DOCUMENT 00 11 16
INVITATION TO BID

PART 1 GENERAL

1.1 CONSTRUCTION CONTRACT

A. Bidders are invited to bid on the Construction Contract named and numbered as:

New WRF SW1A Influent Pump Station (IPS)

1200 Reclamation Road, Salt Lake City

Project No. 524905396

B. For information about the award of this Construction Contract, contact Jason Brown, P.E., Chief Engineer at 801-483-6888.

C. All questions about technical requirements must be submitted through U3P.

1.2 DESCRIPTION OF WORK

A. The location of the work is:

1200 Reclamation Road, Salt Lake City

B. The work to be performed consists of furnishing and installing the equipment, facilities, services, and appurtenances indicated in the Contract Documents. The Work generally includes, but is not limited to, the following:

A 105-mgd capacity wastewater IPS with future build-out to 137-mgd capacity consisting of:

1. Site preparation including demolition, clearing, grubbing, excavation, foundation preparation, backfill
2. Existing utility relocations
3. Two (2) pre-engineered metal buildings housing the IPS and electrical equipment
4. Two (2) trench style, self-cleaning wet wells side by side under same superstructure
5. Pump gallery consisting of five (5) vertical turbine solids handling pumps with space for a total of six (6) pumps, steel discharge headers, and valve pad.
6. Pre-manufactured biofilter odor control system
7. 4MW, n+1, emergency/standby power generator system , such that 4MW output is achievable even if one generator set is not operating
8. Yard utilities including fiber optic, ductbanks, potable water, non-potable water, natural gas, storm drains, influent sewer, and site drainage
9. Approximately 4,000 feet of duct bank connecting WRF site to IPS site
10. Civil site improvements including paving, grading, curb and gutter, sidewalk, chain link fencing, and landscaping for an approximate 8-acre site
11. HDPE forcemains from the valve pad header to station 2+57.46.
12. Installation of GFRP influent sewer from the influent pump station to the connection extended from MH#3.

1.3 **BIDDERS' PRE-QUALIFICATION**

A. Bidders are not required to be pre-qualified for the Work. Refer to section 00 45 14 for qualification requirements.

1.4 **BASIS OF BIDS**

A. Bids shall be on a lump sum and unit price basis. Unsealed or segregated Bids will not be accepted.

1.5 **CONTRACT TIME**

A. The Work will be Substantially Complete by **March 19, 2026**.

1.6 **EXAMINATION AND PROCUREMENT OF DOCUMENTS**

A. Complete sets of Contract Documents may be examined and obtained from the ENGINEER at 1805 West 500 South, Salt Lake City, Utah 84104 on **April 7, 2023** or downloaded from U3P at the following web address:

https://solutions.sciquest.com/apps/Router/SupplierLogin?CustOrg=StateOfUtah.

B. To ensure notification of addenda is received, BIDDERS should register as a plan holder on **U3P- Utah Public Procurement Place (formerly SciQuest)**.

1.7 **PRE-BID CONFERENCE**

A. A **mandatory** pre-bid conference will be held at **09:00 on April 18, 2023**, at 1805 West 500 South, Salt Lake City, Utah 84104 followed by a site walk located at 1200 Reclamation Road, Salt Lake City, Utah 84116. All pre-qualified contractors intending to submit a bid are required to attend to obtain relevant information concerning the project. Bidders are advised that information affecting drawings, specifications, conditions, scope of the Work, etc. may be discussed. OWNER assumes no obligation to disclose information discussed at the pre-bid conference to Bidders who do not attend. Absent Bidders assume all risk of failure to attend.

1.8 **BID SECURITY**

A. Bid security amount must equal 5 percent of the total amount of the Bid. A PDF of the Bid Security should be included in the bid documents. Bids utilizing cashier's checks or cash equivalent may not be submitted electronically. Bid Security will be returned to each unsuccessful Bidder after tabulation and award of the Construction Contract.

1.9 **BID LOCATION AND OPENING**

A. Sealed bids will be received at the **office of the Salt Lake City Department of Public Utilities** 1805 West 500 South, Salt Lake City, Utah 84104 no later than 2:00 p.m., local prevailing time, as conclusively established by the clock at the Bid opening location, on Friday **May 12, 2023**. **Bids delivered to any other location will not be accepted.** Bids received after 2:00 p.m. will not be accepted. Bids will be publicly opened and read in the same building, 1805 West 500 South, Salt Lake City, Utah 84104 at about 2:00 p.m., local prevailing time, on **May 12, 2023** by a Public Utilities representative.

B. On the outside of the envelope, Bidder shall indicate the project name, project number, and include Bidder's return mailing address.

C. Bids can also be submitted electronically no later than 2:00 PM on Friday, **May 12, 2023**, through the U3P (Utah Public Procurement Place) project site (Document 00 21 13).

D. Please join the SLCDPU for the Pre-Bid Meeting in person at 1875 W 500 S, Salt Lake City, UT 84104 SLCDPU'S West Campus.

E. Please join the SLCDPU for the Bid Opening Meeting from the convenience of your computer, tablet, or smartphone by using the link below:

1.10 **RIGHT TO REJECT BIDS**

A. OWNER reserves the right to reject any or all bids or to waive any informality or technicality in any bid if OWNER deems it to be in its best interest.

1.11 **VALIDITY PERIOD FOR BIDS**

A. Bids shall remain valid for 60 days after the day of Bid opening. A Bidder who receives a Notice of Intent to Award and who withdraws their bid after Bid opening, but before expiration of said period, shall forfeit their bid security.

1.12 **GOVERNING LAWS AND REGULATIONS**

A. This project is being partially funded through a federal loan under the Water Infrastructure Finance and Investment Act (WIFIA) program and requires the Contractor to comply with the requirements of the WIFIA program including the payment of Davis Bacon wage rates and weekly submission of copies of Certified Payroll documents as further described in Section 01 41 13 FEDERAL REQUIREMENTS..

B. Bidders on this Work will be subject to the applicable provisions of all federal rules, laws, and regulations or orders as further described in Section 01 41 13 FEDERAL REQUIREMENTS.

C. Bidders on this Work will be subject to the Notice of Requirement for Affirmative Action to Ensure Equal Employment Opportunity (Executive Order 11246) located at 41 CFR § 60-4.2, as further described in Section 01 41 13 FEDERAL REQUIREMENTS.

D. This project requires compliance with American Iron and Steel (AIS) as further described in Section 01 41 13 FEDERAL REQUIREMENTS.

1.13 **AMERICANS WITH DISABILITIES (ADA)**

A. Assisted listening devices or interpreting services are available for all public meetings. Salt Lake City Corporation complies with the American Disabilities Act (ADA). For further information, contact the TDD Number 801-483-6820.

1.14 **REPRESENTATION REGARDING ETHICAL STANDARDS FOR CITY OFFICERS AND EMPLOYEES AND FORMER CITY OFFICERS AND EMPLOYEES**

A. A bid will not be accepted unless it contains the following representation.

THE BIDDER, OFFEROR OR CONTRACTOR represents that it has not:

1. **Provided an illegal gift or payoff to a City officer or employee or former City officer or employee, or its relative or business entity.**
2. **Retained any person to solicit or secure this contract upon an agreement or understanding for a commission, percentage, or brokerage or contingent fee, other than bona fide employees or bona fide commercial selling agencies for the purpose of securing business.**
3. **Knowingly breached any of the ethical standards set forth in the City's conflict of interest ordinance, Chapter 2.44, Salt Lake City Code; or**
4. **Knowingly influenced, and hereby promises that it will not knowingly influence, a City officer or employee or former City officer or employee to breach any of the ethical standards set forth in the City's conflict of interest ordinance, Chapter 2.44, Salt Lake City Code.**

1.15 **AWARD**

A. The Construction Contract will be awarded in compliance with the City's Building Improvement and Public Works Bidding Program which takes into account certain factors in the Bidder's work environment (See Salt Lake City Code Section 3.24.115).

END OF DOCUMENT

DOCUMENT 00 21 13
INSTRUCTIONS TO BIDDERS

PART 1 GENERAL

1.1 DEFINED TERMS

A. Terms used in the Bid Documents that are defined in Article 1.1 of the General Conditions will have the meanings indicated in the General Conditions.

B. General Conditions: as published in Document 00 72 00 in the current edition of the Manual of Standard Specifications by the Utah Chapter of the American Public Works Association.

1.2 COPIES OF BID DOCUMENTS

A. Complete sets of Bid Documents must be used in preparing Bids. OWNER and ENGINEER assume no responsibility for errors or misinterpretations resulting from the use of incomplete sets of Bid Documents.

B. Bid Documents are made available to Bidder only for the purpose of obtaining Bids on the Work. No license or grant for any other use is given.

C. Bidding Document copyrights shall remain with OWNER.

D. All provisions of the current edition of the Manual of Standard Specifications and Manual of Standard Plans published by the Utah Chapter of the American Public Works Association that are applicable to the Work are made a part of the Contract Documents by reference. Those publications are available on the web at http://utah.apwa.net.

E. Salt Lake City Department of Public Utilities has a document entitled "Standard Practices for Salt Lake City Public Utilities". (March 9, 2018 edition) The document is available from 1805 West 500 South, Salt Lake City, Utah 84104

1.3 PRE-BID CONFERENCE

A. Representatives of OWNER and ENGINEER will be present at a pre-bid conference to discuss the Project. Bidders are required to attend and participate in the conference. ENGINEER will publish to U3P copies of the Bid Documents Addenda as ENGINEER/OWNER considers necessary in response to questions arising at the conference. The location and time of the conference are identified in the Invitation to Bid (Document 00 11 16).

1.4 EXAMINATION OF SITE AND CONTRACT DOCUMENTS

A. **In General**: Bidders are NOT permitted to converse with ENGINEER or ENGINEER's personnel having knowledge of the Project, Plans, Specifications, material sites, or conditions generally prevailing in the area of the Project to aid in pre-bid investigations. OWNER is not bound by any statements or representations made by ENGINEER or ENGINEER's personnel before the Bid opening or award of the Construction Contract, nor for any assumptions or conclusions reached by a prospective Bidder as a result of such communication unless ENGINEER issues an Addendum to all prospective Bidders.

B. **Access to Site**: The lands upon which the Work is to be performed, and rights-of-way and easements for access thereto and other lands designated for use by Bidder in performing the Work are identified in the Contract Documents. All additional off-site lands and access

thereto required for temporary construction facilities or storage of materials and equipment must be provided by Bidder.

C. **Contract Documents**: The submission of a Bid will constitute an incontrovertible representation by Bidder that Bidder has complied with every requirement of this Article 1.4; that without exception the Bid is premised upon performing and furnishing the Work required by the Contract Documents; and that the Contract Documents are sufficient in scope and detail to indicate and convey understanding of all terms and conditions for performance and furnishing of the Work.

D. **Bidder's Obligations**: The submission of a Bid constitutes acknowledgement that Bidder has complied with all bidding instructions. It is the responsibility of each Bidder, before submitting a Bid, to:

1. Examine the Contract Documents thoroughly;
2. Visit the site to become familiar with local conditions that may affect cost, progress, performance, or furnishing of the Work;
3. Consider federal, state, and local Laws and Regulations that may affect cost, progress, performance, or furnishing of the Work;
4. Study and carefully correlate Bidder's observations with the Contract Documents; and
5. Identify and notify ENGINEER in writing of all specific conflicts, errors, or discrepancies in the Contract Documents, and of any doubts of Bidder about their meanings. The failure or omission of any Bidder to receive or examine any form, instrument, Addendum, or other document, visit the site and become acquainted with conditions there existing, or attend the pre-bid conference, shall in no way relieve any Bidder from obligations with respect to Bidder's Bid or to the Construction Contract.

E. **Deviations from the Terms of the Contract Documents**: OWNER will not accept any deviations whatsoever from the printed terms of the Agreement (Document 00 52 00) and the Contract Documents, except by Addendum or Change Order.

1.5 PHYSICAL CONDITIONS

A. **In General**: Before submitting a Bid, each Bidder is responsible for review of OWNER's explorations, tests, and data concerning surface conditions, subsurface conditions, and Underground Facilities at or contiguous to the site, or otherwise, that may affect cost, progress, performance, or furnishing of the Work in accordance with the time, price, and other terms and conditions of the Contract Documents.

B. **Surface and Subsurface Conditions**: Provisions concerning surface and subsurface conditions, if any, are set forth in the Geotechnical Data (Document 00 31 32). That document provides the identification of:

1. Those reports of explorations and tests of subsurface conditions at the site that have been utilized by ENGINEER in preparing the Contract Documents; and
2. Those drawings of physical conditions in or relating to existing surface and subsurface structures (except Underground Facilities) at or contiguous to the site that have been utilized by ENGINEER in preparing the Contract Documents.

C. **Underground Facilities**: Information and data indicated in the Contract Documents regarding Underground Facilities at or contiguous to the site is based upon information and

data furnished to OWNER and ENGINEER by owners of such Underground Facilities. OWNER does not assume responsibility for the accuracy or completeness thereof other than as provided in paragraph 4.3A.2 of the General Conditions or unless expressly provided in the Modifications to the General Conditions (Document 00 73 10).

D. **Additional Explorations**: On request in advance, and if possible, OWNER will provide to each Bidder access to the site to conduct any explorations and tests as each Bidder deems necessary for submission of a Bid. Bidder shall obtain permits, fill all holes, and clean up and restore the site to its former condition upon completion of such explorations. Bidder shall indemnify and save OWNER harmless during and after the performance of additional explorations.

E. **Modifications to the Contract Documents**: Provisions concerning the adequacy of the data furnished for subsurface structures and underground facilities and the possibility of changes in the documents due to differing conditions appear in Articles 4.2 and 4.3 of the General Conditions.

PART 2 BIDDING PROCEDURES

2.1 INTERPRETATIONS AND ADDENDA

A. All requests for interpretation of the Contract Documents shall be made in writing and delivered to ENGINEER no later than 7 calendar days before the Bid opening. If required, ENGINEER will send a written interpretation to all persons receiving a set of Bid Documents in the form of a written Addendum. If a Bidder's request for interpretation is not responded to by ENGINEER, Bidder shall not rely on any interpretation in the request that is contrary to the intent and terms of the Contract Documents.

B. OWNER will not be responsible for any explanations or interpretations, except those duly issued in the form of written Addenda.

C. Addenda may also be issued to modify the Bidding Documents as deemed advisable by ENGINEER.

D. Any Addenda so issued during the time of bidding shall be deemed to be included in the Bid. All Addenda shall become a part of the Contract Documents.

E. Except to postpone the Bid opening, no Addenda shall be issued within 48 hours before the Bid opening.

2.2 EQUIPMENT AND MATERIAL OPTIONS BEFORE OPENING

A. If a Bidder or Supplier wishes to use items of equipment or materials other than those identified in the Contract Documents, said Bidder or Supplier shall submit a written request for approval to ENGINEER at least 10 days before the date set for the Bid opening.

B. The procedure for submission of any such request shall be as follows: submit 1) two sets of the written request and technical brochures and 2) a statement of variances. The statement of variances must list all features of the proposed substitution that differ from the Contract Documents and must further certify that the substitution has no other variant features. The brochure and information submitted must be clearly marked showing make, model, size, options, and any other features and must include sufficient evidence for ENGINEER to evaluate each feature listed as a variance. If after installing the substituted

product, an unlisted variance is discovered, CONTRACTOR shall immediately replace the product with a specified product at no cost to OWNER.

C. Any approval of such a request by ENGINEER must be made not later than 48 hours before the Bid opening. ENGINEER's failure to approve by such time shall be deemed a denial of the request.

D. Any such approval is at the sole discretion of ENGINEER and will be in the form of an Addendum, issued to all Bidders holding Bid Documents, indicating that the additional equipment or materials are approved as equal to those specified for the Project.

2.3 BID SECURITY

A. **Delivery of Bid Security**: Bidders must deliver Bid security, in the form of either a Bid Bond or a cashier's check, to OWNER at the time they deliver their Bid. If Bid Security is not delivered with the Bid, the Bid shall not be read.

B. **Amount of Bid security**: The Bid security amount must equal 5 percent of the total amount of the Bid. The total amount of the Bid shall be the sum of all items of the Bid, constituting the maximum amount of the possible award to the Bidder.

C. **Bid Bond:** If a Bid Bond is used, the Bond shall guarantee that the Bidder, if awarded the Work, will promptly enter into the Construction Contract to perform the Work in the manner required by the Contract Documents.

D. **Cashier's Check**: If a cashier's check is used, the cashier's check must be made payable to Salt Lake City Corporation and shall guarantee that the Bidder, if awarded the Work, will promptly enter into the Construction Contract to perform the Work in the manner required by the Contract Documents. A photocopy or facsimile transmission of the check will not be accepted. Personal or company checks will not be accepted.

E. **Return of Bid Security**: OWNER will return the Bid security to all Bidders by the earlier of 45 days after the date of the Bid opening and 7 days after the effective date of the Construction Contract. The liability of OWNER in regard to cashier's checks shall be limited only to the return of the checks.

F. **Default**: If the Bidder fails, within the time limit described in Article 3.6A, to enter into the Construction Contract and to deliver to OWNER a Performance Bond, Payment Bond, or any other Bonds or documents required by the Contract Documents after Notice of Intent to Award by OWNER, the Bidder shall forfeit the amount of the Bid Bond or cashier's check as liquidated damages to OWNER.

2.4 CONTRACT TIME AND PUNCH LIST TIME

A. Provisions concerning Contract Time and Punch List Time are set forth in the Agreement (Document 00 52 00).

2.5 LIQUIDATED DAMAGES

A. Provisions concerning liquidated damages are set forth in the Agreement (Document 00 52 00).

2.6 BID FORM

A. The Bid Form (Document 00 41 00) identifies all forms comprising the Bid Documents. Additional copies may be obtained from ENGINEER.

B. All names must be typed or printed under or near the signature. The signature must meet applicable State and City code..

C. The Bid must contain an acknowledgment of receipt of all Addenda. The Addenda numbers must be filled in on the Bid Form.

D. The Bidder's address, telephone number, email address, and facsimile number for communications regarding the Bid must be shown on the first page of the Bid Form.

E. The Bidder shall make no stipulations or alterations on the Bid forms. The Bidder must use only the Bid Form and Bid Schedules bound in the Contract Documents (unless updated forms are included in an addendum, in which cause the Bidder shall use the updated forms).

F. OWNER may waive any failure to comply with the requirements of this paragraph 2.6 if OWNER determines that such failure (1) is not material to the terms of OWNER's Bid Documents and process and does not render the Bid non-compliant with Laws and Regulations pertaining to bidding, or (2) involves ministerial or minor informalities that are evident from the Bid Documents or that can be waived without prejudice to other Bidders and that do not have a substantial effect on price.

2.7 **BID SCHEDULE**

A. Any work or material that is specified in the Contract Documents or that is necessary because of the nature of the Work, but that is not listed separately in the Bid Schedule (Document 00 43 00), shall not be measured or paid for separately. The cost of such work or material shall be considered as included in the Contract Price.

B. All blanks on the Bid Schedule (Document 00 43 00) must be completed in ink or by typewriter. If applicable, furnish both the unit and the total costs for each item. Numbers shall be stated in figures, and the signature of all persons signing shall be in longhand. Any corrections, alterations or erasures made by the Bidder to the information the Bidder entered on the Bid Schedule shall be initialed in ink by the Bidder. OWNER may waive any failure to comply with the requirements of this paragraph if OWNER determines that such failure (1) is not material to the terms of OWNER's Bid Documents and process and does not render the Bid non-compliant with Laws and Regulations pertaining to bidding, or (2) involves ministerial or minor informalities that are evident from the Bid Documents or that can be waived without prejudice to other Bidders and that do not have a substantial effect on price.

2.8 **SUBMISSION OF BIDS**

A. Bids shall be submitted at the time and place indicated in the Invitation to Bid (Document 00 11 16).

B. Methods of submission

a. Bids may be submitted in an enclosed opaque sealed envelope and marked with the Project title and the name and address of the Bidder. If the Bid is sent through the mail or other delivery system, the sealed envelope must be enclosed in a separate envelope with the notation "BID ENCLOSED" on the face of it. It is the sole responsibility of the Bidder to deliver the Bid before the scheduled time.

b. For the bid to be considered, submit one (1) electronic copy no later than the time and date specified. The electronic copy may be submitted via the U3P site or sent to

SLCDPUENG@SLCGOV.COM. The file size cannot be larger than 9 megabytes for emailed submissions. Bids may be broken into parts to maintain smaller sizes and must be clearly named with "Part x of total" in the file name along with the project number and submitter for example; "400300200_ZZZ_construction_part_1_of_1.pdf." Compile your bid, and any other documents into one single PDF file, given the limit above. Bid securities may be a separate file. Upload your file(s) for this event using U3P. Responses must be uploaded, and the electronic submission completed by the time and date specified. After uploading your response file(s), offerors MUST go to "Review and Submit" and click "SUBMIT RESPONSE" to complete the process. Responses submitted electronically through U3P require uploading of electronic attachments. U3P will accept a wide variety of document types as Word, Excel, and PDF attachments but not all. You MAY NOT submit documents that are embedded (zip files), movies, wmp and mp3 files or password protected files, etc. Such actions may cause your proposal to be deemed as "non-responsive".

C. Alternate bids, other than those called for in the Bid form, will not be considered.

D. No oral, facsimile, or modified bids will be considered. OWNER will not consider any attempted modification of a Bid written or made on the outside of the envelope containing the Bid or electronic submission.

2.9 MODIFICATIONS AND WITHDRAWAL OF BIDS

A. At any time before the Bid opening, Bids may be modified or withdrawn if a written notice of the modification or withdrawal, as the case may be, is signed by Bidder and delivered to the place where Bids are to be submitted.

B. Within two business days after Bids are opened, any Bidder may file written notice with OWNER that there was a substantial mistake made in the preparation of its Bid. Bidder must thereafter promptly demonstrate Bidder's mistake to the reasonable satisfaction of OWNER. If OWNER agrees, Bidder may withdraw its Bid and the Bid security will be returned to Bidder.

2.10 OPENING OF BIDS

A. Bids will be opened and read aloud publicly unless obviously non-responsive. An abstract of the amounts of the base schedule of prices and any alternate schedules will be made available for review after the opening of Bids.

B. Any Bids received after the time specified in the Invitation to Bid (Document 00 11 16) will be returned unopened.

2.11 BIDS SUBJECT TO ACCEPTANCE FOR 60 DAYS

A. Subject to Paragraph 2.3E hereof, Bids remain subject to acceptance for 60 days after the day of the Bid opening. OWNER may, in its sole discretion, release any Bid and return the Bid security before that date. OWNER and Bidder may agree to extend the 60-day deadline.

2.12 NONDISCRIMINATION IN EMPLOYMENT

A. Work under this Bid will obligate the Bidder and Subcontractors not to discriminate in employment practices.

B. Bidders must, if requested, submit a compliance report concerning employment practices and policies in order to maintain their eligibility to receive the award of the Construction Contract.

C. Equal opportunity employment shall be reflected in the racial and sexual composition of Bidder's work force and OWNER urges an affirmative action program to overcome under-utilization.

D. Bidders are advised that the Construction Contract and its performance are subject to the applicable provisions of all Laws and Regulations. Bidder will be obligated, upon written request, to give all applicable assurances of compliance in connection therewith.

E. Federal nondiscrimination requirements are applicable, as further described in Section 01 41 13 FEDERAL REQUIREMENTS. Bidder must be fully knowledgeable and comply with such requirements.

PART 3 AWARD OF CONSTRUCTION CONTRACT

3.1 QUALIFICATIONS OF BIDDERS

A. Minimum Qualifications (must meet all to be qualified)

1. Qualified Contractors must meet the following minimum general criteria:

    A. Contractor's OSHA Recordable Lost Time Incident Rates cannot be greater than 100 percent of the industry average, per the most recent published Bureau of Labor Statistics data: Refer to http://stats.bls.gov/

    B. Contractor's most recent (NCCI) Workers Compensation Experience Modification Rate (EMR) must be at or below 1.00.

    C. Contractor shall have proven track record of completed projects without unresolved, unrealistic, and unnecessary claims.

    D. Contractor shall, at time of bid, hold a current Utah contractor's license in a classification appropriate to the Work described herein.

    E. Contractor shall meet the minimum bid bond of Section 2.3 of this specification at time of bidding.

2. Contractor shall demonstrate their competency in completing projects similar to the work described in these construction documents. Similar projects should include the following items:

    A. Contractor shall have a minimum of ten (10) years of experience in the construction of new, or modifications to existing, water treatment and/or wastewater treatment facilities.

    B. Contractor must have completed three projects during the past ten (10) years that include structural and mechanical process modifications to either a water or wastewater treatment facility.

    C. Contractor's project superintendent shall each have at least ten (10) years of experience in the construction of projects that are similar in nature to the work described herein and shall have direct experience in at least one

of the construction projects that meets the experience requirements above.

3. The Contractor must submit complete and sufficient information to demonstrate compliance with all minimum qualification requirements listed above with their bid (Section 00 45 14). Submission of insufficient or incomplete documentation, or failure to demonstrate compliance with all minimum qualification requirements, may be grounds for disqualification as determined solely by the Owner.

B. Within seven (7) calendar days of the Owner's request, a bidder whose bid is under consideration for award shall submit to the Owner the following information for the bidder. The Owner may request like information on the bidder's Subcontractors, or bidder's Suppliers or any other information the Owner may require.

1. A current financial statement for the Work (as provided to the bonding company);
2. A chronological list of all "completed" construction work done by Bidder during the last 3 years, including project name, address, owner, contract name, and current telephone number;
3. Work Under Contract Report (Document 00 43 37);
4. A functional organization chart, indicating the organizational structure of the Bidder's project team, including the reporting responsibilities and lines of authority of the Project Manager and other Key Personnel who will be providing services during construction. Any changes from the pre-qualification submission shall be indicated and explained;
5. Owned and rented equipment that is to be used to do the Work;
6. Investigations, arbitrations, litigation, or claims that are pending, threatened, settled, or disposed of within the last 3 years;
7. Evidence of ability to perform and complete the Work in a manner and within the time limit specified. If the Project Manager and Resident Superintendent designated to construct this project are different than that provided in the pre-qualification submission, provide resumes of their work history along with their actual project titles and actual responsibilities on each given project.
8. Names of three (3) projects of similar size and nature that the Resident Superintendent has completed. Include the name, address, and telephone number of the office contracting for each project; and
10. Such other data as may be called for in the Supplementary Instructions to Bidders (Document 00 22 16) (if any).OWNER will hold all requested information confidential and, upon request, shall return such information to Bidder after acceptance or rejection of Bidder's Bid.

D. Untimely response by Bidder will release OWNER of any obligation to further negotiate or consider Bidder's Bid.

3.2 EVALUATION OF BIDS

A. OWNER reserves the right: (1) to reject any and all Bids; (2) to waive minor informalities in the Bid Schedule and elsewhere so long as the informalities (a) are not material to OWNER's Bid Documents and process and do not render the Bid non-compliant with Laws and Regulation pertaining to bidding, or (b) involve ministerial or minor informalities that are evident from the Bid Documents or that can be waived without prejudice to other

Bidders and that do not have a substantial effect on price; (3) to negotiate and agree to contract terms with the successful Bidder; and (4) to disregard non-conforming, non-responsive, unbalanced, or conditional Bids.

B. OWNER reserves the right to reject any Bid if OWNER believes that it would not be in the best interest of the Project or OWNER to make an award to that Bidder. Such rejection may be because the Bid is non-responsive, or Bidder is unqualified or of doubtful ability, or Bidder's Resident Superintendent is unqualified or of doubtful ability, or the Bid or Bidder fails to meet any other pertinent standard or criteria established by OWNER in the Supplementary Instructions to Bidders (Document 00 22 16).

C. OWNER will consider the qualifications of Bidder and such alternates, prices, and other data as may be requested in the Bid Form (Document 00 41 00), Bid Schedule (Document 00 43 00), or written requests issued prior to OWNER's Notice of Intent to Award the Construction Contract. OWNER will consider Bidder's compliance with Section 3.24.115, Salt Lake City Code. See Document 00 22 16 Supplementary Instructions to Bidders.

D. OWNER may consider the qualifications and experience of Subcontractors, Suppliers, and other persons and organizations proposed for portions of the Work as provided in the Proposed Subcontractor Form (Document 00 43 36). OWNER will consider Bidder's compliance with Section 3.24.115, Salt Lake City Code. See Document 00 22 16 Supplementary Instructions to Bidders.

E. OWNER may consider the operating costs, maintenance requirements, performance data, and guarantees of materials and equipment when such data is required to be submitted prior to the Notice of Intent to Award the Construction Contract.

F. To establish qualifications of Bidder, OWNER may request such data indicated in Article 3.1 hereinabove and conduct such investigations as OWNER deems appropriate.

G. If the Construction Contract is to be awarded, it will be awarded to the most responsive and lowest, qualified, responsible Bidder as determined by OWNER. Alternates may be accepted depending upon availability of OWNER funds. Bid alternates will be considered in determining the most responsive, lowest, qualified, and responsible Bidder.

H. ENGINEER will evaluate Bid Schedules as follows:

1. ENGINEER will resolve discrepancies in the multiplication of quantities of Work items and unit prices in favor of the unit prices.
2. Prices written out in words shall govern over prices written out in numbers.
3. ENGINEER will resolve discrepancies between the indicated sum of any column of figures and the correct sum thereof in favor of the correct sum.
4. Bids shall not contain any recapitulations of or changes in the work to be done.
5. ENGINEER may accept a Bid despite obvious errors in a Bid Schedule, such as a failure to include unit prices or a misplaced decimal point, as long as ENGINEER reasonably can discern the intention of Bidder as to the amounts to be bid.

3.3 SUBCONTRACTORS, SUPPLIERS AND OTHERS

A. Bidder shall not subcontract more than 75 percent of the dollar value of the total contemplated Work (exclusive of the supply of materials and equipment to be incorporated in the Work) without OWNER's written approval.

B. Conflict of interest restrictions pertaining to Subcontractors are described in paragraph 6.5H of the General Conditions.

C. The following firms, that have been under contract to the OWNER in the design phase of the Work, shall not be used as subcontractors by the CONTRACTOR.
   1. Design Consultant: AECOM.
   2. Geotechnical Consultants: AECOM.
   3. Surveying Consultant: CRS.

3.4 CONTRACT SECURITY AND OTHER SUBMITTALS

A. **Performance Bond (Document 00 61 13) and Payment Bond (Document 00 61 14)**: OWNER's requirements as to Performance and Payment Bonds are as set forth in the Modifications to General Conditions (Document 00 73 10). Specific requirements are set forth in the Performance Bond (Document 00 61 13) and the Payment Bond (Document 00 61 14).
   1. Bidder should carefully examine the form of the Bonds.
   2. When the successful Bidder delivers the executed Construction Contract to OWNER, it must be accompanied by the required Performance and Payment Bonds (using Documents 00 61 13 and 00 61 14, respectively).

B. **Proposed Subcontractor Form (Document 00 43 36)**: Bidder must provide this report form to OWNER within 24 hours after ENGINEER's request. See Bid Form, paragraph 1.5B (Document 00 41 00) for additional information. The form shall list the name and address of each Subcontractor who will perform work or labor or render service to Bidder at the site of the Work, or a Subcontractor who, off the job site, will specially fabricate a portion of the Work or improvement according to detail Drawings. In each instance, the nature and extent of any Work to be subcontracted in an amount in excess of 2 percent of the Bid sum shall be described. Bidder must have the written consent of OWNER to substitute for any of the Subcontractors or Suppliers designated or to employ any Subcontractor or Supplier that is not listed.

C. **Bidder Status Report (Document 00 43 38)**: Bidder must submit the completed form upon ENGINEER's request or after Bidder receives the Notice of Intent to Award.

D. **Other Information**: When a determination has been made to award the Construction Contract, Bidder is required, before the award or after the award, or both, to furnish such other information as ENGINEER requests.

3.5 ADJUSTMENTS TO THE COST OF THE WORK AFTER OPENING OF BIDS

A. The Contract Price identified in the Agreement (Document 00 52 00) represents the Cost of the Work that is to be paid by OWNER to CONTRACTOR. Adjustments to the Contract Price that are agreed to between OWNER and the successful Bidder shall be effected by signing an Agreement Supplement.

3.6 SIGNING OF AGREEMENT

A. Within 10 days, (or such longer period of time that OWNER in its discretion may allow) after OWNER gives Notice of Intent to Award the Construction Contract to the successful Bidder, Bidder shall pick up, sign, and return the required number of copies of the Agreement (Document 00 52 00) and attached documents to OWNER with the required

Bonds. A minimum of 2 originals will be signed. One executed original will be returned to Bidder.

B. Transfers, delegations, or assignments of interests in the Contract Documents are prohibited, unless prior written authorization is received from OWNER.

C. At and from the time of Bidding through the completion of the Work, Bidder shall be properly licensed to do the Work and shall be in compliance with the license laws of the State of Utah, Salt Lake City and Salt Lake County.

PART 4 MISCELLANEOUS

4.1 EQUIPMENT AND MATERIAL OPTIONS AFTER BID OPENING

A. The Construction Contract, if awarded, will be on the basis of materials and equipment described in the Drawings, Specifications, and any Addenda.

B. The procedure for submitting an application for substitution after the effective date of the Construction Contract is set forth in Section 01 25 00.

4.2 PARTNERING

A. Refer to Section 01 31 20 for description of partnering requirements.

B. OWNER's consultants listed in this project manual will be partners to the project.

END OF DOCUMENT

Page Intentionally Left Blank

DOCUMENT 00 22 16
SUPPLEMENTARY INSTRUCTIONS
(Building Improvement or Public Works Projects)

PART 1 GENERAL

1.1 INTRODUCTION

A. OWNER has determined that in accordance with Section 3.24.115 of the Salt Lake City Code the health, safety, and general welfare of the citizens of Salt Lake City are reasonably furthered by OWNER's Building Improvement or Public Works Projects (BIPW) procurement code requirements.

1.2 BIPW PROGRAM

A. The BIPW program is set forth in Salt Lake City Code Section 3.24.115 and can be found at the following web address: https://codelibrary.amlegal.com/codes/saltlakecityut Click on "CITY CODE of SALT LAKE CITY, UTAH" click on "TITLE 3 – REVENUE AND FINANCE", click on "CHAPTER 3.24 PROCUREMENT", click on "3.24.115: BUILDING IMPROVEMENT OR PUBLIC WORKS PROJECTS"

B. Bidder shall submit with its bid the Qualified Health Insurance Coverage Form. In this form Bidder certifies that the information given is true as of the time of submitting its bid. The information will be used in the manner stated in paragraph "F" below to evaluate "responsiveness" if bids are within 10% of each other. This form is used by Bidder to certify that Bidder and all subcontractors of Bidder with a subcontract value of $1,000,000 or more at the original execution of the subcontract working on the project have and will maintain qualified health insurance coverage in compliance with Salt Lake City Code 3.24.115 for the duration of the contract. Neither the failure to submit this form nor checking "No" regarding Qualified Health Insurance Coverage will render the bid non-responsive.

C. Bidder shall submit with its bid the information shown on the Work Environment Certification Form (Document 00 43 46). In that form Bidder certifies that the information given is true as of the time of submitting its bid. If "Yes" is not certified for each item, the bid will be rejected as non-responsive. See Section 3.24.115 of the Salt Lake City Code. That form is used by Bidder to certify that Bidder and all subcontractors of Bidder working on the project have and will maintain 1) a drug and alcohol testing policy; 2) a program to recruit and/or employ veterans; 3) a job training program; 4) a safety program; and 5) a formal policy of non-discrimination in compliance with Salt Lake City Code Section 3.24.115 for the duration of the contract

D. OWNER reserves the right to review or audit any information provided by Bidder to make its evaluation. Bidder shall provide or furnish access to any necessary records or other information in order to permit OWNER to verify Bidder's and/or Subcontractor's certifications. Bidder shall provide or furnish access to such records and information no later than three (3) business days after OWNER issues a written request for the same.

E. The Building Improvement or Public Works projects procurement requirements will only apply to contracts of $2,000,000 or more, as determined by the ENGINEER's estimate.

F. If more than one Bidder answers "YES" to the question on the Qualified Health Insurance Certification Form (Document 00 43 45), the following analysis will apply: A Bidder who has and will maintain an offer of qualified health insurance coverage under the Building Improvement or Public Works projects procurement requirements and whose bid is not more than 10 percent higher than the bid of another Bidder who does not have such insurance, will be deemed the more responsive Bidder. If two or more Bidders are judged to be equally responsive, OWNER will make the award to the Bidder with the lowest bid price. For purposes of this paragraph "F", references to "Bidder" with respect to qualified health insurance coverage shall be deemed to refer also to any subcontractors with a subcontract value of $1,000,000 or more at the original execution of the subcontract under such Bidder.

G. Qualified Health Insurance Coverage documentation for bidder with a contract value of $2,000,000 or more or each subcontractor of bidder with a subcontract value of $1,000,000 or more which shall include the following two documents:

1. An original statement on company letterhead signed by a duly authorized officer of the bidder/subcontractor stating that the bidder/subcontractor will maintain qualified health insurance coverage for the duration of the contract as defined in Section 26-40-115, Utah Code Annotated, as amended, or its successor in compliance with Salt Lake City Code 3.24.115.
2. A written statement of actuarial equivalency from either:
   a. An actuary selected by the bidder/subcontractor or bidder's/subcontractor's health insurer; or
   b. An underwriter who is responsible for developing the bidder's/subcontractor's health insurance premium rates.

1.3 **BIPW PROGRAM**

A. In situations in which the factors listed in the Qualified Health Insurance Certification form affect the award of the Bid, the winning Bidder will be required to enter into a Qualified Health Insurance Supplemental Agreement (Document 00 54 16) with OWNER.

1.4 **Important information for Bidder and all Subcontractors of the successful Bidder**

A. Salt Lake City Code Section 3.24.115 paragraph C.4 states the following:

1. A bidder who does not certify compliance with the factors in subsections C1b to C1f of this section and, if there is a subcontract, subsections C2b to C2f of this section, shall be deemed nonresponsive and shall be disqualified.

B. Refer to the Bid Form (Document 00 41 00) for the sequence of submittals to ensure compliance with Salt Lake City Code Section 3.24.115.

Executive Summary

This report presents the findings of the subsurface explorations, the results of the laboratory testing, the findings regarding subsurface soil conditions in the area of the proposed Influent Pump Station (IPS) and forcemains facilities, and the geotechnical recommendations for its design and construction.

The Salt Lake City New Water Reclamation Facility Project (project) will replace the existing Salt Lake City Water Reclamation Facility. The new facilities and equipment included in this portion of the overall project could include the following: Influent Pump Station (IPS), forcemain influent pipelines (forcemains), standby generators, odor control, electrical power distribution equipment, and power transmission facilities (a duct bank)s and/or overhead lines. The IPS facility will be a relatively large hydraulic structure of cast-in-place concrete construction that will have liquid channels and maintenance access.

Geotechnical drilling, logging, and sampling of 28 exploratory borings, and advancement of 24 cone penetration test (CPT) soundings within or near the proposed IPS facilities site and along the forcemains and power transmission alignments were performed for this study. The purpose of the subsurface explorations was to gather data regarding subsurface conditions and obtain soil samples for laboratory testing, to evaluate the physical and engineering properties of the subsurface soils. The subsurface information and laboratory test results were used in developing the geotechnical recommendations presented in this report.

Based on the results of our field exploration and site reconnaissance, no known geologic or geotechnical conditions preclude design and construction of the IPS facilities. Based on a review of referenced geologic data and the distance to mapped faults and fissures, the potential is low for fault-related surface rupture at the site. Because of the relatively flat grades at the site, the risk of slope instability affecting the constructed IPS is considered to be negligible.

Exploratory CPTs performed for the project suggest that the groundwater elevation is relatively shallow. Groundwater was encountered between approximately 1 and 12 feet below ground surface, at approximate elevations of 4,204 to 4,217 feet in the exploratory CPTs. Considering the anticipated depth-to-groundwater, construction is anticipated to be affected by groundwater issues (e.g., pumping subgrade, soft ground, dewatering) at some site locations. Dewatering is anticipated to facilitate construction. Dewatering may induce settlement of neighboring facilities (e.g., utilities, structures, roadways). The effects of temporary dewatering should be evaluated by the contractor, and the means to mitigate effects should be provided where needed. Water discharged during construction could require treatment, monitoring, sampling, and testing. Dewatering systems should discharge to an appropriate location, in accordance with permit requirements.

Based on the information about groundwater conditions at the site, structural design will need to consider lateral hydrostatic forces and buoyancy, assuming the groundwater level near final surface design grades. Structures with below-grade levels will need to have a subsurface drain system or be designed to resist full soil and water loads when empty.

Subsurface drain systems will need to convey collected water into storm sewers and back into the process flows by gravity or pumped sumps. The walls of structures with below-grade levels will need to be able to resist full lateral hydrostatic forces. Where subsurface drain systems are not intended to function continuously, the walls will need to resist full hydrostatic forces when empty.

Fill materials were encountered in the subsurface explorations and are anticipated in the vicinity of the proposed IPS facilities. Documentation indicating placement and compaction of the encountered fill was not available for review as part of this evaluation. These materials should be considered uncontrolled fill; the term “uncontrolled fill” refers to human-made fill, placed without engineering observation, testing, or documentation. Such uncontrolled fill is considered unsuitable to support proposed project structures in its present condition and should be removed below new structures. Uncontrolled fill may be stockpiled and tested for suitability for use on the project. Approximately 1 to 2 feet of this material may remain in place as a bridging layer to facilitate construction on the underlying soft native soils.

Based on subsurface exploration data, some loose, saturated, cohesionless sand layers are present at the site and were encountered in some of the exploratory borings. Based on subsequent analyses and the limited data from the explorations, post-liquefaction foundation settlement for the IPS facilities generally is estimated to be approximately 1 inch. However, some post-earthquake maintenance may be needed to address ground-shaking and post-liquefaction effects following a seismic event. This pertains particularly to facilities that need to remain in immediate operation and cannot accommodate a maintenance period following a seismic event.

Subsurface investigations performed near the Jordan River encountered an apparently continuous, saturated, and loose sand layer that is susceptible to lateral spreading, approximately coincident with the elevation of the centerline of the forcemains. In a potential lateral spreading event, soils above the centerline of the pipes could deform in the direction of the Jordan River. We estimate that the lateral spreading deformations will be 2 to 8 inches. These deformations should be considered in design of the forcemains where the alignment is within 200 feet of the Jordan River.

Using data collected from the subsurface explorations and the laboratory testing, analyses were performed to estimate the potential for settlement of the IPS facilities. Plans call for the IPS structure to have a mat foundation. Differential settlement at the influent connection from the influent gravity sewer line into the IPS foundation wall also was estimated. Based on discussion with process, pipeline, and structure designers, the IPS can be supported on a mat foundation, and we recommend that lightweight backfill be placed above the influent gravity sewer line connection into the IPS, so that the estimated total and differential settlements can be accounted for in the design of project improvements.

Based on the results of chemical testing, some of the tested soils contain chloride concentrations that should be considered corrosive to reinforcing steel and tendons. Based on the results of resistivity testing, some of the tested soils have a measured resistivity that should

be considered to range from negligibly to extremely corrosive to metal. The project design needs to consider the potential for corrosion and implement appropriate corrosion protection methods.

1. Introduction

This report presents the findings of AECOM Technical Services, Inc. (AECOM) from field explorations and laboratory testing that were conducted for the Salt Lake City Department of Public Utilities (SLCDPU). The purposes of this study were to assess geotechnical-related considerations pertaining to the project site for the proposed Influent pumping Station (IPS) facilities, and to provide geotechnical recommendations for design and construction of associated project improvements. The IPS facilities are planned as part of the Salt Lake City New Water Reclamation Facility (New WRF) Project, to replace the existing Salt Lake City Water Reclamation Facility (SLCWRF), which is more than 55 years old. The IPS project site is near West Reclamation Road and North 1200 West Street in Salt Lake City, Utah (Appendix A).

Construction for the New WRF has begun, independent of design of the IPS facilities. Where IPS facilities will connect to the New WRF facilities that are already being constructed, consideration needs to be given to connections and meeting the intent of the design.

1.1 Scope of Services

Our scope of services, relevant to this study, included the following:

- reviewing pertinent in-house geotechnical data, aerial photographs, and published geologic maps, soils data, historical geotechnical reports, and literature;
- coordinating and mobilizing for subsurface exploration;
- drilling, logging, and sampling of exploratory borings and advancing cone penetration test (CPT) soundings (subsurface explorations are listed in Table 3.1), to gather data regarding subsurface conditions and obtain soil samples for laboratory testing:
  - 14 exploratory borings to depths up to approximately 50 feet below ground surface (bgs) and 12 CPTs to depths up to approximately 120 feet bgs were performed near or along the alignment for the forcemain pipelines (forcemains) that will extend from the IPS to the New WRF Headworks Facility;
  - nine exploratory borings to depths up to approximately 100 feet bgs and eight CPTs to depths up to approximately 160 feet bgs were performed near the proposed IPS site;
  - five exploratory borings and two CPTs were performed for the project during previous geotechnical studies near the Northwest Drain Canal (NDC);
  - two CPTs were performed for the geotechnical study at the main plant site, near the alignment for the forcemains;
- assigning and performing laboratory tests to evaluate physical and engineering properties of the subsurface soils, consisting of in-place moisture content, unit weight, fines content, gradation and hydrometer, Atterberg limits, chemical tests (including chloride, pH, resistivity, sulfate, and total soluble salts), consolidation, triaxial unconsolidated undrained shear, triaxial consolidated drained shear, and triaxial consolidated undrained shear;

- compiling and analyzing the accumulated data for liquefaction, lateral spreading, bearing capacity, settlement, and pavement design; and
- preparing this report to present relevant data, findings, and engineering recommendations.

1.2 Project Description

Structures and improvements that are included in this study include the IPS, IPS Electrical Building, IPS Generators, IPS Odor Control, and influent forcemains. The IPS facilities are generally south of an existing pumping station that is south of the main SLCWRF site. The influent forcemains generally will extend northwest from the planned IPS facility to the Headworks facility, as shown in the site map provided in Appendix A.

Many new WRF Liquid Train facilities are not part of this study, including the Headworks Facility and a length of the influent forcemains that connect to the Headworks Facility. Geotechnical recommendations for Liquid Train facilities are reported under separate cover. Our understanding of the IPS facilities, including the forcemains, is based on preliminary structure plans.

Influent Pump Station and Forcemains

The proposed IPS will receive raw wastewater through a bifurcating wye that will transmit the influent into one or both of two wet wells. Several pumps will lift the influent to raise the hydraulic grade before conveyance through the forcemains to the Headworks Facility. The structure for the wet wells will be approximately 40 feet wide by 80 feet long and will extend approximately 54 feet below finished grade to a bearing elevation of approximately 4,168 feet. A contractor-designed wall system for excavation support will be needed to facilitate excavation and construction of the IPS. The ground floor and above-grade portion of the structure, which is expected to bear on the deeper mat foundation, will be approximately 80 feet wide by 55 feet long and is anticipated to generate an eccentric load on the deeper mat foundation.

Additional proposed facilities near the IPS will include an Odor Control structure, Generators, and an Electrical Building, to the north and northeast. An electrical duct bank will provide power to the IPS Electrical Building from a planned electrical power substation. A preferred electrical service alignment extends roughly north to south, just west of the NDC. The Odor Control structure is anticipated to be supported on a mat foundation approximately 30 feet wide by 72 feet long and bear at an elevation of 4,219 feet. The generator pad is anticipated to be supported on a mat foundation approximately 44 feet wide by 80 feet long and bear at an elevation of 4,219 feet. Two fuel tanks are planned adjacent to the generator pad, each being supported on a mat foundation approximately 12 feet wide by 35 feet long and bearing at an elevation of 4,219 feet. The Electrical Building is anticipated to be supported on spread (spot) footings 7 feet wide by 7 feet long and bear at an elevation of 4,218 feet. In the event of a power outage, the generators near the IPS can provide temporary power to the IPS.

The forcemains from the IPS to the Headworks Facility will consist of two high-density polyethylene (HDPE) pipes (each 48 inches in diameter). The forcemains will be buried with an

approximate invert depth of 7 to 10 feet bgs. The forcemains are anticipated to be constructed using conventional trenching methods (i.e., cut and cover).

1.3 Site Description

The new IPS facilities and forcemains will be on several parcels south of the main treatment plant site. The new IPS facilities will include Generators, an Electrical Building, and an Odor Control structure south of an existing pump station (on parcel 08233510010000). The new IPS will be positioned on parcel 08233510030000, which generally was undeveloped at the time of our subsurface explorations, with the exception of some overhead powerlines and the Orange Street sewer, which crosses through the parcel in an east-west direction before bending north and entering the existing pump station. The new forcemains will extend to the north and west from the new IPS facilities to the new Headworks Facility at the main project site. The new forcemains will be west of North Reclamation Road and North Catherine Street, and south of West Riverview Avenue, until extending north along North Midland Street to the Headworks Facility. The new forcemains will traverse through generally undeveloped terrain. However, the alignment also extends through and along portions of the Rose Park Golf Course (Appendix A).

2. Site Characterization

2.1 Regional Geology

The project site is near the northern end of the Jordan Valley, a north-south trending valley in north-central Utah. The Jordan Valley is a sediment-filled intermountain basin, flanked by two uplifted range blocks, the Wasatch Range and the Oquirrh Mountains. The Wasatch Range east of the project site forms the boundary between the basin and Wasatch Range, and Middle Rocky Mountains physiographic provinces in this region (USACE 1995). Surface and near-surface sediments in the Jordan Valley are dominated by Quaternary materials, deposited by Lake Bonneville in the last 30,000 years (Lund 1990).

Historic seismic refraction surveys of the Jordan Valley indicate that the Quaternary layer varies from about 600 to 2,500 feet in thickness (Mattick 1970), which is characteristic of an unconsolidated material (Arnow and Mattick 1968). The same seismic surveys indicate a Tertiary layer beneath the Quaternary sediments, extending to a depth of approximately 4,800 feet, with indications of semi-consolidated sediments. In addition, wells in the Jordan Valley have indicated a thickness of valley sediments of more than 3,000 feet.

2.2 Geologic Hazards

The following sections describe geologic hazards to which the project site may be subject, and the potential impacts each hazard may have.

2.2.1 Seismicity

The project site is within the Intermountain Seismic Belt, one of the most seismically active areas in the interior western United States. Earthquakes of moment magnitude 7.0 or more have occurred repeatedly in relatively recent geologic history along the nearby Wasatch fault zone. The site is near the northern end of the Salt Lake City segment and the southern end of the Weber segment of the fault. The mapped surface trace of the Warm Springs section of the Salt Lake City segment is near the western foot of the Wasatch Mountains, about 1 mile east of the project site. The Wasatch fault dips in a generally westward direction and likely passes under the site at some depth. The Wasatch fault zone is one of the longest and most tectonically active normal faults in North America. Half of the estimated 50 to 120 post-Bonneville surface-faulting earthquakes in the Wasatch Front region have been on the Wasatch fault, which has an estimated slip rate of between 1 and 5 millimeters per year (USGS and UGS 2019).

The Salt Lake City and Weber segments of the Wasatch fault zone have normal faults that generally trend north to south. Although other mapped faults are within 20 miles of the project site—such as the West Valley fault zone (the Taylorsville fault is about 1 mile to the southwest), the Great Salt Lake fault zone (the Antelope Island section is about 13 miles to the west), the Oquirrh fault zone (about 18 miles to the southwest), the East Canyon fault (the southern East Canyon section is about 16 miles to the east), the Main Canyon fault (about 18 miles to the east), and other sections of the Wasatch fault zone extending north and south of the project

site—the Salt Lake City segment of the Wasatch fault zone is the predominant contributor to the probabilistic seismic hazard in the project area. Grading and fill previously placed at the site have obscured pre-development surface conditions. Our explorations did not identify evidence of near-surface fault traces in the project area.

2.2.2 Liquefaction

Seismically induced liquefaction occurs when earthquake ground motion causes a sufficient increase of pore water pressures in the space between soil particles to overcome frictional resistance between particles in susceptible, typically loose, saturated, and cohesionless soils. The generation of excess pore pressures leads to greatly reduced strength within the liquefied soil layer. Liquefaction effects can include sand boils, settlement, lateral spread, loss of bearing capacity, and increased drag force on deep foundations associated with post-liquefaction settlement.

The Utah Geological Survey provides maps, which include portions of Salt Lake County, identifying liquefaction potential in the project area (Christenson and Shaw 2008). Liquefaction potential was assigned on the basis of regional soil and groundwater depth and earthquake ground-shaking probabilities and does not consider actual soil conditions. Based on the liquefaction potential map, the project area is mapped as an area with high liquefaction potential. This map is a high-level assessment of liquefaction hazard, prepared only for identifying areas where additional investigation is needed to assess actual conditions and hazard. The results of a site-specific seismic hazard analysis are presented in Section 4.1.1. Site-specific analyses of liquefaction triggering and its effects, based on subsurface exploration data, testing results, and the site-specific seismic hazard analysis, are presented in Section 4.1.2.

2.3 Mapped Soil Conditions

Geologic maps of the project site (Appendix A) show surficial deposits (other than artificial fill) to be composed of quaternary Holocene clay deposits and floodplain alluvium (Van Horn 1982). These deposits may include clay, sand, and silt, deposited where streams entered the Great Salt Lake, and consist of interlinking stream and lake deposits. Much of the deposits are saturated below a depth of 3 feet, compressible, and the surface tends to collapse under heavy loads. Shallow quaternary sediments beneath artificial fill and surficial deposits at the site are assumed to be Pleistocene silt and clay deposits, associated with transgressive-regressive Lake Bonneville cycles.

3. Field Investigation, Subsurface Materials and Conditions, and Laboratory Testing

3.1 Field Exploration

We performed geotechnical explorations of subsurface conditions within or in the vicinity of the proposed IPS facilities. Marking of existing public utility locations was conducted by Bluestakes of Utah. Additional clearance for unmarked utilities was performed by a potholing subcontractor. Subsurface explorations were performed between July 2018 and August 2021, including exploratory borings and CPTs. Explorations performed for the IPS facilities are summarized in Table 3.1. Under subcontract to AECOM, drilling was performed by ConeTec, Inc. (ConeTec) of Salt Lake City and Inberg-Miller Engineers; CPT soundings were performed by ConeTec. Some of the explorations, as noted in Table 3.1, were overseen by Intermountain GeoEnvironmental Services, Inc. (IGES) of South Salt Lake, a subconsultant to AECOM (logs and data for explorations that were overseen by IGES personnel are included in Appendices B and C, respectively).

Notes:
"—" denotes a blank entry
1. Surveyed elevation is based on North American Vertical Datum of 1988. Northing and Easting coordinates are provided on the boring logs (Appendix B), in North American Datum of 1983, based on the Utah Central State Plane Projection.
2. Because of the selected mud-rotary drilling method for borings, the groundwater depth neither was readily observed nor measured in the field. For CPT explorations, the groundwater depth is inferred, based on the results of the shallowest pore pressure dissipation test performed within each sounding, assuming 100 percent hydrostatic conditions.
3. Exploration was overseen by Intermountain GeoEnvironmental Services, Inc. of South Salt Lake, a subconsultant to AECOM.
4. Groundwater considered in our analyses ranges from 4,207 to 4,212.
5. Elevation not surveyed for this exploration. The elevation was assumed based on surveyed elevations for nearby explorations.
6. The existing NDC is not a planned project facility; however, some project improvements, such as an electrical duct bank or overhead power transmission line, are planned near the NDC.

Exploratory borings generally were advanced using mud-rotary drilling methods to depths up to approximately 160 feet bgs, using a CME-75 truck-mounted drill, equipped with a 4-7/8-inch drag bit, or a CME-55 track-mounted drill, equipped with a 3-3/4-inch drag bit. Penetration resistances were obtained from the number of hammer blows observed to drive a split-spoon standard penetration test (SPT) sampler, using a 140-pound automatic hammer, dropped from a height of 30 inches. The resistance to

sampler penetration (blowcount or N-value) is noted as “N” in the boring logs (Appendix B) and refers to the number of hammer blows to advance the sampler a distance of 12 inches, beginning after an initial 6 inches of penetration into the subsurface materials. Based on recent calibration testing, the calibrated energy transfer ratio may be assumed to be 87 percent for the hammer equipped on the CME-75 drilling equipment. Calibration for energy transfer was not available for the hammer equipped on the CME-55 drill used by Inberg-Miller Engineers until after this study was essentially complete; consequently, an energy transfer ratio of 85 percent was assumed for this study based on our experience with similar equipment.

The blowcount that was recorded over the SPT sample interval (range of depths over which the blowcount was measured) was used as an indication of relative density and consistency of in-place soil materials. The blowcount at each sample depth was corrected for drilling conditions, adjusted for estimated hammer energy, to obtain the N60 value, and was adjusted for overburden stress at the depth of each sample to obtain the (N1)60 value.

AECOM engineering personnel observed subsurface exploration, prepared logs of subsurface conditions encountered in each boring, classified encountered soils, and collected soil samples for laboratory testing. In some cases, IGES personnel observed the investigations, as shown in Table 3.1. Encountered soils were classified at the time of drilling, using the Unified Soil Classification System, and in general accordance with the standard procedures described in the American Society for Testing and Materials (ASTM) Standard D2488 (ASTM 2017a). Logs of subsurface conditions that were encountered in the exploratory borings, a Key to Boring Logs (applicable to logs created by AECOM), and a Key to Soil Symbols and Terminology (applicable to logs created by IGES) are provided in Appendix B.

The CPT soundings were completed using a 25-ton, truck-mounted CPT rig, equipped with a 60-degree-apex-angle piezocone with a 15-square-centimeter tip and net area ratio of 0.8. The CPT soundings were performed by pushing an approximately 1.7-inch-diameter instrumented cone into the ground with a set of hydraulic rams to collect relatively continuous tip, sleeve, and pore pressure measurements of subsurface soil conditions. The sleeve area was approximately 225 square centimeters, with an offset between measured tip and sleeve resistance of 0.1 meter. This offset is accounted in the reported data.

The CPT soundings were performed in accordance with ConeTec’s CPT operating procedures, reported to be in general accordance with the current ASTM Standard D5778 (ASTM 2012b). Measured cone tip resistance was corrected for pore pressure effects (corrected tip resistance denoted as “q_t”) for reporting. The results of the CPT soundings, included as excerpts from multiple field investigation reports that have been prepared for the project by ConeTec, are provided in Appendix C.

3.2 Subsurface Materials and Conditions

General descriptions of local stratigraphy, fill materials, and native soil encountered in the exploratory borings that were performed at the project site are presented next.

3.2.1 Local Stratigraphy

The sediments in the project site primarily are composed of Lake Bonneville sediments. A map showing the general stratigraphic column is provided in Appendix A. Imported granular fill at the site is composed of a mix of sand, gravel, and cobbles, extending from the ground surface to approximately 4 to 10 feet

bgs. Holocene-age, post-Lake Bonneville sediment extends from the bottom of the fill to between approximately 8 to 15 feet bgs. Lake Bonneville sediments extend from approximately 15 to 112 feet bgs and primarily are composed of fine-grained materials (clay and silt), interbedded with relatively thin sand layers. Below the Lake Bonneville sediments, generally at depths more than 100 feet bgs, are unconsolidated to potentially semi-consolidated sediments of the Alpine Formation. A disconformity exists at the site between the Bonneville deposits and the Alpine Formation (Leeflang 2008), as shown in the generalized stratigraphic column figure that is provided in Appendix A.

3.2.2 Fill Materials

In explorations performed for the pump station site, fill materials were not readily observable. However, based on our understanding of site history, fill materials in the vicinity of the IPS site may be up to 5 feet thick, particularly at nearby existing utilities; fill was encountered in explorations near the forcemain alignment to depths reaching about 4 feet. Fill materials, including disturbed native materials and imported materials placed without documentation or by uncontrolled means, generally are not suitable to support structures. Fill is anticipated to be encountered at locations beyond and between the boring locations, extending to varying elevations that may be associated with existing roadway rights-of-way or buried utility improvements.

3.2.3 Native Soils

Encountered native soils predominantly were composed of fine-grained soil deposits, with a few coarse-grained strata (about 5 feet in thickness or less) and more frequent coarse-grained layers (1 to 2 feet in thickness or less), dispersed throughout the soil profile. Based on the tested samples, the fine-grained deposits primarily appeared to be composed of very soft to stiff, medium to high-plasticity fat clays; very soft to very stiff, low to medium plasticity lean clays; and non-plastic to low-plasticity silts with varying amounts of sand. Coarse-grained layers, which generally were dispersed throughout the subsurface profile, mainly were composed of very loose to dense silty to poorly graded sands.

3.2.4 Groundwater

Groundwater was encountered at depths of approximately 1 to 12 feet bgs near the IPS site and from 3 to 12 feet bgs along the alignment of the forcemains (from the IPS to the Headworks Facility). Groundwater levels fluctuate seasonally because of possible variations in ground surface topography, subsurface geologic conditions, rainfall, irrigation, and other factors. A detailed groundwater analysis was beyond the scope of this geotechnical study; however, groundwater level typically is higher in the late spring months and lower in late fall to early winter. Groundwater level also may be influenced locally by dewatering efforts for excavations during construction.

The inferred groundwater depths encountered in each of the CPTs are shown in Table 3.1. For CPT explorations, the groundwater depth is inferred, based on the results of the shallowest pore pressure dissipation test that was performed within each sounding, assuming 100 percent hydrostatic conditions. Based on the results of pore pressure dissipation testing performed for the project, an upward seepage gradient was identified with an almost linear relationship with depth. Pore pressure dissipation tests that were performed in the vicinity of the IPS site indicate pore pressure trends of approximately 118 percent of hydrostatic, with a groundwater elevation of approximately 4,210 feet.

3.3 Laboratory Testing

Laboratory testing was performed by IGES on selected soil samples, collected from exploratory borings that were completed at the project site during the 2018–2021 field investigations. The laboratory testing program included testing to aid in classification of site soils, assess physical and engineering properties of tested materials, and help assess corrosion potential. The laboratory test data are summarized in the remarks column of the boring log from which each sample was obtained, and a complete summary of all pertinent laboratory testing results from borings in the vicinity of the proposed Liquid Train facilities site is provided in Appendix E. A summary of laboratory test results for selected soil samples is shown in Table 3.2.

Table 3.2. Summary of Laboratory Test Results for Selected Soil Samples

Laboratory Test	Test Results	Notes
Atterberg Limits		Non plastic silt to high plasticity clay
Liquid Limit	NP to 62	
Plastic Limit	NP to 33	
Plasticity Index	NP to 38	
Moisture Content	19.6 to 72.1 percent	Moist to wet
Material passing #200 sieve	6.6 to 99.8 percent	—
Dry Density	62.2 to 103.3 pounds per cubic foot	—
Total Soluble Salts	400 to 8760 mg/kg	—
Sulfate Content	84.1 to 720 ppm	Moderate to severe sulfate exposure
pH	8.12 to 8.79 (unitless)	—
Chloride Content	62.4 to 1370 ppm	Corrosive to metal reinforcement
Resistivity	165 to 3015 ohm-cm	Negligibly to extremely corrosive to metal

Notes:
"—" denotes a blank entry; cm = centimeter; kg = kilogram; mg = milligram; ppm = parts per million; NP = non-plastic

4. Recommendations

This chapter presents geotechnical recommendations for design and construction of the proposed IPS facilities, including seismic design; demolition; earthwork; subgrade stabilization and dewatering; structure foundations; pipe settlement and facility connections; lateral earth pressures; concrete slab-on-grade floors; exterior concrete flatwork, curbs, and gutters; pavement design; construction in cold or wet weather; frost heave; scaling; concrete and corrosion considerations; and moisture infiltration reduction and surface drainage. These recommendations are based on our understanding of the project, engineering properties of tested soils, the geologic conditions presented in this report, and the assumption that an adequate number of tests and observations will be made during construction to evaluate compliance with these recommendations. Earthwork and site preparation at the project site should be performed in general accordance with the requirements presented in this report and referenced specifications (Utah Chapters APWA and AGC 2017).

4.1 Seismic Design

Site-specific seismic hazard analyses for the New WRF project site were completed by Lettis Consultants International, Inc. in 2020, under subcontract to AECOM (LCI 2020). These analyses consisted of a site-specific probabilistic seismic hazard analysis (PSHA), a deterministic seismic hazard analysis (DSHA), a site response analysis, and development of acceleration time histories. In accordance with the International Building Code (IBC; ICC 2017), which has been accepted and adopted by the SLCDPU, and with references to American Society of Civil Engineers (ASCE) 7-16 (ASCE 2016), design ground motion parameters were developed and may be considered appropriate for proposed IPS facilities, which are generally located south of the New WRF main project site where the site-specific data was gathered. Surface wave measurements were collected for the Lettis analyses by GeoVision Geophysical Services, Inc. and are included for convenience in Appendix D.

4.1.1 Seismic Design Parameters

ASCE 7-16 defines the horizontal, site-specific, risk-targeted, Maximum Considered Earthquake (MCE_R) spectral response acceleration as the lesser of the deterministic and probabilistic MCE_R spectra. The deterministic MCE_R spectrum is the 84th-percentile, 5 percent damped, spectral response acceleration in the maximum direction response from the maximum event on the controlling active fault (magnitude 7.2 earthquake in the Salt Lake City segment), but not less than a minimum deterministic spectrum, as defined in Figure 2-1 in ASCE 7-16. The probabilistic MCE_R spectrum was calculated using Method 1 in Chapter 21 of ASCE 7-16, which includes a 2,475-year return period uniform hazard spectrum, adjusted to maximum direction, and uses risk coefficients expected to achieve a 1 percent probability of collapse within a 50-year period (LCI 2020). As part of this analysis, the code generalized spectra were developed for Site Class E, in general accordance with Chapter 11 of ASCE 7-16, with modifications in accordance with Chapter 21 of ASCE 7-16.

For a liquefaction hazard evaluation, the geometric mean peak ground acceleration, PGA_M that was used for the analyses is shown in Table 4.1. Although the site-specific study provided a site-specific peak ground acceleration value of 0.56g (LCI 2020), a peak ground acceleration of 0.62g was selected as 80 percent of the generalized, code-based peak ground acceleration, as per Section 21.5.3 of ASCE 7-16 (ASCE 2016; LCI 2020). Table 4.1 also shows the associated mean and modal magnitudes, and the distances for an acceleration with a 2,475-year return period.

Table 4.1. Summary of 2,475-Year Return Period Ground Motion Design Parameters

Ground Motion	Peak Horizontal Ground Acceleration, PGA_M (g)	Earthquake Magnitude, M (-)		Distance, D (km)	
		Mean	Modal	Mean	Modal
2,475-Year Probabilistic	0.62[1]	7.1	7.1	3.2	2.5

Notes: g = acceleration from gravity; km = kilometer; PGA_M = geometric mean peak ground acceleration
1. PGA_M = 0.62g was taken as 80 percent of the generalized, code-based, peak ground acceleration procedure from Chapter 11 of ASCE 7-16.
Source: LCI 2020

ASCE 7-16 (ASCE 2016) defines the design spectral response acceleration at any period as two-thirds of the MCE_R spectral response acceleration, but not less than 80 percent of the generalized code-minimum spectrum, with modifications as per Chapter 21 of ASCE 7-16. The site-specific horizontal and vertical ASCE 7-16 MCE_R and design response spectra are shown in Table 4.2.

Table 4.2. Site-Specific Horizontal and Vertical ASCE 7-16 Design Spectra

Spectral Period (seconds)	Horizontal MCE_R Spectral Acceleration, S_{aM} (g)	Vertical MCE_R Spectral Acceleration (g)	Horizontal DE Spectral Acceleration, S_a (g)	Vertical DE Spectral Acceleration (g)
0.01	0.56	0.66	0.38	0.44
0.03	0.57	0.92	0.38	0.61
0.05	0.62	1.59	0.41	1.06
0.10	0.82	1.89	0.54	1.26
0.15	0.91	1.54	0.60	1.03
0.20	1.00	1.31	0.67	0.88
0.292	1.24	1.06	0.83	0.71
0.30	1.24	1.03	0.83	0.69
0.40	1.24	0.78	0.83	0.52
0.50	1.31	0.68	0.87	0.45
0.75	1.29	0.65	0.86	0.43
1.00	1.26	0.63	0.84	0.42

7.50	0.26	0.128	0.17	0.086
10.00	0.14	0.072	0.10	0.048

Notes: DE = Design Earthquake; MCE_R = Risk-Targeted Maximum Considered Earthquake

Section 21.4 of ASCE 7-16 outlines development of the design acceleration parameters to be used in seismic design of structures. The design, 5 percent damped, spectral response acceleration at short periods, S_{DS}, is taken as 90 percent of the maximum spectral acceleration value, S_a, at any period within the range of 0.2 to 5 seconds. The design, 5 percent damped, spectral response acceleration parameter

at a period of one second, S_{D1}, is taken as the maximum value of the product of the spectral period multiplied by the spectral acceleration value, at any period within the range of 1 to 5 seconds. The MCE_R, 5 percent damped, spectral response acceleration parameters for short and long periods, S_{MS} and S_{M1}, are obtained by multiplying the design spectral acceleration parameters, S_{DS} and S_{D1} by 1.5. The design acceleration parameters are summarized in Table 4.3.

Table 4.3. Summary of Site-Specific Acceleration Parameters to be Used in Seismic Design of Structures

Acceleration Parameter	Acceleration (g)
S_{DS}; design, 5 percent damped, horizontal spectral acceleration at short periods	0.83
S_{D1}; design, 5 percent damped, horizontal spectral acceleration at 1 second	1.21
S_{MS}; MCE_R, 5 percent damped, horizontal spectral acceleration at short periods	1.24
S_{M1}; MCE_R, 5 percent damped, horizontal spectral acceleration at 1 second	1.82

4.1.2 Liquefaction

Several saturated, cohesionless soil strata and layers were encountered in the subsurface explorations. In some of the explorations near the planned IPS facilities, these soils were encountered within about 25 feet bgs. A site-specific evaluation of liquefaction potential and associated effects was performed for the project site. Data from explorations outside the immediate area of the IPS facilities were considered, to characterize layer properties as appropriate, and were documented in the calculation package. The liquefaction-triggering analysis used the methodology presented by Idriss and Boulanger (2008) and as revised (including the 2014 update to magnitude scaling factor and CPT fines content prediction) by Boulanger and Idriss (2014). CPT tip resistance measurements in thin layers were corrected for thin-layer effects. This procedure calculates a factor of safety (FOS) against liquefaction triggering, by comparing the cyclic resistance ratio (CRR) of the soil to the earthquake-induced cyclic stress ratio (CSR). The ratio of these two parameters (CRR/CSR) is the FOS against liquefaction triggering. An FOS against liquefaction triggering less than 1.0 indicates that soils are anticipated to liquefy during a design seismic event.

Because near-surface, liquefaction-susceptible soils were encountered around the same elevation, we also estimated lateral spreading displacement, using the multilinear regression model proposed by Youd et al. (2002). The lateral spreading analysis predicted very little lateral spreading displacement (less than 6 inches) for encountered saturated, cohesionless soil layers. However, lateral spread is heavily reliant on layer continuity. Layers deposited in alluvial or fluvial environments commonly are discontinuous, winding, braided, and lensed. At some portions along the alignment of the forcemains from the IPS to the Headworks Facility, a shallow, 2-foot-thick liquefiable layer appeared somewhat continuous in our explorations (i.e., CP21-IS-08; CP21-IS-07; B21-IS-06; B21-IS-05); accordingly, this layer is expected in the area where the forcemains alignment is within approximately 200 feet of the Jordan River. This apparent continuous liquefiable layer coincides approximately with the centerline elevation of the forcemains. In a potential lateral spreading event, soils above the centerline of the pipes could deform in the direction of the Jordan River. Based on Youd et al. (2002), potential lateral spreading deformations are estimated to be 2 to 8 inches. These estimated lateral spreading displacements are relatively small,

and the HDPE forcemains will be flexible. However, we recommend that lateral spreading displacements be considered in design of the pipelines where the pipeline alignment is within 200 feet of the Jordan River. Additional information is provided in Appendix F.

To help reduce stress concentrations in the pipelines in areas where lateral spreading may occur, we recommend large-radius bends (in lieu of sharp, abrupt turns) in areas where the pipeline changes direction within 200 feet of the Jordan River. In this area, we also recommend that the strength of the pipeline be checked against the pressure of a passive soil wedge acting on one side of the pipeline. The design team also has discussed adding a low friction material (i.e., polyethylene plastic sheeting) at the interface between the pipes and overlying soil. Although this method is not a proven mitigation technique, adding a low-friction material may help to reduce the lateral stresses on the pipe.

The original scope of services included regular investigations along a preliminary tunnel alignment, roughly parallel to the NDC. This preliminary tunnel alignment was very similar to an electrical service alignment for duct bank or overhead power transmission. Because the tunnel has been removed from the project, a ductbank or an overhead power transmission alignment is being considered along the NDC. However, because of the narrow gravel roadway geometry and the presence of existing forcemains and other utilities in the area, much of the alignment could not be investigated. Accordingly, subsurface explorations performed along the possible electrical service alignment just west of the canal were limited; potentially damaging a forcemain or other critical infrastructure while performing subsurface investigations is not an acceptable risk. Rocky Mountain Power (RMP) has completed a foundation design for an overhead transmission line along the canal farther north, that extends to the planned power substation. It is our understanding that the resiliency of the transmission line between the substation and the IPS facilities might be limited by the performance of the RMP line during a liquefaction event or a slope failure along the canal.

One-dimensional vertical, liquefaction induced settlement was estimated using curves and equations, as presented in the monograph for estimating volumetric strains, prepared by Idriss and Boulanger (2008), which is derived from Ishihara and Yoshimine's (1992) volumetric strain charts. Liquefaction settlement estimation methods are consistent with the state of practice, but largely empirical and somewhat imprecise. Soil condition inputs are based on limited points of investigation, limited soil samples, and limited laboratory testing. As such, the provided estimates of liquefaction settlement may be more than or less than actual settlements.

Based on the liquefaction-triggering analyses performed, Table 4.4 summarizes the amount of post-liquefaction settlement that was predicted for each CPT and CPT-boring pair considered for the IPS facilities site. Table 4.4 shows that estimated post-liquefaction settlement at the ground surface generally is less than 1 inch; however, estimated post-liquefaction settlement at the ground surface may be as much as 4 to 5 inches in an isolated area in the vicinity of the Headworks Facility beyond the limits of the forcemain alignment that is part of this study (i.e., the portion of the forcemains that extends approximately 350 feet from the connection at the Headworks Facility is included in the Liquid Train study, under separate cover, and requires specific mitigative efforts in regard to the potential for post-liquefaction movements near the Headworks Facility).

Table 4.4: Estimated CPT-based Post-Liquefaction Settlement for IPS Facilities

Exploration	Estimated Post-Liquefaction Settlement at Ground Surface (inches)	Estimated Post-Liquefaction Settlement at Base of Foundation (inches)	Nearest Proposed Major Facility
BH19-ES-1[1]	1.9	1.9	NDC[4]
CP19-ES-1[1]	1.8	1.8	NDC[4]
BH19-ES-2[1]	1.7	1.7	NDC[4]
CP19-ES-2[1]	1.4	1.4	NDC[4]
CP18-PC-1	--[2]	--[2]	Area south of the Headworks Facility
CP20-IS-01	2.1	2.1	NDC[4]
CP20-IS-02	1.0	0.6	Forcemains
CP20-IS-03	0.3	--[2]	Forcemains
CP20-IS-04	0.7	0.2	Forcemains
CP20-IS-05	0.9	0.6	Forcemains
CP21-IS-06	0.7	0.6	Forcemains
CP21-IS-07	0.6	0.1	Forcemains
CP21-IS-08	1.0	--[2]	Forcemains
CP21-IS-09	0.2	0.2	Forcemains
CP21-IS-10	0.3	0.3	Forcemains

CP21-OIPS-02	--[2]	--[2]	IPS Generator Pad
CP21-OIPS-03	0.2	0.2	IPS Odor Control Structure
CP21-OIPS-04	--[2]	--[2]	IPS Generator Pad
CP21-OIPS-05	0.4	0.1	IPS
CP21-OIPS-06	0.7	0.7	Forcemains, IPS, IPS Generator Pad
CP21-OIPS-07	0.9	0.9	Forcemains, IPS
CP21-OIPS-08	0.4	--[2]	IPS

Notes:
1. Paired boring and cone penetration test.
2. Post-liquefaction settlement for the given scenario is negligible.
3. Over-excavation and replacement to elevation 4,193 will result in negligible post-liquefaction settlement.
4. The existing NDC is not a planned project facility; however, some project improvements are planned near the NDC.

4.2 Demolition

The work at the IPS facilities site may need to include demolition of existing site features, including the existing Orange Street sewer pipeline and existing pump station. The material produced by demolition

activities should be removed from the site. Demolition of these features should include rerouting, removal, or in-place abandonment of underground utilities. Utilities should be adequately capped or rerouted at the project perimeter, in accordance with the governing requirements, regulations, and the recommendations of the geotechnical consultant at the time of demolition. Where possible, abandoned underground utility pipes should be removed from the site, or if the pipes are left in place, they should be filled with flowable fill, such as grout or controlled low-strength material (CLSM). The contractor should take adequate precautions when grading the site, to reduce the potential for damage to existing utilities that are to remain in service.

4.3 Earthwork

Specifications for materials earth work practices are presented in the project specifications and generally follow the Manual of Standard Specifications (Utah Chapters APWA and AGC 2017). The following sections present additional earthwork recommendations for the project, including observation and testing, excavation, subgrade preparation, stability of temporary excavations, fill materials, and fill placement.

4.3.1 Observation and Testing

Experienced construction materials inspection personnel should perform appropriate observation and testing services during grading and construction operations. These services should include observing the removal of soft, loose, or otherwise unsuitable soils, evaluating the subgrade exposed by excavation before fill placement or construction, and observing and performing testing services during placement and compaction of structural fill and backfill soils. In-place density and moisture tests should be performed in accordance with ASTM Standard D6938 (ASTM 2017b) or alternatively, in accordance with ASTM Standard D1556 (ASTM 2015). For trenches, the test frequency should be at least one test per 200 lineal feet, per each lift of fill material placed. For structures, the test frequency should be at least once per every 10,000 square feet, or a minimum of three tests per lift below structures, whichever is more frequent. Additional tests also may be required in structural and non-structural areas, at the discretion of the geotechnical consultant during construction.

4.3.2 Excavation

Undocumented fill was encountered in some exploratory borings performed near the IPS site. The project contractor should anticipate fill to be encountered during excavation activities, particularly in paved areas and where existing underground utilities are located. Beneath the footprint and immediate vicinity of proposed structures, the full depth of undocumented fill material and any loose, disturbed, or otherwise unsuitable soil should be removed from the project area, including building and block screen/retaining walls, and extend laterally outward from the final structure footprint for a distance equal to, or greater than the total thickness of structural fill to be placed beneath the structure foundations. However, a relatively thin layer of fill that is 1 to 2 feet thick may be left in place, to help facilitate equipment operation when working near the bottom of excavations with underlying, soft, native materials. Specification 31 23 00, Excavation and Fill presents requirements for excavation.

Before excavation, the ground surface in the project area should be cleared of any surface and subsurface obstructions, pavement, debris, organics (including vegetation), and other deleterious

material. Depressions or ruts that contain water should be drained. Materials generated from clearing operations should be removed from the project area and disposed appropriately.

Trench and structure excavations should be performed in accordance with project specifications. Excavated soils may be stockpiled and used as surcharge material, or as fill or backfill, if they comply with project specifications and the applicable material requirements.

Project specifications should be followed for moisture conditioning the soils to be used for on-site trench backfill, and for compacting these soils. Compaction and suitability of trench backfill should be evaluated during construction. Off-site utility trench backfill placement procedures should meet the requirements that are outlined in the referenced specifications (Utah Chapters APWA and AGC 2017).

4.3.3 Subgrade Preparation

Experienced construction materials inspection personnel should observe areas to receive fill before placing any fill, to assess the suitability of the exposed material. Foundations, pavements, or fill may not be placed on frozen subgrade. In addition, the subgrade should be free from trash, vegetation (including roots and other organic materials), and other deleterious soils. After the removals described above have been made, exposed granular soil materials should be scarified to a depth of 6 inches, moisture-conditioned to within 2 percent of optimum moisture content, and compacted to 95 percent relative compaction, as per ASTM Standard D1557 (ASTM 2012a). Exposed native clays should not be scarified or compacted.

Where structural fill is required beneath structure foundations or exterior concrete flatwork, excavations and compacted fill should extend laterally beyond the edge of the structure to a distance greater than, or equal to the final thickness of the fill to be placed under the foundation or flatwork. In exterior concrete flatwork and pavement areas outside structure excavations, excavations needed to remove undocumented fill near buildings or walls; excavation of fill materials may be limited to 3 feet bgs or planned surface grade (whichever is lower in elevation), extending 2 feet or more outside the footprint of these improvements.

4.3.4 Stability of Temporary Excavations

Based on the soil conditions encountered in the exploratory borings, instability of excavations may exist and should be anticipated during project excavation activities. Excavations deeper than 4 feet should be shored or sloped in accordance with Occupational Safety and Health Administration regulations. If unstable conditions are encountered, excavations shallower than 4 feet deep also must be shored or sloped. On-site personnel safety and excavation stability is the responsibility of the contractor.

