Manifold at ton containers mounted on protecting angle-iron support frame.
 - 4. Manufacturer's standard whips.

C. Chlorine gas under vacuum:

- 1. Refer to drawings for locations of material type.
 - 2. Polyethylene (PE) Tubing 1/2-inch and greater.

- a. Conform to AWWA C901 for PE Tubing.
- 3. Schedule 80 PVC Pipe 1/2-inch and greater.
 - a. Conform to ASTM D1784 and ASTM D1785 for SCH 80 PVC.
- D. Chlorine solution:
 - 1. Schedule 80 PVC Pipe 1-inch and greater.
 - 2. Conform to ASTM D1784 and ASTM D1785.
- 2.04 VALVES:
 - A. Chlorine Gas Under Pressure:
 - 1. Whip to manifold valves standard Chlorine Institute Valves.
 - 2. Whip to container valves standard Chlorine Institute auxiliary yoke-type tank valves.
 - B. Chlorine gas under vacuum and chlorine solution:
 - 1. Polyvinylchloride (PVC) Type 1, Grade 1 valves as specified under Section 40 23 13.01.
 - C. Vacuum Relief Valve:
 - 1. On solution discharge header line from injectors.
 - 2. Relieve excess vacuum resulting from negative head in solution line.
- 2.05 FITTINGS:
 - A. Liquid Chlorine and Chlorine Gas Under Pressure:
 - 1. 3000-lb. forged carbon steel socket weld fittings.
 - 2. 2000-lb. forged carbon steel screwed fittings.
 - 3. 300-lb. ANSI forged carbon steel flanges or Schedule 80 seamless butt weld fittings for pipe larger than 1-1/2-inch in size.
 - 4. Use teflon tape mixture of linseed oil and white lead or mixture of linseed oil and graphite on male threads where screwed fittings required.
 - 5. Flange gaskets for chlorine of lead containing 3 percent antimony.
 - 6. 1/16-inch thick gaskets for pipe smaller than 2-inch.

7. 1/8-inch thick gaskets for pipe 2-inch and larger.

B. Pressure Gages:

1. Install with header type isolation valves of suitable material.
2. Diaphragm type.
3. Silver or tantalum diaphragms.
4. Fluorocarbon oil filling.

C. Pressure Switches:

1. Install as indicated.
2. Diaphragm seal to protect activating elements.
3. Normally open contacts with field adjustable closure setting.
4. Wired to alarm high gas pressure in manifold.

2.06 CHLORINATION SYSTEM EQUIPMENT:

A. Scales:

1. Manufacturer
 - a. Force Flow
 - b. Eagle Microsystems
 - c. Engineer-Approved Equal
2. 1-Ton Container Scales:
 - a. The scale shall be universal-type suitable for floor mounting as shown on the drawings.
 - b. Platform size shall be approximately 80 inches x 30 inches and capable of holding and measuring up to 2-tons (4,000 pounds).
 - c. Platform and all metal components shall be made corrosion-resistant with a two-coat vinyl epoxy primer.
 - d. Platform shall have zinc plated steel rollers with bronze bushed bearings and grease fittings and locking feature furnished to allow for easy container rotation and to restrain container once set in place.

- e. Scale shall be of the single load cell design. Weight shall be transferred via lever(s) to a single, NTEP approved load cell of the shear beam, strain gauge type. Flexible cable shall connect load cell to indicator to allow easy remote installation of readout. Cable length shall be 20 feet.
 - f. Scale furnished with programmable digital readout/electronic load cell type.
 - g. The Contractor shall supply three tank restraint straps with ratchet buckles for securing the containers in place.
3. Chemical Weight Scale System Indicator
- a. Digital readout with at least 1/2-inch characters, LCD or LED display up to seven (7) digits and in pounds.
 - b. Readout programmable from panel front for units, tare and zero adjustments.
 - c. Powered by 240 VAC or rechargeable battery and capable of retaining stored data for 2 days.
 - d. Indicator shall carry CE marking and shall be housed in a NEMA 4X, UL approved enclosure.
 - e. Indicator shall independently monitor up to four (4) scales.
 - f. Provide, 4-20 mA direct current output for interfacing with SCADA.
 - g. Each indicator shall have up to four (4) adjustable set points for alarms or liquid level control.

4. Schedule

Scale Equipment Tag No.
CGC-0301-1 / WE 0301-1 (Weigh Scale 1)
CGC-0301-2 / WE 0301-2 (Weigh Scale 2)
CGC-0301-3 / WE 0301-3 (Weigh Scale 3)
CP-0301-1 (Chlorine Gas Weigh Scale System Indicator)

B. Locking Storage Trunnions

- a. Epoxy power coated ASTM A36 steel frames with zinc plated steel rollers with bronze bushed bearing and grease fittings furnished and installed to restrain stored ton containers not in use. One of four rollers shall have a locking pin to prevent tank rotation when containers are not in use.
- b. The Contractor shall supply eight (8) storage trunnions.

- c. The Contractor shall supply eight tank restraint straps with ratchet buckles for securing the containers in place.

C. Automatic Change Over System: (Gas Withdrawal)

1. Furnish units as indicated on Drawings. Suitable for installation on one-ton chlorine gas cylinders.
2. Factory preset to reduce chlorine gas pressure to a vacuum.
3. Furnish vacuum regulating valve body of high tensile cast iron and regulatory diaphragm of Hastelloy "C".
4. Vacuum regulating valve designed to automatically switch from on-line container(s) to reserve container(s) when on-line supply is exhausted. Design to allow manual shutoff, and withdrawal from both supplies until fully exhausted.
5. Equipped with traps and filters to exclude impurities from system.
6. Standby relief device to vent in the event of pressure check valve malfunction.
7. Provide 120 V power supply for each regulator.
8. Each vacuum regulator shall be connected to a vent line and combined common header which is routed to the outside of the chlorine gas storage room above grade per drawings and in accordance with Section 40 23 19.05. The termination point of the common header vent end shall be covered with No. 14, Type 304 stainless steel mesh, non-corrodible screen.
 - a. Tubing: 3/8-inch polyethylene tubing
 - b. Common Header: 1-inch SCH80 PVC
9. Vacuum Regulator Schedule

Tag No.	Capacity
RGL-0301-1	500 PPD
RGL-0301-2	500 PPD
RGL-0301-3	500 PPD
Spare regulators (3)	500 PPD

D. Chlorinators:

1. Visible flow, solution feed, vacuum type arranged for automatic pacing from 4-20 mA flow transmitter signal and with manual dosage adjustment.

2. All necessary accessories included. Signal wiring shielded. All necessary relays included to eliminate interference with flow transmitter.
3. Chlorine gas metered under partial vacuum created by injector located near each chlorinator.
4. Each chlorinator equipped with necessary piping and fittings. Chlorinators contain automatic safety features to prevent escape of chlorine gas in event of (1) loss of vacuum, (2) failure of water supply, (3) blockage of solution line, and (4) breakage of any part of vacuum system.
5. Each chlorinator includes vacuum breaker to prevent excess vacuum.
6. Chlorinator components mounted in self-contained, corrosion-resistant wall or floor mounted cabinet as indicated.
7. Each chlorinator paced by motorized plug positioner. Flow pacing signal 4-20 mA direct current signal.
8. Furnish each chlorinator with pressure indicators to indicate injector vacuum and pressure of chlorine supply to chlorinator. Furnish chlorinators with AUTOMATIC/MANUAL switch. Wire AUTOMATIC/MANUAL switches to provide pacing signal in AUTOMATIC positions.
9. Each chlorinator equipped with alarm actuators to indicate loss of vacuum, and excess vacuum.
10. Provide 120 V power supply for each chlorinator.
11. Schedule

Tag No.	Service	Chlorinator and Metering Tube Capacity
CL / CP-0301-4	CIP Tank 1 & 2	500 PPD
CL / CP-0301-5	CIP Tank 1 & 2	500 PPD
CL/ CL-0301-6	Treatment Process Chlorination	750 PPD
CL / CL-0301-7	Treatment Process Chlorination	750 PPD

E. Injectors

1. Hydraulically operated injectors furnished for each chlorinator wall or pipe mounted units and sized to ensure optimum water usage and vacuum. Injectors sized to operate against a back pressure at point of injection, at flow rate and supply pressure indicated on schedule.

2. Schedule

Injector Schedule				
Tag No.	Service	Back Pressure (psig)	Supply Pressure (psig)	Flow Rate (gpm)
INJ-0301-12	CIP Tank 1 & 2	5	70	15
INJ-0301-13	CIP Tank 1 & 2	5	70	15
INJ-0301-14	Chlorination	6	37.5	30
INJ-0301-15	Chlorination	6	37.5	30

F. Rotameters:

1. Visual flow indicating rotameters suitable for chlorine solution service each having a range suitable to dispense the full output of one of the chlorinators furnished and calibrated in gallons per minute.
2. Rotameters furnished with all mounting hardware.
3. Size and configuration of rotameters as indicated on the drawings.
4. Provide engraved plastic nameplates furnished which indicate point of application served by each rotameter, and suitably affixed above each rotameter.
5. Schedule

Rotameter Schedule		
Service	Tag No.	Flow Range (gpm)
CIP Tank 1 & 2	FI 0301-12	0 - 15
CIP Tank 1 & 2	FI 0301-13	0 - 15
Chlorination	FI 0301-14	0 - 30
Chlorination	FI 0301-15	0 - 30

G. Chlorine Gas Leak Detectors:

1. Solid state type consisting of remote sensing unit (probe) and electronic control unit (NEMA 4X housing).
2. Sensing probe (detector unit) located approximately 6 inches above the floor adjacent to the chlorine supply as shown in the contract drawings.
3. Each receiver control box shall be located in the vicinity of the sensor unit at an exterior entrance to the chlorine gas storage room.

4. Receiver control box will detect 0.5 PPM to 10 PPM (by volume of air) and actuate appropriate alarm relays and lights. Two additional sets of relay contacts (unpowered) to permit operation of external alarms and other equipment. Contacts rated at 250V, 10 A.
 - a. The warning setpoint (user-adjustable) shall be 0.5 PPM (by volume of air).
 - b. The alarm setpoint shall be 1 PPM (by volume of air).
5. In the event of power failure, two integral batteries will maintain operation for up to four hours.
6. Control unit equipped with test switch to check operation of alarm circuits and control unit itself.
7. Upon detection of gas at the warning or alarm setpoint, control unit to send signal to activate the emergency dry gas scrubber and sound the alarm horns.
8. Schedule

Tag No.
AE 0300-1 / AIT 0300-1
AE 0300-2 / AIT 0300-2

H. Standby Chlorine Gas Masks:

1. Manufacturers:
 - a. Scott Safety.
 - b. MSA (Mine Safety Appliances Co.)
 - c. Globe Safety Products Inc.
 - d. American Optical Corp., Safety Products Div.
2. 30-minute capacity self-contained breathing apparatus
 - a. Provide a self-contained unit of type approved by U.S. Bureau of Mines, Title 42 CRF part 84, and NPPTL Certified Equipment List for use for minimum of 30 minutes severe service in toxic and oxygen deficient area. Full-vision face mask suitable for use by persons wearing eyeglasses, with shatterproof-glass eyepiece cushioned in rubber; molded rubber face piece with exhalation valves; and easily adjustable head straps. Breathing tube of corrugated, noncollapsible, flexible, chlorine-resistant material.
 - (1) Apparatus includes demand regulator with provisions to maintain positive static pressure in mask, manual bypass and pressure gage,

alarm, tubing, lightweight 45 cubic feet air cylinder with valve, and adjustable backpack harness with cylinder carrying frame, and complete with carrying case.

- b. Furnish one spare charged 45 cubic feet air cylinder complete with valve.
- 3. 5-minute capacity escape gas masks and bottles
 - a. Furnish three self-contained unit of type approved by U.S. Bureau of Mines, Title 42 CRF Part 84, and NPPTL Certified Equipment List for use for 5 minutes severe service in toxic and oxygen deficient area. Full-vision face mask suitable for use by persons wearing eyeglasses, with shatterproof-glass eyepiece cushioned in rubber; molded rubber face piece with exhalation valves; and easily adjustable head straps. Breathing tube of corrugated, noncollapsible, flexible, chlorine-resistant material.
 - (1) Each apparatus includes demand regulator with provisions to maintain positive static pressure in mask, manual bypass and pressure gage, tubing, lightweight 15 cubic feet air cylinder with valve, and adjustable backpack harness with cylinder carrying frame, and complete with carrying case.
 - b. Furnish three spare 5-minute escape bottles
- 4. Provide suitable wall mounting equipment and hardware for gas masks and air cylinders. Installed location to be as directed by the Owner.
 - a. AO Safety (Aearo Technologies / 3M)
 - b. AO Safety (Aearo Technologies / 3M)

I. Chlorine Gas Leak Detection Kit

- 1. Provide an aqua ammonia test kit for detecting chlorine gas leaks which includes the following:
 - a. One, 16-oz. wash bottle with an ammonium hydroxide hazard label
 - b. A minimum of five cotton swabs
 - c. 16-oz. of aqua ammonia, commercial 26 degree Baume (29.4 percent) ammonia.

J. Vacuum Alarm Switch:

- 1. Switches located on chlorinators, install and wire into control unit as specified by supplier.

2. Provide suitable hardware for mounting the equipment to the wall or Unistrut frame.
 - a. Connect Teflon tubing from the vacuum switch to the vacuum line.
 - (1) 0.158-inch inner diameter, 0.236-inch outer diameter Teflon tubing
 - b. Use flexible conduit wiring as shown on drawings.
3. Schedule

Schedule	
Location	No.
Gas Vacuum Feed Line	PSH 0301-3
Chlorinator 1	PSH 0301-4
Chlorinator 2	PSH 0301-5
Chlorinator 3	PSH 0301-6
Chlorinator 4	PSH 0301-7

K. Audible Alarm Horn

- a. Provide alarms as indicated on the drawings to produce no less than 110 decibels from 1 meter distance and shall sound when activated by detection of chlorine gas by the analyzer.
- b. Mount alarm on wall at location directed by engineer.
- c. Alarms shall be suitable for 120 VAC power and powered by the associated chlorine gas analyzer.
- d. Quantity: Two (2)

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install all equipment and connecting piping in accordance with manufacturer's instructions and as indicated.
- B. Install all chlorine injectors at a slight, upward slope so that the discharge end is higher than the inlet end to prevent air entrapment in the injector throat. Field route all piping connecting to the injectors with suitable deflection to accommodate the slight, upward slope through the injectors.

- C. Prior to testing and start-up, inspect the installation to verify the system is ready for complete testing and calibration of equipment.
- D. Testing to be done with chlorine gas. Chlorine gas will be supplied by the Owner.

3.02 CLEANING:

- A. Work to be done in accordance with Chlorine Institute pamphlets.
- B. Carefully clean all portions of chlorine systems before use so that chlorine will not react with any cutting oil, grease and other foreign and oxidizable materials. Clean by pulling through each length of pipe a lint-free cloth saturated with trichloroethylene or other suitable chlorinated solvent. Do not contact any plastic pipe or equipment with solvent. Hydrocarbons or alcohols are NOT ACCEPTABLE because residual solvent may react with chlorine. Dismantle and clean new valves and other equipment before use. If valve packings are oily or dirty, repack valves with manufacturer's recommended packing . Test valves with clean, dry 300-psi air for seat tightness as specified hereinbefore.
- C. Chlorinated solvents can produce very serious physiological effects unless used in strictest compliance with the solvent manufacturer's safety recommendations. Instruct workmen in the proper use, disposal and handling of these solvents.

3.03 FIELD QUALITY CONTROL: (CALIBRATION AND ACCEPTANCE TESTING)

- A. No form of energy shall be turned on to any part of the system prior to receipt by Engineer of certified statement of approval of installation from Contractor containing his supplier's authorization to energize system, except that supplier's servicemen may do so for purposes of check-out.
- B. After installation, and in presence of the Engineer, test all pipelines for tightness in acceptable manner. Furnish suitable testing plugs or caps, all necessary pipe connections, test fluids, gages, other equipment and all labor required for these tests.
- C. Remove or valve off from lines all instrumentation and appurtenant equipment which is incapable of withstanding the test pressures.
- D. Hydrostatically test all PVC chlorine solution piping with water to 100 psig pressure. Prior to test, remove or isolate solution rotameters and any other devices which may be incapable of withstanding test pressures.
- E. Then pressurize chlorine supply system to 300 psig with dry air or nitrogen and test for leaks by application of soapy water to outside of all joints. After pressure testing all piping gradually introduce chlorine gas and test the system for leaks as described below. Make no attempt to repair leaks by welding unless all chlorine gas has been completely purged from the system. When leaks have been repaired, retest the line.

- F. Test for chlorine leaks as follows; tie a cloth to end of a stick, soak cloth with aqua ammonia, and hold close to suspected area. A white cloud will result if there is any chlorine leakage. Use commercial 26 degree Baume (29.4 percent) ammonia.
 - G. Test and dry all piping as outlined in the latest edition of the Chlorine Institute Manual.
 - H. At the time of the tests make all adjustments necessary to place equipment in satisfactory working order.
 - I. Repair or replace as necessary and retest all items failing to pass required tests at no additional cost to Owner.
 - J. Test chlorine leak detectors.
 - K. After installation of equipment in the presence of the Engineer, operate each unit to demonstrate its ability to operate without leakage and to perform its specified functions satisfactorily.
 - L. Have manufacturer's service engineer test pacing and trimming system at 10, 50 and 80 percent of scale to demonstrate that chlorinator response to pacing and trimming signals is within manufacturer's published accuracy statement.
 - M. Test loss of vacuum switches and alarms, and loss of chlorine and high gas pressure switches and alarms by shutting down water supply to each chlorinator and altering chlorine gas supply. Repeat tests as necessary and correct defects.
 - N. Clean, repair to satisfaction of the Engineer, or replace all equipment or property damaged by testing procedures at no additional cost to the Owner.
 - O. Operate chlorinators over 8-hour period at fixed rates to demonstrate that feed rate is within manufacturer's published range.
- 3.04 FIELD TOUCH-UP PAINTING:
- A. After installation and acceptance testing by the Engineer apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.
- 3.05 CONTRACT CLOSEOUT:
- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 46 31 53

OZONE GENERATING AND FEED EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. Furnish, install, and commission a complete ozone delivery system including the following:
 - 1. Liquid and gaseous oxygen storage and conditioning equipment including LOX storage tank, vaporizers, electric trim heater, oxygen pressure regulating manifold, and nitrogen boost system.
 - 2. Ozone generation system including ozone generators and power supplies, closed loop chillers, and ozone gas monitoring and flow control manifolds.
 - 3. Ozone injection and pressurized solution injection system including a skid with ozone gas flow control, motive water booster pumps, venturi style ozone gas injector, and related instruments, piping, and valves. Inject system also includes an off-skid pipeline flash reactor to be installed in the field by the Contractor.
 - 4. Ozone off-gas handling equipment including de-misting units and ozone destruct units.
 - 5. All associated analog and digital analytical instruments including gauges, pressure and temperature transmitters, flow meters, dew point analyzers, ozone analyzers, and ambient air ozone detectors.
 - 6. System controls package.

1.02 REFERENCES:

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to Division 01 General Requirements.

1.03 SUBMITTALS:

- A. Submit the following shop drawings in accordance with Section 01 33 00:
 - 1. Sustainable Design Submittals.
 - 2. Drawings, including process and instrumentation diagrams (P&ID)
 - 3. Cut sheets
 - 4. Performance curves

5. Spare parts list
6. Testing documents
7. Schematic electrical diagrams.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00 and provide the following:
 1. O2 Filter Element
 2. O3 Analyzer filter
 3. Solenoid Valve
 4. Solenoid Valve Coil
 5. One (1) each size fuse or circuit breaker
 6. Input Card
 7. Output Card
 8. Control Relay
 9. If the dielectrics do not have a ten-year non-prorated labor inclusive warranty, 10% spare dielectrics shall be provided.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Manufacturer's Qualifications
 1. The ozone generator system supplier (OSS) shall have experience in the design and manufacture of ozone generation systems for a minimum of ten (10) years and shall be able to demonstrate a minimum of twenty (20) installations in municipal water and/or wastewater applications.
 2. The Ozone Sidestream Dissolution System supplier shall have experience in the design and manufacture of ozone dissolution systems for a minimum of ten (10) years and shall be able to demonstrate a minimum of twenty (20) installations in municipal water and/or wastewater applications.
- C. Sustainability Standards Certifications.

1.06 DELIVERY, STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10 and as specified herein.
- B. Assemblies and components provided by the OSS must be properly stored and protected during delivery and handling. Pay special note that some items are provided as cleaned and packaged for oxygen service. Integrity of oxygen cleaning must be maintained throughout storage and installation. Caution should be used to maintain quality of finish for all painted, or otherwise finished, surfaces.

1.07 PROJECT/SITE CONDITIONS:

- A. Ambient Conditions at a publicly owned water treatment plant in Provo, Utah.

1.08 WARRANTY:

- A. The Manufacturer shall provide a written warranty against defects in materials and workmanship. Manufacturer shall warrant the goods provided by the Manufacturer to be free from defects in materials and workmanship under normal conditions and use for a period of one (1) year from the date the goods are put into service. This warranty shall not apply to any goods or parts which have been altered, applied, operated or installed contrary to the Manufacturer's instructions or subject to misuse, chemical attack/degradation, negligence or accident.
- B. The warranty terms above shall apply to the Modular Ozone Generator Cells. Additionally, the dielectric elements of the Modular Ozone Generation Cells shall have a non-prorated labor inclusive warranty for a period of ten (10) years after being placed in service. OSS shall guarantee the specified mass transfer efficiency (MTE) for a period of 60 days following commissioning. The OSS must provide all corrective actions to equipment within their scope of supply to consistently achieve this MTE is failed to be met.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

- A. Description of primary components are included in this section.
 - 1. (1) Ozone Gas Sidestream Injection skid featuring eductors for liquid solution injection into a single Pipeline Flash Reactor located upstream of the ozone contactors. Injection skids shall also include flow and pressure monitoring.
 - 2. (1) Pipeline flash reactor for dissolution of ozone sidestream solution in to the 42" ozone contactor feed piping. The ozone sidestream dissolution system supplier, in conjunction with the Ozone supplier shall determine the number and size of injectors and nozzles based on injection requirements.

3. All manual and automatic control, isolation, and emergency shut-off valves and temperature/pressure safety relief valves as indicated on the drawings and as required for a functioning and automated system. Valves shown on the P&ID drawings which do not feature a tag number shall be provided by the OSS.
4. All analytical instruments including pressure transmitters, temperature transmitters, flow meters, dew point analyzers, flow and pressure switches, ozone gas detecting monitors, and ozone solution detecting monitors. Instruments shown on the P&ID drawings which do not feature a tag number shall be provided by the OSS.
5. Electrical controls with internal components for a complete and functional system.
6. The contractor shall furnish and install all piping, fittings, and valves which are not in the OSS scope of supply. The sizes of such piping shall be as recommended by the OSS based on volumetric flow rates of oxygen and ozone gas and as required to match connection sizes on supplied equipment. Any piping, fittings, and valves supplied by the Contractor to provide a complete and functional system shall be coordinated during bidding to fully determine the scope of OSS and Contractor supply.
7. Boundaries and equipment shown within the OSS scope of supply on the drawings are for reference and the OSS shall provide standard equipment adhering to these specifications.
8. OSS shall clearly identify which components are to be shipped loose for field installation and which are included pre-assembled. Additional cost incurred which is incurred for installation or wiring of any loose-shipped items provided by the OSS shall be performed at no additional expense to the Owner.

2.02 MANUFACTURERS:

- A. The OSS is responsible for supplying the equipment specified herein regardless of whether they are the equipment manufacturer or equipment provided by others.
- B. Ozone System Supplier
 1. Aqua-Aerobic Systems, Inc. ElectrOzone M-Series.
 2. Primozone.
- C. Ancillary equipment (furnished by OSS)
 1. Ozone Sidestream Dissolution System, including injection skid with pumps and accessories, and the Pipeline Flash Reactor.
 - a. Mazzei Injector Company

- (1) Refer to section 43 21 00.23 for specific requirements of Ozone motive water pumps
 - b. Mazzei is the basis of design. For any substitutions, the contractor shall submit a proposal for a substitution with engineering details no less than two weeks ahead of the bid date, for review and approval by the Engineer.
- 2. Liquid oxygen storage tank and vaporizers
 - a. Chart Industries
 - b. Approved Equal.
- 3. Closed Loop Chillers
 - a. MTA TAEevo Tech
 - b. Approved Equal

2.03 PERFORMANCE AND DESIGN CRITERIA:

- A. General description: Project includes two (2) parallel ozone contact basins designed to treat 15 MGD each, for a total of 30 MGD. Ozone is injected in to a 42" Pipeline Flash Reactor in the mainline that then splits flow into each ozone contactor. Ozone system is not for disinfection and is not designed as fully redundant.

The ozone generator shall be capable of producing the required amount of ozone as noted below.

- 1. Ozone generator capacity:
 - a. Number of generators shall be determined by OSS based on standard generator sizes and shall be two (2), three (3), or four (4).
 - b. Total capacity of all generators in service shall not be less than 500 PPD.
 - c. Minimum required output for a single generator shall be $\frac{1}{4}$ (or lower) of the rated generator capacity.
- 2. The ozone system shall be supplied as a complete, fully integrated and working system by the OSS, including programming of PLCs.
- 3. Within the boundary of skid limits, OSS shall provide piping, supports and wiring as shown on the drawings. Other items within the OSS scope of supply are shown as shipped loose items for installation by the Contractor. All other work outside of OSS scope of supply shall be by the Contractor. OSS shall either coordinate with contractor on required size of interconnecting piping and valves or furnish all piping and valves to be installed by the contractor.

2.04 EQUIPMENT:

A. Liquid Oxygen (LOX) System

1. OSS shall furnish one (1) liquid oxygen (LOX) storage tank(s), two (2) ambient air vaporizers, and valves and instruments as shown on the Drawings. OSS or contractor may supply interconnecting piping. Except where shown as part of a skid assembly, contractor to install all system components and equipment, including concrete pads and anchoring. Equipment shall be fabricated, shop tested and shipped as fully assembled units as indicated on the Drawings.
2. All piping sections where liquid oxygen could become trapped by closing valves shall be protected by pressure relief valves. Where additional pressure relief valves, beyond those shown on the Drawings, are required due to piping layout, Contractor to provide. All liquid oxygen service pressure relief valves to be fitted with piping to discharge to a safe location.

B. Liquid Oxygen Storage Tank

1. Number of tanks provided: 1
2. The liquid oxygen storage tank shall be Vertical doubled-walled cryogenic tank(s) based on the following conditions:
 - a. Gross capacity of tank: 9,000 gallons
 - b. Maximum Allowable Working Pressure: 175 psig
 - c. Design Temperature: +150 to -320°F (+120° Max. for inner vessel)
3. Liquid oxygen storage tank shall be double-walled cryogenic construction. The inner vessel shall be 304 SS, designed, fabricated, tested, inspected and stamped in accordance with Section VIII, Division I of the ASME Code. Testing shall include hydrostatic factory test as required by code. The outer vessel shall be carbon steel vacuum jacket, designed for full vacuum internal to support the inner vessel. Vacuum space shall be insulated for a boil-off rate not to exceed 0.3% of the tank capacity, by weight, per day. Tank shall include mounting base for anchoring to concrete pad. All exterior, exposed tank surfaces to be painted with manufacturer's standard paint.
4. Inner vessel pressure relief shall consist of both automatic primary and secondary relief devices and manual tank vent valves. Outer vessel pressure relief shall consist of an automatic relief device. Tank shall include an economizer system to re-direct gaseous oxygen back into the system, rather than venting to atmosphere.
5. Tank shall be pre-assembled with all related safety devices, appurtenances and equipment for proper operation. A pressure building system and appropriate

pressure regulator shall be provided such that pressure leaving the system is not less than 50 psig.

6. Internal piping and fittings shall be 316 SS welded construction. External piping shall be Type K copper with wrought copper fittings. All valves shall be of bronze construction. Liquid oxygen service valves shall be fitted with extended stems and bonnets and be rated for cryogenic service. The tank shall include a dip tube liquid withdraw system, a vapor return line from the economizer system, level transmitter, pressure transmitter and fill connection. Fill lines shall be fitted with quick connect couplings for tanker truck connection.
7. All applicable hazardous material signage shall be provided with the tank. Contractor shall permanently affix signage as required.

C. Ambient Air Vaporizers

1. Number of vaporizers provided: 2
2. Ambient air vaporizer shall be provided for the liquid oxygen vaporization system including all related safety devices, appurtenances and equipment required for operation. The design of the vaporizer shall be such that the system can continuously deliver oxygen to the ozone generators.
3. Vaporizer shall be an ambient air vaporizer, factory assembled unit complete with bracing, lifting lugs, pressure safety relief valves, necessary internal manifolding, and suitable for outside installation and operation. The materials of construction shall be suitable for design conditions, shall be oxygen compatible, factory cleaned for oxygen service and sealed. Connections shall be NPT or ANSI 150# flange.
4. Vaporizer shall be capable of receiving liquid oxygen from the storage vessel and continuously converting it to gaseous form to supply the ozone system at required system pressure. Further oxygen compression shall not be required.
5. Vaporizers shall be sized to operate in Duty/ Standby at 12 hours cycle time.

D. Trim Heater

1. Number of heaters provided: 1
2. Gaseous oxygen (GOX) trim heater to be electric gas heater. Construction to be stainless steel heat transfer coils cast into an aluminum block. Electric cartridge heaters shall be moisture-sealed and replaceable with included over-temperature protection. Trim heater to be powered by 120 VAC 2000 Watt with all controls and disconnect switch in a weatherproof enclosure. Unit to be provided fully factory wired and assembled.