Temporary sloped surfaces should be kept from drying out, to minimize raveling and sloughing. Temporary grading could be required to prevent water from flowing into excavations. Surface runoff should be channeled away from the top edge of excavations, and traffic should be routed as far away from the excavation as practicable during construction. Spoils from excavations, heavy construction equipment, and other surcharge loads should be kept back from the top of excavations, at a distance equivalent to the depth of the excavation or more, unless the slopes are engineered with consideration of adjacent surface loads.

As an alternative to laying back the sides of the excavations, temporary excavations may be shored, using trench boxes or other appropriate systems. Temporary earth-retaining systems will be subjected to lateral loads, resulting from earth pressures. As a guideline, the lateral earth pressures presented in this report (see Section 4.7) also may be used in the design of temporary excavations. A structural engineer who is experienced in retaining systems for temporary excavations should be consulted by the contractor during the design of shoring systems.

4.3.5 Fill Materials

The following discussions present recommendations regarding on-site soil suitability for use as structural fill and backfill, and minimum requirements for suitable structural fill and backfill soils. Specification 31 23 00, Excavation and Fill presents the requirements for structural fill material, placement, and compaction.

4.3.5.1 On-Site Soil Suitability

The study findings indicate that the native soils encountered in the exploratory borings generally are not suitable for use as structural fill or backfill material for the project. Undocumented fill materials could vary and might not be suitable for use as structural fill or backfill material without processing.

4.3.5.2 Structural Fill

All fill placed below structure foundations should meet the requirements for structural fill or general fill described in the specifications for the project. All supplies of previously imported structural fill should be used below structures. When the supply of previously imported structural fill is exhausted, general fill may be used. Furthermore, deep fills should receive priority with the allocation of available structural fill. Specification 31 23 00, Excavation and Fill presents the requirements for structural fill material, placement, and compaction (see Section 4.7 for the lateral earth pressure discussion of unit weights associated with structural fill and structural backfill). A separation fabric may be placed on any soft clay that is encountered at the bottom of any excavation before structural fill placement; however, geotextiles should not be used in excavations for pile-supported structures. Specification 31 05 19.13, Geotextiles, presents the requirements for separation geotextiles.

4.3.5.3 Backfill

Recommendations for backfill material in the vicinity of the IPS facilities site are the same as the recommendations for structural fill (see Section 4.3.5.2).

4.3.6 Fill Placement

Following removal of all unsuitable soils and any additional excavation required to achieve design grade, experienced construction materials inspection personnel should probe the exposed subgrade to identify remaining soft, loose, or disturbed soils. Appropriate stabilization measures may need to be implemented if remaining soft, loose, or disturbed soil materials are encountered.

Structural fill should extend laterally beyond the edge of footings, at a distance equal to the structural fill depth. Structural fill should be compacted to 95 percent of the laboratory maximum dry density, as per ASTM Standard D1557 (ASTM 2012a). Where fill is to be placed against an existing slope of 4H:1V (horizontal:vertical) or steeper, the existing slope should be benched or keyed, to allow compaction

against a horizontal surface and provide interlock of the fill with the existing material. Adjacent concrete work should be allowed to cure long enough to obtain sufficient strength, to avoid detrimental effects from earthwork activity.

4.4 Subgrade Stabilization and Dewatering

Moist subgrade and relatively shallow groundwater conditions should be anticipated. Unstable subgrade could be encountered during construction and should be anticipated during excavation and earthwork operations, including pipeline trench excavation. Dewatering will be needed where excavations extend near or below groundwater, and subgrade stabilization will be needed where pumping subgrade conditions are encountered, or where subgrade is too wet to compact. Dewatering may induce settlement of neighboring facilities (e.g., utilities, structures, roadways). The effects of temporary dewatering should be evaluated by the contractor and means to mitigate effects should be provided where needed.

If the bottom of the excavation is unsuitable for foundation or pipe bedding placement, approval of mitigation efforts will be needed, in accordance with the project specifications. Mitigation may include over-excavating a minimum of 4 to 12 inches from the excavation foundation and replacing the material with granular backfill material, sand, or gravel to create a relatively level surface for foundation construction. If conditions are observed that indicate additional stabilization efforts may be needed, a combination of over-excavation, rock fill, and geogrid placement should be considered. Dewatering and use of relatively light or tracked equipment also may be needed. The geotechnical consultant/engineer should review proposed subgrade-stabilization methods before their implementation.

The purpose of dewatering during construction is to improve excavation wall and bottom stability, as well as subgrade stability, to facilitate construction. Dewatering in excavations may need to be performed in some areas, to lower groundwater to about 3 feet or more below the bottom of the anticipated excavations. Where dewatering is needed, a construction dewatering discharge permit may be required. Water discharged during construction may require treatment, monitoring, sampling, and testing. Dewatering systems should discharge to an appropriate location, in accordance with permit requirements.

4.4.1 Construction Considerations

Because of artesian groundwater conditions, significant effort may be needed to manage groundwater in excavations. Where needed, the contractor should be prepared to manage and facilitate treatment and discharge of groundwater.

4.5 Structure Foundations

IPS structures currently are anticipated to be supported on mat, spread, or strip footings. If the anticipated settlement of IPS facilities is higher than preferred by the structural engineer, or if additional uplift resistance is needed to resist buoyant forces, pile foundations may be used; such recommendations can be prepared if requested.

4.5.1 Mat Foundations

The IPS facility is anticipated to be supported by a mat foundation. We have provided design and construction recommendations appropriate for mat foundations for IPS facilities in the subsequent sections (additional information regarding mat foundations is provided in Appendix F).

4.5.1.1 Bearing Resistance

The recommended allowable bearing resistance (i.e., bearing capacity) for mat foundations were calculated using the reported structural dimensions, locations, and bearing elevations. Bearing resistances were calculated for drained (long-term, slow) and undrained (short-term, quick) loading conditions for general bearing failure. In this instance, a drained loading represents an increase in load, which is applied to a structure foundation slowly over a period of a few months or years; an undrained loading represents an increase in load, which is applied to a structure foundation rapidly over a period less than a few weeks. The allowable bearing resistances are shown in Table 4.5 and represent the total allowable load to be applied at the structure foundation.

Settlement, which is presented in Section 4.5.1.2 for mat foundations, also was considered for selecting allowable bearing resistances. Long-term settlement that occurs under permanent or sustained static loads can result in significant settlement over time. The significance of this settlement depends on the magnitude of the permanent load and the duration of the loading. The settlements discussed in Section 4.5.1.2 are appropriate only for permanent bearing pressures that are less than the maximum permanent bearing pressures shown in Table 4.5, which, if exceeded, may result in more settlement than estimated in Section 4.5.1.2. Settlement estimates also are dependent on the bearing elevation and dimensions of each structure. If the bearing elevation or dimensions change for a structure, the associated settlement also may change.

Based on soil types encountered in the subsurface explorations, a modulus of subgrade reaction was developed and is shown in Table 4.5. The recommended moduli of subgrade reaction are appropriate for the anticipated mat foundations.

Table 4.5. Summary of Maximum Allowable Bearing Resistances and Maximum Permanent Bearing Pressures for Mat Foundations

Facility	Allowable Bearing Resistance[1] (ksf)		Maximum Permanent (Sustained) Bearing Pressure (ksf)	Modulus of Subgrade Reaction[2] (pci)
	Drained (slow loading)	Undrained (quick loading)		
IPS Facility				
Construction – no backfill[3]	--[4]	1.6	1.5[3] (1.5)[5]	40
Construction – 20-foot backfill[3]	--[4]	1.9	2.9[3] (1.9)[5]	40
Construction – 50-foot backfill[3]	--[4]	2.6	5.2[3,6] (2.6)[5]	40
Long-Term Drained	7.3[6]	--[4]	5.8[3,6] (3.2)[5]	40
IPS Odor Control Structure	5.1	1.8	0.5	30

Facility	Allowable Bearing Resistance[1] (ksf)		Maximum Permanent (Sustained) Bearing Pressure (ksf)	Modulus of Subgrade Reaction[2] (pci)
	Drained (slow loading)	Undrained (quick loading)		
IPS Generator Pad	6.5	1.8	0.3	30
IPS Generator Fuel Tanks	3.0	1.8	0.3	30

Notes:

ksf = kilopounds (1,000 pounds) per square foot; pci = pounds per cubic inch.

1. Settlement estimates are dependent on bearing elevation for each structure. If the bearing elevation changes for a structure, the associated settlement also may change.
2. Subgrade modulus values are rounded.
3. The maximum bearing pressure listed should not be exceeded until the noted level of backfill around the IPS has been completed (e.g., without any backfill around the IPS bearing elevation, the maximum allowed bearing pressure is 1.5 ksf; after backfill has been completed to 20 feet above the bearing elevation of the IPS, the bearing pressure may be increased from 1.5 to 2.9 ksf, and so on).
4. The bearing resistance is not applicable for the given condition.
5. The IPS excavation will reduce the net applied load at the bearing level. The effect of the excavation was considered incrementally because backfill occurs adjacent to the structure. The bearing pressure noted in parentheses is the net bearing pressure considered for the corresponding level of backfill. For each condition listed, the allowable bearing resistance exceeds the net bearing pressure.
6. Construction of the IPS is anticipated to take place over an adequately long period for porewater pressures to dissipate, so that a partially drained condition will exist as the structure load is increased to the full, permanent dead load.

4.5.1.2 Settlement

We used Settle3 version 5.006 (Rocscience 2020) to estimate foundation settlement for IPS facilities that will be supported on mat foundations, using a one-dimensional analysis that considered elastic and primary consolidation. The secondary compression settlement was estimated in Microsoft Excel, using an adaptation of the recommendations provided by Bartlett et al. for secondary settlement estimation following surcharge loading (2017). A spreadsheet developed by AECOM, based on conventional secondary settlement theory with subdivision of clay layers, was used to perform estimates of secondary compression of structures. Vertical induced stresses were calculated using the Boussinesq (1883) method that is programmed in Settle3.

Soil rebound is anticipated during and after IPS excavations; this soil rebound is anticipated during and after the excavations of relatively large soil loads. Estimated rebound for some facilities is summarized in Table 4.6. Although much of the rebound may occur during and shortly after excavation, a portion of the rebound may occur after facility construction begins and may need to be accommodated during construction.

Estimated long-term settlement, differential settlement, and angular distortion for the IPS facilities that are supported on mat foundations are summarized in Table 4.7. The settlement shown in the table represents our estimate based on field and laboratory data. For the estimated long-term settlement, we also calculated settlement for reasonable low and high values from the field and laboratory data, and the range of calculated settlement based on these low and high cases is provided in Appendix F. Post-construction immediate and recompression settlement is anticipated to occur during construction, between construction and commissioning, and after commissioning; post construction immediate and recompression settlement may occur over a period of years and secondary compression settlement will occur over the design life of the facility.

In addition to total settlement, differential settlement should be considered in design of IPS facilities and appurtenant features. The settlement estimates shown in Table 4.7 suggest that significant long-term

differential settlement can occur between structures. Differential settlement also can occur across structure footprints. Differential settlement across facilities and between facilities should be considered for its effect on the structures, connections, appurtenant facilities, flatwork, and the hydraulic grade line for gravity flow systems. Although some amount of settlement will occur at the ground surface immediately adjacent to structures, as induced by the application of foundation and fill loads, differential settlements also should be expected from the building footprint outward into the adjacent ground.

Utilities or features connecting to a structure (pipelines penetrating into/connecting to the structure) can be adversely affected by differential settlement. In addition, maintenance of appurtenances and flatwork should be expected. We recommend that both immediate and long-term differential settlement be considered by the designers, who will need to make appropriate accommodations (such as flexible connections at pipe/structure interfaces) where needed. Additional information related to settlement affecting pipelines connecting to the IPS is presented in Section 4.6, and IPS pipe settlement calculations are provided in Appendix F.

Table 4.6. Summary of Estimated Excavation Rebound for Select Liquid Train Facilities

Facility	Bearing Elevation[1] (feet)	Estimated Excavation Rebound[2] (inches)
IPS	4,168 to 4,171	1 to 3

Notes:
1. Bearing elevation is used in settlement analysis. If bearing elevations are revised, the settlement analysis may need to be updated.
2. Estimated excavation rebound is affected by numerous factors and should be considered approximate. Actual excavation rebound may be greater or less than the estimates provided. In addition, the estimates provided were calculated based on selected soil parameters. Lower and higher soil parameters would yield lesser or greater magnitudes, respectively, than those reported here.

Table 4.7. Summary of Estimated Mat Foundation Settlement

Facility	Estimated Long-Term Settlement[1] (inches)			Differential Settlement[1] (inches)	Angular Distortion (radians)
	Post-Construction Immediate and Recompression	Secondary[2]	Total		
IPS	2-1/2	0	2-1/2	1/2	0.001
IPS Generator Pad	1	0	1	1/2	0.001
IPS Odor Control Structure	1	1/2	1-1/2	3/4	0.002

Notes:
1. Settlement reported here is our estimate, based on field and laboratory data.
2. Secondary settlement is estimated for the design life of the proposed IPS facilities, which is assumed to be 50 years.

Estimated total and differential post-liquefaction settlement of structures supported on mat foundations are summarized in Table 4.8. Estimated post-liquefaction settlement for the facilities supported on mat foundations generally is anticipated to be 1 inch or less. More information on anticipated post-liquefaction settlement is presented in Section 4.1.2; the liquefaction calculation information is provided in Appendix F. Settlement estimation often is imprecise, and soil conditions are assessed based on limited points of investigation, limited soil samples, and limited laboratory testing. Our estimates of settlement in this report may be more or less than actual settlements, and the locations of maximum settlement may vary.

Table 4.8. Summary of Estimated Post-Liquefaction Settlement for IPS Facilities Supported on Mat Foundations

Facility	Estimated Post-Liquefaction Settlement[1] (inches)	Estimated Differential Post-Liquefaction Settlement[1] (inches)
IPS	<1[2]	<1[2]

Notes:
1. More information on anticipated post-liquefaction settlement is presented in Section 4.1.2, and liquefaction calculation information is provided in Appendix F.
2. Partly because of the deep bearing elevation of the IPS, estimated post-liquefaction settlement is negligible; however, estimated post-liquefaction settlement at the ground surface in the vicinity of the IPS may be on the order of 1 inch. At such locations, sidewalks, flatwork, connections, and other appurtenant facilities adjacent to the IPS may require maintenance and repairs, following a seismic event. Facilities adjacent to the IPS that will need to remain in immediate operation and cannot accommodate a maintenance period following a seismic event, such as the forcemains out of the IPS, should be designed to accommodate post-liquefaction settlement on the order of 1 inch.

4.5.2 Spread Footings

Spread (spot) footings are anticipated for the IPS Electrical Building. Recommendations for spread footings are presented next.

4.5.2.1 Frost Depth and Foundation Embedment

Consistent with the IBC (ICC 2017) and local practices, the minimum foundation embedment to be applied to structures and walls for frost protection at the project site is 30 inches, which represents the depth from the bottom of the foundation to the lowest adjacent final grade. A minimum embedment of 30 inches will be appropriate for project structures; however, other design considerations, such as reduction of foundation settlement, may result in deeper foundations.

4.5.2.2 Bearing Resistance

The recommended allowable bearing resistance (i.e., bearing capacity) for the foundations for the IPS Electrical Building is shown in Table 4.9. This bearing resistance is based on the anticipated foundation size, location, and bearing elevation provided by the design team. The spread footings are expected to be founded on structural fill not less than 12 inches in thickness beneath the footings. If the foundation dimensions or embedment are modified, the geotechnical engineer should be consulted so that the allowable bearing resistances may be revised. If allowable bearing resistance is needed for other facilities, the geotechnical engineer should be contacted so that bearing resistance recommendations specific to those facilities may be provided.

Settlement, which is presented in Section 4.5.2.4 for spread footings, also was considered when selecting allowable bearing resistance. Long-term settlement that occurs under permanent or sustained static loads can result in significant settlement over time. The significance of this settlement will depend on the magnitude of the permanent load and the duration of the loading. The settlement discussed in Section 4.5.2.4 is appropriate only for permanent bearing pressure that is less than the maximum permanent bearing pressure shown in Table 4.9, and if exceeded, may result in more settlement than estimated in Section 4.5.2.4. Settlement estimates also are dependent on the dimensions and bearing elevation for each structure. If the dimensions or bearing elevation change for a structure, the associated settlement also may change.

Based on soil types encountered in the subsurface explorations, a modulus of subgrade reaction was developed for the anticipated conditions, as shown in Table 4.9. The recommended modulus of subgrade reaction is appropriate for the anticipated spread footing foundations.

Table 4.9. Summary of Recommended Allowable Bearing Resistance for Spread Footings

Facility[1]	Foundation Size/Type	Allowable Drained (slow loading) Bearing Resistance (ksf)	Allowable Undrained (quick loading) Bearing Resistance (ksf)	Maximum Permanent (Sustained) Bearing Pressure (ksf)	Modulus of Subgrade Reaction[2], k (pci)
IPS Electrical Building	7 feet by 7 feet/ Spot	3.4[3]	2.0[3]	1.5	30

Notes: ksf = kilopounds (1,000 pounds) per square foot
1. Settlement estimates are dependent on dimensions and bearing elevation for each structure. If the dimensions or bearing elevation change for a structure, the associated settlement also may change.
2. The subgrade modulus values are rounded.
3. The assumed bearing elevation is at least 42 inches below the adjacent finished grade.

4.5.2.3 Sliding Resistance

An interface friction angle of approximately 0.65ϕ should be used to estimate sliding resistance between the base of the foundation and the soil. We recommend that a friction ratio (ratio of shear to normal stress at the base of the foundation) of approximately 0.4 be used for design. Because the displacement required to mobilize ultimate active and passive earth pressure conditions can be substantial, we recommend neglecting the contributions of active or passive earth pressure to sliding resistance. If passive resistance is considered, the passive resistance should be implemented as recommended in Section 4.7.

4.5.2.4 Settlement

We used Settle3 (Rocscience 2020) to estimate foundation settlement for the IPS Electrical Building, which is anticipated to be supported on spread and strip footings; the settlement is based on a one-dimensional analysis considering elastic and primary consolidation. The secondary compression settlement was estimated in Microsoft Excel, using an adaptation of the recommendations provided by Bartlett et al. for secondary settlement estimation following surcharge loading (2017). Vertical induced stresses were calculated using the Boussinesq (1883) method that is programmed in Settle3.

Estimated long-term settlement, differential settlement, and angular distortion for the IPS Electrical Building, supported on spread and strip footings, are summarized in Table 4.10. The settlement shown in the table represents our estimate based on field and laboratory data. Immediate and recompression settlement is anticipated to occur during construction, between construction and commissioning, and after commissioning; post construction immediate and recompression settlement may occur over a period of years while secondary compression settlement is long-term settlement that will occur over the design life of the building.

In addition to total settlement, differential settlement should be considered in design of the IPS facilities and appurtenant features. Settlement estimates suggest that significant long-term differential settlement can occur between structures. Differential settlement also can occur across structure footprints.

Differential settlements across facilities and between facilities should be considered for their effects on the structures, connections, and appurtenant facilities. Although some amount of settlement will occur at the ground surface immediately adjacent to the facilities, as induced by the application of foundation and fill loads, differential settlements should be expected from the building footprint outward into the adjacent ground. Utilities or features connecting to a structure from the outside can be adversely affected. We recommend that both immediate and long-term differential settlement be considered by the designers, and appropriate accommodations, such as flexible connections at the structure interface, be implemented as needed. Section 4.6 presents additional information related to pipe and facility connections.

Table 4.10. Summary of Estimated Spread and Strip Footing Settlement for the IPS Electrical Building

Facility	Estimated Long-Term Settlement[1] (inches)			Differential Settlement[1] (inches)	Angular Distortion (radians)
	Post-Construction Immediate and Recompression	Secondary[2]	Total		
IPS Electrical Building	1/2	0	1/2	1/4	<0.001

Notes:
1. Settlement reported represents our estimate based on field and laboratory data. Additional information relating to settlement estimates is provided in Appendix F.
2. Secondary compression settlement is estimated for the design life of the proposed IPS facilities, which is assumed to be 50 years.

Estimated total post-liquefaction settlement for the IPS Electrical Building is on the order of 1 inch, with differential post-liquefaction settlement of similar magnitude. The IPS Electrical Building as well as sidewalks, flatwork, connections, and other appurtenant facilities near the structures may require minor maintenance and repairs, following a seismic event. More information on anticipated post-liquefaction settlement is presented in Section 4.1.2, and the Liquefaction Calculation is provided in Appendix F.

Settlement estimation often is imprecise, and soil conditions are assessed based on limited points of investigation, limited soil samples, and limited laboratory testing. Our estimates of settlement in this report may be more than or less than actual settlements, and the locations of maximum settlement may vary.

4.6 Pipe Settlement and Facility Connections

A summary of estimated differential settlements between new pipelines and connected structures is presented in this section. Settlement analysis was performed for the following pipeline alignment areas:

- Pipeline Alignment 1: includes about 40 feet of the influent gravity sewer line connecting into the IPS and the forcemains from the IPS to the Headworks Facility

Differential settlement should be considered for its effect on pipelines and pipeline connections to structures. We recommend that, for utilities or features connecting to structures, both immediate and long-term differential settlement be considered by the designers, and accommodations such as flexible connections near the structure interface may be needed to accommodate movements. The estimated differential settlement between the pipeline connection at each structure and the pipeline 10 feet away from the structure is summarized in Table 4.11. For locations where pipes extend between structures which are less than 10 feet apart, settlement was considered at the mid point between the structures.

The differential settlement shown in Table 4.11 may not be distributed evenly along the pipeline from the edge of each facility. Depending on the time and loading condition that the pipelines are connected to each structure, all or some portion of the construction/short-term differential settlement shown in Table 4.11 may apply to the pipe connections. In addition, long-term differential settlement is expected to occur over the design life of the IPS, so that the pipe connection will need to accommodate this portion of the total differential settlement as well. The total differential settlement shown in Table 4.11 is a summation of the construction/short-term and long-term differential settlements and may be considered a conservative estimate of differential settlement. A lower value for the total differential settlement may be used by adding 100 percent of the long-term settlement to a portion of the construction/short-term differential settlement; this estimation should be done in consultation with the geotechnical engineer.

To help limit the amount of differential settlement between the IPS and the bifurcating wye inlet, we recommend constructing the below-grade portion of the IPS and backfilling the excavation up to finished grade, where possible, before connecting the bifurcating wye inlet to the IPS. We also recommend a material with an average saturated unit weight of 100 pcf or less for backfill material above the bifurcating wye.

Table 4.11. Differential Settlement of Pipelines and Connected Structures

Pipeline Alignment	Facility/ Pipeline Connection	Estimated Construction / Short Term Differential Settlement (inches)	Estimated Long Term Differential Settlement (inches)	Estimated Total Differential Settlement (inches)
IPS Area and Headworks Influent	Raw Sewer Influent to IPS Inlet	<1/4	<1/4	<1/4
	IPS Inlet to IPS Structure	<1/4	<1/4	<1/4
	IPS Structure to Forcemains	1/2	<1/4	1/2

In addition to differential settlement, total settlement should be considered during design of IPS facilities and appurtenant features, such as pipelines. Additional information related to settlement affecting pipelines and facilities is included in the pipe settlement calculations, provided in Appendix F.

4.6.1 Modulus of Soil Reaction (E′)

Our understanding is that cut-and-cover methods will be used to install the new forcemains. We have provided the following recommendations for modulus of soil reaction (E′) to be used along the pipeline alignments for design.

The modulus can be used to characterize the soil–pipe relationship when estimating pipe deflection caused by external loads on the pipe; the modulus will depend on several factors, including trench width, pipe diameter, invert depth, backfill material, backfill compaction, and relative compaction density of the trench wall soils (i.e., native materials above the invert, outside the trench). The pipeline designer should have a sound understanding of how these and other factors will influence the input parameters in equations used for pipeline design, and the designer will need to consider the effects of the actual pipeline construction methods on those parameters.

Based on information from the pipeline designer, we understand that forcemain pipelines with a diameter of 48 inches are planned to be installed within a range of invert elevations. The soil type in our calculation (e.g., the material near pipe centerline elevations outside the pipeline trench) was considered for the area near the IPS.

4.6.1.1 Analysis

The constrained modulus of soil, M_s is used in the Iowa formula, as described in the referenced document (AWWA 2013) and also is understood to be the modulus of soil reaction, E′, used for the pipeline design.

The composite value of constrained modulus, M_s was calculated using the methodology used in the referenced AWWA (2013) document. The composite constrained modulus, M_s is calculated by multiplying the stress-dependent constrained modulus of the pipe zone embedment, M_{sb} by a soil support combining factor. The combining factor depends on the relative stiffness of the native soil to the trench backfill material at the pipe centerline, and the ratio of the trench width to the pipe diameter. A description of the calculation and analysis is provided in Appendix F.

The analysis was performed using the following assumptions:

- Class II soil material, described in Table 6.1 (AWWA 2013), will be used to backfill pipe trenches.
- Embedment soil (i.e., pipe zone backfill) will be compacted to 95 percent standard proctor density.
- Although CLSM could have an M_{sb} of as much as 25,000 psi (AWWA 2013), an M_{sb} of 25,000 psi could be higher than the actual M_{sb}. A conservative value equal to the calculated M_{sb} for class II material also is used for CSLM.
- The effective vertical stress at the centerline depth is calculated using a soil unit weight of 125 pcf for the compacted backfill material.
- A groundwater elevation of 4,209 feet was used at the IPS.
- M_{sb} can be estimated reasonably by linearly interpolating between values in Table 5.4 (AWWA 2013).

To estimate the soil support combining factor, S_c, the constrained modulus of the native soil, M_{sn}, near the pipe centerline elevation is needed. Values for M_{sn} were estimated from Table 5.6 (AWWA 2013), based on the undrained shear strength for clay soils, S_u, or based on the general soil description for granular soil. Values for S_c were estimated by linear interpolation of Table 5.5 in the referenced document (AWWA 2013), using the calculated M_{sn} to M_{sb} ratio and the calculated trench width (B_d) to pipe outer diameter (D) ratio, B_d/D, by assuming 12 inches of trench width beyond each side of the pipe.

4.6.1.2 Results

Detailed calculations of M_s versus elevation for the analyses area near the IPS are included in Attachment 2 of the E′ calculations, provided in Appendix F. Considering that M_s can be highly sensitive to soil type, ranging from about 850 to 4,600 psi (e.g., the modulus of soil reaction or constrained modulus, E′ or M_s, generally is lower where fine-grained, clayey, and silty soil layers are dominant, and is higher where coarse grained, granular soils are dominant), and considering that many coarse-grained soil layers at the project site are relatively thin and interbedded, we recommend that values derived from

fine-grained layers be used for most pipeline invert elevations. A summary of estimated E′ values is shown in Table 4.12.

Table 4.12. Modulus of Soil Reaction, E′

Pipe Diameter (inches)	Invert Elevation [Centerline Elevation] (feet)		Modulus of Subgrade Reaction, E′ (pounds per square inch)
	From	To	
48	4,206 [4,208]	4,210 [4,212]	900

4.7 Lateral Earth Pressures

Earth-retaining and buried structures should be designed considering the lateral earth pressures presented in this section. Typically, the resulting lateral earth pressure distribution for soils is assumed to increase linearly from the ground surface (top of the soil adjacent to the wall or foundation) to the base of the wall or foundation. To facilitate the application of this pressure distribution in design for each of the specific structures in the IPS facilities, Table 4.13 and Table 4.14 show recommended static and seismic (pseudostatic) components, respectively, of lateral earth-equivalent fluid weights. These equivalent fluid weights are based on a weighted average unit weight described further in Appendix F. For fill soils (such as structural fill below and around structures), the selected unit weights are 135 pcf for active and at rest evaluations and 115 pcf for passive calculations. For lightweight fill soils that may be used adjacent to the IPS, the selected unit weights are 100 pcf for active and at rest evaluations, and 70 pcf for passive calculations. Unit weights used for native soils and structures anticipated to experience lateral earth pressures from both fill and native soils are provided in Appendix F. The equivalent fluid weights shown in Table 4.13 may be used to estimate the lateral earth pressure at a depth bgs, by multiplying the associated equivalent fluid weight by the depth bgs of the point in question. The pseudostatic components shown in Table 4.14 should be used in conjunction with the appropriate static equivalent fluid weights shown in Table 4.13. The seismic components of equivalent fluid weight shown in Table 4.14 represent the increase (or decrease in the case of passive earth pressure) in lateral earth pressure for the pseudostatic case. The seismic equivalent fluid weight (Table 4.14) should be added to (used together with) the static equivalent fluid weight (Table 4.13) for the pseudostatic case. Where submerged equivalent fluid unit weights are used, which account only lateral earth pressure, fluid (water) pressure will need to be added to the submerged equivalent fluid weights shown.

More movement is required to mobilize full passive earth pressures than active earth pressures. More soil strain and movement generally are needed for fine-grained soils to develop full strength, as compared to coarse-grained soils. The magnitude of movement required to mobilize full active and passive earth pressures can be approximated in terms of the ratio of movement of the top of the wall (needed to reach minimum active or maximum passive pressure) to the height of the wall. For the conditions and soil types observed, we recommend that values of 0.002 and 0.04 be assumed for this ratio in active and passive earth pressure conditions, respectively, for structures bearing above an elevation of 4,218 feet in the area of the IPS. For structures bearing below an elevation of 4,218 feet in the area of the IPS, and below the original ground surface along the forcemains from the IPS to the Headworks Facility, we recommend that ratios of movement at the top of wall to the height of wall of 0.01 and 0.05 be used for active and passive earth pressure conditions, respectively. Non-yielding walls, such

as basement walls or structure walls with strong moment connections (preventing rotation), require design using at-rest wall pressures.

Table 4.13. Summary of Recommended Lateral Earth Equivalent Fluid Weights for the Static Load Case

Liquid Train Facility	Static Load Case		
	Active [submerged [1,2]] (pcf)	At-Rest [submerged [1,2]] (pcf)	Passive [submerged [1,2]] (pcf)
Forcemains	44 [22]	95 [48]	394 [160]
IPS Area – Native	44 [22]	95 [48]	394 [160]
IPS Area – Fill[3,4]	34 [19]	60 [32]	896 [410]
IPS Area – Lightweight Fill[3,5]	30 [11]	50 [19]	398 [43]

Notes:
pcf = pounds per cubic foot

1. Equivalent fluid weights generally were calculated using a weighted average soil unit weight. Submerged equivalent fluid weights are appropriate where the surrounding soil is submerged and only account soil pressure; submerged equivalent fluid weights do not include water pressures, which must be added for design.
2. The dynamic components of equivalent fluid weights, respectively, should be added to the static equivalent fluid weights, as needed, for the seismic (pseudostatic) case.
3. Soil characteristics were obtained solely from fill material properties.
4. Recommended for facilities in the IPS area bearing in fill (at or above an elevation of approximately 4,218 feet).
5. Recommended for facilities in the IPS area bearing in lightweight fill (total in-place unit weight of between 70 to 100 pcf).

Table 4.14. Summary of Recommended Dynamic (Seismic) Component of Lateral Earth Equivalent Fluid Weights for the Pseudostatic Load Case

Liquid Train Facility	Pseudostatic Load Case[1]		
	Active [submerged[2]] (pcf)	At-Rest [submerged[2]] (pcf)	Passive[3,4] [submerged[2]] (pcf)
Forcemains	39 [20]	52 [26]	-90 [-37]
IPS Area – Native	39 [20]	52 [26]	-90 [-37]
IPS Area – Fill[5,6]	35 [19]	56 [30]	-296 [-135]
IPS Area – Lightweight Fill[5,7]	29 [11]	41 [16]	-127 [-14]

Notes:
pcf = pounds per cubic foot

1. The pseudostatic component of lateral earth equivalent fluid weight should be added to the static lateral earth equivalent fluid weight, as needed, for the seismic (pseudostatic) case.
2. Submerged unit weights account only pseudostatic pressure because of soil and are appropriate for use where the surrounding soil is submerged; submerged equivalent fluid weights do not include water pressures, which will need to be added to the equivalent fluid weights shown.
3. Lateral earth equivalent fluid weights for the seismic (pseudostatic) active and passive load cases were based on a seismic coefficient equal to half of the 2,475-year return period peak horizontal ground acceleration (see Section 4.1). Lateral earth equivalent fluid weights for the seismic (pseudostatic) at-rest load case were based on the 2,475-year return period peak horizontal ground acceleration (free-field).
4. As indicated by the negative sign (-), the pseudostatic component of lateral earth equivalent fluid weight for the passive case should be subtracted from (reduce) the static lateral earth-equivalent fluid weights, as needed, for the seismic (pseudostatic) case.
5. Soil characteristics were obtained solely from the fill material properties.
6. Recommended for facilities in the IPS area that bear entirely in fill (at or above an elevation of 4,218 feet).
7. Recommended for facilities in the IPS area bearing in lightweight fill (total in-place unit weight of between 70 to 100 pcf).

Backfill placed behind retaining walls or subsurface walls should satisfy the material and placement recommendations presented in Section 4.3. Over-compaction adjacent to retaining walls or subsurface walls should be avoided; recommended lateral earth pressures assume that compaction behind retaining walls or subsurface walls will be accomplished with relatively light compaction equipment.

4.8 Concrete Slab-on-Grade Floors

Concrete slab-on-grade floors should be designed by the project's structural engineer and be based on anticipated loading conditions. We recommend that concrete slab-on-grade floors be founded on at least 12 inches of compacted structural fill, as described in Section 4.3, to help protect against frost and adverse effects of seasonal moisture changes. The aggregate base underlying concrete slab-on-grade floors should be compacted to 95 percent of the laboratory maximum dry density, as per ASTM Standard D1557 (ASTM 2012a). Use of a vapor barrier or retarder is recommended, particularly in areas where moisture-sensitive flooring is to be used.

4.9 Exterior Concrete Flatwork, Curbs, and Gutters

Exterior concrete flatwork, such as walkways and larger slabs, should be founded on 4 inches of untreated base course, overlying 12 inches or more of compacted structural fill (reworked fill, and/or native or imported soils). The structural fill thickness may include 6 inches of scarified and recompacted soils (see Section 4.3.5). The untreated base course should be compacted to 95 percent relative compaction, as per ASTM Standard D1557 (ASTM 2012a). Flatwork should not be connected to any adjacent structures because differential settlement can adversely affect the performance of the flatwork.

To reduce the potential for shrinkage cracks, the flatwork should be constructed with adequately spaced control joints. Crack control joint spacing should be in accordance with the recommendations of the structural engineer.

Formation of shrinkage cracks in concrete slabs and other cracks from minor soil movement may be reduced further by using steel reinforcement, such as welded wire mesh. However, because of the inherent difficulty in positioning welded wire mesh in the middle of concrete flatwork, other crack control methods should be considered, such as placing steel reinforcing bars on chairs in the concrete, or the use of fiber mesh.

Exterior concrete flatwork, curbs, and gutters should be constructed in accordance with the recommendations of the project's civil or structural engineer and governing agency requirements. Recommendations regarding concrete to be used in project construction are presented in Section 4.13.

4.10 Pavement Design

We recommend that mix designs be made for the asphalt concrete (AC) and portland cement concrete (PCC) by an engineering company that specializes in this type of work, and that a minimum 600 psi, flexural strength PCC be used in concrete pavements. In addition, paving operations should be observed and tested by a qualified testing laboratory. we also recommend that the structural engineer be consulted for appropriate reinforcement of concrete pavement.

In providing these recommendations for pavement sections, we have assumed that AC will be mixed and placed in accordance with Section 32.12.16 of the referenced specifications (Utah Chapters APWA and

AGC 2017). We also have assumed that untreated base course (UTBC) will conform to Section 32.11.23, Part 2.1 of the referenced specifications (Utah Chapters APWA and AGC 2017). UTBC materials should be placed and compacted to 95 percent relative compaction, as per ASTM Standard D1557 (ASTM 2012a), and in accordance with the referenced specifications (Utah Chapters APWA and AGC 2017).

Adequate surface drainage should be provided to reduce ponding and infiltration of water into the pavement and subgrade materials. We suggest that the paved areas have a surface gradient of 1 percent or more. In addition, surface runoff from surrounding areas should be intercepted, collected, and not permitted to flow onto the pavement or infiltrate the base and subgrade. We recommend that perimeter swales, edge drains, curbs, and gutters, or a combination of these drainage devices be constructed to reduce the adverse effects of surface water runoff. Additional recommendations regarding flexible and rigid pavement are presented next.

4.10.1 Flexible Pavement

To form a basis for design of flexible pavement for on-site paved parking and driving areas, we have assumed the following:

- a design ESAL value of 121,500 for general plant traffic areas
- 85 percent reliability
- 0.45 standard deviation
- 4.2 initial serviceability
- 2.5 terminal serviceability
- a subgrade resilient modulus (M_R) of 15,000 psi
- a 20-year design life

Using these values, structural numbers associated with the on-site parking and driving areas were calculated using the design procedures presented in the AASHTO Guide for Design of Pavement Structures (AASHTO 1993). Table 4.15 shows recommended structural pavement sections placed over granular fill for general plant traffic areas and light vehicle parking and driving areas. The granular fill can be the existing fill at the site or can be imported granular fill that is not susceptible to frost heave.

Table 4.15. Recommended Flexible Pavement Section

Traffic Type	Flexible Design ESAL[1]	Asphalt Pavement Thickness ($a_{asphalt}$ = *0.4*) (inches)	Untreated Base Thickness (a_{base} = *0.1*) (inches)	Granular Fill[2] (inches)	Structural Number	
					Provided	Needed
General Plant Traffic or Vehicle Parking and Drive Areas	121,500	4	6	24	2.20	1.79

Notes: ESAL = Equivalent Single Axle Load

1. For the design number of ESALs, minimum thicknesses control the pavement section; for the minimum pavement section, up to 420,000 ESALs can be supported.
2. Existing fill or imported granular fill that is not susceptible to frost heave.

4.10.2 Rigid Pavement

We recommend that PCC pavement be used in areas used by truck traffic, in the vicinity of trash dumpsters and other areas that support relatively heavy traffic loads. Our experience indicates that refuse truck traffic and other heavy traffic can shorten the useful life of PCC pavement substantially. To form a basis for design of rigid pavement, we have assumed the following parameters:

- a design ESAL value of 385,700
- 90 percent reliability
- 0.35 standard deviation
- 4.5 initial serviceability
- 2.5 terminal serviceability
- a resilient modulus (M_R) of 15,000 psi
- a concrete modulus of rupture of 600 psi and modulus of elasticity of 3,600,000 psi
- a load transfer coefficient of 2.8 and a drainage coefficient of 1.0
- an effective modulus of subgrade reaction of 200 pounds per cubic inch
- a subgrade consisting of 2 feet or more of granular fill
- a 40-year design life

Using these values, rigid pavement section thicknesses were calculated using the design procedures in the AASHTO Guide for Design of Pavement Structures (AASHTO 1993). Table 4.16 shows recommended rigid pavement sections placed over granular fill.

Table 4.16. Recommended Rigid Pavement Section

Traffic Type	Rigid Design ESAL[1]	Concrete Pavement Thickness (inches)	Untreated Base Thickness (inches)	Granular Fill[2] (inches)
Areas with Heavy Traffic	385,700	6	6	24

Notes: ESAL = Equivalent Single Axle Load

1. Concrete thickness assumes that concrete pavement is constructed without tied-edge support; a minimum thickness of 6 inches is recommended, otherwise a thickness of 5-1/2 inches can support the design ESALs. In addition, up to 770,000 ESALs can be supported by the recommended pavement section.
2. Existing fill or imported granular fill that is not susceptible to frost heave.

4.11 Construction in Cold or Wet Weather

During construction, the project site should be graded so that surface water can drain quickly away from improvement areas. Based on the encountered soil conditions, ponding of water in or near excavations should be avoided. Water that accumulates in excavations should be pumped out promptly or otherwise removed, and these areas should be allowed to dry sufficiently before resuming construction. Berms, ditches, and similar means should be used to decrease stormwater entering the work area and efficiently convey it off-site.

Earthwork activities undertaken during the cold weather season may be difficult and should be done by an experienced contractor. Fill should not be placed on top of frozen soils. The frozen soils should be removed (or completely thawed) before placement of new engineered fill or other construction material. Frozen soil should not be used as structural fill or backfill. After it has thawed completely, the frozen soil may be re-used (provided it meets the selection criteria). In addition, compaction of the soils may be more difficult because of the viscosity change in water at lower temperatures.

If construction proceeds during cold weather, foundations slabs or other concrete elements should not be placed on frozen subgrade soil. Frozen soil should be removed from beneath concrete elements or should be thawed and recompacted. To limit the potential for soil freezing, the amount of time passing between excavation and construction should be minimized. Blankets, straw, soil cover, or heating may be used to inhibit the moisture in the soil from freezing.

4.12 Frost Heave

Some encountered soils may be susceptible to frost heave, if allowed to become saturated and exposed to freezing temperatures and a repeated freeze/thaw cycling. The formation of ice in the underlying soils can result in 2 inches or more of heave for pavements, flatwork, and other hardscaping in sustained cold weather. A portion of this movement may be recovered when the soils thaw, but because of loss of soil density, some degree of displacement will remain. Frost heave of hardscaping also can occur in areas where subgrade soils are placed on engineered fill.

In areas where hardscape movements are a design concern (i.e., exterior flatwork adjacent to a building within a doorway swing zone), replacing the subgrade soils with 3 feet or more of clean, coarse sand or gravel; supporting the element on foundations similar to the building; or spanning over a void should be considered. Detailed recommendations can be provided on request.

4.13 Scaling

Climatic conditions in the project area during and after construction, including relatively low humidity, large temperature changes, and repeated freeze-thaw cycles, may cause surficial scaling and spalling of exterior concrete. Occurrence of surficial scaling and spalling can be aggravated by poor workmanship during construction, such as “over-finishing” concrete surfaces and the use of de-icing salts on exterior concrete flatwork, particularly during the first winter after construction. The use of de-icing salts on nearby roadways, which can be transferred by vehicle traffic onto newly placed concrete, can be sufficient to induce scaling.

Concrete mix design criteria should be coordinated with other project requirements, including the criteria for soluble sulfate resistance that is presented in Section 4.14, and where specified by the structural engineer. The following measures can be beneficial and may reduce the occurrence of concrete scaling. Other factors, including workmanship, still may cause surface damage to concrete, even when these measures are followed:

- curing concrete in accordance with applicable codes and guidelines;
- maintaining a water/cement ratio of 0.45 or less, by weight, for exterior concrete mixes;
- including Type F fly ash in exterior concrete mixes, as 20 percent of the cementitious material;
- specifying a 28-day compressive strength of 4,500 psi, or more, for exterior concrete;
- including a fiber mesh reinforcement in the concrete mix; and
- avoiding use of de-icing salts through the first full winter after construction.

4.14 Concrete and Corrosion Considerations

Based on the results of chemical testing, some of the tested on-site soils show moderate to severe sulfate exposure, as described in Section 318 of the American Concrete Institute (ACI) manual (ACI 2017), which is referenced by the IBC (ICC 2015). We recommend that concrete in contact with on-site soils, along with subsurface walls up to 12 inches above finished grade, contain Type II cement and have a design compressive strength of 4,000 psi. In addition, reinforcing bars in cast-against-grade concrete should be covered by approximately 3 inches or more of concrete. Concrete should be placed with an approximately 4-inch slump, or as specified by the structural engineer of record, and good densification procedures should be used during placement, to reduce the potential for honeycombing. Concrete samples should be obtained, as indicated in Section 318 of the ACI Manual (ACI 2017), and should be tested by experienced construction materials testing personnel in accordance with project specifications. Structural concrete should be placed in accordance with the ACI Manual and referenced specifications (Utah Chapters APWA and AGC 2017).

Based on the results of chemical testing, some of the tested soils contain chloride concentrations that should be considered corrosive to reinforcing steel and tendons. In addition, some of the tested soils have measured resistivity that should be considered to range from negligibly to extremely corrosive to metal. The designs should implement appropriate corrosion protection methods.

4.15 Moisture Infiltration Reduction and Surface Drainage

Positive drainage should be established and maintained away from IPS facilities. Positive drainage, such as providing a surface gradient of 5 percent or more away from the facilities for a distance of 10 feet (measured perpendicular from the exterior of a structure), should be considered where possible. Where

this is not practical, positive drainage should be provided with approved alternative drainage features. Structure settlement relative to the ground surface over the lifetime of a structure also should be considered.

Adequate surface drainage should be provided, to channel surface water away from the facilities and direct it to a suitable outlet, such as a storm drain. Adequate surface drainage may be enhanced by use of graded swales, area drains, and other drainage devices. Surface runoff should not be allowed to pond near a facility. Because of the nature of this site, regrading may be necessary over time, to maintain positive drainage away from structures and direct surface water into suitable drainage collection features.

Roof drains should have downspouts that extend to an appropriate outlet, such as a storm drain or street. If this is not practical, downspouts should discharge 5 feet or more away from the facility or onto concrete flatwork or asphalt that slopes away from the structure. Downspouts should not be allowed to discharge onto the ground surface adjacent to the facility's foundations.

We recommend that low-water use (drip irrigated) landscaping be used on site, particularly within 5 feet of a facility and exterior site improvements, including areas of concrete flatwork and masonry block walls. Irrigation heads should be oriented so that they spray away from the facility and block wall surfaces.

A relatively impermeable barrier should be placed against retaining structures, where retained soil is in contact with the retaining wall, to help reduce unsightly staining of the exposed wall face and potential for degradation of the wall.

5. Limitations

The field evaluation, laboratory testing, and geotechnical analyses presented in this geotechnical report have been conducted in general accordance with current practices and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. No evaluation is detailed enough to reveal every subsurface condition. Variations may exist, and conditions not observed or described in this report may be encountered during project construction. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation can be performed on request.

The recommendations presented in this report are based on field exploration, laboratory testing, review of referenced maps and literature, and our understanding of the proposed project construction. The soil data used in preparation of this report were obtained from a limited number of subsurface explorations. Variations in the soil conditions possibly exist between or beyond the locations explored. If soil conditions are encountered during project construction that are different from those outlined in this report, we should be notified immediately to review the situation and make supplementary recommendations as needed. In addition, if the scope of the proposed construction, including the types of structures, anticipated loads, and maximum cut and fill depths changes from what is described in this report, we should be notified. This study was limited to assessment of geotechnical aspects of the project and did not include evaluation of structural items, environmental concerns, or the presence of hazardous materials.

The recommendations presented in this report also assume that an adequate number of tests and observations will be made during site construction, to evaluate compliance with the recommendations. These tests and observations should be provided under the direction of a qualified geotechnical consultant. Such testing and observations should include the following:

- review of site construction plans for conformance with the geotechnical recommendations;
- observation and testing during site preparation, grading, structure excavations, foundation installation, and placement of fill, aggregate base, concrete, mortar, grout, asphalt concrete, and steel reinforcement; and
- consultation, as needed during construction.

This document is intended to be used in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. We should be contacted if additional information is needed, or if questions regarding the content, interpretations presented, or completeness of this document arise.

Site conditions may change with time because of natural processes or the activities of people at the project site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur because of government action or the broadening of

knowledge. Therefore, the findings in this report may be invalidated over time, in part or in whole, by changes over which we have no control.

This report is intended for the exclusive use of the SLCDPU. Any use or re-use of the findings, conclusions, and/or recommendations of this report by parties other than the SLCDPU is undertaken at its sole risk. This report may not provide sufficient data to prepare an accurate bid by contractors. Bidders and their geotechnical consultants can perform an independent evaluation of the subsurface conditions in the project area; independent evaluations can include review of other geotechnical reports prepared for nearby areas, site reconnaissance, and additional subsurface exploration, laboratory testing, and geotechnical analyses.

Salt Lake City Water Reclamation Facility

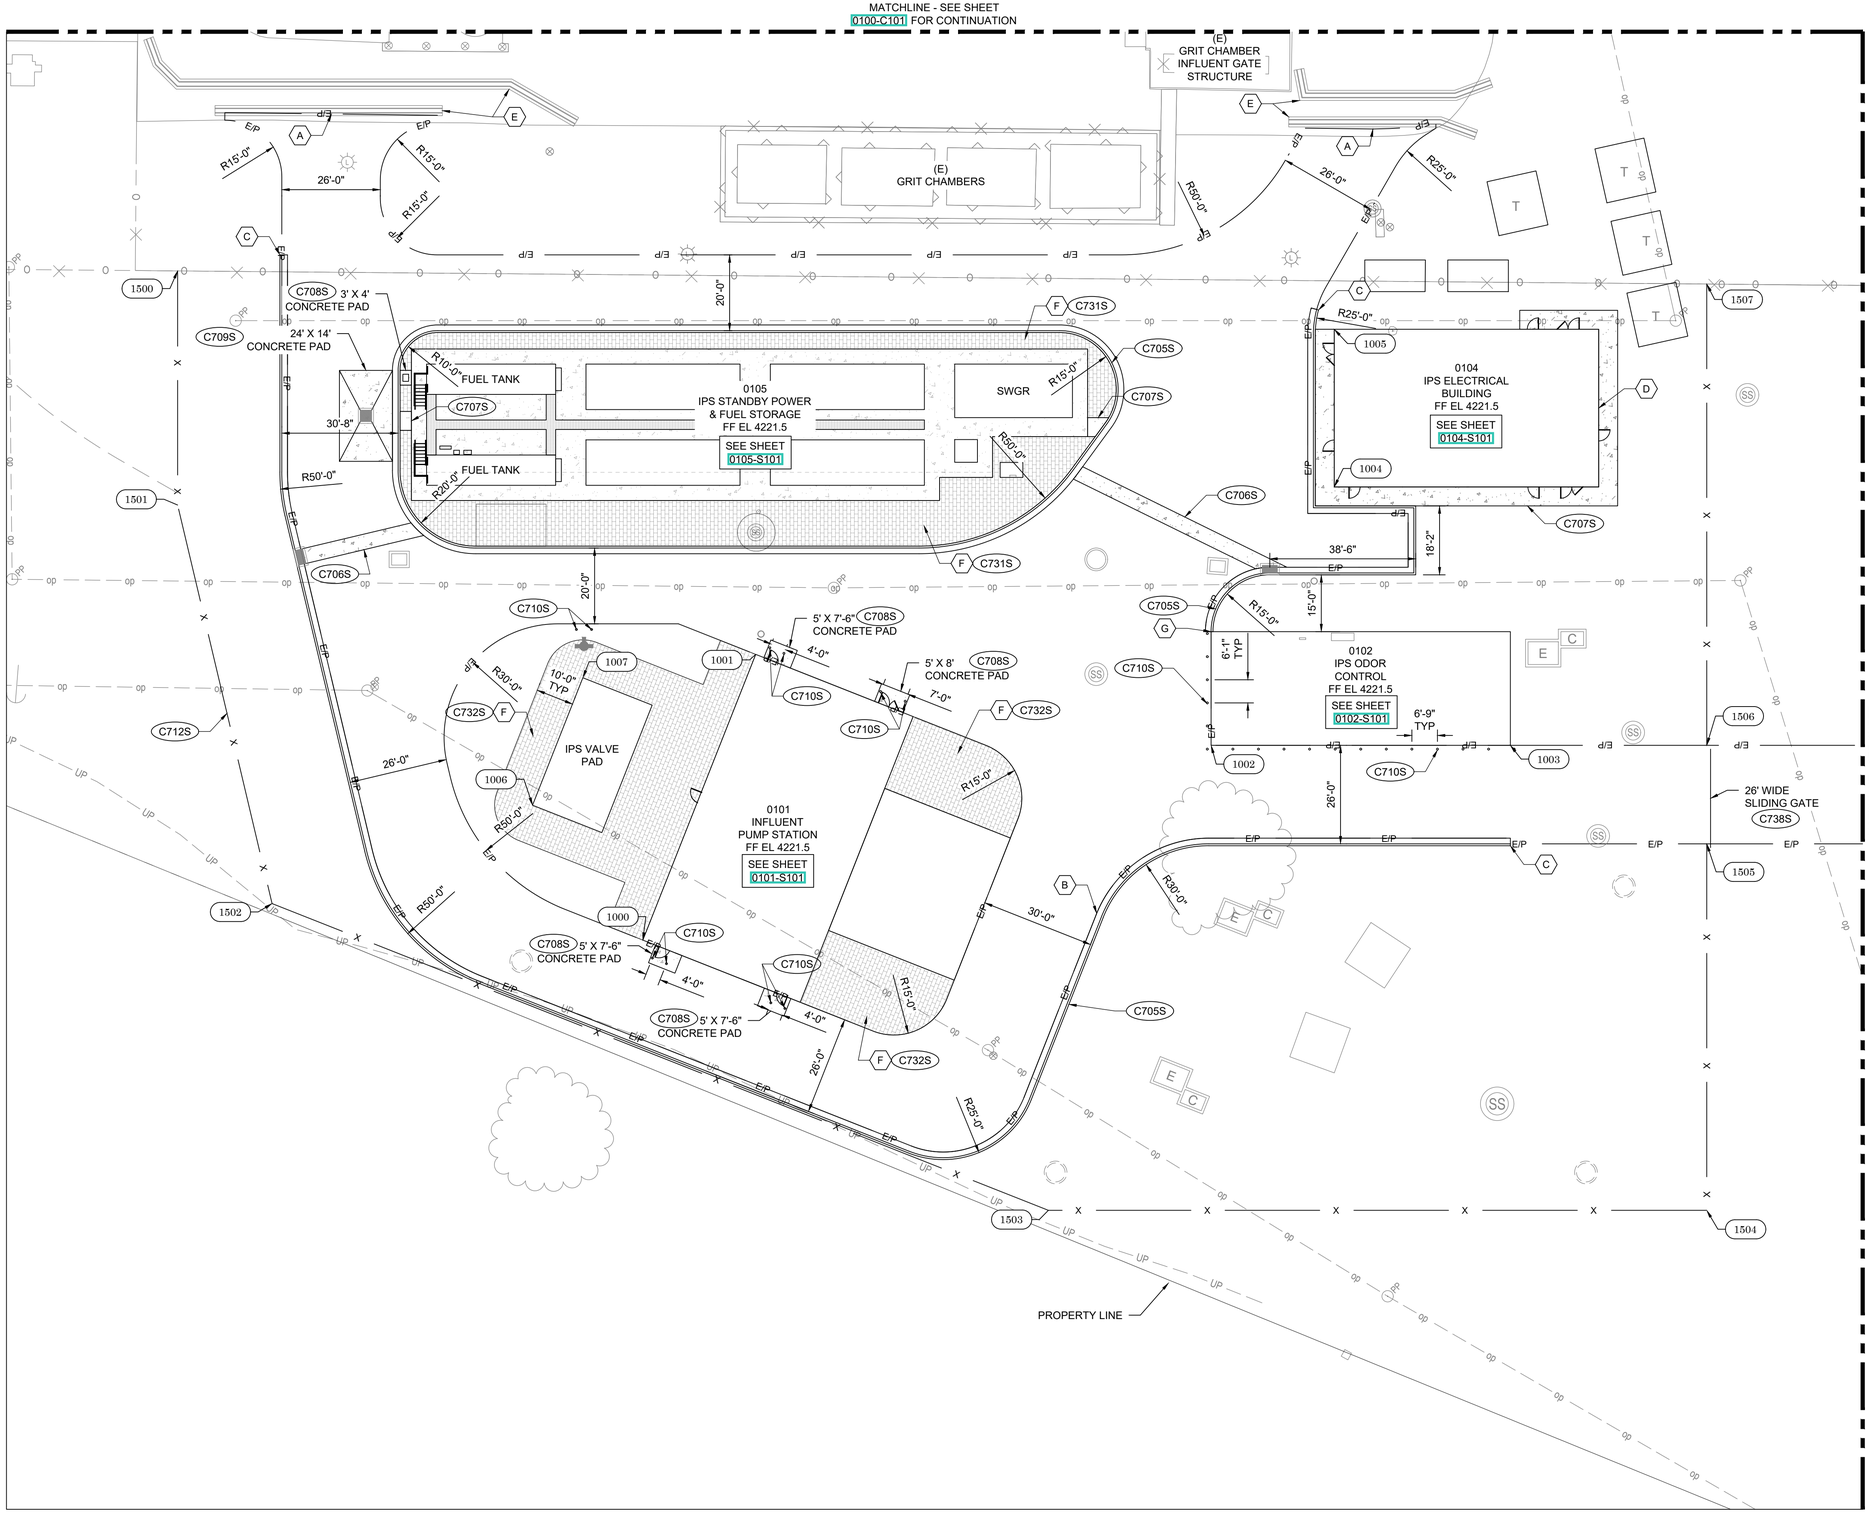
Generalized Stratigraphic Column



Key

- **Fill**
- **Holocene Post-Lake Bonneville Sediments, (Present to 12,000 Years Ago) generally consisting of gravely sands.**
- **Upper Pleistocene Lake Bonneville Sediments, (12,000-30,000 Years Ago), generally consists of clayey silt with silty sand.**
- **Upper Pleistocene Pre-Lake Bonneville Sediments, Alpine Formation 1, (30,000-100,000 Years Ago) generally consisting of sandy silt and silty sand.**

KEYNOTES

A. SAWCUT EXISTING PAVEMENT TO NEAT STRAIGHT LINE PRIOR TO PAVING NEW ACCESS ROAD.

B. TRANSITION TO SPILL PAN.

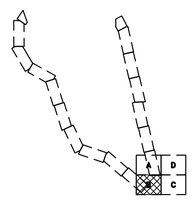
C. TAPER CURB END TO BE FLUSH WITH PAVEMENT.

D. INSTALL 1/2" FIBER EXPANSION BOARD BETWEEN STRUCTURE AND SIDEWALK OF SLAB-ON-GRADE.

E. REMOVE NEW JERSEY BARRIERS FROM SITE WHEN BYPASS FEEDER IS DEMOLISHED.

F. INSTALL 8"X12" INTERLOCKING CONCRETE PAVERS (ICP) SET ON SAND OVER A COMPACTED AGGREGATE BASE (UTBC). INSTALL PAVERS IN A 90 DEGREE HERRINGBONE PATTERN. COLORS SHALL BE LIGHT GREY AND DARK GREY.

G. DOWEL CURB AND GUTTER INTO IPS ODOR CONTROL PAD PER DETAIL C711S.



GENERAL NOTES

1. SIDEWALKS ARE 5 FT WIDE UNLESS NOTED OTHERWISE.
2. INSTALL SIX FOOT HIGH FENCE PER TYPICAL DETAIL C712S.
3. INSTALL BOLLARDS 1 FOOT FROM THE EDGE OF ASPHALT AND 4 FT APART CENTER TO CENTER AROUND FIRE HYDRANT.

Appendix B Exploratory Boring Logs

Key to Boring Logs

CONSISTENCY OR CONDITION OF SOILS

Fine-Grained Soils (Silt and Clay): Major portion passing #200 sieve

Relative Consistency	N_{60} SPT, Blows/foot	Shear Strength, tsf	Unconfined Compressive Strength, tsf	Field Behavior
Very Soft	< 2	< 0.13	< 0.25	Easily penetrated several inches by fist
Soft	2 - 4	0.13 - 0.25	0.25 - 0.5	Easily penetrated several inches by thumb
Medium Stiff	5 - 8	0.25 - 0.5	0.5 - 1	Penetrated several inches by thumb with moderate effort
Stiff	9 - 15	0.5 - 1	1 - 2	Readily indented by thumb but penetrated only with great effort
Very Stiff	16 - 30	1 - 2	2 - 4	Readily indented with thumbnail
Hard	> 30	> 2	> 4	Indented with difficulty by thumbnail

Coarse-Grained Soils (Sand and Gravel): Major portion retained on #200 sieve

Apparent Density	$(N_1)_{60}$ SPT, Blows/foot	Relative Density, %	Field Test with 1/2-in Steel Rod
Very Loose	< 5	0 - 20	Very easily penetrated when pushed by hand
Loose	5 - 10	20 - 40	Easily penetrated when pushed by hand
Medium Dense	11 - 30	40 - 70	Easily penetrated when driven with 5-lb hammer
Dense	31 - 50	70 - 85	Penetrated 1 ft with difficulty when driven with 5-lb hammer
Very Dense	> 50	85 - 100	Penetrated less than 3 in. when driven with 5-lb hammer

Particle Size Descriptions for Sand and Gravel

Description	Gravel Size	Sand Size	Size Requirement
Coarse	3-in. to 3/4-in.	#4 to #10 sieve	<30% medium to fine sand or <12% fine gravel
Coarse to medium	- -	- -	<12% fine sand
Medium	- -	#10 to #40 sieve	<12% coarse sand and >30% medium sand
Medium to fine	- -	- -	<30% medium sand or <12% coarse gravel
Fine	3/4-in. to #4 sieve	#40 to #200 sieve	<30% medium sand or <12% coarse gravel
Coarse to fine	- -	- -	>12% of each size

Moisture Conditions

Dry	No indication of moisture, dusty
Slightly Moist	Appears dry, but some moisture present
Moist	Damp but no visible water
Wet	Visible free water

Structure and Layering of Soils

Stratum	>12 inches thick
Layer	1/2 inch to < 12 inches
Seam	1/16 inch to 1/2 inch
Parting	< 1/16 inch
Frequent	More than one per foot
Varved	Frequent alternating layers, seams, or partings of sand, silt, or clay
Pocket	Small erratic deposit
Lens	Non-continuous lenticular deposit

Plasticity of Fine-Grained Soils

Nonplastic	1/8-in thread cannot be rolled at any water content
Low	Thread can barely be rolled and lump cannot be formed when drier than the plastic limit
Medium	Thead is easy to roll with little time required to reach plastic limit. Thread cannot be rerolled after reaching the plastic limit.
High	Considerable time rolling and kneading to reach plastic limit. Thread can be rerolled several times after reaching plastic limit.

Unified Soil Classification System

Major Divisions			Symbols: Graphic	Symbols: Letter
Coarse-Grained Soils: More than 50% of Material is Retained on No. 200 Sieve	Gravels: More than 50% of Coarse Fraction is Retained on No. 4 Sieve	Clean Gravels (little or no fines)		GW
				GP
		Gravels with Fines (appreciable amount of fines)		GM
				GC
	Sands: More than 50% of Coarse Fraction Passes No. 4 Sieve	Clean Sand (little or no fines)		SW
				SP
		Sands with Fines (appreciable amount of fines)		SM
				SC
Fine-Grained Soils: More than 50% of Material Passes No. 200 Sieve	Silts and Clays	Liquid Limit Less than 50		ML
				CL
				OL
	Silts and Clays	Liquid Limit 50, or more		MH
				CH
				OH
Highly Organic Soils				PT

Note: Dual Symbols are used to indicate borderline soil classifications

TYPICAL SAMPLER GRAPHIC SYMBOLS

- 3.25" OD Dames & Moore Sampler
- S — 3" OD Shelby Tube
- Non-standard Sample
- 2" OD Split Spoon (SPT)
- P — Piston Sample
- Grab Sample

TYPICAL WATER LEVEL SYMBOLS

- Measured Water Level after minimum of 24 hours
- Estimated or observed water level at time of drilling

KEY TERMINOLOGY

CBR	- California bearing ratio
CONS	- One-Dimensional Consolidation Test
CORR	- Corrosion tests
DS	- Direct shear test
F	- Percent fines by weight passing #200 sieve
G	- Percent gravel by weight
γ_d	- Dry unit weight
$\gamma_{d\text{-}max}$	- Maximum dry unit weight as per ASTM D698 or D1557
LL	- Liquid Limit
N	- Number of blows to drive sampler through the second and third 6-inch soil intervals using a 140-lb hammer dropped 30 inches
N_{60}	- SPT N value corrected for field procedures
$(N_1)_{60}$	- SPT N_{60} value corrected for effective overburden pressure
NP	- Nonplastic
OD	- Outer diameter
PI	- Plasticity index
PP	- Pocket penetrometer
S	- Percent sand by weight
SG	- Specific gravity
SPT	- Standard Penetration Test
SS	- Direct simple shear test
TV	- Torvane
TXCD	- Consolidated drained triaxial test
TXCU	- Consolidated undrained triaxial test
TXCY	- Cyclic triaxial test
TXUU	- Unconsolidated undrained triaxial test
UC	- Unconfined compression test
W	- Moisture content
W_{opt}	- Optimum moisture content associated with ASTM D698 or D1557

Descriptions and layers are interpretive; field descriptions may have been modified to reflect lab test results. Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced; they are not warranted to be representative of subsurface conditions at other locations or times.

UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS			USCS SYMBOL	TYPICAL DESCRIPTIONS
COARSE GRAINED SOILS (More than half of material is larger than the #200 sieve)	GRAVELS (More than half of coarse fraction is larger than the #4 sieve)	CLEAN GRAVELS WITH LITTLE OR NO FINES	GW	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
			GP	POORLY-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
		GRAVELS WITH OVER 12% FINES	GM	SILTY GRAVELS, GRAVEL-SILT-SAND MIXTURES
			GC	CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES
	SANDS (More than half of coarse fraction is smaller than the #4 sieve)	CLEAN SANDS WITH LITTLE OR NO FINES	SW	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
			SP	POORLY-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
		SANDS WITH OVER 12% FINES	SM	SILTY SANDS, SAND-GRAVEL-SILT MIXTURES
			SC	CLAYEY SANDS SAND-GRAVEL-CLAY MIXTURES
FINE GRAINED SOILS (More than half of material is smaller than the #200 sieve)	SILTS AND CLAYS (Liquid limit less than 50)		ML	INORGANIC SILTS & VERY FINE SANDS, SILTY OR CLAYEY FINE SANDS, CLAYEY SILTS WITH SLIGHT PLASTICITY
			CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
			OL	ORGANIC SILTS & ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS (Liquid limit greater than 50)		MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILT
			CH	INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
			OH	ORGANIC CLAYS & ORGANIC SILTS OF MEDIUM-TO-HIGH PLASTICITY
HIGHLY ORGANIC SOILS			PT	PEAT, HUMUS, SWAMP SOILS WITH HIGH ORGANIC CONTENTS

LOG KEY SYMBOLS

BORING SAMPLE LOCATION

TEST-PIT SAMPLE LOCATION

WATER LEVEL (level after completion)

WATER LEVEL (level where first encountered)

CEMENTATION

DESCRIPTION	DESCRIPTION
WEAKELY	CRUMBLES OR BREAKS WITH HANDLING OR SLIGHT FINGER PRESSURE
MODERATELY	CRUMBLES OR BREAKS WITH CONSIDERABLE FINGER PRESSURE
STRONGLY	WILL NOT CRUMBLE OR BREAK WITH FINGER PRESSURE

OTHER TESTS KEY

C	CONSOLIDATION	SA	SIEVE ANALYSIS
AL	ATTERBERG LIMITS	DS	DIRECT SHEAR
UC	UNCONFINED COMPRESSION	T	TRIAXIAL
S	SOLUBILITY	R	RESISTIVITY
O	ORGANIC CONTENT	RV	R-VALUE
CBR	CALIFORNIA BEARING RATIO	SU	SOLUBLE SULFATES
COMP	MOISTURE/DENSITY RELATIONSHIP	PM	PERMEABILITY
CI	CALIFORNIA IMPACT	-200	% FINER THAN #200
COL	COLLAPSE POTENTIAL	Gs	SPECIFIC GRAVITY
SS	SHRINK SWELL	SL	SWELL LOAD

MODIFIERS

DESCRIPTION	%
TRACE	<5
SOME	5 - 12
WITH	>12

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
DRY	ABSENCE OF MOISTURE, DUSTY, DRY TO THE TOUCH
MOIST	DAMP BUT NO VISIBLE WATER
WET	VISIBLE FREE WATER, USUALLY SOIL BELOW WATER TABLE

STRATIFICATION

DESCRIPTION	THICKNESS	DESCRIPTION	THICKNESS
SEAM	1/16 - 1/2"	OCCASIONAL	ONE OR LESS PER FOOT OF THICKNESS
LAYER	1/2 - 12"	FREQUENT	MORE THAN ONE PER FOOT OF THICKNESS

GENERAL NOTES

1. Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual.
2. No warranty is provided as to the continuity of soil conditions between individual sample locations.
3. Logs represent general soil conditions observed at the point of exploration on the date indicated.
4. In general, Unified Soil Classification designations presented on the logs were evaluated by visual methods only. Therefore, actual designations (based on laboratory tests) may vary.

APPARENT / RELATIVE DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	SPT (blows/ft)	MODIFIED CA. SAMPLER (blows/ft)	CALIFORNIA SAMPLER (blows/ft)	RELATIVE DENSITY (%)	FIELD TEST
VERY LOOSE	<4	<4	<5	0 - 15	EASILY PENETRATED WITH 1/2-INCH REINFORCING ROD PUSHED BY HAND
LOOSE	4 - 10	5 - 12	5 - 15	15 - 35	DIFFICULT TO PENETRATE WITH 1/2-INCH REINFORCING ROD PUSHED BY HAND
MEDIUM DENSE	10 - 30	12 - 35	15 - 40	35 - 65	EASILY PENETRATED A FOOT WITH 1/2-INCH REINFORCING ROD DRIVEN WITH 5-LB HAMMER
DENSE	30 - 50	35 - 60	40 - 70	65 - 85	DIFFICULT TO PENETRATED A FOOT WITH 1/2-INCH REINFORCING ROD DRIVEN WITH 5-LB HAMMER
VERY DENSE	>50	>60	>70	85 - 100	PENETRATED ONLY A FEW INCHES WITH 1/2-INCH REINFORCING ROD DRIVEN WITH 5-LB HAMMER

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPT (blows/ft)	TORVANE UNTRAINED SHEAR STRENGTH (tsf)	POCKET PENETROMETER UNCONFINED COMPRESSIVE STRENGTH (tsf)	FIELD TEST
VERY SOFT	<2	<0.125	<0.25	EASILY PENETRATED SEVERAL INCHES BY THUMB. EXUDES BETWEEN THUMB AND FINGERS WHEN SQUEEZED BY HAND.
SOFT	2 - 4	0.125 - 0.25	0.25 - 0.5	EASILY PENETRATED ONE INCH BY THUMB. MOLDED BY LIGHT FINGER PRESSURE.
MEDIUM STIFF	4 - 8	0.25 - 0.5	0.5 - 1.0	PENETRATED OVER 1/2 INCH BY THUMB WITH MODERATE EFFORT. MOLDED BY STRONG FINGER PRESSURE.
STIFF	8 - 15	0.5 - 1.0	1.0 - 2.0	INDENTED ABOUT 1/2 INCH BY THUMB BUT PENETRATED ONLY WITH GREAT EFFORT.
VERY STIFF	15 - 30	1.0 - 2.0	2.0 - 4.0	READILY INDENTED BY THUMBNAIL.
HARD	>30	>2.0	>4.0	INDENTED WITH DIFFICULTY BY THUMBNAIL.

	55					-Groundwater not observed due to mud rotary drilling -Exploration backfilled with cement grout and bentonite chips at surface -PZ19-ITW-3N installed adjacent to borehole. Screened ~ 18.9 - 28.9 feet -During installation of PZ19-ITW-3N upon removal of the rods and drill bit ConeTec observed that a possible gas pocket had been penetrated as indicated by an organic odor (max PID reading of 0.4ppm, typical 0.0 - 0.1 ppm) and gurgling sound. The rig was shut down to allow for gas to dissipate. The gas pocket indications continued when removing the 30, 25 and 20 foot augers of the drill string and appeared to subside once additional well sand was placed. Bottom of Boring @ 52 Feet

Appendix C Cone Penetration Test Results

The cone penetration tests (CPTu) are conducted using an integrated electronic piezocone penetrometer and data acquisition system manufactured by Adara Systems Ltd. of Richmond, British Columbia, Canada.

ConeTec's piezocone penetrometers are compression type designs in which the tip and friction sleeve load cells are independent and have separate load capacities. The piezocones use strain gauged load cells for tip and sleeve friction and a strain gauged diaphragm type transducer for recording pore pressure. The piezocones also have a platinum resistive temperature device (RTD) for monitoring the temperature of the sensors, an accelerometer type dual axis inclinometer and a geophone sensor for recording seismic signals. All signals are amplified down hole within the cone body and the analog signals are sent to the surface through a shielded cable.

ConeTec penetrometers are manufactured with various tip, friction and pore pressure capacities in both 10 cm^2 and 15 cm^2 tip base area configurations in order to maximize signal resolution for various soil conditions. The specific piezocone used for each test is described in the CPT summary table presented in the first Appendix. The 15 cm^2 penetrometers do not require friction reducers as they have a diameter larger than the deployment rods. The 10 cm^2 piezocones use a friction reducer consisting of a rod adapter extension behind the main cone body with an enlarged cross sectional area (typically 44 mm diameter over a length of 32 mm with tapered leading and trailing edges) located at a distance of 585 mm above the cone tip.

The penetrometers are designed with equal end area friction sleeves, a net end area ratio of 0.8 and cone tips with a 60 degree apex angle.

All ConeTec piezocones can record pore pressure at various locations. Unless otherwise noted, the pore pressure filter is located directly behind the cone tip in the "u_2" position (ASTM Type 2). The filter is 6 mm thick, made of porous plastic (polyethylene) having an average pore size of 125 microns (90-160 microns). The function of the filter is to allow rapid movements of extremely small volumes of water needed to activate the pressure transducer while preventing soil ingress or blockage.

The piezocone penetrometers are manufactured with dimensions, tolerances and sensor characteristics that are in general accordance with the current ASTM D5778 standard. ConeTec's calibration criteria also meet or exceed those of the current ASTM D5778 standard. An illustration of the piezocone penetrometer is presented in Figure CPTu.

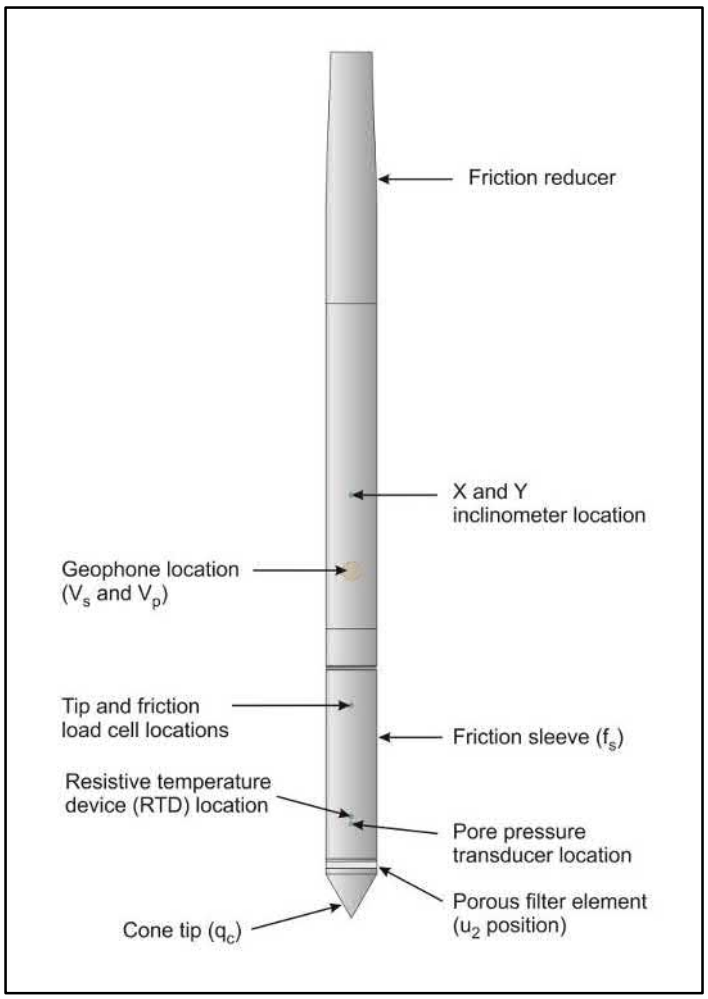

Figure CPTu. Piezocone Penetrometer (15 cm^2)

The ConeTec data acquisition systems consist of a Windows based computer and a signal conditioner and power supply interface box with a 16 bit (or greater) analog to digital (A/D) converter. The data is recorded at fixed depth increments using a depth wheel attached to the push cylinders or by using a spring loaded rubber depth wheel that is held against the cone rods. The typical recording intervals are either 2.5 cm or 5.0 cm depending on project requirements; custom recording intervals are possible. The system displays the CPTu data in real time and records the following parameters to a storage media during penetration:

- Depth
- Uncorrected tip resistance (q_c)
- Sleeve friction (f_s)
- Dynamic pore pressure (u)
- Additional sensors such as resistivity, passive gamma, ultra violet induced fluorescence, if applicable

All testing is performed in accordance to ConeTec's CPT operating procedures which are in general accordance with the current ASTM D5778 standard.

Prior to the start of a CPTu sounding a suitable cone is selected, the cone and data acquisition system are powered on, the pore pressure system is saturated with either glycerin or silicone oil and the baseline readings are recorded with the cone hanging freely in a vertical position.

The CPTu is conducted at a steady rate of 2 cm/s, within acceptable tolerances. Typically one meter length rods with an outer diameter of 1.5 inches are added to advance the cone to the sounding termination depth. After cone retraction final baselines are recorded.

Additional information pertaining to ConeTec's cone penetration testing procedures:

- Each filter is saturated in silicone oil or glycerin under vacuum pressure prior to use
- Recorded baselines are checked with an independent multi-meter
- Baseline readings are compared to previous readings
- Soundings are terminated at the client's target depth or at a depth where an obstruction is encountered, excessive rod flex occurs, excessive inclination occurs, equipment damage is likely to take place, or a dangerous working environment arises
- Differences between initial and final baselines are calculated to ensure zero load offsets have not occurred and to ensure compliance with ASTM standards

The interpretation of piezocone data for this report is based on the corrected tip resistance (q_t), sleeve friction (f_s) and pore water pressure (u). The interpretation of soil type is based on the correlations developed by Robertson (1990) and Robertson (2009). It should be noted that it is not always possible to accurately identify a soil type based on these parameters. In these situations, experience, judgment and an assessment of other parameters may be used to infer soil behavior type.

The recorded tip resistance (q_c) is the total force acting on the piezocone tip divided by its base area. The tip resistance is corrected for pore pressure effects and termed corrected tip resistance (q_t) according to the following expression presented in Robertson et al, 1986:

$$q_t = q_c + (1\text{-}a) \bullet u_2$$

where: q_t is the corrected tip resistance
q_c is the recorded tip resistance
u_2 is the recorded dynamic pore pressure behind the tip (u_2 position)
a is the Net Area Ratio for the piezocone (0.8 for ConeTec probes)

The sleeve friction (f_s) is the frictional force on the sleeve divided by its surface area. As all ConeTec piezocones have equal end area friction sleeves, pore pressure corrections to the sleeve data are not required.

The dynamic pore pressure (u) is a measure of the pore pressures generated during cone penetration. To record equilibrium pore pressure, the penetration must be stopped to allow the dynamic pore pressures to stabilize. The rate at which this occurs is predominantly a function of the permeability of the soil and the diameter of the cone.

The friction ratio (Rf) is a calculated parameter. It is defined as the ratio of sleeve friction to the tip resistance expressed as a percentage. Generally, saturated cohesive soils have low tip resistance, high

friction ratios and generate large excess pore water pressures. Cohesionless soils have higher tip resistances, lower friction ratios and do not generate significant excess pore water pressure.

A summary of the CPTu soundings along with test details and individual plots are provided in the appendices. A set of interpretation files were generated for each sounding based on published correlations and are provided in Excel format in the data release folder. Information regarding the interpretation methods used is also included in the data release folder.

For additional information on CPTu interpretations, refer to Robertson et al. (1986), Lunne et al. (1997), Robertson (2009), Mayne (2013, 2014) and Mayne and Peuchen (2012).

The cone penetration test is halted at specific depths to carry out pore pressure dissipation (PPD) tests, shown in Figure PPD-1. For each dissipation test the cone and rods are decoupled from the rig and the data acquisition system measures and records the variation of the pore pressure (u) with time (t).

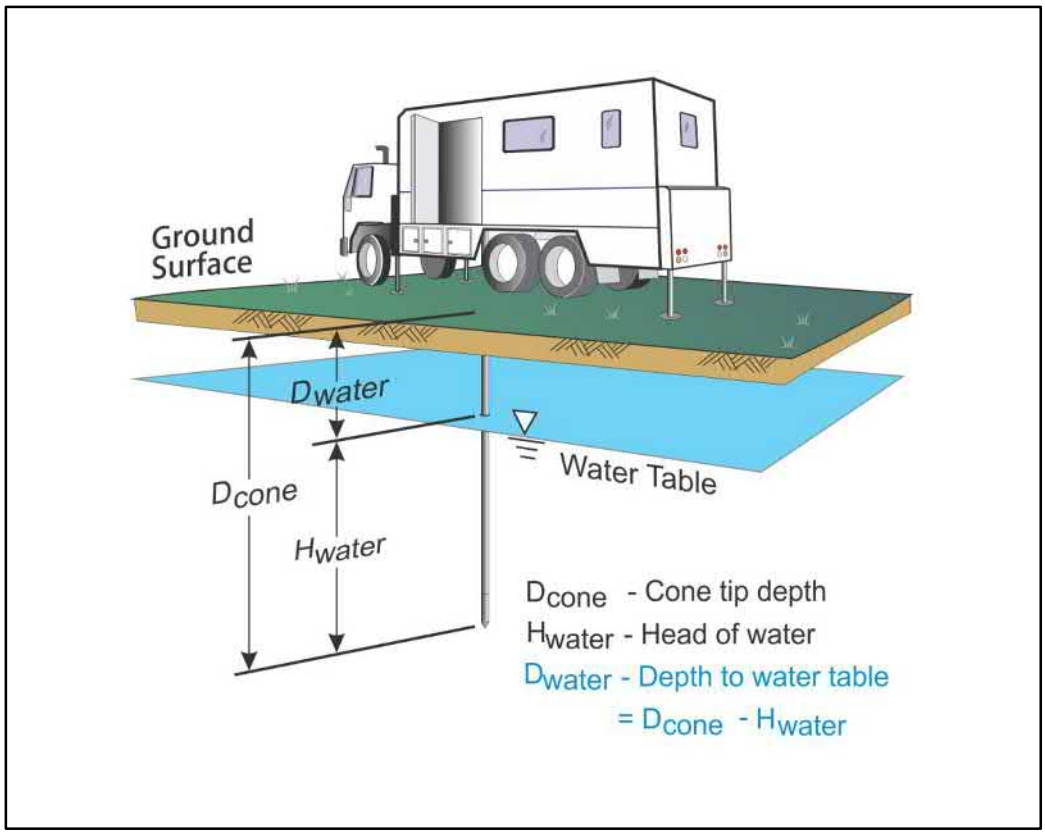

Figure PPD-1. Pore pressure dissipation test setup

Pore pressure dissipation data can be interpreted to provide estimates of ground water conditions, permeability, consolidation characteristics and soil behavior.

The typical shapes of dissipation curves shown in Figure PPD-2 are very useful in assessing soil type, drainage, in situ pore pressure and soil properties. A flat curve that stabilizes quickly is typical of a freely draining sand. Undrained soils such as clays will typically show positive excess pore pressure and have long dissipation times. Dilative soils will often exhibit dynamic pore pressures below equilibrium that then rise over time. Overconsolidated fine-grained soils will often exhibit an initial dilatory response where there is an initial rise in pore pressure before reaching a peak and dissipating.

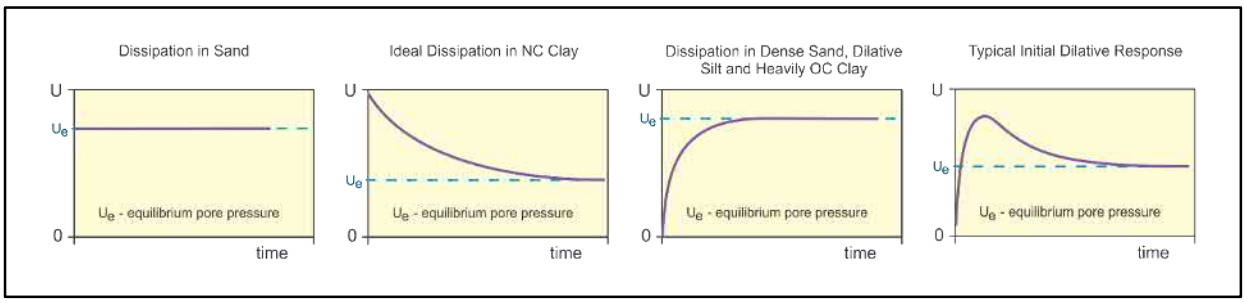

Figure PPD-2. Pore pressure dissipation curve examples

In order to interpret the equilibrium pore pressure (u_{eq}) and the apparent phreatic surface, the pore pressure should be monitored until such time as there is no variation in pore pressure with time as shown for each curve of Figure PPD-2.

In fine grained deposits the point at which 100% of the excess pore pressure has dissipated is known as t_{100}. In some cases this can take an excessive amount of time and it may be impractical to take the dissipation to t_{100}. A theoretical analysis of pore pressure dissipations by Teh and Houlsby (1991) showed that a single curve relating degree of dissipation versus theoretical time factor (T*) may be used to calculate the coefficient of consolidation (c_h) at various degrees of dissipation resulting in the expression for c_h shown below.

$$c_h = \frac{T^* \cdot a^2 \cdot \sqrt{I_r}}{t}$$

Where:

T* is the dimensionless time factor (Table Time Factor)
a is the radius of the cone
I_r is the rigidity index
t is the time at the degree of consolidation

Table Time Factor. T* versus degree of dissipation (Teh and Houlsby, 1991)

Degree of Dissipation (%)	20	30	40	50	60	70	80
T* (u_2)	0.038	0.078	0.142	0.245	0.439	0.804	1.60

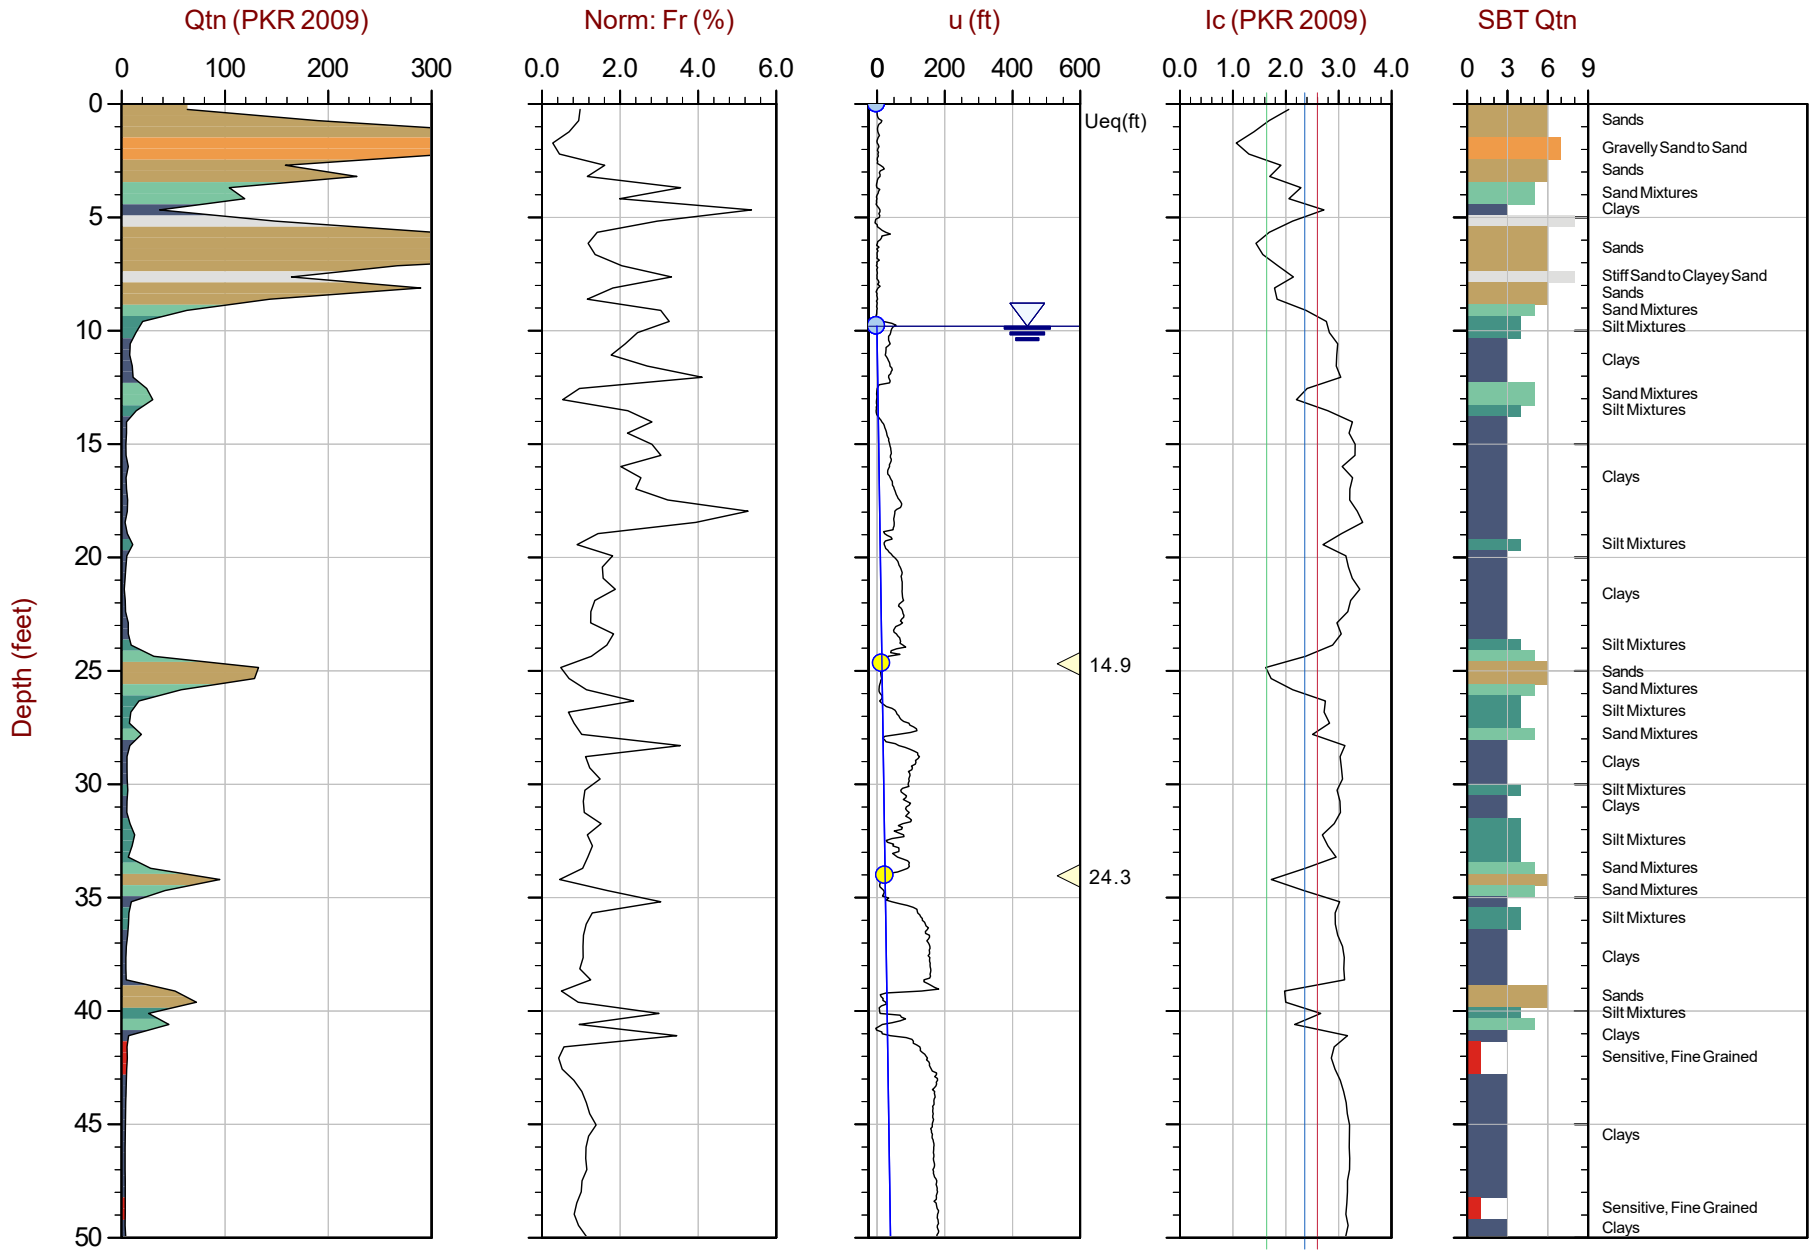
The coefficient of consolidation is typically analyzed using the time (t_{50}) corresponding to a degree of dissipation of 50% (u_{50}). In order to determine t_{50}, dissipation tests must be taken to a pressure less than u_{50}. The u_{50} value is half way between the initial maximum pore pressure and the equilibrium pore pressure value, known as u_{100}. To estimate u_{50}, both the initial maximum pore pressure and u_{100} must be known or estimated. Other degrees of dissipations may be considered, particularly for extremely long dissipations.

At any specific degree of dissipation the equilibrium pore pressure (u at t_{100}) must be estimated at the depth of interest. The equilibrium value may be determined from one or more sources such as measuring the value directly (u_{100}), estimating it from other dissipations in the same profile, estimating the phreatic surface and assuming hydrostatic conditions, from nearby soundings, from client provided information, from site observations and/or past experience, or from other site instrumentation.

For calculations of c_h (Teh and Houlsby, 1991), t_{50} values are estimated from the corresponding pore pressure dissipation curve and a rigidity index (I_r) is assumed. For curves having an initial dilatory response in which an initial rise in pore pressure occurs before reaching a peak, the relative time from the peak value is used in determining t_{50}. In cases where the time to peak is excessive, t_{50} values are not calculated.

Due to possible inherent uncertainties in estimating I_r, the equilibrium pore pressure and the effect of an initial dilatory response on calculating t_{50}, other methods should be applied to confirm the results for c_h.

Additional published methods for estimating the coefficient of consolidation from a piezocone test are described in Burns and Mayne (1998, 2002), Jones and Van Zyl (1981), Robertson et al. (1992) and Sully et al. (1999).



A summary of the pore pressure dissipation tests and dissipation plots are presented in the relevant appendix.

1 INTRODUCTION

In-situ seismic measurements using active and passive surface wave techniques were performed at the Salt Lake City Water Reclamation Plant in Salt Lake City, Utah from October 12 to 15, 2018. The purpose of this investigation was to provide shear (S) wave velocity profiles to a depth of over 100 m (328 ft) and estimate the average S-wave velocity of the upper 30 m (V_{S30}) at six (6) locations on site (Arrays 1 to 6). The active surface wave technique utilized during this investigation consisted of the multi-channel analysis of surface waves (MASW) method. The passive surface wave techniques consisted of the array microtremor methods. The locations of the active and passive source surface wave arrays are shown on Figure 1.

V_{S30} is used in the NEHRP provisions and the Uniform Building Code (UBC) to separate sites into classes for earthquake engineering design (BSSC, 2003). The average shear wave velocity of the upper 100 ft (V_{S100ft}) is used in the International Building Code (IBC) for site classification. These site classes are as follows:

Class A – hard rock – $V_{S30} > 1500$ m/s (UBC) or $V_{S100ft} > 5{,}000$ ft/s (IBC)
Class B – rock – $760 < V_{S30} \leq 1500$ m/s (UBC) or $2{,}500 < V_{S100ft} \leq 5{,}000$ ft/s (IBC)
Class C – very dense soil and soft rock – $360 < V_{S30} \leq 760$ m/s (UBC)
or $1{,}200 < V_{S100ft} \leq 2{,}500$ ft/s (IBC)
Class D – stiff soil – $180 < V_{S30} \leq 360$ m/s (UBC) or $600 < V_{S100ft} \leq 1{,}200$ ft/s (IBC)
Class E – soft soil – $V_{S30} < 180$ m/s (UBC) or $V_{S100ft} < 600$ ft/s (IBC)
Class F – soils requiring site-specific evaluation

At many sites, active surface wave techniques (MASW) with the utilization of portable energy sources, such as hammers and weight drops, are sufficient to obtain a 30 m (100 ft) S-wave velocity sounding. At sites with high ambient noise levels and/or very soft soils, these energy sources may not be sufficient to image to 30 m and a larger energy source, such as a bulldozer, is necessary. Alternatively, passive surface wave techniques, such as the array microtremor technique can be used to extend the depth of investigation at sites that have adequate ambient noise conditions. It should be noted that two-dimensional passive-source surface wave arrays (e.g. triangular, circular, or L-shaped arrays) are expected to perform better than linear arrays.

This report contains the results of the active and passive surface wave measurements conducted at the site. An overview of the surface wave methods is given in Section 2. Field and data reduction and modeling procedures are discussed in Sections 3 and 4, respectively. Interpretation and results are presented in Section 5 and Conclusions in Section 6. References and our professional certification are presented in Sections 7 and 8, respectively.

2 OVERVIEW OF SURFACE WAVE TECHNIQUES

2.1 Introduction

Active and passive source (ambient vibration) surface wave techniques are routinely utilized for site characterization. Active surface wave techniques include the spectral analysis of surface waves (SASW) and multi-channel array surface wave (MASW) methods. Passive surface wave techniques include the horizontal over vertical spectral ratio (HVSR) technique and the array and refraction microtremor methods.

The basis of surface wave methods is the dispersive characteristic of Rayleigh and Love waves when propagating in a layered medium. Surface waves of different wavelengths (λ) or frequencies (f) sample different depth. As a result of the variance in the shear stiffness of the distinct layers, waves with different wavelengths propagate at different phase velocities; hence, dispersion. A surface wave dispersion curve is the variation of V_R or V_L with λ or f. The Rayleigh wave phase velocity (V_R) depends primarily on the material properties (V_S, mass density, and Poisson's ratio or compression wave velocity) over a depth of approximately one wavelength. The Love wave phase velocity (V_L) depends primarily on V_S and mass density. Rayleigh and Love wave propagation are also affected by damping or seismic quality factor (Q). Rayleigh wave techniques are utilized to measure vertically polarized S-waves (S_V-wave); whereas, Love wave techniques are utilized to measure horizontally polarized S-waves (S_H-wave).

2.2 Surface Wave Techniques

The MASW and array microtremor techniques were utilized during this investigation and are discussed below. The MASW and array microtremor surveys were designed to measure Rayleigh wave propagation.

2.2.1 MASW Technique

A description of the MASW method is given by Park, 1999a and 1999b and Foti, 2000. Ground motions are typically recorded by 24, or more, geophones typically spaced 1 to 3 m apart along a linear array and connected to a seismograph. Energy sources for shallow investigations include various sized hammers and vehicle mounted weight drops. When applying the MASW technique to develop a one-dimensional (1-D) V_S model, the surface-wave data, preferably, are acquired using multiple-source offsets at both ends of the array. The most commonly applied MASW technique is the Rayleigh-wave based MASW method, which we refer to as MAS_RW to distinguish from Love-wave based MASW (MAS_LW). MAS_RW and MAS_LW acquisition can easily be combined with P- and S-wave seismic refraction acquisition, respectively. MAS_RW data are generally recorded using a vertical source and vertical geophone but may also be recorded using a horizontal geophone with radial (in-line) orientation. MAS_LW data are recorded using transversely orientated horizontal source and transverse horizontal geophone.

A wavefield transform is applied to the time-history data to convert the seismic record from time-offset space to frequency-wavenumber (f-k) space in which the fundamental or higher

surface-wave modes can be easily identified as energy maxima and picked. Frequency and/or wavenumber can easily be mapped to phase velocity, slowness, or wavelength using the following properties: $k = 2\pi/\lambda$, $\lambda = v/f$. Common wave-field transforms include: the f-k transform (a 2D fast Fourier transform), slant-stack transform (also referred to as intercept-slowness or τ-p transform and equivalent to linear Radon transform), frequency domain beamformer, and phase-shift transform. The minimum wavelength that can be recovered from an MASW data set without spatial aliasing is equal to the minimum receiver spacing. Occasionally, SASW analysis procedures are used to extract surface wave dispersion data, from fixed receiver pairs, at smaller wavelengths than can be recovered by wavefield transformation. Construction of a dispersion curve over the wide frequency/wavelength range necessary to develop a robust V_S model while also limiting the maximum wavelength based on an established near-field criterion (e.g. Yoon and Rix, 2009; Li and Rosenblad, 2011), generally requires multiple source offsets.

Although the clear majority of MASW surveys record Rayleigh waves, it has been shown that Love wave techniques can be more effective in some environments, particularly shallow rock sites and sites with a highly attenuative, low velocity surface layer (Xia, et al., 2012; **GEO***Vision*, 2012; Yong, et al., 2013; Martin, et al., 2014). Rayleigh wave techniques, however, are generally more effective at sites where velocity gradually increases with depth because larger energy sources are readily available for generation of Rayleigh waves. Rayleigh wave techniques are also more applicable to sites with high velocity layers and/or velocity inversions because the presence of such structures is more apparent in the Rayleigh wave dispersion curves than in Love wave dispersion curves. Rayleigh wave techniques are preferable at sites with a high velocity surface layer because Love waves do not theoretically exist in such environments. Occasionally, the horizontal radial component of a Rayleigh wave may yield higher quality dispersion data than the vertical component because different modes of propagation may have more energy in one component than the other. Recording both the vertical and horizontal components of the Rayleigh wave is particularly useful at sites with complex modes of propagation or when attempting to recover multiple Rayleigh wave modes for multi-mode modeling as demonstrated in Dal Moro, et al, 2015. Joint inversion of Rayleigh and Love wave data may yield more accurate V_S models and also offer a means to investigate anisotropy, where S_V- and S_H-wave velocity are not equal, as shown in Dal Moro and Ferigo, 2011.

2.2.2 Array Microtremor Technique

A detailed discussion of the array microtremor method can be found in Okada, 2003. Unlike active source techniques which use an active energy source (i.e. hammer), the array microtremor technique (also referred to as passive surface wave or array ambient vibration method) records background noise (ambient vibrations) emanating from ocean wave activity, wind noise, traffic, industrial activity, construction, etc. The technique uses 4, or more, receivers aligned in a 2-dimensional array. Triangle, circle, semi-circle, and "L" shaped arrays are commonly used, although any 2-dimensional arrangement of receivers can be used. For investigation of the upper 100 m, receivers typically consist of 1 to 4.5 Hz geophones. For deeper investigations, 5 to 120 second seismometers are generally utilized. The nested triangle array, which consists of several embedded equilateral triangles, is popular as it provides accurate dispersion curves with a relatively small number of geophones. The "L" array is useful at sites located at the corner of intersecting streets. The maximum receiver separation in an array should be at a minimum equal to the desired depth of investigation. Typically, 15 to 60 minutes of ambient vibration data is

recorded depending on the size of the array, desired depth of investigation, and noise conditions. Investigations to depths on the order of 1 km may require that ambient vibrations are recorded for a much longer duration. The surface wave dispersion curve is typically estimated from array microtremor data using various f-k methods such as beam-forming (Lacoss, et al., 1969), and maximum-likelihood (Capon, 1969), and the spatial-autocorrelation (SPAC) method. The beam-forming and maximum-likelihood methods are generally referred to as the frequency wavenumber (FK) and high-resolution frequency wavenumber (HRFK or HFK) methods. The SPAC method was originally based on work by Aki, 1957 and has since been extended and modified (Ling and Okada, 1993 and Ohori *et al*., 2002) to permit the use of noncircular arrays, and is now collectively referred to as extended spatial autocorrelation (ESPAC or ESAC). Further modifications to the SPAC method permit the use of irregular or random arrays (Bettig *et al*., 2001). Although it is common to apply SPAC methods to obtain a surface wave dispersion curve for modeling, other approaches involve direct modeling of the coherency data, also referred to as SPAC coefficients (Asten, 2006 and Asten, *et al*., 2015).

FK and HRFK methods are generally expected to perform better when ambient vibration sources are not azimuthally well-distributed (e.g. rural area where primary noise source is a large industrial facility). SPAC methods are expected to perform better when noise sources are azimuthally well-distributed (e.g. in a large urbanized area).

The minimum and maximum wavelength surface wave that can be extracted from an array microtremor dataset acquired utilizing a symmetric array is typically set equal to the minimum and twice the maximum receiver spacings, respectively.

2.3 Surface Wave Dispersion Curve Modeling

The dispersion curves generated from the active and passive surface wave soundings are generally combined and modeled using iterative forward and inverse modeling routines. The final model profile is assumed to represent actual site conditions. The theoretical model used to interpret the dispersion curve assumes horizontally layered, laterally invariant, homogeneous-isotropic material. Although these conditions are seldom strictly met at a site, the results of active and/or passive surface wave testing provide a good "global" estimate of the material properties along the array. The results may be more representative of the site than a borehole "point" estimate.

The surface wave forward problem is typically solved using the Thomson-Haskell transfer-matrix (Thomson, 1950; Haskell, 1953) later modified by Dunkin (1965) and Knopoff (1964), dynamic stiffness matrix (Kausel and Roësset, 1981), or reflection and transmission coefficient (Kennett, 1974) methods. All of these methods can determine fundamental- and higher-mode phase velocities, which correspond to plane waves in 2-D space. The transfer-matrix method is often used in MASW and passive surface-wave software packages, whereas the dynamic stiffness matrix is utilized in many SASW software packages. MAS_RW and/or passive surface-wave modeling may involve modeling of the fundamental mode, some form of effective mode, or multiple individual modes (multi-mode). As outlined in Roësset et al. (1991), several options exist for forward modeling of Rayleigh wave SASW data. One formulation takes into account only fundamental mode plane Rayleigh-wave motion (called the 2-D solution), whereas another includes all stress waves (e.g. body, fundamental, and higher mode surface waves) and incorporates a generalized receiver geometry (3-D global solution) or actual receiver geometry

(3-D array solution).

The fundamental mode assumption is generally applicable to modeling Rayleigh-wave dispersion data collected at normally dispersive sites, providing there are not abrupt increases in velocity or steep velocity gradients. Effective-mode or multi-mode approaches are often required for irregularly dispersive sites and sites with steep velocity gradients at shallow depth. If active and passive surface wave data are combined or $MASW$ data are combined from multiple seismic records with different source offsets and receiver gathers, then effective-mode computations are limited to algorithms that assume far-field plane Rayleigh wave propagation. Local search (e.g. linearized matrix inversion methods) or global search methods (e.g., Monte Carlo approaches such as simulated annealing, generic algorithms and neighborhood algorithm) are typically used to solve the inverse problem.

The maximum wavelength (λ_{max}) recovered from a surface wave data set is typically used to estimate depth of investigation although a sensitivity analysis of the V_S models would be a more robust means to estimate depth of investigation. For normally dispersive velocity profiles with a gradual increase in V_S with depth, maximum depth of investigation is on the order of $\lambda_{max}/2$ for both Rayleigh and Love wave dispersion data. Velocity profiles with an abrupt increase in V_S at depth, maximum depth of investigation is on the order of $\lambda_{max}/3$ for Rayleigh wave dispersion data but less than $\lambda_{max}/3$ for Love wave dispersion data. Depth of investigation can be highly variable for sites with complex velocity structure (e.g. high velocity layers).

As with all surface geophysical methods, inversion of surface wave dispersion data does not yield a unique V_S model and there are multiple possible solutions that equally well fit the observed data. Based on our experience at other sites, the shear wave velocity models (V_S and layer thicknesses) determined by surface wave testing are within 20% of the velocities and layer thicknesses that would be determined by other seismic methods (Brown, 1998). The average velocity of the upper 30 m or 100 ft, however, is much more accurate, often to better than 5%, because it is not sensitive to the layering in the model. V_{S30} does not appear to suffer from the non-uniqueness inherent in V_S models derived from surface wave dispersion curves (Martin et al., 2006, Comina et al., 2011). Therefore, V_{S30} is more accurately estimated from inversion of surface wave dispersion data than the resulting V_S models.

It may not always be possible to develop a coherent, fundamental mode dispersion curve over sufficient frequency range for modeling due to dominant higher modes with the higher modes not clearly identifiable for multi-mode modeling. It may, however, be possible to identify the Rayleigh wave phase velocity of the fundamental mode at 40 m wavelength (V_{R40}) in which case V_{S30} can at least be estimated using the Brown et al., 2000 relationship:

$$V_{S30} = 1.045V_{R40}$$

This relationship was established based on statistical analysis of a large number of surface wave data sets from sites with control by velocities measured in nearby boreholes and has been further evaluated by Martin and Diehl, 2004, and Albarello and Gargani, 2010. Further investigation of this approach has revealed that V_{S30} is generally between V_{R40} and V_{R45} with V_{R40} often being most appropriate for shallow groundwater sites and V_{R45} for deep ground water sites. A detailed study of such an approach for Love wave dispersion data has not been conducted; however,

preliminary analysis demonstrates that V_{S30} is generally between V_{L50} and V_{L55}. Although we do not recommend that these empirical V_{S30} estimates replace modeling of surface wave dispersion data, they do offer a means of cost effectively evaluating V_{S30} over a large area. V_{R40} or V_{L55} can also be used to quantify error in V_{S30} by evaluating the scatter in the dispersion data at these wavelengths.

3 FIELD PROCEDURES

The active and passive source surface wave sounding locations at the site were established by **GEO***Vision* personnel and are shown in Figure 1. Four types of surface wave data were acquired at the site: a MASW survey to characterize near-surface velocity structure, a small aperture microtremor array using a minimum of thirty-seven 4.5 Hz geophones in an L-shaped or nested triangle configuration to characterize shallow to intermediate depth velocity structure, a small aperture microtremor array using nine (9) 1 Hz geophones in an L-shaped configuration to characterize intermediate depth velocity structure, and a large aperture microtremor array using ten (10) 1 Hz geophones to characterize deep velocity structure.

Active source surface wave data were acquired along Arrays 1 to 6 using the MASW technique with either a constant geophone spacing (Arrays 1 and 4) or variable geophone spacing (Arrays 2, 3, 5 and 6). Passive surface wave data were acquired on two (2) arrays, a small L-shaped array and large circular array, using the array microtremor method. The small L-shaped microtremor array (Array 1) consisted of a 48, 4.5 Hz geophones spaced 5 m apart and aligned along two orthogonal linear arrays as shown on Figure 2.

MASW Array 1 consisted of 48 geophones spaced 2 m (6.6 ft) apart for a length of 94 m (308 ft). Array 4 consisted of 48 geophones spaced 1 m (3.3ft) apart for a length of 47 m (154 ft). Arrays 2, 3, 5, and 6 consisted of 28 to 29 4.5 Hz geophones with a variable geophone spacing between 2 and 6 m (6.6 and 19.7 ft) for a length of 126 to 132 m (413 to 433 ft).

MASW equipment used during this investigation consisted of two Geometrics Geode signal enhancement seismographs, 4.5 Hz vertical geophones, seismic cable, a 4 lb hammer, 12 and 20 lb sledgehammers, and a 240 lb accelerated weight drop (AWD). Shot points were located between 1 and 30 m (3.3 and 98 ft) from the end geophone locations, as possible, and multiple locations within the interior of the array. The 4 lb hammer and 10 lb sledgehammer were used for the near offset and interior source locations. The 20 lb sledgehammer was used for all off-end source locations on Array 4. The AWD was used for all off-end source locations and selected interior source locations on Arrays 1, 2, 3, 5, and 6. Data from the transient impacts (hammers) were generally averaged 10 times to improve the signal-to-noise ratio. All field data were saved to hard disk and documented on field data acquisition forms.

The passive surface wave equipment consisted of two Geometrics Geode signal enhancement seismographs, 10 Geometrics Atom single channel wireless seismographs, 1 Hz vertical geophones, 4.5 Hz vertical geophones, and seismic cables.

The six (6), small aperture microtremor arrays consisted either an L-shaped array (Arrays 1, 2, 3, 5, and 6) or nested triangle array (Array 4). The first L-shaped array (Array 1) consisted of 48 4.5 Hz geophones spaced 6 m apart with the lengths of the sides of the array being 138 and 144 m, respectively. Field inspection of the surface wave dispersion data indicated that subsurface sediments had very low S-wave velocity and that lower frequency geophones were required to maximize depth of investigation. Therefore, passive surface wave data were also acquired along Array 1 with 10 1-Hz geophones spaced between 12 and 36 m apart. A variable geophone spacing (2 to 6 m) was utilized on one leg of the remaining L-shaped arrays to allow coincident

MASW data acquisition. The legs of these arrays had lengths between 120 and 132 m. With the exception of Array 2, which only utilized 4.5 Hz geophones, passive surface wave data were acquired along these arrays with 39 4.5 Hz geophones and 9 1 Hz geophones to maximize depth of investigation while also maximized field efficiency. Array 4 consisted of 37, 4.5 Hz geophones distributed along three nested triangles. Due to limited space, the maximum receiver offset in this array was only 48 m (158 ft) and there was no need to deploy 1 Hz geophones. Ambient vibration measurements were typically made along these arrays for 45 to 60 minutes at a 2 ms sample rate (90 to 120, 30 second records). All passive surface wave data were stored on a laptop computer for later processing. The field geometry and associated files names were documented in field data acquisition forms.

The large aperture microtremor array consisted of two (2), ten channel double-circle arrays with diameters of about 100 and 200, and 200 and 400 m, respectively (Figure 1). These arrays consisted of 10, 1 Hz geophones connected to Geometrics Atom wireless seismographs with a sensor at the center of the array and four or five sensors distributed around each of the two circular arrays. Passive surface wave measurements were made for a minimum of 60 minutes on each array. Each sensor location was surveyed using a sub foot accuracy GPS prior to data acquisition. Seismic data stored on the Atom seismographs were downloaded to a laptop computer at the end of the survey.

4 DATA REDUCTION AND MODELING

4.1 Data Reduction

Prior to data reduction, seismic records were reviewed to identify relevant geologic structures that could be constrained during data modeling. Based on review of the seismic records from MASW Array 4, the "seismic" water table was anchored at an approximate depth of 3 m (-9.8 ft) during modeling of the surface wave dispersion data for all sounding locations. Minor changes in the depth of the saturated zone and P-wave velocity of the saturated zone will not significantly impact the modeling of the surface wave dispersion data.

The MASW data were reduced using the software Seismic Pro Surface V9.0 developed by Geogiga and multiple in-house scripts for various data extraction and formatting tasks, with all data reduction documented in a Microsoft Excel spreadsheet.

The following steps were used for data reduction:

- Input seismic records to be used for analysis into software package.
- Check and correct source and receiver geometry as necessary.
- Select offset range used for analysis (multiple offset ranges utilized for each seismic record as discussed below) and document in spreadsheet.
- Apply phase shift transform to seismic record to convert the data from time – offset to frequency – phase velocity space.
- Identify, pick, save, and document dispersion curve.
- Change the receiver offset range and repeat process.
- Repeat process for all seismic records.
- Use in-house script to apply near-field criteria with maximum wavelength set equal to lesser of 40 m (source frequency limitation) or 1 times the source to midpoint of receiver array distance.
- Use in-house script to merge multiple dispersion curves extracted from the MASW data collected along each seismic line for a specific source type (different source locations, different receiver offset ranges, etc.).
- Edit dispersion data, as necessary (e.g. delete poor quality curves and outliers).
- Calculate a representative dispersion curve at equal log-frequency or log-wavelength spacing for the MASW dispersion data using a moving average, polynomial curve fitting routine.

This unique data reduction strategy, which can involve a combination of over 100 dispersion curves for a 1D sounding, is designed for characterizing sites with complex velocity structure that do not yield surface wave dispersion data over a wide frequency range from a single source type or source location. The data reduction strategy ensures that the dispersion curve selected for modeling is representative of average conditions beneath the array and spans as broad a frequency/wavelength range as possible while considering near field effects.

The array microtremor data were reduced using the Seisimager software package developed by Oyo Corporation/Geometrics, Inc. and the following steps:

The processing sequence for implementation of the ESAC method in the SeisImager software package is as follows:

- Use in-house script to separate 1 Hz and 4.5 Hz seismic records from combined data sets, as needed.
- Input all seismic records for a dataset into software.
- Load receiver geometry (x and y positions) for each channel in seismic record.
- Apply time-segmentation routine, as necessary, to break data file into multiple seismic records. Time segmentation is not necessary for smaller arrays where data is acquired as 30 s records. For the large array, data was divided into multiple approximate 80 s time windows for analysis.
- Calculate the SPAC coefficients for each seismic record and average.
- Optionally, combine SPAC coefficients from different arrays (e.g. multiple double circle arrays from large array).
- For each frequency calculate the RMS error between the SPAC coefficients and a Bessel function of the first kind and order zero over a user defined phase velocity range and velocity step.
- Plot an image of RMS error as a function for frequency (f) and phase velocity (v).
- Identify and pick the dispersion curve as the continuous trend on the f-v image with the lowest RMS error.
- Repeat process for all arrays and time blocks.
- Use in-house script to convert dispersion curves to appropriate format for editing.
- Edit dispersion data, as necessary, and use in-house script to combine all dispersion data after setting maximum wavelength to about 2 to 2.5 times the maximum receiver spacing (2 times maximum receiver spacing approximately equivalent to $k_{min}/2$ for a symmetrical array).
- Calculate a representative dispersion curve for the passive dispersion data from each array using a moving average polynomial curve fitting routine.

The Array 1 dispersion curve consisted of Rayleigh wave phase velocity data from a MASW array, a L-shaped passive array with 48 4.5 Hz geophones at 6 m intervals, and an L-shaped passive array with 10 1 Hz geophones with variable (12 to 36 m) spacing. The Array 2 dispersion curve consisted of Rayleigh wave phase velocity data from a MASW array, an L-shaped passive array with 48 4.5 Hz geophones at 2 to 6 m intervals, and the large aperture double circle arrays. The Array 3, 5, and 6 dispersion curves consisted of Rayleigh wave phase velocity data from a MASW array, a L-shaped passive array with 39 4.5 Hz geophones at variable intervals, and an L-shaped passive array with 9 1 Hz geophones at variable (18 to 42 m) intervals. The Array 4 dispersion curve consisted of Rayleigh wave phase velocity data from a MASW array and a nested triangle array with 48 m outer dimension and 37 geophones distributed at 6 m intervals around three nested triangles and at the center of the array.

The representative dispersion curves from the active and passive surface wave data were combined and the moving average polynomial curve fitting routine in WinSASW V3 was used to generate a composite representative dispersion curve for modeling. During this process the active and passive source surface wave data were given equal weights. An equal logarithmically

spaced wavelength sample rate was used for the representative dispersion curve to reflect the gradual loss in model resolution with depth.

4.2 DATA MODELING

Review of the surface wave dispersion data indicated that a stiff, compacted fill layer was located beneath many of the test locations (e.g. dirt roads, asphalt covered lots). Such velocity structure typically excites dominant higher mode Rayleigh waves at high frequencies/small wavelengths and it is not possible to model the data using the fundamental mode assumption. In such velocity structure, it is necessary to model the surface wave dispersion data using a multi-mode or effective mode solution.

The effective mode inverse modeling routine in Geometrics, Inc. Seisimager (WaveEq module) software package was used to generate an S-wave velocity model for Arrays 1, 2, 3, 5, and 6. Array 4 was modeled using the fundamental mode assumption as this location did not have fill with higher velocity that the underlying sediments. During this process the final composite representative dispersion curve was loaded into the modeling software package and an initial velocity model was generated based on general characteristics of the dispersion curve. The theoretical dispersion curve was then generated using the effective mode routine and compared to the field dispersion curve. The inverse modeling routine iteratively adjusted layer velocities until an acceptable fit to the field data was obtained. Data inputs into the modeling software include layer thickness, S-wave velocity, P-wave velocity or Poisson's ratio, and mass density. P-wave velocity and mass density only have a very small influence (i.e. less than 10%) on the S-wave velocity model generated from a surface wave dispersion curve. However, realistic assumptions for P-wave velocity, which is significantly impacted by the location of the saturated zone, and mass density will slightly improve the accuracy of the S-wave velocity model.

Constant mass density values of 1.6 to 2.05 g/cm^3 (100 to 128 lb/ft^3) were used in the profiles for subsurface soils/rock depending on P- and S-wave velocity. Within the normal range encountered in geotechnical engineering, variation in mass density has a negligible (±2%) effect on the estimated V_S from surface wave dispersion data. During modeling of Rayleigh wave dispersion data, the compression wave velocity, V_P, for unsaturated sediments was estimated using a Poisson's ratio, ν, of 0.333 and the relationship:

$$V_P = V_S \left[(2(1-\nu))/(1-2\nu)\right]^{0.5}$$

Poisson's ratio has a larger affect than density on the estimated V_S from Rayleigh wave dispersion data. Achenbach (1973) provides approximate relationship between Rayleigh wave velocity (V_R), V_S and ν:

$$V_R = V_S \left[(0.862 + 1.14\,\nu)/(1+\nu)\right]$$

Using this relationship, it can be shown that V_S derived from V_R only varies by about 10% over possible 0 to 0.5 range for Poisson's ratio where:

$V_S = 1.16V_R$ for $\nu = 0$
$V_S = 1.05V_R$ for $\nu = 0.5$

The realistic range of the Poisson's ratio for typical unsaturated sediments is about 0.25 to 0.35. Over this range, V_S derived from modeling of Rayleigh wave dispersion data will vary by about 5%. An intermediate Poisson's ratio of 0.333 was selected for modeling.

To reduce errors associated with expected high Poisson's ratio of saturated sediments, the saturated zone was anchored at a depth of 3 m, based on inspection of seismic refraction first arrival data from Array 4 seismic records. V_P of the saturated zone was set to a minimum velocity of about 1,475 m/s (4,839 ft/s) and allowed to gradually increase with depth as V_S increased.

5 INTERPRETATION AND RESULTS

The fit of the theoretical dispersion curve to the experimental data collected at the site and the modeled V_S profiles for Arrays 1 to 6 are presented in Figures 2 to 7. The resolution decreases gradually with depth due to the loss of sensitivity of the dispersion curve to changes in V_S at greater depth. The V_S profiles used to match the field data are provided in tabular form in both metric and imperial units as Tables 2 to 13. The velocity models for Arrays 1, 2, 3, 5, 6 were developed using layer contacts at similar depths to facilitate assessment of lateral velocity variability beneath the site. Array 4 was located on a different facility and, therefore, layer depths were not constrained to those of the other arrays. The V_S models from the six arrays are summarized in Figure 8.

The Rayleigh wave phase velocities from the passive surface wave measurements made using double circle, L-shaped, and nested triangle arrays are generally in excellent agreement with those from the MASW data in the regions of overlapping wavelength. There is typically about 20 - 30 m/s (66 - 89 ft/s) scatter in the surface wave dispersion data, which is likely the result of lateral velocity variation beneath each array.

The estimated depth of investigation for the combined active and passive surface wave soundings is about 125 m (410 ft) for Arrays 1, 3, 5, and 6; 225 m (738 ft) for Array 2 and 60 m (197 ft) for Array 4.

Arrays 1 to 3, 5, and 6 are all located on the Salt Lake City Water Reclamation Plant (Figure 1). The V_S models for these arrays have a fill sediment layer up to about 3 m (9.8 ft) thick with highly variable V_S between about 164 and 287 m/s (537 and 940 ft/s). Between a depth of 3 and 11 m (9.8 and 36 ft) is a low velocity layer with V_S typically between 133 and 171 m/s (435 and 562 ft/s). Array 6 has slightly higher V_S over this depth range. Below a depth of 11 m (36 ft) V_S gradually increases with depth from 174 to 188 m/s (571 to 616 ft/s) at about 11 m (36 ft) to 433 to 504 m/s (1,419 to 1,653 ft/s) at 116 m (381 ft) depth. V_S between the five models is very similar between a depth of about 11 and 76 m (36 and 249 ft) and within an approximate 15% velocity range at greater depths. The V_S model for Array 2 extends to a depth of about 225 m (738 ft) as the dispersion data from the large aperture double circle arrays was utilized for modeling. Modeled V_S for this array is 461 m/s (1,514 ft/s) and 531 m/s (1,743 ft/s) at depths of 116 and 176 m (381 and 577 ft), respectively.

Array 4 is located about 1 km (3280 ft) south of the Salt Lake City Water Reclamation Plant (Figure 1). There is no evidence of near-surface compacted fill beneath this array and V_S ranges from 122 to 157 m/s (401 to 515 ft/s) in the upper 11 m (36 ft). Below a depth of 11 m V_S gradually increases with depth from 213 m/s (699 ft/s) to 296 m/s (970 ft/s) at a depth of about 51 m (167 ft). Depth of investigation was limited to about 60 m (197 ft) beneath this array.

V_{S30} is 174, 184, 190, 184, 189, and 201 m/s for Arrays 1 to 6, respectively with V_{S30} for Arrays 1 to 5 being within 5% of the 180 m/s NEHRP Site Class D and E boundary. V_{S100ft} is 573, 607, 624, 605, 622, and 662 ft/s for Arrays 1 to 6, respectively.

6 CONCLUSIONS

Active and passive source surface wave measurements using the MASW and array microtremor techniques were made at six (6) locations at the Salt Lake City Water Reclamation Plant in Salt Lake City, Utah to characterize shear-wave velocity of the upper 100 m (328 ft), or more. The locations of surface wave arrays are presented in Figure 1 and Table 1. The shear wave velocity depth profiles determined by these methods are presented as Figures 2 through 7 and in Tables 2 through 13. It should be noted that these models are not unique and multiple V_S models could be developed with different layer depths that equally well fit the observed surface wave dispersion data; however, non-uniqueness is not expected to have a significant effect on V_{S30} or site response.

A comparison of the upper 125 m (410 ft) of the V_S models for Arrays 1 to 6 is presented as Figure 8. The most significant variation in V_S between the 6 profiles occurs in the upper 11 m (36 ft), which is due to the variable V_S of the fill sediments in the upper 3 m (9.8 ft) and the effect of the fill on the V_S of the underlying sediments. Except for Array 4, located about 1 km south of the other arrays, V_S is almost identical over the 11 to 76 m (36 to 249 ft) depth range. Below a depth of 76 m (249 ft) there is about 15% variation in V_S between the models, much of which could be accounted for by small changes to layer depths. Layer depths were kept approximately constant during modeling to more clearly identify lateral velocity variability.

V_{S30} varies from about 174 to 201 m/s (571 to 661 ft/s) beneath the 6 soundings. Therefore, according to the NEHRP provisions of the Uniform Building Code, the area in the vicinity of the surface wave arrays is classified as Class D/E, stiff/soft soil.

8 CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision of and reviewed by a **GEO*Vision*** California Professional Geophysicist.

Reviewed and approved by

10/10/2018

Antony Martin Date
California Professional Geophysicist, P. GP 989
GEO*Vision* Geophysical Services

* This geophysical investigation was conducted under the supervision of a California Professional Geophysicist using industry standard methods and equipment. A high degree of professionalism was maintained during all aspects of the project from the field investigation and data acquisition, through data processing interpretation and reporting. All original field data files, field notes and observations, and other pertinent information are maintained in the project files and are available for the client to review for a period of at least one year.

  A professional geophysicist's certification of interpreted geophysical conditions comprises a declaration of his/her professional judgment. It does not constitute a warranty or guarantee, expressed or implied, nor does it relieve any other party of its responsibility to abide by contract documents, applicable codes, standards, regulations or ordinances.

Liquid Limit, Plastic Limit, and Plasticity Index of Soils

(ASTM D4318)

© IGES 2004, 2019

Project: AECOM
No: 00100-015, 3G2 (XIII)
Location: SLCity Public Utilities Waste Water Reclamation Facility
Date: 8/1/2019
By: BRR
Grooving tool type: Plastic
Liquid limit device: Mechanical
Rolling method: Hand

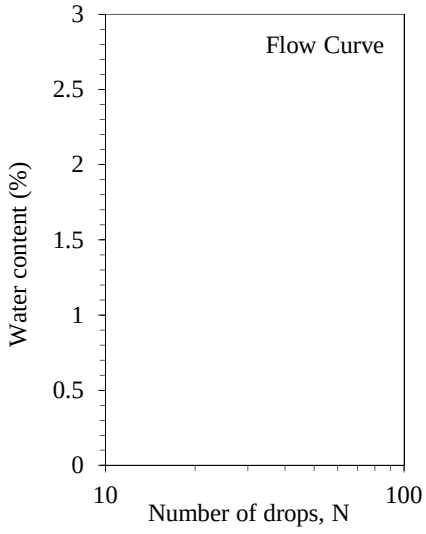
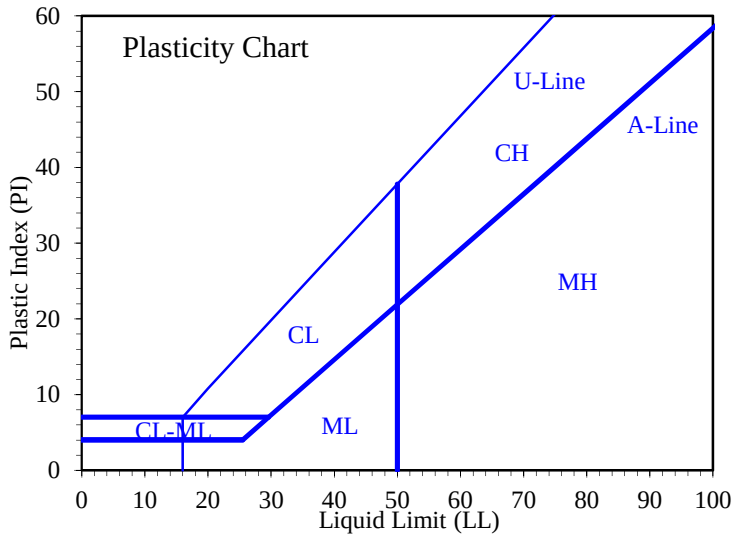
Boring No.: BH19-ES-1
Sample: 5
Depth: 17'
Description: Brown silt

Preparation method: Wet
Liquid Limit: Could not be determined (N.P.)
Screened over No.40: Yes
Larger particles removed: Wet sieved
Approximate maximum grain size: 3/8"
Estimated percent retained on No.40: Not requested
As-received water content (%): Not requested



Plastic Limit



Determination No						
Wet Soil + Tare (g)						
Dry Soil + Tare (g)		Difficult to thread.

Rolling method: Hand

Boring No.: BH19-ITW-4
Sample:
Depth: 15.0'
Description: Grey silty clay

Preparation method: Wet
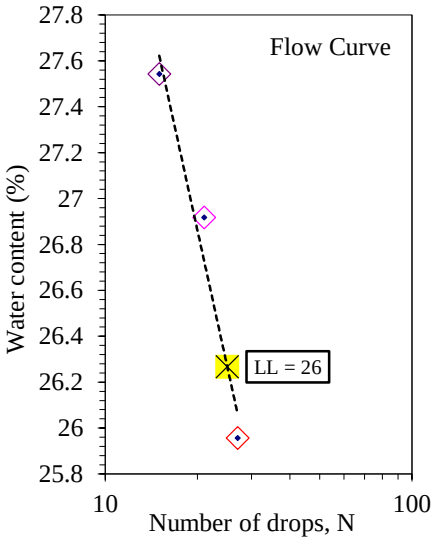
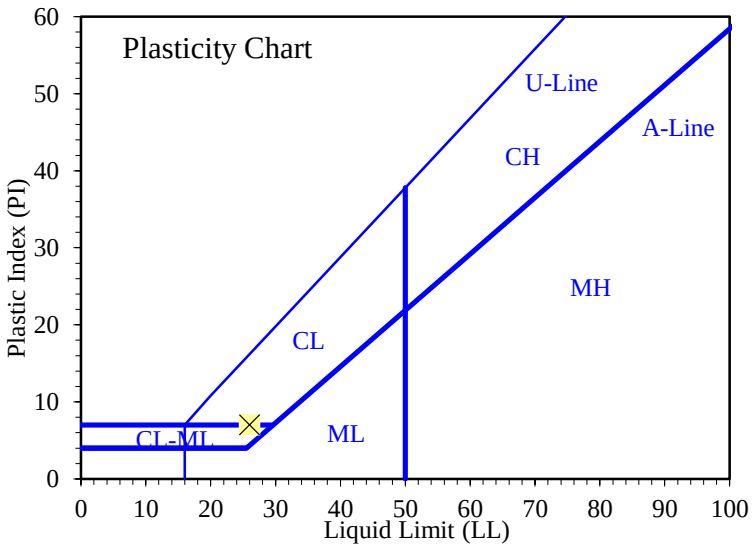
Liquid limit test method: Multipoint
Screened over No.40: No
Larger particles removed: Not required
Approximate maximum grain size: No.20
Estimated percent retained on No.40: See Particle Size Distribution
As-received water content (%): 34.4



Plastic Limit



Determination No	1	2

Date: 8/6/2021
By: JDF

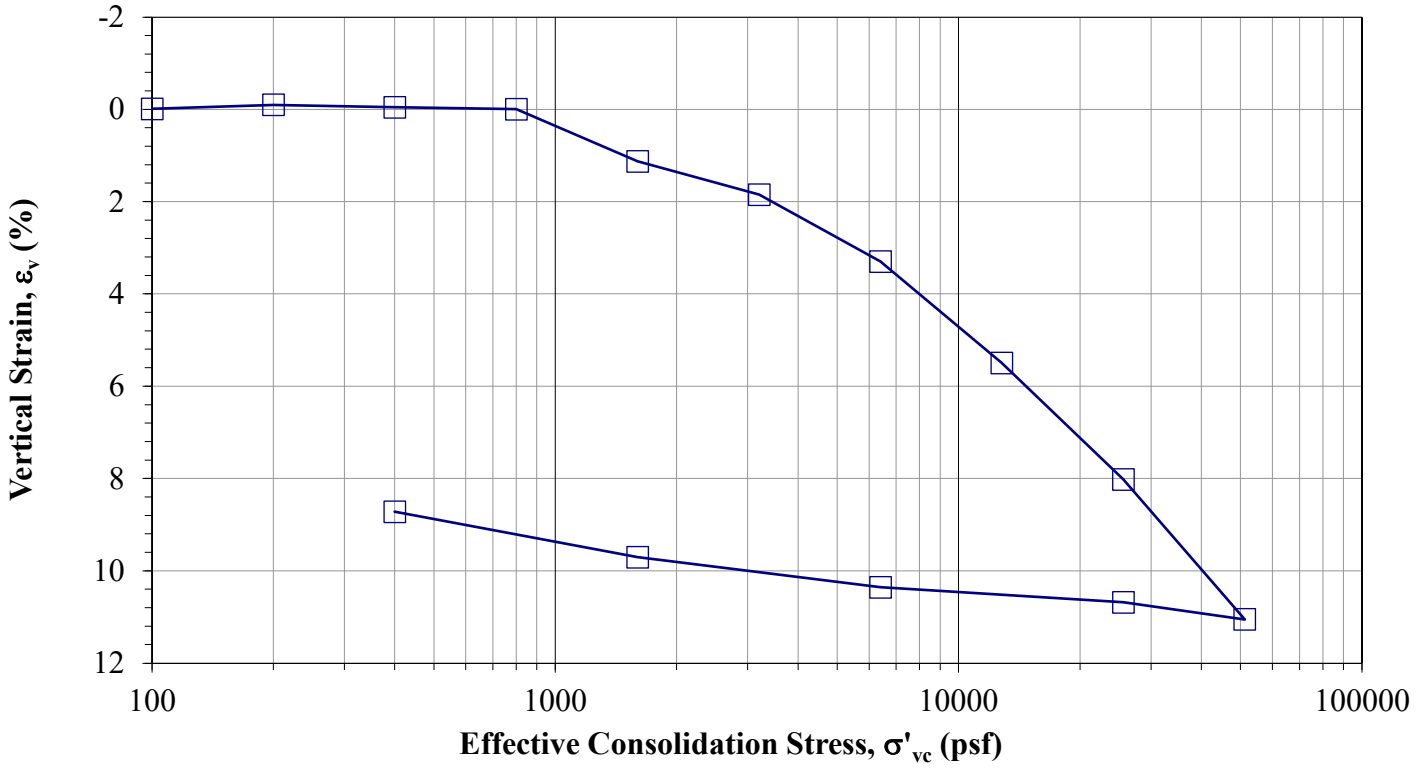
Boring No.: BH18-IT-5
Sample:
Depth: 10.0'
Sample Description: Grey clay with sand
Engineering Classification: Not requested
Sample type: Undisturbed-trimmed from ring



Test method:	A	
Inundation stress (psf), timing:	Seating	Beginning
Specific gravity, G_s	2.70	Assumed

Water type used for inundation: Tap

	Initial (o)	Final (f)
Sample height, H (in.)	0.923	0.843
Sample diameter, D (in.)	2.410	2.410
Wt. rings + wet soil (g)	172.83	167.60
Wt. rings/tare (g)	46.28	46.28
Moist unit wt., γ_m (pcf)	114.5	120.25
Wet soil + tare (g)	409.61	253.94
Dry soil + tare (g)	347.95	230.79
Tare (g)	124.42	127.02
Water content, w (%)	27.6	22.3
Dry unit wt., γ_d (pcf)	89.7	98.3
Saturation	0.85	0.84

*Note: C_v, C_c, C_r, and σ_p' to be determined by Geotechnical Engineer.

Boring No.: B21-OIPS-07
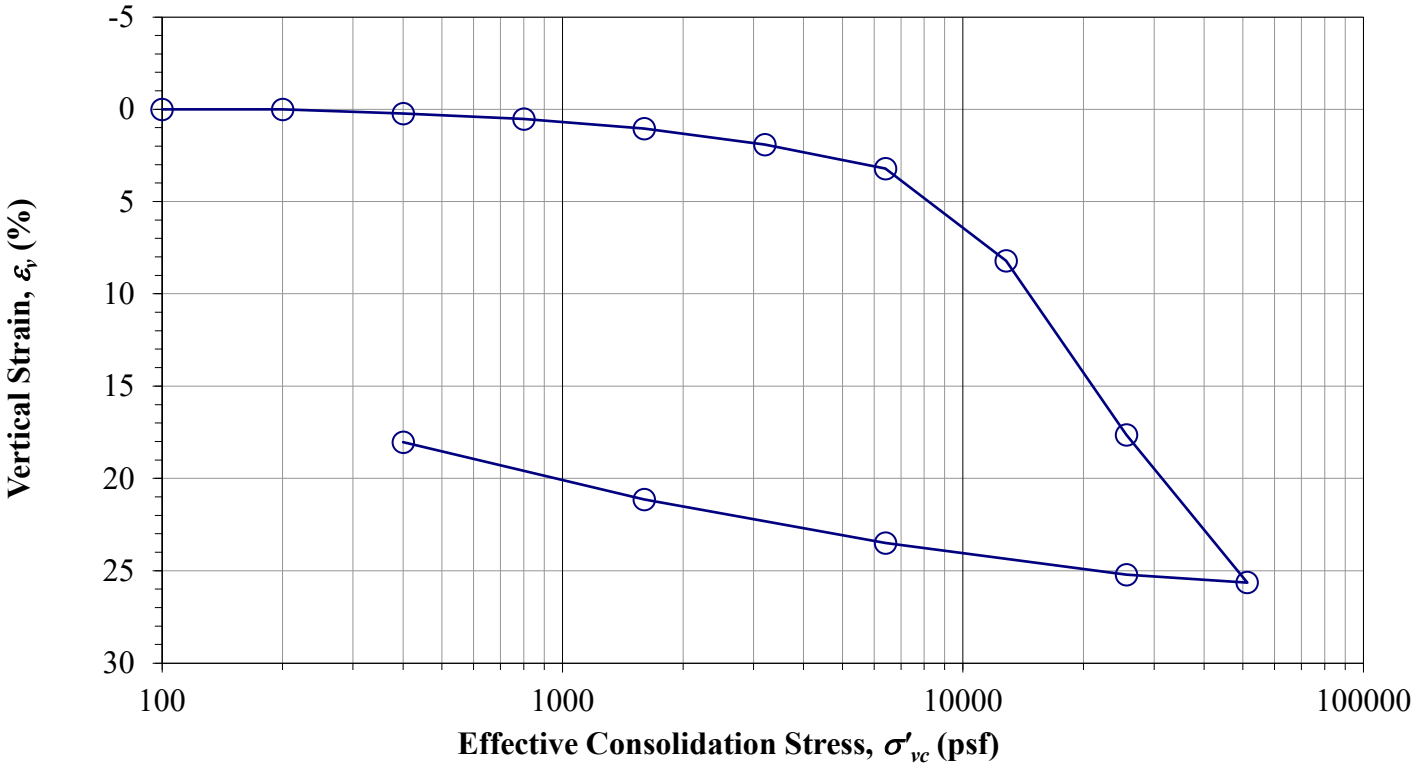
Sample: 19
Depth: 96'
Sample Description: Dark grey clay
Engineering Classification: Not requested
Sample type: Undisturbed-trimmed from Shelby tube



Test method:	B	
Inundation stress (psf), timing:	100	Beginning
Specific gravity, G_s	2.75	Assumed

Water type used for inundation Tap

	Initial (o)	Final (f)
Sample height, H (in.)	0.917	0.752
Sample diameter, D (in.)	2.414	2.414
Wt. rings + wet soil (g)	167.49	158.49
Wt. rings/tare (g)	43.38	43.38
Total unit wt., γ (pcf)	112.7	127.48
Wet soil + tare (g)	329.05	231.10
Dry soil + tare (g)	267.91	204.27
Tare (g)	124.68	121.31
Water content, ω (%)	42.7	32.3
Dry unit wt., γ_d (pcf)	79.0	96.3
Saturation, S	1.00	1.00

*Note: C_v, C_c, C_r, and σ_p' to be determined by Geotechnical Engineer.

Stress (psf)	Dial (in.)	1-D ε_v (%)	H_c (in.)	e
Seating	0.0000	0.00	0.9170	1.1744
100	0.0000	0.00	0.9170	1.1744
200	0.0000	0.01	0.9170	1.1743
400	0.0022	0.24	0.9148	1.1692
800	0.0048	0.52	0.9122	1.1631
1600	0.0096	1.04	0.9074	1.1517
3200	0.0175	1.91	0.8995	1.1329
6400	0.0295	3.22	0.8875	1.1044
12800	0.0752	8.21	0.8418	0.9960
25600	0.1618	17.64	0.7552	0.7908
51200	0.2351	25.64	0.6819	0.6169
25600	0.2312	25.21	0.6858	0.6262
6400	0.2155	23.50	0.7015	0.6634
1600	0.1938	21.13	0.7232	0.7149
400	0.1654	18.04	0.7516	0.7822

Comments: Test specimen contains trace sand seams. Test specimen swelled upon inundation and at 100 and 200 psf load steps.

Salt Lake City Water Reclamation Facility Influent Pump Station Liquefaction Calculation

Purpose

This calculation summarizes the methodology and results of the assessment of liquefaction potential and associated hazards for the influent pump station (IPS) proposed facility at the Salt Lake City New Water Reclamation Facility (New WRF). The proposed new IPS facilities (positioned to the south of an existing pump station), which include IPS electrical building, IPS generator pad, IPS odor control, and Influent Force Main Pipeline (extending from the new IPS facilities towards the Headworks facilities at the main New WRF site) are covered in this calculation package.

Data Available

AECOM performed geotechnical explorations of subsurface conditions within, or in the vicinity of, the footprint of proposed IPS facilities. The subsurface exploration program for the new IPS facilities was performed between July 2018 and August 2021. The explorations performed by AECOM included 22 CPTs and 20 exploratory borings. Additionally, two (2) CPTs and eight (8) exploratory borings were performed by Intermountain GeoEnvironmental Services, Inc. (IGES) of South Salt Lake, a subconsultant to AECOM, within the footprint of the proposed IPS facilities. The summary of exploration information is provided in Table 1.

Spectral Analysis of Surface Waves (SASW) and Multichannel Analysis of Surface Waves (MASW) were performed between September 10 and September 15, 2018, to help assess seismic site class in the project area. Laboratory testing was performed on samples selected from the borings in order to help select engineering properties of encountered subsurface materials.

Blowcount and tip resistance normalization was performed using the assumed depth to groundwater, which is based on pore pressure dissipation tests performed during the subsurface exploration program. However, for the liquefaction analysis, the groundwater depth at the time of the earthquake is assumed to be approximately two (2) feet higher (shallower) than the assumed depth to account for potential groundwater fluctuations. A portion of the drilling occurred during the winter when groundwater levels were lower than other times of the year, and precipitation levels have been lower than average over the last several years. In large part, this assumption has little effect on the overall calculation, but considers the liquefaction potential in some relatively shallow soil layers not saturated at the time the field explorations were performed.

Table 1. Summary of IPS Subsurface Explorations

Notes: ft = feet; '-' denotes a blank entry

1. Surveyed elevation is based on North American Vertical Datum of 1988. Northing and Easting coordinates are provided on the boring logs in North American Datum of 1983 based on the Utah Central State Plane Projection
2. Because of the selected mud-rotary drilling method for borings, the groundwater depth was neither readily observed nor measured in the field. For CPT explorations, the groundwater depth is inferred, based on the results of the shallowest pore pressure dissipation test performed within each sounding, assuming 100 percent hydrostatic conditions.
3. This CPT was not used in liquefaction analysis since it is no longer on the pipeline alignment.
4. Exploration was overseen by Intermountain GeoEnvironmental Services, Inc. of South Salt Lake, a subconsultant to AECOM.

CPT soundings were completed using a piezocone penetrometer with a 15 square centimeter (cm^2) tip and net area ratio of 0.8. Exploratory borings were completed with a CME-75 truck-mounted drill, equipped with a 4-7/8-inch drag bit, or a CME-55 track-mounted drill rig equipped with a 3-3/4-inch outer diameter drag bit. Penetration resistances were obtained from the number of hammer blows observed to drive a split-spoon standard penetration test (SPT) sampler using a 140-pound automatic hammer dropped from a height of 30 inches. The resistance to sampler penetration into a subsurface layer is

noted as blow counts (N) on the logs and refers to the number of hammer blows to advance the sampler a distance of 12 inches, beginning after 6-inches of penetration into the subsurface materials (i.e. the number of hammer blows for 18 inches of sampler penetration minus the number of hammer blows for the first 6 inches of penetration). Based on recent calibration testing, the calibrated energy transfer ratio may be assumed to be 87 percent for the hammer equipped on the CME-75 drilling equipment. Calibration for energy transfer was not available for the hammer equipped on the CME-55 drill used by Inberg-Miller Engineers until after this study was essentially complete; consequently, an energy transfer ratio of 85 percent was assumed for the analyses, based on experience with similar equipment. Laboratory testing was performed on selected soil samples collected from exploratory borings to aid in classification of potentially liquefiable soils.

Design ground motion parameters used for this liquefaction analysis are consistent with a seismic event having a 2 percent probability of exceedance in 50 years (2PE50) associated with an approximate return period of 2,475 years. A site-specific, probabilistic seismic hazard analysis (PSHA) was performed for the site, and the peak ground acceleration and earthquake magnitudes shown in Table 2 are parameters provided by the PSHA (LCI, 2018). The modal earthquake magnitude was used for the liquefaction analysis.

Table 2. Summary of 2,475-Year Return Period Ground Motion Design Parameters

Source	Mean Earthquake Magnitude, M (-)	Mean Source-Site Distance, D (km)	Modal Earthquake Magnitude, M (-)	Modal Source-Site Distance, D (km)	Peak Ground Acceleration, PGA (g)	Peak Ground Acceleration adjusted for Site Class effects, PGA_M (g)
PSHA, 2018[1]	7.1	3.2	7.1	2.5	0.62	0.62

Notes: g = acceleration due to gravity; km = kilometer; PGA = peak ground acceleration

1. "Site-Specific Seismic Hazard Analyses and Development of Seismic Design Ground Motions for the Salt Lake City Water Reclamation Facility, Utah." LCI, 2018.

Assumptions

The following assumptions were made regarding this calculation and supporting data:

- Laboratory tests were performed in accordance with the referenced American Society for Testing and Materials (ASTM) standards and are reported accurately by the subcontracted testing facility.
- Samples tested in the laboratory are representative of the soil unit from which they were obtained. Further, the results of the testing are indicative of material properties for the soil unit.
- Clay and other soils with a plasticity index (PI) more than 7 ($\geq$ 8), are not susceptible to liquefaction (Idriss and Boulanger 2008).
- Soils classified from CPTs with a normalized soil behavior type (SBTn) greater than or equal to five (5) are considered susceptible to liquefaction and its effects.
- Soil layers thinner than approximately 6 inches with a normalized soil behavior type (SBTn) greater than or equal to five (5) are neglected from post-liquefaction settlement calculations (Ahmadi and Robertson 2011; Moss et al. 2006; Youd et al. 2001).
- Based on the available pore pressure dissipation tests performed during the subsurface exploration program, the long-term groundwater elevation at the time of the seismic event was assumed to be 4,213, while the groundwater elevation at the time of drilling was assumed to be 4,211.

Methodology

Liquefaction is used to describe strength loss and deformation in saturated sands and other cohesionless materials resulting from seismically-induced pore pressure generation (Idriss and Boulanger 2008). Clays and elastic silts are not considered in this analysis.

The liquefaction triggering analysis was performed using a pseudo-probabilistic procedure where the ground motion parameters (magnitude and peak ground acceleration) were derived probabilistically and then a deterministic analysis was performed using the probabilistically-derived ground motion parameters. AECOM selected the Idriss and Boulanger (2008) methodology (including the 2014 update to magnitude scaling factor and CPT fines content prediction) to assess liquefaction

triggering. A spreadsheet was used to calculate the factor of safety against liquefaction triggering by comparing the estimated cyclic resistance ratio (CRR) of the soil to the earthquake-induced cyclic stress ratio (CSR). The ratio of these two parameters (CRR/CSR) is the factor of safety against liquefaction triggering. For this analysis, the modal earthquake magnitude is used because deaggregation data indicates that a seismic event from the nearby Wasatch fault is the largest single contributor to the seismic hazard.

Thin, coarse-grained layers were encountered in borehole explorations and CPT explorations throughout the site. Based on a review of available publications (Ahmadi and Robertson 2005; Moss et al. 2006; Youd 2018; Youd et al. 2001), thin layers affect in-situ field measurements such that the soil density is inferred to be looser than the actual in-situ state. A thin-layer correction was applied to coarse-grained layers with thicknesses up to 3 feet according to the procedure described by Moss (Moss et al, 2006). Values for the correction factor that fall between the curves generated from the case histories were linearly interpolated. The correction factor was capped at the recommended maximum value of 1.8. Coarse-grained layers with thicknesses up to 6 inches were considered to not contribute to post-liquefaction settlement. A representative value for tip resistance was applied to the entirety of the thin layer where the correction was applicable. Data from laboratory samples was used to further refine the analysis. Samples from layers that appeared continuous in several CPTs were used to refine the input fines contents or plasticity indices for coarse-grained layers that were producing post-liquefaction settlement, but which were not screened out with the thin-layer correction. For borehole explorations, a blowcount correction was applied to the SPT blowcounts.

The CSR was calculated using the following relationship, which is based on Equations 2.1 and 2.2 in the referenced document by Boulanger and Idriss (2014):

$$CSR_{M,\sigma'_v} = 0.65 \frac{\sigma_v}{\sigma'_v} \frac{a_{max}}{g} r_d$$

where, σ_v = Vertical Total Stress
σ'_v = Vertical Effective Stress
a_{max} = Maximum Horizontal Acceleration at Ground Surface (2PE50)
g = Acceleration of Gravity
r_d = Shear Stress Reduction Factor

The CRR was calculated using the following relationships, which estimates the CRR based on Equations 2.24 and 2.25 in the referenced document by Boulanger and Idriss (2014):

$$CRR_{M,\sigma'_v} = exp\left[\frac{q_{c1Ncs}}{113} + \left(\frac{q_{c1Ncs}}{1000}\right)^2 - \left(\frac{q_{c1Ncs}}{140}\right)^3 + \left(\frac{q_{c1Ncs}}{137}\right)^4 - 2.80\right] \times MSF \times K_\sigma$$

where, q_{c1Ncs} = Normalized Overburden-Corrected Equivalent Clean Sand Tip Resistance
MSF = Magnitude Scaling Factor [Equations 2.19 and 2.20 (Boulanger and Idriss 2014)]
K_σ = Overburden Correction Factor [Equations 2.16a and 2.16b (Boulanger and Idriss 2014)]

$$CRR_{M,\sigma'_v} = exp\left[\frac{(N_1)_{60cs}}{14.1} + \left(\frac{(N_1)_{60cs}}{126}\right)^2 - \left(\frac{(N_1)_{60cs}}{23.6}\right)^3 + \left(\frac{(N_1)_{60cs}}{25.4}\right)^4 - 2.80\right] \times MSF \times K_\sigma$$

where, $(N_1)_{60cs}$ = Normalized Overburden-Corrected Equivalent Clean Sand Blowcount
MSF = Magnitude Scaling Factor [Equations 2.19 and 2.21 (Boulanger and Idriss 2014)]
K_σ = Overburden Correction Factor [Equations 2.16a and 2.16c (Boulanger and Idriss 2014)]

Surface deformations were considered using the liquefaction triggering results from this procedure and the following:

- One-dimensional vertical settlement using curves and equations as presented in the Idriss and Boulanger (2008) monograph for estimating volumetric strains, which is derived from Ishihara and Yoshimine (1992) volumetric strain charts.
- Lateral displacement index, which is an indication of lateral spread potential, using the methodology presented in the referenced document by Idriss and Boulanger (2008).
- Lateral spread displacements after Youd et al. (2002), which requires input of earthquake magnitude, source to site distance, ground slope or free face ratio (if applicable), fines content, D_{50}, and the thickness of liquefiable cohesionless soil layers with blowcounts, $(N_1)_{60}$, less than 15 ($(N_1)_{60} < 15$ indicates a liquefiable layer).

Results

Post-Liquefaction Settlement

The results of the liquefaction triggering analysis and estimates of liquefaction-induced settlement are presented in Table 3. Estimated Post-Liquefaction Settlements for IPS FacilitiesTable 3 and Attachment 1. The results shown in Table 3 include the post-liquefaction settlement estimates at both the ground surface and the proposed bearing elevations, for each of the IPS facilities. Liquefaction triggering analyses based on CPT field measurements indicate that a low to moderate liquefaction hazard exists at the location of IPS facilities. Fines contents and plasticity indices determined for SPT samples were used to supplement the correlated values in the liquefaction triggering analyses based on CPT field measurements. Winckler published research that allows a state parameter (Ψ) to be determined from a plot of normalized friction ratio (F_r) versus normalized cone resistance (Q_{tn}) for a given soil layer (Winckler et al. 2014). Based on this research, a threshold of Ψ = -0.05 was used to determine whether a given soil layer would exhibit contractive or dilative behavior in a seismic event; Ψ values greater than -0.05 for a layer would suggest contractive behavior, and Ψ values less than -0.05 would suggest dilative behavior. Additionally, the dynamic and static pore pressures were compared to determine if dilative pore pressures were present in the same layer. Dilative pore pressures occur if the dynamic pore pressure values are less than the static pore pressure values for a given layer. If both the state parameter and pore pressures for a given layer show dilative behavior, the layer was screened out in the liquefaction analysis. If the state parameter showed contractive behavior, even with dilative pore pressures, the layer was still considered liquefactionsusceptible. The laboratory results, which were used to supplement the CPT-based liquefaction analyses, and the justifications for any refinement of layers is presented in Attachment 2.

Notes:

1. Paired boring and CPT.
2. Post-liquefaction settlement for the given scenario is negligible.

Surface manifestation of liquefaction, which includes post-liquefaction settlement and lateral spread, has generally been concentrated in shallow liquefiable layers. The effects of liquefaction that occur below a depth of approximately 50 to 60 feet are generally not observed at the ground surface (Bartlett and Youd 1995; Cetin et al. 2009). The lowest liquefiable layer for the site is estimated to be near elevations ranging from approximately 4,164 to 4,166 feet. Some deeper layers may have been estimated to trigger based on Idriss and Boulanger (2008) procedure; however, in consideration of the lack of surface manifestation of deep liquefaction reported in the publications by Bartlett and Youd and Cetin et al., layers deeper than 60 feet were not considered to contribute to vertical deformations at the surface. It is also estimated that these deeper layers are late Pleistocene in age and have a low susceptibility to triggering.

Estimated total and differential post-liquefaction settlements were assessed by facility. Predicted post-liquefaction settlements at the base of each structure for each associated exploration are displayed in Table 3. However, estimated post-liquefaction settlement experienced by structures may be less than estimated ground surface settlement due to planned ground improvements and depth of proposed structures. Estimated post-liquefaction settlement beneath proposed IPS facilities is summarized below, grouped by facility.

IPS

Based on the deep bearing elevation of the new IPS (approximately 4,169.5 feet) and liquefaction analyses for explorations in the vicinity, the magnitude of post-liquefaction settlement estimated to be experienced by the IPS is in the order of 0.1 inch and negligible. The liquefaction triggering analysis indicated that there are materials above the design bearing elevation for the IPS which may be susceptible to liquefaction and associated vertical settlement. While the deeper bearing elevation reduces the magnitude of estimated post-liquefaction settlement beneath the IPS, it is anticipated that the ground surface settlements could be on the order of 1 inch in the area around the structure. Accordingly, it is recommended that differential settlements between the structure and the surrounding ground be considered in design, such as through the use of trenching, vaults, and/or flexible connections of shallow utilities coming into or going out of the IPS. Additionally, it is anticipated that sidewalks and flatwork could experience post-liquefaction settlement on the order of 1 inch, and associated maintenance and repairs may be needed following a seismic event. The settlement calculation package for the IPS discusses and analyzes settlement in more detail than is discussed here.

IPS Electrical Building

Based on planned structure elevations for the IPS electrical building (approximately 4,219 feet), and liquefaction analyses for explorations in the vicinity, the magnitude of post-liquefaction settlement estimated to be experienced by this structure is on the order of less than one inch with possible differential settlements of up to 1 inch over 100 feet of length beneath the structure, corresponding to an angular distortion of approximately 0.001 radians.

IPS Odor Control

Based on planned structure elevations for the IPS odor control (approximately 4,219 feet), and liquefaction analyses for explorations in the vicinity, the magnitude of post-liquefaction settlement estimated to be experienced by this structure is negligible.

IPS Generator Pad

Based on planned structure elevations for the IPS generator pad (approximately 4,219 feet), and liquefaction analyses for explorations in the vicinity, the magnitude of post-liquefaction settlement estimated to be experienced by this structure is on the order of less than 1 inch.

Influent Force Main Pipeline

Based on planned structure elevations for the influent pipeline (approximately 4,211.5), and liquefaction analyses for explorations in the vicinity, the magnitude of post-liquefaction settlement estimated to be experienced by this pipeline is on the order of 1 inch, with possible differential settlements of up to 1 inch over 100 feet of length beneath the structure, corresponding to an angular distortion of approximately 0.001 radians.

Lateral Spread

Generally, there were no continuous liquefiable layers across the area of the new IPS. There are some portions along the influent force mains alignment where a shallow, 2-foot thick, liquefiable layer appeared somewhat continuous in our explorations. This layer was encountered in the area where the force mains alignment is within approximately 200 feet of the Jordan River. This apparent continuous, liquefiable layer coincides approximately with the spring line elevation of the influent pipelines. In a potential lateral spreading event, soils above the spring line of the pipes could deform in the direction of the Jordan River.

Calculations were performed to investigate lateral spread potential for this zone using the revised multilinear regression equations for predicting lateral spread displacement proposed by Youd et al. (2002) for a scenario with gently sloping ground (Equation 1), and for a scenario with a free face (Equation 2). For one case where the influent pipeline alignment is close to the Jordan River, a free face case was considered for the potentially liquefiable zone. All other lateral spreading calculations assumed a gently sloping ground scenario. For the gently sloping ground lateral spreading calculations, a regional slope of 1.5% was assumed for the site. For all performed lateral spread calculations, the cumulative thickness of the coarse-grained, non-plastic layers falls outside of the bounds established by the case histories (as noted on the exports included in Attachment 1). The free face ratio used for the calculations is also outside of the bounds established by case histories. Thus, the procedure proposed by Youd et al. (2002) may over-predict the amount of lateral spread that this zone will produce. Accordingly, the lateral spread evaluation is likely conservative and over-predicts the displacement. Youd (2018) also expounded on data and the approach presented in the earlier publication indicating that non-glacial and non-sensitive sediments with fines content over 50 percent should be screened out of the analysis. Furthermore, a general geologic characterization of these soils indicates that this zone may be Pleistocene or Holocene in origin. Available literature suggests that soils of Pleistocene age have a low susceptibility to liquefaction and lateral spread (Youd and Perkins 1978).

$$\log D_h = -16.213 + 1.532 * M - 1.406 * \log\left[R + 10^{(0.89*M-5.64)}\right] - 0.012 * R + 0.338 * \log S + 0.540 * \log T_{15} + 3.413 * \log(100 - F_{15}) - 0.795 * \log(D50_{15} + 0.1mm) \quad (1)$$

where,

D_h = Free Face Lateral Spread Distance (m)

M = Earthquake Moment Magnitude

R = Horizontal Distance to Seismic source (km)

S = Slope in ground (%)

T_{15} = Cumulative Thickness of Liquefiable Layers ($N_{1(60)} < 15$) (m)

$D50_{15}$ = Average Mean Grain Size in T_{15} Liquefiable Layers (mm)

F_{15} = Average Fines in T_{15} Liquefiable Layers (%)

$$\log D_h = -16.713 + 1.532 * M - 1.406 * \log\left[R + 10^{(0.89*M-5.64)}\right] - 0.012 * R + 0.592 * \log W + 0.540 * \log T_{15} + 3.413 * \log(100 - F_{15}) - 0.795 * \log(D50_{15} + 0.1mm) \quad (2)$$

where, D_h = Free Face Lateral Spread Distance (m)
M = Earthquake Moment Magnitude
R = Horizontal Distance to Seismic source (km)
W = Free face Ratio [Height of Free Face/Distance to Base of Free Face]
T_{15} = Cumulative Thickness of Liquefiable Layers ($N_{1(60)} < 15$) (m)
$D50_{15}$ = Average Mean Grain Size in T_{15} Liquefiable Layers (mm)
F_{15} = Average Fines in T_{15} Liquefiable Layers (%)

The slope was determined regionally for the site. This analysis assumes that lateral displacements of the IPS site would be in a northwestward direction, except in the case where a free face scenario occurs, and lateral spreading would move towards the canal, and Jordan River. A modal magnitude of 7.1 and source-to-site distance of 2.5 kilometers were used (in the case of influent pipeline, source-to-site distance of 2.9 kilometers was used). The modal magnitude and distance were used instead of the mean magnitude and distance because of the significant seismic hazard contribution from the nearby Wasatch Fault Section. The fines content for the T15 soil layers was determined by using laboratory data for relevant samples or fines content correlations for relevant CPT explorations. The cumulative thickness of layers that may contribute to lateral spread falls outside of the range of case histories data. Potential lateral spreading deformations are on the order of 2 to 8 inches in the vicinity of the force main pipeline.