E. Gaseous Oxygen Manifold

1. Number of manifolds provided: 1
2. Gaseous oxygen (GOX) conditioning manifold to be provided for installation downstream of oxygen feed system and upstream of ozone generator. GOX manifold shall include a GOX Filter with differential pressure gauge and filter bypass line.
3. GOX Filters shall be sized for maximum gas flow required and shall include pull-out style replaceable and cleanable filter cartridge capable of retaining particles greater than 1.0 micron in size with 99% efficiency and particles greater than 0.40 micron in size with 98% efficiency.
4. Redundant self-contained pressure reducing regulating valves shall be provided in parallel to regulate the oxygen pressure entering the ozone generators. The valves shall be sized to cover the full range of gas flows required to meet the design conditions of the ozone system. The valve shall reduce the oxygen gas pressure to 20 psig, or as required by the OSS. Appropriate valves shall be provided for isolation of a single regulator valve while another is being serviced.
5. Additional instrumentation shall include pressure gauge, temperature transmitter and low temperature switch. An appropriate sample tap and isolation valve shall be provided for dewpoint measurement. The maximum dew point shall not exceed -76°F at any time.
6. GOX Manifold shall be constructed of 316 SS piping and fittings. Manifold shall be mounted on painted carbon steel skid frame, including pipe supports, mounting hardware, etc. Piping shall be cleaned and packaged for oxygen service per CGA G-4.1.

F. Compressed Air System

1. If pneumatic valves are required for automatic operation, a centralized compressed air system is available at the plant. OSS shall coordinate with contractor if compressed air is needed for valve operation.

G. Nitrogen Generation System

1. If nitrogen boost is required by the manufacturer to achieve the specified ozone concentration, the OSS shall furnish a complete nitrogen boost compressor system.
2. The nitrogen generation system shall be provided as a skid mounted unit and shall be fully factory tested prior to shipment. Provide valves and instruments as necessary for a complete and functional system.
3. Air compressors
 - a. Compressor shall be air-cooled and 100 percent oil free.

- b. Compressor shall be supplied with an air-intake filter. Filter shall be replaceable element type that has a full life efficiency of 99.2% at 10 microns or larger.
 - c. Compressors shall utilize a check valve located at the compressed air discharge in order to prevent the discharge air from flowing back through the air compressor.
 - d. Compressor motors shall be a four-pole, high efficiency ODP motor.
- 4. Nitrogen Gas Receiver Tank
 - a. Receiver tank shall be vertically oriented to reduce system footprint.
 - b. Receiver tank shall be appropriately sized by the OSS for the gas flows provided.
 - c. Receiver tank shall be ASME stamped and include a manual drain valve.
 - d. Receiver tank shall be supplied with all required valves and instrumentation.
- 5. Nitrogen Separation Membrane
 - a. A membrane separator utilizing a polyimide hollow fiber membrane that provides higher permeability to oxygen than nitrogen to obtain 95-97% pure nitrogen gas shall be installed in the Nitrogen Generation System.
 - b. The membrane separator shall be sized to provide a nitrogen dewpoint of -40°F at the generator outlet at the peak calculated demand.
 - c. Membrane bundles shall be replaced no sooner than 3 years into the system's operational life.
- 6. Water Separator
 - a. A water separator shall be installed upstream of the nitrogen membrane.
- 7. Particulate Filter
 - a. A 1.0 micron filter shall be installed upstream of the nitrogen membrane.
 - b. Local differential pressure indication shall be provided on the filters.
- 8. Coalescing Filter
 - a. A 0.01 micron pre-filter (coalescing) shall be supplied upstream of the nitrogen membrane.
 - b. Local differential pressure indication shall be provided on the filters.

H. Ozone Generator System

1. Number of generators provided: 2 Minimum, 4 Maximum as determined by the OSS to meet the specified output.
2. Ozone generation equipment shall be continuous duty water cooled and as further described below.
3. The generator shall be provided with complete controls, instrumentation, appurtenances and miscellaneous equipment required for a complete ozone generating system using concentrated oxygen.
4. Modular Construction: The ozone generators shall be of modular design featuring an ozone generator enclosure, internal platform that will accommodate multiple fully independent ozone generator units, common internal power distribution system, common data bus, common oxygen supply manifold, common ozone outlet manifold, and common cooling water inlet/outlet manifold. Up to the limitations of the enclosure, each ozone generator enclosure shall be expandable with no modifications to the enclosure other than adding additional ozone generator cells. No modifications to inlet/outlet piping, controls, etc. shall be required.
5. Ozone Platform Enclosure: The ozone platform enclosure complete with all ozone generator cells housed within it shall be rated NEMA 12, or meet NEMA 12 requirements and provide equivalent certification, and UL508A listed or provided with equivalent certification. The enclosure shall be sealed to prevent the exchange of air to the surrounding room. The enclosure shall be supplied with an internal cooler.
6. The enclosure shall have single points of connection to site utilities including: 480VAC, 45kW power in, oxygen inlet, ozone outlet, cooling water inlet / outlet, compressed air and controls / data bus in/out. For 460VAC or 400VAC power supplies an external step down transformer shall be provided. Provide disconnect switch for the equipment.
7. Ozone Generator Cell: Each ozone generator cell shall be capable of completely independent operation and shall consist of a minimum of four (4) ozone production cells connected to a common control board. Ozone generator cells shall be UL508 listed and of completely sealed design and require no field maintenance. Ozone dielectric elements shall consist of non-fouling, monolithic planar ceramic dielectric materials. Glass dielectric materials, or ozone cells that are not of sealed design or require field maintenance shall not be permitted.
8. Ozone Power Supplies: Each ozone generator unit shall have built-in fully independent high-frequency power supply operating at a minimum of 20kHz. External power supply units (PSU) shall not be permitted. Ozone generators that operate below 20kHz shall not be permitted unless they are fully enclosed in a noise limiting enclosure.

9. Ozone Generator Controls: The generator shall be provided with complete controls, instrumentation, panels, appurtenances and miscellaneous equipment required for a complete ozone generating system using oxygen. Automatic operation of the ozone generator shall be controlled through an Allen Bradley Compact Logix programmable logic control (PLC) system mounted inside the ozone platform enclosure. The operator interface shall be Allen Bradley Panel View Plus 7. The operator interface shall be a NEMA Type 12, 13, 4X rated, 15", color LCD touchscreen display with Ethernet communications. In lieu of Allen Bradley, a Schneider Modicon or Magelis controller may be used, meeting the same requirements for enclosure rating, display size, and communications. For a Schneider alternative, provide full capability to integrate with the Allen Bradley Main Ozone Control Panel (MOCP).
 - a. Provide a top-mounted strobe on the main control panel to indicate alarm status when ambient ozone levels (monitored by the ambient ozone sensors) observe the alarm setpoints.
10. Ozone Generator Instrumentation: The generator shall be provided with a minimum of instrumentation consisting of oxygen mass flow meter (inlet), hi-range ozone analyzer (outlet), and cooling water temperature transducers (inlet & outlet).
11. Ozone Generator Isolation Valves: The ozone generator shall be equipped with both manual and automatic isolation and control valves, including: pneumatically actuated oxygen gas valve, manual oxygen isolation valve, pneumatically actuated spring return ozone outlet control valve, manual ozone outlet isolation valve, pneumatically actuated spring return cooling water inlet control valve, and manual cooling water inlet and outlet isolation valves.
12. All equipment, valves, piping, associated appurtenances shall be suitable for ozone in oxygen service.
13. Generator Design Requirements:
 - a. Number of Ozone Generators Required: 2 Minimum, 4 Maximum as determined by the OSS to meet the specified output.
 - b. Total Ozone Generation Capacity considering all generators in service: 500 PPD at 10% O₃ by weight
 - c. Minimum individual ozone generator turndown shall be 4:1 of the rated generator capacity at 10% O₃ by weight.
 - d. Maximum Oxygen Gas Flow Rate to Generator determined by OSS.
 - e. Minimum Ozone Generator Outlet Pressure: 20 psi
 - f. Cooling Water Temperature Rise at rated production capacity: Maximum 10 degrees F.

- g. Maximum Ozone Generator Cooling Water Flow Rate at rated maximum production capacity determined by OSS.
- h. Minimum Cooling Water Supply Pressure: 40 psig unless otherwise provided by the closed loop chiller internal circulation pumps.
- i. Maximum Carrier Gas Rise Across Generator: 17 degrees F
- j. Maximum Inlet Hydrocarbon Concentration : 15 ppm
- k. Maximum Ozone Power Generating Consumption shall be 4.6 kW-hr/pound at a 10% ozone gas concentration at 50 degree F cooling water temperature.
- l. Maximum ozone generating oxygen consumption shall be 10 pounds oxygen per pound of ozone at any ozone production capacity at 50 degree F cooling water temperature.

I. Closed Loop Chilled Water System

- 1. Number of chillers: 2
- 2. The Ozone Generator system shall be cooled by a chemically treated closed loop chilled water system. The chilled water system shall consist of air-cooled chiller(s) with integral circulation pump and other integral associated equipment such as valves, instruments and controls. The chiller system shall be sized as required by the OSS. The OSS shall provide the required type and quantity of coolant required for the initial fill of the closed loop system.
- 3. Site Elevation: 4,633 ft. MSL
- 4. Cooling Capacity: System redundancy is not required and the total cooling capacity of all chillers in service shall be greater than or equal to the cooling capacity required for all ozone generators in service at maximum ozone production.
- 5. Electrical Power: 480V, 11.5kW. Provide disconnect switch.
- 6. Closed loop chiller shall be adequately sized for the system demands to meet the project design conditions. The chiller shall be a package type with integral chilled water pump(s), expansion tank, air and pressure relief valves, isolation valves and instrumentation.
- 7. Structure of the chiller shall be fabricated from galvanized carbon steel panels and painted with polyester powder. A means of lifting the unit will be provided as part of the structure. The compressor compartment must be separated from the condenser section to allow for accessibility when the unit is running.
- 8. Chiller shall be supplied with hermetic scroll compressor(s) complete with protection against overheating and overcurrent and mounted on rubber anti-

vibration dampeners. Unit includes a crankcase heater with automatic insertion to prevent the dilution of the oil by the refrigerant fluid when the compressor(s) is switched off. Refrigerant fluid shall be R410A.

9. The evaporator shall be constructed of finned coils with copper tubes and aluminum fins and a non-ferrous water circuit. The evaporator shall be installed inside the accumulation tank. All materials of construction to be compatible with the installation. Coolant fluid shall be food-grade DowFrost® propylene glycol at a 30% concentration by weight with the balance consisting of distilled water.
10. Unit shall include single phase ON/OFF cooling fan(s) managed by pressure switches or in step mode with pressure transducer.
11. Refrigeration circuit shall consist of the following:
 - a. Refrigerant filter-dryer with hygroscopic molecular sieves
 - b. Refrigerant liquid flow sight glass and moisture control
 - c. Thermostatic expansion valve with external equalization
 - d. High pressure switches
 - e. Low pressure switches.
12. Centrifugal pumps with seals made of silicon carbide with a controlled porosity, graphitized (SiC/SiC/EPDM).
13. Pump nominal head pressure as determined by OSS.
14. A cylindrical storage tank shall be provided with the evaporator installed inside and covered with thermal insulation. The storage tank shall be made of carbon steel and sized to work in closed hydraulic circuits with a maximum pressure of 87 psig. It may also be used in atmospheric hydraulic circuits by the application of the manual filling tank kit. Storage tank will be equipped with a drain valve and bleed valve to vent air during filling of the hydraulic circuit.
15. Chiller shall be provided with an internal hydraulic by-pass between the supply and return of the process fluid. By-pass shall preserve the integrity of the unit and pump in the event shut-off valves are accidentally closed.
16. A conductive type level sensor will be provided for the accumulation tank to stop the unit when level of the process fluid is insufficient.
17. Electronic chiller control with local display shall be integral to the unit to manage chiller operation. Controls shall include main disconnect switch with safety door interlock, automatic circuit breakers for equipment protection, isolation transformer

feeding control circuits, phase monitor, contacts for ON/OFF/REMOTE indication and general alarm output. Electrical cabinet must be in compliance with UL508A.

18. Chiller must be inspected for correct installation of components, refrigeration leaks and electrical safety prior to being shipped by the manufacturer.
19. Chilled process fluid piping shall be insulated

J. Side Stream Injection Skid

1. Ozone gas valve train shall be included on the sidestream injection skid and shall be capable of monitoring and controlling the flow of ozone gas to the injector.
 - a. A suitable backflow prevention device shall be installed to prevent liquid back-up into the gas line. A check valve is not considered to be a suitable means of backflow prevention. A liquid separator shall be provided to remove any liquid that should become backed up into the line. A quick-close valve as specified herein shall be installed to stop flow in the event liquid backs-up into the back-flow prevention device.
 - b. The ozone flow control shall include thermal mass flow measurement, pressure transmitter, modulating flow control valve, pressure sustaining valve to be monitored and controlled by the Ozone System PLC. A means of regulating the back pressure in the system must be provided.
 - c. The ozone gas injection manifold shall be designed to meet the flow requirements of the project across the range of required ozone gas flow rates.
 - d. Provide a level switch or other suitable sensor to the backflow device for automatic indication of liquid intrusion into the backflow device.
2. Sidestream Injection Pumps and Accessories
 - a. Number of pumps: 2 (duty standby) skid mounted.
 - b. The injection pumps shall be variable speed, end suction type centrifugal pumps. Pumps and venturi injectors shall be skid mounted.
 - c. Each pump shall be rated for a minimum flow of 700 gpm at 140 ft TDH or as required by the OSS or Sidestream Injection Manufacturer.
 - d. Pump motors shall be NEMA standard TEFC, inverter duty rated, premium efficiency type.
 - e. Common pump suction header or discharge header (prior to ozone injection) shall feature a magnetic flow meter, included with the skid.

- d. Off-Gas Relative Humidity 100%.

M. Off-gas Ozone Destruct Unit

1. Number of units: 2
2. The Ozone Destruct Unit shall be designed to pull off-gas from the contactor headspace, maintaining a vacuum at a range acceptable to the contactor design, and destroy unused ozone to a level ≤ 0.08 ppmv. The Ozone Destruct Unit is to include pre-heater, catalytic destruct vessel, off-gas blower, vent gas ozone analyzer (integral to the destruct unit or supplied loose for field installation), and associated valves. Unit to be constructed of stainless steel pipe and fittings and shall be mounted on a painted carbon steel skid frame with 150# ANSI flange or NPT connections. The unit shall be sized to maintain vacuum within a pre-defined range in the contactor off-gas.
3. The pre-heater shall be an electric cartridge style installed in the off-gas stream. The pre-heater shall be controlled by the PLC to heat the off-gas going into the catalyst vessel whenever the blower is running. Pre-heater shall be Watlow or approved equal.
4. The catalytic destruct vessel shall include catalyst trays as required to prevent catalyst leaving the vessel as well as removal and replacement of catalyst with minimal disassembly of the unit. Catalyst material shall be manganese-dioxide based Carus Carulite 200 or equal in sufficient quantity to meet design requirements. A differential pressure gauge shall be provided to monitor head loss across the catalyst bed.
5. The off-gas blower shall be a self-contained package including motor and drive unit. The blower shall be cast aluminum construction with internal inlet and exhaust muffling. Motor shall be UL approved and include stainless steel shaft, TEFC enclosure and permanently sealed bearings. External blower connections shall be 150# ANSI flange or NPT. Blower shall be CP series as manufactured by Rotron or approved equal. An expansion joint shall be provided on the inlet and outlet of the blower. Outlet of blower to be piped to exterior and to a minimum height of 11'-0" above ground level by Contractor.
6. Manual ball valves shall be provided at the inlet to the unit for isolation. A manual ball valve shall be provided upstream of the pre-heater to allow atmospheric intake in order to prevent over-vacuum of the contactor. A vent gas ozone analyzer shall be provided on the destruct unit skid to continuously sample the exhaust stream from the blower to verify destruct performance.
7. Junction Box or Control Panel with Disconnect
 - a. The factory assembled destruct unit shall include a junction box or control panel with HMI. All electrical and signal wiring shall be terminated to terminal blocks in the enclosure. Contractor to connect to termination blocks

as shown on associated wiring diagrams. Exterior of the enclosure shall be fitted with an On/Off selector switch for electrical disconnect. The electrical power will be 480V, 1.4 kW. For 460VAC and lower power supplies, an external step down transformer shall be provided.

8. Silencers: If the normal operating conditions of the destruct units exceed a sound intensity of 85 dBA, provide a silencer or sound enclosure on each unit to reduce noise below this level.

N. Off-gas Demister

1. Number of demisters provided: 2
2. Demisters shall be sized to remove entrained moisture in the off-gas stream. Demister pad shall be constructed of 316 stainless steel interwoven strands, installed in a 316 stainless steel housing with 150# flanged connections. Demister sizing shall limit face velocity at the demister to maximum 8.0 fps and maximum pressure drop across the demister of 1.0 inch water column at full design gas flow.
3. The inlet pipe of each demister shall feature a pressure/vacuum transmitter to monitor vacuum pressure and signal an alarm for high vacuum conditions.

O. Ozone Residual Sample Station

1. Sample station may be provided as a packaged system or loose shipped for installation by the contractor.
2. Total number of sampling stations: 4
3. Each sampling station shall have the following components:
 - a. 1 inline and non-reagent dissolved ozone sensor probe / analyzer
 - b. 1 flow indicators to verify flow
 - c. 1 sampling pump with (1) suction isolation valve, (1) discharge isolation valve, and (1) discharge check valve
 - d. 1 manual sample tap and valve on pump discharge piping
 - e. All piping and valves shall be 316 stainless steel.
4. Route sample pump discharge piping back to the ozone basin inlet piping as indicated on the drawings.
5. Sample pump suction pipes shall feature a manifold inside the tank to better accommodate uniform and representative samples as shown on the drawings.

P. Electrical and Controls System

1. Equipment shall be locally controlled and shall be capable of receiving standard digital or analog control signals from the plant central control system. Status and adjustments to the equipment shall be provided locally and from the plant central control system. Instruments shall be provided with mounting hardware as appropriate. Transmitters with digital outputs shall be accurate to within 1 percent. Primary control voltage shall be 120VAC, 60Hz. Controls shall be provided to remotely monitor and adjust ozone production rate, ozone output concentration, liquid chemical delivery rate(s) (if so equipped), oxygen feed, and cooling water feed. Each major component shall have HMI indication to display the power / on / off status and all three-phase motors shall have a non-resettable HMI elapsed time meter with ability to record operable hours from 0 to 99,999.
2. Ozone Control System
 - a. The ozone control system shall be interfaced with the plant central control system. Changes to the ozone generator equipment operating conditions shall be accomplished locally or from the master control panel. The power, control and instrumentation system provided shall be as specified or as recommended by the ozone generator manufacturer for safe operation and supervision of the ozone generator and related gas feed equipment. Schematics and interconnecting wiring diagrams shall be provided for power, control, and instrumentation circuits. Control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment to interconnect the generator to other auxiliary equipment and master control panel, and control circuits as shown on schematic or instrument control drawings shall be provided. A hard-wired emergency stop button shall be provided at the local generator control panel. The ozone generator shall be protected from power surges, and variations in power supplied to the equipment.
3. Master Control Panel (PLC-ZG)
 - a. Electrical power 120V, 5kW
 - b. PLC: Allen-Bradley Compact Logix
 - c. Operator Interface Terminal (OIT): Allen Bradley Panel View Plus 7
 - d. Communications: Ethernet port
 - e. Control panel shall meet specifications 40 9441, 40 9442, 40 9443, 40 9513, 40 9553, and electrical sheet I-03.
4. Alarms and Interlocks
 - a. Alarms and interlocks shall be provided to ensure proper operation of the ozone generation system and sequenced shutdown in the event of potentially unsafe or improper conditions that may arise. The following paragraphs list alarms that (as a minimum) shall be monitored at the central control point, or

that will initiate shutdown of the appropriate ozone generation system components.

b. Ozone Generator Enclosure or Master Ozone Control Panel

- (1) High dew point in gas feed to ozone generator
- (2) Over current to the power supply unit (PSU)
- (3) Over voltage to the PSU, rectifier, and inverter
- (4) Over frequency protection
- (5) Generator enclosure high temperature shut down, monitored from inside the enclosure or from cooling water supply temperature transmitter.
- (6) High inlet gas temperature
- (7) High outlet ozone gas temperature
- (8) High inlet cooling water temperature
- (9) High gas pressure to the generator
- (10) Insufficient gas flow to the generator
- (11) High moisture / humidity level monitored from inside the control cabinet enclosure or from a transmitter installed in the room.
- (12) High / low ozone concentration
- (13) Major equipment component failure such as over current, over voltage, over frequency, high cooling water temperature or other condition that could damage the equipment or result in effluent non-compliance shall initiate system alarms, followed by plant shutdown, if not acknowledged.

c. Oxygen Feed System

- (1) High pressure downstream of reducing valves
- (2) Oxygen ambient monitor to be installed in the ozone room for detection of high ambient air oxygen levels
 - (a) Comply with requirements specified in Section 40 76 00.
- (3) Major equipment component failure, such as air preparation failure or other conditions that could damage the air feed or ozone equipment, or

result in effluent non-compliance shall initiate system, followed by plant shutdown, if not acknowledged.

d. Ozone Destruct System

- (1) High / low vacuum at contact chamber
- (2) High ozone in destruct unit exhaust gas
- (3) High ozone concentration in off gas from contactor
- (4) Destruct system failure
- (5) Health and safety ambient ozone level non-compliance shall initiate ozone system alarm and shutdown, followed by overall plant shutdown, if alarm is not acknowledged (high ambient ozone levels will not shutdown the ozone destruct system concurrently with other processes).

e. Cooling Water System

- (1) Cooling systems failure
- (2) High water temperature
- (3) No / low cooling water flow
- (4) Pump failure
- (5) Major equipment component failure such as no/low cooling water flow, pump failure or other condition that could damage the gas feed, ozone equipment or result in effluent non-compliance shall initiate ozone generator, followed by plant system shutdown, if not acknowledged.

f. Ambient Air Ozone Detector: OSS shall supply an ambient air ozone gas detector to be installed by the contractor in the Ozone Room. Detection of a residual ozone concentration above the setpoint shall immediately shut down the ozone generators and isolate the gaseous oxygen supply by closing emergency shut-off valve.

- (1) Comply with requirements specified in Section 40 76 00.

5. Analytical Instruments

- a. Comply with the requirements specified in Division 40.
- b. OSS must supply all analytical instruments as indicated on the drawings and as required for a full functional and operational system. OSS may select instrument manufacturer and warrant instruments as part of the package. Instruments included in the OSS scope of supply must include the following:

- (1) Level sensors / transmitters
- (2) Pressure sensors / transmitters
- (3) Differential pressure sensor / transmitters
- (4) Temperature sensors / transmitters
- (5) Dew Point Analyzers / transmitters
- (6) Flow meters / transmitters
- (7) Ambient oxygen sensors / transmitters
- (8) Ambient ozone sensors / transmitters
- (9) In-solution ozone analyzers / transmitters

2.05 SHOP TESTING:

- A. OSS shall conduct their standard factory testing in the OSS shop prior to shipment of equipment to job site. Equipment shall be given manufacturer's standard quality control inspections and tests to ensure the quality of materials used in the manufacture of the equipment and workmanship conform to the specified requirements. The OSS must prepare and submit a final report certifying the test results.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Verify that all components have been constructed in accordance with approved shop drawings and to the tolerances required by the equipment manufacturer.

3.02 INSTALLATION

- A. OSS shall provide instructions and recommendations to Contractor for installation of ozone system components. All ozone equipment shall be installed by the Contractor in strict compliance with the instructions and recommendations of the OSS. Connections on oxygen-cleaned equipment shall remain factory sealed until ready for connection. All equipment that has been oxygen cleaned prior to shipment shall be delivered with sealed connections and a label indicating that equipment has been cleaned and should not be un-sealed until ready for installation. Any equipment that is un-sealed before the time of installation must be properly flushed and / or cleaned and re-sealed by the Contractor per "Cleaning for Ozone / Oxygen Service".
- B. OSS shall provide Contractor with supplier's instructions for installation of all skidded and field installed components. OSS shall provide Contractor with the quality requirements for initial fill of the closed-loop side of the cooling water system. Any

finished surface damaged during installation must be touched-up by the Contractor per OSS recommendations. Contractor shall be responsible for providing and installing all field wiring, except as specified otherwise.

3.03 SERVICE:

- A. The equipment manufacturer shall furnish the services of a factory trained representative for a no less than 4 trips and 20 eight hour days at the jobsite to inspect the installing contractor's equipment installation, supervise the initial operation of the equipment, instruct the plant operating personnel in proper operation and maintenance, and provide process assistance.
- B. If additional service is required due to the mechanisms not being fully operational, at the time of service requested by the contractor, the additional service days will be at no expense to the owner.

3.04 FIELD TESTING:

- A. All liquid oxygen (LOX) required for the start-up, functional testing and performance testing will be provided by the Owner. Owner will provide all required cooling water and electrical power to conduct all ozone system testing. Prior to testing the ozone generators, all associated process and safety monitoring equipment and instrumentation including ambient leak detection, process piping, dissolution system, contactors and destruct system shall be completed, tested and functional.
- B. Ozone destruct units shall be installed and working prior to testing. Sufficient charges of ozone destruct catalyst shall be installed prior to testing to ensure the specified ozone destruction. Ozone shall not be released into process piping until piping installation is completed and flowing water is present.
- C. After each ozone generator unit has been completely installed, initially inspected, and operationally tested, OSS standard functional acceptance tests shall be performed by OSS representative. Functional tests shall cover full specified operating range for the ozone generator. Test each generator to verify equipment operational characteristics are in accordance with the conditions specified in this Section. The OSS shall conduct functional testing in the presence of the Owner or Owner's representative.
- D. After completion of functional testing, mass transfer efficiency testing with ozone shall be conducted to verify the specified MTE is being achieved. All temporary barriers, equipment, tools, etc. shall be removed from the ozone contact basin. Ozone destruct units and ozone generation systems shall be operational prior to performance testing. Ozone contact basin shall be isolated. Sodium Bisulfite shall be applied at the end of the contact basin to quench any remaining ozone. OSS shall conduct performance testing of the ozone dissolution system in the presence of the Owner and / or Engineer. Ozone sidestream dissolution system supplier representative shall be on-site during mass transfer efficiency testing.

Mass Transfer Efficiency shall be defined as:

$$\text{MTE} = \frac{(\text{O}_3 \text{ Concentration In} \times \text{Gas Volume In}) - (\text{O}_3 \text{ Concentration Out} \times \text{Gas Volume Out})}{(\text{O}_3 \text{ Concentration In} \times \text{Gas Volume In})} \times 100\%$$

If the equipment does not satisfy the specified performance criteria corrective measures shall be taken by the manufacturer and OSS to meet specified performance at no additional cost to the Owner.

E. Generator Performance Tests

1. Prior to testing, the ozone generators shall be dried by purging dry oxygen gas through the ozone generators under the direction of the OSS. Test each ozone generator and electrical power supply unit under actual operating conditions to determine that the operation is satisfactory and power consumption and ozone production characteristics are completely developed. Two (2) types of tests shall be conducted as described herein.
2. At least six (6) consecutive readings at each power loading or production level shall be taken and recorded at 15-minute intervals for each ozone generator, after steady-state ozone production conditions are attained.
3. Conduct performance testing of each ozone generator over range of outputs determined by the OSS. Average performance for each ozone generator at these evenly weighted production rates shall not exceed the values indicated in the Ozone Generator Section.
4. In addition to performance testing, conduct additional test for at least 15-minute intervals each for minimum, average and maximum design ozone concentration values to determine specific energy (kWh/lb) at these ozone concentrations. Submit testing results.
5. OSS shall supply portable calibrated power meter and ozone concentration analyzer with factory certified calibration to verify accuracy of generator-mounted high concentration ozone analyzer. The OSS will verify key instruments used for performance testing including thermal mass flow meters, power supply power meters and gas phase ozone concentration analyzers.
6. For each generator, the test data shall indicate as a minimum, the time, oxygen flow rate, inlet oxygen pressure and temperature, ozone-in-oxygen concentration, ozone production, Power Supply Unit (PSU) input power, power factor, specific energy, cooling water flow rate and cooling water inlet and outlet temperatures.
7. If the equipment does not satisfy the specified performance criteria or operational values as certified with the Bid, corrective measures shall be taken by the Contractor and OSS to meet specified performance at no additional cost to the Owner.

3.05 START UP:

- A. A field service technician or start-up engineer of the OSS shall commission the ozone generation equipment. The field service technician shall certify that all equipment is properly installed and that the plant operators have been trained on proper operation and maintenance procedures. The Contractor is required to properly fill out a pre-startup checklist before OSS representative arrives to site.
- B. A field service technician or start-up engineer of the Ozone Sidestream Dissolution System shall commission the ozone dissolution equipment. The field service technician shall certify that all equipment is properly installed and that the plant operators have been trained on proper operation and maintenance procedures. The Contractor is required to properly fill out a pre-startup checklist before Ozone Sidestream Dissolution representative arrives to site.
- C. The cost of all inspection, start-up, testing, adjustment, calibration and instruction work performed by said factory representatives shall be borne by the OSS. The Owner shall pay for costs of power, water, LOX and other required utilities.