The Youd et al. (2002) model is sensitive to fines content. Tested soils with corrected blowcounts less than 15 typically consisted of silts/silty sands with fines contents between 20 and 65 percent. High fines contents when used with the Youd et al. (2002) model will predict markedly lower lateral displacements than clean granular soil layers.

The Youd et al. (2002) model has bounds of F15 and D5015 for which their lateral displacement values are verified. Combinations of F15 and D50 that fall outside of the recommended limits are not susceptible to lateral spread (Youd 2018). If actual D50 values are less than what was assumed for this analysis, results from the Youd et al. (2002) model may have high uncertainty or may be unreliable. Youd et al. (2009) suggest that the prediction of lateral spread displacements may be estimated in fine-grained materials, even though the fines content may exceed the specified 70 percent limit; however, this limit should be reduced to 50 percent based on a later publication (Youd 2018).

In addition to the model limitations mentioned above, lateral spread is heavily reliant on layer continuity. Subsurface investigations suggest that soils in which lateral spread is predicted are fluvial and alluvial deposits. Layers deposited in alluvial or fluvial environments are commonly discontinuous, winding, braided, and lensed. The lateral spread analyses predictions shown in Attachment 1 assume the worst-case scenario where these layers are continuous. Due to the depositional environment, discontinuous nature of liquefaction-susceptible soils, age of deeper sediments (Pleistocene soils are generally characterized as having low liquefaction potential), and variable plasticity and fines content of Holocene liquefaction-susceptible soils, it is our opinion that lateral spreading in the vicinity of the IPS facilities should not be anticipated.

Empirical Regression to Estimate Magnitude of Liquefaction Induced Lateral Spread
Ref. Youd., T.L., Hansen, C.M., and Bartlett, S.F.*

Wasatch Fault Rupture for Gently Sloping Area

		Date:	7/10/2020
Site:	**SLC WRF**	By:	EAR
Location:	Area Near Force Mains	Checked:	BWF
Engineer:	URS	Based on general site char. by CPT and SPT	
Owner:	SLCPU		

		Limits:
1.5%	S, Slope in ground (%):	>20% may ground rupture / landslide
	W, Free Face Ratio - Height of FF / Distance to Base of FF (H/L) :	>20% may ground rupture / landslide
2.5	R, Horizontal distance to seismic source (km):	see R limits table - >3km for M=7.5
7.1	M, Earthquate Moment Magnitude:	or equivalent scaling
2.474976	Z_T, depth to the top of the T15 layer (m)	
3.5	T15, Cum. Thickness of Liq Layers (N1(60)<15) (m):	<15m
0.3	DFifty15, Average mean grain size in T15 Liq Layer (mm):	0.08mm<DFifty15>1mm
20	F15, Average % fines (<#200) in T15 Liq Layer:	<50%

	(m)	(ft)
Dh, Free Face Lateral Spread Distance		
Dh, Slope Lateral Spread Distance	0.81	2.65

Free Face Equation:

$$\text{LogDh} = -16.713 + 1.532*M - 1.406*\text{Log}[R + 10^{(0.89M-5.64)}] - 0.012*R + 0.592*\text{LogW} + 0.540*\text{Log}T_{15} + 3.413*\text{Log}(100-F_{15}) - 0.795*\text{Log}(D50_{15} + 0.1\text{mm})$$

Gently Sloping Ground Equation:

$$\text{LogDh} = -16.213 + 1.532*M - 1.406*\text{Log}[R + 10^{(0.89M-5.64)}] - 0.012*R + 0.338*\text{LogS} + 0.540*\text{Log}T_{15} + 3.413*\text{Log}(100-F_{15}) - 0.795*\text{Log}(D50_{15} + 0.1\text{mm})$$

Empirical Regression to Estimate Magnitude of Liquefaction Induced Lateral Spread
Ref. Youd., T.L., Hansen, C.M., and Bartlett, S.F.*

Wasatch Fault Rupture for Free Face

Date: 10/7/2021
Site: **SLC WRF**
By: NA
Location: IPS
Checked: BE
Engineer: AECOM
Based on general site char. by CPT and SPT
Owner: SLCPU

		Limits:
	S, Slope in ground (%):	>20% may ground rupture / landslide
0.1	W, Free Face Ratio - Height of FF / Distance to Base of FF (H/L) :	>20% may ground rupture / landslide
3	R, Horizontal distance to seismic source (km):	see R limits table - >3km for M=7.5
7.1	M, Earthquate Moment Magnitude:	or equivalent scaling
1.524	Z_T, depth to the top of the T15 layer (m)	
0.5	T15, Cum. Thickness of Liq Layers (N1(60)<15) (m):	<15m
0.34	DFifty15, Average mean grain size in T15 Liq Layer (mm):	0.08mm<DFifty15>1mm
9	F15, Average % fines (<#200) in T15 Liq Layer:	<50%

	(m)	(ft)	(in)
Dh, Free Face Lateral Spread Distance	0.10	0.34	4.07
Dh, Slope Lateral Spread Distance			

Note: W and T15 are outside (below) accepted range of regression model inputs. Predicted Dh may be less reliable.

Free Face Equation:

$$LogDh = -16.713 +1.532*M -1.406*Log[R +10^{(0.89M-5.64)}] -0.012*R +0.592*LogW +0.540*LogT_{15} +3.413*Log(100-F_{15}) -0.795*Log(D50_{15} +0.1mm)$$

Gently Sloping Ground Equation:

$$LogDh = -16.213 +1.532*M -1.406*Log[R +10^{(0.89M -5.64)}] -0.012*R +0.338*LogS +0.540*LogT_{15} + 3.413*Log(100-F_{15}) -0.795*Log(D50_{15} +0.1mm)$$

Salt Lake City Water Reclamation Facility
Influent Pump Station
Bearing Capacity Calculation

Purpose

This memorandum details the approach and methodology used to calculate the bearing capacity for several facilities proposed at the New Salt Lake City Water Reclamation Facility (New WRF). These facilities include the influent pump station (IPS) and associated facilities. The IPS and associated facilities are planned to be located near 1200 West and Reclamation Rd, immediately south of the existing Salt Lake City Department of Public Utilities (SLCDPU) Pump Station site and approximately 0.5 mile southeast of the main plant site.

Data Available

AECOM performed geotechnical explorations of subsurface conditions within, or in the vicinity of, the footprint of proposed IPS structures. A subsurface exploration program specifically for the IPS facilities and the influent pipeline was performed in December 2020 through January 2021, and August 2021. These explorations included 18 CPTs and 15 exploratory borings; additional explorations had been performed previously but are not part of this analysis. The explorations analyzed specifically for the IPS facilities and the Influent Pipeline facilities are included in Table 1. Laboratory testing was performed on selected samples collected from the borings in order to help select engineering properties of encountered subsurface materials. The IPS geotechnical report contains information relating to the explorations and laboratory testing performed.

CPT21-OIPS-08	131.4	11.2

Notes:
1. Boreholes were not left open to obtain groundwater measurements and encountered groundwater is not readily observed in boreholes excavated by mud rotary drilling methods. Groundwater depth is assumed to be similar to depths encountered in nearby explorations.
2. This CPT was used in analysis even though it is no longer located on the pipeline alignment.

Assumptions

The following assumptions were made regarding this calculation and supporting data:

- Laboratory tests were performed in accordance with the referenced American Association of State Highway and Transportation Officials (AASHTO) or American Society for Testing and Materials (ASTM) standards and are reported accurately by the subcontracted testing facility.
- Samples tested in the laboratory are representative of the soil unit from which they were obtained. Further, the results of the testing are indicative of material properties for the soil unit.
- Ground water elevation is at an elevation of approximately 4,212 feet near the IPS and associated facilities, or at the base of the foundation elevation, whichever is higher. Based on pore pressure dissipation (PPD) testing, the groundwater may be lower than 4,212 feet, with a greater than 100% of hydrostatic pressure increase with depth. A higher elevation of 4,212 feet was considered in the bearing capacity analysis for the IPS.
- The top of native ground surface in the area of the IPS and associated facilities ranges from 4,217 feet to 4,220 feet. The proposed finished grade in the area of the IPS and associated facilities ranges between approximately 4,221 to 4,222 feet.
- Excavation shoring is anticipated surrounding the IPS facility, and lightweight backfill was being considered at the time of preparation of this calculation. The bearing capacity analysis considered a staged construction sequence including surrounding backfill being brought up as the facility is constructed. Assumptions relating to incremented structure load application and backfilling are noted in the Methodology and Analysis Results Sections.

Methodology

Bearing resistance analysis includes development of an idealized soil profile based on encountered subsurface conditions, interpreted laboratory test results, construction of a bearing resistance model to represent the subsurface conditions at the project site, the dimensions of the proposed facilities, and surficial grade changes at the structure locations.

For the IPS and associated facilities, the shear strength parameters were selected based on review of the shear strength characterization for the Liquid Train area as well as in the immediate vicinity of the IPS facility.

The modulus of subgrade reaction is analyzed using formula 9-9 in Bowles, Foundation Analysis and Design (1997). The formula input parameters include the allowable bearing capacity and selected safety factor. The analysis and description are shown in Attachment 1.

Calculation Procedure

AECOM used an Excel spreadsheet to perform the bearing resistance analysis for this project. The spreadsheet requires inputs of soil strength, groundwater conditions, foundation dimensions, and foundation embedment depth to analyze the bearing resistance. The allowable bearing resistance was calculated by dividing the nominal bearing resistance by a factor of

safety of 2.5. A detailed description of the bearing resistance analyses methods and factors are presented in Attachment 1 and Attachment 2.

Bearing Layer Soil Parameters

AECOM selected the bearing soil layer parameters for the IPS facilities using available borehole, CPT, and laboratory test data. Selected soil parameters are presented in Table 2. In some cases for which the foundation size was relatively large, shallow surface fills were neglected, and strength parameters were selected based on the underlying clay material.

Groundwater Conditions

In the area of the IPS facility, located near 1200 West and Reclamation Rd, the monitoring well groundwater level for the screened interval was observed to be as high as approximately 4,212 feet based on periodic well measurements in BH19-ITW-6. As noted in the assumptions, for facilities bearing above the estimated groundwater elevation, the depth of groundwater was considered to be at the base of the foundation. Whereas dewatering conditions for the IPS excavation are not known, the groundwater was conservatively assumed to be at the base of the excavation or top of the backfill level for short-term construction analyses, but not higher than 4,212 feet.

Input parameters

Input parameters used in the bearing resistance analysis are summarized in Table 2.

Table 2. Bearing Resistance Analysis Input Parameters

Structure Name	Foundation Dimensions (B x L) or Diameter	Final Grade Elevation	Depth of Foundation Below Final Grade / Effective Embedment Depth	Groundwater Depth in Analysis	Unit Weight of Soil	Drained Parameters		Undrained Parameters	
	(feet)	(feet)	(feet)	(feet)	(pcf)	Friction Angle (deg)	Cohesion (psf)	Friction Angle (deg)	Cohesion (psf)
IPS Facility									
Construction – No Backfill	43 x 82	4221.5	0[1]	0[2]	70[3]	--	--	0	1050 (700)[4]
Construction – 20 ft Backfill	43 x 82	4221.5	20[1]	0[2]	70[3]	--	--	0	1050 (700)[4]
Construction – 50 ft Backfill	43 x 82	4221.5	50[1]	9[2]	70[3]	--	--	0	1050 (700)[4]
Long-Term Drained	43 x 82	4221.5	50.5	9.5	70[3]	26 (18)[4]	0	--	--
IPS Electrical (Spot Footings)	7 x 7	4221.5	3.5	3.5	112	26	0	0	750
IPS Odor Control	30 x 72	4221.5	2.5	2.5	112	26	0	0	750
IPS Generator Pad	44 x 80	4221.5	2.5	2.5	112	26	0	0	750
Fuel Tanks	12 x 35	4221.5	2.5	2.5	112	26	0	0	750

Notes: '--' denotes blank entry

1. Effective embedment depth selected based on relative depth of adjacent ground within the IPS excavation.
2. Water level conservatively assumed to be at the base of the excavation or the level of the backfill within the IPS excavation, but not higher than 4,212 feet.
3. Calculations conservatively assume the use of lightweight backfill within the IPS excavation, which was being considered at the time this calculation was prepared.
4. Parameters reduced for punching or local shear calculations in accordance with AASHTO (2017) Section 10.6.3.1.2b.

Analysis Results

A summary of the allowable drained and undrained bearing resistance results is presented in Table 3. The permanent dead loads are compared to the allowable bearing resistances. For the IPS facility, which has a significant planned excavation, the effective stress reduction associated with the excavation was subtracted from the applied load for the long-term drained condition and for the short-term undrained condition to the level of the adjacent backfill (i.e. for no backfill, no excavation load

reduction was used; for 20 feet of backfill, 20 feet of excavation load reduction was used, and for 50 feet of backfill, the full 50 feet of excavation load reduction was used). This was done in part because limited confinement of bearing soil would be available when backfilling around the structure has not yet been completed. A staged analysis was performed for undrained loading conditions for the IPS to consider the incremental loading and backfilling of the structure. The incremental load assumptions (limits) associated with the analyzed backfill levels are noted in Table 3.

Table 3. Bearing Resistance Analysis Results

Structure Name	Allowable Drained Bearing Resistance (ksf)	Allowable Undrained Bearing Resistance (ksf)	Applied Permanent Dead Load (Effective Net Load) (ksf)	Is Allowable Bearing Resistance ≥ Permanent Dead Load or Effective Net Load (Y/N)
IPS Facility				
Construction – No Backfill	--[1]	1.6	1.5 (1.5)[2]	Y
Construction – 20 ft Backfill	--[1]	1.9	2.9 (1.9)[3]	Y
Construction – 50 ft Backfill	--[1]	2.6	5.2 (2.6)[4]	Y
Long-Term Drained	7.3	--[1]	5.8 (3.2)[5]	Y
IPS Electrical	3.4	2.0	1.5	Y
IPS Odor Control	5.1	1.8	0.5	Y
IPS Generator Pad	6.5	1.8	0.3	Y
Fuel Tanks	3.0	1.8	0.3	Y

Notes:

1. Bearing Resistance not applicable for the given analysis condition.
2. Assumes that up to 25 percent of the total structure dead load (5.8 ksf) may be applied before any backfill is placed around the IPS structure.
3. Assumes that up to 50 percent of the total structure dead load (5.8 ksf) may be applied once backfill has been completed up to an elevation 20 feet above the IPS structure bearing elevation. Effective net load considers that portion of the soil excavation for the IPS facility which is below the backfill level of 20 feet above the structure bearing elevation.
4. Assumes that up to 90 percent of the total structure dead load (5.8 ksf) may be applied once backfill has been completed up to an elevation 50 feet above the IPS structure bearing elevation. Effective net load considers that portion of the soil excavation for the IPS facility which is below the backfill level of 50 feet above the structure bearing elevation. It is anticipated that the construction schedule will be slow enough to allow drainage under initial loads such that adequate strength gain will have occurred by the time the final portion of the permanent load is applied.
5. Considers long-term total structure dead load (5.8 ksf) under drained conditions. Effective net load considers the effect of the soil excavation for the IPS facility.

A summary of the Modulus of subgrade reaction analysis presented in Table 4. These moduli of subgrade reaction are appropriate for the foundation design parameters and soil properties shown in Table 2. If there are changes in the foundation location, dimensions, bearing elevation, or other design parameters, the bearing capacity or modulus of subgrade reaction may also change, and the geotechnical engineer should be contacted to assess the impact of the changes on the recommendations provided herein.

where:

c = cohesion, taken as undrained shear strength (ksf)
N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 10.6.3.1.2a-1 (dim)
N_q = surcharge (embedment) term (drained or undrained loading) bearing capacity factor as specified in Table 10.6.3.1.2a-1 (dim)
N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 10.6.3.1.2a-1 (dim)
γ = total (moist) unit weight of soil above or below the bearing depth of the footing (kcf)
D_f = footing embedment depth (ft)
B = footing width (ft)
C_{wq},$C_{w\gamma}$ = correction factors to account for the location of the groundwater table as specified in Table 10.6.3.1.2a-2 (dim)
s_c, s_γ,s_q = footing shape correction factors as specified in Table 10.6.3.1.2a-3 (dim)
d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 10.6.3.1.2a-4 (dim)
i_c, i_γ, i_q = load inclination factors determined from Eqs. 10.6.3.1.2a-5 or 10.6.3.1.2a-6, and 10.6.3.1.2a-7 and 10.6.3.1.2a-8 (dim)

$$q_R = \varphi_b \, q_n \qquad (10.6.3.1.1\text{-}1)$$

where:

φ_b = resistance factor specified in Article 10.5.5.2.2
q_n = nominal bearing resistance (ksf)

For $\phi_f = 0$:

$$i_c = 1 - (nH/cBLN_c) \qquad (10.6.3.1.2a\text{-}5)$$

For $\phi_f > 0$:

$$i_c = i_q - [(1 - i_q)/(N_q - 1)] \qquad (10.6.3.1.2a\text{-}6)$$

in which:

$$i_q = \left[1 - \frac{H}{(V + cBL\cot\phi_f)}\right]^n \qquad (10.6.3.1.2a\text{-}7)$$

$$i_\gamma = \left[1 - \frac{H}{V + cBL\cot\phi_f)}\right]^{(n+1)} \qquad (10.6.3.1.2a\text{-}8)$$

$$n = [(2 + L/B)/(1 + L/B)]\cos^2\theta + [(2 + B/L)/(1 + B/L)]\sin^2\theta \qquad (10.6.3.1.2a\text{-}9)$$

where:

B = footing width (ft)
L = footing length (ft)
H = unfactored horizontal load (kips)
V = unfactored vertical load (kips)
θ = projected direction of load in the plane of the footing, measured from the side of length L (degrees)

In practice, therefore, for footings with modest embedment, consideration may be given to omission of the load inclination factors.

0.0	0.5	0.5
D_f	1.0	0.5
$>1.5B + D_f$	1.0	1.0

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

$>1.5B + D_f$	1.0	1.0

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

$>1.5B + D_f$	1.0	1.0

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

0.0	0.5	0.5
D_f	1.0	0.5
$>1.5B + D_f$	1.0	1.0

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

D_w	C_{wq}	$C_{w\gamma}$
0.0	0.5	0.5
D_f	1.0	0.5
$>1.5B + D_f$	1.0	1.0

Where the position of groundwater is at a depth less than 1.5 times the footing width below the footing base, the bearing resistance is affected. The highest anticipated groundwater level should be used in design.

10.6.3.1.2b—Considerations for Punching Shear

If local or punching shear failure is possible, the nominal bearing resistance shall be estimated using reduced shear strength parameters c^* and ϕ^* in Eqs. 10.6.3.1.2b-1 and 10.6.3.1.2b-2. The reduced shear parameters may be taken as:

$$c^* = 0.67c \qquad (10.6.3.1.2b\text{-}1)$$

$$\phi^* = \tan^{-1}(0.67\tan\phi_f) \qquad (10.6.3.1.2b\text{-}2)$$

where:

c^* = reduced effective stress soil cohesion for punching shear (ksf)
ϕ^* = reduced effective stress soil friction angle for punching shear (degrees)

C10.6.3.1.2b

Local shear failure is characterized by a failure surface that is similar to that of a general shear failure but that does not extend to the ground surface, ending somewhere in the soil below the footing. Local shear failure is accompanied by vertical compression of soil below the footing and visible bulging of soil adjacent to the footing but not by sudden rotation or tilting of the footing. Local shear failure is a transitional condition between general and punching shear failure. Punching shear failure is characterized by vertical shear around the perimeter of the footing and is accompanied by a vertical movement of the footing and compression of the soil immediately below the footing but does not affect the soil outside the loaded area. Punching shear failure occurs in loose or compressible soils, in weak soils under slow (drained) loading, and in dense sands for deep footings subjected to high loads.

in which:

$$N_{cm} = N_c s_c i_c \qquad (10.6.3.1.2a\text{-}2)$$

$$N_{qm} = N_q s_q d_q i_q \qquad (10.6.3.1.2a\text{-}3)$$

$$N_\gamma m = N_\gamma s_\gamma i_\gamma \qquad (10.6.3.1.2a\text{-}4)$$

where:

c = cohesion, taken as undrained shear strength (ksf)
N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 10.6.3.1.2a-1 (dim)
N_q = surcharge (embedment) term (drained or undrained loading) bearing capacity factor as specified in Table 10.6.3.1.2a-1 (dim)
N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 10.6.3.1.2a-1 (dim)
γ = total (moist) unit weight of soil above or below the bearing depth of the footing (kcf)
D_f = footing embedment depth (ft)
B = footing width (ft)
C_{wq},$C_{w\gamma}$ = correction factors to account for the location of the groundwater table as specified in Table 10.6.3.1.2a-2 (dim)
s_c, s_γ,s_q = footing shape correction factors as specified in Table 10.6.3.1.2a-3 (dim)
d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 10.6.3.1.2a-4 (dim)
i_c, i_γ, i_q = load inclination factors determined from Eqs. 10.6.3.1.2a-5 or 10.6.3.1.2a-6, and 10.6.3.1.2a-7 and 10.6.3.1.2a-8 (dim)

$$q_R = \varphi_b \; q_n \qquad (10.6.3.1.1\text{-}1)$$

where:

φ_b = resistance factor specified in Article 10.5.5.2.2
q_n = nominal bearing resistance (ksf)

For $\phi_f = 0$:

$$i_c = 1 - (nH/cBLN_c) \qquad (10.6.3.1.2a\text{-}5)$$

For $\phi_f > 0$:

$$i_c = i_q - [(1 - i_q)/(N_q - 1)] \qquad (10.6.3.1.2a\text{-}6)$$

in which:

$$i_q = \left[1 - \frac{H}{(V + cBL\cot\phi_f)}\right]^n \qquad (10.6.3.1.2a\text{-}7)$$

$$i_\gamma = \left[1 - \frac{H}{V + cBL\cot\phi_f)}\right]^{(n+1)} \qquad (10.6.3.1.2a\text{-}8)$$

$$n = [(2 + L/B)/(1 + L/B)]\cos^2\theta + [(2 + B/L)/(1 + B/L)]\sin^2\theta \qquad (10.6.3.1.2a\text{-}9)$$

where:

B = footing width (ft)
L = footing length (ft)
H = unfactored horizontal load (kips)
V = unfactored vertical load (kips)
θ = projected direction of load in the plane of the footing, measured from the side of length L (degrees)

In practice, therefore, for footings with modest embedment, consideration may be given to omission of the load inclination factors.

Figure C10.6.3.1.2a-1 shows the convention for determining the θ angle in Eq. 10.6.3.1.2a-9.

φ_b = resistance factor specified in Article 10.5.5.2.2
q_n = nominal bearing resistance (ksf)

For $\phi_f = 0$:

$$i_c = 1 - (nH/cBLN_c) \qquad (10.6.3.1.2a\text{-}5)$$

For $\phi_f > 0$:

$$i_c = i_q - [(1 - i_q)/(N_q - 1)] \qquad (10.6.3.1.2a\text{-}6)$$

in which:

$$i_q = \left[1 - \frac{H}{(V + cBL\cot\phi_f)}\right]^n \qquad (10.6.3.1.2a\text{-}7)$$

$$i_\gamma = \left[1 - \frac{H}{V + cBL\cot\phi_f)}\right]^{(n+1)} \qquad (10.6.3.1.2a\text{-}8)$$

$$n = [(2 + L/B)/(1 + L/B)]\cos^2\theta + [(2 + B/L)/(1 + B/L)]\sin^2\theta \qquad (10.6.3.1.2a\text{-}9)$$

where:

B = footing width (ft)
L = footing length (ft)
H = unfactored horizontal load (kips)
V = unfactored vertical load (kips)
θ = projected direction of load in the plane of the footing, measured from the side of length L (degrees)

In practice, therefore, for footings with modest embedment, consideration may be given to omission of the load inclination factors.

Figure C10.6.3.1.2a-1 shows the convention for determining the θ angle in Eq. 10.6.3.1.2a-9.

Salt Lake City Water Reclamation Facility Influent Pump Station Settlement Calculation

Purpose

This memorandum details the approach and methodology used to calculate estimates of settlement for several facilities in the area of the proposed Influent Pump Station (IPS) at the New Salt Lake City Water Reclamation Facility (New WRF). The IPS facilities include the IPS Electrical Building, IPS generator pad, IPS odor control, and Influent Force Main Sewer. IPS facilities are planned to be supported on mat foundations and/or other shallow foundations This document summarizes the data, assumptions, and methodology used in the settlement calculation, as well as the resulting settlement estimates.

AECOM performed geotechnical explorations of subsurface conditions within, or in the vicinity of, the footprint of proposed IPS facilities. The subsurface exploration program for the new IPS facilities was performed between July 2018 and August 2021. The explorations performed by AECOM included 22 CPTs and 20 exploratory borings. Additionally, two (2) CPTs and eight (8) exploratory borings were performed by Intermountain GeoEnvironmental Services, Inc. (IGES) of South Salt Lake, a subconsultant to AECOM, within the footprint of the proposed IPS facilities. The summary of exploration information is provided in Table 1. Spectral Analysis of Surface Waves (SASW) and Multichannel Analysis of Surface Waves (MASW) were also performed between September 10, 2018, and September 15, 2018, to help assess seismic site class in the project area. Laboratory testing was performed on selected samples collected from the borings in order to help select engineering properties of encountered subsurface materials.

Notes: ft = feet; '-' denotes a blank entry

1. Surveyed elevation is based on North American Vertical Datum of 1988. Northing and Easting coordinates are provided on the boring logs in North American Datum of 1983 based on the Utah Central State Plane Projection
2. Because of the selected mud-rotary drilling method for borings, the groundwater depth was neither readily observed nor measured in the field. For CPT explorations, the groundwater depth is inferred, based on the results of the shallowest pore pressure dissipation test performed within each sounding, assuming 100 percent hydrostatic conditions.
3. Exploration was overseen by Intermountain GeoEnvironmental Services, Inc. of South Salt Lake, a subconsultant to AECOM.

CPT soundings were completed using a piezocone penetrometer with a 15-square-centimeter (cm^2) tip and net area ratio of 0.8. Pore pressure dissipation (PPD) tests were performed at select depths in the cone penetration soundings. Groundwater depths reported in Table 1 are generally calculated from the equilibrium pore pressure measured in the shallowest PPD test for each CPT sounding.

Exploratory borings were completed with a CME-75 truck-mounted drill, equipped with a 4-7/8-inch drag bit, or a CME-55 track-mounted drill rig equipped with a 3-3/4-inch outer diameter drag bit. Penetration resistances were obtained from the number of hammer blows observed to drive a split-spoon standard penetration test (SPT) sampler using a 140-pound automatic hammer dropped from a height of 30 inches. The resistance to sampler penetration into a subsurface layer is noted as blow counts (N) on the logs and refers to the number of hammer blows to advance the sampler a distance of 12 inches, beginning after 6-inches of penetration into the subsurface materials (i.e. the number of hammer blows for 18 inches of sampler penetration minus the number of hammer blows for the first 6 inches of penetration). Based on recent calibration testing, the calibrated energy transfer ratio may be assumed to be 87 percent for the hammer equipped on the CME-75 drilling equipment. Calibration for energy transfer was not available for the hammer equipped on the CME-55 drill used by Inberg-Miller Engineers until after this study was essentially complete; consequently, an energy transfer ratio of 85 percent was assumed based on experience with similar equipment. Laboratory testing (including consolidation, moisture content, and unit weight testing) was performed on selected soil samples collected from exploratory borings; laboratory test results are

summarized in the remarks column of the corresponding boring log, near the depth where the tested sample was obtained, and laboratory test reports will be provided with the geotechnical report.

Assumptions

The following assumptions were made regarding this calculation and supporting data:

- Laboratory tests were performed in accordance with the referenced American Association of State Highway and Transportation Officials (AASHTO) or American Society for Testing and Materials (ASTM) standards and are reported accurately by the subcontracted testing facility.
- Samples tested in the laboratory are representative of the soil unit from which they were obtained. Further, the results of the testing are indicative of material properties for the soil unit.
- Casagrande's method for estimating pre-consolidation stress (maximum past pressure) is adequate for estimating the level of over-consolidation for plastic soils. For soil samples having an apparent variable virgin compression slope, the virgin compression slope within the anticipated stress range of the soil is appropriate for use in Casagrande's method for estimating pre-consolidation stress.
- Modeling of the pre-consolidation stress (maximum past pressure) using an over-consolidation ratio (OCR) adequately captures the over consolidation within a plastic soil layer.
- Immediate settlement is not affected by maximum past pressure, i.e., the nonplastic soils are normally consolidated and linear elastic.
- The estimated induced vertical stress (Boussinesq 1883) adequately predicts the vertical stress condition as it would be in the field.
- Elastic (immediate) settlement occurs as quickly as loads are placed and is completed by end of construction.
- Settlement estimates are based on preliminary structural foundation information for proposed IPS facilities, including structure dimensions, foundation type, bearing pressure, and bearing elevation. The results presented herein are considered valid for the preliminary structural foundation information received to date.
- Small amounts of immediate settlement that occur during facility construction are accommodated in the construction process and are not of consequence for post-construction settlement consideration.
- The effect of subsurface drains will be localized near the structure and will not significantly influence the pore pressure regime of the entire profile.
- If subsurface drains near hydraulic structures are used, drawdown of the water table in the immediate vicinity of the structure will be temporary (short duration), such as for draining and maintenance of facilities.

Methodology

Settlement estimation included development of an idealized soil profile based on encountered subsurface conditions and interpreted laboratory test results, construction of a settlement model to represent the stress history of the subsurface at the project site and construction of proposed facilities and surficial fills along an estimated project timeline, and interpretation of model and calculation results. Foundation settlement is based on applicable loads and considers elastic, consolidation, and secondary settlement components. Settlement estimation considers both total magnitude (immediate as well as primary and secondary consolidation) and time-rate of settlement.

Calculation Procedure

AECOM used Settle3 version 5.006 (Rocscience Inc. 2020) to perform immediate and primary consolidation settlement calculations for this project. This software package allows the user to estimate settlement using a one-dimensional (1-D) analysis under the irregular fill and structure loads anticipated at the project site.

One of the strengths of using Settle3 over other similar packages is that it uses Terzaghi's one-dimensional consolidation equation solved implicitly to calculate excess pore water pressure at any point in time. This method allows a user to model time-dependent settlement in single layer and multilayer clay soils. The software also allows the user to select the methods used to estimate the induced vertical stress within the soil profile. These methods include Boussinesq (1883), Westergaard (1938), a model for multilayer profiles with layers of varying stiffness using the method of images (Curran and Hammah

2006), and simple load spreading techniques. This versatility allows the user to characterize induced vertical stress and, consequently, characterize total and differential settlement. Induced vertical stresses were estimated using Boussinesq's solution (Boussinesq 1883) for vertical induced stresses in this analysis.

Settle3 requires the input of soil lithology and groundwater conditions to characterize the subsurface in addition to soil properties for each of the soil layers. Moist and saturated unit weights are required for all soil models. For granular, freely-draining soils, settlement is considered elastic and is estimated using a 1-D Young's modulus (constrained modulus). The constrained (1-D) Young's modulus can be obtained from the three-dimensional (3-D) Young's modulus using the following expression (Fellenius 2018):

$$E_s = \frac{E(1-v)}{(1+v)(1-2v)}$$

where, E_s = Constrained (1-D) Young's Modulus
E = 3-D Young's Modulus
v = Poisson's Ratio of the Soil

For clayey, slowly-draining soils, settlement is estimated using traditional consolidation parameters including C_c (virgin compression index), C_r (recompression index), C_v (coefficient of consolidation), C_α (secondary compression index), and $C_{\alpha r}$ (secondary recompression index), in conjunction with σ'_c (pre-consolidation stress), OCR, or OCM (over-consolidation margin). For simplicity, Settle3 allows the use of strain-based consolidation parameters, which are typically referred to as compression ratio (CR), recompression ratio (RR), secondary compression ratio (C_α'), and secondary recompression ratio ($C_{\alpha r}'$), rather than the traditional parameters based on void ratio (Fellenius 2018).

Settle3 allows the user to input soil units as a layer of uniform thickness and depth extending infinitely in all horizontal directions or to define lateral variation in lithology. However, in either case, the initial stress (total and effective) is calculated the same way; each is calculated vertically using only the stress due to gravity. Such a calculation is appropriate for analyses which consider construction of a new fill area or which use free-field soil properties (soil properties developed prior to fill placement). This is because the initial stress state is properly characterized by the calculation implemented in Settle3. Settle3 also accommodates redefining soil parameters with each time step to allow parameter adjustments, if needed, for various stages of the settlement analysis. This feature was utilized in the analysis, as discussed in the sections below.

A spreadsheet issued by Bartlett et al. (2017) for secondary compression evaluation was modified and used to perform estimates of secondary compression settlement for the IPS facilities. The spreadsheet was originally created to include a stress calculation for embankment loading. However, the spreadsheet was modified by AECOM to accommodate importation of stresses from Settle3 to apply the general secondary compression calculation procedure to the more complex loading conditions present at IPS facilities. Three parameters are imported from Settle3 for each facility: pre-consolidation pressure with depth prior to early fill placement activities, effective stress with depth at the end of early fill placement activities, and effective stress with depth under the final loading condition. In addition, the spreadsheet was modified to accommodate use of multiple correlations and/or secondary compression coefficients through the depth profile. Additional detail is provided in the Subsurface Material Characterization Section. Secondary compression calculations are included in Attachments 2 and 3.

Soil Profile

AECOM developed a generalized soil profile for the IPS facilities using available borehole and CPT data from the current work, shown in Table 2. Material characterization for the various soil models selected for idealized profile, as shown in Table 2, will be described in subsequent sections.

Subsurface explorations don't generally indicate the presence of fill materials in the area of the proposed IPS facilities. Primarily fine-grained deposits were encountered, with a few thin (about 4 feet in thickness, or less) coarse-grained sand layers dispersed throughout the soil profile. Based on the tested samples, fine-grained deposits appear to be composed primarily of very soft to stiff, medium- to high-plasticity fat clays; very soft to very stiff, low- to medium-plasticity lean clays; and nonplastic to low-plasticity silts with varying amounts of sand. Coarse-grained layers, which are dispersed through the subsurface profile, generally are composed of very loose to dense sands.

Table 2. Summary of Generalized Soil Profile for the IPS Facilities

Layer No.	Soil Model	Layer Thickness	Depth at Top of Layer (ft)	Depth at Bottom of Layer (ft)	Elevation at Top of Layer (ft)	Elevation at Bottom of Layer (ft)
-	Existing Fill Load	0	-	-	-	4217
1	Unsaturated Sand/Clay	8	0	8	4217	4209
2	Clay 1	11	8	19	4209	4198
3	Sand 1	4	19	23	4198	4194
4	Clay 2	10	23	33	4194	4184
5	Clay 3	27	33	60	4184	4157
6	Clay 4	15	60	75	4157	4142
7	Sand 2	7	75	82	4142	4135
8	Clay 5	29	82	111	4135	4106
9	Sand 2	2	111	113	4106	4104
10	Clay 5	7	113	120	4104	4097
11	Sand 2	2	120	122	4097	4095
12	Clay 5	4	122	126	4095	4091
13	Sand 2	8	126	134	4091	4083
14	Clay 5	2	134	136	4083	4081
15	Sand 2	2	136	138	4081	4079
16	Clay 5	20	138	158	4079	4059
17	Sand 2	10	158	168	4059	4049
18	Clay 5	32	168	200	4049	4017

Groundwater Conditions

Groundwater was encountered in the explorations at depths of approximately 2 to 14 feet below the ground surface (groundwater encountered at elevations ranging from 4,208 to 4,216 feet), near the proposed IPS facilities. It was assumed that the groundwater was defined by a constant elevation at the time of drilling for this site. Based on the subsurface explorations identified in Table 1, the groundwater was inferred to be at an approximate elevation of 4,207 feet, which corresponds to a depth of roughly 10 feet or so, relative to existing ground, depending on the ground surface elevation. PPD tests performed at the project site were plotted with elevation, and a pore pressure trend line was selected to represent existing pore water pressure conditions. The pore pressure trend line suggests that there is a slight artesian condition at the IPS site, corresponding to approximately 118% of hydrostatic pressure.

Subsurface Material Characterization

AECOM developed soil properties for each of the layers shown in Table 2. These soil parameters included unit weight, Young's modulus (nonplastic soils), and traditional consolidation theory parameters (plastic soils). The following subsections establish the basis for selecting each parameter used in this analysis.

Unit Weight

More than 100 unit weight test results were available from laboratory testing performed for the New WRF, and soil unit weight for generalized soil layers was selected based on a review of average unit weight for the depth ranges in which the various soil layers are applied in the settlement analysis for the IPS facilities. The selected soil unit weights for each generalized soil layer for the IPS facilities are shown in Table 3 (see Table 2 for generalized soil layers).

Table 3. Summary of Estimated Unit Weights for the IPS Facilities

Soil Layer Description	Soil Unit Weight (pcf)
Clay 1	113
Clay 2	113
Clay 3	113
Clay 4	113
Clay 5	113
Sand 1	113
Sand 2	115

Elastic Modulus

AECOM estimated immediate soil settlement using the linear stress-strain behavior of Young's modulus in conjunction with the induced vertical stress for each layer.

For this analysis, nonplastic soils (e.g. fine- and coarse-grained soils which have plasticity index equal to 0) were considered susceptible to immediate elastic settlement. A Young's modulus was developed for each nonplastic soil layer based on soil type and relative density. Each modulus was estimated based on the typical range of Young's modulus values presented in Table C10.4.6.3-1 of AASHTO (2017). Relative densities for soil units were based on corrected blow counts, (N1)60, for each soil unit and by comparing CPT tip resistance for layers without available blow counts.

Primary Consolidation Parameters

AECOM estimated primary consolidation settlement using log-linear stress-strain behavior and conventional methods in conjunction with the induced vertical stress for each layer.

For this analysis, only plastic soils (fine-grained soils, which were tested with a plasticity index equal to 1, or more) were considered susceptible to consolidation settlement. Strain-based consolidation parameters were interpreted from laboratory test data completed on plastic soil samples. The compression ratio, CR, was interpreted as the steepest slope between two points on the virgin compression portion of the log-linear consolidation curve. Some samples showed flattening of the virgin compression slope for higher load stages. The steeper portion (higher compression ratio) was selected for these samples in part because the lower stress range of virgin compression is more representative of the stress range to which the soil layers will be subjected. The recompression ratio, RR, was interpreted as the steepest slope between two points on the unloading portion of the log-linear consolidation curve. The coefficient of consolidation, C_v, was conservatively selected from values reported by the testing laboratory for an appropriate range of stresses. Consolidation test results were plotted with elevation and developed parameters for the generalized soil layers used in the analysis. The Casagrande (1936) method was used for evaluating the pre-consolidation pressure for a given sample. For soil samples having an apparent variable virgin compression slope, the virgin compression slope within the anticipated stress range of the soil was used in Casagrande's method for estimating pre-consolidation stress. Parameters were selected to investigate settlement that could occur for the IPS facilities. Settlement parameters used in the analysis are presented in Table 4 and are influenced by test results obtained from explorations at the New WRF main plant site and by encountered materials in explorations at the IPS site. Examples of the interpretations of laboratory consolidation tests are provided in Attachment 4.

AECOM used the OCR as a measure of the level of over-consolidation in a soil layer. The selected primary consolidation parameters are presented in Table 4.

The recompression coefficient for each clay layer was reduced for all stages following early fill activities. Based on experience, engineering judgment, and review of case histories (Lee et al., 2013; Asadi & Sokhango, 2018; Dong, 2014; Ou et al., 1998; Tan et al., 2018; Tan & Wang, 2013a; Tan & Wang, 2013b), it is our opinion that actual rebound is often less than rebound estimated using the full recompression coefficients, on the order of one-third to one-half of the rebound estimated using full coefficients. Two abandoned clarifiers located in the existing WRF were taken out of service in the early 2000's. Staining on the tank base next to adjacent pavement suggests that rebound occurred after unloading the fluid weight from the tanks when they were taken out of service. Field measurements taken at three locations on each of the two tanks had an average estimated rebound of 1.7 inches from an estimated unloaded fluid weight of 0.67 ksf. This corresponds to

approximately 2.6 inches of rebound per 1 ksf. This unit rebound from field measurements was compared with recompression estimates in Settle3 using reduction factors of one-third and one-half. The estimated recompression settlement using a recompression coefficient of one-third of the initial interpreted laboratory coefficient was close to the relationship developed from field measurements of tank rebound. Accordingly, for settlement modeling of the IPS, a factor of one-third was applied to the recompression coefficients interpreted from laboratory data for each generalized soil layer in all model stages following early fill activities; this factor influences both rebound and recompression estimates. Table 9 presents a summary of our best estimate of primary consolidation parameters for the IPS. Figure 1 shows the nearby CPTs, the interpreted vertical effective stress, OCR values, and our best-estimated OCRs based on the available AECOM and IGES consolidation tests. In addition, Figure 2 shows interpreted compression ratio, CR, and re-compression ratio, RR, for the laboratory test data, and the nearby CPTs. The selected best estimate trend for each of these parameters is also plotted on the graphs in each figure.

We observed a significant portion of interbedded silt in some of the clay layers and to take its effect into account in our model we reduced compression and recompression ratios proportional to the silt content of the clay layer. For example, clay layer 1 had 40% silt content, so we reduced its RR and CR by 40%. In some of the layers, where percentage of interbedded silt varied significantly (such as clay layer 3) we broke them into sublayers and separately assigned a reduction factor to RR and CR of each sublayer proportional to its silt content rather than uniformly reducing RR/CR of the entire layer.

Table 4. Summary of Primary Consolidation Parameters for the IPS Facilities

Soil Layer Description	Compression Ratio, CR	Recompression Ratio, RR	Over-Consolidation Ratio, OCR	Coefficient of Consolidation, Cv (ft^2/day)
Clay 1	0.2	0.045	1.6	0.4
Clay 2	0.24	0.025	1.6	1.1
Clay 3	0.14	0.03	1.15	1.3
Clay 4	0.25	0.05	1.3	0.8
Clay 5	0.27	0.045	1.9	1.1

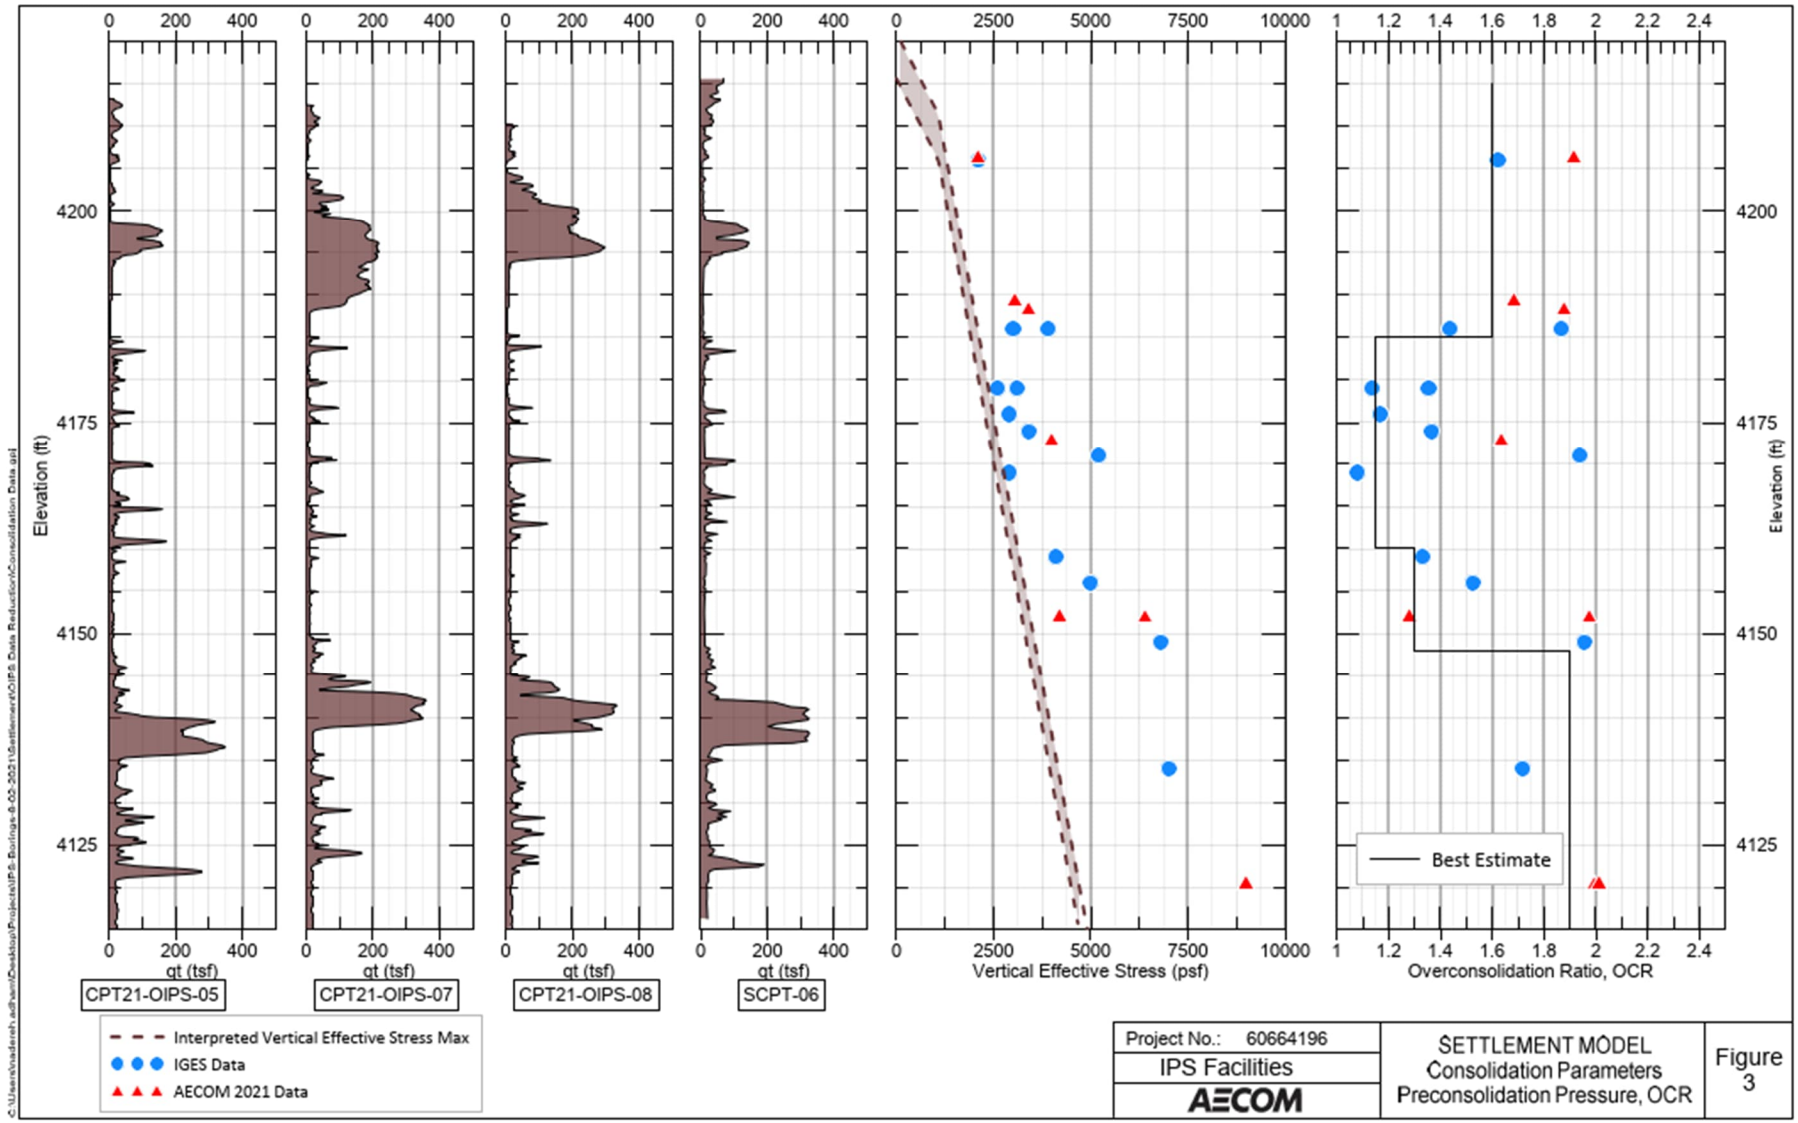

Figure 1. Interpreted vertical effective stress, and over-consolidation ratio for the IPS Facilities.

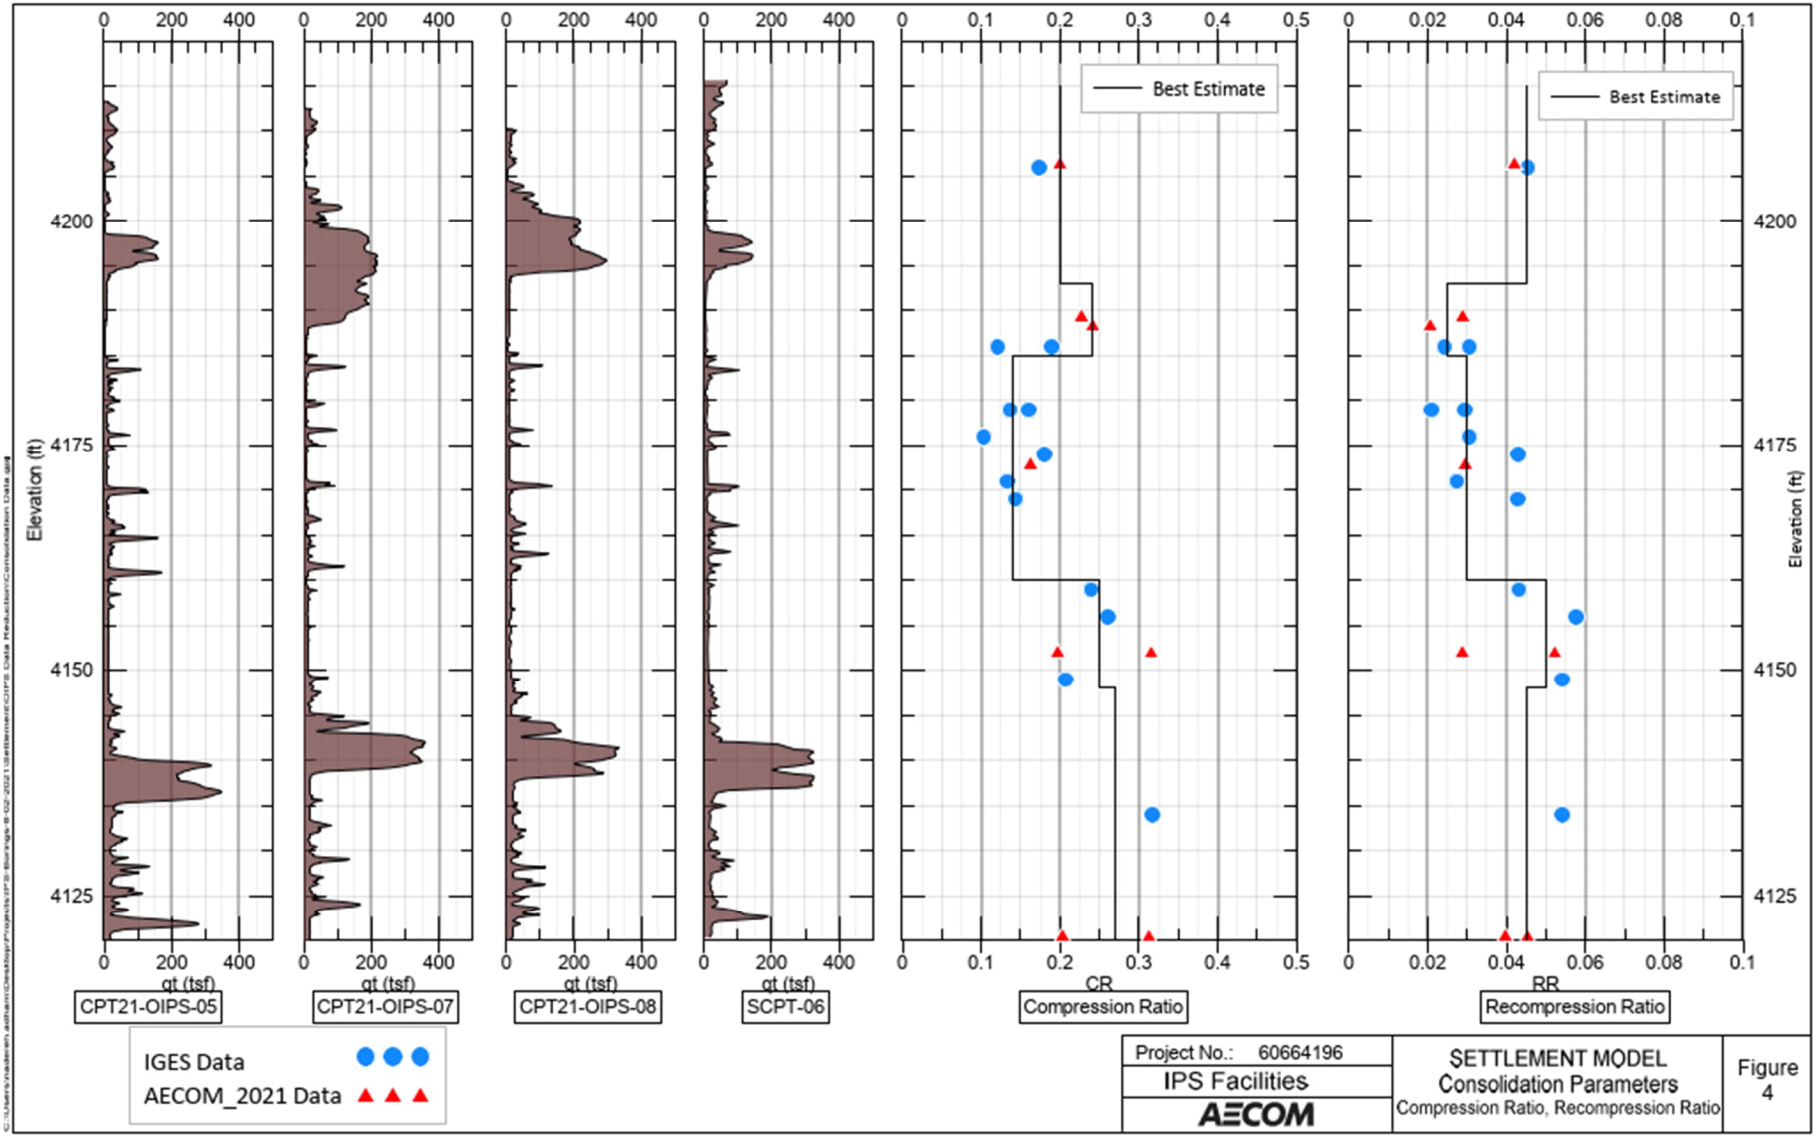

Figure 2. Interpreted compression ratio and re-compression ratio for the IPS Facilities.

Secondary Compression Parameters

AECOM considered secondary soil volume reduction associated with plastic adjustment of the soil fabric (Das 2006) using the secondary compression ratio, C_α'. For this analysis, only plastic soils were considered susceptible to secondary compression settlement. AECOM reviewed a secondary compression study conducted by Bartlett et al. (2017) for data along the Wasatch Front in addition to site-specific data, which included available time-rate of consolidation test results. Though secondary compression tests were not included in the laboratory testing program, secondary compression coefficients were estimated from logarithm of time consolidation plots for some samples for which the load increment appeared to have been kept in place beyond the end of primary consolidation. Bartlett et al. recommend relationships between C_α' and CR based on data tested along the Wasatch Front included in the 2017 study. An average C_α'/CR ratio of 0.0442 is recommended in the study, though one of the study sites, 400 South in Salt Lake City, showed a higher average ratio of 0.0591. The 400 South site is located within a couple of miles of the New WRF, and a similar higher trend was observed in the laboratory test data in the depth range of 20 to 45 feet. The remainder of laboratory test data agreed relatively well with the general ratio recommended. Accordingly, the 400 South relationships from the 2017 study were used in the current analysis for the depth range of 20 to 45 feet, and the general relationships from the 2017 study were used in the current analysis for the clays above and below the depth range of 20 to 45 feet. The selected parameters for the IPS Facilities are summarized in . Interpretations of laboratory consolidation tests for IPS facilities are provided in Attachment 4.

A spreadsheet developed by AECOM based on conventional secondary settlement theory with subdivision of clay layers was used to perform estimates of secondary compression of the IPS structures. Secondary compression calculations are included in Attachments 2 and 3. Refer to the Calculation Procedure Section for additional information.

Table 5. Summary of Secondary Compression Parameters for the IPS Facilities

Soil Layer Description	Secondary Compression Ratio, C_α'
Clay 1	0.008
Clay 2	0.014
Clay 3 (outside the depth range of 20-45 feet)	0.006
Clay 3 (within the depth range of 20-45 feet)	0.008
Clay 4	0.012
Clay 5	0.012

Fill Loads

To represent finished grade in the vicinity of the IPS facilities, fill loads were applied up to finished grade elevation, which is anticipated to be at 4,221.5 feet.

Excavation

Excavation is anticipated prior to facility construction to depths at or below the bearing elevation of the respective facilities. To represent excavation of material, negative loads were applied within the footprint of the structure at the excavation stage. Whereas the site fill load to finished grade is modeled as a single load across the area of the IPS facilities, correction loads were applied at the same bearing contact of the fill/native transition to negate all or a portion of the finished grade fill load, where necessary, within the footprint of structures. For facilities having additional excavation below the estimated native ground surface, additional negative loads were applied at the bearing elevation of the structures. Where excavations extended below the estimated groundwater elevation, effective soil weights were removed, leaving pore pressures in place for the settlement calculation.

Foundations

Spread, strip, and mat foundations for proposed IPS facilities were modeled as polygonal flexible loads placed at design structure elevations according to preliminary site plans and bearing pressures provided by the design team. Bearing pressures and elevations for shallow foundations are summarized in Table 6. Where structures bear below the estimated groundwater elevation, bearing pressures were reduced by the buoyant force of the displaced water.

Table 6. Summary of IPS Foundation Loads in Settle3

Facility	Foundation Type	Permanent Bearing Pressure (psf)	Estimated Percentage of Bearing Pressure Applied During Construction[1] (%)	Bearing Elevation[2] (ft)	Bearing Depth in Settlement Model / Neutral Plane Depth in Model (ft)
Influent Pump Station	Mat	5000 to 5800 [3]	85[4]	4168-4171	52
IPS Electrical Building	Strip/Spread Footings	1500[5]	100	4217.5 - 4218.5	0
IPS Odor Control	Mat	500	100	4218.5-4219.5	0
IPS Generator Pad	Mat	300	100	4218.5-4219.5	0

Notes:

1. A percentage of the total permanent bearing pressure was applied at the Construction stage for time-dependent analysis; the remainder of the permanent bearing pressure was applied at the Commissioning stage (see Table 7). Estimates for several major structures (see note 4) were provided by structure designers, and these were used to inform other estimates.
2. For some structures, bearing elevation and structure dimensions were still under revision at the time these calculations were performed.
3. Proposed foundation has eccentric loading.
4. Estimated percentage of bearing pressure applied at construction stage was provided by the structural team and rounded down to the nearest 5%. See note 1.
5. IPS Electrical building is going to be supported on 10 7'x7' spread footings with permanent bearing pressure of each being 1500 psf.

Load Staging

To model settlement with time and estimate settlement that will occur throughout construction stages, AECOM prepared Settle3 models with time stages. Settle3 reports the settlement at the beginning of each time stage. A preliminary construction schedule for the IPS Facilities was considered in selection of the simplified time stages. The time stages created in Settle3 and a description of loads at each time stage for the IPS Facilities are displayed in Table 7.

Table 7. Summary of Time Stages in Settlement Model for the IPS Facilities

Time Stage Name	Model Time (days)	Duration	Description of Loading/Model
Existing Conditions	0	1 day	Soil representative of existing conditions; no loads placed
Place New Fill	1	~8 months	Fill placed to estimated finished grade elevation (4221.5 feet)
Excavation	250	5 days	Corrections to finished grade fill are made, as needed; Additional material excavated down to bearing elevation of respective structure
Under-slab Backfill	255	5 days	Load placed at bearing elevation of IPS structure to represent 2 feet of structural backfill underneath IPS mat.
IPS Construction	260	1 day	Construction loads applied (percentages of loads ranging from 85-100% depending on nature of structure – see Table 6) Backfill added in IPS excavation surrounding IPS facility.
Day after lower construction	261	~1 month	No change to model
Connect Inlet	290	5 days	Load placed to represent weight of inlet wye.
Backfill Inlet	295	5 days	Load placed to represent backfill placed over the inlet wye.
Finish IPS Structure	300	~10 months	Additional load placed for IPS mat to represent construction of above-grade portion of IPS structure.
Commissioning	600	7 days	All the IPS Facilities receive 100% of total permanent load bearing pressure
1 Week PC	607	7 days	1 week Post-Construction (post commissioning); no loads placed
6 Months PC	782	~6 months	6 Months Post-Construction (post commissioning); no loads placed
50 Years PC	18850	~50 years	50 Years Post-Construction (post commissioning); no loads placed

Results

Estimated Surcharge (Early Grading) Settlement

The estimated settlement in the area of the IPS facilities that is induced by early grading activities to raise the existing grade to be near the final ground surface elevation, as measured at the ground surface, is summarized in Table 8. Figures showing the settlement due to early placement of fill material for IPS facilities are included in Attachment 1.

Table 8. Summary of Estimated Settlement induced by Fill Placement in the Area of the IPS Facilities

Facility	Fill-Induced Settlement (inches)
Influent Pump Station	3.1[1]
IPS Electrical Building	1.5[1]
IPS Odor Control	2.5[1]
IPS Generator Pad	1.7[1]

Notes:
1. IPS facilities are not being surcharged. The settlement values here are due to placement of early grading fill.

Rebound

It is anticipated that rebound will occur as a result of excavations and plant operations. Deep excavations prior to facility construction may induce rebound. A summary of estimated rebound for the relatively large, deep IPS facility is provided in Table 9, primarily based on bearing elevation and associated depth of excavation. There are numerous factors that could influence rebound in excavations; the magnitudes reported in the table are only estimates. Actual rebound magnitude could be more or less than that reported in the table. Much of the rebound resulting from excavation may occur during and shortly after excavation, but it should be expected that a portion of the rebound may need to be accommodated in construction of the facilities. During plant operations after commissioning of the new facilities, filling and emptying will result in recompression and rebound, respectively. The magnitude and duration of recompression and rebound depend on the amount of fluid weight removed or added and the rate at which the changes occur. Generally, in part based on field observations made for suspected rebound associated with decommissioned clarifiers in the existing WRF (see the discussion in the Primary Consolidation Parameters Section), it is anticipated that magnitude of rebound or recompression could be on the order of 1 to 3 inches.

Table 9. Estimated Excavation Rebound For the IPS

Facility	Bearing Elevation (ft)	Estimated Excavation Rebound[1] (in)
Influent Pump Station	4168-4171	1 to 3

Notes:
1. Estimated Excavation Rebound is affected by numerous factors and should be considered approximate. Actual excavation rebound may be more or less than the estimates provided.

Estimated Long-Term Settlement of Structures

Estimates of long-term settlement for the IPS facilities are summarized in Table 10. Long-term settlement is anticipated to be composed of recompression, a small amount of immediate settlement occurring during commissioning of the structures, and secondary compression settlement. The former two are reported together as Post-Construction Immediate and Recompression Settlement in the table. Figures showing Post-Construction Immediate, and Recompression Settlement approximated at the ground surface are included in Attachment 1. In addition, settlement approximated at the ground surface for the IPS facilities and at the bearing elevation for the IPS building are included in Attachment 1. Secondary settlement calculations are included in Attachments 2 and 3. Although settlement estimates have been reported to the nearest tenth of an inch, this level of precision is unrealistic for settlement estimates, and actual settlements may be more or less than those, which are reported.

Table 10. Summary of Estimated Long-Term Settlement for the IPS Facilities

Facility	Post-Construction Immediate and Recompression Settlement[1] (inches)	Secondary Compression Settlement[2] (inches)	Total Long-Term Settlement (inches)
Influent Pump Station	2.3	0.0	2.3
IPS Electrical Building	0.5	0.0	0.5
IPS Odor Control	1.0	0.4	1.4
IPS Generator Pad	0.8	0.0	0.8

Notes:

1. Settlement reported here is our estimate, based on field and laboratory data.
2. Secondary settlement is estimated for the design life of the proposed facility, which is assumed to be 50 years.

Estimated Differential Settlement

In addition to total settlement, differential settlement should be considered in design of the structures and appurtenant features. Settlement estimates suggest that significant long-term differential settlement could occur between structures. Differential settlement could also occur across structure footprints. Differential settlement across facilities and between facilities should be considered for its effect on the structures, connections, appurtenant facilities, and the hydraulic grade line for gravity flow systems. While some amount of settlement will occur at the ground surface immediately adjacent to the structures, as induced by the application of foundation and fill loads, differential settlements should be expected from the building footprint outward into the adjacent ground. Accordingly, utilities or features connecting into a structure from the outside could be adversely affected. Both immediate and long-term differential settlement (post construction immediate, recompression, and secondary settlement) need to be considered, and accommodations such as flexible connections at the Table 11. Summary of Secondary Compression Parameters for the IPS Facilities in the figures provided in Attachment 1, and differential Secondary Settlement calculations are provided in Attachment 3.

Estimates of differential settlement for the best estimate model of IPS facilities are summarized in Table 12. Differential settlement is estimated as the difference in settlement estimated at the center of the facility and a corner point located at approximately 1/8 of the facility's length and width or diameter in from the corner or outer extent of the facility. The differential settlement values are composed of secondary settlement and post-construction settlement. Table 12 includes estimated differential settlement of the IPS facilities, the distance between the center and outer point of the facility, and the associated angular distortion in radians.

To help limit the amount of differential settlement between the IPS structure and the bifurcating inlet wye, our analysis assumes the following construction items:

- Constructing the below grade portion of the IPS and backfilling the excavation up to finish grade where possible *before* connecting the bifurcating wye inlet to the IPS structure.
- For backfill material above the bifurcating wye, a material with an average saturated unit weight of 100 pcf or less is needed.
    - This could include an appropriate combination of geofoam, scoria, conventional backfill, or other suitable material, provided buoyancy is considered for materials susceptible to floating.

Although settlement estimates have been reported to the nearest tenth of an inch, this level of precision is unrealistic for settlement estimates, and actual settlements may be more or less than those, which are reported.

Table 12. Summary of Estimated Largest Differential Settlement of IPS Facilities

Facility Quadrant Point	Differential Settlement (in)	Distance from Center Point of Facility (ft)	Absolute Angular Distortion (radians)
IPS Building NW	0.3	33.7	0.001
IPS Electrical NW	0.1[1]	17.7	0.000
IPS Odor Control NW	0.6	29.2	0.002

Facility Quadrant Point	Differential Settlement (in)	Distance from Center Point of Facility (ft)	Absolute Angular Distortion (radians)
IPS Generator Pad NW	0.3	34.2	0.001

Notes: SW = Southwest; SE = Southeast; NW = Northwest; NE = Northeast.

1. Differential settlement for IPS Electrical building is calculated based on the difference between settlement of the inner spread footings and their adjacent corner footings.

Estimated Post-Earthquake Settlement

In addition to total settlement and differential settlement under permanent loads, post-earthquake liquefaction-induced settlement could occur during a seismic event. Estimated post-liquefaction settlement is discussed in detail and presented for specific facilities in the Liquefaction Calculation Package. For general reference, post-liquefaction settlement estimated to occur at the ground surface for the IPS facilities is less than about 2 inches, with post-liquefaction differential settlement estimated to occur at the bearing elevations of IPS facilities being less than 1 inch for most facilities. Post-liquefaction settlement may be non-uniform, and differential settlement could occur. Accordingly, the IPS Facilities, as well as adjacent sidewalks, flatwork, connections, and other appurtenant facilities may require maintenance and repairs following a seismic event.

Settlement estimation often is imprecise, and soil conditions are assessed based on limited points of investigation, limited soil samples, and limited laboratory testing. AECOM's estimates of settlement that are presented in this calculation package may be more or less than actual settlements, and the locations of maximum settlement may vary.

Secondary Settlement Calculation

Project: SLC WRF
Project No.: 60664196
Analysis: IPS_Center (QP 27)
Date: 11/29/2021

Depth of the base of the foundation (ft): 52

Final σ'v to existing σ'p ratio for triggering secondary: 1.05

Time from preloading to construction (months): 0

Average Degree of consolidation at the end of primary consolidation (%): 98

Using Terzaghi equations the required Tv is: 1.500

Depth of the profile in which secondary consolidation is considered (ft): 200

Dividing each layer into at least 3 sublayer(s) with a maximum sublayer thickness of 1 ft

Soil layer	H (ft)	Depth of bot. of layer (ft)	$H_{modified}$ (ft)	double drainage	C_v (ft^2/day)	T_v check	U_{avg} check	$C_{\alpha r}$	t_{EOP} (days)	$t_{const.}$ (days)	t (days)	Mid. Secondary Settlement

IPS Odor Control Building

Secondary Settlement Calculation

Project: SLC WRF
Project No.: 60664196
Analysis: Odor_Center (QP 2)
Date: 11/29/2021

Depth of the base of the foundation (ft): 0

Final σ'v to existing σ'p ratio for triggering secondary: 1.05

Time from preloading to construction (months): 0

Average Degree of consolidation at the end of primary consolidation (%): 98

Using Terzaghi equations the required Tv is: 1.500

Depth of the profile in which secondary consolidation is considered (ft): 200

Dividing each layer into at least 3 sublayer(s) with a maximum sublayer thickness of 1 ft

Soil layer	H (ft)	Depth of bot. of layer (ft)	$H_{modified}$ (ft)	double drainage	C_v (ft^2/day)	T_v check	U_{avg} check	$C_{\alpha r}$	t_{EOP} (days)	$t_{const.}$ (days)	t (days)	Mid. Differential Settlement

IPS Electrical Building

Secondary Settlement Calculation

Project: SLC WRF
Project No.: 60664196
Analysis: Electrical_N (QP 4)
Date: 11/29/2021

Depth of the base of the foundation (ft): 0

Final σ'v to existing σ'p ratio for triggering secondary: 1.05

Time from preloading to construction (months): 0

Average Degree of consolidation at the end of primary consolidation (%): 98

Using Terzaghi equations the required Tv is: 1.500

Depth of the profile in which secondary consolidation is considered (ft): 200

Dividing each layer into at least 3 sublayer(s) with a maximum sublayer thickness of 1 ft

Secondary Settlement Calculation

Project: SLC WRF
Project No.: 60664196
Analysis: Electrical_NW (QP 3)
Date: 11/29/2021

Depth of the base of the foundation (ft): 0

Final σ'v to existing σ'p ratio for triggering secondary: 1.05

Time from preloading to construction (months): 0

Average Degree of consolidation at the end of primary consolidation (%): 98

Using Terzaghi equations the required Tv is: 1.500

Depth of the profile in which secondary consolidation is considered (ft): 200

Dividing each layer into at least 3 sublayer(s) with a maximum sublayer thickness of 1 ft

Soil layer	H (ft)	Depth of bot. of layer (ft)	$H_{modified}$ (ft)	double drainage	C_v (ft^2/day)	T_v check	U_{avg} check	$C_{\alpha r}$	t_{EOP} (days)	$t_{const.}$ (days)	t (days)	Mid. Salt Lake City Water Reclamation Facility
Influent Pump Station
Lateral Earth Pressure Calculation

Purpose

This calculation references the source and details the approach and methodology used to estimate lateral earth pressure for the Influent Pump Station (IPS) facilities planned at the New Salt Lake City New Water Reclamation Facility (New WRF). The project is located at 2300 North, west of Interstate 15 highway in Salt Lake County, Utah. The Influent Pump Station (IPS) and associated facilities are located approximately 0.5 mile southeast of the other liquid train facilities, near 1200 West and Reclamation Rd immediately south of the existing Salt Lake City Department of Public Utilities (SLCDPU) pump station site. The Influent Force Main Pipeline extends from the IPS to the beginning of the remaining Liquid Train facilities, which are located near the southwest corner of the New WRF site.

Data Available

Geotechnical explorations of subsurface conditions were performed by AECOM and a subconsultant, IGES, between 2018 and 2021 for the proposed locations of the IPS and Influent Pipeline. Soil parameters were selected based on available field and laboratory testing from explorations near the IPS and Influent Pipeline. Unit weight and friction angle of the fill were assumed and are described under the Assumptions section. In this calculation, unit weights were selected separately for facilities considering the proximity of the facilities to the available investigations. Field investigations used for each facility are summarized in Table 1. For the IPS and associated facilities, and for the Influent Force Main Pipeline, input soil parameters were selected based on a review of available field and laboratory testing from the liquid train area, as well as from the investigations in the immediate vicinity of the IPS and Influent Force Main Pipeline.

For the IPS and associated facilities, unit weight was selected based on the range and average of unit weight tests from explorations in the in the immediate vicinity of the IPS. Fill is anticipated to be limited to approximately 2 to 4 feet adjacent to facilities associated with the IPS (Electrical facility, Odor Control, Generator Pad). For the IPS, excavation shoring is anticipated to facilitate an excavation of approximately 48 feet below original grade. Lateral earth pressures were developed based on native materials, which may be needed for shoring design, as well as for standard weight backfill and lightweight backfill which are being considered for use adjacent to the IPS. Shear strengths for these materials were selected based on available lab test data and experience with similar materials. For the Influent Force Main Pipeline, soil parameters were selected based on a review of field and laboratory data from explorations performed in the area of the IPS and along the Influent Force Main Pipeline. For conservatism, shear strength parameters were generally selected on the low side of the anticipated range, and unit weight parameters were selected on the high side for active and at-rest calculations and on the low side for passive calculations.

Table 1. Field Investigations and Layer Thickness Considered for Facilities

Structure	Field Investigation(s)	Native Clay Thickness (feet)	Fill Thickness (feet)
IPS	All B21-OIPS and B21-IS Investigations	48.0	4.0
IPS Electrical Building	All B21-OIPS and B21-IS Investigations	2.0	1.0
IPS Odor Control	All B21-OIPS and B21-IS Investigations	1.5	1.0
IPS Generator Pad	All B21-OIPS and B21-IS Investigations	1.5	1.0
Influent Force Main Pipeline	All B21-OIPS and B21-IS Investigations	12.0[1]	0.0[1]

Notes:
1. Fill thickness and depth of pipeline vary along the alignment. For lateral earth pressure analyses, native clay soil parameters were used for the full depth of the pipeline.

The unit weights used for the Active, At-rest, and Passive cases are summarized in Table 2 and Table 3, respectively. Table 4 presents the friction angles used in analysis.

Table 2. Soil Unit Weight for At-rest and Active Cases

Structure	Fill Unit Weight (pcf)	Native Clay Unit Weight (pcf)	Weighted Average (pcf)
IPS Area – Native	--	125.0	--
IPS Area – Fill	135.0	--	--
IPS Area – Lightweight Fill	100.0	--	--

Influent Force Main Pipeline	--	26.0	--

According to AASHTO LRDF BDS 8th Ed. 2017 Section A11.3.2.p 11-112, where a small amount of deflection can be tolerated, k_h can be taken as half of the peak ground acceleration. Where structures are assumed to be non-displacing, the full peak ground acceleration is used. In this study, the value of peak ground acceleration was obtained from a site-specific seismic hazard analysis for the new water reclamation facility done by Lettis Consultants International in accordance with ASCE 7-16 (ASCE 2016). The geometric mean peak ground acceleration, PGA_M is listed in Table 5.

Table 5. Summary of 2,475-Year Return Period Ground Motion Design Parameters

Source	Mean Earthquake Magnitude, M (-)	Mean Source-Site Distance, D (km)	Modal Earthquake Magnitude, M (-)	Modal Source-Site Distance, D (km)	Peak Ground Acceleration, PGA (g)	Peak Ground Acceleration adjusted for Site Class effects, PGA_M (g)
PSHA, 2018[1]	7.1	3.2	7.1	2.5	0.62	0.62

Notes: g = acceleration due to gravity; km = kilometer; PGA = peak ground acceleration

1. "Site-Specific Seismic Hazard Analyses and Development of Seismic Design Ground Motions for the Salt Lake City Water Reclamation Facility, Utah." LCI, 2018.

Assumptions

The following assumptions were made regarding this calculation and supporting data:

- Laboratory tests were performed in accordance with the referenced American Society for Testing and Materials (ASTM) standards and are reported accurately by the subcontracted testing facility.

- Samples tested in the laboratory are representative of the soil unit from which they were obtained. Further, the results of the testing are indicative of material properties for the soil unit.
- The friction angle of the fill is approximately 34 degrees or more. The unit weight of the fill is approximately 135 pcf for the active and at-rest conditions, while it is assumed to be 115 pcf for the passive case.
- The friction angle of the lightweight fill, if used, is approximately 30 degrees or more. The unit weight of the lightweight fill is approximately 100 pcf for the active and at-rest conditions, while it is assumed to be 70 pcf for the passive case.
- Frictional resistance between the soil and wall is characterized by an interface friction angle of two-thirds the soil friction angle for the granular fill material and one-half the soil friction angle for clay material. In some cases where the structure was embedded in both materials, a weighted average based on layer thickness was used.
- The vertical seismic coefficient is assumed to be zero.

Methodology

Earth-retaining and buried structures should be designed considering the lateral earth pressure presented in this package. Typically, to facilitate the application of lateral earth pressure in design for each of the structures, an equivalent fluid weight will be reported for the static and seismic load cases. Equivalent fluid pressures have a triangular pressure distribution in a form similar to that of water but having a different magnitude. In other words, the lateral earth pressure of soil is assumed to increase linearly from the ground surface (i.e., top of the soil adjacent to the wall or foundation) to the base of the wall or foundation if the soil layer is homogenous. In some cases where the embedding depth is below 4,211 feet and the foundation or wall is in contact with a 2-layered soil system, lateral earth pressure of soil is assumed to increase linearly from the ground surface to the interface between two soils. The lateral earth pressure is then assumed to continue to increase linearly with a different slope from the interface down to the bottom of the foundation or wall. The lateral earth pressure coefficients were converted to equivalent fluid weights using the following relationship:

$$\gamma_{LE} = K\gamma'$$

where, γ_{LE} = Equivalent Fluid Weight (same units as γ')

K = Lateral Earth Pressure Coefficient (active/at-rest/passive)

γ' = Effective Soil Unit Weight

The structural designer will be provided equivalent fluid weights and dynamic components of equivalent fluid weights for each of the load cases. Equivalent fluid weights are intended to account only for soil pressure; water pressures must be added to the lateral earth pressures developed in this calculation.

More movement is required to mobilize full passive earth pressures than active earth pressures. More soil strain and movement generally are needed for fine-grained soils to develop full strength, as compared to coarser-grained soils. The magnitude of movement required to mobilize full active and passive earth pressures can be approximated in terms of the ratio of movement of the top of the wall (needed to reach minimum active or maximum passive pressure) to the height of the wall. For the conditions and soil types observed, it is recommended that values of 0.002 and 0.04 be assumed for this ratio in active and passive earth pressure conditions, respectively, for structures bearing in granular fill (above an elevation of 4,218 feet in the IPS area). For structures bearing in clay (below an elevation of 4,218 feet in the IPS area, or below original ground surface along the Influent Force Main Pipeline), it is recommended that ratios of movement at the top of wall to the height of wall of 0.01 and 0.05 be used for active and passive earth pressure conditions, respectively.

Results

The lateral earth pressure coefficients were calculated using the soil parameters described in the Data Available and Assumptions sections. The recommended lateral earth pressure coefficients and dynamic components of lateral earth pressure coefficients are presented in Table 6, and the associated equivalent fluid weights and dynamic components of equivalent fluid weights are presented in Table 7. The dynamic components of earth pressure coefficients and equivalent fluid weights, respectively, should be added to the static earth pressure coefficients and equivalent fluid weights, as needed, for the seismic (pseudostatic) condition.

Table 6. Recommended Lateral Earth Pressure Coefficients for Static and Seismic Cases

Structure	Static			Dynamic (Seismic) Component[1]		
	Active	Passive	At-rest	Active[2]	Passive	At-rest
IPS Area – Native	0.35	3.75	0.76	0.31	-0.86	0.41
IPS Area – Fill[2,3]	0.25	7.79	0.44	0.26	-2.57	0.41
IPS Area – Lightweight Fill[2]	0.30	5.69	0.50	0.29	-1.82	0.41
Influent Force Main Pipeline	0.35	3.75	0.76	0.31	-0.86	0.41

Notes:

1. The dynamic components of earth pressure coefficients and equivalent fluid weights, respectively, should be added to the static earth pressure coefficients and equivalent fluid weights, as needed, for the seismic (pseudostatic) case.
2. Soil characteristics are obtained solely from the fill.
3. Recommended for facilities in the IPS area bearing in fill (at or above an elevation of approximately 4218 feet).

Table 7. Recommended Lateral Equivalent Fluid Weights for Static and Seismic Cases

Structure	Static [Submerged[1]]			Dynamic (Seismic) Component[2] [Submerged[1]]		
	Active (pcf)	Passive (pcf)	At-rest (pcf)	Active (pcf)	Passive (pcf)	At-Rest (pcf)
IPS Area – Native	44.2 [22.1]	393.7 [159.7]	95.1 [47.6]	39.1 [19.6]	-90.0 [-36.5]	51.7 [25.9]
IPS Area – Fill[3,4]	34.3 [18.5]	895.6 [409.6]	59.5 [32.0]	35.0 [18.8]	-295.5 [-135.1]	55.8 [30.0]
IPS Area – Lightweight Fill[3]	29.7 [11.2]	398.4 [43.3]	50.0 [18.8]	28.9 [10.9]	-127.0 [-13.8]	41.3 [15.5]
Influent Force Main Pipeline	44.2 [22.1]	393.7 [159.7]	95.1 [47.6]	39.1 [19.6]	-90.0 [-36.5]	51.7 [25.9]

Notes:

1. Equivalent fluid weights are calculating using a weighted average soil unit weight. Submerged unit weights are appropriate where the surrounding soil is submerged and only account for soil pressure; submerged equivalent fluid pressures do not include water pressures, which must be added for design.
2. The dynamic components of earth pressure coefficients and equivalent fluid weights, respectively, should be added to the static earth pressure coefficients and equivalent fluid weights, as needed, for the seismic (pseudostatic) case.
3. Soil characteristics are obtained solely from the fill.
4. Recommended for facilities in the IPS area bearing in fill (at or above an elevation of approximately 4218 feet).

Graphical Solution for Log-Spiral Passive Seismic Earth Pressure Coefficient:

$$c/\gamma H = 0$$

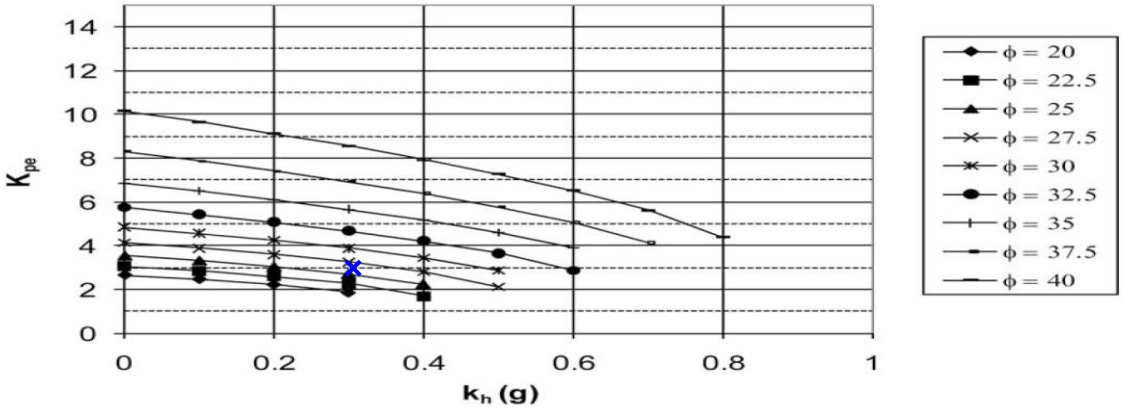

Figure A11.4-2—Seismic Passive Earth Pressure Coefficient Based on Log Spiral Procedure for $c/\gamma H = 0$ and 0.05 (c = soil cohesion, γ = soil unit weight, and H = height or depth of wall over which the passive resistance acts)

Note: $k_h = A_s = k_{ho}$ for wall heights greater than 20 ft.

Salt Lake City Water Reclamation Facility Composite Soil Constrained Modulus for Vertical Pipe Deflection Calculation

Purpose

This calculation document details the approach and methodology used to estimate the composite soil constrained modulus for vertical pipe deflection for the proposed Salt Lake City (SLC) New Water Reclamation Facility (New WRF) Influent Pumping Station (IPS) area.

Data Available

AECOM performed geotechnical explorations of subsurface conditions in the vicinity of the proposed New WRF IPS facilities. The subsurface exploration program for the area of interest was performed between July 2018 and August 2021. The details of the laboratory and field investigations are discussed in the "Salt Lake City Water Reclamation Facility Influent Pump Station Settlement Calculation" document.

Assumptions

The following assumptions were made regarding this calculation and supporting data:

- Laboratory tests were performed in accordance with the referenced American Society for Testing and Materials (ASTM) standards and are reported accurately by the subcontracted testing facility.
- Samples tested in the laboratory are representative of the soil unit from which they were obtained. Further, the results of the testing are indicative of material properties for the soil unit.
- The soil constrained modulus, M_s, may be used directly as the modulus of soil reaction, E', for calculating the pipe vertical deformation in the Iowa formula (AWWA 2013).
- The trench is 24 inches wider than the pipe outer diameter (12 inches on each side) to provide clearance for compaction.
- The embedment soil around and above the pipe will be Controlled Low Strength Material (CLSM) or free-draining granular material.
- The embedment material around the pipe will be compacted to at least 95% of the maximum dry density determined by standard proctor test ASTM D698-12 (ASTM 2012)

Methodology

The composite constrained modulus, M_s, was calculated based on the methodology proposed in AWWA 2013. The composite constrained modulus, M_s, is calculated by multiplying the stress-dependent constrained modulus of the pipe zone embedment, M_{sb}, by a soil support combining factor, which depends on the relative stiffness of the native soil and embedment soil, and trench width to pipe diameter ratio.

Calculation Procedure

The composite constrained soil modulus is calculated using the following formula

$$M_s = S_c M_{sb} \quad \text{(Eq. 1)}$$

where,

M_s = composite constrained soil modulus

S_c = soil support combining factor from Table 5-5 (AWWA 2013)

M_{sb} = constrained soil modulus of the pipe zone embedment from Table 5-4 of AWWA (AWWA 2013)

The M_{sb} depends on the soil class and vertical effective stress at the pipe springline. Class II material was selected for the embedment soil based on Table 6-1 for clean, coarse-grained soil with less than 12% fines content (AWWA 2013). The effective vertical stress is calculated assuming a unit weight of 125 pcf for the backfill material and groundwater elevation of 4,211 feet. The M_{sb} was estimated by linearly interpolating the values in Table 5-4 for calculated vertical effective stress at the springline of the pipe for class II material with relative compaction of 95%, based on standard proctor test (AWWA 2013, ASTM D698-12 2012). Alternatively, CLSM could be used as backfill material. AWWA 2013 recommends M_{sb} of 25,000 psi for calculating the long-time deflection of cement stabilized sand. However, depending on the properties of CSLM, the M_{sb} of 25,000 psi could overestimate the actual M_{sb}. Conservatively, the calculated M_{sb} for class II material is used for CSLM. The calculation could be updated if more information about CSLM material properties is provided.

To estimate the soil support combining factor, S_c, the constrained modulus of the native soil, M_{sn}, at pipe elevation is needed. The M_{sn} was estimated from Table 5-6 in the referenced AWWA (2013) document, based on the undrained shear strength, S_u, and general soil description for clay layers and based on the general soil description for granular layers. The estimation of the S_u values from field and laboratory data is discussed under separate cover. The soil description for the granular material is selected based on the estimated constrained modulus developed in other documents, and the field investigation. The S_c was estimated by linear interpolation of Table 5-5 for the calculated M_{sn} to M_{sb} ratio, M_{sn}/M_{sh}, and the calculated trench width (B_d) to pipe outer diameter (D) ratio, B_d/D, by assuming 12 inches of clearance on each side of the pipe (AWWA 2013).

Soil Profile and Pipe Elevation

Table 1 shows the preliminary pipe diameters at each elevation, which were provided by the pipeline designer.

Generally, within the elevation of interest for pipes, the native soil is composed of very soft to soft clay with a few thin (1 feet to 3.5 feet) coarse-grained sand layers. The soil profile is shown as part of the calculation in Attachment 2.

Table 1. Diameters and Invert Elevations of IPS Effluent Pipe

Pipe Diameter (in)	Invert Elevation (ft)	
	From	To
48	4208	4212

Results and Recommendations

A plot of the M_s (E') vs. elevation is shown in Attachment 1 and the detailed calculations are shown in Attachment 2.

The M_s varies from about 940 psi to 980 psi, depending on the pipe elevation and location. The lower and higher values of M_s correspond to the elevation of the pipe springline and the anticipated soil types near the springline depth. The soil profile that is used in this calculation represents the average soil condition for the IPS area. The field investigation shows some variability of the thickness and elevation of soil layers. The soil profile variability is not anticipated to have a significant effect on the overall settlement calculation. However, considering the presence of thin layers of coarse-grained silty sand and the high sensitivity of the M_s values to the soil layer type, the soil profile variability could have an effect on M_s. Accordingly, it is recommended to use relatively conservative values of M_s where there is variability in soil types near the springline elevation of each pipe (e.g., the low end of values shown in Attachment 1 for the springline depth of a pipe).

DOCUMENT 00 41 00
BID FORM

PART 1 GENERAL

1.1 **BIDDER**

A. Name: _____

B. Address: _____

_____

_____

C. Telephone number: _____

D. Email address: _____

E. Facsimile number: _____

F. Tax identification number: _____

G. Bidder holds license number _____, issued by the Utah State Department of Commerce, Division of Occupational and Professional Licensing. Bidder is licensed to practice as a _____ Contractor. The license expiration date _____.

1.2 **NOTICE**

A. Pursuant to Section 58-55-501(8), Utah Code Annotated (UCA), it is unlawful to submit a bid for any work for which a license is required under Chapter 55 of Title 58, UCA, by a person or other business entity not licensed or excepted from licensure as a contractor under Chapter 55 of Title 58, UCA. Pursuant to Section 58-55-503(1), UCA, contracts for the work may not be awarded to any person or other business entity that violates Sections 58-55-501(8) UCA, in submitting its Bid.

1.3 **CONSTRUCTION CONTRACT**

A. NEW WRF SW1 Influent Pump Station (IPS), Project 524905396.

B. The ENGINEER's estimate for this project is over $2,000,000.00.

C. This project is not CDBG funded.

D. This project does require a permit to work in the Public Way from Salt Lake City Engineering, 349 South 200 East, Suite 100. If such a permit is required, Section 6.7 (H) (1) (d) of Document 00 73 10 (Modifications to the General Conditions) shall apply.

1.4 **ADDENDA**

A. Bidder hereby acknowledges receipt of the following Addenda.

_____

(list Addenda numbers here)

1.5 **SUBMITTALS**

A. **With Bid**:

1. This Bid Form (Document 00 41 00).
2. Bid Schedule (Document 00 43 00).
3. Bid bond.
4. Mandatory Submittals (If the documents noted below are included in the Project Manual).
    a. Qualified Health Insurance Certification Form (Document 00 43 45), checking "No" will not render the bid non-responsive. That form is used by Bidder to certify whether Bidder and all subcontractors of Bidder working on the project have and will maintain an offer of qualified health insurance in compliance with Salt Lake City Code Section 3.24.115 for the duration of the contract.
    b. Work Environment Certification Form (Document 00 43 46) If the Bidder does not certify yes to each question in Document 00 43 46 the bid will be rejected as non-responsive. That form is used by Bidder to certify that Bidder and all subcontractors of Bidder working on the project have and will maintain 1) a drug and alcohol testing policy; 2) a program to recruit and/or employ veterans; 3) a job training program; 4) a safety program; and 5) a formal policy of non-discrimination in compliance with Salt Lake City Code Section 3.24.115 for the duration of the contract. See Section 3.24.115 of the Salt Lake City Code and Article 1.4 of Section 00 22 16 Supplemental Instructions.
    c. Qualifications Statement Form (Document 00 45 14).

B. Due diligence letter to Bidder: If Bidder receives a due diligence letter from OWNER after bid opening, Bidder must submit the following documents to OWNER after ENGINEER's request.

1. Document 00 43 36: Proposed Subcontractor Form.
2. Document 00 43 37: Work Under Contract Report.
3. Document 00 43 38: Bidder Status Report.
4. Other information requested and as defined in Article 3.1 and 3.4 D of Document 00 21 13.

C. **After Notice of Intent to Award**: If Bidder receives a notice of intent to award the Contract from OWNER after bid opening, Bidder must submit the following documents to OWNER.

1. Document 00 52 00: Agreement.
2. Document 00 61 13: Performance Bond.
3. Document 00 61 14: Payment Bond.
4. Document 00 62 16: Applicable Insurance Certificate.
5. Supplementary Submittals (if applicable):

a. Copy of letter from OWNER's Labor Relations Specialist certifying that Bidder has an approved utilization plan that offers economic opportunities to low and very low income persons.

b. Document 00 54 00: Agreement Supplement.

c. Document 00 54 15: Value Program Supplemental Agreement.

d. Document 00 54 16: Qualified Health Insurance Supplemental Agreement.

e. Document 00 54 17: Economic Opportunities Supplemental Agreement.

1.6 **DEFINITIONS**

A. **Bid Documents**: The Bid Documents consist of the Invitation to Bid, the Instructions to Bidders, any Supplementary Instructions to Bidders, this Bid form, any supplements (or post-bid supplements), the Bid Schedule, any data listed by and limited to the provisions in the Geotechnical Data Document, and the Bid Bond.

B. **Bid Bond**: AIA Document A310 as published by the American Institute of Architects, 1736 N. Y. Ave. N. W. Washington, D.C. 20006 or one substantially the same and acceptable to OWNER.

C. **HUD**: United States Department of Housing and Urban Development.

D. **WIFIA**: Water Infrastructure Finance and Investment Act

PART 2 COVENANTS

2.1 **BIDDER TO ENTER INTO AN AGREEMENT**

A. **In General**: Bidder agrees, if this Bid is accepted, to enter into a Construction Contract with OWNER to perform and furnish all Work specified or indicated in the Contract Documents at the Contract Time and Contract Price identified in the Agreement (Document 00 52 00).

B. **Agreement Supplement**: If it becomes necessary to further define the Work, Contract Price, Contract Time, or some other portion of the Construction Contract before signing the Agreement (Document 00 52 00), ENGINEER shall prepare an Agreement Supplement (Document 00 54 00) describing such change. OWNER shall have sole discretion in determining the necessity of preparing such a contract modification. If the Agreement Supplement is acceptable to Bidder, Bidder shall execute the Agreement Supplement before or concurrently with the execution of the Agreement (Document 00 52 00).

C. If Bidder was awarded the Construction Contract in part as a result of OWNER's Value-Based Procurement Program, Bidder shall enter into a Value Program Supplemental Agreement (Document 00 54 15) with OWNER concurrently with its execution of the Agreement (Document 00 52 00).

D. If Bidder was awarded the Construction Contact in part as a result of OWNER's Qualified Health Insurance program, Bidder shall enter into a Qualified Health Insurance Supplemental Agreement (Document 00 54 16) with OWNER concurrently with its execution of the Agreement (Document 00 52 00).

2.2 BIDDER ACCEPTS TERMS AND CONDITIONS

A. Bidder accepts all of the terms and conditions of the Bid Documents, including without limitation those dealing with the disposition of Bid security.

B. Bidder must pick up, sign, and submit, the required number of copies of the Agreement (Document 00 52 00) with the Bonds and other documents required by the Agreement within 10 days (or such longer period of time that OWNER in its discretion may allow) after the date of OWNER's Notice of Intent to Award the Construction Contract.

2.3 REPRESENTATION OF BIDDER

A. In submitting this Bid, Bidder represents, as more fully set forth in the Instructions To Bidders (Document 00 21 13), that:

1. **Nature of the Work**: Bidder has become familiar with the nature and extent of the Contract Documents, Work, site, locality, and all local conditions and Laws and Regulations that in any manner may affect cost, progress, performance, or furnishing of the Work.
2. **Surface and Subsurface Conditions**: Bidder has studied carefully all reports and drawings of subsurface conditions and drawings of physical conditions that are identified in the Geotechnical Data (Document 00 31 32) (if any).
3. **Underground Utilities**: Bidder has reviewed and checked all information and data shown or indicated on the Contract Documents with respect to existing Underground Facilities at or contiguous to the site.
4. **Bidder Investigation**: Bidder has correlated the results of all observations, examinations, investigations, explorations, tests, reports, and studies with the terms and conditions of the Contract Documents.
5. **Discrepancy Resolutions**: Bidder has given ENGINEER written notice of all conflicts, errors, or discrepancies that Bidder has discovered in the Contract Documents and acknowledges that all written resolutions thereof issued by ENGINEER before Bid opening, are acceptable to Bidder.

2.4 OWNER'S RIGHTS AT BID AWARD

A. Bidder agrees that OWNER has the right to reject this Bid or to award the Work or any part thereof to the undersigned at the prices stipulated. Bidder agrees to make no claim for damages for such rejection or award.

B. If the Bid is rejected, then the Bid security shall be returned to Bidder.

C. If the Bid is accepted, OWNER shall notify Bidder of OWNER's intent to award the Construction Contract to Bidder. Bidder shall have 10 days (or such longer period of time that OWNER in its discretion may allow) to sign and return the Agreement (Document 00 52 00) to OWNER. If Bidder fails to sign the Agreement, the Bid security, at OWNER's option, shall be claimed and cashed and the amount thereof paid to OWNER as liquidated damages for the failure of Bidder to comply with the terms of the Bid.

D. Bidder agrees that the Bid may be rejected if the submittals listed in this Document or the Notice of Intent to Award are not submitted within the time listed in the Notice of Intent to Award (or described in paragraph 2.4C hereof).

2.5 **NON-COLLUSION; ETHICS**

A. Bidder represents that the Bid is genuine. The Bid is not made in the interest of or on behalf of any undisclosed person, firm, or corporation.

B. Bidder has not directly or indirectly induced or solicited any other Bidder to submit a false or sham Bid.

C. Bidder has not solicited or induced any person, firm, or corporation to refrain from bidding.

D. Bidder has not sought by collusion to obtain for itself any other advantage over any separate Bidder or over OWNER.

E. **REPRESENTATION REGARDING ETHICAL STANDARDS FOR CITY OFFICERS AND EMPLOYEES AND FORMER CITY OFFICERS AND EMPLOYEES**

Bidder represents that it has not:

1. **Provided an illegal gift or payoff to a City officer or employee or former City officer or employee, or his or her relative or business entity.**
2. **Retained any person to solicit or secure this contract upon an agreement or understanding for a commission, percentage, or brokerage or contingent fee, other than bona fide employees or bona fide commercial selling agencies for the purpose of securing business.**
3. **Knowingly breached any of the ethical standards set forth in the City's conflict of interest ordinance, Chapter 2.44, Salt Lake City Code; or**
4. **Knowingly influenced, and hereby promises that it will not knowingly influence, a City officer or employee or former City officer or employee to breach any of the ethical standards set forth in the City's conflict of interest ordinance, Chapter 2.44, Salt Lake City Code.**

2.6 **BID PRICING**

A. Bidder will complete the Work for the prices listed in the Bid Schedule (Document 00 43 00). Bidder agrees that quantities for Unit Price Work are not guaranteed. (Refer to Article 11.7 of the General Conditions (Document 00 72 00).

2.7 **SUBSTANTIAL COMPLETION, PROJECT COMPLETION, AND LIQUIDATED DAMAGES**

A. Bidder agrees that the Work will be Substantially Complete and ready for Final Inspection on or before the expiration of the Contract Time indicated in the Agreement (Document 00 52 00).

B. Bidder agrees that the Work will be complete and ready for final payment in accordance with Article 14.9 of the General Conditions (Document 00 72 00) on or before the expiration of the Punch List Time indicated in the Agreement.

C. Bidder accepts the provisions of the Agreement (Document 00 52 00) as to liquidated damages in the event of failure to complete the Work on time and in accordance with the Contract Documents.

PART 3 EXECUTION

3.1 **EFFECTIVE DATE**

A. Bidder executes this Bid and declares it to be in effect as of the _____ day of _____-_____, 20 _____.

3.2 **BIDDER'S SUBSCRIPTION**

A. Bidder's Signature: _____

B. Please print Bidder's name here: _____

C. Title: _____

DOCUMENT 00 43 00
BID SCHEDULE

PART 1 GENERAL

1.1 **DOCUMENT INCLUDES**

A. Price schedules.

B. Measurement and payment provisions.

1.2 **CONSTRUCTION CONTRACT**

A. **New WRF SW1A Influent Pump Station (IPS)**
1200 Reclamation Road, Salt Lake City
Project No. 524905396

1.3 **REFERENCES**

A. APWA Section 01 29 00: Payment Procedures.

B. Document 00 52 00: Agreement.

PART 2 PRICE SCHEDULES

2.1 **GENERAL**

A. Number of schedules in Base Bid: One (1).

B. For progress payment procedures, see APWA Section 01 29 00.

2.2 **BASE BID**

A. Bidder shall complete all blanks in the bid schedule included in this section. Failure to do so may cause the bid to be declared non-responsive by ENGINEER.

B. The base bid for the project shall include items 1-8 and all allowances from the bid schedule.

2.3 **ALTERNATES**

A. Bidder shall complete all blanks in the bid schedule included in this section. Failure to do so may cause the bid to be declared non-responsive by ENGINEER. Refer to Section 01 23 00 for description of each alternate.

B. Prices for each alternate shall be included in the bid schedule and be selected by Owner in accordance with 01 23 00.

2.4 **ALLOWANCES**

A. Bidder shall complete all blanks in the bid schedule included in this section. Failure to do so may cause the bid to be declared non-responsive by ENGINEER. Refer to Section 01 21 00 for description of each allowance.

Item No.	Description	Quantity Unit	Unit Price	Amount ($)
Base Bid				
1	Pump Station Construction	1 Lump Sum		
2	Mobilization/Demobilization	1 Lump Sum		
3	Odor Control Construction	1 Lump Sum		
4	Electrical Building Construction	1 Lump Sum		
5	Standby Power and Fuel Construction	1 Lump Sum		
6	Ductbank Construction	1 Lump Sum		
7	1" Mill and Overlay	24,000 yd^2 Unit Price ($/$yd^2$)		
8	Site Civil	1 Lumps Sum		
Allowances				
9	Golf Netting	1 Lump Sum	$100,000	$100,000

14	Installation of 6th Pump	1 Lump Sum		

PART 3 MEASUREMENT AND PAYMENT

3.1 GENERAL

A. This Section defines the manner in which the Lump Sum Prices, Unit Prices, and the Allowances listed in the Bid Schedule will be used to determine measurement and payment for all Work and describes the required procedures for monthly progress payments to the Contractor.

B. Lump Sum (LS) Bid Items: Measured on a percent complete basis.

C. See payment procedures in APWA Section 01 29 00 – Payment Procedures. For lump sum items, Contractor will be required to submit a schedule of values in accordance with the specifications prior to the first pay request.

D. No initial progress payment (other than a single mobilization payment as described in Article 3.3 below) will be made prior to acceptance by the ENGINEER of the Progress Schedule, the associated Schedule of Costs (or Values), and the list of anticipated submittals.

E. No subsequent progress payment will be made prior to receipt by the ENGINEER of the monthly update of the Construction Progress Schedule, as specified in Section 01 31 13 - Coordination.

F. All Work required by the Contract, Drawings, and Specifications not otherwise used as a separate bid item, shall be considered as included in the prices of the bid, and no additional compensation will be made.

G. CONTRACTOR will take all measurements and compute all quantities.

H. CONTRACTOR will provide all equipment, workers, and survey crews as necessary to assist ENGINEER in verifying measurements.

3.2 LUMP SUM PRICES

A. Bid amounts include full compensation for all plant, labor, service, materials, products, tools, equipment, transportation, services and incidentals; erection, application or installation of the Work; overhead and profit, permits; and completing the WORK included in the Agreement, shown in the Drawings, defined in the Specifications, and stipulated herein. WORK required for which no separate Bid items is identified will be considered as a subsidiary obligation of the Contractor, and the cost therefore shall be included in the most applicable Bid item.

B. Payment for all items in the Bid Schedule will include full compensation for furnishing all tools, equipment, supplies, and manufactured articles, and for all labor, operations, and incidentals appurtenant to the items of Work being described, as necessary to complete the various items of the Work in accordance with the requirements of the Contract Documents, including all appurtenances thereto, and including but not limited to all costs of permits and cost of compliance with the regulations of public agencies having jurisdiction, including Safety and Health Requirements of the Utah Division of Industrial Safety and

the Occupational Safety and Health Administration of the U.S. Department of Labor (OSHA).

C. Payment for all items in the Bid Schedule will include the cost of incidental work such as but not limited to: baseline and progress schedule (01 32 17); QA/QC program; submittal processing; traffic control plan (01 55 26); project identification sign(s); safety procedure plan (00 72 00, 2.5B.7); dust control; surveying; testing; commissioning; temporary utilities during construction; coordination with utility companies for temporary and permanent utility services; locating existing utilities and other underground facilities; providing any needed coordination, assistance, and work to other utility companies in locating and relocating service laterals and mains, as needed; irrigation, surface water and drainage management (01 57 00); dewatering plan (31 23 19); shoring (31 50 00); saw cutting, removal, and disposal of any Portland cement concrete as required; pothole excavations; backfill per construction drawings; removal and disposal of waste materials; backfill material and compaction; startup and testing; dewatering; fees from the County Surveyor for monument restoration; hauling and stockpiling of materials and equipment; protection and support of existing surface and subsurface features; untreated base course at depth indicated; removal and disposal of existing curb and gutter, concrete waterway, driveway, drive approach and sidewalk; coordination with public outreach; replacement of all curb and gutter, concrete waterway, and sidewalk/driveway; installation of sewer manhole invert cover(s) and subsequent removal as directed by governing authorities; temporary asphalt concrete patch; coordination with property owners, businesses, contractors, and government agencies; all provisions required to provide and maintain full and continuous access to all properties affected by construction operations; replacement of existing facilities removed without prior approval of the ENGINEER; replacement and restoration of existing facilities damaged by the CONTRACTOR's operations; surface restoration not identified as separate pay items in bid schedule; and all other necessary work, to complete the work in place.

D. The unit or lump sum item of work, which involves excavation or trenching shall include all costs for such work. No direct payment will be made for excavation or trenching. All excavation and trenching will be unclassified as to materials which may be encountered; in addition, trenches will be unclassified as to depth. There will be no payment for over excavation and backfill unless approved in writing by ENGINEER prior to excavation.

E. All costs shall be included in the prices named in the Bid Schedule for the various items of Work. Except as otherwise provided herein, no separate payment will be made for any item that is not specifically set forth in the Bid Schedule.

3.3 SCHEDULE OF COSTS FOR PAYMENTS

A. Submit to the ENGINEER, within 5 days of acceptance of the Construction Schedule, an electronic copy of a Schedule of Costs (or Values). The Schedule of Costs shall be a form showing a detailed breakdown of quantities and prices of work and materials required to perform and complete the contract.

B. The Schedule of Costs shall provide a cost breakdown for each element detailed in the approved Construction Schedule. The total of the price breakdown must agree with the unit price bid items added. The elements listed and price breakdown shall not be front end

loaded or unbalanced, shall be subject to adjustment between the ENGINEER and the CONTRACTOR, and will be used as a basis for progress payments.

3.4 DESCRIPTION OF BID ITEMS

A. Bid Item No. 1 – Pump Station Construction

1. General Measurement and Payment:

a. Pump Station Construction shall be measured and paid for on a lump sum basis.

b. Measurement: The sum allowed for Bid Item No. 1 as set forth in the Bid Form includes all Work for and in connection with construction of the Influent Pump Station in its entirety excluding items listed in the subsequent bid items.

c. Payment shall include all labor, materials, equipment, supplies, and other work necessary for the construction of the complete pump station and all associated structures, trade work, and appurtenances as shown in the Contract Documents, and as listed in section 3.2.C above, and all other appurtenances and requirements as applicable to provide a complete and functional project.

d. Payment for Work under this Bid item will be based on the breakdown of costs for each scheduled activity in the Construction Schedule of Costs as approved and accepted by the ENGINEER and OWNER. The amount paid shall be in accordance with the actual percent complete at the time of payment for each item listed in the Schedule of Values as submitted by the CONTRACTOR and as approved and accepted by the ENGINEER.

B. Bid Item No. 2 –Mobilization/Demobilization

1. Measurement and Payment

a. Measurement: Mobilization/Demobilization will be measured and paid on a lump sum (LS) basis.

b. Payment: Payment for Mobilization & Demobilization shall consist of preparatory work and operations, including, but not limited to, those necessary for the movement of personnel, equipment, supplies, and incidentals to the Site, securing all insurances required to complete the work including those listed in Sections 00 72 00, 00 73 00, and 00 73 10, and for all other appurtenances, work and operations which must be performed, or costs incurred, prior to beginning the Work, and as described in Section 01 71 13.

c. Payment for mobilization/demobilization will be as follows:

1) When the Contract, proposed Description of Bid Items includes a separate item for mobilization/demobilization, payment for mobilization/ demobilization will include full compensation for the furnishing of all labor, materials, tools, equipment, administrative costs, and incidentals for mobilization/demobilization.

2) The OWNER anticipates no greater than three percent (3%) of the total Contract Sum for Bid Items #1,3,4,5,6,7 & 8 as a separate pay item for

mobilization/demobilization.

3) In the event the CONTRACTOR submits a mobilization/demobilization pay item greater than three percent (3%) of the value of Bid Items #1, 3, 4, 5, 6, 7 & 8, the OWNER will pay any excess mobilization/demobilization amount with the final Progress Payment.

d. Payment for mobilization/demobilization will be prorated as follows:

1) When the Progress Payment request is three percent (3%) or more of the original total Contract Sum (excluding all mobilization/demobilization bid items), fifty percent (50%) of the contract item price for mobilization/demobilization or one and one-half percent (1.5%) of the total Contract Sum, whichever is less, will be paid for mobilization/ demobilization.

2) When the Progress Payment request is ten percent (10%) or more of the original total Contract Sum (excluding all mobilization/demobilization bid items), seventy percent (70%) of the contract item price for mobilization/ demobilization or two percent (2%) of the total Contract Sum, whichever is less, will be paid for mobilization/demobilization.

3) When the Progress Payment request is twenty percent (20%) or more of the original total Contract Sum (excluding all mobilization/demobilization bid items), ninety percent (90%) of the contract item price for mobilization/ demobilization or two and one-half percent (2.5%) of the total Contract Sum, whichever is less, will be paid for mobilization/ demobilization.

4) When the Progress Payment request is fifty percent (50%) or more of the original total Contract Sum (excluding all mobilization/demobilization bid items), one hundred percent (100%) of the contract item price for mobilization/demobilization or three percent (3%) of the total Contract Sum, whichever is less, will be paid for mobilization/demobilization.

5) After final acceptance of the Contract, the amount, if any, of the Contract item price for mobilization/demobilization in excess of three percent (3%) of the original total Contract Sum will be included for payment in the final estimate.

e. The OWNER will not pay additional mobilization/demobilization compensation for work under a Contract Change Order. Payment for mobilization/ demobilization shall be subject to retention.

C. Bid Item No. 3 – Odor Control Construction

1. Measurement: Odor Control shall be measured and paid for on a lump sum basis and shall include the following; all underslab utilities and foundation preparation, foundation slab, odor control system, electrical, and instrumentation associated with the odor control system.

2. Payment for odor control system shall be paid for based on the percentage complete

for an operational system approved by ENGINEER and OWNER.

D. Bid Item No. 4 – Electrical Building Construction

1. Measurement: Electrical Building Construction shall be measured and paid for on a lump sum basis and shall include the following; all underslab utilities and foundation preparation, foundation slab, electrical building, all interior and exterior electrical equipment, terminations, connections, instrumentation, ancillary works associated with the electrical building.

2. Payment for Electrical Building construction shall be paid based on the percentage complete for an operational system approved by the ENGINEER and OWNER.

E. Bid Item No. 5 – Standby Power and Fuel

1. Measurement Standby Power and Fuel shall be measured and paid for on a lump sum basis and shall include the following; all underslab utilities and foundation preparation, foundation slab, generators, fueling systems, fuel storage tanks, interior and exterior electrical equipment, terminations, connections, instrumentation, and ancillary works associated with the Standby Power and Fuel System.

2. Payment for the Standby Power and Fuel System shall be paid shall be paid based on the percentage complete for an operational system approved by the ENGINEER and OWNER .

F. Bid Item No. 6 – Ductbank Construction

1. Measurement: Ductbank construction will be measured and paid on a lump sum (LS) basis and consist of construction of the ductbank between the existing ductbank at the new SLCWRF facility and Influent Pump Station Electrical Building including all associated terminations and cable.

2. Payment: Payment for Ductbank Construction shall be paid based on the percentage complete of installation of ductbank, including compacted backfilling over completed ductbank.

G. Bid Item No. 7 – 1” Mill and Overlay

1. Measurement: 1” Mill and Overlay shall be measured and paid based on actual quantities of asphalt milled and overlayed in accordance with APWA plan 253.2, APWA 32 01 16.71 and related sections.

2. Payment: 1” Mill and Overlay shall be paid based on the unit rate bid by the CONTRACTOR to mill and overlay 1” of asphalt pavement for areas of existing roadways damaged during construction. ENGINEER has estimated a total quantity of 24,000 yd^2 of asphalt will require milling and overlay to repair streets damaged by construction activities.

H. Bid Item No. 8 – Site Civil

1. Measurement: Site Civil work shall be measured and paid for on a lump sum basis and shall include the following; all underground piping, ductbanks, and conduits up to the edge of structures, excavation, backfill, compaction, paving, grading,

curb/gutter, tie-ins, and ancillary works associated with providing all site civil and utilities.

2. Payment shall be made for Site Civil paid based on the percentage complete of civil site improvements approved by ENGINEER and OWNER.

I. Bid Item No. 9 – Golf Netting Allowance

1. Measurement: Shall be measured based on actual quantities of netting installed.
2. Payment for golf course netting shall be paid based on the actual cost incurred by the CONTRACTOR to put up new netting around the pump station site. Payment shall be made upon receipt of invoices. The lump sum amount shown on the bid schedule is an estimate for bidding purposes only.

J. Bid Item No. 10 – Bypass Pumping Allowance

1. Measurement: Allowance payment to CONTRACTOR during implementation of the work required to assist the OWNER in designing, implementing, and operating a temporary bypass pumping system to allow construction of the connections to the existing facilities.

2. Measurement: Prior to commencing this WORK, CONTRACTOR, OWNER and ENGINEER shall meet in a pre-activity conference to define the WORK required. CONTRACTOR shall then prepare a schedule of values for the requested work and submit it to the ENGINEER/OWNER for review and approval, prior to starting work. Schedule of values shall include all requested WORK and shall represent the full reimbursement for the requested WORK.

3. Payment for Bypass Pumping shall be made based upon advanced written approval from the OWNER of the submitted Schedule of Values based upon WORK completed, submittal of receipts, or other documentation of actual costs and/or completion of the Work and acceptance by ENGINEER and OWNER. The lump sum amount shown on the bid schedule is an estimate for bidding purposes only.

K. Bid Item No. 11 – Permitting Fees Allowance

1. Measurement: Permitting Fees shall be measured and paid on the actual cost incurred by the CONTRACTOR to obtain the required permits.

2. Payment: Permitting Fees shall be paid based on the actual cost incurred by the CONTRACTOR to obtain the required permits. Payment shall be made upon receipt of the associated permit and submittal of receipts/ payment documentation. The lump sum amount shown on the bid schedule is an estimate for bidding purposes only.

L. Bid Item No. 12 – Hauling and Disposal of Unsuitable Materials to Brown Property Allowance

1. Measurement: Hauling and Disposal of Unsuitable Materials to Brown Property shall be measured and paid based on actual quantities of Unsuitable Materials hauled to the Brown Property.

2. Payment: Hauling and Disposal of Unsuitable Materials to Brown Property shall be paid based on the unit rate bid by the CONTRACTOR to haul and dispose of the material.

Payment shall be made upon receipt of the haul tickets. ENGINEER has estimated a total quantity of 80,800 ton of material will be unsuitable and require hauling.

M. Bid Item No. 13 – Hauling and Disposal of Unsuitable or Impacted/Contaminated Materials to Landfill

1. Measurement: Hauling and Disposal of Unsuitable or Impacted/Contaminated Materials to Landfill shall be measured and paid based on actual quantities of materials hauled to the Landfill.
2. Payment: Hauling and Testing of Unsuitable Materials to Landfill shall be paid based on the unit rate bid by the CONTRACTOR to haul, test, and tip the material. Payment shall be made upon receipt of the haul tickets. ENGINEER has estimated a total quantity of 20,200 ton of material will be unsuitable and require hauling.

N. Bid Item No. 14 – Installation of 6^{th} Pump Alternate

1. Measurement: Installation of 6^{th} Pump will be measured and paid on a lump sum (LS) basis.
2. Payment: Payment for Installation of 6^{th} Pump shall be paid based on schedule of values on percentage of work complete.

PROPOSED SUBCONTRACTOR FORM

PART 1 GENERAL

1.1 **BIDDER**

A. Name: _____

Address: _____

_____

_____

B. Telephone Number: _____

1.2 **CONSTRUCTION CONTRACT**

A. New WRF SW1 Influent Pump Station (IPS)
1200 Reclamation Road, Salt Lake City
Project No. 524905396

PART 2 REPORT

2.1 **SUBCONTRACTOR AND SUPPLIER REPORT**

A. Failure of Bidder to specify a Subcontractor for any portion of the Work constitutes an agreement by Bidder that Bidder is fully qualified to perform that portion of work and that Bidder shall perform that portion. See Instructions to Bidders (Document 00 21 13, paragraph 3.4B for additional information concerning the subcontractors and the nature and extent of any work that must be listed on this form.

B. Bidder will be fully responsible to OWNER for the acts and omissions of Subcontractors and Suppliers and of persons either directly or indirectly employed by them, as Bidder is for the acts and omissions of persons employed by Bidder directly.

C. Nothing contained in the Contract Documents shall create any contractual relationship between any Subcontractor or Supplier and OWNER. Bidder agrees that each subcontract with Bidder's Subcontractor will disclaim any third party or direct relationship between OWNER and any Subcontractor or Supplier.

D. The names and addresses of the Subcontractors and Manufacturers who will work under the terms of the Contract Documents and the estimated dollar amount of each subcontract, as appropriate, are set forth in the following tables.

SUBCONTRACTORS		
Name	**Nature and Extent of Work to be Subcontracted**	**Amount**
1.		
2.		
3.		
4.		
5.

QUALIFICATIONS STATEMENT

ARTICLE 1 — GENERAL INFORMATION

1.01 Provide contact information for the Contractor:

Legal Name of Contractor:			
Corporate Office Information			
Contact Name:		Phone number:	
Email Address:			
Address of corporate office:			
Local Office Information			
Contact Name:		Phone number:	
Email Address:			
Address of local office:			

1.02 Provide information on the Contractor's organizational structure:

Form of Business:	☐ Sole Proprietorship ☐ Partnership ☐ Corporation		
☐ Limited Liability Company ☐ Joint Venture comprised of the following companies:			
	1.		
	2.		
	3.		
Provide a separate Qualification Statement for each Joint Venturer if applicable.			
Date Business was formed:		State in which Business was formed:	
Is this Contractor licensed to operate in Utah for the work as defined in the contract documents?		☐ Yes ☐ No ☐ Pending	

1.03 Identify all businesses that own Contractor in whole or in part (25 percent or greater), or that are wholly or partly (25 percent or greater) owned by Contractor:

Name of business:		Affiliation:	
Address:			
Name of business:		Affiliation:	
Address:			
Name of business:		Affiliation:	
Address:			

ARTICLE 2 — CONSTRUCTION EXPERIENCE

2.01 Provide information that will identify the overall size and capacity of the Contractor:

Average number of current full-time employees:	
Estimate of revenue for the current year:	
Estimate of revenue for the previous year:	

2.02 Provide information regarding the Contractor's previous contracting experience.

Years of experience with projects like the proposed project:				
As a general contractor:		As a joint venturer:		
Has Contractor, or a predecessor in interest, or an affiliate identified in Paragraph 1.03 done any of the following:				
Been disqualified as a bidder by any local, state, or federal agency within the last 5 years? ☐ Yes ☐ No				
Been barred from contracting by any local, state, or federal agency within the last 5 years? ☐ Yes ☐ No				
Been released from a bid in the past 5 years? ☐ Yes ☐ No				
Defaulted on a project or failed to complete any contract awarded to it? ☐ Yes ☐ No				
Refused to construct or refused to provide materials defined in the contract documents or in a change order? ☐ Yes ☐ No				
Been a party to any currently pending litigation or arbitration? ☐ Yes ☐ No				
If yes to any of the above, provide full details in a separate attachment with bid.				
Contractor's OSHA Recordable Lost Time Incident Rates:				
Contractor's most recent (NCCI) Workers Compensation Experience Modification Rate (EMR):				
Available Bonding Capacity at time of bidding:				

2.03 List a minimum of 2 and a maximum of 6 projects completed in the last 10 years in Schedule A and provide indicated information to demonstrate the Contractor's experience with projects similar in type and cost of construction to the Project. Bidder must demonstrate successful completion during the last 10 years of at least 1 project comparable in nature and scope to this project and one project with a dollar value of at least 50 percent of the value bid for the Project. Similar projects would include projects that include complicated pump stations, water/wastewater treatment plant construction, or complicated deep excavation concrete structures.

2.04 In Schedule B, provide information on key individuals whom Contractor intends to assign to the Project. Key individuals include the Project Manager and Project Superintendent, at a minimum.

ARTICLE 3 — REQUIRED ATTACHMENTS

3.01 Provide the Statement of Qualifications with the Bid. Provide the following information with the Statement of Qualifications:

A. If Contractor is a Joint Venture, separate Qualifications Statements for each Joint Venturer, as required in paragraph 1.02.

B. Completed tables within this specification.

C. Attachments providing additional information as specified herein.

D. Schedule A (Previous Experience with Similar Projects) as specified in this Document.

E. Schedule B (Key Individuals) as specified in this Document.

This **Statement of Qualifications** is offered by:

Contractor: _____
(typed or printed name of organization)

By: _____
(individual's signature)

Name: _____
(typed or printed)

Title: _____
(typed or printed)

Date: _____

AGREEMENT

This Agreement is dated as of the date that the City Recorder attests the applicable City signature, which date shall be the recordation date, and is between Salt Lake City Corporation, a Utah municipal corporation, 1530 S. West Temple, Salt Lake City, Utah 84115-5223 (OWNER or City) and the following entity (CONTRACTOR)

Name: _____

Address: _____

_____

_____

Telephone number: _____

Facsimile number: _____

For valuable consideration, the receipt of which the parties acknowledge, OWNER and CONTRACTOR agree to the following.

PART 1 GENERAL

1.1 DEFINITIONS

A. Words used in this Agreement, in any Qualified Health Insurance Supplemental Agreement (Document 00 54 16), in any Value Program Supplemental Agreement (Document 00 54 15), and in any Supplemental Agreement (Document 00 54 00) related hereto that are defined in Document 00 72 00 in the current Edition of the Manual of Standard Specifications published by the Utah Chapter of the American Public Works Association shall have meaning as defined therein.

1.2 WORK

A. CONTRACTOR shall provide the construction and services specified in the Drawing and Specifications in the Construction Contract known as:

New WRF SW1 Influent Pump Station (IPS)

1200 Reclamation Road, Salt Lake City

Project No. 524905396

B. CONTRACTOR shall comply with its obligations under the Contract Documents.

1.3 ENGINEER

A. **JASON BROWN, P.E.** is OWNER's representative and agent who has the rights, authority, and duties assigned to ENGINEER in the Contract Documents.

1.4 ASSIGNMENT NOT BINDING WITHOUT WRITTEN CONSENT

A. No assignment of any right or interest in the Construction Contract shall be made without written consent of OWNER and CONTRACTOR. No assignment will release or discharge OWNER or CONTRACTOR from any duty or responsibility under the

Construction Contract unless specifically stated to the contrary in any written consent to an assignment.

B. CONTRACTOR shall make no assignment of money that is due without OWNER's written consent (except to the extent that the effect of this restriction may be limited by Law or Regulation).

1.5 **BINDING TERMS**

A. OWNER and CONTRACTOR each binds itself, its partners, successors, assigns, and legal representatives to the other party hereto, its partners, successors, assigns, and legal representatives in respect to all covenants, agreements, and obligations contained in the Construction Contract.

1.6 **REPRESENTATION REGARDING ETHICAL STANDARDS FOR CITY OFFICERS AND EMPLOYEES AND FORMER CITY OFFICERS AND EMPLOYEES**

A. CONTRACTOR represents that it has not:

1. Provided an illegal gift or payoff to a City officer or employee or former City officer or employee, or his or her relative or business entity.

2. Retained any person to solicit or secure this contract upon an agreement or understanding for a commission, percentage, or brokerage or contingent fee, other than bona fide employees or bona fide commercial selling agencies for the propose of securing business.

3. Knowingly breached any of the ethical standards set forth in City's conflict of interest ordinance, Chapter 2.44, Salt Lake City Code; or

4. Knowingly influenced, and hereby promises that it will not knowingly influence, a City officer or employee or former City officer or employee to breach any of the ethical standards set forth in City's conflict of interest ordinance, Chapter 2.44, Salt Lake City Code.

PART 2 TIME AND MONEY CONSIDERATIONS

2.1 **CONTRACT PRICE**

A. The Contract Price includes the cost of the Work specified in the Contract Documents, plus the cost of all bonds, insurance, permits, and fees, and all charges, expenses, and assessments of whatever kind or character.

B. The Schedules of Prices awarded from the Bid Schedule (Document 00 43 00) are as follows.

1. _____

2. _____

3. _____

4. _____

C. An Agreement Supplement (Document 00 54 00) [___] is, [_X_] is not attached to this Agreement.

D. A Qualified Health Insurance Supplemental Agreement (Document 00 54 16) [__] is, [_X__] is not attached to this Agreement.

E. A Value Program Supplemental Agreement (Document 00 54 15) [___] is [_X_] is not attached to this Agreement.

F. Based upon the above-awarded schedules and the Agreement Supplement (if any), the Contract Price awarded is: _____ _____ dollars and _____ cents ($_____).

2.2 **CONTRACT TIME**

A. Contract Time shall:

1. Work shall be substantially complete by **March 19, 2026.**

B. Any time specified in work sequences in the Summary of Work (Section 01 11 00) shall be a part of the Contract Time.

2.3 **PUNCH LIST TIME**

A. CONTRACTOR shall complete all Work within _30_ days after CONTRACTOR receives ENGINEER's Final Inspection Punch List unless ENGINEER grants additional time in writing or an exception has been specified in the Contract Documents.

B. Permitting CONTRACTOR to continue and finish the Work or any part of the Work after the time fixed for its completion, or after the date to which the time for completion may have been extended, whether or not a new completion date is established, shall in no way operate as a waiver on the part of OWNER of any of OWNER's rights.

2.4 **LIQUIDATED DAMAGES**

A. CONTRACTOR agrees that OWNER will suffer damage or financial loss if the Work is not completed within the Contract Time, if sequenced work is not completed on time, or if public services are interrupted. CONTRACTOR and OWNER agree that the exact amount of damage or loss is difficult to determine.

B. OWNER shall be entitled to deduct and retain liquidated damages out of any money that may be due or become due CONTRACTOR. To the extent liquidated damages exceed any amounts due CONTRACTOR, CONTRACTOR shall be liable for such amounts and shall return such amounts to OWNER.

C. Instead of requiring proof of damage or specific financial loss, CONTRACTOR shall pay the following sums to OWNER as liquidated damages and not as a penalty. Such liquidated damages shall relate only to the additional administrative costs and expenses incurred by OWNER and shall not prevent OWNER from pursuing other remedies or collecting actual damages for damage or loss other than administrative costs and expenses.

1. **Late Completion**: **five thousand dollars** and _zero_ cents ($**5000.00)** for each day or part thereof that expires after the Contract Time until the Work is Substantially Complete as provided in Article 14.5 of the General Conditions (Document 00 72 00).

2. **Late Punch List Time Completion**: 50 percent of the amount specified for Late Contract Time Completion for each day or part thereof that the Work remains incomplete after the Punch List Time. The Punch List shall be considered received by

CONTRACTOR on the day it is transmitted by facsimile, email, or hand delivery or the day it is received by registered or certified mail.

4. **Survey Monuments**: $1,000.00 if a land survey monument is disturbed or moved and ENGINEER's surveyor has not referenced the survey monument for resetting.
5. **Interruption of Public Services**: No interruption of public services shall be caused by CONTRACTOR, its agents, or employees, without ENGINEER's prior written approval.

2.5 **RETAINAGE**

A. **Retainage is at OWNER's Option**: OWNER may, in its sole discretion, retain and withhold up to five percent of any payment due to CONTRACTOR under the Construction Contract, but the total retention may not exceed five percent of the total Contract Price. If, in ENGINEER's opinion, the Work is proceeding in accordance with CONTRACTOR's approved progress schedule, and all progress schedule submittals are current and up to date, and all required payrolls, Shop Drawings, and miscellaneous submittals are current and up to date, OWNER may choose not to withhold retainage.

1. **Payments**: At any time after 50 percent of the Work has been completed and if $50,000 or more has been retained, OWNER may make any of the remaining progress payments in full if, in OWNER's sole discretion, the Work is progressing satisfactorily. While CONTRACTOR is carrying on the Work, OWNER may pay monthly the balance not retained as aforesaid, after deducting all previous payments and all sums to be kept or retained under the provisions of the Construction Contract. No such payment shall be required to be made when, in the judgment of ENGINEER, the Work is not proceeding in accordance with the Contract Documents or when in ENGINEER's judgment the total value of the Work done since the last estimate amounts to less than $300. No such payment shall be construed to be an acceptance of any defective or improper Work or materials.
2. **Reducing the Retainage**: As the Work nears completion and solely at ENGINEER's discretion, OWNER may reduce the retainage to an amount more in line with the Work actually remaining.

B. **Interest**: Any money retained by OWNER shall be placed in an interest-bearing account held by OWNER as of the date such money would have otherwise been payable. The interest accrued thereon shall be for the benefit of CONTRACTOR.

C. **Release of Retainage and Interest**: Any retained moneys and any accrued interest thereon shall be released to CONTRACTOR pursuant to a billing statement from CONTRACTOR within 45 days after the later of: (1) the date that OWNER receives the billing statement from CONTRACTOR; (2) the date that a certificate of occupancy or final acceptance notice is issued to CONTRACTOR or OWNER; (3) the date that OWNER does not issue a certificate of occupancy but permits partial or complete occupancy of a newly constructed or remodeled building at the Project; or (4) the date that CONTRACTOR accepts the final pay quantities.

D. Other Retainage: Notwithstanding paragraph 2.5A: (1) if CONTRACTOR is in default or breach of the terms and conditions of the Construction Contract, OWNER may withhold from payment for as long as reasonably necessary an amount necessary to cure the breach

or default of CONTRACTOR; or (2) if the Project or a portion of the Project has been substantially completed, OWNER may retain until completion up to twice the fair market value of the Work of CONTRACTOR that has not been completed in accordance with the Construction Contract.

2.6 PAYMENT PROCEDURES

A. **Progress Payments**: CONTRACTOR shall submit Applications for Payment in accordance with Part 14 of the General Conditions (Document 00 72 00). Payment shall not become due or payable for any contract item not provided or installed by CONTRACTOR. As work is performed, OWNER shall pay money due to CONTRACTOR.

1. **Withholding Payment**: OWNER reserves the right to withhold payment from CONTRACTOR for non-compliance with any provision of the Contract Documents.
2. **Price Adjustments**: OWNER will consider making partial payment to CONTRACTOR for certain non-conforming work in advance of any negotiated settlement reached between CONTRACTOR and OWNER, provided CONTRACTOR requests in writing that this be done. CONTRACTOR agrees that any such payments made by OWNER are "payments in advance" and that any money that becomes due when the final settlement is negotiated will not constitute payments "withheld" or "retained" under State law.
3. **Pay Applications** must be submitted to ENGINEER through SLCDPU Engineering's Project Central SharePoint site. Access and use instructions are provided at the end of section 01 33 00 and must include, at a minimum, the following;
    a. Updated schedule;
    b. Schedule of values.

B. **Final Payment**: After completion of all Work and Punch List items, OWNER shall pay the Contract Price due after deducting all previous payments, unit price quantity adjustments, penalties, liquidated damages, and other amounts to be retained. All prior progress payments shall be subject to correction in the final payment. The final payment shall not be due and payable until 30 days after approval of the request for final payment by OWNER's finance department.

1. **Submittal**: Final payment shall not be made until CONTRACTOR has delivered and ENGINEER has accepted all submittals specified in Article 14.8 of the General Conditions (Document 00 72 00).
2. **OWNER Released From Claims**: The payment and acceptance of the final Contract Price due and the adjustment and payment for any Work done in accordance with any alterations of the same shall release OWNER from any and all claims of CONTRACTOR on account of Work performed under the Contract Documents or any Modification thereof, except for those claims specifically agreed to by OWNER as reserved and unresolved.

2.7 EXTRA WORK

A. No money will be paid to CONTRACTOR for any additions, deletions, or revisions in the Work as stipulated in Article 10.1 of the General Conditions (Document 00 72 00), unless

a Contract Modification for such has been made in writing and executed by OWNER and CONTRACTOR.

PART 3 EXECUTION

3.1 **EFFECTIVE DATE**

A. OWNER and CONTRACTOR executed this Agreement and declare the Effective Date of the Construction Contract to be the same as the recordation date.

3.2 **CONTRACTOR'S SUBSCRIPTION AND ACKNOWLEDGEMENT**

A. Name of organization: _____

B. Type of organization: _____

(Corporation, partnership, limited liability company, individual, etc.)

C. CONTRACTOR's Utah license number: _____

D. CONTRACTOR's signature: _____

E. Please print name here: _____

F. Title: _____

G. **Business Entity Acknowledgement**:

PERFORMANCE BOND

PART 1 GENERAL

1.1 **BOND**

A. Number:_____.

B. Amount:_____

_____ dollars ($ _____).

1.2 **SURETY**

A. Name:_____

B. Address:_____

_____

_____

_____

C. Telephone number: _____

D. Facsimile number: _____

1.3 **CONTRACTOR**

A. Name:_____

B. Address:_____

_____

_____

_____

C. Telephone number: _____

D. Facsimile number: _____

1.4 **OWNER**

A. Salt Lake City Corporation, a Utah municipal corporation, 1530 S. West Temple, Salt Lake City, Utah 84115-5223.

1.5 **CONSTRUCTION CONTRACT**

A. New WRF SW1 Influent Pump Station (IPS)

1200 Reclamation Road, Salt Lake City

Project No. 524905396

1.6 **DEFINED TERMS**

A. Terms used in this Performance Bond which are defined in Article 1.1 of the General Conditions (Document 00 72 00) will have the meanings indicated in the General Conditions.

PART 2 COVENANTS

2.1 SURETY'S AND CONTRACTOR'S RELATIONSHIP

A. The Surety, as surety, and the CONTRACTOR, as principal, jointly and severally, bind themselves, their heirs, executors, administrators, successors, and assigns to the OWNER, as obligee, for the performance of the Construction Contract.

B. If the CONTRACTOR performs the Construction Contract, the Surety and the CONTRACTOR shall have no obligation under this Bond; otherwise this Bond shall remain in full force and effect.

2.2 NOTICE

A. Notice to the Surety, the OWNER, or the CONTRACTOR shall be sent by registered or certified mail, postage prepaid, by hand delivery, or by overnight delivery service for which a delivery receipt is required, to the address shown on this Bond.

B. Notices sent as provided in Section 2.2A shall be effective on the date on which such notice was sent.

C. Notice may be sent by facsimile. Facsimile notice shall be effective on the date of transmission provided that a confirmation establishing the successful transmission of the notice is sent by first-class mail, postage prepaid, along with a copy of the notice transmitted, no later than twenty-four (24) hours after the facsimile notice is transmitted.

D. If any notice requires a period of less than seven (7) days for response, the notice shall be sent by facsimile.

E. If the time for response to any notice expires on a Saturday, Sunday, or a legal holiday in the State of Utah, the time shall be extended to the next business day.

2.3 PROCEDURE TO INVOKE SURETY'S OBLIGATION

A. If the CONTRACTOR fails to perform any of its obligations under the Construction Contract, and such failure to perform has not been waived by the OWNER, the OWNER may notify the CONTRACTOR and the Surety, at their addresses described above, that the CONTRACTOR is in default, and may formally terminate the CONTRACTOR’s right to perform its obligations under the Construction Contract.

B. If the Construction Contract is terminated, the OWNER shall pay the unpaid Balance of the Contract Price to the Surety for completion of the Work in accordance with the terms of the Construction Contract or to a contractor selected by the Surety to perform the Work in accordance with the terms of the Construction Contract.

2.4 SURETY'S OPTIONS AT CONTRACTOR TERMINATION

A. Surety Completes the Work: The Surety may undertake to perform and complete the Work itself, through its agents, or through independent contractors.

B. Surety Obtains Bids or Proposals: The Surety may obtain bids or negotiated proposals from qualified contractors acceptable to the OWNER for a contract for performance and completion of the Work.

1. Such bids or proposals shall be prepared by the Surety for execution by the OWNER and the completion contractor selected.
2. The Surety shall secure the contract with performance and payment bonds executed by a qualified surety equivalent to this Bond and the payment bond (Document 00 61 14).
3. The Surety shall pay to the OWNER the amount of damages as described in Section 2.6 in excess of the balance of the Contract Price incurred by the OWNER resulting from the CONTRACTOR's default.

C. Surety to Pay OWNER: The Surety may determine the amount, not to exceed the amount of this Bond specified in Section 1.1B, for which the Surety believes it may be liable to pay, and tender payment therefore to the OWNER. The OWNER has sole discretion to accept payment.

2.5 PROCEDURE FOR OWNER TO DECLARE SURETY IN DEFAULT

A. The OWNER may declare the Surety to be in default pursuant to the following procedures:

1. The OWNER shall issue an additional written notice to the Surety, after declaring the CONTRACTOR in default as provided in Section 2.3, demanding that the Surety perform its obligations under this Bond; and
2. The Surety shall respond to the OWNER within 15 days after receipt of the OWNER's additional notice, either denying the claim or accepting liability and exercising its options under Section 2.4.

B. If the OWNER declines to accept the payment tendered by the Surety pursuant to Section 2.4(C), or if the Surety has denied the claim in whole or in part, the OWNER, without further notice, may pursue any remedies available to the OWNER.

2.6 SURETY'S OBLIGATIONS

A. After the OWNER has terminated the CONTRACTOR's right to complete its obligations under the Construction Contract, and if the Surety elects to complete the Work under the Construction Contract as provided in Section 2.4, then the responsibilities of the Surety to the OWNER shall not be greater than those of the CONTRACTOR under the Construction Contract, and the responsibilities of the OWNER to the Surety shall not be greater than those of the OWNER under the Construction Contract.

B. To the limit of the amount of this Bond, but subject to a commitment by the OWNER to pay all valid and proper payments made to or on behalf of the CONTRACTOR under the Construction Contract, the Surety is obligated, without duplication, for:

1. the responsibilities of the CONTRACTOR for correction of Defective Work and completion of the Work under the Construction Contract;
2. any additional legal, design professional, and delay costs resulting from the CONTRACTOR's default, and resulting from the actions or failure to act of the Surety under Section 2.4; and
3. liquidated damages that are or may become due for any reason.

2.7 **UNRELATED OBLIGATIONS OF THE CONTRACTOR**

A. The Surety shall not be liable to the OWNER for obligations of the CONTRACTOR that are unrelated to the Construction Contract, and the balance of the Contract Price shall not be reduced or changed on account of any such unrelated obligations.

B. No right of action shall accrue on this Bond to any person or entity other than the OWNER or its heirs, executors, administrators, or successors.

2.8 **SURETY WAIVES NOTICE OF ANY CHANGE**

A. Surety hereby waives notice of any change, including changes of Contract Time, Contract Price, and scope of Work, to the Construction Contract or to related subcontracts, purchase orders, and other obligations.

2.9 **VENUE**

A. Any suit or action commenced by the OWNER under this Bond shall be in a court of competent jurisdiction in Salt Lake City, Utah.

PART 3 EXECUTION

3.1 **EFFECTIVE DATE**

A. The Surety and the CONTRACTOR executed this Bond and declared it to be in effect as of the _____day of _____, 20__.

1.4 **OWNER**

A. Salt Lake City Corporation, a Utah municipal corporation, 1530 S. West Temple, Salt Lake City, Utah 84115-5223.

1.5 **CONSTRUCTION CONTRACT**

A. New WRF SW1 Influent Pump Station (IPS)

1200 Reclamation Road, Salt Lake City

Project No. 524905396

1.6 **DEFINED TERMS**

A. Terms used in this Payment Bond that are defined in Article 1.1 of the General Conditions (Document 00 72 00) will have the meanings indicated in the General Conditions.

PART 2 COVENANTS

2.1 SURETY's AND CONTRACTOR's RELATIONSHIP

A. The Surety as surety, and the CONTRACTOR, as principal, jointly and severally, bind themselves, their heirs, executors, administrators, successors, and assigns to the OWNER, as obligee, to pay for labor, materials, and equipment furnished for use in the performance of the Construction Contract.

B. If the CONTRACTOR makes payment for all labor, materials, and equipment furnished for use in the performance of the Construction Contract, the Surety and the CONTRACTOR shall have no obligation under this Bond; otherwise this Bond shall remain in full force and effect.

2.2 NOTICE

A. Notice to the Surety, the OWNER, or the CONTRACTOR shall be sent by registered or certified mail, postage prepaid, by facsimile, by hand delivery, or by overnight delivery service for which a delivery receipt is required, to the address shown on this Bond.

B. Notices sent as provided in Section 2.2A shall be effective on the date on which such notice was sent.

C. Notice may be sent by facsimile. Facsimile notice shall be effective on the date of transmission provided that a confirmation establishing the successful transmission of the notice is sent by first-class mail, postage prepaid, along with a copy of the notice transmitted, no later than twenty-four (24) hours after the facsimile notice is transmitted.

D. If any notice requires a period of less than seven (7) days for response, the notice shall be sent by facsimile.

E. If the time for response to any notice expires on a Saturday, Sunday, or a legal holiday in the State of Utah, the time shall be extended to the next business day.

2.3 CONDITIONS OF SURETY'S LIABILITY

A. With respect to the OWNER, this Bond shall be null and void if the CONTRACTOR promptly takes the following actions:

1. makes payment, directly or indirectly, for all sums due Claimants; and
2. defends, indemnifies, and saves harmless the OWNER from all claims, demands, Liens, or suits by any person or entity who furnished labor, materials, or equipment for use in the performance of the Work, provided the OWNER has tendered defense of such claims, demands, Liens, or suits to the CONTRACTOR and the Surety.

2.4 PROCEDURE TO INVOKE SURETY'S OBLIGATION

A. **Concerning Claimants who have a Direct Contract with the CONTRACTOR**: The Surety shall have no obligation to Claimants under this Bond who are employed by or have a direct contract with the CONTRACTOR until such Claimants have given notice to the Surety at the address shown on this Bond and have sent a copy, or notice thereof, to the OWNER, stating that a claim is being made under this Bond and, with substantial accuracy, stating the amount of the claim.

B. **Concerning a Claimant who does not have a Direct Contract with the CONTRACTOR**: The Surety shall have no obligation to a Claimant under this Bond who does not have a direct contract with the CONTRACTOR until such Claimant takes the following actions.

1. The Claimant furnishes written notice to the CONTRACTOR and sends a copy, or notice thereof, to the OWNER, within 90 days after having last performed labor or last furnished materials or equipment included in the claim stating, with substantial accuracy, the amount of the claim and the name of the party to whom the materials were furnished or supplied or for whom the labor was done or performed;
2. The Claimant either receives a rejection in whole or in part from the CONTRACTOR, or does not receive within 15 days after furnishing the above notice any communication from the CONTRACTOR by which the CONTRACTOR indicates that the claim will be paid directly or indirectly; and
3. Not having been paid within the above 15 days, the Claimant sends a written notice to the Surety at the address described on this Bond and sends a copy, or notice thereof, to the OWNER stating that a claim is being made under this Bond and enclosing a copy of the previous written notice furnished to the CONTRACTOR.

2.5 **SURETY'S OPTION TO SETTLE CLAIMS**

A. When the Claimant has satisfied the conditions of Section 2.4, the Surety shall promptly and at the Surety's expense take the following actions:

1. Send an answer to the Claimant, with a copy to the OWNER, within 45 days after receipt of the claim, stating the amounts that are undisputed and the basis for challenging any amounts that are disputed; and
2. Pay or arrange for payment of any undisputed amounts.

2.6 **SURETY'S OBLIGATION**

A. The Surety's total obligation under this Bond shall not exceed the amount of this Bond, and the amount of this Bond shall be reduced in the amount of any payments made in good faith by the Surety.

2.7 **UNRELATED OBLIGATIONS OF THE CONTRACTOR**

A. The Surety and the OWNER shall not be liable to Claimants or others for obligations of the CONTRACTOR that are unrelated to the Construction Contract.

B. The OWNER shall not be liable for payment of any damages, costs, or expenses of any Claimant under this Bond, and shall have under this Bond no obligation to make payments to, give notices on behalf of, or otherwise have obligations to Claimants under this Bond.

2.8 **SURETY WAIVES NOTICE OF ANY CHANGE**

A. Surety hereby waives notice of any change to the Construction Contract including changes of Contract Time, Contract Price, and Scope of Work, or to related subcontracts, purchase orders, or other obligations.

2.9 **VENUE**

A. Any suit or action commenced by a Claimant under this Bond shall be in a court of competent jurisdiction in Salt Lake City, Utah.

2.10 **COPIES OF THIS BOND**

A. Upon request by any person or entity appearing to be a potential beneficiary of this Bond, the CONTRACTOR or the OWNER shall promptly furnish a copy of this Bond or shall permit a copy to be made.

PART 3 EXECUTION

3.1 **EFFECTIVE DATE**

A. The Surety and the CONTRACTOR executed this Bond and declared it to be in effect as of the _____day of _____, 20__.

DOCUMENT 00 62 11
SUBMITTAL TRANSMITTAL FORM

PART 1 GENERAL

1.1 SUMMARY

A. Form is self-transmittal. Letter of transmittal is not required.

B. All submittals must be submitted utilizing the OWNERS construction management software. A link will be provided in the letter of intent to award.

C. ENGINEER's review of submittals does not release or relieve CONTRACTOR from complying with all requirements of the Contract Documents.

1.2 ENGINEER'S FORM

A. An example of the ENGINEER's form is as follows:

SUBMITTAL REVIEW

[ ] NO EXCEPTIONS TAKEN [ ] REJECTED

[ ] MAKE CORRECTIONS NOTED [ ] RESUBMIT

[ ] SUBMIT SPECIFIED ITEM [ ] DO NOT RESUBMIT

This review is for general conformance with the design concepts of the Work and general compliance with the Contract Documents and does not constitute an approval or variance. Corrections or comments, or the failure to make them, on this review does not relieve the CONTRACTOR from full contract compliance.

The CONTRACTOR is responsible for compliance with all contract provisions, dimensions, sizes, capacities, fabrication and construction techniques, installation, coordinating work with others, and performing the Work in a safe and satisfactory manner.

Date: _____ By: _____

SALT LAKE CITY PUBLIC UTILITES ENGINEERING

B. Meaning of ENGINEER's form:

1. No Exceptions Taken: Submittals have been reviewed and no corrections were noted.
2. Make Corrections Noted: Submittals that have only minor discrepancies. Resubmission will not be required unless the stamp is marked "Resubmit".
3. Submit Specified Item: Submittals that are incomplete or require more than minor corrections will be annotated to indicate necessary corrections. Resubmit the part of the submittal showing the corrections.
4. Rejected: Submittals that are fundamentally in error, cover wrong equipment or construction, or require extensive corrections.
5. Resubmit: Submittals that require resubmission. Make corrections required, note any changes by dating the revisions to correspond with the change require date, and resubmit the corrected material.
6. Do Not Resubmit: Submittals that are not necessary to resubmit.

				SPEC. PARA. No. e.	DRAWING SHEET No. f.	

REMARKS

I certify that the above submitted items have been reviewed in detail and are correct and conform with the contract Drawings and specifications except as otherwise noted.

_____

NAME AND SIGNATURE OF CONTRACTOR

FORM 00 62 11.1 (Read Instructions on the reverse side prior to initiating this form)

INSTRUCTIONS

1. TRANSMITTAL No: Number each transmittal consecutively in the space entitled "Transmittal No.". This number will identify each submittal.
2. PREVIOUS TRANSMITTAL No: Mark the box for re-submittal and insert the transmittal number of last submission as well as the new submittal number in the spaces provided. Each re-submittal will become a new transmittal.
3. SPECIFICATION SECTION NUMBER: Cover only one specification section with each transmittal.
4. Column "a": For each entry on this form, the "SUBMITTAL ITEM No." will be the same SUBMITTAL ITEM No. indicated on the Submittal Register (Form 01 33 00).
5. Column "c": When a sample of material or Manufacturer's Certificate of Compliance is transmitted, indicate "Sample" or "Certificate".
6. Column "g": CONTRACTOR will place a check mark in the "Variation" column when a submittal is not in accordance with the plans and specifications – also, a written statement to that effect shall be included in the space provided for "Remarks" or on a separate page.
7. ENGINEER shall return a Submittal Review Response form.

SECTION 00 65 00

CERTIFICATE OF SUBSTANTIAL COMPLETION (EJCDC C-625)

Page Intentionally Left Blank

SECTION 00 65 00

CERTIFICATE OF SUBSTANTIAL COMPLETION (EJCDC C-625)

Certificate of Substantial Completion

Project:	
Owner:	Owner's Contract No.:
Contract:	Engineer's Project No.:

This [tentative] [definitive] Certificate of Substantial Completion applies to:

☐ All Work under the Contract Documents: ☐ The following specified portions of the Work:

Date of Substantial Completion

The Work to which this Certificate applies has been inspected by authorized representatives of Owner, Contractor, and Engineer, and found to be substantially complete. The Date of Substantial Completion of the Project or portion thereof designated above is hereby declared and is also the date of commencement of applicable warranties required by the Contract Documents, except as stated below.

A [tentative] [definitive] list of items to be completed or corrected is attached hereto. This list may not be all-inclusive, and the failure to include any items on such list does not alter the responsibility of the Contractor to complete all Work in accordance with the Contract Documents.

The responsibilities between Owner and Contractor for security, operation, safety, maintenance, heat, utilities, insurance and warranties shall be as provided in the Contract Documents except as amended as follows:

☐ Amended Responsibilities ☐ Not Amended

Owner's Amended Responsibilities:

Contractor's Amended Responsibilities:

The following documents are attached to and made part of this Certificate:

This Certificate does not constitute an acceptance of Work not in accordance with the Contract Documents nor is it a release of Contractor's obligation to complete the Work in accordance with the Contract Documents.

Accepted by Owner	Date

SECTION 00 73 00
SPECIAL PROVISIONS

The following special provisions apply to all technical sections for the work in this Project Manual.

1. **WARRANTY**
   A. The following warranty conditions shall apply for all products unless otherwise modified in the individual specifications:
      1. A written material warranty guarantee of **1 year** minimum shall be provided by the manufacturer against any breakdown of the material effectiveness of the structural repair elements. CONTRACTOR shall submit a warranty document certifying the material is protected against defects for the entire length of the warranty period.
      2. A written workmanship warranty guarantee of **1 year** minimum shall be provided by the CONTRACTOR against any shortcomings of the workmanship. CONTRACTOR shall submit a warranty document certifying the workmanship is protected against defects for the entire length of the warranty period.
      3. A warranty inspection may be conducted in the 11th month or anytime following the final acceptance of the work. At their option, the CONTRACTOR and a representative of the manufacturer may participate in the inspection. Inspection shall be conducted by OWNER. All deficiencies shall be repaired at CONTRACTOR 's expense in a manner mutually agreed by OWNER and CONTRACTOR.
2. **CONTRACTOR'S RESPONSIBILITIES**
   A. Locate and designate all existing manholes and new manhole or structure access points as necessary for the Work. Where existing manholes are to be used for installation of rehabilitation methods, enlarge existing openings into the pipe as required to install the products and provide for the removal and replacement of manhole cones, grade rings, ring and covers as required. Condition of existing manholes may require complete replacement at access points. Some manholes have been noted as offset manholes. If an offset manhole is used as an access point, the manhole shall be removed and replaced with a new manhole.
   B. OWNER or ENGINEER shall determine if condition of surrounding pipe warrants replacement. Where new structures are necessary or existing structures will be modified or otherwise disturbed, provide a stamped design and installation plan from a Professional Engineer registered in the state of Utah. Provide for installation of new or modified structures and complete restoration of all areas disturbed by CONTRACTOR operations.
   C. All manhole work including enlarging of access points, manhole repair, and new manhole installation shall be as indicated on the Drawings. All work designs, plans and proposals are to be submitted to the OWNER or ENGINEER for review and approval. All work will be in accordance with the APWA Standard Plans and Specifications and as required and approved by the OWNER or ENGINEER.
   D. The CONTRACTOR shall obtain access to water hydrants for cleaning, installation and other work items requiring water. CONTRACTOR shall comply with all connection and

use requirements. The CONTRACTOR shall obtain a fire hydrant meter from Salt Lake City Public Utilities and pay a refundable one thousand dollar ($1000.00) deposit. There shall be no charge for water used through the fire hydrant meter for the project.

E. Provide Blue Stakes locating and marking of all existing utilities in areas where excavation is to be performed prior to beginning any excavation. CONTRACTOR to field locate and mark limits of any excavation work required. Utilities are shown on the Drawings for informational purposes only. The indication of utilities in the Drawings shall not be construed by the CONTRACTOR to mean that all utilities are shown in the Drawings, or that those shown are in the exact location.

F. Provide for protection of all existing facilities and restoration of all areas disturbed by the CONTRACTOR operations as specified. If utilities relocation is required, CONTRACTOR shall coordinate with utility owner to relocate utility under provisions of the Salt Lake City Utility franchise agreements.

3. **TRAFFIC CONTROL**

A. The Contractor shall follow all traffic control guidelines as specified in the Traffic Control section.

4. **FIELD VERIFICATION OF DIMENSIONS**

A. The existing sewer may have deteriorated due to hydrogen sulfide corrosion. The CONTRACTOR shall verify the actual diameter before ordering or manufacturing any products to be used during connection Work. The CONTRACTOR is responsible for field verifying the inside dimensions of the sewer prior to ordering, preparing, or installing any rehabilitation materials. A mandrel test shall be performed as specified in the individual rehabilitation sections.

B. The manhole depths, manhole locations, and pipeline lengths indicated on the drawings are approximate. CONTRACTOR shall verify all dimensions before ordering or manufacturing any products to be used during the rehabilitation work.

5. **PHOTOGRAPHS AND DVD RECORDING**

A. Prior to start of construction, photographs and video recording shall be taken by the Contractor where excavations or entry onto private property are required during construction to show utility crossings, installation of bypass piping, excavations, installation of lining system, and repair or construction of manholes or access structures. The Contractor shall include all existing structures, vegetation, and general conditions of the work site.

B. The video recording shall be high quality video .MP4 format with a minimum of 720p resolution on a digital media (flash drive or portable hard drive) formatted to be compatible with PC systems. The .MP4 file should contain an audio track that narrates the progression of the camera through the site. Photographs shall be digital (10.0 mega pixel minimum) of foundations, driveways and other areas of potential damage.

C. After completion of the construction and restoration, photographs and video recordings shall be taken by the CONTRACTOR from the same points in the same direction as the pre-construction examination.

D. video recordings and photographs shall be submitted to the OWNER or ENGINEER

within seven (7) days prior to substantial completion and prior to acceptance of the work by the OWNER or ENGINEER.

6. **PRE-CONSTRUCTION SUBMITTALS**

A. The following shall be submitted for review prior to the start of construction:

1. Items listed in the individual sections.
2. Access points and pit locations and dimensions, as required. Limits on locations for access points are indicated on the Drawings. Access points outside these limits shall require review and approval by the OWNER or ENGINEER for each deviated location.
3. Access structure details, as required. Drawings shall be stamped by a Professional Engineer registered in the State of Utah and include the following:
    a. Dimensions
    b. Reinforcement
    c. Locations
4. Groundwater management plan and a State of Utah groundwater permit application.
5. Traffic Control plan submittal as specified.
6. Safety plan with a list of hazards and mitigation methods.
7. Quality Control and testing plan.
8. Site Security Plan

B. Each submittal shall cover items from only one section of the specification unless the item consists of components from several sources. CONTRACTOR shall submit a complete initial submittal including all components. When an item consists of components from several sources, CONTRACTOR 's initial submittal shall be complete including all components.

C. All submittals, regardless of origin, shall be approved by CONTRACTOR and clearly identified with the name and number of this Contract, CONTRACTOR 's name, and references to applicable specification paragraphs and Contract Drawings. Each copy of all submittals, regardless of origin, shall be stamped or affixed with an approval statement of CONTRACTOR. Each submittal shall indicate the intended use of the item in the Work. When catalog pages are submitted, applicable items shall be clearly identified and inapplicable data crossed out. The current revision, issue number, and date shall be indicated on drawings and other descriptive data.

D. CONTRACTOR shall be solely responsible for the completeness of each submittal. CONTRACTOR 's stamp or affixed approval statement of a submittal, per the Submittal Transmittal Form, is a representation to OWNER or ENGINEER that CONTRACTOR accepts sole responsibility for determining and verifying all quantities, dimensions, field construction criteria, materials, catalog numbers, and similar data, and that CONTRACTOR has reviewed and coordinated each submittal with the requirements of the Work and the Contract Documents.

E. All deviations from the Contract Documents shall be identified as deviations on each submittal. Such submittals shall, as pertinent to the deviation, indicate essential details of all changes proposed by CONTRACTOR (including modifications to piping other facilities that may be a result of the deviation).

F. OWNER or ENGINEER's review of submittals covers only general conformity to the Drawings and Specifications, external connections, and dimensions that affect the layout; it does not indicate thorough review of all dimensions, quantities, and details of the material, equipment, device, or item covered. OWNER or ENGINEER's review shall not relieve CONTRACTOR of sole responsibility for errors, omissions, or deviations in the drawings and data, nor of CONTRACTOR 's sole responsibility for compliance with the Contract Documents.

H. OWNER or ENGINEER's submittal review period shall be 28 consecutive calendar days and shall commence on the first calendar day following receipt of the submittal or resubmittal in OWNER or ENGINEER's office. The time required to mail the submittal or resubmittal back to CONTRACTOR shall not be considered a part of the submittal review period.

I. CONTRACTOR shall accept full responsibility for the completeness of each resubmittal. CONTRACTOR shall verify that all corrected data and additional information previously requested by OWNER or ENGINEER are provided on the resubmittal.

J. When corrected copies are resubmitted, CONTRACTOR shall direct specific attention to all revisions in writing and shall list separately any revisions made other than those called for by OWNER or ENGINEER on previous submittals. Requirements specified for initial submittals shall also apply to resubmittals. Resubmittals shall bear the number of the first submittal followed by a letter (A, B, etc.) or a unique identification that indicates the initial submittal and correct sequence of each resubmittal

8. PERMITS REQUIRED

A. All permits required for this project will be paid at cost.

B. Supplement the permit list given in the General Conditions Article 6.7 and additional permits listed in 00 73 10 Modifications to the General Conditions, the following permits are required:

1. Traffic Control—Traffic Control plan approval required to get the Public Way permit.
2. Public Way Excavation—Fee permit issued by UDOT based on the amount of excavation completed in the public right-of-way.
3. Noise—No-cost permit issued by Salt Lake Valley Health Department (SLVHD), 788 E. Woodoak Lane, Murray, Utah 84107.
    a. The requirements of the SLVHD noise permit is built around keeping noise in residential neighborhoods no more than 10 dB(A) above ambient between 7:00 AM to 10:00 PM and no more than 5 dB(A) above ambient outside those hours (nighttime). A waiver may be applied for to work outside the SLVHD specified regular working hours of 7:00 AM to 10:00 PM.

9. WORKING HOURS

A. The work hours need to be controlled as much as possible to minimize disturbances to adjacent residences. The OWNER or ENGINEER may permit Work outside normal project work hours but the CONTRACTOR shall still comply with appropriate noise, safety, environmental, odor and other requirements.

B. CONTRACTOR may conduct nighttime work as allowed by prior schedule approval 2-weeks in advance by OWNER or ENGINEER and subject to local neighborhood coordination. Nighttime work will be limited to times when continuous operations are required for specific construction activities and not for CONTRACTOR convenience.

10. ACCESS AND USE OF THE OWNER's SHAREPOINT WEBSITE

1. The CONTRACTOR shall utilize the OWNER's SharePoint website for all written CONTRACTOR correspondence, submittals, transmittals, pay applications, schedule updates, or other communication where feasible. CONTRACTOR shall utilize OWNER-established SharePoint workflows as directed.
2. The CONTRACTOR shall request access to the OWNER's SharePoint website through the Project Manager, by providing the name, employer, e-mail address and phone number of each individual for which access is requested.
3. All SharePoint workflow functions require one (1) individual to be designated as the point of contact to receive workflow e-mail alerts from the system. The CONTRACTOR shall designate one individual as the point of contact for these workflows at the time access is requested. The point of contact can be changed upon the request from the CONTRACTOR at any time during the execution of the project.
4. The OWNER will determine the level of access to the SharePoint website that will be granted to each individual.
5. The OWNER and or OWNER's Representative shall provide SharePoint training to the CONTRACTOR(s).
6. The OWNER shall provide instruction sheets for the electronic workflows executed through the SharePoint site.
7. CONTRACTOR is required to have access to computer hardware and software that is compatible with the OWNER's SharePoint system, capable of running automated process workflows, and supporting electronic signatures. Minimum system requirements include:
    a. Windows 7 or higher.
    b. Microsoft Internet Explorer version 8 or higher (Google Chrome preferred).
    c. Microsoft Office 2010 or higher.
    d. Latest version of Adobe Acrobat (at a minimum Reader, Standard or Professional for editing).

e. Broadband internet connection.

f. Open access to https://slcut.sharepoint.com

8. CONTRACTOR shall verify current system requirements at start of contract and may need to adjust requirements during the contract period to accommodate upgrades or changes to the SLCDPU's system.