3.06 TRAINING:

- A. As part of their service responsibilities, the OSS shall provide training in the operation and maintenance of the ozone system, including all components provided under this contract. Training shall consist of both classroom and hands-on sessions conducted at a time and location acceptable to the Owner. The OSS shall designate a person responsible for scheduling and coordinating all training.
- B. The OSS representative shall provide detailed system training including, but not limited to:
 - 1. Safety Precautions and Emergency Procedures
 - 2. System Operation
 - 3. Understanding of loop operation (i.e. adjusting process variable set points, Local and Remote control, alarm acknowledgement and resetting)
 - 4. Component performance requirements
 - 5. Component functions, operation, maintenance, troubleshooting, replacement and calibration procedures.
- C. Classroom training shall be conducted during regular work hours during a single shift on weekdays at a location to be designated by the Owner. Hands-on training may be conducted during and as part of the start-up. Training shall be split into equal morning and afternoon sessions to accommodate employee's schedules. Copies of all materials used for training shall be provided. The specified manufacturer's services and the OSS

representative shall be coordinated and furnished for post start-up training of the Owner's personnel.

- D. The ozone manufacturer must schedule an agreeable time for the visit to ensure that facilities personnel will have ample training time. The manufacturer may include classroom training during each visit to provide ongoing education and communicate equipment updates. Each maintenance procedure shall be performed first by the manufacturer's representative with the facilities personnel observing. The facilities personnel will then perform the same task under the supervision of the manufacturer's representative.

3.07 PROTECTION:

- A. All equipment, piping, valves, instruments and associated appurtenances to be used with oxygen/ ozone service shall be properly cleaned, labeled as clean, sealed and protected for oxygen service prior to shipment to site. Contractor shall use caution in storage, handling and installation of such items to avoid compromising oxygen cleaning. Contractor shall field clean all piping, fittings, equipment, etc. that come into contact with oxygen and/or ozone liquid or gas. All cleaning must comply with the latest revision of CGA G-4.1. Piping requiring this cleaning is as follows:

1. All liquid oxygen piping
2. All gaseous oxygen piping
3. All ozone gas piping between generators and eductors
4. All liquid ozone solution piping between eductors and basins
5. All sampling piping including supply and return lines
6. All air draw-off piping between basins and destruct units
7. All basin vent piping

3.08 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 46 33 44

PERISTALTIC METERING PUMPS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section includes furnishing and installing adjustable speed peristaltic chemical feed pumps where shown on the Drawings, specified, and listed in Table attached with this specification section. All chemical feed pumps shall be furnished by the manufacturer on a pre-assembled panel suitable for wall mounting, which contains all equipment and materials specified and required for operation and control of the pumps. All pumps shall be suitable for the indicated chemical and application. Installation shall include all accessories as may be required and not mounted on the panel, such as pump tubing, translucent HDPE tubing, tubing fittings, pressure relief valves, drum/tote siphon tubes, and appropriate tank/drum/tote seals. All accessories shall be made of material suitable for the chemical being fed.
- B. This section also includes furnishing one peristaltic pump for conveying water to an analytical instrument. This pump is to be mounted on a shelf as indicated on the drawings, and does not require a pre-assembled panel with accessories.

1.02 REFERENCES:

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including but not limited to Division 01 General Requirements.

1.03 1.3 SUBMITTALS:

- A. Submit the following in accordance with Section 01 33 00:
 - 1. Certified shop drawings.
 - 2. Characteristic performance curve showing flow rate as a function of RPM and pressure.
 - 3. Dimensional drawings.
 - 4. Operating, maintenance, programming, and wiring instructions
 - 5. P/10 ratio calculation.

1.04 SPARE PARTS:

- A. Comply with the requirements specified in Section 01 61 00.

- B. Spare Head Assemblies: Provide one (1) spare pump head assembly for each size of chemical feed pump provided.
- C. Provide one (1) spare tube for every chemical pump supplied with the project.

1.05 QUALITY ASSURANCE:

- A. Comply with the requirements specified in Section 01 43 00.
- B. Pumps shall, at a minimum, meet the following design requirements.
 - 1. Pumps shall be designed so that they do not to exceed a specified P/10 ratio (theoretical maximum number of occlusions per 10 gallons pumped) so as to maximize pump efficiency and minimize tube fatigue, performance, and accuracy. Pumps exceeding the specified P/10 ratio will not be considered suitable for the duty condition. The following criteria are set to maintain the P/10 ratio below the maximum for the tube size specified:
 - a. Maximum two compressing rollers for two compressions per revolution.
 - b. Tube wall thickness of 2.4 mm and material specified
 - c. Large diameter spring-loaded roller set for 2.4 mm wall thickness tubing
 - d. Max base drive speed of 220 RPM for 2.4 mm wall thickness tubing.
 - e. Track geometry of not less than 180 degrees and rotor geometry with rollers 180 degrees apart.
- C. P/10 ratio shall not exceed the following per tube size:

Tube Bore & Wall	P/10 ratio	
1.6mm	x 2.4mm	181,820
3,2mm	x 2.4mm	45,460
4.8mm	x 2.4mm	20,840
6.4mm	x 2.4mm	11,570
8.0mm	x 2.4mm	7,170
9.6mm	x 2.4mm	4,960

- D. Drive and pump heads shall be 24-hr continuous duty rated and have a three-year manufacturer's warranty from date of startup.
- E. Pumps shall be the manufacturer's standard product. Manufacturers of tubing pumps shall have at least 20 operating installations in municipally owned water or wastewater treatment plants over a period of at least five years in the same application and size specified.

- F. Pumps shall be manufactured under ISO 9001.
- G. Pumps shall meet all applicable CE and CETL US standards per UL610101A

1.06 DELIVERY, STORAGE AND HANDLING

- A. Comply with the requirements specified in Section 01 66 10 and as specified herein.
- B. Delivery, storage, and handling shall meet the requirements of manufacturer/supplier in general and the following specifically:
 - 1. Shipping: Ship pump and drive assemblies complete. Ship tubing separately packed in a continuous length. Required length for installation shall be cut by the Contractor, with the remaining tubing stored for spare replacement.
 - 2. Pack all spare parts in containers bearing labels clearly designating contents and the specific equipment for which they are intended.
 - 3. Deliver spare parts at the same time as equipment.
- C. Receiving
 - 1. Contractor shall inspect and inventory items upon delivery to site.
 - 2. Contractor shall store and safeguard equipment, material, instructions, and spare parts in accordance with manufacturer's written instructions.

PART 2 - PRODUCTS

2.01 DESCRIPTION

- A. Pumps shall be positive displacement peristaltic type complete with spring-loaded pump head, self-contained adjustable speed drive, and flexible extruded tube as specified.
- B. Chemical feed pumps shall be capable of sending and receiving 4-20 mA signal for speed control.
- C. Peristaltic pumping action shall be created by the compression of a flexible tube between the pump head rollers and track, induced forward fluid displacement within the tube by the rotation of the pump rotor, and subsequent vacuum-creating restitution of the tube.
- D. Pumps shall be dry self-priming, and be capable of being run dry without damaging effects to pump or tube. Pump shall have a maximum suction lift capability of up to 30 feet vertical water column. Maximum pressure discharge rating shall be in excess of the Max psi listed in Table 1. Pump shall not use check valves or diaphragms and shall not require dynamic seals in contact with the pumped fluid. Process fluid shall be contained within pump tubing and shall not directly contact any rotary or metallic components.

- E. Flow shall be in the direction of the rotor rotation, which can be reversed and shall be proportional to rotor speed.
- F. The manufacturer shall provide pre-assembled chemical feed panels which can be mounted directly on the wall or Unistrut type frame system.

2.02 PUMP MANUFACTURERS:

- A. Watson Marlow.
- B. Blue-White.
- C. Prominent Fluid Controls.

2.03 PUMP CONSTRUCTION:

A. Pump Head

1. Pump head shall consist of a fixed track, a hinged guard door, two spring-loaded tube clamp mechanisms, and spring-loaded roller rotor assembly. Pump tubing shall be in contact with the inside diameter of the track through an angle of 180 degrees and be held in place on the suction and discharge by a spring loaded self-adjusting clamp mechanism. At all times, one roller shall be fully engaged with the tubing providing complete compression and preventing back flow or siphoning.

a. Pump Head Assembly

- (1) Provide high corrosion/impact materials as specified.

- (a) Track Construction: polyphenylene sulfide (PPS)
- (b) Guard Construction: hinged impact-resistant polycarbonate breakaway guard, tool un-lockable for operator safety.
- (c) Rotor Construction: polyphenylene sulfide (PPS)

- b. Tube Retainer Mechanism: Provide two spring-loaded adjustable tube retainer mechanism to secure the tubing at the entry and exit points of the pump head

c. Rotor Assembly:

- (1) Provide rotor assembly that ensures gradual tube occlusion and compensates for tube tolerance:
 - (a) Twin spring-loaded roller arms located 180 degrees apart, each fitted with stainless steel helical springs and compressing roller for occlusion of the tube twice per rotor revolution

(1) Compressing Rollers: 316SS with low friction stainless steel bearings and PTFE seals, minimum diameter of 18 mm.

(a) Provide non-compressing guide rollers constructed of corrosion resistant Nylatron.

2. Clutch: Equip rotor with a central handgrip hub and manually activated clutch to disengage the rotor from the drive for manual rotor rotation during tube loading. Clutch shall automatically reengage rotor to gearbox upon one complete revolution.
3. Mounting: To prevent slip, the rotor assembly shall be axially secured to the dogged output shaft of the gearmotor via a slotted collet and central retaining screw.
4. Pump heads requiring disassembly or special tools for tube changing are not acceptable.

B. Pump Tubing

1. Pump head shall accept tubing sizes 1.6mm, 3.2mm, 4.8mm, 6.4mm, 8.0mm and 9.6mm with 2.4mm wall thickness and materials including, Marprene. Pumps that require tools for adjustment or changing pump heads to accept different tubing materials or sizes are not acceptable.
2. Pump tubing shall be constructed of Marprene II, a thermoplastic elastomer with 64 Shore A durometer and minimum 2.4mm wall thickness. If required for chemical compatibility, pump manufacturer shall recommend an alternate tubing material.

C. Drive

1. Rating: Continuous 24 hour operation, 40 deg C ambient.
2. Supply: 110-120V 60 Hz, 1-Phase. Supply nine-foot minimum length power cords with standard 115V three-prong lug.
3. Max drive power consumption: 135VA.
4. Enclosure: NEMA 4X
5. Housing: Pressure cast aluminum with exterior grade corrosion resistant polyester powder coat. Uncoated housings are not acceptable.
6. Drive motor- brushless DC motor with integral gearbox and tachometer feedback.
 - a. Speed Control Range of 2200:1 from 0.1 to 220 rpm +/- 0.1 rpm throughout the range.
 - b. Closed loop microprocessor controlled drive with pulse width modulation at speeds above 35 rpm and synchronous mode with magnetic field rotation control below 35 rpm

- c. Circuitry complete with temperature and load compensation and protection.
- 7. Mounting: Drive shall be self-supporting and shall not require anchoring.
- D. Chemical Feed Pump Control
 - 1. Supply auto control features to meet the following minimum functionality requirements. Pumps not meeting this minimum functionality will not be accepted.
 - a. Remote Control Inputs
 - (1) Speed Control: Analog 4-20mA or 0-10VDC, with input signal trimmable and speed scalable over any part of the drive speed range.
 - (2) Start/Stop Control: via 5V TTL, 24V industrial logic, or dry contact-Configurable command sense allowing open to equal run or open to equal stopped. Configurable to be a keypad start/stop override in Manual mode.
 - (3) Forward/Reverse Control: via 5V TTL, 24V industrial logic, or dry contact.
 - (4) Auto/Man Mode Control: via 5V TTL, 24V industrial logic, or dry contact.
 - (5) Leak Detector Run/Stop Control:
 - b. Status Outputs
 - (1) Four relay contacts rated for 30 VDC with maximum load of 30W, NO or NC software configurable to indicate the following:
 - (a) Running/Stopped status.
 - (b) Forward/Reverse status.
 - (c) Auto/Manual status.
 - (d) General Alarm status.
 - (e) Leak Detected status.
 - (2) Speed output – Analog 0-10 VDC or 5V Square Wave Frequency output
 - (a) Termination: supply screw down terminals suitable for up to 18 AWG field wire and accessible through four glanded cable entry points on the pump.

2.04 ACCESSORIES:

- A. Provide a section of translucent tubing at the chemical discharge locations to visually observe chemical being fed to the injection point.
- B. Pressure Relief Valves:
 - 1. An in-line, adjustable-pressure, diaphragm-type pressure relief valve, constructed of materials compatible with chemical to be used, shall be provided with each pump. Pressure relief valve shall be capable of being adjusted.
- C. Anti-Siphon Valves:
 - 1. Provide back pressure regulating anti-siphon valve(s) at each discharge pipe of the chemical feed pump panel. Valves shall be of PVC or CPVC construction, and having Hypalon or Teflon diaphragms, suitable for the chemical being pumped, to protect upper works of valve from process fluid. Provide spring opposed diaphragms with loading pressures adjustable by means of screw in top works. Field-adjust valves to settings required of the system. Setting to be minimum pressure to occur upstream of the valve, as installed in system, while pump is operating.
- D. Calibration Column:
 - 1. A clear PVC calibration column shall be provided with each pump. The column shall be sized to provide at least 2 minutes draw down at maximum pump capacity. The calibration column shall be located on the chemical feed pump panel and piped such that chemical is drawn from the calibration column (i.e. draw down calibration). The calibration column shall be vented to the upper edge of the chemical feed pump panel as shown on the process pump schematic to allow for chemical filling and withdraw without creating a vacuum or pressurized calibration column.
- E. Discharge Gauge with Diaphragm Seal
 - 1. A glycerin-filled pressure gauge to indicate pump discharge pressure. Pressure gauges shall cover the full range of the chemical feed pump discharge pressure.
- F. Injection Quill/Nozzle
 - 1. For each injection point, provide an injection quill/nozzle assembly that is removable without dewatering the process line. CPVC body check valve shall be the spring-loaded ball check type. Manufacturer: Saf-T-Flo, or equal. Unions shall be provided for easy removal.
- G. Dilution Water Panel

1. Dilution water panel may be integrated with the metering pump skid or provided as a standalone wall mountable unit, constructed of polypropylene, and include the piping, valves and accessories shown.
2. Rotameters shall have a 10-inch scale. The feed range shall be 10:1 with a V-notch control system capable of maintaining the set feed rate to within 2 percent of the indicated flow. Provide direct read flow scale.
3. Static Mixers: Mixers shall be designed for efficient turbulent-flow mixing at low pressure drop and be suitable for admixing specified chemical. Mixing elements shall consist of a series of polypropylene baffles, and mounted in a clear PVC or CPVC housing with FNPT ends.
 - a. Koflo Corporation, Omega FMX7200 series or equal

2.05 PUMP SCHEDULE:

- A. Values listed as “typical service flow” are the anticipated ranges of pumped chemical flow. Manufacturer shall select a pump from their standard line which best suits the range listed. Minimum and maximum pump ranges shall be beyond those listed.
- B. Sodium Bisulfite; 38%, 1.32 S.G.
 1. Ozone Quench
 - a. Number of pumps: 3
 - b. Typical service flow: 0.1 to 6 gph
 - c. Backpressure: 50 psi
 2. CIP Waste de-chlorination
 - a. Number of pumps: 2
 - b. Typical service flow: 1 to 30 gph
 - c. Backpressure: < 40 psi
- C. Aluminum Chlorohydrate; 38%, 1.35 S.G.
 1. Number of pumps: 3
 2. Typical service flow of each pump: 1 to 30 gph
 3. Backpressure: 50 psi

2.06 PANEL CONSTRUCTION:

- A. Chemical pump and dilution water panel assemblies shall be provided on a pre-plumbed FRP or polypropylene panel as indicated on the drawings which can be attached directly to the wall or a unistrut frame.
- B. Each chemical pump panel shall contain the following:
 - 1. Shelves, each suitable for mounting a pump.
 - 2. All piping, valves, and connections to suction and discharge piping / tubing as shown on the drawings.
 - 3. Peristaltic metering pumps as described above.
 - 4. A common calibration column with appropriate isolation valves and vent. Calibration column shall be piped such that it can fill via the discharge of a pump and be capable of operating in “draw from column” mode.
 - 5. Discharge pressure gauges for each pump with a diaphragm back and isolation valve.
 - 6. Pressure relief valve with discharge connection.
 - 7. Flow indicators (sight glass) where indicated.
 - 8. The panel shall be plumbed such that each pump has its own designated suction pipe and can be connected to flexible suction tubing.
- C. Each dilution water panel shall contain the following:
 - 1. Adjustable pressure regulator factory set to 50 psi on the incoming water supply.
 - 2. Rotameter to visually observe water flow.
 - 3. Chemical injection port downstream of rotameter.
 - 4. Static mixer downstream of chemical injection port.
 - 5. Pressure gauge with diaphragm seal.
 - 6. Associated piping and isolation valves. Electrically actuated isolation valve to control water supply is by others.
- D. The panel layouts have been custom designed for this project for each application and must meet the requirements of functionality and maximum sizes. Detailed layouts of each panel are shown on the drawings and the supplier shall mimic the general design as close as possible. “Standard” panels provided by a manufacturer will not be acceptable unless they fully comply with the functionality and size of the designed panels.

E. If selected manufacturer is unable to construct a panel meeting the design requirements, the Contractor must construct the panel

F. Chemical Pump Panel Schedule

1. Type 1

a. Function: 2-Pump, 1-Discharge Panel

b. Maximum panel width: 48 inches

c. Number of panels provided: 1

d. Applications:

(1) Sodium Bisulfite Panel #1 (CIP waste de-chlorination)

2. Type 2

a. Function: 3-Pump, 2-Discharge

b. Maximum panel width: 72 inches

c. Number of panels provided: 2

d. Application:

(1) Aluminum Chlorohydrate

(2) Sodium Bisulfite Panel #2 (Ozone Quench)

G. Dilution Water Panel Schedule

1. Number of panels provided: 2

2. Application:

a. Sodium bisulfite – feed to clearwell cell 1

b. Sodium bisulfite – feed to clearwell cell 2

PART 3 - EXECUTION

3.01 INSTALLATION

A. Contractor shall install items as specified and as shown on the Drawings in accordance with manufacturer's printed instructions.

- B. Contractor shall supply all accessories needed to connect tubing to pumps and process injection points for a complete and functioning system. This may include, but is not limited to, compression fittings, stainless steel hose claps, hose barbs, and injection quills.
- C. Contractor shall supply shielded signal wiring for the required remote input and output to the connectors.

3.02 TESTING:

- A. All chemical feed piping shall be purged of air and completely filled with clean, dechlorinated water prior to the system tests.
- B. Wet test the entire skid with water to 1.5 times its design operating pressure.
- C. Testing of the chemical metering pump equipment shall be performed in conjunction with the chemical storage tank hydrotest. Perform initial calibration column tests using clean water to verifying the approximate pump accuracy and loop tuning.
- D. At the completion of the system test, all chemical feed lines shall be completely drained of water and dried.
- E. Following draining and drying, the chemical feed pipes shall be filled with their respective chemicals and purged of air.

3.03 MANUFACTURER'S SERVICES:

- A. Conform to the requirements of the manufacturer's field services paragraph 1.5 of the Quality Control Section. Provide a minimum of 24 hours on site performing these services in no less than two separate trips. Additional time required to perform these services shall be at no additional cost to the Owner. The Owner shall be credited for the unused portion of startup services.
- B. Startup services and training of Owner's personnel shall be at such times as requested by the Owner.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 46 61 33

ULTRAFILTRATION MEMBRANE SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION OF WORK

- A. The Original Equipment Manufacturer or Supplier (OEM) shall furnish the following equipment as specified herein:
 - 1. Thirteen (13) Ultrafiltration (UF) pre-assembled skids complete with epoxy coated steel frame, UF membranes, face and interconnecting piping within skid boundaries, pneumatic control valves, manual valves, analytical instruments, local control panel, and ancillary equipment for a complete and operable system.
 - 2. Two (2) complete UF clean-in-place (CIP) systems including polyethylene tanks, heaters, feed pumps, face and interconnecting piping, pneumatic control valves, manual valves, analytical instruments, local control panel and ancillary equipment for a complete and operable system.
 - 3. Compressed air system including three (3) rotary screw air compressors, two (2) refrigerated air driers, and two (2) vertical air receivers with ancillary gauges, instruments, valves, and accessories for a complete and operable systems.
 - 4. Three (3) horizontal end suction type pumps to perform UF backwashing. Backwash tank, piping, valves, and electrical appearances to be provided by the Contractor.
 - 5. Master membrane system control panel integrated with the overall plant SCADA system for control, monitoring and communication with all UF skids, cleaning system, UF feed pumps (pumps by others), and the balance of the water treatment plant.
- B. The OEM shall provide complete integration and control system programming for monitoring and control of the UF skid system, air system, UF CIP system, and ancillary UF equipment. Provide all necessary control panels, HMIs, I/O racks, software, and other hardware for a complete and functional system.
- C. All OEM equipment provided in this specification, along with interconnecting piping between skids and electrical / control connections will be installed by others. Anchor bolts and mounting hardware to be provided and installed by the Contractor. The OEM shall provide all necessary calculations for anchor bolt design and sizing to facilitate installation of membrane equipment.
- D. The OEM shall provide complete system commissioning including system functionality and I/O checkouts, onsite startup, testing, and operator training for all systems provided.

1.02 REFERENCES

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section, including, but not limited to Division 01 General Requirements.
- B. Refer to Division 26 specifications for Electrical System requirements including wire and cabling, motors, motor control centers, and related components.
- C. Refer to Division 40 specifications for Control System Requirements including control panel hardware, software, control descriptions, network switches, and related components.
- D. Refer to Section 40 23 19.05 for Process Piping and Appurtenances requirements.
- E. Refer to Section 40 23 13.01 for Process Valves and Appurtenances requirements, including pneumatic actuators.

1.03 SUBMITTALS

- A. Comply with the requirements specified in Section 01 33 00.
- B. All submittals shall conform completely to the requirements of the Contract Documents.
- C. Submit shop drawings in 2D and 3D (where applicable) for the equipment to be furnished.
- D. Provide product data including but not limited to valves, actuators, piping, fittings, UF membrane elements, tanks, pumps, heaters, analytical instrumentation, controls, and electrical components.
- E. Wiring plan, wiring diagram, control panel layout, and other relevant information.
- F. Assembly and installation drawings including arrangement, layout, and dimensions of all components including the control panel and piping connections.
- G. Printed instructions for the handling, delivery, storage, and installation of the components.
- H. The OEM shall prepare a comprehensive operation and maintenance (O&M) manual for the system specified as part of this Contract. The manual shall include information on the operation and maintenance of the individual components of the system and the overall package.
 - 1. Maintenance summary forms
 - 2. Vendor O&M data and manuals
 - 3. Pre-operational procedures
 - 4. Controls documentation
 - 5. Operating procedures

6. System maintenance procedures
7. Drawings and diagrams
8. Factory quality control reports
9. Field quality control reports

1.04 SPARE PARTS

- A. Comply with the requirements specified in Section 01 61 00.
- B. UF System
 1. Provide any special tools required for disassembly and removal of a UF module. This shall include, but not be limited to, a mechanical module removal device with the following features:
 - a. Manual operation with hydraulic assist
 - b. Telescopic and rotatable attachment arm with straps to hold module in place
 - c. Lockable rolling caster with brake.
 - d. Manufacturer: Piedmont FiberMove™ or equal.
 2. Provide UF membrane pinning equipment.
 3. Provide one complete seal repair kit for the CIP pumps.
 4. Provide one complete seal repair kit for the backwash pumps.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements specified in Section 01 43 00.
- B. The skid components shall be manufactured from all new materials and equipment.
- C. The Owner or Engineer shall be provided access at any time to inspect or observe all equipment prior to shipment to the site.

1.06 DELIVERY STORAGE AND HANDLING:

- A. Comply with the requirements specified in Section 01 66 10 and as specified herein.
- B. The OEM will fabricate or furnish and deliver all components of the equipment specified herein to the site. All components shall be properly crated and stored at the job site until ready for installation. All components shall be kept clean, dry, and protected from

freezing. OEM is responsible for shrink wrapping equipment with 6 mil plastic prior to shipping.

1.07 WARRANTY

- A. Provide a written warranty stating that the system and all equipment provided is free of defects.
- B. All components of the UF skid, CIP system, air system, pumps, and ancillary components furnished by the OEM shall be warranted for a period of 1 year.
- C. The UF membranes shall have a pro-rated warranty for an additional 6 years (7 years total) as follows:
 - 1. Years 1 and 2: Manufacturer to cover 100% of replacement cost
 - 2. Year 3: Manufacturer to cover 80% of replacement cost.
 - 3. Year 4: Manufacturer to cover 65% of replacement cost.
 - 4. Year 5: Manufacturer to cover 50% of replacement cost.
 - 5. Year 6: Manufacturer to cover 35% of replacement cost.
 - 6. Year 7: Manufacturer to cover 20% of replacement cost.
- D. Failure of a module shall be defined as more than 3 fiber breaks per year with a maximum 10 breaks in the 7-year warranty period.
 - 1. A fiber break is defined as a failed LRV score during a membrane integrity test. The failed module(s) is subsequently identified by the individual membrane fiber(s) exhibiting large continuous bubbles during a bubble test where pressurized air introduced into the feed side of the module.
 - 2. During manufacturing and QA testing, the maximum number of pinned/repared fibers before certifying the module for release shall be 20.

PART 2 - PRODUCTS

2.01 ULTRAFILTRATION SYSTEM

- A. Manufacturer
 - 1. The equipment specified herein shall be furnished and commissioned by a single original equipment manufacturer (OEM).

2. The OEM is not responsible for the manufacturing of all components specified herein but must be included with their full UF Equipment Package, unless otherwise coordinated with the Contractor ahead of bidding.
3. The complete system package is specified herein and in noted reference specification sections and includes UF skids, membranes, tanks, heaters, pumps, compressed air systems equipment, instrumentation and analyzers, control panels, pre-assembled skid piping, valves, actuators, and ancillary equipment.
4. Prequalified OEMs for this project, in alphabetical order, are as follows:
 - a. H2O Innovations
 - b. Westech
 - c. Wigen Water Technologies

B. Performance:

1. Filtrate turbidity: shall be less than 0.1 NTU more than 95% of time and shall never exceed 0.3 NTU.
2. Minimum NSF/ANSI Standard 419-2018 LRV_{C-Test} shall be 5 LOG. The minimum regulatory LRV requirements are 3.0 LOG for *Giardia lamblia* and 2.0 LOG for *Cryptosporidium*.
3. Membranes and all materials in contact with water shall be NSF/ANSI 61 certified.

C. The UF system shall be complete and operable designed with the following conditions:

1. Number of UF skids: Thirteen (13).
2. Maximum treatment plant production capacity with one unit out of service: 30 MGD
3. Minimum filtrate capacity at normalized flux per skid: 2.5 MGD.
4. Each UF membrane skid must contain a minimum of 79,000 square feet of effective membrane area, resulting in minimum calculated (non-temperature corrected) flux of 31.6 GFD.
5. The design normalized (temperature corrected) flux at design filtrate flow shall be approximately 60 GFD considering the coldest specified water temperature. The maximum approved piloted temperature-corrected flux rate is 70 GFD.
 - a. Normalized flux shall be calculated as the actual flux rate (flow divided by membrane area) times water viscosity in cP.
6. The minimum UF recovery shall be 95% calculated with backwash waste and daily maintenance cleaning volumes.

D. Raw Water Quality Data:

1. The source of water surface water from the Provo River.
2. Prior to the UF system, the water plant will utilize course screening at the intake and 200-micron fine screening via strainers (strainers by others).
3. The plant can feed an aluminum chlorohydrate coagulant if needed (and to help TOC removal), although the UF pilot study demonstrated the ability to sustainably operate without coagulant.
4. The plant can feed free chlorine to raw water upstream of the UF, although this is not considered to be normal operation.
5. Raw quality data is noted in the table below.

Parameter	Unit	Avg.	Min.	Max.
Aluminum, Total	mg/L	0.11	0.05	0.20
Barium, Total	µg/L	64.8	57.0	82.0
Calcium, Total	mg/L	53.0	44.3	65.3
Iron, Total	mg/L	0.08	0.02	0.32
Magnesium, Total	mg/L	14.6	11.6	17.6
Manganese, Total	µg/L	26.0	5.0	113

- E. Each UF skid shall include all equipment mounted to a common epoxy-coated steel frame (or multiple frames for field assembly). Skid mounted components including the local

control panel with instruments and control valves pre-wired. All piping on the skid shall have flanged termination points near the edge of the skid for the following services (pipe size per manufacturer):

1. Feed inlet;
2. Filtrate outlet;
3. Air scour inlet;
4. CIP and MC inlet and drain / returns;
5. UF backwash inlet and outlet / drain;
6. Any vent or filtrate exhaust outlet(s);
7. Control air inlet.

F. The UF skid shall be designed to minimize the overall footprint as much as practical. OEM shall note any deviations in excess of the dimensions indicated on the drawings with their bid.

1. Provide the minimum number of membrane elements required to meet the specified flow rate and normalized flux for each skid.
2. Provide space on the UF rack with blind end-caps for future installation of additional membrane elements. A goal of 10% additional installed capacity is desired but must stay within a module rack length and width of 25'-0" and 7'-4", respectively (refers to module rack only and not the front-end pipe/valve assembly). The OEM shall identify the achievable number of spare modules with their bid.

G. General materials of construction include:

1. All materials in contact with water shall be NSF 61 certified. Components not in direct contact with water (such as analyzers fed from a sample port) do not require NSF certification.
2. The skid-mounted water process piping shall be DR 11 HDPE or Schedule 80 PVC. Any piping connections which are pressurized with air during an integrity test shall be DR 11 HDPE or 304 Stainless steel.
 - a. Connections between the UF header and individual membrane elements shall be DR17 HDPE or translucent reinforced PVC tubing having a 125-psi minimum pressure rating.
 - b. For each UF skid, provide one (1) segment of clear PVC piping on the backwash outlet connection to allow visual observation of debris removed during a backwash.