END OF SECTION

DOCUMENT 00 73 10
MODIFICATIONS TO THE GENERAL CONDITIONS

(Supplementary Conditions)

This document changes provisions specified in the General Conditions (Document 00 72 00) in the Manual of Standard Specifications published by the Utah Chapter of the American Public Works Association.

Add the following paragraphs to Article 1.1A

61. **COVID-19:** The 2019 novel coronavirus and the disease it causes are collectively referred to herein as COVID-19.

62. **COVID-19 Proclamations:** Captures the orders, directives and guidance concerning COVID-19 that have been issued, and which may be issued, by public bodies with jurisdiction over the project.

Add the following paragraphs to Article 2.2

2.2 **COPIES OF DOCUMENTS**

B. OWNER shall not furnish to CONTRACTOR published Contract Documents that include the current edition of the Manual of Standard Plans and the Manual of Standard Specifications. The CONTRACTOR shall purchase such documents separately.

C. Copies of all Contract Documents including the current edition of the Manual of Standard Plans and the Manual of Standard Specifications shall be provided on site by the CONTRACTOR.

Modify paragraph 2.5C

2.5 **BEFORE STARTING CONSTRUCTION**

C. Field Office: The CONTRACTOR shall establish and maintain a field office in such a location that ENGINEER may always contact CONTRACTOR for transmittal of Plans and instructions and, for dissemination of Project information. CONTRACTOR shall provide and maintain a telephone in the field office during performance of the Work.

Modify Article 5.1

5.1 **PERFORMANCE, PAYMENT AND OTHER BONDS**

A. Before OWNER executes the Agreement, CONTRACTOR shall file with OWNER a good and sufficient Performance Bond (using OWNER's Document 00 61 13) and a Payment Bond (using OWNER's Document 00 61 14), each in the sum of not less than 100 percent of the Contract Price.

B. The Bonds shall be executed by CONTRACTOR and issued by a company duly and regularly authorized to do a general surety business in the State of Utah and either (i) named in the current U.S. Treasury Department's listing of approved sureties (Department Circular 570) (as amended), or (ii) with a current "A-" rating and a financial size category rating of at least a "VII" or better in A.M. Best Co., Inc.'s Best Insurance Reports, Property and Casualty Edition.

C. The Performance Bond shall guarantee the faithful performance of the Construction Contract by CONTRACTOR and the Payment Bond shall guarantee the payment of labor and materials. The Bonds shall inure by their terms to the benefit of OWNER. Neither this nor any other provision requiring a Performance Bond shall be construed to create any rights in any third party Claimant as against OWNER for performance of the Work under the Construction Contract.

D. If the surety on any Bond furnished by CONTRACTOR is subject to any proceeding under the Bankruptcy Code (Title 11, United States Code) or becomes insolvent or its right to do business is terminated in the State of Utah or it ceases to meet the requirements of this Article, CONTRACTOR shall, within 15 days thereafter, substitute another Bond and surety, both of which must be acceptable to OWNER.

Modify Article 5.2

5.2 **INSURANCE**

A. **In General**:

1. Any insurance coverage required herein that is written on a "claims made" form rather than on an "occurrence" form shall (i) provide full prior acts coverage or have a retroactive date effective before the date of the Agreement, and (ii) be maintained for a period of at least three (3) years following the end of the term of the Agreement or contain a comparable "extended discovery" clause. Evidence of current extended discovery coverage and the purchase options available upon policy termination shall be provided to OWNER.
2. All policies of insurance shall be issued by insurance companies licensed to do business in the state of Utah and either:
   a. Currently rated A- or better by A.M. Best Company;

      -OR-

   b. Listed in the United States Treasury Department's current Listing of Approved Sureties (Department Circular 570), as amended.
3. CONTRACTOR shall furnish certificates of insurance, acceptable to OWNER, verifying the foregoing matters concurrent with the execution hereof and thereafter as required.

4. In the event any work is subcontracted, CONTRACTOR shall require its subcontractor, at no cost to OWNER, to secure and maintain all minimum insurance coverages required of CONTRACTOR hereunder.

    a. This project involves the creation of following elements of work that require the stamp of a professional engineer. CONTRACTOR shall obtain and submit to OWNER insurance certificates evidencing that the subcontractor or supplier has professional liability insurance coverage meeting the requirements in the Agreement and the limits identified in Article 5.2 B.5.

5. All required certificates and policies shall provide that coverage thereunder shall not be canceled or modified without providing, in a manner approved by the OWNER**'s** Attorney, 30 days prior written notice to OWNER.

B. **Required Insurance Policies**: CONTRACTOR, at its own cost, shall secure and maintain during the term of this Agreement, including all renewal terms, the following minimum insurance coverage:

1. Worker's compensation and employer's liability insurance sufficient to cover all of CONTRACTOR's employees pursuant to Utah law, unless a waiver of coverage is allowed and acquired pursuant to Utah law. In the event any work is subcontracted, CONTRACTOR shall require its subcontractor(s) similarly to provide worker's compensation insurance for all of the latter's employees, unless a waiver of coverage is allowed and acquired pursuant to Utah law.
2. Commercial general liability (CGL) insurance with Salt Lake City Corporation as an additional insured on a primary and non-contributory basis in comparison to all other insurance including OWNER's own policy or policies of insurance, in the minimum amount of $2,000,000 per occurrence with a $3,000,000 general aggregate and $3,000,000 products completed operations aggregate. These limits can be covered either under a CGL insurance policy alone, or a combination of a CGL insurance policy and an umbrella insurance policy and/or a CGL insurance policy and an excess insurance policy. The policy shall protect OWNER, CONTRACTOR, and any subcontractor from claims for damages for personal injury, including accidental death, and from claims for property damage that may arise from Contractor's operations under this Agreement, whether performed by Contractor itself, any subcontractor, or anyone directly or indirectly employed by either of them. Such insurance shall provide coverage for premises operations, acts of independent contractors, products and completed operations.
3. Commercial automobile liability insurance that provides coverage for owned, hired, and non-owned automobiles used in connection with this Agreement in the minimum amount of a combined single limit of $1,000,000 or $500,000 liability per person, $1,000,000 liability per accident, and $250,000 property damage. These limits can be reached either with a commercial automobile liability insurance policy alone, or with a combination of a commercial automobile liability insurance policy and an umbrella insurance policy and/or a commercial automobile liability insurance policy and an

excess insurance policy. If the policy only covers certain vehicles or types of vehicles, such as scheduled autos or only hired and non-owned autos, Contractor shall only use those vehicles that are covered by its policy in connection with any work performed under this Agreement.

4. Builder's Risk: Builder's risk insurance with a policy limit equal to the total amount of the Contract Price. The policy shall be written on an "All Risk" coverage basis with OWNER as a "named insured" and "loss payee".
5. Professional liability insurance in the minimum amount of $2,000,000 per claim made with a $2,000,000 annual aggregate limit. If CONTRACTOR is not eligible to obtain such insurance, CONTRACTOR's obligation is satisfied if a subcontractor (or supplier) provides such insurance.
6. Pollution liability insurance, with OWNER as an additional insured, in the minimum amount of $2,000,000 per occurrence with a $3,000,000 annual aggregate limit.

Remove Article 6.4 in its entirety.

6.4 SUBSTITUES OR "OR-EQUAL" ITEMS

Add the following paragraphs to Article 6.7

6.7 **PERMITS**

H. Salt Lake City Permits: In addition to any other permits required for the Work, CONTRACTOR shall obtain permits from Salt Lake City Corporation for Work on the Project.

1. OWNER-Paid Permits: CONTRACTOR shall be responsible for submitting plans, scheduling inspections and paying all costs incidental to such actions as required for any permit required by Salt Lake City Corporation. Except for construction water meter fees, the fees for these permits shall be paid by OWNER and shall not be included in CONTRACTOR's bid. The following list is not exclusive and does not relieve CONTRACTOR of the responsibility of obtaining all permits.
    a. From Salt Lake City Community & Neighborhoods Department, Division of Transportation, 349 South 200 East, Suite 450, Salt Lake City, Utah 84111. Phone 801-535-6630
        1. Parking meter bagging and removal permit
        2. Street closure permit
        3. Traffic control permit
        4. Any other applicable Division of Transportation imposed fee
    b. From Salt Lake City Department of Public Utilities, 1530 South West Temple Street, Salt Lake City, Utah 84115
        1. UPDES storm drain water discharge permit for sites 1 to 5 acres
        2. SLC SWPPP permit

3. All applicable water, fire, sewer and storm drainage impact and connection fees
4. ¾ inch meter permit for new and existing drinking fountain

c. From Salt Lake City Building Services and Licensing, 451 South State Street, Salt Lake City, Utah 84111. Phone 801-535-7751
   1. Building, plumbing, mechanical, electrical permit (as applicable)

d. The CONTRACTOR or subcontractor (whichever is doing work in the public way) shall obtain from Salt Lake City Corporation Department of Community and Neighborhoods, Engineering Division, 349 South 200 East, Suite 100, Salt Lake City, Utah 84111a permit to work in the Public Way. To obtain such permit the CONTRACTOR or subcontractor, as the case may be, shall provide or have on file a $15,000.00 bond to work in the Public Way and applicable insurance. The insurance required is the same as that required for this contract.

2. CONTRACTOR-Paid Permits: The fees for permits not paid for by OWNER shall be included in CONTRACTOR's Bid. The following list is not exclusive and does not relieve CONTRACTOR of the responsibility of obtaining all permits:

a. Construction Water Meter: If water for construction is required to be taken from fire hydrants or a new water meter, CONTRACTOR shall be solely responsible for obtaining and paying for such permits and water usage to Salt Lake City Corporation Department of Public Utilities permit office, 1530 South West Temple Street, Salt Lake City, Utah.
   1. Hydrant meters require a $1,000.00 deposit ($100.00, non-refundable). A refund will be returned to CONTRACTOR by the Department of Public Utilities if the meter and equipment is returned undamaged.

I. Other Permits: All other permit fees required by Salt Lake County, the State of Utah, the United States of America, and any of their agencies, or by any private utility companies, shall be paid for and obtained by CONTRACTOR and included in CONTRACTOR's Bid. The following list is not exclusive and does not relieve CONTRACTOR of the responsibility of obtaining all permits:

1. UDOT Region 2: Digging permit in a UDOT roadway right of way.
2. Private Property Owner Permit: Written permission to use private water.
3. Private Property Owner Permit: Written permission to store product, equipment, materials, and supplies outside of the Work site boundaries.
4. General Permit for Storm Water Discharge (Sites greater than 1 acres): From the State of Utah, Department of Environmental Quality, Division of Water Quality, 288 North 1460 West Street. P.O. Box 144870, Salt Lake City, Utah 84114-4879. Fee varies; contact the State for a quote.
5. Flood Control Permit: From Salt Lake County, Department of Public Works, Division of Flood Control, 2001 South State Street, Salt Lake City, Utah.

6. Monument Permit: From Salt Lake County Surveyor, 2001 South State Street, Salt Lake City, Utah. Fee will be at least $100.00 per monument and is based upon time of performance.

Modify paragraph 6.17A and add paragraph 6.17E

6.17 **INDEMNIFICATION**

A. **Indemnification of OWNER:** Subject to paragraph 6.17E below, CONTRACTOR shall indemnify, save harmless, and defend OWNER, its officers and employees, from and against all losses, claims, demands, actions, damages, costs, charges, and causes of action of every kind or character, including attorney's fees, arising out of CONTRACTOR's wrongful, reckless, or negligent performance hereunder. CONTRACTOR's duty to defend OWNER shall exist regardless of whether OWNER or CONTRACTOR may ultimately be found to be liable for anyone's negligence or other conduct. If OWNER's tender of defense, based upon this indemnity provision, is rejected by CONTRACTOR, and CONTRACTOR is later found by a court of competent jurisdiction to have been required to indemnify OWNER, then in addition to any other remedies OWNER may have, CONTRACTOR shall pay OWNER's reasonable costs, expenses, and attorney's fees incurred in proving such indemnification, defending itself, or enforcing this provision. Nothing herein shall be construed to require CONTRACTOR to indemnify the indemnitee against the indemnitee's own negligence.

E. Nothing herein shall be construed to require CONTRACTOR to indemnify OWNER, ENGINEER, or their agents or employees for any damages that are caused by or result from the fault of OWNER, ENGINEER, or their agents or employees.

Add the following Paragraph 10.4

PART 10 CHANGES IN THE WORK

10.4 **CHANGE ORDERS, ALLOWANCE WORK ORDERS, AND CONSTRUCTION CHANGE DIRECTIVES**

A DEFINITIONS

1. Construction Change Directive is a signed directive by the Owner's designated representative, directing a change in Work prior to a Work Order or Change Order where there is a dispute as to the terms of the Work Order or Change Order and/or there is an urgency to proceed with the change without pricing being obtained from the Contractor at the time of the directive.

3. Specific Allowances include specified items of Work generally known to be required for the Project but whose quantities and/or pricing is unknown until after the items of Work have been identified. Specific Allowances should be used only for work related to the bid items specified by the Allowance. The use of the Specific Allowances shall be documented by a Work Order signed by Owner's designated representative.

4. Work Orders are issued with an automated workflow from the Owner's Project Management System, Project Central, to the Contractor and shall authorize the

Contractor to perform Work for payment from the General Allowance and Specific Allowance(s), if any, set forth in the Contract between the Owner and Contractor for the Project. The content of these Work Orders is made up of previously defined RFP's, as accepted by the Owner's designated representative (as defined in Section 01 26 00 of APWA Standard Specifications).

B PROCESS

1. **Work Orders**

a. Changes in the Work may be accomplished after execution of the Contract, and without invalidating the Contract and without notice to any surety, by Change Orders, Allowance Work Orders (both General Allowance and Specific Allowance) and Construction Change Directives. The Contract Sum and the Final Completion Date shall be adjusted accordingly, per Contract terms.

b. Except for emergencies, a Work Order authorizing payment from the General Allowance or the Specific Allowance requires prior authorization from the Owner's designated representative before starting the work. Work Orders are issued with an automated workflow from the Owner's Project Management System, Project Central, to the Contractor.

c. Work Order or Change Order signed by Contractor with no extension of time shall exclusively establish Contractor's contract that there shall be no time extension in connection with that Work Order or Change Order Contractor acknowledges that any attempt to preserve a future request for a time extension due to the performance of any Work associated with a Work Order or Change Order or the cumulative effects of multiple Work Orders or Change Orders is ineffective and has no force or effect pursuant to this Contract. Except for emergencies, changes to the Final Completion Date may be made only by a signed Change Order signed by the Owner's designated representative. Additional time associated with a General Allowance Work Order or a Specific Allowance Work Order must be processed with a change order.

d. Work Orders and Change Orders shall use the Request for Proposal (RFP) automated workflow from the Owner's Project Central system, specified by Owner and may be initiated by either party as follows:

e. Contractor may initiate the process by submitting a proposal, using the automated workflow, to the Owner which shall fully describe the changes sought, the reasons for the changes, and the impact, if any, on the contract Final Completion Date or Contract Sum. If the Final Completion Date will be impacted by the proposed change, Contractor shall submit a schedule highlighting the anticipated impact resulting from the proposed change. If Contractor is seeking additional payment from the General Allowance, a Specific Allowance, a Bid Item Number that comprises Contractor's Base Contract Price, or the Contract Sum, it shall submit a price proposal which identifies the basis and the net change for this proposal. Contractor shall also advise the Owner in writing the results of Contractor's technical evaluation of the proposed change stating any undesirable consequences then known or reasonably foreseeable to Contractor. The Owner shall promptly

respond to the proposal, within ten (10) calendar days, after reviewing the submitted material and shall either timely process the Work Order or Change Order or request additional information, clarifications or corrections until the Work Order or Change Order has been agreed upon by both Owner and Contractor.

f. The Owner may initiate the process, with consultation from the Engineer, by submitting a request with an automated workflow to Contractor describing the change in sufficient detail to permit evaluation and Contractor shall promptly respond (within ten (10) Calendar Days) by submitting a price and time proposal to Owner. At the same time, Contractor shall also advise the Owner of Contractor's technical evaluation of the requested change stating any undesirable consequences then known or reasonably foreseeable to Contractor. Contractor shall indicate the potential severity of impact and effect to the Contractor's schedule, Base Contract Price or Contract Sum at the time the request is initially made.

g. Any time during the Work Order or Change Order process, the Owner may elect to issue a Construction Change Directive requiring Contractor to immediately carry out the Work as defined in the Construction Change Directive or may cancel the proposed Work Order or Change Order. The Owner shall not be liable for any costs incurred by Contractor for proceeding with the contemplated Work Order or Change Order in anticipation of an approved Work Order or Change Order from the Owner's designated representative.

h. After the Owner's approval has been obtained, the Work Order or Change Order will be prepared by the Owner for execution by the parties. The documents shall be transmitted to Contractor for signature signifying acceptance through the automated workflow from the owner's Project Central system. The documents will be similarly signed by the Owner. The acceptance of a Work Order or Change Order constitutes a mutual contract with respect to all extensions of time and all direct or indirect costs related to the Work Order or Change Order.

2. **Construction Change Directives**

a. A Construction Change Directive is a signed directive by the Owner, directing a change in Work prior to an authorized Work Order or Change Order where there is a dispute as to the terms of the Work Order or Change Order or agreement on the pricing has not been reached for the Work associated with the Work Order or Change Order. A Construction Change Directive shall be signed, using an Automated Workflow from the owner's Project Central system, by Owner's designated representative.

b. An adjustment to the cost of the Work resulting from a Construction Change Directive shall be documented with an RFP and once accepted by the Owner's designated representative, authorized in a specific allowance work order, general allowance work order, or change order.

c. All Construction Change Directives shall be signed first by the Owner's designated representative(s) followed by the Contractor, respectively.

d. Upon receipt of a Construction Change Directive signed by Owner, Contractor shall promptly proceed with the Work provided in the Construction Change Directive. The Contractor will acknowledge and accept the work issued with an automated workflow within ten (10) calendar day. The Contractor shall promptly advise the Owner of disagreement with the method, if any, within ten (10 calendar days.

e. A Construction Change Directive acknowledged and accepted by Contractor indicates the adherence of Contractor to its terms. Such contract shall be effective immediately and shall be subsequently defined by an RFP which is authorized by a Specific Allowance Work Order or General Allowance Work Order signed by Owner's designated representative authorizing payment or a signed Change Order by Owner's designated representative(s).

f. Except as otherwise agreed by the Owner and Contractor, the method and the adjustment shall be initially determined by the Owner based on reasonable expenditures and savings of those performing the Work attributable to the Work Order or Change Order, including expenditures for design services and revisions to the Contract Documents. If the Contractor does not respond within ten (10) calendar days or disagrees with the method for adjustment, Contractor shall keep and present, in such form as Owner may prescribe, an itemized accounting together with appropriate supporting data to substantiate the accounting to the reasonable satisfaction of Owner.

g. When the Owner and Contractor, subsequent to the issuance of a Construction Change Directive, agree concerning the adjustments to the Work, the Construction Change Directive shall be effective immediately and subsequently documented by an RFP and is authorized by the preparation and execution of an appropriate signed Specific Allowance Work Order or General Allowance Work Order by the Owner's designated representative, or a Change Order signed by Owner's designated representative.

Modify paragraph 13.6A

13.6 **CORRECTION OR REMOVAL OF DEFECTIVE WORK BY CONTRACTOR**

A. In addition to CONTRACTOR's obligations under Article 6.16, if required by ENGINEER, CONTRACTOR shall promptly, as directed, either correct all Defective Work, whether or not fabricated, installed, or completed, or, if the Work has been rejected by ENGINEER, remove it from the site and replace it with non-Defective Work. No rejected material, the defects of which have been subsequently corrected, shall be used in the Work unless approval in writing has been given by ENGINEER. CONTRACTOR shall bear all direct, indirect, and consequential costs of such correction or removal (including but not limited to fees and charges of OWNER, engineers, architects, and other professionals) made necessary thereby.

Modify paragraph 13.7A

13.7 **CORRECTION PERIOD**

A. In addition to CONTRACTOR's obligations under Article 6.16, if any portion of the Work is found to be defective within **one year** after the date of Substantial Completion, CONTRACTOR shall correct it or replace it with non-Defective Work. The **one year** correction period may be superseded by such longer period of time as prescribed in the Contract Documents or by special guarantee terms required by the Contract Documents.

Add the following paragraph to Article 13.7

13.7 **CORRECTION PERIOD**

E. Nothing contained in this Article 13.7 shall be construed to establish a period of limitation with respect to other obligations CONTRACTOR has under the Contract Documents, including Article 6.16. Establishment of the **one year** period for correction of Work as described in this Article 13.7 relates only to the specific obligation of CONTRACTOR to correct the Work, and has no relationship to the time within which the obligation to comply with the Contract Documents may be enforced, nor the time within which proceedings may be commenced to establish CONTRACTOR'S liability with respect to CONTRACTOR's obligations other than specifically to correct the Work. Such times include the applicable statute of limitations or statute of repose, which may be longer than one year.

Modify Article 14.5

14.5 SUBSTANTIAL COMPLETION

A. CONTRACTOR to Certify Work is Substantially Complete: When CONTRACTOR considers the Work (or portion thereof) ready for its intended use, CONTRACTOR shall certify using the electronic workflow from SLCDPU's Project Central from the corresponding project site to ENGINEER that the Work (or portion thereof) has been completed in accordance with the Contract Documents. Contractor shall include in such written certification a list of any items not finished.

   The following must be accomplished to achieve Substantial Completion:

   i. All systems and parts are tied-in/commissioned; critical equipment inspected and functioning normally
   ii. All applicable O&M Manuals have been provided and required Owner training on equipment and systems have been completed
   iii. All applicable required safety and security deliverables have been completed
   iv. Updated operating maps and diagrams including redlines, and all other applicable required operational updates have been received by Owner
   v. Punchlist developed and issued

B. ENGINEER to Review CONTRACTOR's Certification: Within five (5) Days after ENGINEER receives CONTRACTOR certification and list of Work items not finished (punchlist), ENGINEER will issue notice via the electronic workflow agreeing the Work

is Substantially Complete or via email stating reasons why the Work is not Substantially Complete.

C. Prior to CONTRACTOR submitting their certification of Substantial Completion, ENGINEER shall conduct site walk with the CONTRACTOR. During the site walk, the punchlist items will be identified, and shortly thereafter the ENGINEER will issue the punchlist to the CONTRACTOR.

D. OWNER's Rights: OWNER shall have the right to exclude CONTRACTOR from the Work after the date of Substantial Completion, but owner shall allow CONTRACTOR reasonable access to complete or correct items on the Punch List.

Add the following Articles to Part 16

PART 16 DISPUTE RESOLUTION

16.2 **GENERAL**

A. Unless a decision is held by an appropriate court of law to have been procured by fraud or to be arbitrary and capricious or so grossly erroneous as necessarily to imply bad faith, any factual decision made under this dispute resolution procedure shall be final and binding in any suit or action arising under the Construction Contract, including any actions by CONTRACTOR or others against OWNER or any of OWNER's agents, consultants, or employees.

B. Compliance by CONTRACTOR with provisions of this Part shall be a condition precedent to any legal action by CONTRACTOR or any of CONTRACTOR's Subcontractors and Suppliers against OWNER or any of OWNER's agents, consultants, or employees.

C. The provisions of this Part shall not preclude or limit judicial review of issues of law.

D. Ambiguities in or between Contract Documents shall be construed in favor of the OWNER.

16.3 **DISPUTES NOT RELATED TO THE GUARANTEE OF THE WORK**

A. Any dispute arising under the Construction Contract concerning a question of fact, not related to the guarantee of the Work (Article 13.1 of the General Conditions (Document 00 72 00)), that is not disposed of by Contract Modification shall be decided pursuant to the following procedure.

1. Any decision by ENGINEER interpreting the requirements of the Contract Documents may be appealed in writing to the ENGINEER. The ENGINEER's decision, regarding that appeal shall be reduced to writing and a copy shall be mailed or otherwise furnished to CONTRACTOR within 10 days. The decision of ENGINEER shall be final and conclusive unless, within 30 days after the date of receipt of such copy, CONTRACTOR mails or otherwise furnishes to ENGINEER a written appeal to the head of OWNER's department responsible for constructing the project.

2. Within 15 days from the receipt of any such appeal, the department head shall issue a decision in writing and mail or otherwise furnish a copy thereof to CONTRACTOR. The decision of the department head shall be final and conclusive unless, within 15

days from the date of receipt of such decision, the CONTRACTOR mails or otherwise furnishes to the department head a written appeal to OWNER's Committee.

3. The Dispute Committee shall consist of three persons selected by the department head who are knowledgeable about the Work.
4. OWNER and CONTRACTOR shall each have the opportunity to fully present its case to the Dispute Committee before the Dispute Committee's deliberation. The Dispute Committee may request any other materials or written memoranda necessary to consider the issues, and may schedule other proceedings as necessary.
5. The decision of the Dispute Committee shall be rendered in writing within 15 days after the Dispute Committee's final hearing of the issue and receipt of any supplemental material requested by the Dispute Committee. The decision shall be mailed or otherwise delivered to CONTRACTOR.
6. The decision of the Dispute Committee shall be the final binding interpretation of the facts that are the subject of the appeal.

16.4 **DISPUTES RELATED TO THE GUARANTEE**

A. Except as otherwise provided by Contract Modification, any dispute concerning a question of fact involving or arising out of the guarantee required by the Contract Documents (Article 13.1 of the General Conditions (Document 00 72 00)), that is not disposed of by Contract Modification, shall be decided pursuant to the provisions of Paragraph 16.3 above, except that the initial factual decision shall be issued in writing by the ENGINEER, together with the department head.

B. Any appeal therefrom shall be made within 15 days directly to the Dispute Committee where such disputes shall be governed by provisions in sub-paragraphs 3 to 6 in paragraph 16.3A above.

16.5 **WORK DURING APPEAL**

A. Notwithstanding the pendency of any protest or appeal provided above, CONTRACTOR shall, if so ordered by ENGINEER, proceed with the Work under the Contract Documents according to ENGINEER's direction and according to the decision on any appeal. The existence of a claim or protest shall not excuse CONTRACTOR from the requirements of the Contract Documents, including, but not limited to, the Contract Time.

16.6 **APPEALS OF TERMINATION OR SUSPENSION**

A. Any decision of OWNER to terminate or suspend the Work shall not be subject to the provisions of this Part.

END OF DOCUMENT

SECTION 00 73 15
MODIFICATIONS TO APWA STANDARD PLANS
(Supplementary Conditions)

PART 1 GENERAL

1.1 DOCUMENT INCLUDES

A. This Document specifies changes to the Standard Plans published by the Utah Chapter of the American Public Works Association. Not all of these modifications will apply to the Work. CONTRACTOR is to apply the appropriate modification to the appropriate Standard Plan.

1.2 CHANGES

A. Modify the standard plans as follows.

Table 1 – WATER

APWA Standard Plan No.	Description	Modification
381	Trench backfill	Refer to Salt Lake City Public Utility (SLCPU) - Standard Practice #1. Maximum depth for magnetic marking tape is 18 inches.
382	Pipe zone backfill	Refer to SLCPU – Standard Practice #1 and notes given in Table 3 – Storm Drain.
502	27" frame & cover	Use smooth surface "waffle" pattern class 35 lid.
511	Fire hydrant	• Move the auxiliary valve to connect to the fitting at the fire hydrant. • If the pipe connecting to the main is greater than 16 feet, a second shutoff valve is required at the main.
521	3/4" & 1" meter	No material is to be backfilled inside meter box.
522-529	Various sized meters	See SLCPU standard drawings for Contractor checklist.
543		Not used
551	3/4" & 1" service taps	• Depth of service line is 48" minimum. • Tap will be at 10 or 2 o'clock position.
552	1-1/2" & 2" service taps	• B - 2-piece cast iron valve box with lid is required. • H – Type K–soft copper.
572	Detector check valve	• Fitting D will be MJ x flange • The extra gate valve located in the vault on the same side as the main supply pipeline is **not** required.
574	Cover collar	Concrete supports required under traffic box.
575	Air release valve	Not used – refer to SLCPU drawing. Use PVC piping above air released valve

Table 2 - SANITARY SEWER

Standard Plan No.	Description	Modification
381	Trench backfill	Refer to SLCPU - Standard Practice #1.
382	Pipe zone backfill	Refer to SLCPU - Standard Practice #1 and notes given in Table 3 – Storm Drain.
402	30" frame & cover	• Use smooth surface "waffle" pattern class 35 lid. • Low profile (1") rings are **not** allowed.
411	Manhole	• 5-foot minimum manhole diameter required. • Eccentric manhole cones are **not** allowed. • Lateral connections directly to the manhole are **not** allowed. • Ramneck manhole section joint sealant and concrete grouting of manhole section joints is required. • On precast manhole bases provide base with neoprene or rubber coupling system and stainless steel clamps
412	Invert cover	• 2"x4" bracing only required at manholes with pipe entering above the mainline flowline. • Normal manholes will have the invert cover supported by the manhole "shelf".
431	Sewer lateral connection	• Prior Public Utilities approval and permit required for all lateral installations. • Salt Lake City will provide and install wye. • 24-hour notice required. • Stainless steel straps required.
432	Sewer lateral relocation	• Note 2- Salt Lake City will provide & install wye. • Material under bottom of obstruction will be loosely compacted ¾"minus well graded granular material or sand. Flowable fill not allowed.
433	Pipe drop	Alternate 2- **not** used unless approved in writing by Public Utilities Chief Engineer.

Table 3 - STORM DRAIN

Standard Plan No.	Description	Modification
302	30" frame & cover	Use smooth surface "waffle" pattern class 35 lid.
303	44" frame & cover	Use smooth surface "waffle" pattern class 35 lid.
310	48" grate & frame	Not used
315	Catch basin	Note: CONTRACTOR to make back wall of box behind curb face opening as detailed.
316	Catch basin	Not used
320	Debris grate inlet	Not used
321	Automatic flap gate	Modify to include a clean-out box and lid over the flap gate.
361	Concrete grade rings	minimum height 6-1/2"
381	Trench backfill	Refer to SLCPU - Standard Practice #1.
382	Pipe zone backfill	Refer to SLCPU - Standard Practice #1 • Pipe zone material will be ¾" minus material. An exception may be granted for concrete pipe being installed below the water table. In these cases, the fill material below the pipe springline may be 2 inches minus sewer rock when approved in advance by the Chief Engineer. Sewer rock is not allowed with PVC and HDPE-N12 pipe. • In all cases, backfill in the pipe zone above springline of pipe will be Grade ¾" minus material . • The thickness of Type B – haunch material will be 6 inches below the outside diameter of the pipe.

PART 2 PRODUCT Not Used

PART 3 EXECUTION Not Used

DOCUMENT 00 73 50
REQUIREMENTS OF THE DEPARTMENT OF PUBLIC UTILITIES

(Supplementary Conditions)

PART 1 GENERAL

1.1 DOCUMENT INCLUDES

A. Procedures for water line and sewer line construction.

1.2 RELATED WORK

A. Salt Lake City Department of Public Utilities has published a document entitled Standard Practices for Salt Lake City Public Utilities (most current edition). The document is available from 1805 West 500 South, Salt Lake City, Utah 84104. In that publication there is a list of standard practices that apply to contractors.

1. The standard practices are as follows
    a. Trench Backfill Requirements (No. 1).
    b. Jordan and Salt Lake Canal Standards (No. 3).
    c. Flushing and De-chlorination (No. 4).
    d. Cable Installations (No. 8).
    e. Water Service Kills (No. 9).
    f. Commissioning Waterlines (No. 12).
    g. Commissioning Large Service and Fire Lines (No. 13).
    h. Hydrostatic Testing of Water Lines (No. 14).
    i. Tree Pruning and Root Cutting (No. 15).
    j. Raising Manholes, Cleanout and Water Valve Boxes (No. 16).
    k. Standard Fire Hydrant Colors (No. 17).
    l. Disinfection Large Water Connections (No. 18).
    m. Waterline Installation in Hydrocarbon Contaminated Areas (No. 19).
2. Use the appropriate standard practice when doing work on sewer, water, and storm drain facilities that are owned by the City Department of Public Utilities.

1.3 SUBMITTALS

A. Prior to final payment, submit.

1. All Contract Documents as required by Article 6.11 of Document 00 72 00 in the Manual of Standard Specifications.

PART 2 CHANGES TO THE APWA SPECIFICATIONS

2.1 SECTION 01 11 00 – SUMMARY OF WORK

Replace specification 01 11 00 Summary of Work of APWA with specification 01 11 00 Summary of Work included in the contract in its entirety.

2.2 SECTION 01 25 00 – PRODUCT OPTIONS AND SUBSTITUTIONS

Replace specification 01 25 00 Product Options and Substitutions of APWA with specification 01 25 00 Substitution Procedures included in the contract in its entirety.

2.3 SECTION 01 31 19 – PRECONSTRUCTION CONFERENCE

Replace specification 01 31 19 Preconstruction Conference of APWA with specification 01 31 19 Project Meetings included in the contract in its entirety.

2.4 SECTION 01 73 29 – CUTTING AND PATCHING

Replace specification 01 73 29 Cutting and Patching of APWA with specification 01 73 29 Cutting, Coring, and Patching included in the contract in its entirety.

2.5 SECTION 01 74 13 – PROGRESS CLEANING

Replace specification 01 74 13 Progress Cleaning of APWA with specification 01 74 23 Cleaning Up included in the contract in its entirety.

2.6 SECTION 01 78 23 – OPERATION AND MAINTENANCE DATA

Replace specification 01 78 23 Operation and Maintenance Data of APWA with specification 01 78 23 Operation and Maintenance Data included in the contract in its entirety.

2.7 SECTION 01 78 39 – PROJECT RECORD DOCUMENTS

Replace specification 01 78 39 Project Record Documents of APWA with specification 01 78 39 Project Record Documents included in the contract in its entirety.

2.8 SECTION 33 08 00 - COMMISSIONING OF WATER UTILITIES.

A. Add a new paragraph to Article 1.2

1.2 REFERENCES

C. AWWA C600, C602, and C606.

2.9 **SECTION 33 08 00 – COMMISSIONING OF WATER UTILITIES**.

A. Replace Article 3.6 with the following.

3.6 PRESSURE TEST AND DISINFECTION

A. Prevent contamination from entering the line during storage, construction, or repairs. For new construction, keep a plug on the end of the pipe except for installing the next section of pipe.

B. Disinfect the line by placing granular or tablet chlorine (10 to 25 mg/l concentration for 24 hours) in the line during installation and filling the line with water.

C. De-chlorinate the line or dispose of chlorinated water in an acceptable manner and flush the line (see Standard practice No. 4 and the following paragraphs.

D. Provide air release taps at pipeline's highest elevations and expel all air before test. Insert permanent plugs or air relief valves after test has been completed.

E. Complete a hydrostatic test of the line according to AWWA for the type of pipe used (i.e. for ductile iron pipe; AWWA C600, PVC pipe AWWA C605). This will include connecting any external pump to the pipe and applying a hydrostatic pressure as established for the work by the Chief Engineer. This will be at least 200 psi at the lowest point of the line. This pressure will be maintained within 5 psi for two hours (2 hrs.) and the amount of makeup water will be measured. The amount of makeup water must be less than 1.5 gallons and 2.2 gallons per 1,000 feet of pipe for eight inch (8") and 12 inch (12") pipe respectively. No piping installation will be accepted until the leakage is less than the amount listed above.

F. Locate and repair defective joints and retest until leakage rate is less than allowable.

G. Repair any noticeable leakage even if the total leakage is less than allowable.

H. Flush after hydrostatic test and let the line sit for at least 16 hours before collecting a water sample.

I. A representative of the Chief Engineer will collect and deliver a water sample to the City laboratory.

J. Earliest test results may be available the next day.

K. If the test passes, a second sample will be collected by the City representative and delivered to the City laboratory.

L. If the first sample is bad, then the line will be flushed and allowed to sit in chlorinated state for 16 hours before another sample is collected.

M. When two (2) acceptable samples have been obtained, the line is acceptable and services can be connected.

2.10 **SECTION 33 11 00 – WATER DISTRIBUTION AND TRANSMISSION.**

A. Add a new paragraph to Article 2.1

2.1 PIPES AND FITTINGS

E. Provide Chevron fm #1 non-oxide grease and 8 mil polyethylene wrap.

B. Add a new paragraph to Article 3.4

3.4 INSTALLATION – PIPE AND FITTINGS

I. Coat all exposed nuts and bolts with Chevron fm #1 non-oxide grease and 8 mil polyethylene wrap.

2.11 **SECTION 33 13 00 – DISINFECTION**.

A. Add a new paragraph to Article 3.2

3.2 DISINFECTION OF WATER LINES

H. Refer to Article 3.6 of Section 33 08 00 – Commissioning of Water utilities as amended in Section 00 73 50.

END OF DOCUMENT

DOCUMENT 00 91 13
ADDENDA

PART 1 GENERAL

1.1 **PROCEDURE**

A. For filing purposes, add Addenda and Modifications to the Contract Documents following this page.

B. All official Addenda and Modifications will be labeled, DOCUMENT 00 91 13.X, ADDENDUM NO. X

Any other document will not be considered as an Addendum for purposes of acknowledgement.

END OF DOCUMENT

WAGE RATES

Page Intentionally Left Blank

"General Decision Number: UT20230097 01/06/2023

Superseded General Decision Number: UT20220097

State: Utah

Construction Type: Heavy
HEAVY CONSTRUCTION PROJECTS

Counties: Salt Lake and Tooele Counties in Utah.

Note: Contracts subject to the Davis-Bacon Act are generally required to pay at least the applicable minimum wage rate required under Executive Order 14026 or Executive Order 13658. Please note that these Executive Orders apply to covered contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but do not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(2)-(60).

If the contract is entered into on or after January 30, 2022, or the contract is renewed or extended (e.g., an option is exercised) on or after January 30, 2022:	. Executive Order 14026 generally applies to the contract. . The contractor must pay all covered workers at least $16.20 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in 2023.
If the contract was awarded on or between January 1, 2015 and January 29, 2022, and the contract is not renewed or extended on or after January 30, 2022:	. Executive Order 13658 generally applies to the contract. . The contractor must pay all covered workers at least $12.15 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on that contract in 2023.

The applicable Executive Order minimum wage rate will be adjusted annually. If this contract is covered by one of the Executive Orders and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must still submit a conformance request.

Additional information on contractor requirements and worker protections under the Executive Orders is available at http://www.dol.gov/whd/govcontracts.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at https://www.dol.gov/agencies/whd/government-contracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example:

PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour National Office because National Office has responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

==========

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

** Workers in this classification may be entitled to a higher minimum wage under Executive Order 14026 ($16.20) or 13658 ($12.15). Please see the Note at the top of the wage determination for more information.

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this

contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at https://www.dol.gov/agencies/whd/government-contracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which

these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour National Office because National Office has responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.

Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

SECTION 01 11 00
SUMMARY OF WORK

PART 1 GENERAL

1.1 WORK COVERED BY CONTRACT DOCUMENTS

A. Work of this Construction Contract comprises but not limited to the construction of the following:

A 105-mgd capacity wastewater IPS with future build-out to 137-mgd capacity consisting of:

1. Site preparation including demolition, clearing, grubbing, excavation, foundation preparation, backfill
2. Existing utility relocations
3. Two (2) pre-engineered metal buildings housing the IPS and electrical equipment
4. Two (2) trench style, self-cleaning wet wells side by side under same superstructure
5. Pump gallery consisting of five (5) vertical turbine solids handling pumps with space for a total of six (6) pumps, steel discharge headers, and valve pad.
6. Pre-manufactured biofilter odor control system
7. 4MW, n+1, emergency/standby power generator system , such that 4MW output is achievable even if one generator set is not operating
8. Yard utilities including fiber optic, ductbanks, potable water, non-potable water, natural gas, and site drainage
9. Approximately 4,000 feet of duct bank connecting WRF site to IPS site
10. Civil site improvements including paving, grading, curb and gutter, sidewalk, chain link fencing, and landscaping for an approximate 8-acre site
11. HDPE forcemains from the valve pad header to station 2+57.46.
12. Installation of GFRP influent sewer from the influent pump station to the connection extended from MH#3.

B. Along with the necessary temporary facilities and equipment including but not limited to bypass pumping to perform the work in accordance with the Contract Documents and listed in Specification 01 53 00.

The location of the work is: 1200 Reclamation Road.

1.2 CONTRACT METHOD

A. Construct the Work under a multiple lump sum price contract.

1.3 COORDINATION WITH PROPERTY OWNERS – PUBLIC RELATIONS PLAN

A. Maintaining good public relations with property owners and residents that use the streets affected by construction is an important component of this project. In order to maintain good public relations, the OWNER has employed WF&Co. as it's public relations manager. CONTRACTOR shall be responsible for coordinating with WF&Co. for all public relations matters.

2. The CONTRACTOR shall provide a professionally prepared, movable temporary project sign as outlined in Section 01 58 00, Project Identification and Signs at the work location of the project.

1.4 **COORDINATION WITH ADJACENT PROJECTS**

A. Sundt/PCL is currently constructing the new Salt Lake City Water Reclamation Facility (SLCWRF). CONTRACTOR shall be required to coordinate startup and testing of pump station with forcemain project and the new SLCWRF.

B. CONTRACTOR shall coordinate construction of influent sewer junction structure with 1800 North Sewer Realignment Project.

C. CONTRACTOR shall coordinate with contractor installing forcemain and influent sewer work to ensure site access as work will be in close proximity between the two projects.

PART 2 PRODUCTS (Not Used)

PART 3 EXECUTION (Not Used)

END OF SECTION

SECTION 01 14 00
WORK RESTRICTIONS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Requirements for sequencing and scheduling the Work affected by existing site and facility, existing utility connections, work restrictions, and coordination between construction operations and plant operations.

1.02 GENERAL CONSTRAINTS ON SEQUENCE AND SCHEDULING OF WORK

A. Wastewater projects
   1. Conduct work such that Owner's ability to collect, pump, and treat wastewater is not impaired or reduced in terms of the required quantity or quality of treated wastewater. Do not impair the operational capabilities of essential elements of the treatment process or reduce treatment capacity below levels sufficient to meet demands for wastewater collection and treatment throughout the contract time. The required wastewater collection and/or treatment capacity are described in this Section.

B. Work sequence and constraints:
   1. Utilize description of critical events in work sequence as a guideline for scheduling and undertaking the Work, as follows:
      a. Connections to existing sewers
      b. Connections to existing electrical service
      c. Bypass pumping operations

C. Work sequence and constraints presented do not include all items affecting completion of the Work, but are intended to describe critical events necessary to minimize disruption of the existing facilities and to ensure compliance with Utah Pollutant Discharge Elimination System (UPDES) and other permit requirements.

D. Work impacting the use of the golf course shall be completed between November 1 and March 30 and minimized to the extent possible.

1.03 SHUTDOWN AND CONSTRUCTION CONSTRAINTS

A. General shutdown constraints:
   1. Execute the Work while the existing facility is in operation.
   2. All activities must be accomplished without a pump station or plant shutdown.
   3. Apply to activities of construction regardless of process or work area.
   4. Organize work to be completed in a minimum number of equipment and operations shutdowns.
   5. Provide thorough advanced planning, including having required equipment, materials, and labor on hand at time of shutdown.

6. Where required to minimize treatment process interruptions while complying with specified sequencing constraints, provide temporary pumping, power, lighting, controls, instrumentation, and safety devices.
7. Any full treatment plant shutdown, or significant reduction in treatment capacity or treatment capabilities is not permitted.

B. Dewatering of existing process and disposal of residue:
1. The Contractor is responsible for costs and procedures required to dewater and dispose of liquid, solids, etc. in the pipelines for making connections.
   a. Costs for dewatering, disposal of solids and residuals, and preparation of surfaces for the Work are Contractor's responsibility.
      1) Includes tipping fees for the removal and disposal of the grit/debris.
   b. Dewatering and/or testing of grit/debris to meet landfill requirements is the responsibility of the Contractor.
   c. Contractor shall provide adequate time in schedules for draining and cleanup.

C. Ductbank construction constraints:
1. During construction of the ductbank between the new pump station and new substation on the WRF site (by others) the existing overhead power lines and forcemains shall be protected at all times from construction activity.

D. Traffic constraints
1. All construction traffic must access the site through Reclamation Road from the North and shall not be permitted through the Rose Park neighborhood unless construction activities restrict access and require it.

1.04 REQUIREMENTS FOR OPERATION OF PLANT AND MAINTAINING CONTINUOUS OPERATION OF EXISTING FACILITIES

A. Coordinate with specification 01 53 00 Maintenance of Plant Operations During Construction.

B. Facilities or conditions required to keep the existing plant operational include, but are not limited to, the following:
1. Electrical power including transformers, distribution wiring, and motor control centers.
2. Influent sewers.

C. Conduct the Work and provide temporary facilities required to keep the existing plant and pump station continuously operational.

D. Do not remove or demolish existing facilities required to keep the existing pump station operational at the capacities specified until the existing facilities are replaced by temporary, new, or upgraded facilities or equipment.
1. Test replacement facilities to demonstrate operational success prior to removing or demolishing existing facilities.

1.05 OPERATIONS AND MAINTENANCE ACCESS

A. Provide safe, continuous access to process control equipment for plant operations personnel.

B. Provide access on 1-hour advance notice to process control equipment for plant maintenance personnel and associated maintenance equipment.

1.06 UTILITIES

A. Provide advance notice to, and utilize services of, Blue Stake for location and marking of underground utilities operated by utility agencies other than the Owner.

B. New utilities were designed using existing facility drawings.
   1. Field verification of utilities locations was not performed during design.
   2. Services crossed or located nearby by new yard utilities may require relocation and possible shutdowns.
   3. Pipe alignments as indicated on the Drawings.

1.07 COVID-19 RESTRICTIONS

A. COVID-19 Proclamations may require the project to be shut down or otherwise increase the Contractor's cost or time of performance by calling for things such as social distancing and the use of personal protective equipment.

1.08 LAYDOWN AND STORAGE RESTRICTIONS

A. Laydown area east of pump station designated in plans is an EPA superfund site and as such no disturbance of soils is permitted at any time.

1.09 EXISTING STRUCTURE SETTLEMENTS

A. Contractor must monitor and ensure no settlement to existing pipe, equipment, or facilities caused by Contractor operations, including but not limited to dewatering methods and sheet piling or other means of deep excavation shoring used for construction.

PART 2 PRODUCTS

Not Used.

PART 3 EXECUTION

Not Used.

END OF SECTION

APPENDIX A
"Method of Procedure" (MOP)
Instructions and Forms

Definition and Purpose

"Method of Procedure" (MOP) is a detailed document submitted by the Contractor to request process shutdown(s), utility tie-in(s), work in areas that may risk unanticipated outages, or flow diversions to accommodate site construction activities during a project. Such activities may include (but are not limited to) new tie-ins to utilities or structures, mechanical modifications to process piping or equipment, demolition, bulkhead installation, and cleaning processes.

The MOP provides a detailed plan to the Owner and Engineer that describes specific aspects of the work including purpose, time of execution, and anticipated impacts on treatment processes. The MOP also includes contingency measures and provisions for rapid closure in the event that shutdown or work progress difficulties are encountered. Information from relevant trades associated with the requested shutdown, diversion, or tie-in is also included.

The Owner should use the information within the MOP to define operational procedures and methods to safely and successfully assist the Contractor.

MOP Process Summary

WHO	STEP	TIMING
Contractor	1. Identify MOPs needed on MOP Log and Baseline Schedule.	7 days prior to Preconstruction Meeting
Contractor, Owner, Engineer	2. Pre-MOP Meeting.	More than 28 days prior to work
Contractor	3. Submits MOP.	No later than 28 days prior to work
Owner	4. Reviews MOP.	
Owner	5. MOP finalized.	7 days prior to work
Contractor	6. Complete Readiness Checklist.	5 days prior to work
Contractor	7. Complete Safety Checklist.	Just prior to commencing work
Contractor	8. Complete Work.	
Contractor	9. Update MOP Log and Progress Schedules.	Monthly

MOP Process Detail

STEP 1. Identifies MOPs needed on MOP Log and Baseline Schedule.

Contractor submits a preliminary list of anticipated project MOPs on MOP Log. MOPs identified but not limited to those shutdowns, diversions, or tie-ins described in the Contract Documents. Incorporate MOPs as tasks in Baseline Schedule. Date scheduled MOPs to coincide with the appropriate construction activities.

STEP 2. Pre-MOP Meeting.

Contractor requests a Pre-MOP Meeting with the Owner and Engineer to discuss the nature of the shutdown, diversion, or tie-in, and to gather the information necessary to complete the MOP Form. The pre-MOP meeting may be waived by the Owner or Engineer if the work is deemed to be minor.

STEP 3. Submits MOP.

Contractor completes the MOP Form and submit 3 copies for approval to the Engineer/Owner.

STEP 4. Reviews MOP.

Engineer/Owner distributes MOP Form for review by the Owner's Construction Coordinator, O&M Representative, and Engineer's Project Representative. Review MOP Form for completeness, accuracy, compliance with both the construction schedule, constraints defined in contract documents, and to ensure that the requested work does not negatively impact plant operations or other concurrent project activities. Additional information may be requested to better understand the nature of and method for completing the Work.

STEP 5. MOP finalized.

Once the MOP is agreed to by all parties, the MOP will be finalized by signature. Copies are distributed to the Owner, Engineer, and Contractor.

STEP 6. Complete Readiness Checklist.

Contractor verifies everything is ready for the work.

STEP 7. Complete Safety Checklist.

Contractor ensures safety.

STEP 8. Complete work.

Contractor complete work.

STEP 9. Update MOP Log and Progress Schedules.

Contractor updates MOP Log weekly and distributes at the regularly scheduled construction progress meetings.

READINESS CHECKLIST
(5 days prior to work)

Checklist provided as a guide but is not all inclusive.

1. Confirm all parts and materials are on site: _____
   _____
2. Review work plan: _____
   _____
3. Review contingency plan: _____
   _____

SAFETY CHECKLIST
(Just prior to commencing work)

Checklist provided as a guide but is not all inclusive.

1. Location awareness:
   a. Emergency exits: _____
   b. Emergency shower and eyewash: _____
   c. Telephones and phone numbers: _____
   d. Shut-off valve: _____
   e. Electrical disconnects: _____
2. Inspect work area:
   a. Take time to survey the area you are working in. Ensure that what you want to do will work. Do you have enough clearance? Is your footing secure? Do you have adequate lighting and ventilation? Are surrounding utilities out of the way for you to perform your work?
3. SDS (Safety Data Sheets):
   a. Understand the chemicals and substances in the area you are working in by reading the SDS.
4. Lockout/Tagout Procedure:
   a. Lockout/tagout energy sources before beginning work.
   b. Make sure all valves associated with the work are locked out and tagged out on each side of the penetration.
   c. Make sure the lines are depressurized.
5. Overhead work:
   a. Use appropriate personal protective equipment; i.e., safety harness, lifeline, etc.
   b. Select appropriate tie-off points; i.e., structurally adequate, not a pipe or conduit, etc.
   c. Spotter assigned and in position.
   d. Pipe rack access; i.e., check design capacity, protective decking or scaffolding in place, exposed valves or electrical switches identified and protected.
6. Safety equipment:
   a. Shepherd's hook.
   b. ARC flash protection.
   c. Fire extinguisher.
   d. Other: _____.
7. Accidents:
   a. Should accidents occur, do not shut off and do not attempt to correct the situation, unless you are absolutely positive that your action will correct the problem and not adversely affect other people or equipment.
8. Review process start-up documents:
   a. In the event the system is shutdown, the Control Center should have a working knowledge of the process start-up procedures in order to deal effectively with unforeseen events.
9. Evacuation procedures:
   a. Do not obstruct evacuation routes.
   b. Take time to survey the area for evacuation routes.

SECTION 01 14 14

CONTROL OF WORK

PART 1 - GENERAL

1.01 PLANT AND HOURS OF CONSTRUCTION:

A. Furnish labor, materials, and equipment which will be efficient, appropriate, and large enough to secure a satisfactory quality of work and a rate of progress which will insure the completion of the work within the Contract Time. If at any time it appears to the Engineer or Owner to be inefficient, inappropriate, or insufficient for securing the quality of work required or for producing the rate of progress aforesaid, the Engineer or Owner may order the Contractor to increase the efficiency, change the character, or increase the equipment, and the Contractor shall conform to such order. Failure of the Engineer or Owner to give such order shall in no way relieve the Contractor of his obligations to secure the quality of the work and rate of progress required.

B. Normal construction activity shall take place only between the hours of 7 a.m. to 5 p.m., excluding Saturdays, Sundays, and legal holidays. Work outside the above time periods will be permitted only with the written approval of the Owner.

1.02 OCCUPYING PRIVATE LAND:

A. The Contractor shall not (except after written consent from the proper parties) enter or occupy with personnel, tools, materials, or equipment any land outside the rights of way or property of the Owner. A copy of the written consent from the proper parties shall be given to the Engineer and Owner.

1.03 DIMENSION OF EXISTING STRUCTURES:

A. The Contractor shall verify the dimensions and locations of existing structures in the field before the fabrication of any material or equipment which is dependent on the correctness of such information.

1.04 OPEN EXCAVATIONS:

A. All open excavations shall be adequately safeguarded by providing temporary barricades, fencing, caution signs, lights, and other means to prevent accidents to persons and damage to property, and in accordance with applicable occupational health and safety regulations. The Contractor shall, at his own expense, provide suitable and safe bridges and other crossings for accommodating travel by pedestrians and workmen. Bridges provided for access during construction shall be removed when no longer required. The length or size of excavation will be controlled by the particular surrounding conditions, but shall always be confined to the limits agreed upon with the Engineer or Owner. If the excavation becomes a hazard, or if it excessively restricts traffic at any point, the Engineer or Owner may require special construction procedures such as limiting the length of the open trench,

prohibiting stacking excavated material in the street, and requiring that the trench shall not remain open overnight.

B. All open excavations within the golf course property and roadway are public property and shall be properly barricaded and isolated from public access during installation of the forcemains and ductbank.

C. The Contractor shall take precautions to prevent injury due to open trenches. All trenches, excavated material, equipment, or other obstacles which could be dangerous shall be well lighted at night.

1.05 INTERFERENCE WITH AND PROTECTION OF STREETS:

A. The Contractor shall not close or obstruct any portion of a street, road, or private way without obtaining permits therefor from the proper authorities. If any street, road or private way shall be rendered unsafe by the Contractor's operations, he shall make such repairs or provide such temporary ways or guards as shall be acceptable to the proper authorities.

B. Streets, roads, private ways, and walks not closed shall be maintained passable and safe by the Contractor, who shall assume and have full responsibility for the adequacy and safety of provisions made therefor.

C. The Contractor shall, at least 72 hours in advance, notify the Police and Fire Departments in writing, with a copy to the Engineer and Owner, if the closure of a street or road is necessary. The Contractor shall cooperate with the Police Department in the establishment of alternate routes and shall provide adequate detour signs, plainly marked and well lighted, in order to minimize confusion.

1.06 TRAFFIC CONTROL:

A. Comply with the Public Way/Traffic Control Permit.

B. For control of moderate traffic, the Contractor shall provide an adequate number of flagmen.

C. Whenever and wherever, in the opinion of the Engineer or Owner, traffic is sufficiently congested or public safety is endangered, the Contractor, as required, shall furnish uniformed special officers to direct traffic and to keep traffic off the highway area affected by his construction operations. Such officers shall be in addition to the watchmen required under other provisions of the contract.

D. The employment or presence of traffic flagmen, special officers, or police shall in no way relieve the Contractor of any responsibility or liability which is his under the terms of the contract.

1.07 CARE AND PROTECTION OF PROPERTY:

A. The Contractor shall be responsible for the preservation of all public and private property, and shall use every precaution necessary to prevent damage thereto. If any direct or indirect damage is done to public or private property by or on account of any act, omission, neglect, or misconduct in the execution of the work on the part of the Contractor, such property shall be restored by the Contractor, at his expense, to a condition similar or equal to that existing before the damage was done, or he shall make good the damage in other manner acceptable to the Engineer and Owner.

1.08 INTERFERENCE WITH EXISTING WORKS:

A. The Contractor shall at all times conduct his operations so as to interfere as little as possible with existing works. The Contractor shall develop a program, in cooperation with the Engineer and the Owner, which shall provide for the construction and putting into service of the new works in the most orderly manner possible. This program shall be adhered to except as deviations therefrom are expressly permitted. All work of connecting with, cutting into, and reconstructing existing pipes or structures shall be planned to interfere with the operation of the existing facilities for the shortest possible time when the demands on the facilities best permit such interference, even though it may be necessary to work outside of normal working hours to meet these requirements. Before starting work which will interfere with the operation of existing facilities, the Contractor shall do all possible preparatory work and shall see that all tools, materials, and equipment are made ready and at hand.

B. The Contractor shall make such minor modifications in the work relating to existing structures as may be necessary. Submit a claim if believed due compensation.

1.09 PROTECTION AND RELOCATION OF EXISTING STRUCTURES AND UTILITIES:

A. The Contractor shall assume full responsibility for the protection of all buildings, structures, and utilities, public or private, including poles, signs, services to buildings, utilities in the street, gas pipes, water pipes, hydrants, sewers, drains, and electric and telephone cables, whether or not they are shown on the Drawings. The Contractor shall carefully support and protect all such structures and utilities from damage of any kind. Any damage resulting from the Contractor's operations shall be repaired by the Contractor at their expense.

B. The Contractor shall bear full responsibility for obtaining all locations of underground structures and utilities (including existing water services, drain lines, and sewers). Services to buildings shall be maintained, and all costs or charges resulting from damage thereto shall be paid by the Contractor when a result of Contractor’s work. Results of potholing done for this project will be provided to the Contractor.

C. Protection and temporary removal and replacement of existing utilities and structures as described in this Section shall be a part of the work under the Contract and all costs in connection therewith shall be included in the Total Price.

1.10 CLEANUP AND DISPOSAL OF EXCESS MATERIAL:

A. During the course of the work, the Contractor shall keep the site of operations in as clean and as neat a condition as is possible. Dispose of all residue resulting from the construction work and, at the conclusion of the work, remove and haul away any surplus excavation, broken pavement, lumber, equipment, temporary structures, and any other refuse remaining from the construction operations, and leave the entire site of the work in a neat and orderly condition.

B. In order to prevent environmental pollution arising from the construction activities related to the performance of this Contract, the Contractor and subcontractors shall comply with all applicable Federal, State, and local laws, and regulations concerning waste material disposal, as well as the specific requirements stated in this Section and elsewhere in the Specifications.

C. The Contractor is advised that the disposal of excess excavated material in wetlands, stream corridors, and plains is strictly prohibited even if the permission of the property owner is obtained. Any violation of this restriction by the Contractor or any person employed by the Contractor, will be brought to the immediate attention of the responsible regulatory agencies, with a request that appropriate action be taken against the offending parties. Therefore, the Contractor will be required to remove the fill at their own expense and restore the area impacted.

D. Obtain prior approval from the Owner and Engineer for any stockpiling of material on-site.

END OF SECTION

SECTION 01 21 00

ALLOWANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section includes administrative and procedural requirements governing allowances.

1. Certain items are specified in the Contract Documents by allowances. Allowances have been established in lieu of additional requirements and to defer selection of actual materials and equipment to a later date when direction will be provided to Contractor. If necessary, additional requirements will be issued by Change Order.

B. Types of allowances include the following:

1. Lump-sum allowances.

2. Unit-cost allowances.

3. The Contractor agrees that they are not entitled to payment of Allowances, except for additional work carried out by them in accordance with the Contractor as directed by the Engineer and only to the extent of such additional work as directed by the Engineer. Use the allowances only as directed by Engineer for Owner's purposes and only by Change Order(s) that indicate amount(s) to be charged to the allowance.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit invoices for quantities of soil hauled for distribution of allowance funds.

C. Submit time sheets and other documentation to show labor time and cost for installation of allowance items that include installation as part of the allowance.

1.03 COORDINATION:

A. Coordinate allowance items with other portions of the Work. Furnish templates as required to coordinate installation.

1.04 ALLOWANCES:

A. Allowance shall include cost to Contractor of specific products and materials ordered by Owner or selected by Engineer under allowance and shall include taxes, freight**,** and delivery to Project site.

B. Unused Materials: Return unused materials purchased under an allowance to manufacturer or supplier for credit to Owner, after installation has been completed and accepted.

1. If requested by Engineer, retain and prepare unused material for storage by Owner. Deliver unused material to Owner's storage space as directed.

1.05 ADJUSTMENT OF ALLOWANCES:

A. Allowance Adjustment: To adjust allowance amounts, prepare a Change Order proposal based on the difference between purchase amount and the allowance, multiplied by final measurement of work-in-place where applicable. If applicable, include reasonable allowances for cutting losses, tolerances, mixing wastes, normal product imperfections, and similar margins.

1. Include installation costs in purchase amount only where indicated as part of the allowance.

2. If requested, prepare explanation and documentation to substantiate distribution of overhead costs and other margins claimed.

3. Submit substantiation of a change in scope of work, if any, claimed in Change Orders related to unit-cost allowances. Renegotiation of rates associated with unit-cost allowances shall not be permitted.

4. Owner reserves the right to establish the quantity of work-in-place by independent quantity survey, measure, or count.

B. Submit claims for increased costs because of a change in scope or nature of the allowance described in the Contract Documents, whether for the purchase order amount or Contractor's handling, labor, installation, overhead, and profit.

1. No change to Contractor's indirect expense is permitted for selection of higher- or lower-priced materials or systems of the same scope and nature as originally indicated.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine products covered by an allowance promptly on delivery for damage or defects. Return damaged or defective products to manufacturer for replacement.

3.02 PREPARATION:

A. Coordinate materials and their installation for each allowance with related materials and installations to ensure that each allowance item is completely integrated and interfaced with related work.

3.03 SCHEDULE OF ALLOWANCES:

A. Allowance No. 1 (Bid Item #9): Lump-Sum Allowance for Golf Netting: Include the sum of **$100,000** for netting around the Influent Pump Station Site.

1. This allowance includes costs associated with netting and support systems around the Influent Pump Station site.

B. Allowance No. 2 (Bid Item #10): Lump-Sum Allowance for Bypass Pumping: Include the sum of **$500,000** for bypass pumping associated with making the connection to the extension of the GFRP sewer at MH#3. Additionally this bypass pumping may include bypass pumping needed for redirecting flows for startup, and testing of the influent pump station facilities.

1. This allowance includes costs associated with material procurement, installation, rental, and labor associated with temporary facilities to bypass the influent sewers for construction and connection to existing facilities.

C. Allowance No. 3 (Bid Item #11): Lump-Sum Allowance for Permitting: Include the sum of **$30,000** for permitting fees.

1. This allowance includes costs associated with permitting fees for City Engineering Permits (Excavation, Public Way, Obstruction Traffic Control et.), Salt Lake City Building/Inspection, Storm Water Pollution and Prevention, and Construction Dewatering Permits.

D. Allowance No. 4 (Bid Item #12): Unit-Cost Allowance for Disposal and Hauling of Unsuitable Materials to Brown Property: Include the sum of costs associated with hauling, and grading 80,800 tons of unsuitable material at a unit rate bid by the Contractor. Contractor shall include costs for spreading dumped material across the site in this unit rate.

1. This allowance includes costs associated with hauling, and grading unsuitable material from the excavations to the Owners Brown Property located at 4650 W 700 S. Unsuitable material defined in Section 31 23 00.

E. Allowance No. 5 (Bid Item #13): Unit-Cost Allowance for Hauling and Disposal of Unsuitable or Impacted/Contaminated Materials to Landfill: Include the sum of costs associated with hauling and disposal fees for 20,200 tons of unsuitable material at a unit rate bid by the Contractor.

1. This allowance includes costs associated with hauling, testing, and tipping unsuitable and/or impacted/contaminated material from the excavations to the landfill. Unsuitable material defined in Section 31 23 00. Testing frequency shall be as required for landfill to accept the material.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 01 23 00

ALTERNATE BID ITEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This Section includes administrative and procedural requirements governing alternates.

1.02 DEFINITIONS:

A. Alternate is amount proposed by Bidder and stated on Bid Form in Section 00 43 00 for certain work defined in Bidding Requirements that may be added to or deducted from Contract Price if OWNER decides to accept corresponding change in either amount of construction to be completed, or in materials, equipment, or installation methods described in Contract Documents.

B. Cost or credit for each alternate is net addition or deduction from Contract price to incorporate Alternate into Work. No other adjustments will be made to Contract Price.

1.03 PROCEDURES:

A. Coordination:

1. Modify or adjust affected adjacent work as necessary to completely and fully integrate work of Alternate into Project.

2. Include as part of each alternate, miscellaneous devices, accessory objects, and similar items incidental to or required for complete installation whether or not indicated as part of Alternate.

B. Execute accepted alternates under same conditions as other work of Contract.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 DESCRIPTION OF ALTERNATES:

A. Alternate 1 (Bid Item 14): Installation of 6th Pump

1. Add for providing the 6th pump and ancillary components for functionality in accordance with Section 43 21 00.34. This shall include all inlet/discharge piping, ancillary components, electrical wiring, power, controls, instrumentation, seal water etc. for a fully operational pump similar to others.

END OF SECTION

SECTION 01 25 00

SUBSTITUTION PROCEDURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section includes administrative and procedural requirements for substitutions.

1.02 DEFINITIONS:

A. Substitutions: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor.

1. Substitutions for Cause: Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.

2. Substitutions for Convenience: Changes proposed by Contractor or Owner that are not required in order to meet other Project requirements but may offer advantage to Contractor or Owner.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Substitution Requests: Submit each request for consideration under a separate cover. Identify product or fabrication or installation method to be replaced. Include Specification Section number and title and Drawing numbers and titles.

1. Substitution Request Form: Use Form 01 25 00-1 to request substitution.

2. Documentation: Show compliance with requirements for substitutions and the following, as applicable:

a. Justification for use of the proposed equivalent item(s), including evidence, as applicable, that Contract specified material, product or equipment is unobtainable or unobtainable within an acceptable time for Contract completion.

b. Statement indicating why specified product or fabrication or installation cannot be provided, if applicable. If the Contractor is proposing the substitution because of unavailability of the product, submit a letter from the manufacturer stating the product is unavailable with an explanation of why it is unavailable with the Form 01 25 00-1

c. Detailed comparison of qualities of proposed substitution with those of the Work specified. Include annotated copy of applicable Specification Section. Significant qualities may include attributes such as performance, weight, size, electrical characteristics, visual effect, sustainable design characteristics, warranties, and specific features and requirements indicated and specified. Indicate deviations, if any, from the Work specified.

d. Product Data, including drawings and descriptions of products and fabrication and installation procedures.

e. Samples, where applicable or requested.

f. Certificates and qualification data, where applicable or requested.

g. List of similar installations for completed projects with project names and addresses and names, telephone numbers and addresses of engineers and owners.

h. Material test reports from a qualified testing agency indicating and interpreting test results for compliance with requirements indicated.

i. Detailed comparison of Contractor's construction schedule using proposed substitution with products specified for the Work, including effect on the overall Contract Time. If specified product or method of construction cannot be provided within the Contract Time, include letter from manufacturer, on manufacturer's letterhead, stating date of receipt of purchase order, lack of availability, or delays in delivery.

j. Cost information, including a proposal of change, if any, in the Contract Sum.

k. A prediction of any effects the proposed change will have on operation and maintenance costs, where applicable.

l. Contractor's certification that proposed substitution complies with requirements in the Contract Documents except as indicated in substitution request, is compatible with related materials, and is intended for applications indicated.

m. Contractor's waiver of rights to additional payment or time that may subsequently become necessary because of failure of proposed substitution to produce indicated results.

3. Engineer's Action: If necessary, Engineer will request additional information or documentation for evaluation in accordance with General Conditions review time for submittals.

    a. Forms of Acceptance: Change Order, Work Change Directive, RFI or submittal response.

1.04 ACCEPTABLE EQUIVALENT PRODUCTS, MATERIALS AND EQUIPMENT:

A. Any other product the contractor wants to substitute must follow the requirements of this Section.

B. If the Contractor chooses to substitute equipment other than a named manufacturer, any additional costs or time required to accommodate such equipment shall be made without a change in the Contract Price or Contract Time and at no additional cost to the Owner.

1.05 MATERIAL AND WORKMANSHIP:

A. Whenever a material, article, system or sub-system is specified or described by using the name and/or model of a proprietary product or trademark or the name of the manufacturer or vendor, the specified item shall establish the type, function, and quality required; it shall be understood that the words “or approved equivalent” are implied whether or not they follow the proprietary enumeration.

B. The Engineer and Owner reserves the right to determine when proprietary items have no equivalency, and when uniformity of operations, interchangeability of parts, standard parts inventory, etc., are in Owners’ best interest.

C. Requests for review of equivalency will be considered upon submission of sufficient information as described herein, to allow complete review.

D. Such requests will not be accepted from anyone other than the Contractor. Such submission must be made prior to purchase, fabrication, manufacture or use of the equivalent items under consideration.

E. The Contractor is responsible for all delays caused by its failure to submit complete and accurate information with any request for approval of any material, article, system or subsystem, as an equivalent.

    1. Contractor Risk:

        a. If the Contractor includes in his bid or later proposes any material, product or equipment that he considers equivalent to that specified, the Contractor assumes all risk of any sort associated with acceptance or rejection of proposed equivalent items.

b. The Contractor shall have no right to make claim based upon his bid that includes a proposed equivalent item(s) of work which resulted in a lower bid amount for said item(s) or lower total bid.

2. Equivalency:

a. An item will be considered equivalent to the item specified if:

(1) It is equal or better in design and strength in all subparts, quality, reliability and durability, operation, maintenance and serviceability, as applicable; and

(2) It is equal or better in specified parameters in performance in all respects for the specific function(s) indicated in the contract.

3. Supplemental Requirements:

a. Any tests required by the Engineer to establish quality and performance standards shall be promptly conducted by or through the Contractor at no additional cost to the Owner.

b. The Contractor shall submit any additional data requested by the Engineer for the equivalency review.

c. The Contractor shall satisfactorily accomplish all changes, including any engineering associated with use of equivalent items, at no additional cost to the Owner.

d. The Contractor shall have no right of appeal to any decision rejecting the equivalency of any item.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Compatibility of Substitutions: Investigate and document compatibility of proposed substitution with related products and materials. Engage a qualified testing agency to perform compatibility tests recommended by manufacturers at no cost to the Owner.

1.07 PROCEDURES:

A. Coordination: Revise or adjust affected work as necessary to integrate work of the approved substitutions.

PART 2 - PRODUCTS

2.01 SUBSTITUTIONS:

A. Substitutions for Cause: Submit requests for substitution immediately on discovery of need for change, but not later than 15 days prior to time required for preparation and review of related submittals.

1. Conditions: Engineer will consider Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not satisfied, Engineer will return requests without action, except to record noncompliance with these requirements:

a. Requested substitution is consistent with the Contract Documents and will produce specified and indicated results.

b. Substitution request is fully documented and properly submitted.

c. Requested substitution will not negatively affect Contractor's construction schedule.

d. Requested substitution has received necessary approvals of authorities having jurisdiction.

e. Requested substitution is compatible with other portions of the Work.

f. Requested substitution has been coordinated with other portions of the Work.

g. Requested substitution provides specified warranty.

B. Substitutions for Convenience: Engineer will consider requests for substitution if received within 60 days after the Notice to Proceed. Requests received after that time may be considered or rejected at discretion of Engineer.

2. Conditions: Engineer will consider Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not satisfied, Engineer will return requests without action, except to record noncompliance with these requirements:

a. Requested substitution offers Owner an advantage in cost, time, energy conservation, or other considerations, after deducting additional responsibilities Owner must assume. Owner's additional responsibilities may include compensation to Engineer for redesign and evaluation services, increased cost of other construction by Owner, and similar considerations.

b. Requested substitution does not require revisions to the Contract Documents.

c. Requested substitution is consistent with the Contract Documents and will produce specified and indicated results.

d. Substitution request is fully documented and properly submitted.

e. Requested substitution will not affect Contractor's construction schedule.

f. Requested substitution has received necessary approvals of authorities having jurisdiction.

g. Requested substitution is compatible with other portions of the Work.

h. Requested substitution has been coordinated with other portions of the Work.

i. Requested substitution provides specified warranty.

j. Requested substitution does not increase operation or maintenance costs to the Owner.

PART 3 - EXECUTION

3.01 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

Form 01 25 00-1
SUBSTITUTION REQUEST

The Undersigned certifies:

- Proposed substitution has been fully investigated and determined to be equal or superior in all respects to specified product.
- Same warranty will be furnished for proposed substitution as for specified product.
- Same maintenance service and source of replacement parts, as applicable, is available.
- Proposed substitution will have no adverse effect on other trades and will not affect or delay progress schedule.
- Claims for additional costs related to accepted substitution which may subsequently become apparent are to be waived.
- Proposed substitution does not affect dimensions and functional clearances.
- Payment will be made for changes to design, including Engineer design, detailing, and construction costs caused by the substitution.
- Coordination, installation, and changes in the Work as necessary for accepted substitution will be complete in all respects.

END OF SECTION

SECTION 01 31 13
COORDINATION

This specification changes a portion of APWA Standard Specification Section 01 31 13. All other provisions of the Section remain in full force and effect. This project is in Salt Lake City so it will be necessary to have a good coordination effort.

Add the following paragraph to Article 1.4 (page 97):

1.4 COORDINATING WITH SEPARATE CONTRACTORS

C. Forcemain contractor shall supply influent sewer GFRP pipe and couplings and provide to CONTACTOR. CONTRACTOR shall install all piping and coupling shown on drawing 0101-D101 to pump station.

Add the following paragraph to Article 1.5 (page 98):

1.5 COORDINATION WITH ADJACENT PROPERTY OWNER

F. 14-days prior to beginning work in any area and once each month during construction, hand deliver a written **"Construction Status Update Notice"** to all residents, businesses, schools and property owners adjacent to and affected by the Work. Notice shall be based on the template provided by the ENGINEER and be secured to door knob should occupants not be home. Obtain ENGINEER's final review of notice and distribution list/map prior to distribution. As a minimum the notice shall contain the following:

1. name and phone number of CONTRACTOR's representative for the project;
2. name and phone number of Public Relations Supervisor
3. name and phone number of OWNER's project manager
4. work anticipated for the next 30 days including work locations and work by subcontractors and utility companies;
5. rough estimate of construction schedule through end of work affecting area;
6. anticipated impact to driveway approach access and closures;
7. anticipated water, sewer or power outages;
8. anticipated vehicular traffic impacts, rerouting or lane closures;
9. anticipated pedestrian impacts and sidewalk closures;
10. changes to public transportation bus routes; and
11. any other construction or work items which will impact or restrict the normal use of streets and amenities.

Failure to comply with this contract provision is considered grounds for project suspension per Article 15.1 of the General Conditions (APWA Document 00 72 00, page 71).

G. CONTRACTOR shall notify all businesses affected by water shutdowns 72-hours in advance of the shutdown

H. CONTRACTOR shall notify all residents affected by water shutdowns 48-hours in advance of the shutdown.

Add the following Article to Part 1:

1.8 **PUBLIC AGENCIES AND UTILITY PERSONNEL TO CONTACT**

A. Utility Companies: Utility companies generally require a minimum of 48 hours' notice if their utility requires location, relocation or protection. Contact the following individuals to coordinate. (Please note Contractor must contact **Blue Stakes** before digging, phone **(801) 208-2100**.)

1. Questar Gas Company: Jason McGee, Design: phone (801) 324-3640, email Jason.mcgee@questar.com; Craig Johnson, North of 3900 South (Salt Lake City Area) – (801) 324-3841; Wade Homer, West of Redwood Road and South of 2100 South – (801) 324-3339; Michael "Rudy" Bryant, South of 3900 South – 801-324-3375. Call 2 weeks prior to requiring Questar work on gas mains and 1 week on service lines to property owners. A Questar representative must be present at the pre-construction meeting and when working around high pressure gas mains.
2. Rocky Mountain Power Company:
   a. Suzan Baker: phone (801) 220-2444; cell (801) 497-6334
3. Qwest CenturyLink:
   a. Jeff Stapley: office (801) 974-8505; fax (801) 974-8192
   b. Darren Keller: (801) 356-6975
   c. Deanne Powell: (801) 974-8165
4. The Salt Lake City Department of Public Utilities: Tamara Wambeam, G.I.S. & IT Manager, (801) 483-6834 – Mapping Questions
5. The Salt Lake City Department of Public Utilities to schedule inspection and survey of project of installed sanitary sewer mains, storm drain mains, street lighting and water mains prior to backfilling fittings, valves, washouts, etc.: Call (801) 483-6727.
6. The Salt Lake City Department of Public Utilities Industrial Storm Program Coordinator, Greg Archuleta, (801) 483-6821
7. The Salt Lake City Department of Public Utilities Street Lighting Program Manager, David Pearson, (801) 483-6738
8. AT&T: Ken Howcroft, (801) 580-8005
9. Comcast (Cable TV): Gary Goldstein, (801) 401-3041; Kent Johnson (801) 401-3039; Eric Patten eric_patten@cable.comcast.com; (801) 255-2711
10. Integra Telecom, Inc., (801) 924-3000; (801) 265-0928
11. Questar Infocomm, Inc.: Jeff Jerabek, (801) 324-1942
12. XO Communications:

B. Salt Lake County Engineering Division: (385) 468-6600

C. Salt Lake County Public Works Operations Division: Kevin Smeltzer (385) 468-6124; Brandon Johnson cell, (801) 557-9699; email brjohnson@slco.org a minimum of 48 hour prior to:

1. Setting traffic barricades.
2. Removal and relocation of traffic regulation, information signs and all striping modifications

D. Salt Lake County Flood Control, Bonnie McCallister, BMcCallister@slco.org (385) 468-6626

E. Salt Lake County Health Noise Ordinance – Sanitation and Safety, (385) 468-3835

F. Salt Lake City Golf Course – Mike Price, (801) 596-5030

G. State of Utah (UDOT), Region 2 – Shane Safford, Encroachment and Permits Officer, (801) 975-4809, email lsafford@utah.gov, (801) 975-4979 fax.

H. Utah Transit Authority: Dispatch, phone (801) 287-3202. UTA generally requires 72 hours' notice if it becomes necessary to move bus stops or make scheduling changes

I. Salt Lake City Urban Forestry: (801) 972-7818, a minimum of 72 hours prior to removing trees.

J. Salt Lake City Transportation Division: Mr. Scott Vaterlaus, (801) 535-6630, a minimum of 48 hours prior to:

1. Setting traffic barricades.
2. Removal and relocation of traffic regulation and information signs.

K. Salt Lake City Traffic Signal: Cabot Jennings, (801) 535-6994; (801) 910-5720, a minimum of 48 hours prior to have Traffic Detector Loops marked.

L. Salt Lake City, City Engineer, (801) 535-6248, a minimum of 48 hours prior to street closure.

M. Chevron Pipe Line Company: Concerning location and crossing crude oil lines.

1. Melissa Horiuchi, Conflict Inquiry Coordinator, Salt Lake Station, 801-539-7285
2. Don Bristol, Facility Inspector, office 801-539-7189; cell 801-598-6131

SECTION 01 31 19

PROJECT MEETINGS

PART 1 - GENERAL

1.01 SUMMARY:

A. Contractor shall schedule and administer progress meetings with their own staff and/or other contractors, construction foremen's meetings, and specially called meetings with these parties throughout progress of Work. Contractor shall:

1. Prepare agenda for meetings.

2. Distribute written notice of specially called meetings minimum of one working day(s) in advance of meeting date.

3. Make physical arrangements for meetings.

4. Preside at meetings.

5. Record minutes; include significant proceedings and decisions.

6. Prepare formal minutes and distribute within two working days after each meeting to the following:

a. Meeting participants.

b. Parties affected by decisions made at meeting.

c. Engineer and Owner

B. Representatives of Contractor, Subcontractors, and Suppliers attending meetings shall be qualified and authorized to act on behalf of entity each represents.

C. Owner and Engineer may attend meetings.

1.02 PRECONSTRUCTION CONFERENCE:

A. Engineer will schedule and conduct preconstruction conference in accordance with General Conditions paragraph 2.6 and this section.