3. The skid-mounted compressed air process piping headers shall be 304 stainless steel or Ashahi AirPro HDPE. Air pipe pressure rating shall be determined by the OEM based on air pressure requirements and an appropriate factor of safety. Individual pneumatic connections to components shall be polyethylene air tubing.
4. The frame shall be epoxy- or powder-coated carbon steel.
5. Valve bodies shall be ductile iron, cast iron, or stainless steel for 4-inches and larger. Valves smaller than 4 inches may be ductile iron, cast iron, stainless steel, or thermoplastic material as determined by the OEM.

H. UF Feed Pumps

1. Each skid will have a dedicated UF feed pump. The feed pumps are not in the OEM scope of supply and each pump and VFD are furnished and installed by others.
 - a. The design point of each UF feed pump is 1800 gpm at 130 feet of head.
 - b. The UF system programming shall control the start, stop, and VFD speed control of each feed pump (one dedicated per skid).

I. UF Strainer

1. Each skid will have a dedicated 200 mesh self-cleaning strainer located between the feed pump and skid. The strainers are not in the OEM scope of supply and each strainers and controls are furnished and installed by others.

J. UF Membranes and Housings

1. Membranes: Basis of design for the membrane elements are HFUG-2020AN as manufactured by Toray.
2. Bid alternate: OEM may provide alternate pricing from at least one of the following equivalent membrane manufactures:
 - a. Hydranautics HYDRAcap MAX 80
3. The membrane skid shall be designed to accommodate the installation of Toray, Hydranautics, and DuPont membranes.
4. Membrane modules basis of design (Toray) shall meet the criteria listed below. Variations for alternate manufacturers must be provided with the bid:
 - a. Flow configuration: Outside-in, hollow fiber.
 - b. Membrane material: PVDF
 - c. Pore size: 0.01 micron, MWCO of 150,000 daltons

- d. Inside Fiber Diameter: 0.7 mm
 - e. Minimum Fiber Wall thickness: 0.2 mm
 - f. Minimum Membrane Area per module: 969 square feet.
 - g. Maximum Transmembrane Pressure as required by manufacturer.
 - h. pH Tolerance (normal operation) 1 – 10 at temperature of 0 to 40 deg C
 - i. pH Tolerance (cleaning) 0-12 at temperature of 0 to 40 deg C
5. Housing:
- a. Body material: PVC.
 - (1) Provide a total of two (2) clear body housings to facilitate visual observation of the membrane fibers. The two locations / skids to receive the clear housings shall be determined by the Owner during the submittal review period.
 - b. Potting Material: Epoxy Resin
 - c. Gaskets: EPDM
 - d. Housing shall feature influent and effluent connections.
6. Quantity:
- a. As required by manufacturer to achieve specified flux and filtrate production.

K. UF Skid Accessories

- 1. Provide a UF filtrate turbidimeter for each UF skid
- 2. Provide one additional filtrate turbidimeter to monitor combined filter effluent turbidity, to be installed in the field by the contractor.
 - a. Turbidimeter: Hach TU5300 low range laser turbidimeter or approved equal
 - b. Controller: Hach SC4500 controller or approved equal
 - c. Skid mounted bubble trap, Hach TU5 SC or approved equal
 - d. Turbidimeter drain will be routed to a floor drain by others
- 3. Provide an influent flow meter for each UF skid
 - a. Type: Magnetic, bi-directional functionality

- b. Manufacturer: Siemens, Endress & Hauser, or approved equal
- 4. Provide an air flow rotameter for visual observation of air flow during air scour operations.
- 5. Provide pressure transmitters in adequate locations for monitoring membrane feed pressure, membrane filtrate pressure (skid control panel to calculate trans-membrane pressure), and air supply pressure.
 - a. Manufacturer: Rosemont (3051), Endress & Hauser, or approved equal
 - b. For each transmitter, provide an analog pressure gauge installed adjacent to the transmitter.
- 6. Provide a local remote I/O panel for each UF skid for communication with the Master UF Control Panel. Refer to “UF System Controls” in this specification for additional detail.

L. UF Skid Valves

- 1. Refer to specification Section 40 23 13.01 for requirements.
- 2. All automatic control valves shall be pneumatically operated (not including solenoid valves).
- 3. Pneumatic control valves shall come fully pre-wired and connected via polyurethane pneumatic tubing to a skid-mounted air supply solenoid panel. The solenoid valves within the solenoid panel shall all be pre-wired.
- 4. Power and signal wiring for the pneumatic valve actuator limit switches shall come pre-wired and landed at the UF skid local control panel for complete valve status monitoring.

M. UF Backwash Pumps

- 1. Backwash water will be supplied by dedicated UF backwash pumps using UF filtrate as the source. The backwash pumps and motors shall be furnished by the UF equipment manufacturer and will be installed by others.
- 2. Number of UF backwash pumps: Three (3) at 100% capacity: two (2) duty + one (1) standby. No more than two UF skids shall be backwashed simultaneously.
- 3. Pump style: Horizontal end suction. Refer to Section 43 21 00.23 for mechanical requirements of the pump.
- 4. The OEM shall determine the flow and head requirements for the backwash pumps such that they are suitable for all compatible UF modules. The water level in the

backwash supply tank is approximately 16 feet below the center elevation of the membrane modules.

5. The UF control system shall be programmed to control all start, stop, and VFD speed control functions of the UF backwash pumps. VFDs provided by others.
6. Maximum horsepower of each backwash pump motor shall be 100 HP.

N. Compressed air system

1. The UF Manufacturer shall provide a complete compressed air system for use as air scour during backwashes and cleaning procedures, membrane integrity testing, and for control of pneumatic valves. The components of the compressed air system shall be one packaged scope of supply furnished by a qualified manufacturer specializing in compressed air systems, including:
 - a. Quincy
 - b. Ingersoll Rand
 - c. Kaeser
 - d. Atlas Copco
2. Compressed air system shall be monitored and controlled by the UF System Master PLC. Refer to Instrumentation Drawings for system control philosophy.
3. Dedicated aeration blowers are not to be provided with the project and the UF system shall have regulators to achieve the desired air pressure for backwash and cleaning processes.
4. Air Compressors
 - a. Quantity: Three (3)
 - b. Type: Rotary Screw
 - c. Minimum Capacity of each compressor shall be sized for all compatible UF modules: Provide no less than 100 ACFM at 100 psi unless otherwise recommended by the OEM.
 - d. Power: 30 HP maximum.
 - e. TEFC NEMA Premium Drive and Fan Motor.
 - f. Microprocessor controls with local LCD display, E-stop, and phase monitor.
 - g. Sound attenuating enclosure.

- h. Five-year warranty.
5. Air Driers
- a. Quantity: Two (2)
 - b. Minimum capacity: 220 CFM at 100 psi unless otherwise recommended by the UF System Manufacturer.
 - c. Non-cycling two-stage heat exchanger configuration.
 - d. Digital dew point display.
 - e. Integrated moisture separator and electronic drain.
6. Compressed Air Filters
- a. Quantity: Four (4) – provide for inlet and outlet of each drier.
 - b. Minimum capacity: 220 CFM at 100 psi unless otherwise recommended by the UF System Manufacturer.
 - c. Coalescing filter with 0.01 micron rating for removal of fine solid particles, water, and oil aerosol.
 - d. Aluminum housing with integral differential pressure gauge.
 - e. Automatic float style drain.
7. Compressed Air Receivers
- a. Quantity: Two (2)
 - b. Minimum capacity: 500 gallons unless otherwise recommended by the UF System Manufacturer.
 - c. Arrangement: Vertical, approximately 36-inch diameter.
 - d. Pressure rating: Not less than 160 psi.
 - e. Provide solenoid valve for user-adjustable timer for automatic tank condensate blow-off.
 - f. Provide safety pressure relief valve.
 - g. For each receiver, provide pressure indicating gauge and high- and low-pressure switches for automated control of the compressors.
8. Compressed Air Accessories

- a. Provide one (1) pressure indicating transmitter to be mounted to the common air header pipe for continuous monitoring of air pressure supplying the UF system.
- b. Provide four (4) spare air filter elements.

O. UF Cleaning System

- 1. Provide two (2) complete cleaning systems each consisting of a tank, heater(s) separate pre-assembled skid with pump, piping, valves, instrumentation, local control panel, and accessories. The system will serve for both the maintenance clean (MC) and CIP functions.
 - a. CIP tank:
 - (1) Number of tanks: one (1) per system, two (2) total
 - (2) Closed top HDPE tank with flat bottom.
 - (3) Provide epoxy- or powder-coated carbon steel tank support stand and all necessary anchor bolts.
 - (4) Each tank volume shall be as required by the OEM to provide the minimum amount of water needed for a single UF skid MC or CIP (greater volume of the two) plus no less than 20% additional capacity.
 - (5) Provide HDPE gusseted flange connections for all required inlet and outlet connections to the tank. Flange sizes shall be determined by the manufacturer to not exceed 10 feet per second at the design flow.
 - (6) Provide a top-flange mounted ultrasonic or radar level sensor with 4-20 mA output for each tank for monitoring of tank level via the UF control system. In lieu of top mounted level sensors, a pressure transducer may be provided. OEM shall coordinate the type of transmitter provided with the Contractor prior to bidding for proper field wiring and installation. Provide any necessary hardware required for installing the equipment.
 - (7) Each tank shall include two (2) flange-mounted immersion water heater.
 - (a) 304 SS flange and Incoloy sheath;
 - (b) 480V, 3 phase, 60 Hz;
 - (c) Include internal thermostat with high temperature cut-off switch;
 - (d) Heaters shall be sized to provide a 50 degree F temperature rise to the full tank volume in no more than two (2) hours, considering both heaters running.

b. CIP pump skid:

- (1) Number of CIP pump skids: Two (2) each with the following:
- (2) Epoxy or powder coated carbon steel frame for mounting the equipment including the pump, strainer, valves, piping, instruments, and electrical equipment.
- (3) Number of pumps per skid: One (1)
- (4) Pumps shall be horizontal end suction style. Refer to Section 43 21 00.23 for mechanical requirements of the pump.
- (5) Pumps shall be sized to accommodate the daily maintenance clean and CIP flow and pressure requirements.
- (6) Pump shall be 480 V, 3 phase, 60 Hz.
- (7) The pump VFD and local disconnect will be furnished and installed by others.
- (8) Provide pump suction and discharge pressure gauges with diaphragm seal.
- (9) Piping shall be Schedule 80 PVC or DR11 HDPE.

c. CIP skid valves

- (1) Refer to specification Section 40 23 13.01 for requirements.
- (2) All automatic control valves shall be pneumatically operated.
- (3) Pneumatic control valves shall come fully pre-wired and connected via polyurethan pneumatic tubing to a skid-mounted air supply solenoid panel.

d. CIP control panel: Provide a local remote I/O control panel for each CIP system (total of two panels) mounted to the CIP pump skid frame for communication with the master UF Control Panel. Each panel shall include the following components.

- (1) Panel shall comply with the mechanical requirements of Division 40 Specifications.
- (2) On/Off/Auto Selector switch for the pump with indicator light.
- (3) On/Off/Auto Selector switch for each heater.
- (4) Tank heater starters.

- (5) Remote I/O accessories for the signal wiring associated with the tank level sensor, free chlorine residual analyzer, pH analyzer, temperature transmitter, limit switches, and feedback signals from the pumps and heaters. Provide suitable ethernet connection shall be communicated with the master UF Control panel via ethernet.
 - (a) Local displays for the analyzers may be wall-mounted and wired by the Contractor if not pre-mounted and wired to the CIP frame. OEM shall coordinate installed location with contractor.
 - (b) Contractor to provide all power cabling from the VFD to the CIP pump.
 - (c) Contractor to provide all field wiring between the tank accessories (heaters, tank level sensor) and local control panel. All other power and signal wiring on the CIP pump frame shall be pre-wired between the equipment and local control panel.
- e. Provide CIP system instrumentation for each tank/pump mounted to the equipment and as follows. Remote displays may be wall mounted
 - (1) Tank water level sensor
 - (2) CIP solution free chlorine residual analyzer
 - (3) CIP solution pH analyzer
 - (4) CIP solution temperature transmitter
 - (5) Pump fault alarms

P. Air Diaphragm Pumps

- 1. Provide two sets of air driven double diaphragm pumps for transfer of liquid sodium hypochlorite and citric acid during cleaning operations.
- 2. Each set of pumps shall be provided on a factory-assembled skid suitable for mounting to the floor as shown on the drawings. Pre-assembled skid shall include all accessories including the metering pumps, suction and discharge piping and valves, discharge pressure gauge, pressure relief valves, adjustable backpressure valve, inlet air connection, and air pressure regulator.
- 3. Citric acid pumps
 - a. Quantity: Two (2)
 - b. Chemical: Citric acid at 50% strength.
 - c. Pump housing material: PVDF

- d. Diaphragm material: PTFE or Santoprene
- e. Delivery rate at 30 psi differential pressure: Approximately 0 to 790 gallons per hour
- 4. Sodium hypochlorite pumps
 - a. Quantity: Two (2)
 - b. Chemical: Sodium hypochlorite at 12.5% strength.
 - c. Pump housing material: PVDF
 - d. Diaphragm material: PTFE or Santoprene as selected by UF System manufacturer for chemical compatibility.
 - e. Delivery rate at 30 psi differential pressure: Not less than 600 gallons per hour
- 5. Accessories
 - a. Provide 20 feet of suitable-sized suction tubing for each metering pump, and 10 feet of suitably-sized discharge tubing for each metering pump.
 - b. Provide a backpressure anti-siphon valve for each chemical metering pump. Materials of valve construction shall be compatible with the chemical being pumped.
 - c. Provide an adjustable pressure relief valve for each chemical metering pump discharge. Contractor shall route the relief tubing to the suction side of the pump.
 - d. Contractor to perform all field installation of pumps, tubing, valves, and pneumatic connections. Include all hose barb fittings and tees, stainless steel hose clamps, and support for piping and tubing.
- 6. Manufacturer:
 - a. Prominent DUODOS Series
 - b. ARO EXP Series
 - c. Wilden AAOD Series

Q. UF Backwash and Cleaning Operations

- 1. Backwash operation: Set-points shall be adjustable and determined by the OEM. Provide the following for initial commissioning unless otherwise specified or required by the membrane manufacturer:

- a. Frequency: once every 30 minutes.
 - b. Backwash (30 seconds).
 - c. Air scour (30 seconds).
 - d. Drain modules (45 seconds).
 - e. Refill modules (45 seconds)
2. Maintenance cleaning: Set-points shall be adjustable. Provide the following for initial commissioning unless otherwise specified or required by the membrane manufacturer.
- a. Start CIP pump with valve positioned to circulate water through the tank while chemical is being added. Once cleaning solution strength setpoints are achieved (free chlorine and/or pH), switch valve positions to send MC solution to UF system.
 - b. Cleaning solution is recirculated through the membrane rack, alternating between the feed side and the filtrate side of the UF modules.
 - c. Frequency: Every other day. One skid at a time.
 - d. Initiated after a normal backwash, fully automated.
 - e. Soak for 20 minutes in 300 mg/L chlorine solution. The UF PLC shall call for chlorine until the concentration setpoint is reached. Feed of chlorine solution to the CIP tank will be performed and controlled by others (supplied from the main plant chlorine gas facility). However, the UF control system shall call for chlorine using discrete output(s) to the plant SCADA system.
 - f. Optional addition of citric acid for the soak period. The UF PLC shall call for citric acid until the pH setpoint is reached. Feed of citric acid solution via the air diaphragm pumps to the CIP tank shall be controlled by the master UF Control panel.
 - g. Air scour every 5 minutes for 30 seconds.
 - h. Total time required is 23 minutes.
3. CIP operation: Set-points shall be adjustable. Provide the following for initial commissioning unless otherwise specified or required by the membrane manufacturer.
- a. Frequency: Initiated by an operator.

- b. Valves and circulation pump shall be a completely automated operation when initiated by the operator. Chemicals will be added to the tank with manual control of the chemical pumps by operators prior to initiating a clean.
- c. The HMI shall notify the operator when the Transmembrane Pressure (TMP) reaches the maximum setpoint. Perform CIP after a normal backwash.
- d. Procedure: Soak membranes for up to 6 hours with any of the following or as recommended by the membrane manufacturer:
 - (1) 1,000 to 3,000 mg/L chlorine. Feed of sodium hypochlorite solution via the air diaphragm pumps to the CIP tank shall be controlled by the master UF Control panel.
 - (2) Citric acid solution at a pH as recommended by the OEM. Feed of citric acid solution via the air diaphragm pumps to the CIP tank shall be controlled by the master UF Control panel.
 - (a) Chemical is fed from a removable tote and other acids, or caustics, may be substituted for pH adjustment as needed.
- e. Air scour every 5 minutes for 30 seconds during soak.

R. UF System Controls

- 1. Provide instrumentation and PLC/OIT-based control system to control the UF and CIP systems. All instrumentation required to control and monitor the operation of the system shall be provided including all PLC and OIT programming for all supplied equipment.
- 2. The UF system will be integrated with the balance of the water plant SCADA system provided by others.
- 3. General functionality:
 - a. The number of UF skids will running and instantaneous flow rate will be determined based on the following criteria:
 - (1) Operator selection of dedicated online and offline skids, and maximum number of skids to run.
 - (2) Call for water production based on the operating levels in the water plant clearwell.
 - (3) The UF system will control the VFD speed of the UF feed pumps. One pump is dedicated for each UF skid and the pumps and VFDs are provided by others.

- b. If the feed pressure exceeds the maximum feed pressure or the transmembrane pressure specified by the manufacturer, the skid shall shutdown and send an alarm.
- c. If filtrate turbidity exceeds 0.15 for two consecutive 15 minute periods, the skid shall shutdown and perform an Integrity Test. It cannot be placed back in service until it passes. Each turbidity meter shall have an air trap and solenoid valves to automatically isolate the meter during backwash.
- d. An air integrity / pressure decay test shall be performed for each skid for any of the following conditions:
 - (1) No less than once per day
 - (2) After every maintenance clean
 - (3) After every CIP
- e. Setpoint for integrity testing procedures and setpoints shall be pre-programmed by the OEM and include the following:
 - (1) Start pressure: 15 psi
 - (2) Pressure decay shall be measured during the integrity testing sequence and used to determine the LOG Reduction Values (LRV) of the system using the following equation:

$$LRV = \log \left(\frac{Q_p * ALCR * P_{atm}}{\Delta P_{Test} * V_{sys} * VCF} \right)$$

Where Q_p = Design capacity of filtrate flow (gpm)
 $ALCR$ = Air-to-liquid Conversion Ratio (by OEM)
 P_{atm} = Atmospheric Pressure (psi)
 ΔP_{test} = Pressure decay during test (psi/min)
 V_{sys} = Volume of the UF system (gal)
 VCF = Volumetric concentration factor (1, unitless)

- (3) Test time for sequences shall be as follows:
 - (a) Pressurization and water purging: 5 minutes maximum
 - (b) Pressure decay monitoring: 5 minutes minimum
 - (c) Air purge and water refill: 5 minutes maximum
- (4) Alarm setpoints shall be as follows:

- (a) The UF system must achieve 3 LRV for giardia and 2 LRV for cryptosporidium.
 - (b) An general alarm shall notify operators when the LRV falls below a value of 4.0.
 - (c) An LRV result of 3.5 or less shall prohibit the UF skid from returning to service until repairs can be made and an integrity test meets the requirements.
- f. Provide one remote I/O panel for each UF skid, one remote I/O panel for each CIP skid, and one master UF system control panel with user interface touchscreen.
- g. At a minimum, display the following information / on the Master Control Panel HMI. Graphic screens shall be the standard offering of the manufacturer given that they meet the minimum following requirements.
 - (1) Use the following color coding for motorized equipment:
 - (a) Flashing Red: Alarm / fault status
 - (b) Green: Running
 - (c) Yellow: Standby or offline
 - (2) For each UF skid:
 - (a) Overview of all skids
 - (b) Status of UF (normal operation, standby, backwash, maintenance clean, CIP, or fault condition).
 - (c) Water quality and other analyzers outputs including influent and effluent turbidity, temperature, flow, and pressure. Raw water temperature will be measured using instrumentation by others and through the balance of plant SCADA system and communicated with the UF control system.
 - (d) Calculated membrane operational parameters including flux, permeability, transmembrane pressure.
 - (e) Speed command output for VFD speed of the feed pump;
 - (f) Position of all actuated valves;
- h. At a minimum, display the following information on the HMI for each CIP panel

- (1) Status and VFD speed of the CIP pump;
 - (2) Water level in the CIP tank
 - (3) Water temperature
 - (4) Status of the CIP tank heater.
 - (5) pH of water in the CIP tank
 - (6) Free chlorine residual in the CIP tank
- i. Include a performance monitoring software system for purposes of:
- (1) Automatic data acquisition
 - (2) Data trending
 - (3) Report generation
 - (4) Alarm management including notification and alarm archiving
 - (5) Facilitating system performance analysis
 - (6) Facilitating performance optimization

PART 3 - EXECUTION

3.01 STARTUP AND COMMISSIONING ACTIVITIES

- A. I/O checkouts and testing of the UF and CIP systems shall be accomplished prior plant startup.
- B. Installation of membranes
 1. If the skid is not shipped with membrane modules installed, field installation work shall conform to the Membrane Manufacturer's recommended procedures and instructions.
 2. Provide for the services of a factory trained service technician to be present to supervise the installation of the membranes.
- C. Functional Testing
 1. Each skid is to be operated at representative flows with automatic instrument control as required to confirm responsiveness over the design operating range. Testing shall continue until the system is run for two consecutive days without abnormal

interruption and shall include normal backwashing and MC cycles of the UF skid and CIP system.

2. No less than two successful start-up and shutdown sequences shall be demonstrated prior to the start of the functional run test.
3. The OEM shall return to the project site when the first CIP is scheduled to occur and perform functional testing. Successful functional testing must be demonstrated for each skid (one CIP per skid).

D. Performance Testing and Training

1. Time of Performance Testing: The performance testing for the UF and CIP systems shall occur following completion of functional testing and completion of all facilities and equipment required for the testing. Final acceptance of the systems will be contingent upon successful performance testing. See "SYSTEM TRAINING" section for further requirements.
2. Duration of Performance Test: The system shall be tested for five consecutive days during normal plant operation shifts. The manufacturer shall be fully responsible for every aspect of the performance test. Representatives of the manufacturer and shall be on site during the entire performance test. Representatives of the Engineer and Owner may also be present during the performance test.
3. The UF OEM shall conduct formal training with the Owner during the performance testing period, and may extend beyond the performance period as needed for the extent of training.
4. Performance Test Conditions: All systems shall be tested under design operating conditions.
5. Data Collection During Performance Test: The following continuous data shall be collected hourly unless otherwise specified during the performance testing:
 - a. Water Quality: water temperature, feed water pH, feed water turbidity, and UF filtrate turbidity. Readings may be taken from the plant instrumentation provided the instrumentation is operable and calibrated at the time of the test.
 - b. Mechanical Data: Process stream pressures, UF transmembrane pressure, process flow, membrane flux, chemical dosages, and duration of operating, startup and shutdown times.
6. Test Report: A formal startup and testing report shall be produced and submitted to the Engineer for all testing activities. Report shall contain results for all activities performed during testing. Results from all testing shall be tabulated, trended, and graphed as appropriate. Discussion of testing, along with conclusions and recommendations, shall be presented in the test report.

- E. Field Representative: The equipment shall provide the services of a qualified field representative for all startup and commissioning procedures. The representative shall perform all testing, operation, and debugging of the systems. A minimum of thirty (30) business days in a total of four trips shall be included in the base bid for onsite representation to perform system checkouts, startup and commissioning, testing, and Owner Training. The OEM proposal shall include the additional cost per day information.

3.02 SYSTEM TRAINING

- A. The manufacturer shall provide the services of a qualified representative(s) to provide training during the startup and commissioning period to instruct the Owner's personnel on proper operation, installation, sampling, cleaning, and maintenance for the systems provided in this specification. Topics of discussion shall include, at a minimum:

1. UF System

- a. General UF concepts and definitions such as in-side out versus outside-in feed arrangements, flux, transmembrane pressure, permeability, air scour, etc.
- b. The process of how UF works including backwashing and cleaning functions.
- c. Problems caused by particulates, foreign materials, and dissolved foulants.
- d. Membrane chemical compatibilities with oxidants, acids, and bases.
- e. Monitoring techniques of how to detect problems.
- f. Maintenance: Issues involving the maintenance of the UF units and CIP systems.
- g. Cleaning procedures including desired pH, chlorine dosages, temperatures, flow rates, cycle times, etc.
- h. Controls/operation of this specific installation, including touch screens, logic, instrumentation calibration, and other operations.

3.03 REMOTE MONITORING

- A. The OEM shall provide one year of remote monitoring the system operating parameters using a VPN connection in their base cost. At the completion of the one-year period. The Owner may select to renew the OEM monitoring program.
- B. UF performance data collected and monitored by the OEM during this period shall be used to compile a monthly status report with a complete analysis of all normalized data with recommendations for any adjustments to operation and maintenance. OEM shall deliver the monthly report to the Owner in PDF format once per month.

- C. Manufacturer shall recommend when the first CIP is required and be present onsite to oversee the CIP procedures and perform general acceptance testing of those systems. The OEM shall assume being onsite for a total of two (2) days to oversee a CIP of all 13 UF skids.

3.04 CONTRACT CLOSEOUT:

- A. Provide in accordance with Section 01 77 00.

1. Introduction

AECOM Technical Services, Inc. (AECOM) is pleased to provide this geotechnical report for the new water treatment plant (WTP) and finished water transmission pipeline in Provo City (City). The purpose of this report is to present the findings of our geotechnical field exploration and laboratory testing as well as provide geotechnical recommendations for the design and construction of project improvements.

1.1 Scope of Services

Our scope of services for this geotechnical study includes the following:

- Review of pertinent in-house geotechnical data, aerial photographs, and published geologic maps, soils data, and literature.
- Coordination and mobilization for subsurface exploration, including marking of existing utilities through Blue Stakes of Utah.
- Drilling, logging, and sampling of 7 exploratory borings and performance of 6 cone penetration tests (CPTs) at the project site and along the transmission pipeline alignment to depths ranging from 16 to 121 feet (ft) to assess subsurface conditions and to obtain soil samples for laboratory testing.
- Assignment and performance of laboratory tests to assess physical and engineering properties of subsurface soils, including water content, Atterberg limits, particle size distribution, organic content, consolidation, and corrosion suite testing (Chlorides, pH, Resistivity, Sulfates, Chlorides, Sulfides, and Soluble Salts) on selected soil samples.
- Compilation and engineering analysis of collected data to develop design recommendations.
- Preparation of this report presenting data, findings, and geotechnical design recommendations regarding the subject project.

Our scope of services did not include environmental consulting services such as hazardous waste sampling or analytical testing.

1.2 Project Description

Our understanding of the project is based on our discussions with the design team and City Public Works personnel. Our understanding is that the new WTP will be constructed south of 2230 North Street, and just west of Freedom Boulevard in Provo, Utah. A finished water transmission pipeline approximately ½-mile in length will extend southward from the planned WTP and then eastward along Stadium Avenue, crossing University Avenue and Canyon Road (150 East Street) to connect with existing ductile iron pipelines. The new 36-inch diameter ductile iron transmission pipeline is anticipated to be constructed primarily using cut and cover methods, with depth of cover ranging from approximately 4 to 15 ft. Cut and cover methods are also anticipated for the University Avenue crossing rather than a trenchless excavation, which had been under consideration. The project will include demolition of the existing parking area at the new WTP site.

The new WTP and associated structures are assumed to be supported on mat foundations or shallow spread and strip footings based upon discussions with the structural engineer. From the preliminary plan sheet, the WTP will treat up to 30 million gallons per day (MGD) and will include two 1-million-gallon (MG) clearwell tanks and a pump station. The treatment plant will have a finished floor near final grade with elevation (El.) 4,632.75 ft above mean sea level (msl) and the top of the tanks will be slightly above final grade, near El. 4,635.7 ft msl. The pump station is planned to have a bearing elevation below grade, near El. 4,616.3 ft msl.

1.3 Site Description

The new WTP project area is less than two miles west of the foot of the Wasatch Mountain Range in Utah County, Utah. The area is less than 5 miles from the eastern shoreline of Utah Lake and about 50 miles from the Great Salt Lake, which is northwest of the project site. The project site is located along the west side of Freedom Boulevard approximately 500 ft south of 2230 North Street in an existing asphalt-paved parking area. Residential parking areas border the project site to the west, south and north extending to multifamily residences, most notably Raintree Apartments. A project vicinity map is provided in **Appendix A**. At the time of performance of the site investigation and preparation of this report, the project site was relatively flat, with most of the ground surface area covered with asphalt paving, sloping slightly downward to the west. Some mature trees were situated near the western edge of the site, and an overhead power transmission line extended roughly north to south near the eastern edge of the site; some grasses and other small vegetation were present in the unpaved powerline easement. The northwest region of the parking area at the project site was being used as a temporary staging area to support construction occurring offsite. Some debris and garbage was observed along the western side of the site.

1.4 Alignment Description

The transmission pipeline conveying treated water is planned to extend southward along Freedom Boulevard from the new WTP, then eastward to connect with an existing pipeline near the Lavell Edwards Football Stadium. The alignment lies within asphalt paved roads and parking areas. Along the alignment Freedom Boulevard is a four-lane asphalt-paved roadway and includes a center median lane. Concrete curb and gutter extend along both sides of the roadway, overhead power transmission extends along the west side of the roadway right-of-way, and indications of buried utilities are also present.

The project alignment extends eastward from Freedom Boulevard through paved parking areas; the alignment is at similar latitude as Stadium Avenue, located east of 150 East Street and just North of the Lavell Edwards Football Stadium. Between Freedom Boulevard and University Avenue, the alignment extends through a paved parking area. The area includes an overhead electrical power transmission line, associated utility easement, and chain link gated accessways to/from the parking area. Several grass sport fields are located to the south and to the north of the parking area, and a residential development borders the area on the north, from west of University Avenue to one of the grass fields (to approximately halfway between University Avenue and Freedom Boulevard).

East of University Avenue, the alignment extends through another paved parking area with the same power transmission line extending eastward toward 150 East Street. The alignment is near the north end of the parking area; residential developments and religious structures are located just north of the alignment. The ground surface elevation along the pipeline alignment is relatively level along Freedom Boulevard, but generally rises between Freedom Boulevard and 150 East Street.

2. Site Characterization

2.1 Regional Geology

The site setting between Utah Lake and the Wasatch mountains is within the eastern margin of the Basin and Range physiographic province. The Basin and Range consists of an alternating series of generally north-south trending narrow mountain ranges and valleys (basins) extending from approximately Reno, Nevada, in the west to Salt Lake City, Utah, in the east. The basins and ranges that are part of the Great Basin were created largely by normal faulting during a period of extensional tectonic activity that continues to be active in the present time.

The geology of the areas surrounding the Great Salt Lake, including the project site, is dominated by the former Lake Bonneville, a freshwater lake that covered much of northern Utah and extended into Idaho and Nevada as recently as 12,000 years ago during the Pleistocene Epoch. During this time, lacustrine

sediments including fine-grained deep-water deposits, as well as coarse-grained beach, turbidite (subaqueous landslide), and alluvial deposits were deposited in areas surrounding the Great Salt Lake. As Lake Bonneville receded, lacustrine soils were overlain by alluvial fan deposits placed along major drainages emanating from the mountains as well as some aeolian (wind-derived) deposits in certain locations. The Great Salt Lake and Utah Lake are the modern remnants of Lake Bonneville.

2.2 Mapped Soil Conditions

Geologic maps that include the project site indicate surficial deposits to be primarily composed of young alluvial fan deposits with a matrix of sand silt and clay deposited by debris flows, debris floods, or streams (Qafy); some stream-terrace deposits with only minor amounts of clay (Qat1); and deltaic deposits of the regressive (Provo) phase of the Bonneville Lake cycle (Qldp) consisting of well-sorted pebble and cobble gravel with a matrix of sand and silt interbedded with thin pebbly sand beds (Solomon et al. 2010).

2.3 Geologic Hazards

2.3.1 Seismicity

The project site is located within the Intermountain Seismic Belt, one of the most seismically active areas in the interior western United States. Earthquakes of moment magnitude of 7.0 or more have occurred repeatedly in relatively recent geologic history along the nearby Wasatch fault zone, which generally runs along the foot of the Wasatch Mountains. The main surface expression of the Wasatch fault zone is located approximately 1-1/2 miles east of the project site. The Wasatch fault zone is one of the longest and most tectonically active normal faults in North America and half of the estimated 50 to 120 post-Bonneville surface-faulting earthquakes in the Wasatch Front region have been on the Wasatch fault with an estimated slip rate of between 1 and 5 millimeters per year (Black et al. 2004). Additional quaternary or younger faults in the nearby vicinity of the project site with seismic potential include the Utah Lake faults about 5 miles west of the project site, the Round Valley faults about 13 miles northeast of the project site, and the Little Diamond Creek fault about 14 miles southeast of the project site. The Utah Lake, Round Valley, and Little Diamond Creek faults are normal faults with slip rates less than 0.2 millimeters per year.

2.3.2 Liquefaction

Seismically induced liquefaction occurs from the development of excess pore pressures in soil during earthquake loading. This most typically occurs in loose, saturated, cohesionless soils. The generation of excess pore pressure decreases effective stresses within the liquefied soil layer, weakening the soil. Liquefaction effects can include sand boils, settlement, lateral spread, loss of bearing capacity, and increased drag force on deep foundations associated with post-liquefaction settlement.

The Utah Geological Survey (UGS) provides geologic hazard maps that include portions of Utah County, one of which qualitatively shows liquefaction potential in the project area (Christenson and Shaw 2008). Liquefaction potential was assigned on the basis of regional soil and groundwater conditions in conjunction with earthquake ground-shaking probabilities. Based on the liquefaction potential map, the project area is shown as having moderate liquefaction potential. This assessment is consistent with subsurface conditions encountered on our explorations (encountered subsurface conditions are summarized in **Section 3.4** of this report). Based on mapped conditions and our subsurface explorations completed to date at the project site, there could be a risk of liquefaction in some soil layers at the site.

2.3.3 Surface Fault Rupture

The UGS geologic map for the area qualitatively shows potential for surface fault rupture in the project area (Christenson and Shaw 2008). Surface fault rupture is defined as fault-related offset or displacement of the ground surface that may occur due to an earthquake. Relative displacements may be anywhere from a few inches to several feet and can occur horizontally or vertically. The relative displacement commonly recurs along existing fault traces and can result in significant damage if the displacement occurs beneath a building. The surface-fault-rupture potential map shows that the project is not in a surface-fault-rupture special study area (Christensen and Shaw 2008).

The Utah Quaternary Fault and Fold database contains faults that are considered “active” or have an activity class of Quaternary (1.6 million years) or younger. Considering that mapped quaternary faults are more than a mile east of the project site and the transmission pipeline alignment, our opinion is that the risk of surface fault rupture in the project area is low.

3. Subsurface Investigation

A subsurface investigation was performed at the project site and along the transmission pipeline alignment in support of the project's design and construction. Seven (7) soil borings, advanced to depths ranging from approximately 16 to 118 ft, were completed on March 21-23, 2022, and July 28-August 2, 2022. As part of the subsurface investigation plan, six (6) cone penetration tests (CPTs), advanced to depths ranging from 71 to 121 ft, were completed on June 27-28 and July 29, 2022, at the project site. Prior to drilling and CPT soundings, identification and marking of existing utilities was coordinated through Blue Stakes of Utah in the vicinity of each exploration. Drilling and CPT services were provided by our subcontractor, ConeTec, Inc. of Salt Lake City, Utah. The purpose of the subsurface exploration was to gather information regarding subsurface materials and to collect soil samples for further engineering characterization and testing. A description of the site conditions at the time the explorations were performed is provided in **Section 1.3**.

The as-drilled location of each exploration was surveyed by Hansen, Allen & Luce, Inc. Aerial maps showing exploration locations at the new WTP site and along the transmission pipeline are provided in **Appendix A**.

3.1 Borehole Drilling and Sampling Methods

Exploratory borings performed in March of 2022 were advanced using high-frequency resonant energy vibration methods (sonic drilling) to depths ranging from approximately 16 to 118 ft below ground surface (bgs), using a Boart Longyear LS 600 track-mounted drill rig, equipped with 6-inch diameter casing and 4.75-inch diameter core barrel button bit. Exploratory borings performed in July and August 2022 were advanced using overburden drilling eccentric (ODEX) to depths ranging from approximately 20 to 24 ft bgs, with a 4.5-inch diameter ODEX bit, and using mud rotary drilling to depths ranging from approximately 20 to 81 ft bgs, with a 3.875-inch diameter tricone bit. The explorations in July and August 2022 were performed using a FRASTE MD-XL track-mounted drilling rig. Logs documenting subsurface conditions that were encountered in the exploratory borings and a Key to Boring Logs are provided in **Appendix B**.

Soil samples were obtained by driving a 2.0-inch outside-diameter (OD) split barrel, standard penetration test (SPT) sampler and 3.0-inch OD split barrel, modified split-spoon sampler (modified California style sampler) in general accordance with ASTM International (ASTM) Standard D1586 (2018), pushing a 3.0-inch OD thin-walled tube sample (Shelby tube) in general accordance with ASTM Standard D1587 (2015), or collecting, in bags, disturbed samples of the sonic core material at depth. Penetration resistance (blowcount) was recorded for each 6-inch interval while driving the split-barrel sampler with an automatic trip 140-pound hammer, dropped from a height of 30 inches. The blowcount recorded over the driven sample interval was used along with pocket penetrometer and torvane devices for an indication of relative density and consistency of in-place soil materials. The blowcount or N-value is recorded on the boring logs (included in **Appendix B**), denoted by “N.” Additionally, the blowcount at each sample depth was corrected for drilling conditions, adjusted for estimated hammer energy to obtain the N_{60} value, and adjusted for overburden stress at the depth of each sample to obtain the $(N_1)_{60}$ value. The N_{60} and $(N_1)_{60}$ values are also shown on the boring logs included in **Appendix B**.

AECOM geotechnical personnel observed subsurface explorations, maintained detailed logs of subsurface conditions encountered in each boring, classified encountered soils, and collected soil samples for laboratory testing. Encountered soils were classified at the time of drilling using the Unified Soil Classification System (USCS) in general accordance with ASTM Standard D2488 (2017). Soil samples were placed into re-sealable plastic bags, or 5-gallon buckets, depending on the type of

sampling performed, labeled with sample location and depth information, and transported to the laboratory testing facility. A summary of geotechnical explorations performed for the project is presented in **Table 3.1**.

In the first phase of drilling (Initial), exploratory borings were performed by sonic drilling methods. Sonic drilling uses vibration to advance the casing behind the core barrel. While this drilling method provides a continuous soil core for classification and sampling, in-situ measures of soil density and geotechnical laboratory testing may be adversely impacted by vibration. Consequently, blowcounts recorded and reported on the boring logs in **Appendix B**, may be lower than those from SPTs using traditional rotary drilling and may not reflect the typical correlation to actual *in situ* condition of the soil. The vibration may also cause some disturbance to tube soil samples.

Exploratory borings completed during the second phase of drilling (Follow Up) were advanced using ODEX and mud rotary drilling methods to gain additional perspective. ODEX drilling was used to advance borings through the upper soil deposits with dense gravel and cobbles, but ODEX drilling also causes vibration that can lead to sample disturbance and can influence blowcounts. Below 20-24 ft, mud rotary drilling was performed to improve reliability of field blowcounts and reduce sample disturbance.

3.2 Borehole Abandonment

After each exploratory boring was completed, the borehole was backfilled. For borings completed along the transmission pipeline alignment and above the observed groundwater, boreholes were backfilled with bentonite chips to within approximately 1 foot of the ground surface and finished near the ground surface with sand/gravel aggregate and then a cold patch asphalt. For borings completed in the vicinity of the new WTP site, boreholes were backfilled using portland cement-bentonite grout to within 0-10 ft of the ground surface via tremie pipe and with bentonite chips within 0-10 ft of the ground surface. Borings performed within paved areas at the project site were finished near the ground surface with sand/gravel aggregate and cold patch asphalt.

3.3 Cone Penetration Tests

The CPT soundings were completed using a 25-ton, truck-mounted CPT rig, equipped with a 60-degree-apex-angle piezocone with a 15-square-centimeter tip and net area ratio of 0.8. The CPT soundings were performed by pushing an approximately 1.7-inch-diameter instrumented cone into the ground with a set of hydraulic rams to collect relatively continuous tip, sleeve, and pore pressure measurements of subsurface soil conditions. The sleeve area was approximately 225 square centimeters, with an offset between measured tip and sleeve resistance of 0.1 meter. This offset is accounted in the reported data. The CPT soundings were performed in accordance with ConeTec's CPT operating procedures, which are reported to be in general accordance with the current ASTM Standard D5778 (ASTM 2012b). Measured cone tip resistance was corrected for pore pressure effects (corrected tip resistance denoted as "q_t") for reporting. The results of the CPT soundings are included in **Appendix C**.

Table 3.1 Summary of Geotechnical Explorations

Exploration ID	Investigation Phase	Depth (ft)	Groundwater Depth (ft)
DH22-HDD-01	Initial	43.0	Not Encountered
DH22-P-01	Initial	18.0	Not Encountered
DH22-P-02	Initial	18.0	Not Encountered
DH22-P-03	Initial	16.1	Not Encountered
DH22-WTP-01	Initial	118.0	13.8
DH22-WTP-02	Follow Up	80.0	15.2
DH22-WTP-03	Follow Up	81.0	15.0
CP22-WTP-01	Follow Up	120.1	(16.1 ²)

Exploration ID	Investigation Phase	Depth (ft)	Groundwater Depth (ft)
CP22-WTP-02	Follow Up	74.8	18 ¹ (18.5 ²)
CP22-WTP-03	Follow Up	121.3	15.8 ¹ (25.8 ²)
CP22-WTP-04	Follow Up	71.2	13 ¹ (13.6 ²)
CP22-WTP-05	Follow Up	81.0	15 ¹ (20.1 ²)
CP22-WTP-06	Follow Up	74.2	(23.9 ²)

Notes:

1. Groundwater depth observed during pre-drilling activities.
2. Groundwater depth estimated based on shallowest pore pressure dissipation (PPD) performed during CPT sounding.

3.4 Encountered Subsurface Conditions

General descriptions of encountered subsurface conditions, including fill materials and native soil encountered in the exploratory borings at the project site are presented in subsequent sections.

3.4.1 Fill Materials

Subsurface explorations at the project site encountered fill materials from the ground surface to depths of approximately 0.5 to 2.5 ft bgs. Fill materials, including disturbed native materials and imported materials placed without documentation or by uncontrolled means, generally are not suitable to support structures. The sampled fill materials primarily were composed of silty sand, silty sand with gravel, poorly graded sand with silt and gravel, and sandy silt with gravel. The fill material was encountered directly below the existing 2 to 5 inches of asphalt concrete pavements. No documentation of fill placement has been provided to us for consideration. In addition to the fill materials encountered in the exploratory borings, fill is anticipated to be encountered at locations beyond and between the boring locations, extending to varying elevations that may be associated with existing roadway right-of-way, previous site grading, or buried utility improvements.

3.4.2 Native Soils

Native soils encountered immediately beneath the fill materials include gravel, sand, silt, and clay. Primarily coarse-grained soils, including silty/clayey sands and gravels, were encountered at shallow depths on the logs; however, several clay and silt strata were also encountered. Below the coarse-grained soils, thicker deposits of fine-grained sediments, including clays and silts with much less sand and gravel, were encountered. A couple of relatively dense layers of sand were also encountered in the deeper sediments. Consistent with the proximity to the Provo River and the alluvial deposition of some of the native soils, variation in layer depth and thickness was observed in the explorations performed.

3.4.3 Groundwater

Groundwater was not encountered to the depth explored in the four soil borings along the project pipeline alignment. At the WTP site, groundwater was initially observed during drilling of soil borings or pre-drilling for CPTs at depths ranging from 13 to 18 ft bgs (El. 4,608 to 4,613 ft msl). Groundwater depth estimations in CPT soundings is based on shallowest pore pressure dissipation (PPD) test performed during the CPT sounding, and are somewhat deeper than the depths encountered during drilling and pre-drilling, approximately 13.6 to 25.8 ft bgs. The estimated equilibrium pore pressure reached in some of the deeper PPD tests showed little to no head, suggesting that full hydrostatic pore pressure conditions may not exist in some materials and that a perched or falling head groundwater condition could exist at the site. However, for the geotechnical analyses performed and reported herein, hydrostatic, saturated conditions were assumed.

Considering that groundwater was observed in the explorations and considering the depth of our explorations along the project pipeline alignment, groundwater should be anticipated in localized regions

and should be considered for design and construction of project improvements. In general, groundwater levels fluctuate seasonally because of possible variations in ground surface topography, subsurface geologic conditions, rainfall, irrigation, and other factors. A detailed groundwater analysis was beyond the scope of this geotechnical study; however, groundwater typically is higher in the late spring months and lower in late fall to early winter. Groundwater level also may be influenced locally by nearby construction activities, or by dewatering efforts for excavations during construction.

4. Laboratory Testing

Laboratory testing was performed by Ninyo & Moore in North Salt Lake, Utah, on selected soil samples, which were collected from exploratory borings completed for this study. The following subsections describe the laboratory testing performed on collected soil specimens.

4.1 Index Properties

Index property testing was conducted to measure physical properties of the materials and to confirm field soil classifications. Index tests included the following:

- Natural moisture content (ASTM Standard D2216 2019)
- Atterberg limits (ASTM Standard D4318 2017)
- Sieve analysis (ASTM Standard D6913 2017)
- Hydrometer analysis (ASTM Standard D7928 2017)

The results of laboratory testing are presented in **Appendix D**, and select results are summarized in **Table 4.1**. The original field classifications, as well as the revised classifications based on laboratory data, are noted in the table. Note that the final borings logs were updated to include index laboratory test results at the tested depths on the logs, and laboratory Unified Soil Classification System (USCS) classifications are reported on the logs.

4.2 Corrosion Properties

Analytical testing was performed to provide information on corrosion potential of onsite soils to buried metal and/or concrete for use in corrosion design of project improvements. Specifically, corrosion tests were focused on bulk soil samples that could come into contact with pipelines, hydraulic structures, or other subsurface facilities. The tests performed included pH (EPA 9045D, USEPA 2015), Soluble Chloride (EPA 300.0, USEPA 2015), Soluble Sulfate (EPA 300.0, USEPA 2015), and Electrical Resistivity (SSSA 10-3.3, USEPA 1991). The results of corrosion testing are presented **Appendix D** and summarized in **Table 4.1**.

The results of six electrical resistivity tests were between 610 and 1930 ohm-cm (average 1425 ohm-cm) and indicate that soils at the site may exhibit severe corrosion potential to buried metal. Chloride content results (10 to 431 ppm) are less than an approximate threshold of 450-500 ppm, above which soils should be considered corrosive to metal. The pH results (8.1 to 9.5) indicate some alkalinity but do not indicate significant influence on corrosion potential. Sulfate content results (12 to 379 ppm) indicate a negligible to moderate potential for deleterious amounts of water-soluble sulfate ions that can react unfavorably with concrete (American Concrete Institute [ACI] 2019).

Table 4.1 Laboratory Test Results Summary

Laboratory Test	Test Results	Notes
Atterberg Limits		
Liquid Limit	NP to 48	Fines classify as non-plastic silt to medium plasticity clay
Plastic Limit	NP to 25	

Laboratory Test	Test Results	Notes
Plasticity Index	NP to 24	
Moisture Content	2 to 37 percent	Slightly moist to wet
Material passing #200 sieve	5 to 97 percent	--
Dry Density	94 to 98 pounds per cubic foot	--
Organic Content	29 percent	DH22-P-03, sampled from 4 to 6 ft
Sulfate Content	12 to 379 ppm	Negligible to moderate sulfate exposure
pH	8.1 to 9.5	--
Chloride Content	10 to 431 ppm	Less than 500 ppm; negligible corrosivity
Resistivity	610 to 1930 ohm-cm	Severe corrosion potential to buried metal

Notes:

"--" denotes a blank entry; cm = centimeter; kg = kilogram; mg = milligram; ppm = parts per million

4.3 One Dimensional Consolidation

One-dimensional consolidation tests (ASTM Standard D2435 2020) were performed on Shelby tube samples to assess settlement properties of site soils. Reported traditional consolidation parameters are summarized in **Table 4.2**. The consolidation parameters (CR, RR, and OCR) reported herein for the current study were developed from the consolidation plots using the Casagrande graphical method and were used in foundation settlement analysis. Additional consolidation test data are provided in **Appendix D**.

Table 4.2 Summary of Consolidation Test Results

Boring	Sample Depth (ft)		USCS	CR	RR	P' _c (ksf)	OCR
	Top	Bottom					
DH22-WTP-01	36.5	38.5	CL	0.106	0.016	3.6	1.2
DH22-WTP-01	56.5	58.5	CL	0.163	0.010	6.9	1.7

Notes: 'ft' = feet, USCS = Unified Soil Classification System, 'ksf' = kips per square foot

Parameter Definitions:

- CR = compression ratio (strain basis)
- RR = recompression ratio (strain basis)
- P'_c = estimated pre-consolidation pressure

- OCR = estimated over-consolidation ratio

5. Findings

Based on the results of our field exploration and laboratory testing programs, it is our opinion that there are no known geologic or geotechnical conditions that would preclude the design and construction of proposed project improvements. It is also our opinion that there are some geotechnical considerations that may affect design and construction of project elements described below:

- Undocumented fill materials were encountered in our subsurface exploration to depths ranging from approximately 0.5 to 2.5 ft below the existing ground surface. The term undocumented fill refers to human-made fill without documentation of engineering observation and testing during its placement. Undocumented fill is considered unsuitable to support project structures in its present condition unless documentation of its placement and compaction is reviewed or other studies are undertaken to assess the suitability and condition of the fill materials. Untested fill material should be removed from all areas of structural support.
- Based on the results of sampling and laboratory testing during construction, excavated and stockpiled undocumented fill materials generally may be used as project structural fill and backfill provided the materials meet the requirements in **Section 6.13.4** of this report. Stockpiled, on-site soils and import soils proposed for use as fill should be sampled and evaluated by the geotechnical consultant before use.
- Groundwater was not encountered in our exploratory borings along the pipeline alignment but was encountered in our explorations at the planned WTP site, with water observed at depths ranging from about 13 to 18 ft below the ground surface (El. 4,608 to 4,613 ft msl). Accordingly, some construction and excavation activities may be affected by groundwater (e.g., pumping or unstable subgrade, excavation dewatering, flowing sands, etc.) in some locations. Groundwater levels in nearby wells and piezometers can be monitored for changes in depth to groundwater prior to the start of construction to help assess the need for trench excavation dewatering. Installation of piezometers at the project site also should be considered so that periodic measurements of groundwater depth can be collected, leading up to construction.
- Based on our review of referenced geologic data and the distance to mapped faults and fissures, it is our opinion that the potential for fault-related surface rupture for project structures is low.
- Based on the soils encountered in our subsurface explorations, it is our opinion that structures may be supported by shallow strip footings or mat foundations. A factor of safety of 3.0 was used for recommended allowable bearing pressures. An allowable total settlement of 2 inches was considered for mat foundations and 1 inch for spread and strip footings. Detailed analyses and recommendations, including differential settlements and angular distortion of mat foundations, are presented in **Section 6.3.2** and **Section 6.4.2**.
- Based on our subsurface explorations, some of the project site is underlain by loose, wet, cohesionless silt and sand with relatively low penetration resistance. Accordingly, potential for some liquefaction induced settlement up to about 6 inches at the ground surface should be anticipated during a design seismic event. Liquefaction induced settlement is anticipated to occur primarily within soil layers between about 13 to 46 ft bgs. If estimated post-earthquake liquefaction settlements exceed design tolerances for Project facilities, liquefaction mitigation and/or ground improvement may be implemented to reduce or eliminate estimated liquefaction-induced settlement. More detailed discussion of post-earthquake liquefaction settlement and ground improvement alternatives is provided in **Section 6.5** and **Section 6.6**.
- Tested samples recovered from the exploratory borings have sulfate contents considered to be moderately deleterious to concrete; accordingly, concrete with Type II cement, a 4,500-psi design compressive strength, and a maximum water-cement ratio of 0.45 is recommended for concrete in

contact with on-site soils and for walls within 12 inches of finished grade. Recommendations for concrete and corrosion considerations are provided in **Section 6.11**.

- Tested soil samples indicate soil resistivity values considered highly to extremely corrosive to buried metal. Recommendations for buried metal are provided in **Section 6.11**.

6. Design and Construction Recommendations

The following sections provide our recommendations for design and construction of proposed project improvements based on our current understanding of the project, engineering properties of tested samples, geologic conditions presented in this report, and the assumption that an adequate number of tests and observations will be made during construction to evaluate compliance with these recommendations.

6.1 Seismic Design Parameters

The project site is at risk from ground shaking due to strong earthquake motions. Based on the results of subsurface investigations and field and laboratory testing performed, seismic Site Class D is considered appropriate for the project site in accordance with *ASCE/SEI 7-16, Minimum Design Loads and Associated Criteria for Buildings and Other Structures* (ASCE 2017), adopted by Provo within the 2018 International Building Code (ICC 2017). Seismic structural design parameters are identified below, in **Table 6.1**, consistent with the generalized acceleration response spectrum procedure from *ASCE/SEI 7-16*. The seismic coefficients displayed in **Table 6.1** are applicable to an earthquake event having a return period of approximately 2,475 years, which is the building code requirement. Seismic design parameters were obtained from the ATC Hazards by Location website which uses the United States Geological Survey (USGS) Conterminous U.S. 2014 seismic source model or were developed directly from *ASCE/SEI 7-16*. As noted in **Table 6.1** (see note 2), special provisions apply relating to the calculation of the seismic response coefficient, C_s (due to seismic Site Class D and $S_1 > 0.2g$). A site-specific ground motion hazard analysis is not within the scope of this study; accordingly, the equivalent lateral force (ELF) procedure (Article 12.8 of *ASCE/SEI 7-16*) is assumed for use in structural design, and the seismic response coefficient C_s will be generated by Eq. (12.8-2) for values of $T \leq 1.5T_s$ and taken as equal to **1.5 times the value computed** in accordance with Eq. (12.8-3) for $T_L \geq T > 1.5T_s$ or with Eq. (12.8-4) for $T > T_L$.

Notes:

1. Source: ATC Hazards by Location – <https://hazards.atcouncil.org/>
2. Given Site Class D with S_1 more than 0.2, additional requirement from Section 11.4.8 applies:
Ground motion hazard analysis is not required for structures other than seismically isolated structures and structures with damping systems where:
Structures on Site Class D sites with S_1 more than or equal to 0.2, provided the value of the seismic response coefficient C_s is determined by Eq. (12.8-2) for values of $T \leq 1.5T_s$ and taken as equal to 1.5 times the value computed in accordance with either Eq. (12.8-3) for $T_L \geq T > 1.5T_s$ or Eq. (12.8-4) for $T > T_L$.

6.2 Ductile Iron Water Main Pipeline

The following subsections present design and construction recommendations for the planned 36-inch-diameter finished water transmission pipeline that will extend southward along Freedom Boulevard from the southeast corner of the new WTP site and cross two parking areas as well as University Avenue to connect with existing water transmission infrastructure. The recommendations for the transmission pipeline are based on the geotechnical exploration completed along the alignment, our understanding of the proposed design, and anticipated construction methods.

6.2.1 University Avenue Crossing

Various installation methods were evaluated for the University Avenue transmission line crossing. Based on the proposed 36-inch diameter of the transmission pipeline, length of the crossing, and encountered subsurface soils in boring DH22-HDD-01, horizontal directional drilling, jack and bore techniques and traditional open cut trenching installation were considered. Of the trenchless methods, due to the short distance and adequate soil cover above the water table, jack and bore is anticipated to be more cost effective than HDD for trenchless installation. However, based upon current feedback from UDOT, who has jurisdiction for University Avenue, we understand that that cut-and-cover installation will be allowed with traffic lane closures and that cut-and-cover is planned since it is expected to be a less-costly method of construction for the crossing. Accordingly, trenchless pipeline design and construction recommendations are not presented herein.

6.2.2 Encountered Subsurface Soils and Conditions

Four borings were completed along the pipeline alignment near approximately stations 5+50 (DH22-explorationsP-03), 13+50 (DH22-P-02), 19+50 (DH22-HDD-01), and 27+00 (DH22-P-01). One additional boring was drilled approximately 150 ft west of Freedom Boulevard (DH22-WTP-01). The following sections describe subsurface soils and conditions encountered in the exploratory borings performed along the pipeline alignment.

6.2.2.1 Subsurface Soils

Subsurface soils encountered east of approximately Freedom Boulevard (approximately station 12+00) primarily consisted of medium stiff to stiff, low plasticity sandy silty clay (CL-ML) to sandy lean clay (CL) with varying amounts of fine sand and trace gravel. There were also occasional layers of nonplastic to low plasticity, loose to medium dense silty sand (SM) encountered, which ranged in thickness from 1 to 3 ft. At least one layer of silty gravel layer, approximately 2 to 3 ft thick, was encountered near the transmission pipeline's tie into the existing infrastructure near 150 E. Laboratory tested fine-grained soils indicate liquid

limits ranging from about 25 to 30 and plasticity indexes ranging from about 4 to 11; fines content of these layers typically exceeded 60 percent, and gravel content is generally less than 10 percent.

Subsurface soils encountered along Freedom Boulevard (new WTP site to approximately station 12+00) primarily consisted of nonplastic silty gravel (GM) to poorly graded gravel with sand (GP) overlain by several feet of silt, sand, and clay mixtures. There were also occasional cobbles encountered with individual particle diameters of up to 7 inches.

6.2.2.2 Groundwater

Groundwater was not encountered to the depth explored in the four soil borings along the project pipeline alignment; however, groundwater was encountered in explorations at the new WTP site between 13 and 18 ft bgs. Considering the primarily granular, cohesionless nature of existing site soils, groundwater level at the new WTP site is anticipated to be influenced significantly by the Provo River with diminishing influence farther from the river. Accordingly, groundwater should be anticipated during construction excavations along some portions of the pipeline alignment. Dewatering should also be anticipated during pipeline construction in some areas.

6.2.2.3 Concrete and Corrosion

Chemical tests and resistivity testing associated with the transmission pipeline were similar to those of the exploration at the new WTP site (see **Section 6.11**). Accordingly, the provisions and recommendations presented in **Section 6.11** are also applicable to the pipeline.

6.2.3 Trench Stability

The use of simple trench shoring, such as trench boxes and shields, is feasible for subsurface soils encountered east of approximately Freedom Boulevard (approximately station 12+00) to the planned depth of the pipeline invert (approximately 8 to 13 ft bgs). Because of the cohesionless nature of subsurface soils encountered along Freedom Boulevard (new WTP site to approximately station 12+00), the contractor should carefully evaluate the suitability of simple trench shoring prior to its implementation, including maintaining stability of the trench outside the shoring system to avoid undesirable impacts to adjacent utilities, pavement surfaces, or structures along that portion of the pipeline alignment. In the segment along Freedom Boulevard, vertical, or near vertical, excavation walls may be prone to raveling, instability, and collapse. Accordingly, trench excavation support, which may include the use of sloping (instead of benching), shoring, sheet piles, or secant piles, some combination of these systems, or other methods may need to be considered. A structural engineer experienced in retaining systems for temporary excavations should be consulted by the contractor during the design of a shoring system. The project's geotechnical engineer should review the design plans for a temporary retaining system prior to its implementation.