B. Location: At location to be selected by Engineer.

C. Attendance.

1. All Contractor's Project Managers.

2. All Contractor's Resident Superintendents.

3. All Contractor's "hands-on" persons designated by Contractor to submit Shop Drawings to Engineer.

4. Subcontractors' or suppliers' representatives Contractor may desire to invite or Engineer may request.

5. Engineer's representatives.

6. Owner's representatives.

7. Local utility representatives, if applicable.

D. Suggested format includes, but not be limited to following:

1. Project Safety.

2. Presentation of preliminary schedules in accordance with General Condition paragraph 2.5.

3. Check of required bonds and insurance policies prior to Notice to Proceed.

4. Liquidated damages.

5. Procedures for handling submittals such as substitutions and Shop Drawings.

6. O&M submittal procedures.

7. Training requirements.

8. Requirements for plant functional testing, startup, commissioning, performance testing, and reliability testing.

9. On-site witness testing by independent subconsultants and approval/regulatory agencies.

10. Direction of correspondence and coordinating responsibility.

11. Weekly and monthly progress meetings.

12. Equal opportunity requirements.

13. Laboratory and field testing requirements.

14. Provisions for inventory of material stored on-site or off-site if off-site storage is authorized.

15. Schedule of values, application for progress payment, and progress payment procedures.

16. Change Order procedures.

17. Contractor's proposed Environmental Management and Erosion Control Plan.

18. Contractor's proposed Health and Safety Plan.

19. Contractor's proposed Quality Control Plan.

20. Coordination requirements with plant staff and ongoing operations.

21. Construction sequencing and stipulated construction and plant operational constraints.

22. Project funding and associated requirements (WIFIA, AIS)

1.03 PROGRESS MEETINGS WITH ENGINEER AND OWNER:

A. In addition to other regular project meetings for other purposes (as indicated elsewhere in the Contract Documents), hold general progress meetings weekly with times coordinated with preparation of payment requests. Meeting dates shall be established by the Owner and overseen by Owner. Require every entity then involved in the planning, coordination or performance of work to be properly represented at each meeting. Include (when applicable):

1. Consultants

2. Separate contractors (if any)

3. Principal subcontractors

4. Suppliers/manufacturers/fabricators

5. Governing authorities

6. Insurers

7. Special supervisory personnel and others with an interest or expertise in the progress of the work.

B. Suggested format includes, but not limited to following:

1. Review each entity's present and future needs including interface requirements

2. Construction sequence, coordination and shutdown requirements

3. Construction schedule and progress reporting

4. On-site witness testing by independent subconsultants and approval/regulatory agencies

5. Deliveries

6. Access

7. Site utilization

8. Temporary facilities and services

9. Hours of work

10. Safety, hazards and risks

11. Housekeeping

12. Submittals

13. Change managements (request for quotation, change directives, change orders)

14. Contract administration logs (request for information, etc.)

15. Documentation of information for payment requests

16. O&M submittal

17. Training

18. Pump station functional testing, startup, and performance testing.

C. Discuss whether each element of current work is ahead of schedule. Determine how behind-time work will be expedited and secure commitments from the entities involved in doing so. Discuss whether schedule revisions are required to ensure that current work and subsequent work will be completed within the Contract Time. Review everything of significance which could affect the progress of the work.

D. Immediately following each progress meeting where revisions to the Progress Schedule/Critical Path Schedule have been made or recognized (regardless of whether agreed to by each entity represented), revise the Schedule. Reissue revised Schedule within 10 working days after meeting.

E. At intervals matching the preparation of payment requests, revise and reissue the Schedule to show actual progress of the work in relation to the latest revision of the Schedule.

1.04 FUCTIONAL TESTING, STARTUP AND COMMISSIONING MEETING:

A. Schedule three months prior to the start of functional testing.

B. Location: At location to be selected by Engineer.

C. Attendance.

1. All Contractor's Project Managers.

2. All Contractor's Resident Superintendents.

3. All Contractor's Startup Managers.

4. Subcontractors' or suppliers' representatives Contractor may desire to invite or Engineer may request.

5. Engineer's representatives.

6. Owner's representatives.

7. Local utility representatives, if applicable.

D. Suggested Agenda.

1. Detailed testing and commissioning plans and schedules.

2. Requirements and schedules for training of Owner's staff.

3. Requirements and schedules for O&M data.

4. Coordination and shutdown requirements.

5. On-site witness testing by independent subconsultants and approval/regulatory agencies.

6. Sampling and analytical requirements and responsibilities.

7. SCADA integration and control

8. Engineer's responsibility for separate training of Owner's staff.

9. Engineer's responsibility for separate process O&M manual.

1.05 SCADA MEETING:

A. Schedule six months prior to the start of functional testing (if SCADA programming is being done by the Engineer, OR prior to the submission of SCADA-programming related submittals (if SCADA programming is being done by the Contractor.

B. Location: At location to be selected by Engineer.

C. Attendance.

1. All Contractor's Project Managers.

2. All Contractor's Startup Managers.

3. Subcontractors' or suppliers' representatives Contractor may desire to invite or Engineer may request.

4. Engineer's representatives.

5. Owner's representatives.

D. Suggested Agenda.

1. SCADA software and programming requirements.

2. Detailed testing and commissioning plans and schedules.

3. FAT testing requirements and schedules.

4. SAT testing requirements and schedules.

5. SCADA training of Owner's staff.

END OF SECTION

SECTION 01 32 17
BASELINE AND PROGRESS SCHEDULES

PART 1 GENERAL

1.1 PURPOSE

A. The OWNER is committed to delivering quality, cost-effective infrastructure to its customers in a timely manner. One of the most important tools the OWNER uses to achieve this goal is accurate, updated, current schedules for its capital projects. Accurate and updated schedules allow the OWNER to effectively track and manage its projects both in aggregate (at the program or OWNER-wide level) and project-by-project.

B. The OWNER's goal is to take every reasonable step to ensure that projects finish on time and within budget. Project schedules are the fundamental building blocks to planning and executing projects efficiently and on time. These schedules are best prepared by those closest to the work. Because the vast majority of capital project delivery at the OWNER is performed by CONTRACTOR, it is critical that CONTRACTOR prepare schedules as part of performing their work for the OWNER.

C. This Schedule Guidance Document is designed to guide CONTRACTOR in preparing and submitting acceptable schedules for use by the OWNER.

1.2 APPLICABILITY AND BASIC REQUIREMENTS

A. CONTRACTOR is responsible for preparing schedules as defined herein and as required in their contracts. A waiver allowing a CONTRACTOR not to prepare a schedule in accordance with this Schedule Guidance Document may only be granted by the OWNER or designee.

There are three (3) basic elements to schedule submittals.

1. **Baseline Schedule**: Initial schedule submitted before work begins that will serve as the baseline for measuring progress and departures from the schedule. The Baseline Schedule is prepared by the CONTRACTOR at the beginning of the project and submitted to the OWNER for review and approval.

2. **Progress Schedule**: Monthly submittal of a Progress Schedule documenting progress on the project and any changes anticipated. The Progress Schedule is prepared monthly by the CONTRACTOR and submitted to the OWNER.

3. **Schedule Narrative**: Concise narrative that highlights changes in the schedule, expected delays, key schedule issues, etc., along with a cash flow graph or summary table. The Schedule Narrative is submitted to the OWNER monthly in conjunction with the Progress Schedule.

B. The schedules required herein will be prepared using the following software (or saved down in the following version) in order to be compatible with the OWNER's schedule system, unless prior permission to use another software is requested and granted by the OWNER.

a. Primavera Project Planner (now owned by Oracle) version 8.2 or later

b. or Microsoft Project.

1.3 **BASELINE SCHEDULE**

A. General: The CONTRACTOR will develop a cost loaded schedule using the software version required in Section 1.2 and the Critical Path Method (CPM).

1. The OWNER will inform the CONTRACTOR of the Project Code (Project Number) for the Project. The file naming convention is demonstrated in the examples below.

- Baseline

  Format. ProjectCode (project number)_DocumentType_Date_

  Example. 1701_ScheduleBaseline_03162017.XER

- Monthly Update

  Format. ProjectCode (project number)_DocumentType_Date_

  Example. 1701_ScheduleUpdate_03162017.XER

- Monthly Schedule Narrative

  Format. ProjectCode (project number)_DocumentType_Date_

  Example. 1701_ScheduleNarrative_03162017.DOC

2. The approved Baseline Schedule is a part of the contract by reference. The CONTRACTOR has the sole responsibility to correct any latent defects in the Baseline Schedule and perform to the subsequently revised schedule.
3. The CONTRACTOR will use the Baseline Schedule to coordinate and monitor the work (including the activities of subcontractors, equipment vendors and suppliers).
4. The CONTRACTOR must keep a copy of the approved Baseline Schedule.

B. Schedule Work Breakdown Structure and Activities

1. **Work Breakdown Structure (WBS)**: The OWNER's Work Breakdown Structure is designed to meet the basic reporting needs for the OWNER's financial and tracking systems. The CONTRACTOR's project-specific WBS should work within this basic framework and provide additional detail to efficiently deliver and track the work.

   WBS elements that are definitely not a part of the scope of services need not be included in the schedule. Note that as many subtasks and activities as desired may be included underneath the WBS elements.

2. **Activities**: Activities are the discrete elements of work that make up the schedule. They should be organized underneath the umbrella of the WBS as described in Exhibit A.

   The following information should be provided for each activity:

   a. Activity ID Number
   - Use a four-digit number left justified in the activity I.D. field.
   - Alphanumeric activity numbers are NOT acceptable.

b. Activity Description
- Activity descriptions should adequately describe the activity and in some cases the extent of the activity. Examples of acceptable descriptions might include "install pipeline between Avenue A and Avenue B", "water line route layout", etc.).

c. Activity Durations
- The activity duration will be based upon the physical amount of work that is to be performed for the stated activity and are limited to 20 working days. If work is to exceed 20 days, then break the work down so the work will be completed within a 20-day time frame.
- The intent of this requirement is to ensure that the activities are segmented sufficiently to adequately track progress.

d. Activity Start and Finish Dates
- Activity start and finish dates will only be accepted if calculated by the software.
- Actual activity start and finish dates may not be assigned in a baseline. However, they must accurately be assigned in the working version of the schedule (see Section 4 Progress Schedule).

e. Activity Dependencies
All activities will be logically tied with a predecessor and a successor. The only exception to this rule will be for the project start and project finish milestones.

f. Milestone Activities
- The following milestone activities (i.e., important events on a project that mark critical points in time) are of particular interest to the OWNER and should be reflected in the Project Schedule for all phases of work, as applicable. Notice to Proceed (Construction)
- Draft Baseline Schedule submittal
- Preparation and submission of shop drawings, submittals, and any required re-submittals (if applicable)
- Mobilization
- Fabrication and delivery of equipment and materials (if applicable)
- Substantial Completion
- Construction Complete

C. **Baseline Schedule Development**: The CONTRACTOR will designate an authorized representative (Project Scheduler) responsible for developing and updating the schedule and preparing reports. It is recommended that a qualified scheduler develop the Baseline Schedule.

The CONTRACTOR's initial schedule submittal will contain NO progress and represent the planned work for the duration of the project. Once approved by the OWNER, this schedule will become the baseline against which all future variance analysis will be performed.

The use of activity external constraint dates and lags on relationships is discouraged unless specified or approved by the OWNER. An example of an external constraint date is "concrete placement will begin no later than January 1." The reason for this requirement is that it creates an artificial (rather than calculated) critical path.

The Baseline Schedule will consider delivery lead times, construction and access constraints and the coordination of construction with OWNER operations.

1. **Safety Requirements**: Schedule performance should never take precedence over safety. Project schedules must allow work to be performed in a safe manner.

   The CONTRACTOR cannot reduce safety or worker protection in order to shorten schedules, recover lost time or accelerate the work.
2. **Inclement Weather**: Refer to climatology data for anticipating work that can be affected by inclement weather. Historical rain days can be reviewed from the following web site: http://www.noaa.gov/climate

D. Changes to Approved Baseline Schedule: The approved Baseline Schedule is the basis for measuring progress on the project (see Paragraph 1.4, Progress Schedule). As such, the CONTRACTOR should develop the Baseline Schedule considering the realistic delivery of the work tasks and likely constraints.

Total and free float is not for the exclusive use or benefit of either the OWNER or the CONTRACTOR, but is a resource available to both parties for the benefit of the project on a first needed basis. Changes to the Baseline Schedule will only be considered after all float has been consumed.

Changes to the approved Baseline Schedule may only be considered under limited circumstances. If warranted, any changes will require PRIOR approval by the ENGINEER's Designee and OWNER's Program Manager. Project circumstances that could be considered by the OWNER as potentially warranting re-baselining include the following:

- Change Orders to the contract affecting the scope of the work to be performed and the associated schedule completion date

1.4 PROGRESS SCHEDULE

As described in Paragraph 1.3, the Baseline Schedule is used to coordinate and monitor the work. The CONTRACTOR is required to keep a copy of the approved Baseline Schedule.

The Progress Schedule is simply a copy of the approved Baseline Schedule that will be statused monthly. In other words, progress on the project will be shown monthly as an update of the schedule that will be compared to the approved Baseline Schedule.

Note that the Progress Schedule will be statused (data date) through month end, although the submittal date must comply with Paragraph 1.6 of this section.

A. **Progress Updates**: The CONTRACTOR should show on the Progress Schedule updates of the following:

- The actual dates that activities start
- The actual dates that activities finish
- The remaining duration of activities in progress
- The percent complete of all activities on the schedule (0 percent to 100 percent complete)

B. **Schedule Narrative**: The Progress Schedule will be accompanied monthly by a concise Schedule Narrative that explains the submitted schedule. The purpose of the Schedule Narrative is to:

- Speed review time
- Explain variances from Baseline on critical path activities
- Explain to the OWNER logic changes and potential schedule conflicts related to dependences.
- Concisely summarize the projected cash flow for the project based on the statused schedule.

If the project is on schedule, and no significant issues related to schedule exist, then the Schedule Narrative is extremely brief. On the other hand, if the project is falling behind, and/or there are significant conflicts and obstacles to meeting the Baseline Schedule, then the Schedule Narrative should describe the issues and what steps will be necessary for the project to recover. Sharing this information ensures that the entire project team will be aware of the issues and have opportunity to assist, where applicable.

1.5 ADDITIONAL GUIDANCE APPLICABLE TO CONSTRUCTION SCHEDULES ONLY

In addition to the requirements in Sections 1.1 – 1.4 of this Schedule Guidance Document, the CONTRACTOR's schedule will include the following.

A. **Schedule of Value Pay Items**: Schedule of Values Pay Items (Work) shall be loaded into the scheduling software using the labor, materials, and equipment resource types showing the quantity of Work to be done along with the corresponding value of the Work measured in dollars.

1.6 SUBMITTAL OF SCHEDULES

A. **Submittal File Formats**: Every time that a schedule or report is submitted (baseline and monthly progress) the following file formats are required.

1. Baseline Schedule: Submit the schedule in native file format (see below).

   Also submit a .pdf of the bar chart schedule consisting of the following columns:

   - Activity ID
   - Activity Name
   - Duration
   - Start Date
   - Finish Date
   - Float

- Cost

2. **Progress Schedule**: Submit the schedule in native file format (see below).
   Also submit a .pdf of the bar chart schedule consisting of the following columns:
   - Activity ID
   - Activity Name
   - Physical Percent Complete
   - Duration
   - Start Date
   - Finish Date
   - Total Float
   - Remaining Total Cost
3. **Schedule Narrative**: Submit the schedule narrative in .doc format.
4. **Native Schedule File Formats**: The native file structure is to save the schedule as follows:
   a. In Primavera 6, save the file as an .XER file.
   b. In Microsoft Project, save the file as an .MPP file.

B. **Submittal Process**: All submittals of schedules must be made to the ENGINEER's Designee. Draft project Baseline Schedules must be submitted within thirty (30) calendar days after the formal Notice to Proceed from the OWNER. All schedules must be submitted in their native format (.XER file or .MPP) as well as in a PDF format. The OWNER will review, accept or reject the schedule within five (5) days of submittal.
   Once the Baseline Schedule has been accepted, Progress Schedule updates will be due monthly prior to the monthly progress meetings.

SECTION 01 32 33

CONSTRUCTION VIDEO

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Pre-construction video pertinent to the Contract work will be taken by Contractor.

1.02 QUALITY ASSURANCE:

A. Dates for videography at site will be coordinated by the Engineer, Owner, and SLCDPU staff.

B. Videographer will make and retain detailed records of all video under this Contract:

1. The records will be in sufficient detail to support any attestation that may be required of videographer.

2. Videographer will retain such records for a period not less than two years from the final acceptance of entire work under this Contract.

1.03 USAGE RIGHTS:

A. Contractor will have access to documentation.

PART 2 - PRODUCTS

2.01 MEDIA:

A. Digital Video Recordings: High-resolution, digital video in format. Ability to extract high-resolution photographs from the video.

PART 3 - EXECUTION

3.01 CONSTRUCTION VIDEO:

A. General: Video will provide the maximum range of depth of field, and that are in focus, to clearly show the Work.

1. Videographer will maintain key plan with each set of pre-construction videos that identifies each video location.

B. Digital Images: Maintain one set of files accessible in the field office at Project site, available at all times for reference. Identify images in the same manner as those submitted to the Engineer.

C. Preconstruction Video: Before starting construction, video will be taken of Project site and surrounding properties, including existing items to remain during construction, from different vantage points, as directed by the Engineer. Video will:

1. Show existing conditions adjacent to property before starting the Work.

2. Show each existing building structure, or feature either on or adjoining property to accurately record physical conditions at start of construction.

3. Take additional video as required to record settlement or cracking of adjacent structures, pavements, and improvements.

4. Take video the existing conditions and facilities at the existing raw wastewater pump station.

5. Take video along the proposed Influent Sewer route. If a drone is proposed to be used, confirm with the Owner and Engineer approval for use of a drone. Due to proximity to the airport, restrictions may be required.

3.02 FORCEMAIN AND DUCTBANK ROUTE VIDEOGRAPHY:

A. Video of route before commencement of construction will be:

1. Progressive video of route starting at one end of route and progressing to other end then reverse progressive video back to point of beginning.

2. Additional video of features along route as directed by the Owner and Engineer.

3.03 PRE-CONSTRUCTION VIDEO RECORDINGS:

A. Recording will display continuous running time and date. At start of each video recording, records weather conditions from local newspaper or television and the actual temperature reading at Project site.

B. Before starting construction, record video recording of forcemain route, ductbank route, Project site, and surrounding properties from different vantage points, as directed by the Owner and Engineer.

1. Showing existing conditions adjacent to Project site before starting the Work.

2. Showing existing buildings either on or adjoining Project site to accurately record physical conditions at the start of construction.

END OF SECTION

SECTION 01 32 63

CONSTRUCTION SURVEYS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide pre and post construction surveys as indicated and specified.

B. Section includes administrative and procedural requirements for the following:

1. Certified topographic field surveys performed by a registered land surveyor to determine first floor elevations, etc. as specified herein.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Field Reports:

1. One copy of final Pre and Post-Construction Survey report and native survey files.

1.03 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. The topographic surveys shall be performed by or under the supervision of and certified by a Registered Land Surveyor.

1.04 SEQUENCING AND SCHEDULING:

A. Dates for surveys at the site shall be coordinated with the Engineer and Owner.

PART 2 - PRODUCTS

2.01 TOPOGRAPHIC SURVEYS

A. Provide first floor elevations, the corners of buildings and structures foundations both front and rear.

B. Provide elevations of sidewalks, driveways, edge of roadway, retaining walls, fences, garages, sheds, valve boxes, meters, cleanouts etc.

C. The location of each elevation shall be described in detail in words and located on the plan. The cotour interval shall be 1-foot.

D. Provide construction surveys for surroundings buildings both on and off the property. Contractor shall coordinate with adjacent property owners to gain access as needed.

PART 3 - EXECUTION

3.01 CONSTRUCTION SURVEYS:

A. Provide construction surveys in accordance with the following:

1. Notify the Owner a minimum of 24 hours prior to post construction surveys.

2. The Contractor shall obtain permission, from adjacent Facility Owners a minimum of 7 days prior to conducting each survey.

3. If the Contractor is unable, after two repeated attempts, to obtain permission from adjacent Facility Owners, then the Contractor shall immediately notify the Owner so that appropriate measure may be taken.

4. Obtain the age of each facility, known permit modification and foundation information from local building departments.

5. Detailed examination shall include a visual internal and external survey of the building or structure; digital video and color photographs showing visually evident internal and external structural cracks and damage.

3.02 CONSTRUCTION SUREVEYS DURING CONSTRUCTION:

A. Provide continuous construction surveys of existing adjacent buildings at frequencies adequate to monitor existing structures for settlement but not less than once every other month.

1. Submit results of surveys in accordance with 01 33 00.

2. Locations for settlement monitoring shall be coordinated with ENGINEER and OWNER and shall be included in each monitoring event.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 01 33 00
SUBMITTAL PROCEDURE

This specification changes a portion of APWA Standard Specification Section 01 33 00. All other provisions of the Section remain in full force and effect.

Add the following article to Part 1.

1.8 **PROCEDURE**

A. Transmit submittals to ENGINEER through SLCDPU Engineering's Project Central SharePoint site. Access and use instructions are provided at the end of this section.

1.9 **SUBMITTAL REGISTER**

A. List submittals required by Contract Documents on the attached Submittal Register form. Identify CONTRACTOR's need dates and ENGINEER's action dates.

B. The following list identifies required submittal due dates. Submittals not identified in the list but specified in the Specifications shall be submitted as need to progress the project.

When Due	Section Reference	Submittal	Responsible
Pre-construction conference	01 33 00	Submittal Register	
	00 72 00	Preliminary Progress Schedule	
	00 72 00	Mobilization Plan	
	00 72 00	Safety and Protection Plan	
	00 72 00	Quality Control Program	
Prior to Starting Work	00 73 10	Permits for Work	
	01 55 26	Traffic Control Plan	
	01 57 00	Storm Water Pollution Prevention Plan	
	01 71 23	Surveyor's Name, Certificate of Assurance, License Number, Schedule of Values.	
	32 01 93	Arborist's Certification and Registration Number	
	32 01 93	Tree Protection Plan	
Prior to Use	00 73 10	Written Permission to use Private Citizen's Property and Water	
	31 05 13	Top Soil Supplier and Source Data	
Prior to Delivery On Site	31 05 13	Common Fill	
	32 11 23	Target Gradation Curve Crushed Aggregate	

When Due	Section Reference	Submittal	Responsible
	32 12 05	Asphalt Concrete Mix Design Supplier's Mix Number.	
Prior to Delivery On Site	03 30 04	Portland Cement Concrete Source Data and Supplier's Mix Number.	
	33 11 00	Water System Product Data	
Upon Delivery to Site	32 12 16	Asphalt Concrete Batch Delivery Ticket	
	03 30 10	Portland Cement Concrete Batch Delivery Ticket	
Prior to Water Line Use	33 12 19	Water System Disinfection Report	
Prior to System Use	33 08 00	Pipeline Commissioning	
Prior to 1st Concrete Placement	03 30 10	Name, Certification Number and renewal date for all ACI Certified Finishers	
	03 30 10	Portland Cement Concrete Curing Compound Source, Type, and Data	
Daily as applicable	03 30 04 03 30 10	Portland Cement Concrete Quality Control Test Reports	
With Each Monthly Pay Request	01 32 16	Progress Schedule, Survey Schedule of Values	
5 Working Days Prior to Substantial Completion	01 78 50	Certification of Compliance and Request for Final Inspection	
Prior to Final Payment	01 71 23 01 71 24 31 05 10	Land Survey Closeout Documentation of Un-classified Excavation Calculations	
	01 78 50	Evidence of Payment to Suppliers and Sub-contractors	
	01 78 39	Redlines	
	01 78 39	Water Line Commissioning Test Reports	

NOTES:

FORM 01 33 00.1

INSTRUCTIONS

GENERAL

1. CONTRACTOR to complete electronic SLCDPU Project Central Submittal Form: Review the Contract Documents to insure completeness. Expand general category listings. Show individual entries on this form for each item. Attach each item properly labeled.
    a. As an example, a general category would be "Plumbing Fixtures" which the CONTRACTOR is to breakdown into individual entries such as "Toilet P-1, Lavatory P-2, etc.". Complete the Submittal Register, and submit it to ENGINEER.
2. Resubmittals: If a submittal is returned for correction, create a new Submittal workflow and reference the original SR ID number in the description and include the submittal register number. Do not amend the data already contained on the Submittal Register.

SUBMITTAL REGISTER

1. SCHEDULED ACTIVITY: If an activity on the Progress Schedule is assigned to the submittal, place the schedule activity number in the "SCHEDULED ACTIVITY" column.
2. SUBMITTAL ITEM No.: Assign to each entry on the Submittal Register a sequential number in the "SUBMITTAL IDENTIFICATION (ITEM NUMBER)" column.
3. REVIEW ACTION: The "REVIEW ACTION" column identifies technical review responsibility of submittal. Review of all products and materials is the CONTRACTOR's responsibility; however, certain specified submittals will also require ENGINEER's review.
    a. If REVIEW ACTION Column is Blank: Identified submittal shall be approved by the CONTRACTOR and then submitted to the ENGINEER for information.
    b. If the "ENGINEER" is Identified in the REVIEW ACTION Column: Identified submittals shall be first approved by the CONTRACTOR and then submitted to the ENGINEER for review.
4. ENGINEER ACTION DATES: This column is for ENGINEER's use to record date submittal was received and the action code assigned in the submittal review process.
5. Upload the Submittal Register to the SLCDPU Project Central site

ACCESS AND USE OF THE OWNER’s SHAREPOINT WEBSITE

9. The CONTRACTOR shall utilize the OWNER’s SharePoint website for all written CONTRACTOR correspondence, submittals, transmittals, pay applications, schedule updates or other communication where feasible. CONTRACTOR shall utilize OWNER-established SharePoint workflows as directed.

10. The CONTRACTOR shall request access to the OWNER's SharePoint website through the Project Manager, by providing the name, employer, e-mail address and phone number of each individual for which access is requested.
11. All SharePoint workflow functions require one (1) individual to be designated as the point of contact to receive workflow e-mail alerts from the system. The CONTRACTOR shall designate one individual as the point of contact for these workflows at the time access is requested. The point of contact can be changed upon the request from the CONTRACTOR at any time during the execution of the project.
12. The OWNER will determine the level of access to the SharePoint website that will be granted to each individual.
13. The OWNER and or OWNER's Representative shall provide SharePoint training to the CONTRACTOR(s).
14. The OWNER shall provide instruction sheets for the electronic workflows executed through the SharePoint site.
15. CONTRACTOR is required to have access to computer hardware and software that is compatible with the OWNER's SharePoint system, capable of running automated process workflows, and supporting electronic signatures. Minimum system requirements include:
    g. Windows 7 or higher.
    h. Microsoft Internet Explorer version 8 or higher (Google Chrome preferred).
    i. Microsoft Office 2010 or higher.
    j. Latest version of Adobe Acrobat (at a minimum Reader, Standard or Professional for editing).
    k. Broadband internet connection.
    l. Open access to https://slcut.sharepoint.com
16. CONTRACTOR shall verify current system requirements at start of contract and may need to adjust requirements during the contract period to accommodate upgrades or changes to the SLCDPU's system.

DOCUMENT 01 35 24

CONTRACTORS CERTIFICATION OF COMPLIANCE TO SAFETY PLAN

PART 1 GENERAL

1.1 CONTRACTORS CERTIFICATION

1. The Contractor will certify that they will comply with the Safety and Protection Plan requirements of the City. A letter from the Contractor describing the hazards present on this project and their plan to mitigate those hazards is attached following this page.

END OF DOCUMENT

[This page was intentionally left blank.]

Page Intentionally Left Blank

SECTION 01 41 13

FEDERAL REQUIREMENTS

PART 1 - GENERAL

1.01 REGULATIONS FOR PROJECTS SUBJECT TO FEDERAL REQUIREMENTS:

A. This contract is subject to the requirements and regulations governing projects receiving Federal Funding. These include the following:

1. Representatives of the U. S. Environmental Protection Agency and of the State shall have access to the Work wherever it is in preparation or progress and the Contractor shall provide proper facilities for such access and inspection.

2. Whenever a material, article or piece of equipment is identified on the drawings or in the specifications by reference to brand name or catalog number, it shall be understood that this is referenced for the purpose of defining the performance or other salient requirements and that other products of equal capacities, quality and function shall be considered. The Contractor may recommend the substitution of a material, article, or piece of equipment of equal substance and function for those referred to in the Contract Documents by reference to brand name or catalog number, and if, in the opinion of the Engineer, such material, article or piece of equipment is of equal substance and function to that specified, the Engineer may permit its substitution and use by the Contractor. Any cost differential shall be deductible from the contract price and the Contract Documents shall be appropriately modified by a change order. The Contractor warrants that if substitutes are permitted, no major changes in the function or general design of the project will result. Incidental changes or extra component parts required to accommodate the substitute shall be made by the Contractor without a change in the contract price or contract time for completion.

1.02 MINIMUM WAGE RATES:

A. Federal Wage Determination No. UT20230097, dated 01/06/23, issued by the U.S. Department of Labor is included at the end of this section.

B. Federal Wage Determination No. UT20220085, dated 03/17/23, issued by the U.S. Department of Labor is included at the end of this section.

1.03 WATER INFRASTRUCTURE FINANCING AND INNOVATION ACT (WIFIA) REQUIREMENTS:

A. Partial funding for the project is being provided under the WIFIA program.

B. The Contractor shall comply with the requirements of the WIFIA program as described herein.

C. Debarment and Suspension:

Contractor certifies that it will not knowingly enter into a contract with anyone who is ineligible under the 2 CFR part 180 and part 1532 (per Executive Order 12549, 51 FR 6370, February 21, 1986) or who is prohibited under Section 306 of the Clean Air Act or Section 508 of the Clean Water Act to participate in the Project. Suspension and debarment information can be accessed at http://www.sam.gov. Contractor represents and warrants that it has or will include a term or conditions requiring compliance with this provision in all of its subcontracts under this Agreement.

D. Federal Lobbying Restrictions (31 U.S.C 1352):

Recipients of federal financial assistance may not pay any person for influencing or attempting to influence any officer or employee of a federal agency, a member of Congress, an officer or employee of Congress, or an employee of a member of Congress with respect to the award, continuation, renewal, amendment, or modification of a federal grant, loan, or contract. These requirements are implemented for USEPA in 40 CFR Part 34, which also describes types of activities, such as legislative liaison activities and professional and technical services, which are not subject to this prohibition. Upon award of this contract, Contractor shall complete and submit to the City the certification and disclosure forms in Appendix A and Appendix B to 40 CFR Part 34. Contractor shall also require all subcontractors and suppliers of any tier awarded a subcontract over $100,000 to similarly complete and submit the certification and disclosure forms pursuant to the process set forth in 40 CFR 34.110.

E. Civil Rights Obligation:

Contractor shall comply with the following federal non-discrimination requirements:

a. Title VI of the Civil Rights Act of 1964, which prohibits discrimination based on race, color, and national origin, including limited English proficiency (LEP). (42 U.S.C 2000D, et. seq)

b. Section 504 of the Rehabilitation Act of 1973, which prohibits discrimination against persons with disabilities. (29 U.S.C. 794, supplemented by EO 11914, 41 FR 17871, April 29, 1976 and EO 11250, 30 FR 13003, October 13, 1965)

c. The Age Discrimination Act of 1975, which prohibits age discrimination. (42 U.S.C 6101 et. seq)

d. Section 13 of the Federal Water Pollution Control Act Amendments of 1972, which prohibits discrimination on the basis of sex.

e. 40 CFR Part 7, as it relates to the foregoing.

F. Equal Employment Opportunity:

The Contractor shall comply with Executive Order 11246, entitled 'Equal Employment Opportunity,' as amended by Executive Order 11375, and as supplemented in Department of Labor regulations (41 CFR Part 60). (EO 11246, 30 FR 12319, September 28, 1965)

Contractor's compliance with Executive order 11246 shall be based on implementation of the Equal Opportunity Clause, and specific affirmative active obligations required by the Standard Federal Equal Employment Opportunity Construction Contract Specifications, as set forth in 41 CFR Part 60-4.

During the performance of this contract, the contractor agrees as follows:

1) The contractor will not discriminate against any employee or applicant for employment because of race, color, religion, sex, sexual orientation, gender identity, or national origin. The contractor will take affirmative action to ensure that applicants are employed, and that employees are treated during employment, without regard to their race, color, religion, sex, sexual orientation, gender identity, or national origin. Such action shall include, but not be limited to the following: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. The contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices to be provided by the contracting officer setting forth the provisions of this nondiscrimination clause.

2) The contractor will, in all solicitations or advancements for employees placed by or on behalf of the contractor, state that all qualified applicants will receive consideration for employment without regard to race, color, religion, sex, sexual orientation, gender identity, or national origin.

3) The contractor will not discharge or in any other manner discriminate against any employee or applicant for employment because such employee or applicant has inquired about, discussed, or disclosed the compensation of the employee or applicant or another employee or applicant. This provision shall not apply to instances in which an employee who has access to the compensation information of other employees or applicants as a part of such employee’s essential job functions discloses the compensation of such other employees or applicants to individuals who do not otherwise have access to such information, unless such disclosure is in response to a formal complaint or charge, in furtherance of an investigation, proceeding, hearing, or action, including an investigation conducted by the employer, or is consistent with the contractor’s legal duty to furnish information.

4) The contractor will send to each labor union or representative of workers with which he has a collective bargaining agreement or other contract or understanding, a notice, to be provided by the agency contracting officer, advising the labor union or workers’ representative of the contractor’s commitments under Section 202 of

Executive Order No. 11246 of September 24, 1965, and shall post copies of the notice in conspicuous places available to employees and applicants for employment.

5) The contractor will comply with all provisions of Executive Order No. 11246 of Sept. 24, 1965, and of the rules, regulations, and relevant orders of the Secretary of Labor.

6) The contractor will furnish all information and reports required by Executive Order No. 11246 of September 24, 1965, and by the rules, regulations, and orders of the Secretary of Labor, or pursuant thereto, and will permit access to his books, records, and accounts by the contracting agency and the Secretary of Labor for purposes of investigation to ascertain compliance with such rules, regulations, and orders.

7) In the event of the contractor's noncompliance with the nondiscrimination clauses of this contract or with any of such rules, regulations, or orders, this contract may be cancelled, terminated, or suspended in whole or in part and the contractor may be declared ineligible for further Government contracts in accordance with procedures authorized in Executive Order No. 11246 of Sept. 24, 1965, and such other sanctions may be imposed and remedies invoked as provided in Executive Order No. 11246 of September 24, 1965, or by rule, regulation, or order of the Secretary of Labor, or as otherwise provided by law.

8) The contractor will include the provisions of paragraphs (1) through (8) in every subcontract or purchase order unless exempted by rules, regulations, or orders of the Secretary of Labor issued pursuant to Section 204 of Executive Order No. 11246 of September 24, 1965, so that such provisions will be binding upon each subcontractor or vendor. The contractor will take such action with respect to any subcontract or purchase order as may be directed by the Secretary of Labor as a means of enforcing such provisions including sanctions for noncompliance: Provided, however, that in the event the contractor becomes involved in, or is threatened with, litigation with a subcontractor or vendor as a result of such direction, the contractor may request the United States to enter into such litigation to protect the interests of the United States. [Sec. 202 amended by EO 11375 of Oct. 13, 1967, 32 FR 14303, 3 CFR, 1966–1970 Comp., p. 684, EO 12086 of Oct. 5, 1978, 43 FR 46501, 3 CFR, 1978 Comp., p. 230, EO 13665 of April 8, 2014, 79 FR 20749, EO 13672 of July 21, 2014, 79 FR 42971]

G. Standard Federal Equal Employment Opportunity Construction Contract Specifications. (41 CFR 60-4.3)

1) As used in these specifications:

a) "Covered area" means the geographical area described in the solicitation from which this contract resulted;
b) "Director" means Director, Office of Federal Contract Compliance Programs, United States Department of Labor, or any person to whom the Director delegates authority;

c) "Employer identification number" means the Federal Social Security number used on the Employer's Quarterly Federal Tax Return, U.S. Treasury Department Form 941.

d) "Minority" includes:

i) Black (all persons having origins in any of the Black African racial groups not of Hispanic origin);

ii) Hispanic (all persons of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish Culture or origin, regardless of race);

iii) Asian and Pacific Islander (all persons having origins in any of the original peoples of the Far East, Southeast Asia, the Indian Subcontinent, or the Pacific Islands); and

iv) American Indian or Alaskan Native (all persons having origins in any of the original peoples of North America and maintaining identifiable tribal affiliations through membership and participation or community identification).

2) Whenever the Contractor, or any Subcontractor at any tier, subcontracts a portion of the work involving any construction trade, it shall physically include in each subcontract in excess of $10,000 the provisions of these specifications and the Notice which contains the applicable goals for minority and female participation and which is set forth in the solicitations from which this contract resulted.

3) If the Contractor is participating (pursuant to 41 CFR 60-4.5) in a Hometown Plan approved by the U.S. Department of Labor in the covered area either individually or through an association, its affirmative action obligations on all work in the Plan area (including goals and timetables) shall be in accordance with that Plan for those trades which have unions participating in the Plan. Contractors must be able to demonstrate their participation in and compliance with the provisions of any such Hometown Plan. Each Contractor or Subcontractor participating in an approved Plan is individually required to comply with its obligations under the EEO clause, and to make a good faith effort to achieve each goal under the Plan in each trade in which it has employees. The overall good faith performance by other Contractors or Subcontractors toward a goal in an approved Plan does not excuse any covered Contractor's or Subcontractor's failure to take good faith efforts to achieve the Plan goals and timetables.

4) The Contractor shall implement the specific affirmative action standards provided in paragraphs 7 a through p of these specifications. The goals set forth in the solicitation from which this contract resulted are expressed as percentages of the total hours of employment and training of minority and female utilization the Contractor should reasonably be able to achieve in each construction trade in which it has employees in the covered area. Covered Construction contractors performing construction work in geographical areas where they do not have a Federal or federally assisted construction contract shall apply the minority and female goals established for the geographical area where the work is being

performed. Goals are published periodically in the Federal Register in notice form, and such notices may be obtained from any Office of Federal Contract Compliance Programs office or from Federal procurement contracting officers. The Contractor is expected to make substantially uniform progress in meeting its goals in each craft during the period specified.

5) Neither the provisions of any collective bargaining agreement, nor the failure by a union with whom the Contractor has a collective bargaining agreement, to refer either minorities or women shall excuse the Contractor's obligations under these specifications, Executive Order 11246, or the regulations promulgated pursuant thereto.

6) In order for the nonworking training hours of apprentices and trainees to be counted in meeting the goals, such apprentices and trainees must be employed by the Contractor during the training period, and the Contractor must have made a commitment to employ the apprentices and trainees at the completion of their training, subject to the availability of employment opportunities. Trainees must be trained pursuant to training programs approved by the U.S. Department of Labor.

7) The Contractor shall take specific affirmative actions to ensure equal employment opportunity. The evaluation of the Contractor's compliance with these specifications shall be based upon its effort to achieve maximum results from its actions. The Contractor shall document these efforts fully, and shall implement affirmative action steps at least as extensive as the following:

   a) Ensure and maintain a working environment free of harassment, intimidation, and coercion at all sites, and in all facilities at which the Contractor's employees are assigned to work. The Contractor, where possible, will assign two or more women to each construction project. The Contractor shall specifically ensure that all foremen, superintendents, and other on-site supervisory personnel are aware of and carry out the Contractor's obligation to maintain such a working environment, with specific attention to minority or female individuals working at such sites or in such facilities.

   b) Establish and maintain a current list of minority and female recruitment sources, provide written notification to minority and female recruitment sources and to community organizations when the Contractor or its unions have employment opportunities available, and maintain a record of the organizations' responses.

   c) Maintain a current file of the names, addresses and telephone numbers of each minority and female off-the-street applicant and minority or female referral from a union, a recruitment source or community organization and of what action was taken with respect to each such individual. If such individual was sent to the union hiring hall for referral and was not referred

back to the Contractor by the union or, if referred, not employed by the Contractor, this shall be documented in the file with the reason therefor, along with whatever additional actions the Contractor may have taken.

d) Provide immediate written notification to the Director when the union or unions with which the Contractor has a collective bargaining agreement has not referred to the Contractor a minority person or woman sent by the Contractor, or when the Contractor has other information that the union referral process has impeded the Contractor's efforts to meet its obligations.

e) Develop on-the-job training opportunities and/or participate in training programs for the area which expressly include minorities and women, including upgrading programs and apprenticeship and trainee programs relevant to the Contractor's employment needs, especially those programs funded or approved by the Department of Labor. The Contractor shall provide notice of these programs to the sources compiled under 7b above.

f) Disseminate the Contractor's EEO policy by providing notice of the policy to unions and training programs and requesting their cooperation in assisting the Contractor in meeting its EEO obligations; by including it in any policy manual and collective bargaining agreement; by publicizing it in the company newspaper, annual report, etc.; by specific review of the policy with all management personnel and with all minority and female employees at least once a year; and by posting the company EEO policy on bulletin boards accessible to all employees at each location where construction work is performed.

g) Review, at least annually, the company's EEO policy and affirmative action obligations under these specifications with all employees having any responsibility for hiring, assignment, layoff, termination or other employment decisions including specific review of these items with onsite supervisory personnel such as Superintendents, General Foremen, etc., prior to the initiation of construction work at any job site. A written record shall be made and maintained identifying the time and place of these meetings, persons attending, subject matter discussed, and disposition of the subject matter.

h) Disseminate the Contractor's EEO policy externally by including it in any advertising in the news media, specifically including minority and female news media, and providing written notification to and discussing the Contractor's EEO policy with other Contractors and Subcontractors with whom the Contractor does or anticipates doing business.

i) Direct its recruitment efforts, both oral and written, to minority, female and community organizations, to schools with minority and female students and to minority and female recruitment and training organizations serving the

Contractor's recruitment area and employment needs. Not later than one month prior to the date for the acceptance of applications for apprenticeship or other training by any recruitment source, the Contractor shall send written notification to organizations such as the above, describing the openings, screening procedures, and tests to be used in the selection process.

j) Encourage present minority and female employees to recruit other minority persons and women and, where reasonable, provide after school, summer and vacation employment to minority and female youth both on the site and in other areas of a Contractor's work force.

k) Validate all tests and other selection requirements where there is an obligation to do so under 41 CFR part 60-3.

l) Conduct, at least annually, an inventory and evaluation at least of all minority and female personnel for promotional opportunities and encourage these employees to seek or to prepare for, through appropriate training, etc., such opportunities.

m) Ensure that seniority practices, job classifications, work assignments and other personnel practices, do not have a discriminatory effect by continually monitoring all personnel and employment related activities to ensure that the EEO policy and the Contractor's obligations under these specifications are being carried out.

n) Ensure that all facilities and company activities are non-segregated except that separate or single-user toilet and necessary changing facilities shall be provided to assure privacy between the sexes.

o) Document and maintain a record of all solicitations of offers for subcontracts from minority and female construction contractors and suppliers, including circulation of solicitations to minority and female contractor associations and other business associations.

p) Conduct a review, at least annually, of all supervisors' adherence to and performance under the Contractor's EEO policies and affirmative action obligations.

8) Contractors are encouraged to participate in voluntary associations which assist in fulfilling one or more of their affirmative action obligations (7a through p). The efforts of a contractor association, joint contractor-union, contractor-community, or other similar group of which the contractor is a member and participant, may be asserted as fulfilling any one or more of its obligations under 7a through p of these Specifications provided that the contractor actively participates in the group, makes every effort to assure that the group has a positive impact on the employment of minorities and women in the industry, ensures that the concrete

benefits of the program are reflected in the Contractor's minority and female workforce participation, makes a good faith effort to meet its individual goals and timetables, and can provide access to documentation which demonstrates the effectiveness of actions taken on behalf of the Contractor. The obligation to comply, however, is the Contractor's and failure of such a group to fulfill an obligation shall not be a defense for the Contractor's noncompliance.

9) A single goal for minorities and a separate single goal for women have been established. The Contractor, however, is required to provide equal employment opportunity and to take affirmative action for all minority groups, both male and female, and all women, both minority and non-minority. Consequently, the Contractor may be in violation of the Executive Order if a particular group is employed in a substantially disparate manner (for example, even though the Contractor has achieved its goals for women generally, the Contractor may be in violation of the Executive Order if a specific minority group of women is underutilized).

10) The Contractor shall not use the goals and timetables or affirmative action standards to discriminate against any person because of race, color, religion, sex, sexual orientation, gender identity, or national origin.

11) The Contractor shall not enter into any Subcontract with any person or firm debarred from Government contracts pursuant to Executive Order 11246.

12) The Contractor shall carry out such sanctions and penalties for violation of these specifications and of the Equal Opportunity Clause, including suspension, termination and cancellation of existing subcontracts as may be imposed or ordered pursuant to Executive Order 11246, as amended, and its implementing regulations, by the Office of Federal Contract Compliance Programs. Any Contractor who fails to carry out such sanctions and penalties shall be in violation of these specifications and Executive Order 11246, as amended.

13) The Contractor, in fulfilling its obligations under these specifications, shall implement specific affirmative action steps, at least as extensive as those standards prescribed in paragraph 7 of these specifications, so as to achieve maximum results from its efforts to ensure equal employment opportunity. If the Contractor fails to comply with the requirements of the Executive Order, the implementing regulations, or these specifications, the Director shall proceed in accordance with 41 CFR 60-4.8.

14) The Contractor shall designate a responsible official to monitor all employment related activity to ensure that the company EEO policy is being carried out, to submit reports relating to the provisions hereof as may be required by the Government and to keep records. Records shall at least include for each employee the name, address, telephone numbers, construction trade, union affiliation if any, employee identification number when assigned, social security number, race, sex,

status (e.g., mechanic, apprentice trainee, helper, or laborer), dates of changes in status, hours worked per week in the indicated trade, rate of pay, and locations at which the work was performed. Records shall be maintained in an easily understandable and retrievable form; however, to the degree that existing records satisfy this requirement, contractors shall not be required to maintain separate records.

15) Nothing herein provided shall be construed as a limitation upon the application of other laws which establish different standards of compliance or upon the application of requirements for the hiring of local or other area residents (e.g., those under the Public Works Employment Act of 1977 and the Community Development Block Grant Program).

H. **Segregated Facilities.** (41 CFR 60-1.8) The contractor must ensure that facilities provided for employees are provided in such a manner that segregation on the basis of race, color, religion, sex, sexual orientation, gender identity, or national origin cannot result. The contractor may neither require such segregated use by written or oral policies nor tolerate such use by employee custom. The contractor's obligation extends further to ensuring that its employees are not assigned to perform their services at any location, under the contractor's control, where the facilities are segregated. This obligation extends to all contracts containing the equal opportunity clause regardless of the amount of the contract. The term "facilities," as used in this section, means waiting rooms, work areas, restaurants and other eating areas, time clocks, restrooms, wash rooms, locker rooms, and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing provided for employees; Provided, That separate or single-user restrooms and necessary dressing or sleeping areas shall be provided to assure privacy between the sexes.

I. Notice of Requirement for Affirmative Action to Ensure Equal Employment Opportunity (Executive Order 11246) located at 41 CFR § 60-4.2:

1. The Offeror's or Bidder's attention is called to the "Equal Opportunity Clause" and the "Standard Federal Equal Employment Specifications" set forth herein.

2. The goals and timetables for minority and female participation, expressed in percentage terms for the Contractor's aggregate workforce in each trade on all construction work in the covered area, are as follows:

Timetables	Goals for minority participation for each trade	Goals for female participation in each trade
	Goal from https://www.dol.gov/agencies/ofccp/construction	6.9%

These goals are applicable to all the Contractor's construction work (whether or not it is Federal or federally assisted) performed in the covered area. If the contractor

performs construction work in a geographical area located outside of the covered area, it shall apply the goals established for such geographical area where the work is actually performed. With regard to this second area, the contractor also is subject to the goals for both its federally involved and non-federally involved construction.

The Contractor's compliance with the Executive Order and the regulations in 41 CFR part 60-4 shall be based on its implementation of the Equal Opportunity Clause, specific affirmative action obligations required by the specifications set forth in 41 CFR 60-4.3(a), and its efforts to meet the goals. The hours of minority and female employment and training must be substantially uniform throughout the length of the contract, and in each trade, and the contractor shall make a good faith effort to employ minorities and women evenly on each of its projects. The transfer of minority or female employees or trainees from Contractor to Contractor or from project to project for the sole purpose of meeting the Contractor's goals shall be a violation of the contract, the Executive Order and the regulations in 41 CFR part 60-4. Compliance with the goals will be measured against the total work hours performed.

3. The Contractor shall provide written notification to the Director of the Office of Federal Contract Compliance Programs within 10 working days of award of any construction subcontract in excess of $10,000 at any tier for construction work under the contract resulting from this solicitation. The notification shall list the name, address and telephone number of the subcontractor; employer identification number of the subcontractor; estimated dollar amount of the subcontract; estimated starting and completion dates of the subcontract; and the geographical area in which the subcontract is to be performed.

4. 4. As used in this Notice, and in the contract resulting from this solicitation, the "covered area" is (insert description of the geographical areas where the contract is to be performed giving the state, county and city, if any).

J. **Disadvantaged Business Enterprises (DBE).** The contractor must ensure that the DBE's six good faith efforts are used during the procurement of subcontractors for the Project. The six good faith efforts are found at:

https://www.epa.gov/grants/disadvantaged-business-enterprise-program-requirements#sixgoodfaithefforts.

1.04 AMERICAN IRON AND STEEL (AIS) REQUIREMENTS:

A. The Contractor acknowledges to and for the benefit of the Salt Lake City Department of Public Works and the United States Environmental Protection Agency ("EPA") that it understands the goods and services under this Agreement are being funded with monies made available by the Water Infrastructure Finance and Innovation Act program of the EPA that has statutory requirements commonly known as "American Iron and Steel" that requires all of the iron and steel products used in the project to be produced in the United States ("American Iron and Steel Requirement") including iron and steel products

provided by the Contactor pursuant to this Agreement. The Contractor hereby represents, warrants and covenants to and for the benefit of the Purchaser and the EPA that (a) the Contractor has reviewed and understands the American Iron and Steel Requirement, (b) all of the iron and steel products used in the project will be and/or have been produced in the United States in a manner that complies with the American Iron and Steel Requirement, unless a waiver of the requirement is approved, and (c) the Contractor will provide any further verified information, certification or assurance of compliance with this paragraph, or information necessary to support a waiver of the American Iron and Steel Requirement, as may be requested by the Purchaser or the EPA. Notwithstanding any other provision of this Agreement, any failure to comply with this paragraph by the Contractor shall permit the Purchaser or the EPA to recover as damages against the Contractor any loss, expense, or cost (including without limitation attorney's fees) incurred by the Purchaser or the EPA resulting from any such failure (including without limitation any impairment or loss of funding, whether in whole or in part, from the EPA or any damages owed to the EPA by the Purchaser). While the Contractor has no direct contractual privity with the EPA, as a lender to the Purchaser for the funding of its project, the Purchaser and the Contractor agree that the EPA is a third-party beneficiary and neither this paragraph (nor any other provision of this Agreement necessary to give this paragraph force or effect) shall be amended or waived without the prior written consent of the EPA.

1.05 COMPLIANCE WITH DAVIS-BACON AND RELATED ACTS:

(a) In any contract in excess of $2,000 which is entered into for the actual construction, alteration and/or repair, including painting and decorating, of a public building or public work, or building or work financed in whole or in part from Federal funds or in accordance with guarantees of a Federal agency or financed from funds obtained by pledge of any contract of a Federal agency to make a loan, grant or annual contribution (except where a different meaning is expressly indicated), and which is subject to the labor standards provisions of any of the acts listed in 29 C.F.R. § 5.1, the following clauses (or any modifications thereof to meet the particular needs of the agency, provided that such modifications are first approved by the Department of Labor):

(1) Minimum wages.

(i) All laborers and mechanics employed or working upon the site of the work (or under the United States Housing Act of 1937 or under the Housing Act of 1949 in the construction or development of the project), will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3)), the full amount of wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of

any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics. Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph (a)(1)(iv) of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in § 5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: Provided that the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classification and wage rates conformed under paragraph (a)(1)(ii) of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers.

(ii)

(A) The WIFIA assistance recipient, Salt Lake City Department of Public Works, on behalf of the U.S. Environmental Protection Agency (EPA), shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The WIFIA assistance recipient shall approve an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

(1) The work to be performed by the classification requested is not performed by a classification in the wage determination; and

(2) The classification is utilized in the area by the construction industry; and

(3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(B) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the WIFIA assistance recipient agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), a report of the action taken shall be sent to the Administrator of the Wage and Hour Division (WHD Administrator), U.S. Department of Labor, Washington, DC 20210. The WHD Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification action within 30 days of receipt and so advise the WIFIA assistance recipient or will notify the WIFIA assistance recipient within the 30-day period that additional time is necessary.

(C) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the WIFIA assistance recipient do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the WIFIA assistance recipient shall refer the questions, including the views of all interested parties and the recommendation of the WIFIA assistance recipient, to the WHD Administrator for determination. The WHD Administrator, or an authorized representative, will issue a determination within 30 days of receipt and so advise the WIFIA assistance recipient or will notify the WIFIA assistance recipient within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs (a)(1)(ii) (B) or (C) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(iii) Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

(iv) If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, Provided, That the Secretary of Labor has found, upon the written request of the contractor, that the applicable standards of the Davis Bacon Act have

been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

(2) Withholding. Salt Lake City Department of Public Works, shall upon written request of the WIFIA Director or an authorized representative of the Department of Labor withhold or cause to be withheld from the contractor under this contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of the work (or under the United States Housing Act of 1937 or under the Housing Act of 1949 in the construction or development of the project), all or part of the wages required by the contract, the WIFIA Director may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

(3) Payrolls and basic records.

(i) Payrolls and basic records relating thereto shall be maintained by the contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work (or under the United States Housing Act of 1937, or under the Housing Act of 1949, in the construction or development of the project). Such records shall contain the name, address, and social security number of each such worker, his or her correct classification, hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in section 1(b)(2)(B) of the Davis-Bacon Act), daily and weekly number of hours worked, deductions made and actual wages paid. Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the contractor shall maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

(ii) {no text here}

(A) The contractor shall submit weekly for each week in which any contract work is performed a copy of all payrolls to Salt Lake City Department of Public Works. The payrolls submitted shall set out accurately and completely all of the information required to be maintained under 29 CFR 5.5(a)(3)(i), except that full social security numbers and home addresses shall not be included on weekly transmittals. Instead the payrolls shall only need to include an individually identifying number for each employee (e.g., the last four digits of the employee's social security number). The required weekly payroll information may be submitted in any form desired. Optional Form WH-347 is available for this purpose from the Wage and Hour Division Web site at https://www.dol.gov/agencies/whd/forms/wh347 or its successor site. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors. Contractors and subcontractors shall maintain the full social security number and current address of each covered worker, and shall provide them upon request to Salt Lake City Department of Public Works, for transmission to the EPA, the contractor, or the Wage and Hour Division of the Department of Labor for purposes of an investigation or audit of compliance with prevailing wage requirements. It is not a violation of this section for a prime contractor to require a subcontractor to provide addresses and social security numbers to the prime contractor for its own records, without weekly submission to Salt Lake City Department of Public Works).

(B) Each payroll submitted shall be accompanied by a "Statement of Compliance," signed by the contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

(1) That the payroll for the payroll period contains the information required to be provided under § 5.5 (a)(3)(ii) of Regulations, 29 CFR part 5, the appropriate information is being maintained under § 5.5 (a)(3)(i) of Regulations, 29 CFR part 5, and that such information is correct and complete;

(2) That each laborer or mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations, 29 CFR part 3;

(3) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(C) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the "Statement of Compliance" required by paragraph (a)(3)(ii)(B) of this section.

(D) The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under section 1001 of title 18 and section 231 of title 31 of the United States Code.

(iii) The contractor or subcontractor shall make the records required under paragraph (a)(3)(i) of this section available for inspection, copying, or transcription by authorized representatives of the Salt Lake City Department of Public Works, EPA, or the Department of Labor, and shall permit such representatives to interview employees during working hours on the job. If the contractor or subcontractor fails to submit the required records or to make them available, the EPA may, after written notice to the Salt Lake City Department of Public Works, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12

(4) Apprentices and trainees-

(i) Apprentices. Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Office of Apprenticeship Training, Employer and Labor Services, or with a State Apprenticeship Agency recognized by the Office, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually registered in the program, but who has been certified by the Office of Apprenticeship Training, Employer and Labor Services or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice. The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the

classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the contractor's or subcontractor's registered program shall be observed. Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the WHD Administrator determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination. In the event the Office of Apprenticeship Training, Employer and Labor Services, or a State Apprenticeship Agency recognized by the Office, withdraws approval of an apprenticeship program, the contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(ii) Trainees. Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration. The ratio of trainees to journeymen on the job site shall not be greater than permitted under the plan approved by the Employment and Training Administration. Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of fringe benefits listed on the wage determination unless the WHD Administrator determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination which provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate who is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. In the event

the Employment and Training Administration withdraws approval of a training program, the contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(iii) Equal employment opportunity. The utilization of apprentices, trainees and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR part 30.

(5) Compliance with Copeland Act requirements. The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract.

(6) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses contained in 29 CFR 5.5(a)(1) through (10) and such other clauses as the EPA may by appropriate instructions require, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR 5.5.

(7) Contract termination: debarment. A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.

(8) Compliance with Davis-Bacon and Related Act requirements. All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract.

(9) Disputes concerning labor standards. Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and Salt Lake City Department of Public Works, EPA, the U.S. Department of Labor, or the employees or their representatives.

(10) Certification of eligibility.

(i) By entering into this contract, the contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(ii) No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(iii) The penalty for making false statements is prescribed in the U.S. Criminal Code, 18 U.S.C. 1001

(b) Contract Work Hours and Safety Standards Act. The following clauses set forth in paragraphs (b)(1), (2), (3), and (4) of this section shall be inserted in full in any contract in an amount in excess of $100,000 and subject to the overtime provisions of the Contract Work Hours and Safety Standards Act. These clauses shall be inserted in addition to the clauses required by § 5.5(a) or § 4.6 of part 4 of this title. As used in this paragraph, the terms laborers and mechanics include watchmen and guards.

(1) Overtime requirements. No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.

(2) Violation; liability for unpaid wages; liquidated damages. In the event of any violation of the clause set forth in paragraph (b)(1) of this section the contractor and any subcontractor responsible therefor shall be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States (in the case of work done under contract for the District of Columbia or a territory, to such District or to such territory), for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (b)(1) of this section, in the sum of $25 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (b)(1) of this section.

(3) Withholding for unpaid wages and liquidated damages. The Salt Lake City Department of Public Works shall upon its own action or upon written request of an authorized representative of the Department of Labor, or the EPA, withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (b)(2) of this section.

(4) Subcontracts. The contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraph (b)(1) through (4) of this

section and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (b)(1) through (4) of this section.

(c) In addition to the clauses contained in paragraph (b), in any contract subject only to the Contract Work Hours and Safety Standards Act and not to any of the other statutes cited in § 5.1, the contractor or subcontractor shall maintain payrolls and basic payroll records during the course of the work and shall preserve them for a period of three years from the completion of the contract for all laborers and mechanics, including guards and watchmen, working on the contract. Such records shall contain the name and address of each such employee, social security number, correct classifications, hourly rates of wages paid, daily and weekly number of hours worked, deductions made, and actual wages paid. Further, the EPA shall cause or require the Salt Lake City Department of Public Works to insert in any such contract a clause providing that the records to be maintained under this paragraph shall be made available by the contractor or subcontractor for inspection, copying, or transcription by authorized representatives of the Salt Lake City Department of Public Works, EPA and the Department of Labor, and the contractor or subcontractor will permit such representatives to interview employees during working hours on the job.

1.06 PROHIBITION ON CERTAIN TELECOMMUNICATIONS AND VIDEO SURVEILLANCE SERVICES OR EQUIPMENT (EFFECTIVE AUGUST 13, 2020)

The John S. McCain National Defense Authorization Act for Fiscal Year 2019 (P.L. 115-232), at Section 889, prohibits EPA financial assistance recipients, including WIFIA borrowers, from expending loan funds to procure or obtain; extend or renew a contract to procure or obtain; or enter into a contract (or extend or renew a contract) to procure or obtain equipment, services, or systems that use covered telecommunications equipment or services as a substantial or essential component of any system, or as critical technology as part of any system. As described in the Act, "covered telecommunications equipment or services" means:

a) Telecommunications equipment produced by Huawei Technologies Company or ZTE Corporation (or any subsidiary or affiliate of such entities).

b) For the purpose of public safety, security of government facilities, physical security surveillance of critical infrastructure, and other national security purposes, video surveillance and telecommunications equipment produced by Hytera Communications Corporation, Hangzhou Hikvision Digital Technology Company, or Dahua Technology Company (or any subsidiary or affiliate of such entities).

c) Telecommunications or video surveillance services provided by such entities or using such equipment.

d) Telecommunications or video surveillance equipment or services produced or provided by an entity that the Secretary of Defense, in consultation with the Director of the National Intelligence or the Director of the Federal Bureau of Investigation, reasonably believes to be an entity owned or controlled by, or otherwise connected to, the government of a covered foreign country.

The Act does not prohibit:

a) Procuring with an entity to provide a service that connects to the facilities of a third-party, such as backhaul, roaming, or interconnection arrangements.

b) Telecommunications equipment that cannot route or redirect user data traffic or permit visibility into any user data or packets that such equipment transmits or otherwise handles.

END OF SECTION

SECTION 01 41 20

SEISMIC AND WIND REQUIREMENTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section establishes the minimum seismic design requirements for architectural, mechanical, electrical and non-structural components.

B. The Contractor shall be responsible for the seismic requirements specified including the conformance of work for all subcontractors, manufacturers and suppliers with regard to the indicated and specified seismic requirements.

1. Specification for the Design, Testing, and Utilization of Industrial Steel Storage Racks

L. FM Global Standards for Certification:

1. FM Global standards for design.

1.03 DEFINITIONS:

A. Components are defined as systems, equipment, parts, or other elements, including supporting structures and attachments.

B. The reference building code is defined as the building code cited on the structural drawings or specified herein for the design of the basic structure.

C. The specified seismic criteria is defined as the seismic criteria cited on the structural drawings or specified herein for the design of the basic structure.

D. The specified wind criteria is defined as the wind criteria cited on the structural drawings or specified herein for the design of the basic structure.

1.04 MINIMUM DESIGN REQUIREMENTS:

A. Architectural, mechanical, electrical and non-structural components shall be designed and constructed to resist the seismic and wind forces and displacements

based upon ASCE/SEI 7, the reference building code, and the specified seismic and wind criteria. In the case of conflict the more stringent requirements shall govern.

B. The interrelationship of components and their effect on each other shall be such that the failure of one component shall not cause the failure of any other component.

C. Components shall be anchored to the building structure to transfer seismic and wind forces. Connections shall be bolted, welded or otherwise positively anchored to the structure. Anchorage shall not rely on friction for force transfer.

D. Exceptions: Exemption from the requirements for seismic and wind analysis and design are permitted only to the extent permitted in the reference code.

E. The following design criteria shall be used in conjunction with the appropriate minimum design criteria section listed below.

1. Influent Pump Station Occupancy Category: IV

2. Electrical Building Occupancy Category: IV

F. The pre-engineered metal buildings shall be designed to meet or exceed FM Global standards for snow and wind loads.

1.05 WIND LOADING MINIMUM DESIGN CRITERIA:

A. Design in accordance with the requirements of the above referenced codes.

1. Wind Speed : 110 miles per hour, 115 miles per hour for Risk Category IV structures

2. Wind Exposure: C

1.06 SEISMIC LOADING MINIMUM DESIGN CRITERIA:

A. Design Requirements: Design in accordance with the requirements of the above referenced codes.

1. Risk Category:

a. III

b. IV, specifically designated structures

2. Short Period MCE (Ss) = 1.547

3. Long Period MCE (S1) = 0.564

4. Soil Site Class: E

5. Seismic Parameters for soil site Class E:

   a. Site Coefficient, Fa = 1.0

   b. Site Coefficient, Fv = 4.0

   c. Site Specific Short Period Spectral Acceleration (SDS) = 0.830

   d. Site Specific Long Period (1-sec) Spectral Acceleration (SD1) = 1.200

6. Seismic Design Category: D

7. Importance Factor (Ie):

   a. Select based upon Risk Category and corresponding values provided by ASCE/SEI 7.

8. Component Importance Factor (Ip):

   a. Equipment and systems related to operations, including but not limited to pumping systems, supply piping; Ip = 1.5

   b. Other structures, Ip = 1.0

9. Selection and application of the appropriate seismic design sections of ASCE/SEI 7 shall be the responsibility of the Engineer responsible for the element being designed; however final approval of the selected section of ASCE 7 shall be provided by the Engineer.

1.07 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Where specified in the technical specifications, provide and complete the Certificate of Unit Responsibility form in Section 01 33 00 and submit to Engineer prior to manufacture of components.

C. In addition, submit the following support data along with Certificate of Unit Responsibility:

   1. Certification, signed and sealed by a Professional Structural Engineer registered in the jurisdiction where the project is located, stating that all systems, equipment, and other elements, including supporting structures, attachments and connections are designed to withstand the required seismic and wind forces and displacements.

2. Codes and specifications to which structural design conforms.

D. A copy of this specification section, with addenda updates, with each paragraph check marked to show specification compliance or marked to show deviations.

E. Manufacturer's information and catalog data showing compliance with this specification and a full description of the product.

F. Design calculations for shoring systems and support and anchorage of equipment and appurtenances. Calculations shall be stamped and signed by a civil or structural engineer currently licensed in the State of Utah and submitted under the appropriate technical specification Section.

G. Submit complete shop drawings and corresponding calculations which thoroughly cover the work elements associated with an area of work being requested for review.

1. Calculations shall be signed and stamped by a civil or structural engineer licensed in the state of Utah and submitted under the appropriate technical specification section.

1.08 SPECIFIC COMPONENTS:

A. Compound Equipment: Connecting elements for equipment combinations such as pumps and motors, valves and operators, engines and generators, etc. which are not capable of transferring seismic and/or wind loads or accommodating seismic and wind displacements shall be protected by appropriate design.

B. Storage Tanks: Tanks, supporting structures and anchorages shall be designed for the weight of the tank, appurtenances and the tank contents at the maximum capacity. Tank contents shall not be considered in resistance to seismic and wind loads.

1. Where applicable include impulsive and convective "sloshing" effects.

2. Component response modification factor for impulsive effects, Ri: In accordance with ASCE 7, Table 15.4-2.

3. Component response modification factor for convective effects, Rc = 1.0.

4. Component importance factor, Ie: Determine in accordance with ASCE 7, Section 15.4.1.1.

C. Ductwork: Equipment installed within ductwork shall be independently supported and braced. Support and bracing of heating and cooling coils shall account for the weight of the contents.

D. Piping Systems: Support and bracing of piping systems shall account for the weight and hydrodynamic effects of the contents.

E. Pressure Piping: Pressure piping support and bracing shall conform to ASME B31 in addition to the force and displacement requirements of the reference code.

F. Sprinkler Systems: Sprinkler system support and bracing shall conform to NFPA 13 in addition to the force and displacement requirements of the reference code.

G. General Supports: Pipe, duct, raceways and cable tray supports and bracing shall conform to the AISC Manual of Steel Construction and MSS SP-58 in addition to the force and displacement requirements of the reference code.

H. Submerged components shall be designed for hydrodynamic sloshing forces.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 01 45 00
QUALITY CONTROL

This specification changes a portion of APWA Standard Specification Section 01 45 00. All other provisions of the Section remain in full force and effect.

Add the following Article to Part 1.

1.7 **QUALITY CONTROL PROGRAM**

A. **Quality Control Program**: Provide a quality control program which includes procedures and organization so equipment, workmanship, fabrication, construction, operations, and inspections comply with the Contract Documents.

B. **Quality Control Program Manager Qualifications**:

1. Not CONTRACTOR's work or site superintendent.
2. Quality control experience with projects of similar type and magnitude.
3. Authorized as CONTRACTOR's representative for all quality control and quality assurance matters.

C. **Quality Control Program Manager Responsibilities**:

1. Manage and supervise quality control plan and quality control surveillance personnel.
2. Verify that testing procedures comply with contract requirements.
3. Verify that facilities and testing equipment are available and comply with testing standards.
4. Check test instrument calibration data against certified standards.
5. Verify that recording forms, including all the documentation requirements, have been prepared.
6. Prepare copies of each test result with all necessary data recorded and with documentation and computations compiled.
7. Provide more testing, if, in ENGINEER's opinion, work is not being adequately controlled.
8. Immediately report any non-compliance of materials and mixes to ENGINEER and CONTRACTOR.
9. When an out-of-tolerance condition exists, perform additional control testing until tolerance is attained.
10. Correlate CONTRACTOR's assurance testing program (APWA Section 01 43 00) with ENGINEER's acceptance testing program (APWA Section 01 45 00).

END OF SECTION

[This page was intentionally left blank.]

SECTION 01 45 33

STRUCTURAL TESTS AND INSPECTIONS

PART 1 - GENERAL

1.01 GENERAL:

A. The Structural Engineer of Record (SER) is the Structural Engineer (an individual) who is in responsible charge of the preparation of the structural drawings and structural specifications for this project and whose professional engineering seal appears on said structural drawings.

B. The Program of Structural Tests and Inspections which has been or will be submitted to the building official who has jurisdiction over this project is included in the Contract Drawings.

C. The Structural Tests and Inspections shall not relieve the Contractor or its subcontractors of their responsibilities and obligations for quality control of the Work, their other obligations for supervising the work, for any design work, which is included in their scope of services, and for full compliance with the requirements of the Contract Documents. The detection of, or failure to detect, deficiencies or defects in the Work during the testing and inspection conducted pursuant to the Structural Tests and Inspections shall not relieve the Contractor or its subcontractors of their responsibility to correct all deficiencies or defects, whether detected or undetected, in all parts of the Work, and to otherwise comply with all requirements of the Contract Documents. Further, while the SER, and the Resident Project Representative shall perform certain tasks in the Program requiring the review of certain construction activities, the SER and Resident Project Respresentative shall only perform such tasks to ensure compliance with the SER approved submittals and the specifications. Neither the SER nor the Resident Project Representative shall assume any responsibility or liability for the means, methods, procedures or techniques used by any construction contractor.

D. The program of structural tests and inspection does not apply to the Contractor's equipment, temporary structures used by the Contractor to construct the project, the Contractor's means, methods, and procedures, and job site safety.

1.02 CONTRACTOR'S RESPONSIBILITIES:

A. Where the Program of Structural Tests and Inspections indicates that a structural component or system is subject to structural tests and inspections and that the SER for the project has not been retained to design said component or system or to prepare a performance specification for said component of system, the Contractor shall retain, or require others under Contractor's aegis to retain, a professional engineer registered in the jurisdiction where the project is located to design said component or system and to

provide the required program of structural tests and inspections for said component or system.

B. The Contractor shall provide free and safe access to the Work for the SER and all other individuals who are observing the Work or performing structural tests or inspections. The Contractor shall provide all ladders, scaffolding, staging, and up-to-date safety equipment, all in good and safe working order, and qualified personnel to handle and erect them, as may be required for safe access.

C. The Contractor shall be responsible for all scheduling and coordination of Owner and Contractor's Testing Laboratory Services to comply with testing frequencies and tests required as indicated in the Contract Documents.

D. Building permit applications are submitted by the Engineer through the City's Citizen Access Portal. Inspections required for the project by the building department must additionally be requested through the online Citizen Access Portal by the Contractor. Engineer shall not be responsible for scheduling building department inspections. Engineer and Owner shall not be responsible for any additional costs or delays to the project caused from Contractor delay in getting or requesting building department inspections.

1. Any costs associated with rework or removal to allow access/inspection by building department shall be at Contractor expense.

1.03 CONTRACTOR FURNISHED TESTING LABORATORY SERVICES:

A. An independent commercial testing laboratory acceptable to the Engineer shall perform all tests that require the services of a laboratory to determine compliance with the Contract Documents. The laboratory shall be staffed with experienced technicians, properly equipped, and fully qualified to perform the tests in accordance with the specified standards.

B. Preliminary Testing Services: The Contractor shall be responsible for all testing laboratory services in connection with concrete materials and mix designs, the design of asphalt mixtures, gradation tests for structural and embankment fills, backfill materials, and all other tests and engineering data required for the Engineer's review of materials and equipment proposed to be used in the Work. The Contractor shall obtain the Engineer's acceptance of the testing laboratory before having services performed, and shall pay all costs for services.

C. The Contractor shall not retain any testing laboratory against which the Owner or the Engineer have reasonable objection, and if at any time during the construction process the services become unacceptable to the Owner, or the Engineer, either the Owner or the Engineer may direct in writing that such services be terminated. The request must be supported with evidence of improper testing or unreasonable delay. If the Engineer determines that sufficient cause exists, the Contractor shall terminate the services and engage a different testing laboratory.

D. Transmittal of Test Reports: Written reports of testing and engineering data furnished by the Contractor for the Engineer's review of materials and equipment proposed to be used in the Work shall be submitted as specified for Shop Drawings.

E. The Contractor's testing laboratory shall furnish electronic copies of a written report of each test performed by laboratory personnel within three days after each test is completed.

1.04 OWNER FURNISHED TESTING AND INSPECTION SERVICES:

A. The Owner or the Owner through a subcontract with the Engineer will employ the services of an independent testing agency to conduct the Program of Structural Tests and Inspections as described in the Contract Drawings and perform all quality control tests of materials of construction in the field or in the laboratory during and after their incorporation in the Work. Field sampling and testing shall be performed in the general manner indicated in the specifications, with minimum interference with construction operations.

B. The Contractor shall furnish a construction schedule and a minimum of 24 hour notice of readiness for testing and inspection of the work. The Engineer shall determine the exact time and location of field sampling and testing, and may require such additional sampling and testing as necessary to determine that materials and equipment conform with data previously furnished by Contractor and with the Contract Documents.

C. The Contractor shall schedule the work to permit adequate time for testing and re-testing should test results not conform to the contract documents. Lack of testing or inspection which is attributable to insufficient notice by the Contractor or failure of the Contractor to cooperate, will be cause for rejection of the work.

D. The Contractor shall deliver materials in sufficient quantities to the Owner's testing agency as may be required. Laboratory testing shall be performed within a reasonable time, consistent with the specified standards.

E. The Contractor shall furnish material samples and cooperate in the field sampling and testing activities, interrupting the work when necessary. The Contractor shall furnish personnel, facilities and access to assist in the sampling and testing activities.

F. Contractor shall be responsible for all costs associated with retests as indicated in the General Conditions Paragraph 13.3.B. In addition, Contractor shall be responsible for reimbursement of trip costs and personnel time associated with Owner's material testing services in which Contractor was not ready or prepared and testing laboratory arrives on-site to perform the test.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

ATTACHMENT 01 45 33-1
PROGRAM OF STRUCTURAL TESTS AND INSPECTIONS

Project: [_____]

Location: [_____]

Owner: [_____]

Owner's Address: [_____]

Architect of Record: [_____]

Structural Engineer of Record (SER): [_____]

This program of structural tests and inspections is submitted as a condition for issuance of the building permit in accordance with the International Building Code 2000.

The following firms, agencies, or individuals (hereinafter referred to collectively as agents) will perform the tests and inspections under the direction of the SER:

Abbreviation	Agent
SER	Structural Engineer Of Record Listed Above
RES	The Resident Representative
ITA	Independent Testing Agency Employed By Owner
ITA(C)	Independent Testing Agency Employed By Contractor
RPE(C)	Registered Professional Engineer Employed by Contractor
GEO	The Project Geotechnical Engineer
IWI	Independent Welding Inspector

The above abbreviations will be used on the attached pages to identify which agent is performing the particular tests or inspections.

The following categories of structural tests and inspections, if checked, are included in the program for structural tests and inspections for this project. The specific tests and inspections required for each checked category are listed on the page noted opposite the category and further described in the various technical specification sections.

	Category	Page		Category	Page
☐	**Steel Construction**	**7**	☒	**Controlled Structural Fill**	**13**
☒	**Cast-in-Place Concrete**	**8**	☐	**Pile Foundations**	**14**
☒	**Precast Concrete Construction**	**9**	☐	**Drilled Pier Foundations**	**15**
☒	**Masonry Construction**	**11**	☒	**Aluminum Construction**	**16**
☒	**In-Situ Bearing Strata for Foundations**	**12**	☒	**Special Cases**	**17**

The following items of construction, if checked, are specified in the structural plans or specifications on a performance basis. The structural design of these items will be performed by the RPEC and reviewed by the SER. The construction of these items is included in the program for tests and inspections on the attached sheets.

	Category		Category
☒	**Curtain Walls**	☒	**Metal Buildings**
☒	**Precast Concrete Components**	☐	**Metal Stairs**
☐	**Post-Tensioning Steel**	☐	**Metal Railings**
☐	**Structural Steel Connections**	☒	**Metal and Composite Gratings**
☐	**Structural Aluminum Connections**	☒	**Metal Plate Covers**

The following items are excluded from this program of structural tests and inspections, since other structural engineers not under the aegis of the SER designed them and the SER has no duties or responsibilities with respect to such performance specifications or designs. The Owner shall assign other architects, or construction contractors, as applicable; to be special SER's for their respective designs and such architects and/or contractors shall be responsible for all such structural tests and inspections for their respective designs.

- Seismic design of mechanical or electrical components, systems and their anchorage to the structure.
- Excavation support systems.
- Temporary bracing, temporary platforms, scaffolding, temporary guards and railings.
- Anything related to jobsite safety or construction means and methods.

Structural Engineer of Record:

STEEL CONSTRUCTION

Item	Agent	Scope	Frequency
1. Fabricator Certification/ Quality Control Procedures.	SER	Review to ensure that quality control procedures have been adopted for each Fabricator.	Start of project
2. Fabricator Inspection	SER	Review to ensure that an Independent Inspection Agency has approved each Fabricator.	Start of project
3. Material Certification	SER	Review for conformance to the specifications.	Each produce
4. Bolting	ITA	Test and inspect bolted connections in accordance with specifications. Verify bolt size and grade in accordance with AISC specifications A325/A490.	Periodic
5. Welding	IWI	Check welder qualifications. Verify filler material in accordance with AWS D1.1. Visually inspect fillet welds. Test complete and partial penetration groove welds full length by dye penetrant, ultrasonic, or radiographic testing in accordance with the contract documents.	Periodic
6. Shear Connectors	IWI	Inspect for size and placement. Test for proper weld attachment.	Periodic
7. Structural Framing, Details and Assemblies	RES	Review for conformance with specifications and shop drawings.	Continuous
8. Open Web Steel Joists	RES	Inspect for size, placement, bridging, bearing and connection to structure.	Continuous
9. Open Web Steel Joists	IWI	Visually inspect all welds of a minimum of 5 percent of the joists, randomly selected.	Periodic
10. Steel Decking	RES/ IWI	Verify gage, width, and type. Inspect placement, laps, welds, side lap attachment and screws or other mechanical fasteners (IWI). Check welder qualifications (RES).	Periodic

CAST-IN-PLACE CONCRETE CONSTRUCTION

Item	Agent	Scope	Frequency
1. Mix Design	ITA(C)	Design concrete mixes	Each mix
	SER	Review mix designs.	Each mix
2. Materials Certification	SER	Review for conformance to specifications.	Each product
3. Batching Plant	ITA/SER	Review to ensure that Plant quality control procedures have been adopted.	Start of project
4. Reinforcement Installation	RES	Inspect reinforcing for size, quantity, condition and placement.	Prior to each placement
5. Formwork Geometry	RES	Inspect form sizes for compliance with specifications.	Prior to each placement
6. Concrete Placement	RES	Review for conformance with specifications.	Each placement
	ITA	Perform slump, density and air content tests at point of discharge.	Each truck
7. Curing and Protection	ITA/RES	Observe procedures for conformance to the specifications.	Each placement
8. Evaluation of Concrete Strength	ITA	Test and evaluate in accordance with the specifications.	Every 50 cubic yards or part thereof
Note: The Contractor may elect to have the Contractor's independent testing agency (ITA(C)) perform additional tests in addition to the testing by the Owner's Independent Testing Agency (ITA) at no cost to the Owner.			