The contractor should protect all existing underground and overhead utilities and facilities and should conform with all laws and requirements governing the protection of underground utilities and facilities within the State of Utah, including all permit requirements of the Utah Department of Transportation (UDOT), Utah County, and the City within their respective jurisdictions. Consideration should be given to pipelines running parallel to the planned excavation. Trench excavations within two pipe diameters of existing pipelines and extending below the springline of, and running parallel to, existing pipeline utilities may need to be supported by properly designed trench shoring and bracing to prevent damage to existing pipelines or facilities.

Design and installation of utilities should accommodate the widespread difficult geotechnical conditions including shallow groundwater, soft soil bearing and long-term soil consolidation constraints, and loose liquefiable deposits (e.g., loose, saturated sands/gravels) with potential lateral spread, if encountered. Consideration should be given to ductile joints and connections, including recommended use of fully restrained joint systems where practical.

The purpose of dewatering during construction is to improve trench excavation wall and bottom stability, as well as subgrade stability, to facilitate pipeline installation. Dewatering in excavations is anticipated in some areas (see **Section 6.2.2.2**), to lower groundwater to about 2 ft or more below the bottom of the

anticipated excavations. Common dewatering methods may include sump pumping, well points, vacuum well points, or combinations of these. The contractor is responsible for the design, implementation, and operation of dewatering systems. The contractor should prepare a dewatering plan and, if applicable, a groundwater recharge plan, and submit to the engineer for approval prior to beginning excavation. Dewatering, if used, should be controlled and monitored to help reduce the potential for drawdown subsidence during construction, and dewatering effluent should be contained to avoid discharges into state receiving waters in accordance with applicable state and federal clean water regulations. A construction dewatering discharge permit may be needed, and water discharged during construction may require treatment, monitoring, sampling, and testing. Dewatering systems should discharge to an appropriate location, in accordance with permit requirements; surface water should be directed away from open trenches.

Trench dewatering and stability is the responsibility of the contractor. Accordingly, the contractor is responsible for the adequacy and safety of the means, methods and sequencing of trenching and pipeline installation. The contractor should also adhere to applicable Occupational Safety and Health Administration (OSHA) safety and industry standards. On-site safety of personnel will also be the responsibility of the contractor.

6.2.4 Trench Backfill

Trench backfill should generally comply with provisions put forth in Standard Detail P-255, Trench Backfill and Surface Restoration, of City Standard Drawing Details (PCPW 2022) and American Public Works Association (APWA) Standard Specifications (Utah APWA and Utah AGC 2017) as modified by City (PCPW 2022).

6.2.4.1 Bedding and Pipe Zone Backfill

Existing subsurface soils excavated east of approximately Freedom Boulevard (approximately station 12+00) or compacted Common Fill meeting requirements of Section 31 05 13 (Utah APWA and Utah AGC 2017) should provide suitable support for pipe bedding material. Existing subsurface soils encountered along Freedom Boulevard (new WTP site to approximately station 12+00) were silty to poorly graded gravels, which may be difficult to compact if disturbed. Accordingly, soils excavated on early portions of the transmission pipeline alignment may not be suitable as bedding support or trench zone backfill as discussed in **Section 6.2.4.2** and should be disposed of offsite by the contractor. Soils and fills used to support pipe bedding material should be moisture conditioned to within ± 2 percent of optimum moisture content (OMC) and compacted to 95 percent of maximum dry density (MDD) (ASTM Standard D1557-12 2021) in uncompacted lifts not exceeding 8 inches (6 inches for walk-behind equipment).

Bedding and pipe zone backfill, inclusive of haunching (backfill above the bedding and below the springline of the pipe) and backfill surrounding the pipe (backfill above the springline of the pipe to a minimum of 12 inches above the crown of the pipe), should be compacted sand meeting requirements of Section 31 05 13 (Utah APWA and Utah AGC 2017) as modified by City (PCPW 2022). The sand should be free of organics and should not contain pea gravel, recycled RAP, or crushed fines. The pipe bedding should be moisture conditioned and compacted to 90 percent of MDD (ASTM Standard D1557-12 2021) in uncompacted lifts not exceeding 8 inches (6 inches for walk-behind equipment). The thickness of bedding material should be 4 inches or more. For open cut excavations where the proposed transmission pipeline will bear at or near the current groundwater elevation, the soils at this depth are expected to lose stability due to construction activity. If the soils at the base of the pipeline excavations consist of higher clay content or looser sands, then it may be necessary to increase the thickness of the bedding layer to approximately 18 to 24 inches with geotextiles placed on the base of the trench and extending up to the spring line of the pipe, depending on the stability of the soil at the time of construction.

In areas underlain by silty to poorly graded gravels (new WTP site to approximately station 12+00) against which fine sands, silts, or clays are to be placed, a stabilization-separation geotextile should be used to prevent particle migration. The geotextile should extend along the bottom of the trench and extend vertically along the sides to the springline of the pipe. The geotextile should generally meet requirements of Section 31 05 19 (Utah APWA and Utah AGC 2017). The geotextile should be non-woven geotextile with an apparent opening size (AOS) of the No. 60 standard US sieve or finer, as needed.

6.2.4.2 Trench Zone Backfill

Some existing subsurface soils that will be excavated east of approximately Freedom Boulevard (approximately station 12+00) might meet the requirements for Borrow as specified in Section 31 05 13 (Utah APWA and Utah AGC 2017), as shown in **Table 6.2**, and could be used as trench zone backfill. Existing subsurface soils encountered along Freedom Boulevard (new WTP site to approximately station 12+00) were silty to poorly graded gravels, which may be difficult to compact, and at least one sample, silty sand (SM) encountered above the gravel in DH22-P-03, had organic content of nearly 30 percent. Such soils are unsuitable for use as trench backfill and should be disposed of offsite by the contractor. Particles larger than 2 inches should also be removed and disposed of offsite by the contractor. Imported fill meeting the requirements for Borrow, as specified in Section 31 05 13 (Utah APWA and Utah AGC 2017), or flowable fill, meeting requirements in Section 31 05 15 (Utah APWA and Utah AGC 2017), may be used as trench zone backfill. The trench zone backfill should be free of organics; relatively clean or uniformly graded gravels, pea gravel, or recycled RAP should not be used as trench zone backfill. Trench zone backfill should be moisture conditioned and compacted to 90 percent of MDD (ASTM Standard D1557-12 2021) placed in uncompacted lifts not exceeding 8 inches (6 inches for walk-behind equipment).

If flowable fill is to be used, material should flow easily requiring no vibration, and should be allowed to cure adequately before placing or compacting the pavement section. Flowable fills should have a design compressive strength of 60 pounds per square inch (psi), or more, in 28 days.

Table 6.2 Summary of Soil Properties for Tested Soils Encountered in Pipeline Borings

Boring (Approx. Station)	Sample Depth (ft)	Percent Passing			LL	PI	AASHTO Soil Classification	Meets Borrow Specification ¹
		No. 10	No. 40	No. 200				
DH22-P-01 (27+00)	3	88	84	63	24	7	A-4	Yes
DH22-P-01 (27+00)	8.5	0	99	79	23	5	A-4	Yes
DH22-P-02 (13+50)	3	100	100	92	29	10	A-4	Yes
DH22-P-02 (13+50)	10	100	100	91	27	7	A-4	Yes
DH22-P-02 (13+50)	14	100	99	93	30	11	A-6	No
DH22-P-03 (5+50)	4	61	51	31	32	7	A-2-4	No ²
DH22-P-03 (5+50)	14	22	17	8	--	--	A-1-a	Yes
DH22-HDD-01 (19+50)	6.5	100	99	83	23	5	A-4	Yes
DH22-HDD-01 (19+50)	14	100	100	88	25	6	A-4	Yes

Notes: LL = Liquid Limit; PI = Plasticity Index; AASHTO = American Association of Highway and Transportation Officials; '--' = not measured

1. Borrow as specified in Section 31 05 13 (Utah APWA and Utah AGC 2017) as modified by City (PCPW 2022).

2. Organic content for this sample was nearly 30 percent.

6.2.5 Transmission Pipeline Structures

Structural design and earthwork requirements for the transmission pipeline's appertaining structures (e.g., vaults) should follow the same guidance provided for new WTP structures (see **Sections 6.1, 6.2.5** through **6.8, 6.11**, and **6.13**).

6.2.6 Pavement Restoration

In areas where trench excavations extend through asphalt or Portland Cement concrete pavement (PCCP) sections, the pavement should be replaced to the full limits of damage if extending beyond the

trench cut, following City Public Works Standard Detail P-255, Trench Backfill and Surface Restoration (PCPW 2022).

6.3 Mat Foundations

Structures such as the basement level of the WTP, pump station, valve vault and diversion box are anticipated to have mat foundations. Accordingly, relevant design and construction recommendations appropriate for mat foundations are provided in the subsequent sections.

6.3.1 Bearing Capacity

The recommended allowable bearing capacities for foundations were calculated using dimensions and bearing elevations from preliminary drawings. Bearing capacities were evaluated under drained loading conditions for general bearing failure. The allowable bearing capacities are shown in **Table 6.3** and represent the total pressure applied to the structure foundation. The bearing capacity calculations were performed according to AASHTO LRFD Bridge Design Specifications (2017). A factor of safety of 3.0 was used for recommended allowable bearing pressures.

Settlement, which is presented in **Section 6.3.2** for mat foundations, was also considered while developing allowable bearing resistances. Long-term settlement that occurs under permanent or sustained static loads can result in significant settlement over time depending on the magnitude of the permanent load and the duration of the loading. The settlements discussed in **Section 6.3.2** are appropriate only for permanent bearing pressures that are less than the maximum permanent bearing pressures shown in **Table 6.3**, which, if exceeded, may result in more settlement than estimated in **Section 6.3.2**. Settlement estimates also are dependent on the bearing elevation for each structure. If the bearing elevation changes for a structure, the associated settlement also can change. Bearing capacity analysis results are provided in **Appendix F**.

Table 6.3 Bearing Resistance Analysis Input Parameters and Results

Structure Name	Foundation Dimensions [B x L] ³ (ft)	Anticipated Bearing Elevation ³ (ft)	Allowable Bearing Resistance (ksf)	Maximum Permanent Bearing Pressure (ksf)
Water Treatment Plant – Basement Level	120 x 120	4612.0	2.3 ²	1.5 / 2.3 beneath fluid tank
Pump Station	35 x 95	4612.0	2.9 ²	1.0
Valve Vault	17 x 17	4619.0	4.0	-- ⁴
Diversion Box	10 x 14	4618.0	4.0	1.0

Notes: 'ft' = feet, 'ksf' = kips per square foot

1. Water level was assumed to be at the El. 4,611 ft based on borings performed at the site.
2. Allowable bearing resistance was selected by limiting total settlement to about 2 inches – this includes immediate and primary consolidation settlement.
3. Settlement estimates are dependent on bearing elevation for each structure. If the bearing elevation changes for a structure, the associated settlement also may change.
4. Relatively low net loading is anticipated for the valve vault and diversion box and less than about 1 inch of settlement.

6.3.2 Settlement

Settle3 Version 5.0.15 (Rocscience, 2022) was used to estimate total settlements due to foundation loading based on a one-dimensional analysis, which considers immediate elastic settlement and primary consolidation of subsurface materials. Immediate settlement is the settlement that is anticipated to mostly occur immediately upon loading and construction; primary consolidation is the result of the expulsion of air and water out of the soil matrix and generally takes a longer time to progress. Vertical induced stresses were calculated using the Boussinesq (1883) flexible foundation methods implemented in the

Settle3 software. Soil compressibility parameters were based on the conditions encountered in the exploratory borings and the laboratory testing results.

Estimated settlement, differential settlement, and angular distortion for the WTP facilities that are supported on mat foundations are summarized in **Table 6.4**. Data from the settlement analysis are provided in **Appendix F**.

Table 6.4 Settlement and Angular Distortion of Mat Foundations

Structure	Maximum Estimated Settlement (inches)	Estimated Settlement at Corner of Mat (inches)	Differential Settlement (inches) / Distance (ft)	Angular Distortion (radians)
Water Treatment Plant – Beneath Fluid Tank	2.0 ¹	1.3	0.7/ 51	0.001
Water Treatment Plant –Basement	1.8 ¹	1.1	0.7/ 58	0.001
Pump Station	1.0 ¹	0.7	0.3/ 40	0.001
Diversion Box	0.2 ¹	0.2	0	0

Notes: 'ft' = feet

1. Estimated settlement shown represents both immediate and long-term settlement. Immediate settlement is estimated to be about one half of the total settlement reported and is anticipated to occur during construction and commissioning of project structures. Long-term settlement is estimated to be about one half of the total settlement reported and is anticipated to occur over time during the design life of the facility.
2. Water level was assumed to be at the El. 4,611 ft based on borings performed at the site.
3. Settlement reported here is estimated using field and laboratory data.

Settlement estimation often is imprecise, and soil conditions are assessed based on limited points of investigation, limited soil samples, and limited laboratory testing. Estimates of settlement in this report may be more or less than actual settlements, and the locations of maximum settlement may vary. Estimated settlement and tolerable settlement for structures, based on information provided by the structural engineer, were considered in developing allowable bearing capacity in the following sections.

6.4 Spread and Strip Footings

The upper level of the WTP and the first floor of the pump station can be supported by shallow strip footings. The clearwell tanks can be supported on shallow spread footings. Accordingly, design and construction recommendations appropriate for spread and strip footings are provided, based on structural plans.

6.4.1 Frost Depth and Foundation Embedment

Consistent with the IBC (ICC 2017) and local practices, the minimum foundation embedment recommended for exterior structure and wall foundations is 30 inches, which represents the depth from the bottom of the foundation to the lowest adjacent final grade.

6.4.2 Bearing Capacity and Settlement

The recommended allowable bearing capacity, which considers an allowable settlement up to 1 inch, for strip footings supporting the upper level of the new WTP, the clearwell walls, and the first floor of the pump station is 4 kips (one kip is one thousand pounds) per square foot (ksf). Applying this to footing widths from 2 to 4 ft results in an allowable strip load of 8 to 16 kips per lineal foot (klf). This recommendation was developed based on our understanding of the preliminary foundation loads and anticipated embedment depth.

The recommended allowable bearing capacity, which considers an allowable settlement up to 1 inch, for spread footings supporting the clearwells is 4 ksf; this applies to footing widths ranging between 4 to 9 ft. This recommendation assumes that the footings are bearing near El. 4,612 ft.

Bearing capacity and settlement estimates are dependent on the bearing elevation for each structure. If the bearing elevation, load, or width of the strip footing changes, the associated settlement could also change. The settlement and bearing capacity analysis results are provided in **Appendix F**.

6.5 Post-Earthquake Liquefaction Settlement

Post-earthquake liquefaction settlement was estimated for facilities located at the treatment plant site. Exploratory borings and CPTs advanced at the treatment plant site encountered some wet, cohesionless sand and silt layers with field blow counts, *N*, as low as 6 with apparent individual layer thicknesses of about 2 to 10 ft at depths ranging from 13 to 57 ft bgs corresponding to El. 4,569 to 4,612 ft (primarily between 13 to 46 ft bgs, corresponding to El. 4,578 to 4,612 ft). Liquefaction triggering and settlement analyses were performed following the methodology of Idriss and Boulanger (2008) as modified by Boulanger and Idriss (2014) and Ishihara and Yoshimine (1992). Post-earthquake liquefaction settlement estimates are summarized in **Table 6.5**. The results of the liquefaction settlement analyses suggest the potential for post-liquefaction settlements of approximately 3 to 6 inches for the design seismic loading. Based on this assessment, extreme event post-liquefaction settlements on the order of 6 inches should be considered in the design of project structures and utilities unless mitigation efforts are implemented to help reduce the potential for liquefaction to occur (e.g., removal of susceptible layers, ground improvement) or to help reduce the associated post-liquefaction settlement (selecting a deep foundation system to extend below the susceptible layers). It is anticipated that ground improvement might be preferred over deep foundation systems; some ground improvement alternatives are discussed in **Section 6.6**.

Table 6.5 Summary of Post-Earthquake Liquefaction Settlement Estimates

Exploration ID	Exploration Depth (ft)	Estimated Post-Earthquake Liquefaction Settlement (in) ¹	Nearest Structure/Facility
DH22-HDD-01	43.0	-- ²	Transmission Pipeline near HDD crossing Under University Avenue
DH22-P-01	18.0	-- ²	Transmission Pipeline Near 150 East Street
DH22-P-02	18	-- ²	Transmission Pipeline from Freedom Boulevard to University Avenue
DH22-P-03	16.1	-- ²	Transmission Pipeline Under Freedom Boulevard
DH22-WTP-01	118	3.8 ³	Water Treatment Plant
DH22-WTP-02	80	4.9 ³	Clearwell East, Pump Station, Valve Vault
DH22-WTP-03	81	3.0 ³	Clearwell West, Drain Vault
CP22-WTP-01	120.1	2.6 ³	Water Treatment Plant
CP22-WTP-02	74.8	3.5 ³	Clearwell East, Pump Station, Valve Vault
CP22-WTP-03	121.3	4.0 ³	Clearwell West, Drain Vault
CP22-WTP-04	71.2	4.7 ³	Water Treatment Plant, Clearwell West
CP22-WTP-05	81.0	3.7 ³	Water Treatment Plant, Diversion Box
CP22-WTP-06	74.2	3.3 ³	Water Treatment Plant

Notes: 'ft' = feet

1. Post-earthquake liquefaction settlement estimate based on Boulanger and Idriss (2014) using SPT (measured and inferred) blowcounts from exploratory drill hole advanced using sonic methods.
2. Saturated groundwater conditions not encountered during drilling of the given exploration. Saturated conditions could exist at deeper depths.

Exploration ID	Exploration Depth (ft)	Estimated Post-Earthquake Liquefaction Settlement (in) ¹	Nearest Structure/Facility
3.	Due to conditions during drilling of borings or pre-drilling for CPTs, SPT sampling or CPT sounding was not able to be performed in the upper 1-4 ft of the liquefaction-susceptible materials. Accordingly, slightly more post-earthquake liquefaction settlement than the reported estimates could occur (an additional 1 inch, or so, totaling up to approximately 3 to 6 inches).		

Groundwater and saturated conditions were not encountered in the four exploratory borings performed for this study along the proposed pipeline alignment; the borings along the alignment extended to depths ranging from 16 to 43 ft bgs. Accordingly, some conditions needed for liquefaction were not encountered to the depths explored along the proposed pipeline alignment. Between Freedom Blvd and 150 East Street, the existing ground surface is approximately 10 to 25 ft higher in elevation and farther from the Provo River than the segment along Freedom Blvd. Elevation and proximity to the Provo River may influence the potential for saturated, loose, and cohesionless materials susceptible to liquefaction that could exist between, beyond, or below the explorations performed along the proposed pipeline alignment. If materials susceptible to liquefaction are present along the alignment below the depth explored and post-earthquake liquefaction settlement was to occur in a seismic event, it is anticipated that the magnitude of settlement could be less than that estimated to occur at the treatment plant site. However, considering that explorations along the pipeline alignment were relatively shallow, the proposed pipeline should be designed to accommodate some liquefaction-induced settlement that could occur during an earthquake event. The results of the liquefaction analysis are presented in **Appendix E**.

6.6 Ground Improvement Alternatives

If estimated post-earthquake liquefaction settlements exceed design tolerances for Project facilities, liquefaction mitigation and/or ground improvement is recommended to reduce or eliminate estimated liquefaction-induced settlement. Based on the elevation range in which potentially liquefiable soils were encountered, as discussed in **Section 6.5**, it is anticipated that if suitable ground improvement using established industry methods is performed between El. 4,578 to 4,612 ft, post-earthquake liquefaction settlement could be reduced to less than about 1 inch. For such an improved ground condition, it is anticipated that essentially no post-earthquake liquefaction settlement would be anticipated within the treated area. Beyond any area of ground improvement, post-earthquake liquefaction settlement should still be expected; differential settlement near the perimeter of an area of ground treatment will need to be accommodated in design of appurtenant structures, utilities, connections, etc.

Ground improvement alternatives may be proposed by the contractor; however, some ground improvements are anticipated to be more effective for the site conditions dealing with the gravel and cobble overburden, such as rammed aggregate piers or stone columns. Rammed aggregate piers form a densified column of aggregate surrounded by a stiffened soil matrix and can be installed by several open hole and cased methods to depths of up to about 35 ft. Stone column ground improvements use a down-hole vibrating probe suspended from a crane to displace and open a space in the soil column and fill it with aggregates that are densified with the surrounding matrix soil by vibrating the probe. Stone columns can be formed to deeper depths than rammed aggregate piers, particularly where crane equipment is used. Other methods such as soil cement mixing and rigid inclusions could be used but will require significant predrilling or additional excavation.

Acceptance of ground improvements proposed by the contractor to mitigate liquefaction at the project site will need to be based on review of the proposed construction alternative and confirmation of the installed solution to meet performance requirements. A performance specification is planned to be included in the construction documents to provide the ground improvement specialty contractor with guidelines and criteria to meet, such as: a zone of treatment that extends beyond the footprint of proposed structures, a zone of treatment that extends down to El. 4,578 ft (to penetrate through the depths where liquefiable soil layers are anticipated), and an adequate distribution of the treatment method (e.g., spacing and effective diameter of aggregate piers/columns) to meet specified settlement performance criteria and the intent of the design.

6.7 Lateral Earth Pressures and Sliding

Design of earth-retaining and buried structures should consider lateral earth pressures (LEP) presented in this section. These recommendations are based on consideration of existing materials at the site along with anticipated fill materials (that are placed and compacted adjacent to structures).

Typically, the resulting LEP distribution for soils is assumed to increase linearly from the ground surface (top of the soil adjacent to the wall or foundation) to the base of the wall or foundation. To facilitate the application of this pressure distribution in design, recommended lateral-earth equivalent-fluid weights are presented in **Table 6.6**. Lateral-earth equivalent-fluid weights represent the equivalent-fluid weight (analogous to water pressure) resulting from LEP in the various retaining cases. Lateral-earth equivalent-fluid weights may be used to develop the pressure distribution with depth resulting from retained soils. The provided equivalent-fluid weights do not account for any water pressure that may build up behind a wall. Accordingly, when water pressures are anticipated to be present during the design life of the structure, static water pressure should be added to the earth pressures obtained from the equivalent-fluid weights presented in **Table 6.6**. For relatively rigid, buried structures, or for restrained walls, the at-rest equivalent-fluid weights (static and seismic components) should be used.

The seismic component of the equivalent-fluid weights listed in **Table 6.6** are the pseudostatic component of the seismic earth pressure, rather than the combined static and seismic LEP; accordingly, the static equivalent-fluid weight (i.e., either the active or at-rest value) should be added to the seismic equivalent-fluid weight shown in the table for the combined effect. For the passive earth case, the seismic component of the equivalent-fluid weights will reduce the static passive earth pressure equivalent-fluid weight. The results of the LEP analysis are provided in **Appendix G**.

A certain amount of movement is required to mobilize active and passive earth pressure. The amount of movement required to mobilize earth pressure can be expressed as the ratio of the movement at the top of the wall, Δ , to the height of the wall, H . It is recommended that values of Δ/H of 0.002 and 0.02 be used for mobilization of active and passive pressure, respectively, for granular backfill. We recommend that values of Δ/H of 0.01 and 0.05 be used for mobilization of active and passive pressure, respectively, for silt or clay material. Linear development of earth pressure should be assumed. Where such deflection is deemed unacceptable, at-rest pressures should be used in place of active/passive earth pressures.

Table 6.6 Summary of Recommended Lateral Earth Equivalent-Fluid Weights

Location	Load Case	Active ¹ [Submerged ²] (pcf)	At-Rest ¹ [Submerged ²] (pcf)	Passive ¹ [Submerged ²] (pcf)
Project Site (El. 4,630 to 4,570 ft)	Static	45 [25]	75 [40]	490 [225]
	Seismic Component ³ (Pseudostatic)	50 [25]	60 [30]	-125 [-60]

Notes: pcf = pounds per cubic foot

1. Equivalent-fluid weights for passive and at-rest/active earth pressure are calculated using assumed soil unit weights of 135 pcf for at-rest/active and 115 pcf for passive. Earth pressure coefficients may be calculated by dividing the equivalent-fluid weight by the assumed soil unit weight.
2. Submerged unit weights only account for pressure from soil and are appropriate for use where the surrounding soil is submerged; submerged equivalent fluid pressures do not include water pressures, which will need to be added to the pressure shown.
3. Lateral earth equivalent-fluid weights for the seismic components are based on a horizontal seismic coefficient equal to half of the peak ground acceleration (see **Section 6.1**) for the active and passive conditions.

Backfill placed behind retaining walls or subsurface walls should meet material and placement recommendations for structural fill presented in **Sections 6.13.4** and **6.13.5**. Over-compaction adjacent to retaining walls or subsurface walls should be avoided; recommended LEPs assume that compaction behind retaining walls or subsurface walls will be accomplished with relatively light compaction equipment.

Sliding resistance is estimated using a ratio of normal stress to shear resistance for an interface between concrete and the soil upon which the concrete is bearing. A friction ratio (τ/σ_n) of approximately 0.4 should

be used for sliding resistance, assuming that the concrete is bearing on granular backfill. Because the displacement required to mobilize ultimate passive earth pressure conditions can be substantial, the passive earth pressure contribution to sliding resistance should be neglected. If passive resistance is considered, the passive resistance should be implemented per the recommendations in this section.

6.8 Floor Slabs and Coefficient of Subgrade Reaction

Concrete slab-on-grade floors (including jointing and reinforcement) should be designed by the project's structural engineer based on anticipated loading conditions. Conventional concrete slab-on-grade floors should be founded on approximately 6 inches of untreated base course (UTBC) compacted to 95 percent or more of the laboratory maximum dry density, as evaluated by ASTM D1557. For concrete slab-on-grade design, an average modulus of subgrade reaction, k , of 175 pounds per cubic inch (psi/in) is recommended.

Floor slabs should be 4 inches or more in thickness and reinforced to control cracking. As a minimum, No. 3 steel reinforcing bars placed at 24 inches on-center both ways, placed at mid-height within the slab should be considered (masonry or plastic "chairs" should also be considered to aid in the placement of the reinforcement). Final slab thickness and reinforcement should be recommended by the project structural engineer. To help reduce shrinkage cracks, conventional slab-on-grade floors should include control joints in accordance with the recommendations of a qualified structural engineer.

Floor slabs should be separated from bearing walls and columns with expansion joints which allow unrestrained vertical movement. Joints should be observed periodically, particularly during the first several years after construction. Slab movement can cause previously free-slipping joints to bind. Measures should be taken so that slab isolation is maintained in order to reduce the likelihood of damage to walls and other interior improvements.

As an alternative to slab reinforcement with steel reinforcing bars, post-tensioned slabs designed by a qualified structural engineer may be considered. Geotechnical recommendations for design of post-tensioned slabs-on-grade will be provided upon request.

A 10-mil or thicker polyethylene (or equivalent) membrane should be used. Such a membrane is typically placed beneath the slab and over the UTBC and overlain by an additional 2 inches of sand or fine gravel (the overlying granular material can help to protect the membrane from puncture during placement, to aid in concrete curing, and help control slab curl). The project structure designer or architect should design and detail any such moisture control systems and their applications, such as in areas where moisture sensitive flooring is used or where mold or musty smells are not wanted.

6.9 Frost Depth

Shallow foundations for the project should be embedded a minimum of 30 inches below the adjacent ground surface (measured to the base of the footing from the lowest, adjacent, exterior ground surface) to help reduce movement associated with freeze-thaw cycles and frost heave.

6.10 Concrete Flatwork

Ground-supported flatwork, such as walkways, may be subject to soil-related movements resulting from heave/settlement, frost, etc. Accordingly, where these types of elements abut rigid building foundations or isolated/suspended structures, differential movements should be anticipated. Flexible joints should be provided where such elements abut the WTP structures to allow for differential movement at these locations.

Exterior concrete flatwork should be supported on properly prepared subgrade, as described in **Section 6.13.2** of this report, overlain by 4 or more inches of UTBC compacted to 95 percent or more of the laboratory maximum dry density, as evaluated by ASTM D1557. Positive drainage should be established and maintained adjacent to flatwork. Water should not be allowed to pond on or adjacent to flatwork.

Exterior flatwork should not extend under any portion of the building where there is less than 2 inches of vertical clearance between the flatwork and any element of the building. Exterior flatwork in contact with brick, rock facades, or any other element of the building can cause damage to the structure when differential movements occur between the flatwork and structure.

Prior to placement of flatwork, a proof roll should be performed to evaluate areas that exhibit instability and deflection. The soils in these areas should be removed and replaced with engineered fill or be stabilized according to recommendations presented in **Section 6.13.3**.

6.11 Concrete and Corrosion Considerations

Chemical tests and resistivity testing associated with this study were performed. Based on the results of the chemical testing, some of the tested on-site soils indicate negligible to moderate sulfate exposure, as described in the American Concrete Institute (ACI) manual, Section 318R-14 (ACI, 2017). In addition, concrete at the site is anticipated to be exposed to freezing-and-thawing cycles with relatively frequent exposure to water. Accordingly, concrete in contact with on-site soils, along with walls up to 12 inches above finished grade, should contain Type II cement, have a design compressive strength of 4,500 psi, and a maximum water-cement ratio of 0.45. The maximum water-soluble chloride ion content in concrete should be limited in accordance with ACI 318-19 Table 19.3.3.1 (considering F2 or F3 exposure class). Chloride content of tested soils was relatively low (less than 431 ppm); however, if concrete is expected to be exposed to de-icing salts, it is recommended that a maximum water-cement ratio of 0.40 be used with a design compressive strength of 5,000 psi or more. In addition, concrete cover and slump should be specified by the structural engineer of record, and good densification procedures should be used during placement, to reduce the potential for honeycombing.

Based on the results of the chemical testing, samples recovered in some exploratory borings have tested chloride levels less than 500 ppm, which suggests specific corrosion mitigation methods based on chloride levels are not needed. However, resistivity tests performed during this study indicate fully saturated, laboratory resistivity values ranging from 610 to 1,930 ohm-centimeters. This is considered severely corrosive to metal. Accordingly, corrosion reduction methods should be considered for this project, especially when designing buried metal pipes. These corrosion reduction methods might include bonded dielectric protective coatings, electrical isolation from connecting pipelines, pipe sleeving, and/or appropriate cathodic protection as recommended by a qualified corrosion engineer. Where permitted by jurisdictional building codes, the use of plastic pipes for buried utilities should also be considered.

6.12 Demolition

Construction of proposed project improvements will include demolition of existing asphalt pavements and might include removal or relocation of some existing utilities. Remnants from demolished structures and pavements should be removed from the project site with a minimum disturbance to the underlying soils unless directed by contract documents. The contractor should take adequate precautions when grading and excavating to reduce the potential for damage to utilities that need to remain in service. The project's geotechnical consultant should observe demolition activities to evaluate whether demolished structural materials and utilities are adequately removed, and that the resulting excavations are adequately backfilled. Disturbed soils should be removed or prepared and properly compacted (providing they meet backfill requirements) prior to placing any new structural fill, pavement base, or pavement materials.

6.13 Earthwork

The following sections provide our recommendations for earthwork, including excavations, site grading, subgrade stabilization, structural fill and backfill, and fill placement and compaction. Our recommendations are based on our evaluation of information obtained from five exploratory borings and associated laboratory testing performing for this study, our observations while at the project site, and our experience with similar materials. Earthwork operations should be performed in accordance with applicable codes, safety guidelines, and other city, county, state and federal guidelines.

6.13.1 Excavations

In our opinion, the site soils may generally be excavated with heavy-duty earthmoving or excavation equipment in good operating condition. Excavated materials might include undocumented fills and or/native soils (including sands, gravel, silts, and clays). When nearing excavation bottoms, equipment and procedures that do not cause significant disturbance to the excavation bottoms should be used, as feasible. Excavators with buckets having large claws to loosen the soil should be avoided when excavating the bottom 6 to 12 inches of the excavation, as such equipment may disturb the excavation base.

Groundwater was encountered in some of our exploratory borings at depths ranging from about 13 to 18 ft, corresponding to approximately El. 4,608 to 4,613 ft. It is anticipated that project improvements, including facilities at the water treatment plant site, will require excavations to elevations below the observed groundwater level (see also **Section 6.2.2.2** and **Section 6.2.3**). Accordingly, groundwater should be considered during design and for construction of project improvements. Installation of piezometers at the project site prior to the start of construction should be considered so that depth to groundwater can be periodically measured and the data made available to the contractor.

Yielding/pumping subgrade conditions may be encountered in some excavations. Incorporation of subgrade stabilization measures, limiting rubber-tire equipment access, etc. may be needed in areas of yielding subgrade. In addition, because anticipated groundwater depths are shallower than proposed excavations, dewatering measures should be considered during design, construction, and operation of project improvements.

The contractor should construct the sides of excavations at a safe and stable slope condition in accordance with current OSHA guidelines or provide an appropriately designed and constructed braced-shoring system; shoring should follow current OSHA guidelines, for employees working in an excavation where they could be exposed to dangers of moving ground. If material is stored or equipment is operated near an excavation, additional pressure due to superimposed loads should be considered in the shoring design. Water should not be allowed to flow over the top of an excavation in an uncontrolled manner.

Excavation dewatering and stability are the responsibility of the contractor. Accordingly, the contractor is responsible for the adequacy and safety of the means, methods, and sequencing of excavations. The contractor should adhere to applicable Occupational Safety and Health Administration (OSHA) safety and industry standards. On-site safety of personnel will also be the responsibility of the contractor.

Undocumented fill materials in their current condition should not be considered suitable to support project structures. Four exploratory borings performed for this study encountered undocumented fill at depths ranging to about 2 ft. The full depth of any on-site undocumented fill and surficial loose and/or disturbed native soils should be removed from proposed structure and other improvement areas including building, block screen/retaining wall, pavement, and exterior concrete flatwork areas. These excavated soils may be processed and stockpiled for later use as structural fill or backfill if they comply with the recommendations provided in this report.

6.13.1.1 Dewatering

Groundwater was observed at depths shallower than some of the anticipated excavation depths. Dewatering of excavations, or other means of mitigating the effects of groundwater, including flowing sands, should be anticipated during earthwork operations, where excavations extend near or below anticipated groundwater. In addition, based on the depth of groundwater encountered in our subsurface explorations and the planned basement elevations of the proposed below-grade structures, it is our opinion that long-term exposure of subsurface structures to infiltration of groundwater should be anticipated. Measures should be taken to adequately drain and convey groundwater away from below-grade structures. These measures may include sump pumps and waterproofing the subsurface portions of the structure to mitigate potential groundwater infiltration. When construction dewatering is anticipated, permitting for discharge of pumped groundwater could be needed.

The purpose of dewatering is to improve excavation wall and bottom stability, as well as subgrade stability, and to allow installation of subsurface improvements and compaction of structural fill. Dewatering measures may include installation of well points, deep wells, and other devices. The scope of our study did not include performance of a hydrogeologic study, design of a dewatering program, nor applying for a dewatering permit for this project. Upon request, we can prepare a proposal for a dewatering study and/or preparation of a dewatering permit application for this project.

Existing structures or utilities within the limits of groundwater drawdown resulting from dewatering might experience settlement during dewatering activities. The amount of settlement, if it occurs, will depend primarily on the amount and duration of the dewatering and subsurface soil conditions. Consideration should be given to monitoring nearby facilities for possible movement and associated damage during dewatering operations. If movement occurs, or if damage is observed, dewatering operations should be temporarily suspended, and the project's geotechnical consultant/owner's representative should be informed. Recommendations for mitigating settlement and associated distress should be provided by the geotechnical consultant/owner's representative.

6.13.2 Site Grading

Prior to grading, proposed structure and improvement areas should be cleared of any pavements, surface obstructions, debris, organics (including vegetation), and other deleterious material. Materials generated from clearing operations should be removed from the project site for disposal (e.g., at a legal landfill site). Obstructions that extend below finish grade, if present, should be removed and resulting voids filled with compacted soil or cement slurry, in accordance with the recommendations of the geotechnical consultant. Topsoil present on-site should not be incorporated into engineered fill but may be stockpiled for re-use as landscaping material or other non-structural material.

The geotechnical consultant should observe areas to receive fill at the time of grading to assess the suitability of the exposed material and to evaluate if removals down to more competent soils are needed. After the removals described above have been made and prior to foundation preparations or additional fill placement, the exposed native materials should be scarified to approximately 6 inches, moisture-conditioned to within +/-2 percent of OMC and compacted to 95 percent MDD (ASTM Standard D1557-12 2021).

6.13.3 Subgrade Stabilization

Subgrade stabilization will be needed where unstable (pumping) subgrade conditions are encountered. Pumping conditions may occur where excavations extend near to or below groundwater. Stabilization methods should be provided by the grading contractor, as needed, and may include the use of a geogrid, such as Tensar TX160, or a woven geotextile fabric, such as Mirafi 600X, placed on unstable subgrade and overlain by 12 inches of crushed rock or Aggregate Base. Pushing oversized angular rock, up to approximately 6 inches in nominal diameter, into exposed unstable subgrade soils may also be an appropriate stabilization alternative. The volume of rock needed will vary based upon factors including the moisture content of the native soil, soil type, depth to groundwater, and total affected area. Placement of angular rock should continue until the area exhibits a relatively non-yielding behavior as observed or tested by the geotechnical consultant.

If conditions (e.g., excavations extending below groundwater) are observed that indicate additional stabilization efforts may be needed, a combination of over-excavation, rock fill, and geogrid placement should be considered. Dewatering and use of relatively light or tracked equipment may also be needed. The geotechnical consultant/engineer during construction should evaluate proposed subgrade stabilization methods prior to their implementation.

6.13.4 Structural Fill and Backfill

Structural fill and backfill soil should consist of well graded, coarse-grained material (a relatively even distribution of grain sizes with 50 percent or more retained on the No. 200 sieve), a low plasticity index (less than 10), a sulfate content less than 0.2 percent, and chlorides less than 500 ppm. Structural fill and

backfill soils should have an expansion index (EI) less than 50 and be free of organic material, clay lumps, claystone bedrock fragments, construction debris, rock particles, other deleterious matter, or rocks or hard chunks larger than approximately 2 inches nominal diameter unless directed by the geotechnical consultant.

Fragments of rock, cobbles, and inert construction debris (e.g., concrete or asphalt) larger than 2 inches in dimension should be specially handled prior to incorporating them into project fills. AECOM should be consulted regarding appropriate recommendations for use of such materials on a case-by-case basis when such materials are encountered during earthwork.

6.13.5 Fill Placement and Compaction

Following site excavations and prior to the placement of engineered fill, the resulting exposed surfaces should be carefully evaluated by the geotechnical consultant. This evaluation may include proof-rolling, soil probing, visual assessment and/or additional laboratory testing. Based on this evaluation, additional remediation may be needed, which could include additional improvement of the exposed surface. This additional remediation (if needed) should be resolved by the geotechnical consultant during the earthwork operations. Fill should not be placed on pumping subgrades. Also, fill materials should not be placed, worked, or rolled while they are frozen or thawing, and should not be placed during poor/inclement weather conditions.

Preparation of subgrade surfaces in areas to receive fill or that will have structures bearing on them should include scarification and moisture-conditioning to a depth of approximately 6 inches, and compaction to a relatively nonyielding condition, prior to placement of fill.

Soils used as structural fill and backfill should be moisture-conditioned to within ± 2 percent of OMC and placed and compacted in uniform horizontal lifts to 95 percent of MDD (ASTM Standard D1557-12 2021). The optimal lift thickness of fill will depend on the type of soil and compaction equipment used. All types of compaction equipment have a depth of influence; hence the maximum appropriate thickness of a lift of fill depends upon the type of equipment used. For light, hand-operated equipment such as vibratory plate and "jumping jack" compactors (or for fills placed in confined areas), the maximum uncompacted lift thickness is commonly 4 inches. For small trench compactors, the maximum uncompacted lift thickness is commonly 4 to 6 inches depending on the size of the compactor. For larger compactors, the thickness of fill lifts should be limited to 8 inches of uncompacted material. The minimum thickness of lifts should also generally be at least twice the dimension of the largest particle size of the fill material.

If fill material is placed where the existing ground surface is steeper than 5H:1V, the surface on which fill is to be placed should be benched. Benches should be 8 ft wide, or more, or be of sufficient width to permit operation by compaction equipment. Benches should include approximately 2-foot high vertical or near-vertical intervening steps, cut to expose medium dense to very dense soil as evaluated in the field by the geotechnical consultant during earthwork operations.

Earthwork operations should be observed and compaction of structural fill and backfill materials should be tested by the project's geotechnical consultant. Typically, one field test should be performed, per lift, for each approximately 500 cubic yards of fill placement in structural areas and every 500 linear ft of trench backfill. Additional field tests may also be performed in structural and non-structural areas at the discretion of the geotechnical consultant or the direction of the building official. Compaction areas should be kept separate, and no lift should be covered by another until relative compaction and moisture content within the recommended ranges are obtained.

6.14 Utility Installation

The contractor should provide adequate mechanical compaction in utility trench backfills, consistent with the moisture conditioning and compaction required for structural fill and backfill in **Section 6.13.5**. The contractor should take particular care to achieve and maintain adequate compaction of the backfill soils around manholes, valve risers and other vertical pipeline elements where settlements are commonly observed. Use of "flowable fill," (e.g., a controlled low strength mix, CLSM, or a similar material) may be

considered in lieu of compacted soil backfill for areas with low tolerances for surface settlements in deep excavations and areas with difficult access.

Pipe bedding materials, placement and compaction should meet the specifications of the pipe manufacturer and applicable municipal standards. Materials proposed for use as pipe bedding should be tested for suitability prior to use.

Special care should be exercised to avoid damaging the pipe or other structures during the compaction of trench backfill materials. In addition, the underside (or haunches) of the pipe should be supported on bedding material that is compacted as described above. This may need to be performed with handheld compaction equipment or small-scale mechanical compaction equipment.

Sandy pipe bedding materials can function as conduits for re-distribution of natural and applied waters in the subsurface. Development of site grading plans should consider the subsurface transfer of water in utility trenches and the pipe bedding in areas where the utility trenches penetrate the building footprint. Cut-off walls in utility trenches or other water-stopping measures should be considered to help reduce the rates and volumes of water transmitted along utility alignments and transmitted toward the proposed building, or other structures; wetting of soils near structures can increase the potential for soil movements, material degradation, and structural distresses. Incorporation of water cut-offs and/or outlet mechanisms for saturated bedding materials into development plans should be considered for the project. Cutoffs and outlet mechanisms will help reduce the potential for migration of fines into the bedding and subsequent, associated settlement.

To help reduce the risk of damage to utilities due to long-term settlement or seismic ground motions, flexible connections for utility-structure connections should be considered. In addition, to help limit effects of differential settlement, permanent pipe connections should be made as late as practical in the construction sequence. Making pipe connections late in the construction process will allow some long-term permanent settlement from new structure loads to occur before pipe connections are made.

6.15 Site Drainage

Infiltration of water into subsurface soils can lead to soil movement and associated distress, and chemical and physical deterioration of concrete structures. To help reduce the potential for infiltration of moisture into subsurface soils at the site, the following should be considered:

- Positive drainage should be established and maintained away from the proposed building(s). Positive drainage may be established by providing a surface gradient for paved areas of 2 to 5 percent or more for a distance of 10 ft or more away from structures. For unpaved areas, positive drainage may be established by a slope of 5 to 10 percent for 10 ft or more away from structures, where possible.
- Adequate surface drainage should be provided to channel surface water away from on-site structures and off paved surfaces to a suitable outlet such as a storm drain or infiltration basin. Adequate surface drainage may be enhanced by utilization of graded swales, area drains, and other drainage devices. Surface run-off should not be allowed to pond near structures or structure footings.
- Building roof drains should have downspouts tight lined to an appropriate outlet, such as a storm drain or the street. If tight lining of the downspouts is not practicable, they should discharge 5 ft or more away from structures and onto surfaces that slope away from the structure. Downspouts should not be allowed to discharge onto exposed ground surface adjacent to building foundations.
- Downspouts should discharge to drainage systems away from structures, pavements, and flatwork. Incorporating a perimeter drainage system around the building foundations that will aid in reduction of moisture infiltration into subsurface soils might need to be considered.

6.16 Scaling

Climatic conditions in the project area including relatively low humidity, large temperature changes and repeated freeze-thaw cycles, may cause surficial scaling and spalling of exterior concrete. Occurrence of

superficial scaling and spalling can be aggravated by poor workmanship during construction, such as “over-finishing” concrete surfaces and the use of de-icing salts on exterior concrete flatwork, particularly during the first winter after construction. The use of de-icing salts on nearby roadways, which can be transferred by vehicle traffic onto newly placed concrete, can be sufficient to induce scaling.

The measures below can be beneficial for reducing concrete scaling. However, because of the other factors involved, including contractor workmanship, surface damage to concrete can develop even when the measures provided below are followed. Concrete mix design criteria should be coordinated with other project requirements including the criteria for soluble sulfate resistance presented in **Section 6.11**.

- Curing concrete in accordance with applicable codes and guidelines.
- Maintaining a water/cement ratio of 0.45 by weight for exterior concrete mixes.
- Including Type F fly ash in exterior concrete mixes as 20 percent of the cementitious material.
- Specifying a 28-day, compressive strength of 4,500 psi, or more, for exterior concrete.
- Including ‘fiber mesh’ in the concrete mix.
- Avoiding the use of de-icing salts through the first winter after construction and using Type V cement.

6.17 Construction in Cold or Wet Weather

During construction, the site should be graded such that surface water can drain readily away from excavations and structure areas. It is important to avoid ponding of water in or near excavations; water that accumulates in excavations should be promptly pumped out or otherwise removed and these areas should be allowed to dry out before resuming construction. Berms, ditches, and similar means should be used to decrease stormwater entering the work area and to efficiently convey it off site.

Earthwork activities undertaken during the cold weather season may be difficult and should be done by an experienced contractor. Fill should not be placed on top of frozen soils. The frozen soils should be removed prior to the placement of new engineered fill or other construction material. Frozen soil should not be used as structural fill or backfill. The frozen soil may be reused (provided it meets the selection criteria) once it has thawed completely. In addition, compaction of the soils may be more difficult due to the viscosity change in water at lower temperatures.

If construction proceeds during cold weather, foundations, slabs, or other concrete elements should not be placed on frozen subgrade soil. Frozen soil should either be removed from beneath concrete elements or thawed and recompacted. To limit the potential for soil freezing, the time passing between excavation and construction should be minimized. Blankets, straw, soil cover, or heating may be used to help discourage the soil from freezing.

6.18 Construction Observation and Testing

A qualified geotechnical consultant should perform appropriate observation and testing services during grading and construction operations. These services should include observation of removal of soft, loose, or otherwise unsuitable soils, evaluation of subgrade conditions where soil removals are performed, evaluation of the suitability of proposed borrow materials for use as fill, evaluation of the stability of open temporary excavations, evaluation of the results of any subgrade stabilization or dewatering activities, and performance of observation and testing services during placement and compaction of structural fill and backfill soils.

The geotechnical consultant should also perform observation and testing services during placement of concrete, mortar, grout, asphalt concrete, and steel reinforcement. If another geotechnical consultant is selected to perform observation and testing services for the project, the selected consultant should provide a letter to the owner, with a copy to AECOM, indicating that they fully understand the recommendations in this report and that they are in full agreement with them. Qualified subcontractors utilizing appropriate techniques and construction materials should perform construction of the proposed improvements.

6.19 Plan Review

The recommendations presented in this report are based on preliminary design information for the proposed project, as provided by HAL Engineers, and on the findings of our geotechnical evaluation. When finished, project plans and specifications should be reviewed by the geotechnical engineer prior to submitting the plans and specifications for bid. Additional field exploration and laboratory testing may be needed upon review of the project design plans.

6.20 Pre-Construction Meeting

A pre-construction meeting should be held prior to site excavation and foundation work. The owner or the owner's representative, the project architect or civil designer, the contractor, and the geotechnical consultant should be in attendance to discuss the plans and quality control program for the project.

7. Limitations

The field evaluation, laboratory testing, and geotechnical analyses presented in this geotechnical report have been conducted in general accordance with current practice and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be encountered during construction. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation can be performed upon request.

The recommendations presented in this report are based on field exploration, laboratory testing, review of referenced maps and literature, and our understanding of the proposed construction. The soil data used in the preparation of this report were obtained from a limited number of subsurface explorations. It is possible that variation in the soil conditions will exist between or beyond the locations explored. Accordingly, if soil conditions are encountered during construction that are different from those outlined in this report, AECOM should be immediately notified so that we may review the situation that exists and make supplementary recommendations as needed. In addition, if the scope of the proposed construction, including the types of structures, anticipated loads and maximum cut and fill depths, changes from what is described in this report, we should be notified. This study was limited to assessment of geotechnical aspects of the project, and did not include evaluation of structural items, environmental concerns, or the presence of hazardous materials.

The recommendations presented in this report are also based on the assumption that an adequate number of tests and observations will be made during site construction to evaluate compliance with the recommendations. These tests and observations should be provided under the direction of a qualified geotechnical consultant. Such testing and observations should include, but not be limited to, the following:

- Review of site construction plans for conformance with geotechnical recommendations.
- Observation and testing during site preparation, grading, structure excavations, foundation installation, and placement of fill, aggregate base, concrete, mortar, grout, asphalt concrete, and steel reinforcement.
- Consultation, as needed during construction.

This document is intended to be used in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. AECOM should be contacted if additional information is needed or if questions regarding the content, interpretations presented, or completeness of this document arise.

Site conditions could change with time as a result of natural processes or the activities of man at the subject site or at nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which we have no control.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk. This report might not provide sufficient data to prepare an accurate bid by contractors. Bidders and their geotechnical consultant could perform an independent evaluation of the subsurface conditions in project areas; independent evaluations could include review of other geotechnical reports prepared for nearby areas, site reconnaissance, and additional subsurface exploration, laboratory testing, and geotechnical analyses.

Qat1

Stream-terrace deposits: (middle Holocene to upper Pleistocene) - Poorly to moderately sorted pebble and cobble gravel with a matrix of sand, silt, and minor clay; contains thin sand lenses; subangular to rounded clasts; thin to medium bedded. Lie 5 to 15 feet (1.5-5 m) above the Provo River and are incised by them

Qaf2

Level-2 alluvial-fan deposits (middle Holocene to upper Pleistocene) – Poorly sorted pebble and cobble gravel, locally bouldery, with a matrix of sand, silt, and minor clay; clasts angular to subrounded, with sparse well-rounded clasts derived from Lake Bonneville gravel; medium to very thick bedded.

Qldp

Deltaic deposits (upper Pleistocene) – Moderately to well-sorted, clast-supported, pebble and cobble gravel with a matrix of sand and silt; interbedded with thin pebbly sand beds; clasts subrounded to rounded; locally weakly cemented with calcium carbonate.

Qafy

Young alluvial-fan deposits, undivided (Holocene to upper Pleistocene)– Poorly to moderately sorted, pebble to cobblegravel with boulders near bedrock sources, with a matrix of sand, silt, and clay, grading to mixtures of sand, silt, and clay on gentler slopes.

Appendix B Logs of Soil Borings

Key to Boring Logs

CONSISTENCY OR CONDITION OF SOILS

Fine-Grained Soils (Silt and Clay): Major portion passing #200 sieve

Relative Consistency	N ₆₀ SPT, Blows/foot	Shear Strength, tsf	Unconfined Compressive Strength, tsf	Field Behavior
Very Soft	< 2	< 0.13	< 0.25	Easily penetrated several inches by fist
Soft	2 - 4	0.13 - 0.25	0.25 - 0.5	Easily penetrated several inches by thumb
Medium Stiff	5 - 8	0.25 - 0.5	0.5 - 1	Penetrated several inches by thumb with moderate effort
Stiff	9 - 15	0.5 - 1	1 - 2	Readily indented by thumb but penetrated only with great effort
Very Stiff	16 - 30	1 - 2	2 - 4	Readily indented with thumbnail
Hard	> 30	> 2	> 4	Indented with difficulty by thumbnail

Coarse-Grained Soils (Sand and Gravel): Major portion retained on #200 sieve

Apparent Density	(N ₁) ₆₀ SPT, Blows/foot	Relative Density, %	Field Test with 1/2-in Steel Rod
Very Loose	< 5	0 - 20	Very easily penetrated when pushed by hand
Loose	5 - 10	20 - 40	Easily penetrated when pushed by hand
Medium Dense	11 - 30	40 - 70	Easily penetrated when driven with 5-lb hammer
Dense	31 - 50	70 - 85	Penetrated 1 ft with difficulty when driven with 5-lb hammer
Very Dense	> 50	85 - 100	Penetrated less than 3 in. when driven with 5-lb hammer

Particle Size Descriptions for Sand and Gravel

Description	Gravel Size	Sand Size	Size Requirement
Coarse	3-in. to 3/4-in.	#4 to #10 sieve	<30% medium to fine sand or <12% fine gravel
Coarse to medium	--	--	<12% fine sand
Medium	--	#10 to #40 sieve	<12% coarse sand and >30% medium sand
Medium to fine	--	--	<30% medium sand or <12% coarse gravel
Fine	3/4-in. to #4 sieve	#40 to #200 sieve	<30% medium sand or <12% coarse gravel
Coarse to fine	--	--	>12% of each size

Moisture Conditions

Dry	No indication of moisture, dusty
Slightly Moist	Appears dry, but some moisture present
Moist	Damp but no visible water
Wet	Visible free water

Structure and Layering of Soils

Stratum	>12 inches thick
Layer	1/2 inch to < 12 inches
Seam	1/16 inch to 1/2 inch
Parting	< 1/16 inch
Frequent	More than one per foot
Varved	Frequent alternating layers, seams, or partings of sand, silt, or clay
Pocket	Small erratic deposit
Lens	Non-continuous lenticular deposit

Plasticity of Fine-Grained Soils

Nonplastic	1/8-in thread cannot be rolled at any water content
Low	Thread can barely be rolled and lump cannot be formed when drier than the plastic limit
Medium	Thread is easy to roll with little time required to reach plastic limit. Thread cannot be rerolled after reaching the plastic limit.
High	Considerable time rolling and kneading to reach plastic limit. Thread can be rerolled several times after reaching plastic limit.

Unified Soil Classification System

Major Divisions			Symbols
			Graphic Letter
Coarse-Grained Soils More than 50% of Material is Retained on No. 200 Sieve	Gravels More than 50% of Coarse Fraction is Retained on No. 4 Sieve	Clean Gravels (little or no fines)	GW
		Gravels with Fines (appreciable amount of fines)	GP
	Sands More than 50% of Coarse Fraction Passes No. 4 Sieve	Clean Sand (little or no fines)	GM
		Sands with Fines (appreciable amount of fines)	GC
Fine-Grained Soils More than 50% of Material Passes No. 200 Sieve	Sands More than 50% of Coarse Fraction Passes No. 4 Sieve	Clean Sand (little or no fines)	SW
		Sands with Fines (appreciable amount of fines)	SP
	Silts and Clays	Liquid Limit Less than 50	SM
		Liquid Limit 50, or more	SC
Highly Organic Soils	Silts and Clays	Liquid Limit Less than 50	ML
		Liquid Limit 50, or more	CL
	Silts and Clays	Liquid Limit Less than 50	OL
		Liquid Limit 50, or more	MH
Highly Organic Soils	Silts and Clays	Liquid Limit Less than 50	CH
		Liquid Limit 50, or more	OH
	Silts and Clays	Liquid Limit Less than 50	PT
		Liquid Limit 50, or more	PT

Note: Dual Symbols are used to indicate borderline soil classifications

TYPICAL SAMPLER GRAPHIC SYMBOLS

	3.25" OD Dames & Moore Sampler
	3" OD Shelby Tube
	Sonic Core Sample
	2" OD Split Spoon (SPT)
	Piston Sample
	Grab Sample

TYPICAL WATER LEVEL SYMBOLS

	Measured Water Level after minimum of 16 hours
	Estimated or observed water level at time of drilling

KEY TERMINOLOGY

CBR	- California bearing ratio
CONS	- One-Dimensional Consolidation Test
CORR	- Corrosion tests
DS	- Direct shear test
F	- Percent fines by weight passing #200 sieve
G	- Percent gravel by weight
γ_d	- Dry unit weight
γ_{d-max}	- Maximum dry unit weight as per ASTM D698 or D1557
LL	- Liquid Limit
N	- Number of blows to drive sampler through the second and third 6-inch soil intervals using a 140-lb hammer dropped 30 inches
N₆₀	- SPT N value corrected for field procedures
(N₁)₆₀	- SPT N ₆₀ value corrected for effective overburden pressure
NP	- Nonplastic
OD	- Outer diameter
PI	- Plasticity index
PP	- Pocket penetrometer
S	- Percent sand by weight
SG	- Specific gravity
SPT	- Standard Penetration Test
SS	- Direct simple shear test
TV	- Torvane
TXCD	- Consolidated drained triaxial test
TXCU	- Consolidated undrained triaxial test
TXCY	- Cyclic triaxial test
TXUU	- Unconsolidated undrained triaxial test
UC	- Unconfined compression test
W	- Moisture content
W_{opt}	- Optimum moisture content associated with ASTM D698 or D1557

Descriptions and layers are interpretive; field descriptions may have been modified to reflect lab test results. Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced; they are not warranted to be representative of subsurface conditions at other locations or times.

ABOUT THIS REPORT

The enclosed report presents the results of the site investigation program conducted by ConeTec, Inc. The program consisted of Seismic Piezocone Penetration Testing and Pore Pressure Dissipation Testing. Please note that this report, which also includes all accompanying data, are subject to the 3rd Party Disclaimer and Client Disclaimer that follow in the 'Limitations' section of this report.

Project Information

Client	AECOM
Project	Provo WTP
ConeTec Project Number	22-52-24382
Rig Description	25-ton Truck CPT Rig (C-7A)

Coordinates

Collection Method	USB/Serial GPS
EPSG Number	4326 (WGS 84 / LatLong)

Cone Penetration Test (CPTu)

Depth Reference	Existing ground surface at the time of the investigation
Sleeve data offset	0.1 Meters

Please refer to the list of attached documents following the text of this report. A test summary, location map, and plots are included. Thank you for the opportunity to work on this project.

LIMITATIONS

3rd Party Disclaimer

- The “Report” refers to this report titled Provo WTP
- The Report was prepared by ConeTec for AECOM

The Report is confidential and may not be distributed to or relied upon by any third parties without the express written consent of ConeTec. Any third parties gaining access to the Report do not acquire any rights as a result of such access. Any use which a third party makes of the Report, or any reliance on or decisions made based on it, are the responsibility of such third parties. ConeTec accepts no responsibility for loss, damage and/or expense, if any, suffered by any third parties as a result of decisions made, or actions taken or not taken, which are in any way based on, or related to, the Report or any portion(s) thereof.

Client Disclaimer

- ConeTec was retained by AECOM
- The “Report” refers to this report titled Provo WTP
- ConeTec was retained to collect and provide the raw data (“Data”) which is included in the Report.

ConeTec has collected and reported the Data in accordance with current industry standards. No other warranty, express or implied, with respect to the Data is made by ConeTec. In order to properly understand the Data included in the Report, reference must be made to the documents accompanying and other sources referenced in the Report in their entirety. Other than the Data, the contents of the Report (including any Interpretations) should not be relied upon in any fashion without independent verification and ConeTec is in no way responsible for any loss, damage or expense resulting from the use of, and/or reliance on, such material by any party.

CONTENTS

The following listed below are included in the report:

- **Site Map**
- **Piezococone Penetration Test (CPTu) Sounding Summary**
- **CPTu Plots**
- **Pore Pressure Dissipation (PPD) Summary**
- **PPD Test Plots**
- **Seismic CPTu Results, Plots, and Traces**
- **Methodology Statements**
- **Data File Formats**

CONE PENETRATION TEST SUMMARY

Sounding ID	File Name	Date	Cone	Cone Area (cm ²)	Final Depth (ft)	Latitude ¹	Longitude ¹	Elevation ² (ft)	Refer to Notation Number
CP22-WTP-01	22-52-24382_SP01	28-Jun-2022	EC773:T1500F15U35	15	120.08	40.262105	-111.662034	4627	
CP22-WTP-03	22-52-24382_CP03	27-Jun-2022	EC773:T1500F15U35	15	121.31	40.261523	-111.662224	4626	
CP22-WTP-06	22-52-24382_CP06	28-Jun-2022	EC773:T1500F15U35	15	74.15	40.262225	-111.661771	4631	

1. The coordinates were collected using consumer grade GPS and have an accuracy of ±30 feet. EPSG number: 4326 (WGS84 / LatLong).

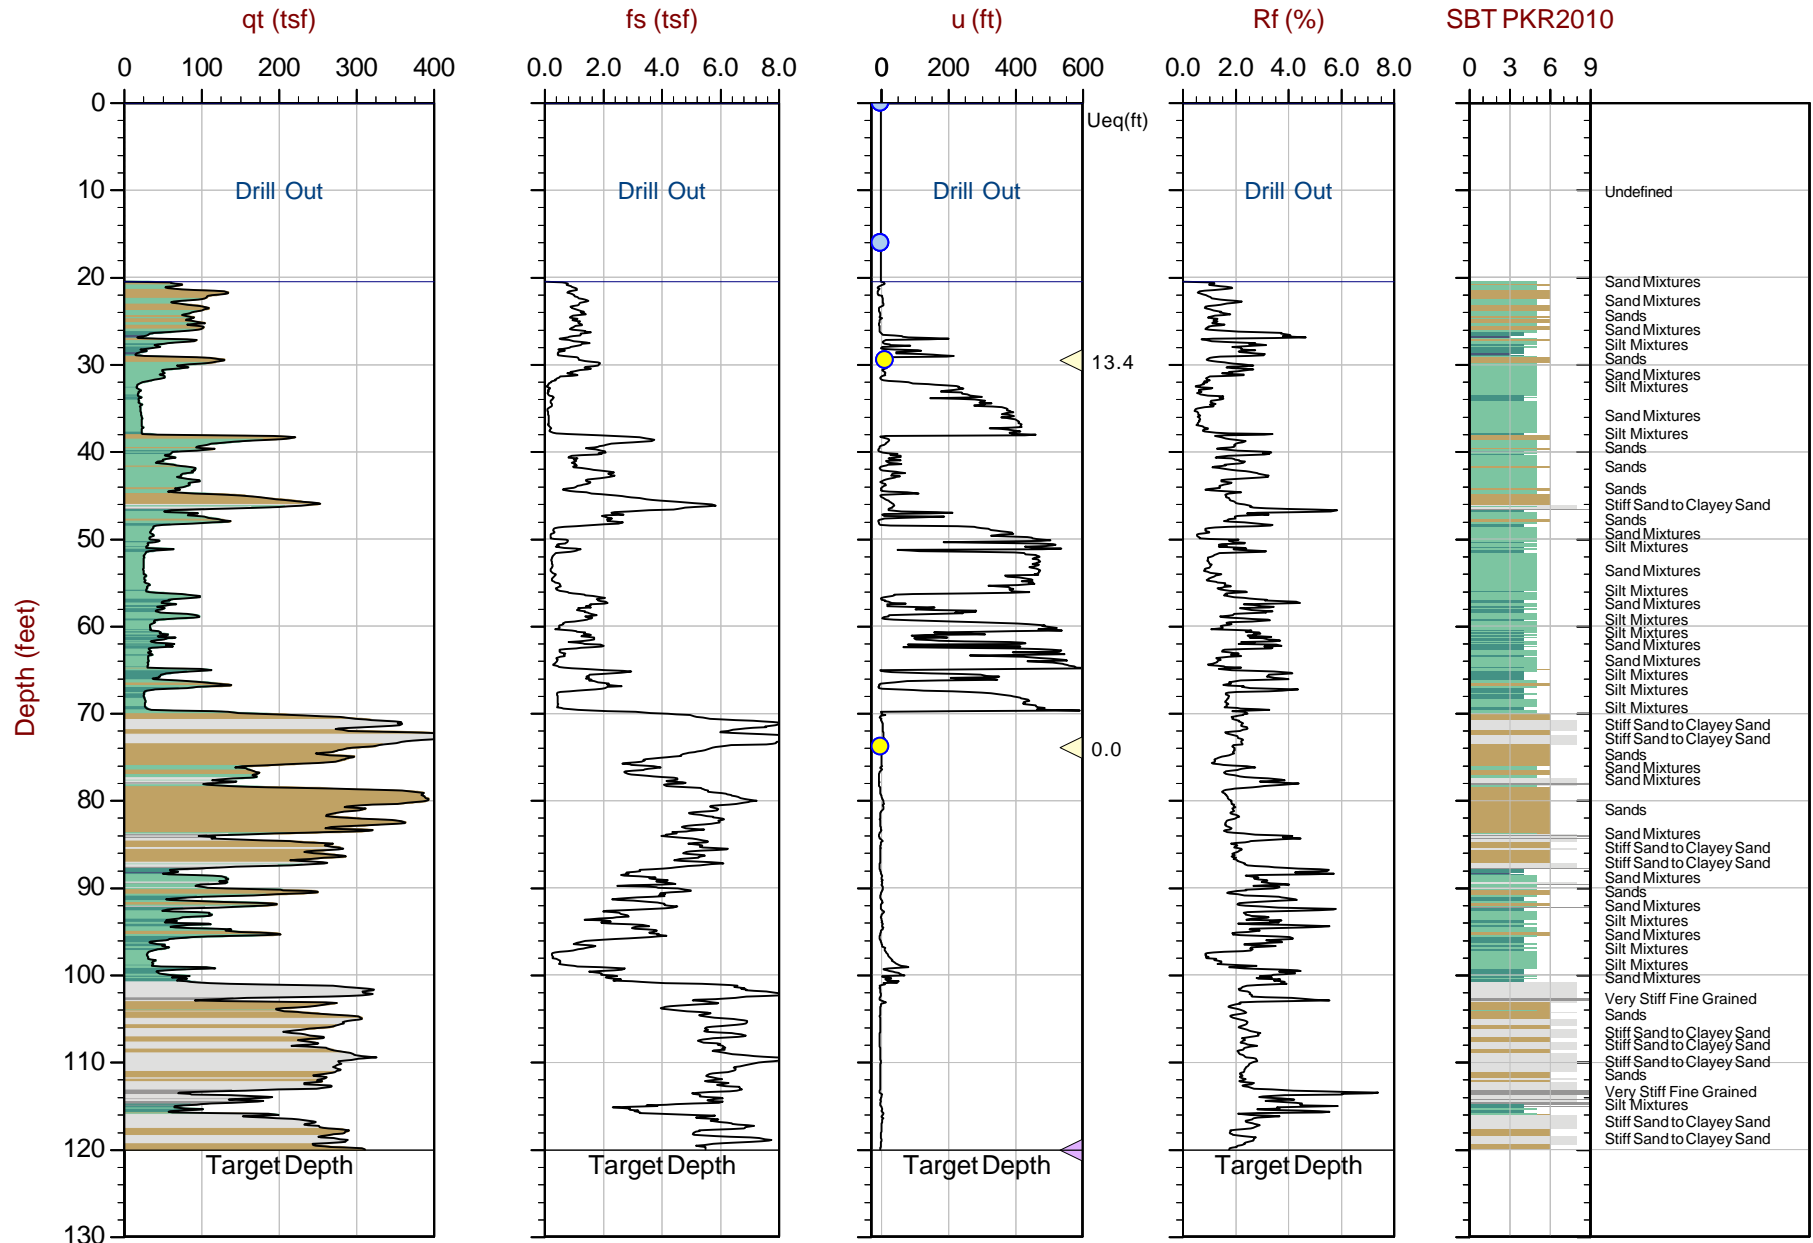

2. Elevations are referenced to the ground surface at the time of testing and were derived from the Google Earth elevation.

Seismic Cone Penetration Test Shear Wave (V_s) Traces

Methodology Statements and Data File Formats

METHODOLOGY STATEMENTS

CONE PENETRATION TEST (CPTu) - eSeries

Cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd., a subsidiary of ConeTec.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and two geophone sensors for recording seismic signals. All signals are amplified and measured with minimum sixteen-bit resolution down hole within the cone body, and the signals are sent to the surface using a high bandwidth, error corrected digital interface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm² and 15 cm² tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table. The 15 cm² penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm² piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 millimeters diameter over a length of 32 millimeters with tapered leading and trailing edges) located at a distance of 585 millimeters above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All ConeTec piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u₂" position ([ASTM Type 2](#)). The filter is six millimeters thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current [ASTM D5778](#) standard. ConeTec's calibration criteria also meets or exceeds those of the current [ASTM D5778](#) standard. An illustration of the piezocone penetrometer is presented in [Figure CPTu](#).

Figure CPTu. Piezocone Penetrometer (15 cm²)

The ConeTec data acquisition system consists of a Windows based computer, signal interface box, and power supply. The signal interface combines depth increment signals, seismic trigger signals and the downhole digital data. This combined data is then sent to the Windows based computer for collection and presentation. The data is recorded at fixed depth increments using a depth encoder that is either portable or integrated into the rig. The typical recording interval is 2.5 centimeters; custom recording intervals are possible.

The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to ConeTec's CPTu operating procedures which are in general accordance with the current [ASTM D5778](#) standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of two centimeters per second, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to ConeTec's cone penetration testing procedures:

- Each filter is saturated in silicone oil under vacuum pressure prior to use
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with [ASTM](#) standards

The interpretation of piezocone data for this report is based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by [Robertson, P.K., 2010](#). The Soil Behavior Type (SBT) classification chart developed by [Robertson, P.K., 2010](#) is presented in [Figure SBT](#). It should be noted that it is not always possible to accurately identify a soil behavior type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

Figure SBT. Non-Normalized Soil Behavior Type Classification Chart (SBT)

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in [Robertson et al. \(1986\)](#):

$$q_t = q_c + (1-a) \cdot u_2$$

where: q_t is the corrected tip resistance

q_c is the recorded tip resistance

u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)

a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all ConeTec piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (R_f) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

For additional information on CPTu interpretations and calculated geotechnical parameters, refer to [Robertson et al. \(1986\)](#), [Lunne et al. \(1997\)](#), [Robertson \(2009\)](#), [Mayne \(2013, 2014\)](#) and [Mayne and Peuchen \(2012\)](#).

PORE PRESSURE DISSIPATION TEST

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in [Figure PPD-1](#). For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in [Figure PPD-2](#) are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

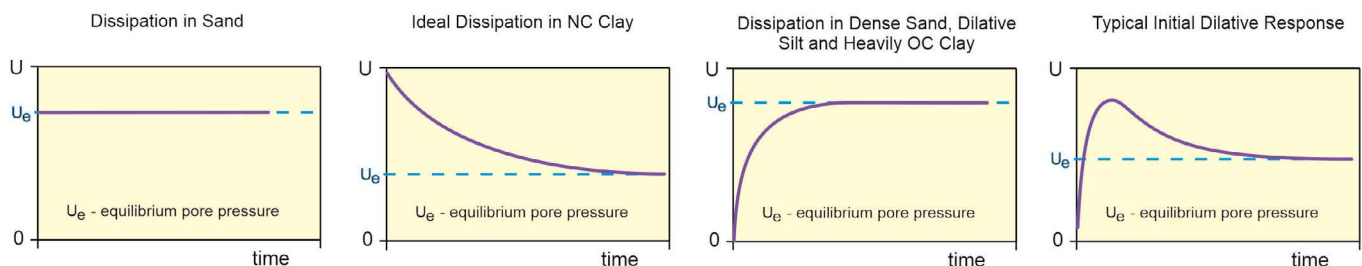

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve in [Figure PPD-2](#).

SEISMIC CONE PENETRATION TEST (SCPTu) - eSeries

Shear wave velocity (V_s) testing is performed in conjunction with the piezocone penetration test (SCPTu) in order to collect interval velocities. For some projects seismic compression wave velocity (V_p) testing is also performed.

ConeTec's piezocone penetrometers are manufactured with one horizontally active geophone (28 hertz) and one vertically active geophone (28 hertz). Both geophones are rigidly mounted in the body of the cone penetrometer, 0.2 meters behind the cone tip. The vertically mounted geophone is more sensitive to compression waves.

Shear waves are typically generated by using an impact hammer horizontally striking a beam that is held in place by a normal load. In some instances, an auger source or an imbedded impulsive source may be used for both shear waves and compression waves. The hammer and beam act as a contact trigger that initiates the recording of the seismic wave traces. For impulsive devices an accelerometer trigger may be used. The traces are recorded in the memory of the cone using a fast analog to digital converter. The seismic trace is then transmitted digitally uphole to a Windows based computer through a signal interface box for recording and analysis. An illustration of the shear wave testing configuration is presented in [Figure SCPTu-1](#).

Figure SCPTu-1. Illustration of the SCPTu system

All testing is performed in accordance to ConeTec's SCPTu operating procedures which are in general accordance with the current [ASTM D5778](#) and [ASTM D7400](#) standards.

Prior to the start of a SCPTu sounding, the procedures described in the Cone Penetration Test section are followed. In addition, the active axis of the geophone is aligned parallel to the beam (or source) and the horizontal offset between the cone and the source is measured and recorded.

Prior to recording seismic waves at each test depth, cone penetration is stopped and the rods are decoupled from the rig to avoid transmission of rig energy down the rods. Typically, five wave traces for each orientation are recorded for quality control and uncertainty analysis purposes. After reviewing wave traces for consistency the cone is pushed to the next test depth (typically one meter intervals or as requested by the client). [Figure SCPTu-2](#) presents an illustration of a SCPTu test.

For additional information on seismic cone penetration testing refer to [Robertson et al. \(1986\)](#).

Figure SCPTu-2. Illustration of a seismic cone penetration test

Calculation of the interval velocities are performed by visually picking a common feature (e.g. the first characteristic peak, trough, or crossover) on all of the recorded wave sets and taking the difference in ray path divided by the time difference between subsequent features. Ray path is defined as the straight line distance from the seismic source to the geophone, accounting for beam offset, source depth and geophone offset from the cone tip.

CONE PENETRATION DIGITAL FILE FORMATS - eSeries

CPT Data Files (COR Extension)

ConeTec CPT data files are stored in ASCII text files that are readable by almost any text editor. ConeTec file names start with the job number (which includes the two digit year number) an underscore as a separating character, followed by two letters based on the type of test and the sounding ID. The last character position is reserved for an identifier letter (such as b, c, d etc) used to uniquely distinguish multiple soundings at the same location. The CPT sounding file has the extension COR. As an example, for job number 21-02-00001 the first CPT sounding will have file name 21-02-00001_CP01.COR

The sounding (COR) file consists of the following components:

1. Two lines of header information
2. Data records
3. End of data marker
4. Units information

Header Lines

Line 1: Columns 1-6 may be blank or may indicate the version number of the recording software

Columns 7-21 contain the sounding Date and Time (Date is MM:DD:YY)

Columns 23-38 contain the sounding Operator

Columns 51-100 contain extended Job Location information

Line 2: Columns 1-16 contain the Job Location

Columns 17-32 contain the Cone ID

Columns 33-47 contain the sounding number

Columns 51-100 may contain extended sounding ID information

Data Records

The data records contain 4 or more columns of data in floating point format. A comma and spaces separate each data item:

Column 1: Sounding Depth (meters)

Column 2: Tip (q_c), recorded in units selected by the operator

Column 3: Sleeve (f_s), recorded in units selected by the operator

Column 4: Dynamic pore pressure (u), recorded in units selected by the operator

Column 5: Empty or may contain other requested data such as Gamma, Resistivity or UVIF data

End of Data Marker

After the last line of data there is a line containing an ASCII 26 (CTL-Z) character (small rectangular shaped character) followed by a newline (carriage return / line feed). This is used to mark the end of data.

Units Information

The last section of the file contains information about the units that were selected for the sounding. A separator bar makes up the first line. The second line contains the type of units used for depth, q_c , f_s and u . The third line contains the conversion values required for ConeTec's software to convert the recorded data to an internal set of base units (bar for q_c , bar for f_s and meters for u). Additional lines intended for internal ConeTec use may appear following the conversion values.

CPT Data Files (XLS Extension)

Excel format files of ConeTec CPT data are also generated from corresponding COR files. The XLS files have the same base file name as the COR file with a -BSC suffix. The information in the file is presented in table format and contains additional information about the sounding such as coordinate information, and tip net area ratio.

The BSCI suffix is given to XLS files which are enhanced versions of the BSC files and include the same data records in addition to inclination data collected for each sounding.

CPT Dissipation Files (XLS Extension)

Pore pressure dissipation files are provided in Excel format and contain each dissipation trace that exceeds a minimum duration (selected during post-processing) formatted column wise within the spreadsheet. The first column (Column A) contains the time in seconds and the second column (Column B) contains the time in minutes. Subsequent columns contain the dissipation trace data. The columns extend to the longest trace of the data set.

Detailed header information is provided at the top of the worksheet. The test depth in meters and feet, the number of points in the trace and the particular units are all presented at the top of each trace column.

CPT Dissipation files have the same naming convention as the CPT sounding files with a "-PPD" suffix.

Data Records

Each file will contain dissipation traces that exceed a minimum duration (selected during post-processing) in a particular column. The dissipation pore pressure values are typically recorded at varying time intervals throughout the trace; rapidly to start and increasing as the duration of the test lengthens. The test depth in meters and feet, the number of points in the trace and the trace number are identified at the top of each trace column.

Cone Type Designations

ABOUT THIS REPORT

The enclosed report presents the results of the site investigation program conducted by ConeTec, Inc. The program consisted of Piezocone Penetration Testing and Pore Pressure Dissipation Testing. Please note that this report, which also includes all accompanying data, are subject to the 3rd Party Disclaimer and Client Disclaimer that follow in the 'Limitations' section of this report.

Project Information

Client	AECOM
Project	Provo WTP - Supplementary
ConeTec Project Number	22-52-24382
Rig Description	25-Ton Truck CPT Rig (C-7A)

Coordinates

Collection Method	USB/Serial GPS
EPSG Number	4326 (WGS 84 / LatLong)

Cone Penetration Test (CPTu)

Depth Reference	Existing ground surface at the time of the investigation
Sleeve data offset	0.1 Meters

Please refer to the list of attached documents following the text of this report. A test summary, location map, and plots are included. Thank you for the opportunity to work on this project.

Methodology Statements and Data File Formats

METHODOLOGY STATEMENTS

CONE PENETRATION TEST (CPTu) - eSeries

Cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd., a subsidiary of ConeTec.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and two geophone sensors for recording seismic signals. All signals are amplified and measured with minimum sixteen-bit resolution down hole within the cone body, and the signals are sent to the surface using a high bandwidth, error corrected digital interface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm² and 15 cm² tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table. The 15 cm² penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm² piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 millimeters diameter over a length of 32 millimeters with tapered leading and trailing edges) located at a distance of 585 millimeters above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All ConeTec piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u₂" position ([ASTM Type 2](#)). The filter is six millimeters thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current [ASTM D5778](#) standard. ConeTec's calibration criteria also meets or exceeds those of the current [ASTM D5778](#) standard. An illustration of the piezocone penetrometer is presented in [Figure CPTu](#).

Figure CPTu. Piezocone Penetrometer (15 cm²)

The ConeTec data acquisition system consists of a Windows based computer, signal interface box, and power supply. The signal interface combines depth increment signals, seismic trigger signals and the downhole digital data. This combined data is then sent to the Windows based computer for collection and presentation. The data is recorded at fixed depth increments using a depth encoder that is either portable or integrated into the rig. The typical recording interval is 2.5 centimeters; custom recording intervals are possible.

The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to ConeTec's CPTu operating procedures which are in general accordance with the current [ASTM D5778](#) standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of two centimeters per second, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to ConeTec's cone penetration testing procedures:

- Each filter is saturated in silicone oil under vacuum pressure prior to use
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with [ASTM](#) standards

The interpretation of piezocone data for this report is based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by [Robertson, P.K., 2010](#). The Soil Behavior Type (SBT) classification chart developed by [Robertson, P.K., 2010](#) is presented in [Figure SBT](#). It should be noted that it is not always possible to accurately identify a soil behavior type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

Figure SBT. Non-Normalized Soil Behavior Type Classification Chart (SBT)

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in [Robertson et al. \(1986\)](#):

$$q_t = q_c + (1-a) \cdot u_2$$

where: q_t is the corrected tip resistance

q_c is the recorded tip resistance

u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)

a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all ConeTec piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (R_f) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

For additional information on CPTu interpretations and calculated geotechnical parameters, refer to [Robertson et al. \(1986\)](#), [Lunne et al. \(1997\)](#), [Robertson \(2009\)](#), [Mayne \(2013, 2014\)](#) and [Mayne and Peuchen \(2012\)](#).

PORE PRESSURE DISSIPATION TEST

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in [Figure PPD-1](#). For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in [Figure PPD-2](#) are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

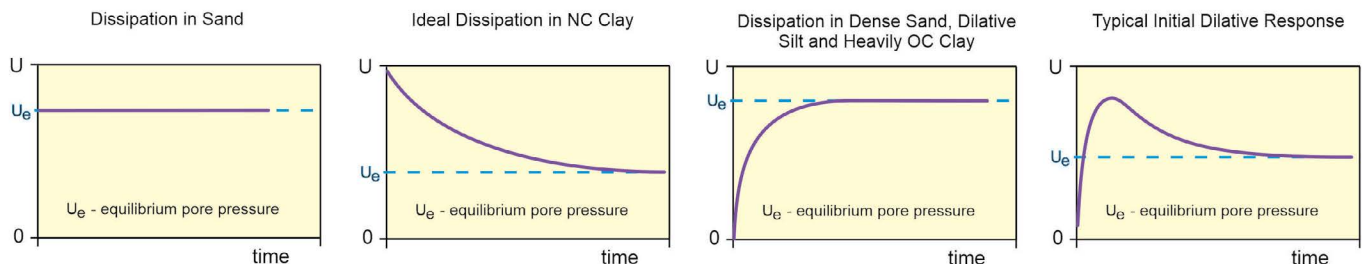

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve in [Figure PPD-2](#).

CONE PENETRATION DIGITAL FILE FORMATS - eSeries

CPT Data Files (COR Extension)

ConeTec CPT data files are stored in ASCII text files that are readable by almost any text editor. ConeTec file names start with the job number (which includes the two digit year number) an underscore as a separating character, followed by two letters based on the type of test and the sounding ID. The last character position is reserved for an identifier letter (such as b, c, d etc) used to uniquely distinguish multiple soundings at the same location. The CPT sounding file has the extension COR. As an example, for job number 21-02-00001 the first CPT sounding will have file name 21-02-00001_CP01.COR

The sounding (COR) file consists of the following components:

1. Two lines of header information
2. Data records
3. End of data marker
4. Units information

Header Lines

Line 1: Columns 1-6 may be blank or may indicate the version number of the recording software

Columns 7-21 contain the sounding Date and Time (Date is MM:DD:YY)

Columns 23-38 contain the sounding Operator

Columns 51-100 contain extended Job Location information

Line 2: Columns 1-16 contain the Job Location

Columns 17-32 contain the Cone ID

Columns 33-47 contain the sounding number

Columns 51-100 may contain extended sounding ID information

Data Records

The data records contain 4 or more columns of data in floating point format. A comma and spaces separate each data item:

Column 1: Sounding Depth (meters)

Column 2: Tip (q_c), recorded in units selected by the operator

Column 3: Sleeve (f_s), recorded in units selected by the operator

Column 4: Dynamic pore pressure (u), recorded in units selected by the operator

Column 5: Empty or may contain other requested data such as Gamma, Resistivity or UVIF data

End of Data Marker

After the last line of data there is a line containing an ASCII 26 (CTL-Z) character (small rectangular shaped character) followed by a newline (carriage return / line feed). This is used to mark the end of data.

Units Information

The last section of the file contains information about the units that were selected for the sounding. A separator bar makes up the first line. The second line contains the type of units used for depth, q_c , f_s and u . The third line contains the conversion values required for ConeTec's software to convert the recorded data to an internal set of base units (bar for q_c , bar for f_s and meters for u). Additional lines intended for internal ConeTec use may appear following the conversion values.

CPT Data Files (XLS Extension)

Excel format files of ConeTec CPT data are also generated from corresponding COR files. The XLS files have the same base file name as the COR file with a -BSC suffix. The information in the file is presented in table format and contains additional information about the sounding such as coordinate information, and tip net area ratio.

The BSCI suffix is given to XLS files which are enhanced versions of the BSC files and include the same data records in addition to inclination data collected for each sounding.

CPT Dissipation Files (XLS Extension)

Pore pressure dissipation files are provided in Excel format and contain each dissipation trace that exceeds a minimum duration (selected during post-processing) formatted column wise within the spreadsheet. The first column (Column A) contains the time in seconds and the second column (Column B) contains the time in minutes. Subsequent columns contain the dissipation trace data. The columns extend to the longest trace of the data set.

Detailed header information is provided at the top of the worksheet. The test depth in meters and feet, the number of points in the trace and the particular units are all presented at the top of each trace column.

CPT Dissipation files have the same naming convention as the CPT sounding files with a "-PPD" suffix.

Data Records

Each file will contain dissipation traces that exceed a minimum duration (selected during post-processing) in a particular column. The dissipation pore pressure values are typically recorded at varying time intervals throughout the trace; rapidly to start and increasing as the duration of the test lengthens. The test depth in meters and feet, the number of points in the trace and the trace number are identified at the top of each trace column.

Cone Type Designations

Cone ID	Cone Description	Tip Cross Sect. Area (cm ²)	Tip Capacity (bar)	Sleeve Area (cm ²)**	Sleeve Capacity (bar)	Pore Pressure Capacity (bar)

Settle3 Analysis Information

ProvoWTP_Settlement Analysis

Project Settings

Document Name	ProvoWTP_Settlement Analysis.s3z
Date Created	4/25/2022, 3:37:37 PM
Last saved with Settle3 version	5.015
Stress Computation Method	Boussinesq
Stress Units	Imperial, stress as ksf
Settlement Units	inches

Advanced Settings

Start of secondary consolidation (% of primary)	95
Min. stress for secondary consolidation (% of initial)	1
Reset time when load changes for secondary consolidation	No
Minimum settlement ratio for subgrade modulus	0.9
Use average poisson's ratio to calculate layered stresses	
Ignore negative effective stresses in settlement calculations	
Add field points to load edges	

Soil Profile

Layer Option	Horizontal Soil Layers
Vertical Axis	Depth below ground surface

Stage Settings

Stage #	Name
1	Existing Condition
2	Excavation
3	Construction
4	50 Years Post Construction

Results (relative to Stage: Excavation)

Time taken to compute: 0 seconds

Stage: Existing Condition

Passive Seismic

Total Unit Weight of Soil, γ (pcf)	115
Effective Horizontal Acceleration, K_h (g)	0.35
Friction Angle of Soil, ϕ_f (°)	28
Soil-Wall Interface Friction Angle from Normal, δ (°)	19
Slope of Backfill from Horizontal, β (°)	0
Skew Angle of Wall from Normal, θ_{skew} (°)	0.0
δ/ϕ_f ratio	0.67
Total Passive Seismic Earth Pressure Coefficient, K_{pe}	3.194
Total Passive Seismic Earth Pressure Coefficient with Skew Effects, $K_{pe-skew}$	3.194
Dynamic Component of K_{pe} , ΔK_{pe}	-1.097
Dynamic Component of K_{pe} with Skew Effects, $\Delta K_{pe-skew}$	-1.097
Total Passive Seismic Equivalent Fluid Density, γ_e (pcf)	367.3
Dynamic Component of Passive Seismic Equivalent Fluid Density, $\Delta \gamma_e$ (pcf)	-126.1
Submerged Dynamic Component of Passive Seismic Equivalent Fluid Density, $\Delta \gamma_{e(sub)}$ (pcf)	-57.7

$$K_{pe-skewed} = R_{skew} K_{pe}$$

$$\Delta K_{pe} = K_{pe} - K_p$$

$$\gamma_e = \gamma_m K_{pe} \quad \Delta \gamma_e = \gamma_m \Delta K_{pe}$$

(Skew effects included in results if applicable)

Graphical Solution for Log-Spiral Passive Seismic Earth
Pressure Coefficient:

Figure A11.4-2—Seismic Passive Earth Pressure Coefficient Based on Log Spiral Procedure for $c/\gamma H = 0$ and 0.05 (c = soil cohesion, γ = soil unit weight, and H = height or depth of wall over which the passive resistance acts)

Note: $k_h = A_s = k_{h0}$ for wall heights greater than 20 ft.