PRECAST CONCRETE CONSTRUCTION

Item	Agent	Scope	Frequency
1. Plant Certification/Quality Control Procedures	SER/ ITA	Review to ensure that Plant quality control procedures have been adopted (SER). Inspect plant storage and handling procedures (ITA). Confirm that approved submittals are being used for fabrication; review welder's certifications (SER). Monitor finished product for structural defects (cracks) (ITA).	Start of project
2. Material Certification	SER	Review for conformance to ACI 318.	Each product
3. Formwork Geometry	ITA	Inspect form sizes.	Selected placements
4. Reinforcement Installation	ITA	Inspect reinforcing and prestressing strands for size, quantity, condition and placement for conformance with Contract Documents, SER approved submittals, and ACI 318. Inspect welding.	Selected placements
5. Mix Design	ITA(C)	Design concrete mixes	Each mix
	SER	Review for conformance with specifications (SER).	Each mix
6. Concrete Placement	RES/ ITA	Inspect concrete placement procedures for conformance to ACI 318, Sections 5.9 and 5.10 (ITA), and for conformance with specifications (RES).	Selected placements
7. Curing and Protection	RES/ ITA	Inspect for maintenance of specified curing temperatures and techniques per ACI 318 (ITA), and for conformance with specifications (RES).	Each placement
8. Evaluation of Concrete Strength	ITA	Test for conformance to specifications in accordance with ACI 318.	Every 50 cubic yards or part thereof
9. Prestress Operation	ITA	Inspect application of prestressing forces per ACI 318. Inspect grouting of bonded, post-tensioned, prestressing tendons.	Selected placements

Item	Agent	Scope	Frequency
10. Assembled/Erected Precast Elements.	RES	Inspect for compliance with SER approved submittals and specifications. Review site storage and handling procedures for consistency with design of precast elements. Verify that SER approved erection drawings are on site and are being used for erection. Verify that SER approved erection procedures are being followed. Review welder's certifications.	Each unit
11. Connections/ Embedded Items	ITA	Inspect interface connections including end and edge doweling. Inspect embedment for proper location. Inspect shimming, bearing, bolting and welding of connections.	Each unit

MASONRY CONSTRUCTION

Item	Agent	Scope	Frequency
1. Material Certification	SER	Review for conformance to specifications.	Each product
2. Evaluation of Masonry Strength	ITA	Verify strength in accordance with the specifications.	Periodic
3. Proportioning, Mixing and Consistency of Mortar and Grout	ITA	Inspect field-mixing procedures for conformance to the specifications.	Continuous
4. Installation of Masonry	RES	Inspect placement for conformance to the specifications.	Continuous
5. Reinforcement Installation	RES/ IWI	Inspect reinforcing steel for conformance to SER approved submittals and specifications (RES) Inspect welding of reinforcement and review welder's certifications (IWI).	Periodic
6. Grouting Operations	RES	Review grouting procedures for conformance with the specifications.	Periodic
7. Weather Protection	RES	Review procedures for protection for cold and hot weather for conformance with the specifications.	Periodic
8. Anchorage	RES	Inspect anchorage of masonry to other construction for conformance with specifications.	Periodic

IN-SITU BEARING STRATA FOR FOUNDATIONS

Item	Agent	Scope	Frequency
1. Bearing strata for foundations	GEO/ RES	Review strata for conformance to the structural drawings, specifications, and/or geotechnical report.	Prior to foundation placement
2. Bearing surfaces of foundations	GEO/RES	Review for conformance to the requirements of the structural drawings, specifications, and/or geotechnical report.	Prior to foundation placement

CONTROLLED STRUCTURAL FILL (PREPARED FILL)

Item	Agent	Scope	Frequency
1. Fill Material	ITA	Test material for conformance to specifications or geotechnical report. Perform laboratory compaction tests in accordance with the specifications to determine optimum water content and maximum dry density.	Each material
2. Installation of Controlled Structural Fill	RES/ ITA	Provide review of the installation, in accordance with the specifications. Verify maximum lift placement thickness (ITA).	Each lift
3. Density of Fill	ITA	Perform field density tests of the in-place fill in accordance with the specifications.	Each lift
NOTE: Above testing is confirmatory testing by the Owner's Independent Testing Agency (ITA). These tests are <u>in addition</u> to the testing required by the Contractor's independent testing agency (ITA(C)).			

PILE FOUNDATIONS

Item	Agent	Scope	Frequency
1. Pile Material	SER/ RES	Review for conformance with the specifications, and that the identification is maintained from the point of manufacture to the point of delivery to the site.	Each pile shipment
2. Pile Material Tests	ITA	If Item 1 is unsatisfactory, test material for conformance to the Contract Documents.	As required
3. Precast Concrete Piles.	-	Perform structural tests and inspections as listed under Precast Concrete Construction.	See precast concrete requirements
4. Steel Piles	-	Perform structural test and inspections as listed under Steel Construction.	See steel construction requirements
5. Pile Installation	RES/ GEO	Provide review for conformance with specifications. Maintain accurate records for each pile. Record final location of each pile in plan.	Continuous
6. Cast-in-Place Concrete Piles	-	Perform structural tests and inspections as listed under Cast-in-Place Concrete Construction.	See cast-in-place concrete construction
Note: Additional confirmatory observations and/or testing by the Owner's independent testing agency (ITA) in addition to the observations and testing required by the Contractor's independent testing agency (ITA(C)) and the Contractor's registered professional engineer (RPE(C)) may be performed at the Owner's discretion.			

DRILLED PIER FOUNDATIONS

Item	Agent	Scope	Frequency
1. Load-bearing Steel Components	SER	Review documents identifying material and certifying grade of material for conformance to the specifications	Each component
2. Concrete and Reinforcing Steel Components	-	Perform structural tests and inspections as listed under Cast-in-Place Concrete Construction.	See concrete requirements
3. Pier installation	RES	Provide review of installation for conformance with specifications. Maintain accurate records for each pier, documenting observations.	Continuous

ALUMINUM CONSTRUCTION

Item	Agent	Scope	Frequency
1. Fabricator Certification/ Quality Control Procedures.	SER	Review to ensure that quality control procedures have been adopted for each Fabricator.	Start of project
2. Fabricator Inspection	SER	Review to ensure that an Independent Inspection Agency has approved each Fabricator.	Start of project
3. Material Certification	SER	Review for conformance to the specifications.	Each product
4. Bolting	ITA	Test and inspect bolted connections in accordance with specifications. Verify bolt size and grade in accordance with AISC specifications A325/A490.	Periodic
5. Welding	IWI	Check welder qualifications. Verify filler material in accordance with AWS D1.1. Visually inspect fillet welds. Test complete and partial penetration groove welds full length by dye penetrant, ultrasonic, or radiographic testing in accordance with the contract documents.	Periodic
6. Structural Framing, Details and Assemblies	RES	Review for conformance with specifications and shop drawings.	Periodic

SPECIAL CASES

Item	Agent	Scope	Frequency
1. Rock Anchors	RES	Witness testing in accordance with contract documents.	Each anchor
2. Pressure Relief Valves	RES	Verify that quantity, location and details conform to SER approved submittals and specifications.	Each valve
3. Tank Leakage Testing	RES	Witness testing in accordance with contract documents.	Each tank
4. Concrete Anchor Installation	RES	Verify diameters, depth and cleaning of holes conforms to manufacturer's instructions.	Each anchor

END OF SECTION

Page Intentionally Left Blank

SECTION 01 50 00

TEMPORARY FACILITIES

PART 1 - GENERAL

1.01 SCOPE OF WORK:

A. The Contractor shall provide all temporary facilities for the proper completion of the work as indicated and in compliance with Contract Documents.

1. Section Includes:

a. User Charges:

(1) Sewer.

(2) Water.

(3) Electric.

(4) Temporary heat.

b. Project identification.

c. Traffic regulation.

d. Temporary Facilities:

(1) Field offices and sheds.

e. Equipment.

f. Support facility installation.

g. Security and Protection:

h. Operation, termination, and removal.

B. American National Standards Institute (ANSI):

1. A 117.1: Accessible and Usable Buildings and Facilities.

C. American Society for Testing and Materials (ASTM):

1. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

2. E136: Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 deg. C.

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

2. 241: Standard of Safeguarding Construction, Alteration, and Demolition Operations

3. 701: Standard Methods of Fire Tests for Flame Propagation of Textiles and Films

1.02 USE CHARGES:

A. General: Costs for installation, removal and use of temporary facilities shall be included in the Contract Sum unless otherwise indicated. Allow other entities to use temporary services and facilities without cost, including, but not limited to, Owner's operation staff, Engineer, testing agencies, and authorities having jurisdiction.

B. Sewer Service: Pay sewer-service use charges for sewer usage by all entities for construction operations.

1. The Contractor shall provide adequate sanitary facilities for the use of those employed on the Work. Such facilities shall be made available when the first employees arrive on the site of the Work, shall be properly secluded from public observation, and shall be constructed and maintained during the progress of the Work in suitable numbers and at such points and in such manner as may be required by pertinent health and safety regulations.

2. The Contractor shall maintain the sanitary facilities in a satisfactory and sanitary condition at all times and shall enforce their use. He shall rigorously prohibit the committing of nuisances on the site of the Work, on the lands of the Owner, or on adjacent property.

a. The Contractor shall not use the Owner's sanitary facilities.

C. Potable Water Service: Obtain from Owner water meter for use of any potable water.

1. The Contractor shall furnish all necessary pipe or hose extensions to conduct the water to the points of use and shall exercise due care not to waste water. The Contractor shall be responsible for acquiring a temporary water meter that can be attached to the water source to monitor water use in accordance with local standards and regulations. The Contractor shall not contaminate the water supply and shall comply with all applicable regulations and code requirements.

2. The Owner reserves the right to limit, suspend, or terminate the supplying of water as set forth above should it consider such action to be necessary on account of damage to the distribution system, the necessity of conserving water, or other

emergency. In this event, the Contractor shall obtain water from some other approved source, at his own expense.

D. Electric Power Service: Pay electric-power-service use charges for electricity used by all entities for construction operations.

1. The Contractor shall make all necessary applications and arrangements and pay all fees and charges for electrical energy for power and light necessary for the proper completion of the Work and during its entire progress. The Contractor shall provide and pay for all temporary wiring, switches, connections, and meters.

2. The Contractor shall provide sufficient electric lighting so that all work may be done in a workmanlike manner when there is not sufficient daylight.

E. Temporary Heat:

1. If temporary heat is required for the protection of the Work, the Contractor shall provide and install suitable heating apparatus, shall provide adequate and proper fuel, and shall maintain heat as required. Costs for temporary heating, cooling, and ventilating required to execute the Work shall be borne by the Contractor.

2. Temporary heating apparatus shall be installed and operated in such manner that finished work will not be damaged thereby. After the permanent heating system has been installed, tested, and made ready for operation, the Contractor may, at his own risk and expense, use it for providing heat for protection of the Work. He shall provide and pay for all fuel and care necessary, and, when the Work is ready for acceptance, he shall, at his own expense, put the system into first-class condition, even to the extent of replacing worn or damaged parts.

3. If permanent natural gas piping is used for temporary heating units, the Contractor shall not modify or reroute gas piping without the prior approval of the natural gas supplier. The Contractor shall provide separate gas metering as required by the natural gas supplier.

1.03 PROJECT IDENTIFICATION:

A. Project Identification Sign:

1. Contractor shall provide one project signs in accordance with 01 58 00.

1.04 TRAFFIC REGULATION:

A. Comply with requirements of Public Way Permit, Traffic Control Permit, and 01 55 26 Traffic Control.

1.05 SUBMITTALS:

A. Site Plan: Show temporary facilities, utility hookups, staging areas, and parking areas for construction personnel.

B. Erosion- and Sedimentation-Control Plan: Show compliance with requirements of EPA Construction General Permit or authorities having jurisdiction, whichever is more stringent.

C. Fire-Safety Program: Show compliance with requirements of NFPA 241 and authorities having jurisdiction. Indicate Contractor personnel responsible for management of fire-prevention program.

1.06 QUALITY ASSURANCE:

A. Electric Service: Comply with NECA, NEMA, and UL standards and regulations for temporary electric service. Install service to comply with NFPA 70.

B. Tests and Inspections: Arrange for authorities having jurisdiction to test and inspect each temporary utility before use. Obtain required certifications and permits.

1.07 PROJECT CONDITIONS:

A. Temporary Use of Permanent Facilities: Engage Installer of each permanent service to assume responsibility for operation, maintenance, and protection of each permanent service during its use as a construction facility before Owner's acceptance, regardless of previously assigned responsibilities.

B. During adverse weather and against the possibility thereof, the Contractor shall take all necessary precautions so that the Work may be properly done and satisfactory in all respects. When required, protection shall be provided by use of tarpaulins, wood and building-paper shelters, or other suitable means.

C. During cold weather, materials shall be preheated, if required, and the materials and adjacent structure into which they are to be incorporated shall be made and kept sufficiently warm so that a proper bond will take place and a proper curing, aging, or drying will result. Protected spaces shall be artificially heated by suitable means which will result in a moist or a dry atmosphere according to the particular requirements of the work being protected. Ingredients for concrete and mortar shall be sufficiently heated so that the mixture will be warm throughout when used.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Chain-Link Fencing: Minimum 2-inch, 0.148-inch-thick, galvanized-steel, chain-link fabric fencing; minimum 8 feet high with galvanized-steel pipe posts; minimum 2-3/8-inch-OD line posts and 2-7/8-inch-OD corner and pull posts.

2.02 TEMPORARY FACILITIES:

A. Field Offices, General: Prefabricated or mobile units with serviceable finishes, temperature controls, and foundations adequate for normal loading.

B. The Contractor shall maintain a temporary field office near the work for his own use during the period of construction at which readily accessible copies of all contract documents shall be kept. The office shall be located where it will not interfere with the progress of the work. In charge of this office there shall be a competent superintendent of the Contractor.

C. Temporary Storage Yards: The Contractor shall construct temporary storage yards for storage of Products that are not subject to damage by weather conditions.

D. Temporary Storage Buildings:

1. The Contractor shall provide environmental control systems that meet the recommendations of Suppliers and manufacturers of the equipment and materials stored.

2. The Contractor shall arrange for a chain link partition fence to provide security of contents and ready access for inspection and inventory.

E. The Contractor shall store combustible materials (paints, solvents, fuels) in a well ventilated and remote building meeting all applicable safety standards.

PART 3 - EXECUTION

3.01 INSTALLATION, GENERAL:

A. Locate facilities where they will serve Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required by progress of the Work.

B. Provide each facility ready for use when needed to avoid delay. Do not remove until facilities are no longer needed or are replaced by authorized use of completed permanent facilities.

3.02 TEMPORARY UTILITY INSTALLATION:

A. General: Install temporary service or connect to existing service.

1. Arrange with utility company, Owner, and existing users for time when service can be interrupted, if necessary, to make connections for temporary services.

B. Sewers and Drainage: Provide temporary utilities to remove effluent lawfully.

1. Connect temporary sewers to municipal system as directed by authorities having jurisdiction.

C. Water Service: Connect to Owner's existing water service facilities. Clean and maintain water service facilities in a condition acceptable to Owner. At Substantial Completion, restore these facilities to condition existing before initial use.

D. Sanitary Facilities: Provide temporary toilets, wash facilities, and drinking water for use of construction personnel. Comply with requirements of authorities having jurisdiction for type, number, location, operation, and maintenance of fixtures and facilities.

E. Heating and Cooling: Provide temporary heating and cooling required by construction activities for curing or drying of completed installations or for protecting installed construction from adverse effects of low temperatures or high humidity. Select equipment that will not have a harmful effect on completed installations or elements being installed.

F. Ventilation and Humidity Control: Provide temporary ventilation required by construction activities for curing or drying of completed installations or for protecting installed construction from adverse effects of high humidity. Select equipment that will not have a harmful effect on completed installations or elements being installed. Coordinate ventilation requirements to produce ambient condition required and minimize energy consumption.

1. Provide dehumidification systems when required to reduce substrate moisture levels to level required to allow installation or application of finishes.

G. Electric Power Service: Provide electric power service and distribution system of sufficient size, capacity, and power characteristics required for construction operations.

H. Lighting: Provide temporary lighting with local switching that provides adequate illumination for construction operations, observations, inspections, and traffic conditions.

1. Install and operate temporary lighting that fulfills security and protection requirements without operating entire system.

3.03 SUPPORT FACILITIES INSTALLATION:

A. General: Comply with the following:

1. Provide construction for temporary offices, shops, and sheds located within construction area or within 30 feet (9 m) of building lines that is noncombustible according to ASTM E136. Comply with NFPA 241.

2. Maintain support facilities until Engineer schedules Substantial Completion inspection. Remove before Substantial Completion. Personnel remaining after Substantial Completion will be permitted to use permanent facilities, under conditions acceptable to Owner.

B. Temporary Roads and Paved Areas: Construct and maintain temporary roads and paved areas adequate for construction operations. Locate temporary roads and paved areas within construction limits indicated on Drawings.

1. Provide dust-control treatment that is nonpolluting and non-tracking. Reapply treatment as required to minimize dust.

2. Do not use chemical means of dust control without prior written approval from the Engineer. The use of petroleum products will not be allowed at any time.

C. Traffic Controls: Comply with requirements of authorities having jurisdiction.

1. Protect existing site improvements to remain including curbs, pavement, and utilities.

2. Maintain access for fire-fighting equipment and access to fire hydrants.

3. Unless described and approved under a Traffic Control Plan (TCP), conduct operations on the site so that the use of any plant roads by vehicles employed under this Contract will not restrict pedestrian and vehicular traffic thereon nor hinder the use of such facilities.

4. All roads within the plant are used simultaneously by vehicles and pedestrians. The speed limit of 10 mph applies throughout the plant, including the access roads and parking lots. Failure to comply with speed limit or to operate vehicles safely will result in possible removal of the staff from the plant.

D. Parking: Provide temporary areas for construction personnel. The Contractor shall not use public roads or undesignated areas for parking.

E. Dewatering Facilities and Drains: Comply with requirements of authorities having jurisdiction. Maintain Project site, excavations, and construction free of water.

1. Dispose of rainwater in a lawful manner that will not result in flooding Project or adjoining properties or endanger permanent Work or temporary facilities.

2. Remove snow and ice as required to minimize accumulations.

F. Waste Disposal Facilities: Comply with requirements specified in 01 81 13.01 Sustainable Design Requirements – Envision.

3.04 SECURITY AND PROTECTION FACILITIES INSTALLATION:

A. Protection of Existing Facilities: Protect existing vegetation, equipment, structures, utilities, and other improvements at Project site and on adjacent properties, except those indicated to be removed or altered. Repair damage to existing facilities.

B. Environmental Protection: Provide protection, operate temporary facilities, and conduct construction to comply with environmental regulations and that minimize possible air, waterway, and subsoil contamination or pollution or other undesirable effects.

1. Comply with work restrictions specified in Division 01 Section.

C. Temporary Erosion and Sedimentation Control: Provide measures to prevent soil erosion and discharge of soil-bearing water runoff and airborne dust to undisturbed areas and to adjacent properties and walkways, according to requirements of 2003 EPA Construction General Permit or authorities having jurisdiction, whichever is more stringent.

1. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross tree- or plant- protection zones.

2. Inspect, repair, and maintain erosion- and sedimentation-control measures during construction until permanent vegetation has been established.

3. Clean, repair, and restore adjoining properties and roads affected by erosion and sedimentation from Project site during the course of Project.

4. Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

D. Stormwater Control: Comply with requirements of authorities having jurisdiction. Provide barriers in and around excavations and subgrade construction to prevent flooding by runoff of stormwater from heavy rains.

E. Site Enclosure Fence: Before construction operations begin, furnish and install site enclosure fence in a manner that will prevent people and animals from easily entering site except by entrance gates. The Owner shall not assume liability for breaches of security on the Contractor's Work Area. It is the Contractor's responsibility to secure its construction materials, tools and equipment. The Owner is not responsible for providing security services, and is not responsible for any loss, theft or damage to any equipment/material within the Contractor's Work Area

1. Extent of Fence: As required to enclose entire Project site or portion determined sufficient to accommodate construction operations.

2. Comply with Owner requirements for access to existing Water Reclamation Facility.

F. Security Enclosure and Lockup: Install temporary enclosure around partially completed areas of construction. Provide lockable entrances to prevent unauthorized entrance, vandalism, theft, and similar violations of security. Lock entrances at end of each work day.

G. Barricades, Warning Signs, and Lights: Comply with requirements of authorities having jurisdiction for erecting structurally adequate barricades, including warning signs and lighting.

H. Temporary Egress: Maintain temporary egress from existing occupied facilities as indicated and as required by authorities having jurisdiction.

I. Temporary Enclosures: Provide temporary enclosures for protection of construction, in progress and completed, from exposure, foul weather, other construction operations, and similar activities. Provide temporary weathertight enclosure for building exterior.

1. Where heating or cooling is needed and permanent enclosure is incomplete, insulate temporary enclosures.

J. Temporary Fire Protection: Install and maintain temporary fire-protection facilities of types needed to protect against reasonably predictable and controllable fire losses. Comply with NFPA 241; manage fire-prevention program.

1. Prohibit smoking in construction areas.

2. Supervise welding operations, combustion-type temporary heating units, and similar sources of fire ignition according to requirements of authorities having jurisdiction.

3. Develop and supervise an overall fire-prevention and -protection program for personnel at Project site. Review needs with local fire department and establish procedures to be followed. Instruct personnel in methods and procedures. Post warnings and information.

4. Provide temporary standpipes and hoses for fire protection. Hang hoses with a warning sign stating that hoses are for fire-protection purposes only and are not to be removed. Match hose size with outlet size and equip with suitable nozzles.

3.05 MOISTURE AND MOLD CONTROL:

A. Contractor's Moisture-Protection Plan: Avoid trapping water in finished work. Document visible signs of mold that may appear during construction.

B. Exposed Construction Phase: Before installation of weather barriers, when materials are subject to wetting and exposure and to airborne mold spores, protect as follows:

1. Protect porous materials from water damage.

2. Protect stored and installed material from flowing or standing water.

3. Keep porous and organic materials from coming into prolonged contact with concrete.

4. Remove standing water from decks.

5. Keep deck openings covered or dammed.

C. Partially Enclosed Construction Phase: After installation of weather barriers but before full enclosure and conditioning of building, when installed materials are still subject to infiltration of moisture and ambient mold spores, protect as follows:

1. Do not load or install drywall or other porous materials or components, or items with high organic content, into partially enclosed building.

2. Keep interior spaces reasonably clean and protected from water damage.

3. Periodically collect and remove waste containing cellulose or other organic matter.

4. Discard or replace water-damaged material.

5. Do not install material that is wet.

6. Discard, replace, or clean stored or installed material that begins to grow mold.

7. Perform work in a sequence that allows any wet materials adequate time to dry before enclosing the material in drywall or other interior finishes.

D. Controlled Construction Phase of Construction: After completing and sealing of the building enclosure but prior to the full operation of permanent HVAC systems, maintain as follows:

1. Control moisture and humidity inside building by maintaining effective dry-in conditions.

2. Use permanent HVAC system to control humidity.

3. Comply with manufacturer's written instructions for temperature, relative humidity, and exposure to water limits.

a. Hygroscopic materials that may support mold growth, including wood and gypsum-based products, that become wet during the course of construction and remain wet for 48 hours are considered defective.

b. Measure moisture content of materials that have been exposed to moisture during construction operations or after installation. Record readings beginning at time of exposure and continuing daily for 48 hours. Identify materials containing moisture levels higher than allowed. Report findings in writing to Engineer.

c. Remove materials that cannot be completely restored to their manufactured moisture level within 48 hours.

3.06 CLEANING CONSTRUCTION OFFICES DURING CONSTRUCTION:

A. Contractor to maintain the grounds within his working limits and around any equipment or storage areas. This includes removal of waste material, cutting of grass, weed whacking around storage racks and material, snow plowing and snow shoveling.

B. The Contractor shall make arrangements with, and obtain permits from, any authorities having jurisdiction for disposal of waste and debris.

C. The Contractor shall wet down exterior surfaces prior to sweeping to prevent blowing of dust and debris. At least weekly, the Contractor shall sweep all floors (basins, tunnels, platforms, walkways, roof surfaces), and pick up all debris and dispose of off Site.

D. The Contractor shall provide approved containers for collection and disposal of waste materials, debris, and rubbish. At least at weekly intervals, the Contractor shall dispose of such waste materials, debris, and rubbish off Site.

E. At least weekly, the Contractor shall brush sweep entry drive and roadways, and all other streets and walkways affected by the Work and where adjacent to the Work.

3.07 OPERATION, TERMINATION, AND REMOVAL:

A. Supervision: Enforce strict discipline in use of temporary facilities. To minimize waste and abuse, limit availability of temporary facilities to essential and intended uses.

B. Maintenance: Maintain facilities in good operating condition until removal.

1. Maintain operation of temporary enclosures, heating, cooling, humidity control, ventilation, and similar facilities on a 24-hour basis where required to achieve indicated results and to avoid possibility of damage.

C. Temporary Facility Changeover: Do not change over from using temporary security and protection facilities to permanent facilities until Substantial Completion.

D. Termination and Removal: Remove each temporary facility when need for its service has ended, when it has been replaced by authorized use of a permanent facility, or no later than Substantial Completion. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.

1. Materials and facilities that constitute temporary facilities are property of Contractor. Owner reserves right to take possession of Project identification signs.

2. Remove temporary roads and paved areas not intended for or acceptable for integration into permanent construction. Where area is intended for landscape development, remove soil and aggregate fill that do not comply with requirements for fill or subsoil. Remove materials contaminated with road oil, asphalt and other petrochemical compounds, and other substances that might impair growth of plant materials or lawns. Repair or replace street paving, curbs, and sidewalks at temporary entrances, as required by authorities having jurisdiction.

3. At Substantial Completion, repair, renovate, and clean permanent facilities used during construction period. Comply with final cleaning requirements specified in Division 01 Section "Closeout Procedures."

END OF SECTION

SECTION 01 50 10

WEATHER PROTECTION STANDARD

PART 1 - GENERAL

1.01 DESCRIPTION:

A. It is the intent of these standards to require the general contractor to provide temporary enclosures and heat to permit construction work to be carried on year round. These standards are not to be construed as requiring enclosures or heat for operations that are economically infeasible to protect in the judgment of the awarding authority. Included in this category, without limitations, are such items as Site Work, Excavation, Pile Driving, Steel Erection, Erection of Certain Exterior Wall Panels, Roofing, and similar operations.

1.02 WEATHER PROTECTION:

A. "Weather Protection" shall mean the temporary protection of that work adversely affected by moisture, wind and cold by covering, enclosing and/or heating. This protection shall provide adequate working areas year round as determined by the awarding authority and consistent with the accepted construction schedule to permit the continuous progress of all work necessary to maintain an orderly and efficient sequence of construction operations. The General Contractor shall furnish and install all "weather protection" material and be responsible for all costs, including heating required to maintain a minimum temperature of 40 degrees F (4.4 degrees C) at the working surface. This provision does not supersede any specific requirements for methods of construction and/or curing of materials.

B. The General Contractor may, with the approval of the awarding authority, elect to utilize the permanent heating systems for temporary heat after the building is enclosed and after it has been tested and is ready to operate. However, it shall be his responsibility to have all portions of the permanent heating system that are used for heating during construction thoroughly cleaned and restored to first-class condition, to the satisfaction of the awarding authority.

C. Installation of weather protection and heating devices shall comply with all safety regulations including provisions for adequate ventilation and fire protection devices.

D. The General Contractor shall furnish and install dual scale Celsius and Fahrenheit thermometers at places designated by the awarding authority in order to determine if specified temperatures are maintained.

E. Within 30 calendar days after his award of contract, the General Contractor shall submit in writing to the awarding authority for approval, three copies of his proposed methods for "Weather Protection".

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

(Not Used)

END OF SECTION

SECTION 01 53 00

MAINTENANCE OF PLANT OPERATIONS DURING CONSTRUCTION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide maintenance of plant operations during construction as indicated and in compliance with Contract Documents.

B. The existing influent pump station will be maintained in continuous operation during the entire construction period as specified herein. The intent of this section is to outline the minimum additional and necessary requirements required of the Contractor to maintain continuous treatment of all wastewater treatment plant facilities and operations throughout the construction period.

1. Limitations on removal of channels, tanks, equipment, conduits, chemical systems, electrical systems and other systems are described.

2. Removal of any portion of existing facilities not described herein shall be planned to maintain service to the greatest extent possible as approved by Owner.

C. Work under this Contract shall be scheduled and conducted by the Contractor so as not to impede any treatment process, reduce the quality of plant effluent or cause odor or other nuisance. In performing the work indicated and specified, the Contractor shall plan and schedule his work to meet the plant operating requirements.

D. Owner will maintain operation of all existing facilities during the construction of the project. The Contractor shall develop his sequence of construction, outage requests and outage work-plans such that all services to on-line facilities are available to Owner to provide unimpeded operation and maintenance during construction. These services will include, but are not to be limited to the following:

1. Safe access to facilities for operations and maintenance staff, vehicles and equipment using plant roads, paths, walkways and other existing physical features.

2. Electrical power for equipment, controls, and lighting.

3. Water for housekeeping, pump seals and bearings.

4. Heating and ventilating and sanitary facilities.

5. Drainage.

6. Process and equipment controls and instrumentation.

7. Railings and toe plates around all open channels and tanks and slab openings.

E. The Contractor shall be responsible for coordinating the general construction and demolition, electrical, mechanical, HVAC, instrumentation, plumbing and other disciplines' construction schedules to ensure that temporary requirements are met for maintaining the operation of all existing pump station facilities that are required to be on line at any given time.

F. After the Contractor has developed and submitted its detailed Work Plan and outage request, the Contractor, the Engineer and Owner's operations and maintenance staff shall meet to review the proposed Work Plan and outage request. The meeting purpose shall be to solicit Plant staff recommendations, limitations and necessary changes to the proposed Work Plan.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

B. Temporary Bulkhead Design Drawings and Calculations, Signed and Sealed by a Professional Structural Engineer, registered in the State of Utah, for each proposed Bulkhead location.

1. To the greatest extent possible at each location indicate all field verified dimensions, depths, locations of existing adjacent piping, equipment, conduits, etc.

2. Include copies of all available existing construction drawings documenting the existing construction and geometry of the area where each bulkhead is to be installed.

3. Provide step-by-step installation sequence and schedule for each bulkhead location.

4. Provide step-by-step removal sequence and schedule for each bulkhead location.

5. Comply with all requirements stated in the Project Manual for Temporary Flow Isolation.

C. Outage Requests:

1. Submit outage request a minimum of 14 days prior to the requested outage start date.

2. Submit outage request only after work plan, bulkhead design, flow isolation design and strategy, etc. have been previously submitted and reviewed and commented on.

3. Include all proposed methods, equipment and plan for transferring or dewatering contents of the existing pipe(s), conduits, tanks, channels, etc.

D. Work Plans:

1. Where required for large, complicated or long-term outages and/or tie-ins, provide more detailed and comprehensive written work plan in addition to the outage request. Include information such as:

a. Detailed description of the work in step-by-step manner from start to finish.

b. Work Schedule and Work Times

c. Labor forces anticipated

d. Materials and equipment required

e. Special tools required

f. Safety Plan

g. Lighting and HVAC plan.

h. Work supervisor’s name and contact information

i. Full time (24 hr/day, 7 days/week) emergency contact

j. Daily and final clean-up

k. Traffic maintenance plans

2. Required Work Plan submittals are defined herein.

E. All outage requests and Work plans will be subject to Owner review and shall be modified as necessary to accommodate Owner requirements and concerns and Plant's operation, maintenance and delivery schedules.

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 GENERAL CONSTRAINTS:

A. The Contractor shall schedule all Work so that the existing influent pump station and all pump station systems are maintained in continuous operation. All treatment processes shall be maintained in continuous operation during the construction period except during approved interruptions.

B. All system shutdowns, complete or partial, temporary or extended, must be approved by Owner. Each request for shutdown shall be submitted a minimum of 14 calendar days prior to the planned start of the shutdown. When required by Owner, requests for shutdown shall include a written workplan with details of the Contractor's proposed work schedule, labor forces, materials, special tools and equipment, safety plan, etc. If in the judgment of Owner, a requested shutdown is not required for the Contractor to perform the Work, the Contractor shall utilize approved alternative methods to accomplish the Work.

C. All shutdowns shall be coordinated with and scheduled at times approved by Owner. The scheduling and duration of tie-ins and connections that require process interruptions or removal of equipment from service, or are dependent on process operations, performance requirements, flow of wastewater, or weather as related to flow rate, shall be coordinated with and approved by Owner based on field conditions and consideration of the above listed factors.

D. Wherever possible, process interruptions shall be scheduled during low flow periods. All night work premiums, overtime and other costs related to scheduling of process interruptions shall be borne by the Contractor. Shutdowns shall not begin until all required materials are verified to be on site and ready for installation. Each shutdown period shall commence at a time approved by Owner, and the Contractor shall proceed with the Work continuously, start to finish, until the Work is completed and normal plant operation is restored. If the Contractor completes all required Work before the specified shutdown period has ended, Owner may immediately place the existing system back into service.

E. The Contractor shall schedule short-term and extended shutdowns in advance and shall present all desired shutdowns in the construction schedules. Contractor shall allow a minimum 7-day "window" for each shutdown when assembling his initial construction schedule, Actual shutdowns and shutdown duration and times shall be fully coordinated with Owner. Owner personnel shall operate Owner's facilities involved in the short-term and extended shutdowns and diversions, unless otherwise noted. Denial of an outage or shutdown request for a specific date shall not entitle the Contractor to an extension in the contract time.

F. Short term shutdowns in plant systems will be allowed for tie-ins to existing facilities, installation of temporary bulkheads, shoring, and similar construction activities. All such shutdowns shall be scheduled for low-flow periods or low demand periods as applicable to the plant operation. The Contractor shall provide appropriate diversion facilities to be approved by Owner, and at no additional cost to Owner, when the plant services cannot be shut down for a sufficiently long time to accomplish the required work. The schedule and duration of short-term shutdowns shall be at the discretion of Owner.

G. Any temporary work, facilities, roads, walks, protection of existing structures, piping, blind flanges, valves, equipment, protection of existing open channels and basins and other items that may be required within the Contractor's work limits to maintain continuous and dependable plant operation shall be furnished, installed, and maintained by the Contractor at the direction of Owner at no extra cost to Owner.

H. Owner shall have Work stopped or prohibit Work that would, in his opinion, unreasonably result in interrupting the necessary functions of the plant operations.

I. If the Contractor impairs the performance or operation of the plant as a result of not complying with specified provisions for maintaining plant operations, then the Contractor shall immediately make all repairs or replacements and do all work necessary to restore the plant to operation to the satisfaction of Owner. Such work shall progress continuously to completion on a 24-hours per day, seven work days per week basis.

J. The Contractor shall provide the services of emergency repair crews on call 24-hours per day.

K. Protection of Existing Facilities and Structures:

1. The Contractor shall plan all work and develop all sequences of construction such that the structural and functional integrity of all existing facilities and structures surrounding the work areas are maintained and protected from damage which may impede or interrupt plant operations. This shall include, but is not limited to:

    a. Protection of existing structures and facilities from damages due to site excavation, site dewatering, drilling of foundation piers and excavation shoring, driving of foundation piling, etc.

    b. Protection of existing structures and facilities from damages due to impact by heavy construction or delivery equipment, tools, lifted or conveyed loads, etc.

    c. Protection of existing structures and facilities from damages due to impact from hoisting mishaps or accidents, crane failure, crane collapse, etc.

    d. Protection of the interior surfaces and/or liquid contents of existing structures and facilities, tankage, channels, etc. from damages or contamination which are detrimental to their intended wastewater treatment

process or function due to: hoisting mishaps or accidents; spillages or leakage from construction equipment or fuel tanks; construction debris; etc.

2. As used herein, "damage" shall include:

   a. Any new cracking, leakage, settlement, tilting position or alignment shifting, obvious areas of impact damage, etc. to the surfaces of each existing structure observed throughout the construction period.

   b. Any sudden or unexplained changes in normal operating water levels or volume capacities of tanks, channels, etc. surrounding the construction area due to observed cracking, leakages, settlement, etc. of portions of the existing structure, or perceived to be due to similar cracking, leakages, settlements, etc. affecting portions of the existing structure not visible or exposed.

   c. The potential for damage to existing structures due to failures (or the observed instability or potential for future failure) of the Contractor's excavations, shorings, site dewatering systems, etc. which, if uncorrected could lead to, or contribute to, physical damage to the plant's existing structures and facilities.

3. All such damages shall immediately be investigated by the Contractor and the Engineer upon their observation, and a written report prepared by the Contractor and submitted to Owner within 30 calendar days following their observation. Reports shall be prepared and sealed by a Registered Structural Engineer licensed in the State of Utah. Reports shall include:

   a. Full assessment of the locations, nature and extent of the damage.

   b. Temporary corrective action and repairs to be made, and the Contractor's schedule therefor.

   c. Permanent corrective action and repairs to be made, and the Contractor's schedule therefor.

   d. The effect of such temporary and permanent repairs on the Contractor's overall construction schedule and his ability to meet all construction milestones. Include recovery schedules as necessary to demonstrate that such corrective repairs shall be planned and made using means and methods which will not cause delay to the overall construction schedule or the Contractor's failure to achieve the construction milestones as specified.

   e. All damages to existing facilities and structures surrounding the work areas shall be promptly repaired, to the satisfaction of Owner, at the Contractor's expense.

f. Repairs of damages to existing facilities and structures shall not be cause or source of claims filed by the Contractor (or his subcontractors or vendors) against Owner for time delay or additional compensation.

1.08 TEMPORARY FLOW ISOLATION:

A. If installation of temporary bulkheads and/or portable cofferdams is required for completion of the Work. Any temporary device, structure, stoplog, gate or bulkhead required to isolate channels, tanks, conduits, pipelines, or other existing work for construction shall be designed, fabricated, installed, maintained and removed by the Contractor. These items shall be placed at a location selected by the Contractor and approved by Owner. Owner owned stop logs shall not be used by the Contractor for temporary flow isolation.

B. Where temporary devices, structures, stoplogs, gates or bulkheads are placed into active channels, the maximum open area possible shall be provided to maintain flow with minimum disruption of plant hydraulics and without flooding of tanks, conduits, or other plant facilities. The sizing, design and water-tightness of all such temporary devices, structures, stoplogs, gates or bulkheads shall be provided by the Contractor and shall be:

1. Design drawings and calculations shall be submitted three (3) weeks prior to scheduled fabrication of cofferdams and/or bulkheads. Submittal shall include description of proposed installation methods, special labor requirements such as underwater divers, localized removal of settled solids and anticipated sequences of bulkhead installation and bulkhead removal.

2. The design submittal shall have been reviewed and be acceptable to Owner prior to the Contractor's submittal of the outage request and Work Plan for which the bulkhead is to be used.

3. Contractor shall be responsible for field measurements, fabrication, installation, maintenance and removal of the temporary bulkheads and/or portable cofferdams.

4. Temporary flow isolation Work may also require localized removal of varying depths of settled solids to clear the channel or basin area in the immediate area where the Work is required.

C. Existing stop log grooves may be used by the Contractor for temporary flow isolation at the Contractor's risk. Owner does not warrant or guarantee that the grooves are acceptable for temporary flow isolation.

1.09 GENERAL OPERATING REQUIREMENTS, CONSTRAINTS, AND CONSTRUCTION REQUIREMENTS:

A. Plant Traffic: Must be maintained in accordance with the General Requirements and Special Provisions to all plant buildings and facilities. Maintain a minimum of one-way traffic access to Contractor's work areas for emergency response access.

B. Personnel Access: Treatment plant personnel shall have safe access to all areas that remain in operation throughout the construction period. The Contractor shall locate stored material, dispose of construction debris and trash, provide temporary walkways and fall protection, provide temporary lighting, and other such work as to maintain personnel access to areas in operation. Access and adequate parking areas for plant personnel must be maintained throughout construction. Temporary chain link fencing or equivalent barrier shall be maintained around the periphery of all excavations, trenches and other hazardous areas to preclude inadvertent access by treatment plant personnel.

C. Electrical and Control Demolition Work:

1. All switching to de-energize existing cables and equipment will be performed by Owner personnel.

2. Prior to any electrical demolition work, the Contractor shall perform final testing and shall demonstrate to Owner that all associated electrical and control conductors, cables, fiber optic / communication cables, have been disconnected and made harmless; and that all temporary and / or permanent replacement services have been provided.

3. Any ductbanks, manholes or other structures / piping encountered which are not indicated on the Contract Drawings shall be left intact until such time as a determination is made by the Owner as to the necessary disposition of the item.

4. Electrical and control service to equipment which is to remain in service shall be relocated and fed by new power sources and new or existing control interfaces and the equipment energized and demonstrated prior to demolition of the original electric and control service connections and feeders.

5. Where the relocated power sources or control interfaces are not indicated in the Contract Documents, the Contractor shall submit power/control connection location(s) for Owner review and approval.

D. Power, Light and Communications Systems:

1. Electric power, lighting service and communications systems shall be maintained in uninterrupted operation in all areas.

2. Individual units may be disconnected as required for replacement, but service shall be available at all times including periods when certain plant utilities are out of service.

3. The Contractor shall coordinate shutdowns required in order to minimize the total number of shutdowns necessary to complete construction. Owner's phone service to the plant shall be maintained in continuous operation during construction.

E. Temporary Power:

1. Temporary Power shall be provided as required.

2. Contractor has the option of using a standby generator to provide temporary power, subject to approval by Owner and unless otherwise specified in the contract documents. Any temporary generator shall be insulated to keep noise to a minimum.

F. Protection of Existing and New Facilities:

1. The Contractor shall be required to provide bulkheads and cover sufficient to protect all equipment and electrical components from damage due to weather elements, including but not limited to rain, snow, wind, hail, sleet, and other weather events.

G. Draining Process Pipes, Tanks, Channels and Conduits:

1. The contents of all pipes, tanks, channels, structures and conduits to be removed, demolished, replaced or relocated (or dewatered for a specific purpose) shall be transferred to a suitable facility in a manner approved by Owner through hoses, vacuum hoses, or piping, or by using pumps if hydraulic conditions so require them.

2. The Contractor shall provide the pumps, piping and hoses at no additional cost to Owner.

3. No uncontrolled spillage of a pipe, tank, or conduit shall be permitted. Any spillage, other than potable water, shall be immediately contained, cleaned up and properly disposed of in a manner acceptable to Owner and the surrounding plant areas and structures cleaned of residual spilled materials.

H. Settled Solids Removal:

1. Following the dewatering of existing operating channels, basins, tanks, etc., varying depths of settled solids and grit may be encountered. Such settled solids and grit shall be removed by the Contractor and disposed of on-site as hereinafter described in order to provide clear, clean and safe working areas for the Contractor's Work, In the preparation of bids for this Project, the following shall be used as "baseline" settled solids depths and volumes expected to be encountered and which shall be removed and disposed of by the Contractor:

a. Existing Semielliptical Pipeline: Up to a 1-foot average depth over the entire pipeline's floor area. (Note: Settled solids removal within an existing structure shall be carefully conducted in such a manner to not impact, disturb or damage any existing equipment or piping within the structure's interior area).

b. Volumes of settled solids encountered in excess of the volume anticipated by the above baseline average depths shall be reported immediately to the construction manager. Such excess volume shall be measured by the Contractor and construction manager and, after receiving authorization for its removal and disposal by Owner, shall be paid for as a negotiated change order to this Contract

c. Solids and grit removed shall be transported by the Contractor to the Plant's Septage Receiving Station (SRS) where it shall be discharged. Quantities and scheduling of such discharge shall be coordinated with Plant Management and Operations.

d. Solids and grit removal activities shall be conducted in such a manner so as to not leave large accumulations of removed solids, water, etc. on the roadways, walkways and operating surfaces surrounding the tankage. All such surface areas shall be thoroughly flushed and cleaned of all sludge and grit residue at the end of each working day.

I. Potable Water System:

1. Potable water service shall be maintained in continuous service at all times during construction except for short term interruptions required for tie-ins.

2. Shutdown of the potable water system shall be fully planned and coordinated at least fourteen (14) days in advance with Owner and shall be limited to not more than two (2) hours.

3. Existing fire hydrants within the plant site shall be maintained operational at all times, unless otherwise approved by Owner.

J. Reuse Water System (W3):

1. The existing W3 services shall be maintained in continuous operation during construction except for short term tie-ins of new or temporary facilities to existing facilities.

2. The Contractor may require temporary support or relocation or demolition of existingW3 facilities to complete the work as shown. The Contractor shall provide all temporary supports, relocation of existing piping, or demolition of existing W3 piping including replacement with temporary or permanent W3 piping as required at no additional cost to Owner.

3. Shutdowns of the W3 system shall be fully planned and coordinated at least 14 days in advance with Owner.

K. Networked Systems:

1. When a networked system is to be modified, the Contractor shall not be allowed to modify the system until notification has been given to Owner.

2. Upon completion of modifications to a networked system, the Contractor must demonstrate that the networked system works for all components, including those previously connected to the network and those most recently added.

3. Once components have been connected to a networked system, interruptions to data flow shall not be permitted.

PART 2 - PRODUCT

(Not Used)

PART 3 - EXECUTION

3.01 PREPARATION:

A. Submit, and receive Owner's approval of, outage request, electrical switching/de-energizing request (if applicable), (and detailed workplan where applicable) prior to final scheduling of the Work.

B. Prior to commencement of any outage, Contractor and Owner shall jointly verify that all necessary equipment, tools, materials, etc. are on-site and ready for utilization throughout the outage and/or the Work Plan's execution.

C. Prior to commencement of any outage, provide photograph documentation of condition of existing facilities, structures, buildings, equipment, etc. within and immediately surrounding the work area.

3.02 SPECIFIC CONSTRAINTS:

A. The following specific constraints are based on concept designs of anticipated connections with the existing plant and provide minimum requirements that must be implemented to maintain plant operations. The Contractor shall prepare a specific plan during final design to define the requirements to the satisfaction of Owner for each interface and connection with the existing plant facilities, systems and utilities.

B. Connection to new junction structures (Beck Street, Orange Street, 1800 N) constructed by others.

1. Required Work: Bypass pumping as necessary to dewatering new sewer junction structures to connect to extension from MH#3.

C. Relocation of existing overhead power lines:

1. Required Work: Coordinate with Rocky Mountain Power to relocate overhead power lines. Coordinate and sequence earthwork required to not undermine relocated power poles as shown on drawing 0100-E111 and 0100-E112.

a. Disruption time:

(1) Coordinate with Rocky Mountain Power on acceptable outages for service.

3.03 EXECUTION:

A. Owner will release facilities for construction in accordance with the Contractor's Outage Requests and Work Plans which have been previously reviewed by Owner.

B. Execute Work diligently and in compliance with the Contract Documents and as detailed in Contractor's Work Plan(s) for the specific work area or outage request and within the outage time limitations.

C. For long-term work provide regular written updates to work plan's schedule to advise plant and construction manager of all anticipated activities, truck traffic and field inspection requirements.

D. Contractor shall plan, schedule and perform all work so as to minimize interference operations of the facility and the work of other Contractors.

E. Attend and participate in Contract Coordination Meetings.

3.04 PROCESS INTERFACING:

A. Distribution of Responsibility:

1. Owner’s Responsibility:

a. Owner will operate all fixed and existing pumps, gates, sluice gates, valves, circuit breakers, switches, and instrumentation.

b. Owner will make operational changes in the existing plant as described in the Contractor' s Sequence of Construction.

2. Contractor's Responsibility:

a. The Contractor shall be responsible for all other activities.

b. Fines for violation of the discharge permit due to the specified or scheduled shutdown times being exceeded shall be the responsibility of the Contractor.

END OF SECTION

Page Intentionally Left Blank

SECTION 01 55 26
TRAFFIC CONTROL

This specification changes a portion of APWA Standard Specification Section 01 55 26. All other provisions of the Section remain in full force and effect.

Change paragraph 1.2 D. to read as follows.

1.2 **REFERENCES**

D. Manual on Uniform Traffic Control Devices for Streets and Highways published by the American Traffic Safety Services Association (ATSSA), 15 Riverside Parkway, Suite 100, Fredericksburg, Virginia, 22406-1717, U.S. Department of Transportation Federal Highway Administration, 2009 Edition of MUTCD.

END OF SECTION

[This page was intentionally left blank.]

SECTION 01 57 00
TEMPORARY CONTROLS

This specification changes a portion of APWA Standard Specification Section 01 57 00. All other provisions of the Section remain in full force and effect.

Change the following paragraph in **Article 3.2 DUST AND MUD CONTROL** to:

C. At a minimum, dust and mud control efforts shall include a daily sweeping of the work area streets. One sweeping shall take place at the end of the workday at a minimum, if needed additional sweeping shall take place midway through the workday. Additional efforts may be required as determined by the ENGINEER, OWNER, SWPPP inspector, or other representative.

Add the following paragraph in **Article 3.2 DUST AND MUD CONTROL**:

D. Contractor shall prepare, submit and implement a Fugitive Dust Control Plan with the Utah Department of Environmental Quality, Division of Air Quality.

Change the following paragraph to **Article 3.3 SURFACE WATER CONTROL** to:

A. Control all on-site surface water. Provide proper drainage so flooding of the site or changed flow conditions including path, quantity or quality onto an adjacent property does not occur.

Add the following paragraph to **Article 3.3 SURFACE WATER CONTROL**:

F. CONTRACTOR shall prepare a Storm Water Pollution Prevention Plan (SWPPP) specifically for this project in compliance with Salt Lake City and State of Utah requirements for Stormwater Discharges Associated with Construction and Land Disturbance Activities. CONTRACTOR shall comply with all Clean Water Act, City Ordinance and SWPPP requirements for the project.

G. Some minimum erosion control and storm water protection components have been identified. These do not constitute all necessary components of a comprehensive SWPPP.

1. For projects less than one acre the CONTRACTOR shall provide all labor, equipment, materials, and services necessary to complete the work.
    a) Site Map: Showing boundaries and BMPs that will be implemented.
    b) Concrete washout: Describe in detail how concrete washout will be contained.
    c) Concrete/Road cutting (must be contained): Describe in detail how concrete & road cutting dust and pollutants will be contained.
    d) Housekeeping BMPs: Describe in detail general housekeeping e.g. restroom (port-a-potty), dumpster(s), roll off container or cans, etc.
    e) Erosion/sediment controls: Describe in detail the boundary controls to be used e.g. inlet protection, silt fence, fiber rolls, wattle, cut back, etc.
    f) Offsite tracking prevention: Describe in detail how you will mitigate tracking dirt/mud outside of construction boundaries in compliance with the City's Clean Wheel Ordinance.
    g) De-watering: Describe in detail BMPs that will be used to de-silt the discharge before entering a waterway/storm drain e.g. de-watering bag, filter sock, check down dam, frac tank, etc.
2. The CONTRACTOR shall identify type and placement of BMPs.
3. The CONTRACTOR shall be responsible for implementation and maintenance of all BMPs.

4. The CONTRACTOR shall perform weekly inspections of the site for the duration of the project. Note: Inspection shall include housekeeping, placement and condition of all BMPs.
5. The CONTRATOR shall be responsible stabilizing and removing all temporary BMPs at the conclusion of the job.
6. If work is being performed outside the boundaries of Salt Lake City the CONTRACTOR shall contact the MS4 operator and comply to any additional stormwater pollution prevention requirements for that jurisdiction.

H. If CONTRACTOR is assessed fines for not meeting permit requirements, those costs will not be passed onto the OWNER.

Change the following paragraph to **Article 3.4 GROUND WATER CONTROL** to:

C. Remove all dewatering facilities meeting inspector requirements when no longer required.

Add the following **Article 3.7 Sanitation to Part 3 – Execution**

3.7 Sanitation

A. Toilet Facilities: Provide portable chemical toilets at each active work site or staging area for the use of employees. Toilets at construction job sites shall conform to the requirements of Part 1926 of the OSHA Standards for Construction.
    1. Furnish at least one portable toilet at each active work site.

END OF SECTION

SECTION 01 57 13

EROSION CONTROL, SEDIMENTATION AND CONTAINMENT OF CONSTRUCTION MATERIALS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide all work and take all measures necessary to control soil erosion resulting from construction operations, prevent flow of sediment from construction site, and contain construction materials (including excavation and backfill) within protected working area as to prevent damage to any stream or wetlands as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. United Stated Environmental Protection Agency (USEPA):

1. Guidelines for Erosion and Sediment Control, Planning and Implementation.

2. Processes, Procedures and Methods to Control Pollution Resulting from all Construction Activity.

B. Stormwater Pollution and Preventation Plan

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Two weeks prior to the start of the work, submit to Engineer, for review, a plan with detailed sketches showing the proposed methods to be used for controlling erosion during construction.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Use acceptable procedures, including use of water diversion structures, diversion ditches, settling basins, and sediment traps.

C. Operations restricted to areas of work indicated on drawings and area which must be entered for construction of temporary or permanent facilities.

D. If construction materials are washed away during construction, remove materials from fouled areas.

E. Stabilize diversion outlets by means acceptable to Engineer.

F. Engineer has authority to limit surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and fill operations and to direct immediate permanent or temporary pollution control measures to prevent contamination of any stream or wetlands, including construction of temporary berms, dikes, dams, sediment basins, sediment traps, slope drains, and use of temporary mulches, mats, or other control devices or methods to control erosion.

PART 2 - PRODUCTS

2.01 BALES:

A. Hay or straw or other suitable material acceptable to Engineer.

2.02 WOOD STAKES:

A. 2 inches by 2 inches by 3 feet.

PART 3 - EXECUTION

3.01 GENERAL:

A. Do not discharge chemicals, fuels, lubricants, bitumen, raw sewage and other harmful waste into or alongside any body of water or into natural or man-made channels.

B. Design erosion and sediment controls to handle peak runoff resulting from storm events.

C. The Contractor shall be responsible for inspecting and maintaining these control measures to ensure their proper function and adequate sediment storage at all times. The Contractor shall remove sediment once it reaches 50 percent of the capacity of the structure. Sediment collected shall be disposed of offsite at the Contractor's cost.

3.02 INSTALLATION:

A. Install baled hay or straw erosion checks in all locations as directed, surrounding base of all deposits of stored excavated material outside of disturbed area, and where directed by the Engineer.

B. Install checks immediately after site is cleared and before trench excavation. Locate checks, surrounding stored material, approximately 6 feet from material.

C. Hold bales in place with two 2 inches by 2 inches by 3 feet stakes so that each bale is butted tightly against adjoining bale thereby precluding shortcircuiting of erosion check.

D. Construct earth berms or diversions to intercept and divert runoff water from critical areas.

E. Discharge silt-laden water from excavations onto filter fabric mat and/or baled hay or straw sediment traps to ensure that only sediment-free water is returned to watercourses.

F. Do not place excavated soil material adjacent to water-course in manner that will cause it to wash away by high water or runoff.

G. Prevent damage to vegetation by excessive watering or silt accumulation in the discharge area.

H. Do not dump spoiled material into any streams, wetlands, surface waters, or unspecified locations.

I. Prevent indiscriminate, arbitrary, or capricious operation of equipment in streams, wetlands or surface waters.

J. Do not pump silt-laden water from trenches or excavations into surface waters, streams, wetlands, or natural or man-made channels leading thereto.

K. Prevent damage to vegetation adjacent to or outside of construction area limits.

L. Do not dispose of trees, brush, debris, paints, chemicals, asphalt products, concrete curing compounds, fuels, lubricants, insecticides, washwater from concrete trucks or hydroseeders, or any other pollutant in streams, wet-lands, surface waters, or natural or man-made channels leading thereto, or unspecified locations.

M. Do not alter flow line of any stream unless indicated or specified.

END OF SECTION

Page Intentionally Left Blank

SECTION 01 58 00
PROJECT IDENTIFICATION AND SIGNS

PART 1 GENERAL

1.1 SECTION INCLUDED

A. Temporary on-site identification and informational signs to identify key elements of construction facilities and traffic routing.

1.2 SUBMITTALS

A. Sketch of informational signs.

1.3 QUALITY ASSURANCE

A. Sign Painter: Professional experienced in type of work required.
B. Finishes, Painting: Adequate to resist weathering and fading for scheduled construction period.

PART 2 PRODUCTS

2.1 SIGN MATERIALS

A. Structure and Framing: May be new or used, wood or metal, in sound condition, structurally adequate to work and suitable for specified finish.
B. Sign Surfaces: Exterior grade plywood
   1. Type 4'x4': 4-feet high by 4-feet wide
   2. Thickness: As required by standards to span framing members, resist wind loading, and to provide an eve, smooth surface without waves or buckles.
C. Rough Hardware: Galvanized steel or equal.
D. Paint: Exterior quality
   1. Background: White
   2. Lettering: Black
   3. Accents: Green

PART 3 EXECUTION

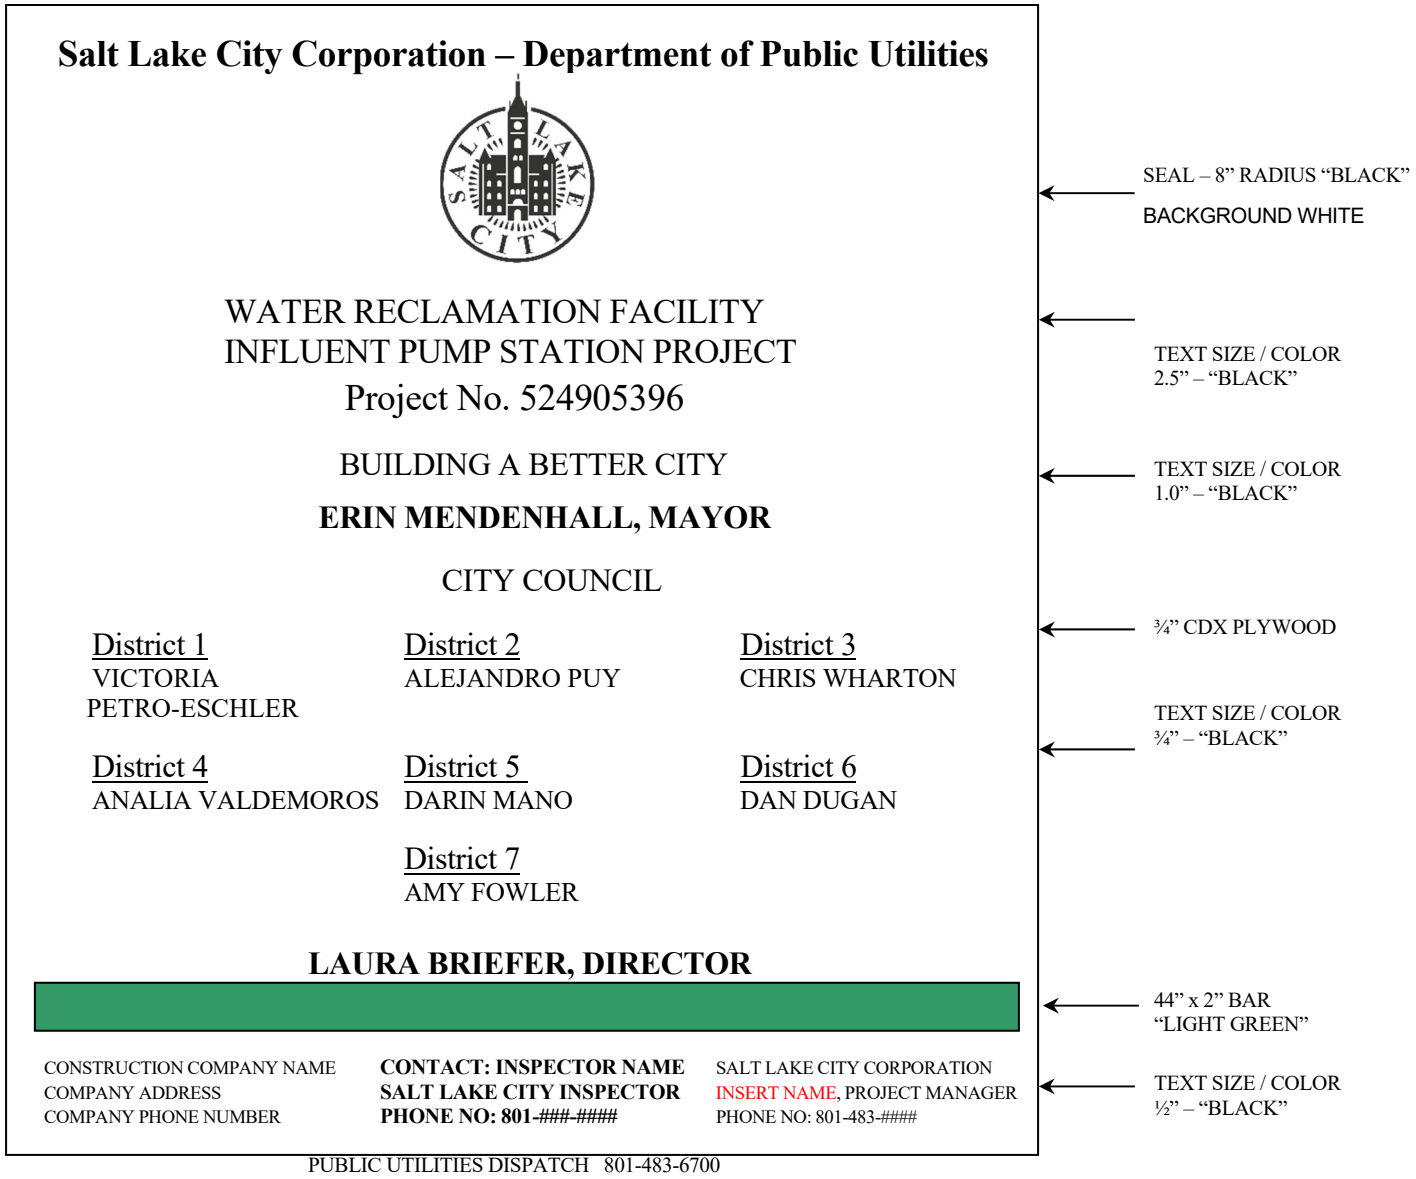
3.1 PROJECT INDENTIFICATON SIGNS

A. Content to include:
   1. Title of Project
   2. City logo and motto
   3. Name of Mayor
   4. Names of City Council members and the district they represent
   5. Names of professional consultants and their titles
   6. Name of ENGINEER and title
   7. Name of CONTRACTOR
B. Graphic design, style of lettering, colors: See Drawing
C. Paint exposed surfaces of supports, framing, and surface material; one coat of primer and one coat of exterior paint.
D. Erect on the site at a lighted location of high public visibility, adjacent to the main

entrance to the site, as approved by ENGINEER.

3.2 INFORMATIONAL SIGNS

A. Size of signs and lettering: As required by regulatory agencies, or as appropriate to usage.
B. Colors: As required by regulatory agencies, otherwise of uniform colors throughout project.
C. Paint exposed surfaces: One coat of primer, and one coat of exterior paint.
D. Paint graphics in styles, sizes, and colors selected.
E. Install at a height for optimum visibility, on ground-mounted poles, or attached to temporary structural surfaces.



3.3 MAINTENANCE

A. Maintain signs and supports in a neat, clean condition; repair damages to structure, framing, or sign.
B. Relocate information signs, as required by progress of the Work.
C. Remove graffiti from signs immediately.

3.4 REMOVAL

A. Remove signs, framing, supports, and foundations at completion of Project.
B. Repair landscaping, and surface improvements damaged by removal.

PROJECT IDENTIFICATION SIGN
USE WITHIN SALT LAKE CITY LIMITS

4' x 4' PROJECT SIGN ATTACHED TO WOODEN OR METAL POSTS

NOTE: SEE APWA SPECIFICATION 01 58 00 FOR DETAILED INFORMATION REGARDING PROJECT SIGNS.

END OF SECTION

SECTION 01 61 00

CONTROL OF MATERIALS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section includes administrative and procedural requirements for selection of products for use in Project; product delivery, storage, and handling; manufacturers' standard warranties on products; special warranties; and comparable products.

1. Section Includes:

a. Definitions.

b. Submittals.

c. Spare parts.

d. Quality assurance.

e. Delivery, storage and handling.

f. Warranty.

g. Products.

h. Substitution and “Or Equal” items.

i. Reuse of existing material.

j. Manufacturer’s instructions.

k. Special tools.

l. Lubrication.

m. Nameplates.

n. Loads and seismic forces.

o. General material and equipment requirements.

p. Materials and Equipment.

q. Field Quality Control; Installation, Instructional, and Post Startup Services.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)

B. American Society for Testing and Materials International (ASTM):

1. A123: Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

2. A325: Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

1.03 DEFINITIONS:

A. Products: Items obtained for incorporating into the Work, whether purchased for Project or taken from previously purchased stock. The term "product" includes the terms "material," "equipment," "system," and terms of similar intent.

1. Named Products: Items identified by manufacturer's product name, including make or model number or other designation shown or listed in manufacturer's published product literature, that is current as of date of the Contract Documents.

2. New Products: Items that have not previously been incorporated into another project or facility. Products salvaged or recycled from other projects are not considered new products.

1.04 SPARE PARTS:

A. Provide spare parts for Products as specified in the individual technical specification sections. Comply with the requirements specified in Section 01 61 00.

B. Pack spare parts to protect them during storage. Tag spare parts and containers to clearly identify them in accordance with Contractor’s parts numbering system as reviewed by the Engineer. All parts shall be cross-referenced to their applicable the Specification Section.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Arrange deliveries of materials and equipment in accordance with construction Progress Schedule, coordinate to avoid conflict with Work and conditions at site.

B. Comply with the requirements of APWA Section 01 66 00.

C. Provide equipment and personnel to handle materials and equipment by methods recommended by manufacturer to prevent soiling or damage to materials or equipment, or their packaging.

D. Deliver, store, and handle products using means and methods that will prevent damage, deterioration, and loss, including theft and vandalism. Comply with manufacturer's written instructions.

E. Owner assumes no responsibility for damage or loss due to storage of materials and equipment.

F. Interior Storage:

1. Store with seals and labels intact and legible.

2. Store materials and equipment subject to damage by elements in weathertight enclosures.

3. Maintain temperature and humidity within ranges required by manufacturer’s instructions.

G. Exterior Storage:

1. Store fabricated materials and equipment above ground, on blocking or skids, to prevent soiling or staining. Cover materials and equipment subject to deterioration with impervious sheet coverings. Provide ventilation to avoid condensation.

2. Store loose granular materials in well-drained area on solid surfaces to prevent mixing with foreign matter.

3. Store materials such as pipe, reinforcing steel, structural steel, and equipment on pallets or racks, off ground.

H. Inspection and Maintenance:

1. Arrange storage to provide easy access for inspection, maintenance, and inventory.

2. Make periodic inspections of stored materials and equipment to ensure materials and equipment maintained under specified conditions are free from damage or deterioration, and coverings are in-place and in condition to provide required protection.

3. Perform maintenance on stored material and equipment in accordance with manufacturer’s written instructions and in presence of Owner or Engineer.

a. Notify Engineer 24 hrs before performance of maintenance.

b. Submit report of completed maintenance and condition of coverings to Engineer with each Application for Payment.

c. Failure to perform maintenance, to notify Engineer of intent to perform maintenance or to submit maintenance report may result in rejection of material or equipment.

I. Assume responsibility for protection of completed construction and repair and restore damage to completed Work equal to original condition.

J. Wheeling of loads over finished floors, with or without plank protection, is not permitted in anything except rubber-tired wheelbarrows, buggies, trucks or dollies. This applies to finished floors and exposed concrete floors, as well as those covered with composition tile or other applied surfacing.

K. Where structural concrete is also finished surface, avoid marking or damaging surface.

1.07 WARRANTY:

A. Warranties specified in other Sections shall be in addition to, and run concurrent with, other warranties required by the Contract Documents. Manufacturer's disclaimers and limitations on product warranties do not relieve Contractor of obligations under requirements of the Contract Documents.

1. Manufacturer's Warranty: Written warranty furnished by individual manufacturer for a particular product and specifically endorsed by manufacturer to Owner.

2. Special Warranty: Written warranty required by the Contract Documents to provide specific rights for Owner.

B. Special Warranties: Prepare a written document that contains appropriate terms and identification, ready for execution.

1. Manufacturer's Standard Form: Modified to include Project-specific information and properly executed.

2. Specified Form: When specified forms are included with the Specifications, prepare a written document using indicated form properly executed.

3. See other Sections for specific content requirements and particular requirements for submitting special warranties.

1.08 PRODUCTS:

A. Furnish products of qualified manufacturers suitable for intended use. Furnish products of each type by single manufacturer unless specified otherwise.

1.09 SUBSTITUTION AND “OR EQUAL” ITEMS:

A. Follow the procedures in Section 01 25 00.

1.10 ACCEPTANCE OF MATERIALS:

A. Unless otherwise specified, only new materials and equipment shall be incorporated in the work. All materials and equipment furnished by the Contractor shall be subject to the inspection and acceptance of the Engineer. No material shall be delivered to the work without prior acceptance of Engineer.

B. As specified in Section 01 33 00, the Contractor shall submit to the Engineer, data relating to materials and equipment he proposes to furnish for the work. Such data shall be in sufficient detail to enable the Engineer to identify the particular product and to form an opinion as to its conformity to the specifications.

C. Facilities and labor for handling and inspection of all materials and equipment shall be furnished by the Contractor. If the Engineer requires, either prior to beginning or during the progress of the work, the Contractor shall submit additional samples or materials for such special tests as may be necessary to demonstrate that they conform to the specifications. Such samples shall be furnished, stored, packed, and shipped at the Contractor's expense. Except as otherwise noted, the Owner will make arrangements for and pay for the tests.

D. Any delay of acceptance resulting from the Contractor's failure to submit samples or data promptly shall not be used as a basis of a claim against the Owner or the Engineer.

E. In order to demonstrate the proficiency of workmen or to facilitate the choice among several textures, types, finishes, and surfaces, the Contractor shall provide such samples of workmanship or finish as may be required.

F. The materials and equipment used on the work shall correspond to the accepted samples or other data.

1.11 MANUFACTURER’S INSTRUCTIONS:

A. Installation of equipment and materials shall comply with manufacturer’s instructions. Obtain and distribute printed copies of such instructions to parties involved in installation, including 2 copies to Engineer.

1. Maintain one set of complete instructions at Site during installation and until completion of Work.

B. Handle, store, install, connect, clean, condition, and adjust materials and equipment in accordance with manufacturer's written instructions and in conformance with Specifications.

1. If Site conditions or specified requirements conflict with manufacturer's instructions, consult Engineer for further instructions. Do not proceed with Work without written instructions.

1.12 SPECIAL TOOLS:

A. For each type of equipment furnished, the Contractor shall provide a complete set of all special tools (including grease guns or other lubricating devices) which may be necessary for the adjustment, operation, maintenance, and disassembly of such equipment. Tools shall be high-grade, smooth, forged, alloy, tool steel. Grease guns shall be lever type.

B. Special tools are considered to be those tools which because of their limited use are not normally available, but which are necessary for the particular equipment.

C. Pack items to protect them during storage. Tag items and containers to clearly identify them in accordance with Contractor's part system, as reviewed by the Engineer. Cross-reference all items to their applicable Specification Section.

D. Special tools shall be delivered at the same time as the equipment to which they pertain. The Contractor shall properly store and safeguard such special tools until completion of the work, at which time they shall be delivered to the Owner.

E. The Contractor shall furnish and erect one or more steel wall cases with flat key locks and clips or hooks to hold each tool in arrangement.

1.13 LUBRICATION:

A. Where lubrication is required for proper operation of equipment, incorporate necessary and proper provisions in equipment in accordance with manufacturer's requirements. Where possible, lubrication shall be automated and positive.

B. Where oil is used, reservoir shall be of sufficient capacity to supply unit for 24 hr period.

C. Provide adequate and, as far as practicable, automatic means of lubrication for working parts. Arrange lubrication grease nipples, grease boxes and other lubrication devices so that they are readily accessible for routing greasing using grease nipples and Type 316 stainless steel or copper tubing extensions where required. Secure nipples and tubing to the equipment at appropriate locations. Indicate on the working drawings submitted, the types of lubricants to be used (must be readily available in State of Utah). Use grease nipples of a consistent type, Alemite button head type or equivalent. Provide grease gun(s) of the appropriate size(s) and pressure(s).

D. Provide a one (1) year supply of all lubricants necessary for the routine, daily operation of the equipment. All lubricants to be readily available in State of Utah. Provide a complete schedule of all the lubricant including the manufacturer name, type, name and local address and phone number of where each lubricant can be purchased for each piece of equipment.

1.14 NAMEPLATES:

A. With the exceptions mentioned below, each piece of equipment shall be provided with a nameplate of non-corrodible metal, securely fastened in place and clearly and permanently inscribed with the manufacturer's name, model or type designation, serial number, principal rated capacities, electrical or other power characteristics, and similar information.

B. This requirement shall not apply to standard, manually operated hydrants or to gate, globe check and plug valves.

C. Each process valve shall be provided with a substantial tag of non-corrodible metal securely fastened in place and inscribed with an identification number in conformance with the Valve Identification Schedule indicated on the drawings or furnished later by the Engineer.

PART 2 - PRODUCTS

2.01 MATERIALS AND EQUIPMENT:

A. Material and Equipment Incorporated into Work:

1. Conform to applicable specifications and standards.

2. Comply with size, make, type, and quality specified or as accepted by Submittal.

B. Manufactured and Fabricated Materials and Equipment:

1. Design, fabricate, and assemble in accordance with engineering and shop practices standard with industry.

2. Manufacture like parts of duplicate units to standard sizes and gauges, to be interchangeable.

3. Two or more items of same kind shall be identical, by same manufacturer.

4. Material and equipment shall be suitable for service conditions.

5. Equipment capabilities, sizes, and dimensions shown or specified shall be adhered to, unless variations are specifically accepted, in writing.

6. Equipment shall be adapted to best economy in power consumption and maintenance. Parts and components shall be proportioned for stresses occurring during continuous or intermittent operation, and for additional stresses occurring during fabrication or installation.

7. Design so working parts are readily accessible for inspection and repair, easily duplicated, and replaced.

8. Design structural members of equipment for anticipated shock and vibratory loads.

9. Design machinery such that working parts are readily accessible for inspection and repair, and that each part is suitable for the service required.

C. Do not use material or equipment for purpose other than for which it is designed or specified.

PART 3 - EXECUTION

A. General:

1. Provide on-site services of Supplier's representatives for equipment provided by Contractor during construction, installation, equipment startup, and training of Owner's personnel for equipment or plant operation as specifically required in Specification section for equipment or system.

2. Include and pay costs for Supplier's services.

3. Work day is defined as 8 hr period during Owner's or Contractor's typical calendar day. Work day for purposes of this section does not include travel to or from Site.

4. Specifications include minimum mandays to provide basis for bidding. If additional time is required to perform services Contractor shall include that time in Contract Price.

B. Installation Services:

1. Where installation services are called for in Specifications, provide competent and experienced technical representatives of manufacturers of material or equipment and systems to resolve assembly or installation procedures attributable to, or associated with, equipment furnished.

2. After equipment is installed, representatives shall perform initial equipment and system adjustment and calibration to conform to Specifications and manufacturer's requirements and instructions.

3. Provide “Certificate of Installation Services” stating proper adjustments have been made to equipment or system and equipment or system is ready for startup and system demonstration. Use Form 01 61 00-1 and furnish 2 copies to Engineer.

C. Training:

1. Comply with Section 01 78 24.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

SECTION 01 71 13
MOBILIZATION AND DEMOBILIZATION

This specification changes a portion of APWA Standard Specification Section 01 71 13. All other provisions of the Section remain in full force and effect.

Add the following paragraph:

1.5 **SUBMITTALS**

A. Project Video Recording: Video record the project area prior to commencing construction in accordance with Section 01 32 33 Construction Video. The ENGINEER's representative shall be present during recording. The recording shall be performed on foot, noting all salient existing features in the project area and the location of the recording shall be clearly indicated. "Drive-by" video recording will not be accepted. The video recording shall be submitted to the ENGINEER a minimum of 5 days prior to starting construction.

END OF SECTION

[This page was intentionally left blank]

SECTION 01 73 29

CUTTING, CORING AND PATCHING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section Includes:

1. Alterations to existing buildings or structures.

2. Cutting, coring, and patching.

B. All cutting, coring, and rough patching shall be performed by the Contractor. Finish patching shall be the responsibility of the Contractor and shall be performed by the trade associated with the application of the particular finish.

C. Work Includes:

1. Alterations:

a. Cutting, moving or removal of items as shown on Drawings.

b. Cutting, moving or removal of items not shown to be cut, moved or removed, but which must be cut, moved or removed to allow new Work to proceed. Patch or reinstall Work or items which are to remain in finished Work after cutting, moving or removal, and make joints and finishes match adjacent or similar Work.

c. Removal of existing surface finishes as needed to install new Work and finishes.

d. Removal of abandoned items and removal of items serving no useful purpose, such as piping and electrical conduit.

e. Repair or removal of dangerous or unsanitary conditions.

f. Removal of unsuitable or extraneous materials not marked for salvage, such as abandoned furnishings, debris, grease buildup, rotted wood, rusted trench covers, and deteriorated concrete and masonry.

2. Cutting and Patching:

a. Uncovering Work for installation of ill-timed Work.

b. Removal and replacement of defective Work and Work not conforming to Contract Documents.

c. Uncovering Work to provide observation by Engineer or inspection or tests by others of covered Work.

d. Removal of samples of installed materials for testing.

e. To make several parts fit properly.

3. Temporary enclosures and services.

1.02 REFERENCES:

A. American Society for Testing and Materials International (ASTM):

1. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

1.03 ALTERATIONS, CUTTING, AND PROTECTION:

A. Survey and record condition of existing facilities to remain in-place that may be affected by alteration operations. After alteration work is complete, survey conditions again and restore existing facilities to pre-alteration condition.

B. Perform Work of moving, removal, cutting, and patching with trades qualified to perform Work in manner causing least damage to each type of Work.

1. Cut finish surfaces such as masonry, tile, plaster or metals, by methods to terminate surfaces in straight line at natural point of division.

C. Protect existing finishes, equipment, and adjacent Work which is to remain, from damage.

1. Protect existing and new Work from weather and extremes of temperature.

a. Maintain existing interior work area above 60 degrees F (15 degrees C).

b. Provide weather protection, waterproofing, heat, and humidity control as needed to prevent damage to remaining existing and new Work.

D. Provide shoring, needling, and bracing to keep building(s) or structures structurally secure and free of damaging deflection for installation of new structural members.

E. Do not pile material to endanger building or structure.

1.04 HOLES IN EXISTING CONCRETE:

A. When the Contractor is required to make new holes in existing concrete for piping, conduit, cables, or equipment, the Contractor shall accurately and carefully mark out the locations and the extent of cutting required and coordinate with the trade(s) involved. The Contractor shall make new holes using one of the methods described below:

1. Prior to drilling any openings, the Contractor shall determine the location, if any, of existing services concealed in and/or behind the construction to be drilled. X-ray the walls or slabs, if required to determine the location.

2. The Contractor shall chip with an electric hammer with chisel point. Adjust the location of holes as necessary to avoid electrical conduits if encountered. Cut reinforcing steel after permission is received.

1.05 SECURITY:

A. When keys to locked areas are needed to provide access to areas to perform Work, obtain from Owner. Return keys at end of each day's Work.

1.06 PROTECTION AND CONTINUITY OF UTILITIES AND OPERATIONS:

A. Protect existing utilities so they will continue to function during and after construction.

B. Where interference with such facilities occurs, cooperate with Owner of facility and, if necessary, alter facility to eliminate interference.

C. Service Continuity:

1. Provide and maintain continuous electrical, plumbing, and HVAC services to functioning portions of process, building, facilities, or areas during hours normally in use.

2. Temporary outages are permitted during cutover Work at such times and places as can be pre-arranged with Owner. Keep such outages to minimum number and length of time. Make no outages without prior acceptance.

3. Include costs for temporary equipment, materials, and Work required in Contract Price.

4. Remove temporary equipment and materials when no longer required or at completion of Work.

D. Plant Operation:

1. Maintain continuity of pump station operation to functioning portions of existing pump station.

2. Temporary shutoff is permitted during cutover Work at such times and places as can be pre-arranged with Engineer and Owner. Keep such shutoffs to minimum number and length of time and, once Work has started on temporary shutoff, continue until Work is complete. Make no shutoffs without prior acceptance. Shutoff of existing sewer lines is not permitted and will require bypass pumping.

3. Include costs for temporary piping and Work required in Contract Price.

4. Remove temporary piping when no longer required or at completion of Work.

1.07 TEMPORARY ELECTRICAL AND MECHANICAL SERVICES:

A. Comply with Section 01 50 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Concrete repair shall adhere to Section 03 01 30.

2.02 SALVAGED MATERIALS:

A. Salvage sufficient quantities of cut or removed material to replace damaged Work of existing construction or patch new Work when material not readily obtainable on current market.

2.03 PRODUCTS FOR PATCHING, EXTENDING, AND MATCHING:

A. Provide same products, salvaged materials, types of construction or finish as that in existing structure, as needed to patch, extend or match existing Work.

1. Generally, Contract Documents will not define products or standards of workmanship present in existing construction, determine products by inspection and necessary testing and workmanship by use of existing as sample of comparison.

PART 3 - EXECUTION

3.01 GENERAL:

A. All cutting and coring shall be performed in such a manner as to limit the extent of patching.

B. All holes cut through concrete and masonry walls, slabs or arches shall be core drilled unless otherwise accepted. No structural members shall be cut without acceptance of the Structural Engineer of Record and all such cutting shall be done in a manner directed by him. No holes may be drilled in beams or other structural members. All work shall be performed by mechanics skilled in this type of work.

C. Rough patching shall be such as to bring the cut or cored area flush with existing construction unless otherwise shown. Finish patching shall match existing surfaces.

3.02 PREPARATION:

A. Where new work conceals existing surfaces or spaces Contractor shall remove foreign substances such as accumulated dirt, dust, grease, sludge, and odoriferous material before concealing existing surfaces.

B. Where surfaces are to remain exposed Contractor shall remove foreign substances described above.

3.03 TEMPORARY ENCLOSURES:

A. Exterior: Provide temporary weathertight enclosure for successive areas of building as Work progresses, to provide:

1. Acceptable working conditions.

2. Weather protection for materials.

3. Effective temporary heating.

4. Prevention of entry by unauthorized persons.

B. Relocate as required by progress of construction, by storage or Work requirements, and to accommodate requirements of Owner and other contractors employed at site.

C. Remove temporary materials, equipment, and services:

1. When construction needs can be met by use of permanent construction.

2. At completion of Project.

3.04 REMOVAL, RELOCATION AND SECURING MATERIALS AND EQUIPMENT:

A. Where existing materials and equipment are removed or relocated, remove materials no longer used such as studs, straps, conduits, ducts, wires, anchors, piping and supports. Remove or cut off concealed or embedded materials such as conduit, boxes, anchors, piping or other materials to not less than 3/4-inches below finished surface.

B. Materials that cannot be removed shall be secured to adjacent structure to prevent coming loose.

C. Repair affected surfaces to conform to type, quality, and finish of adjacent surfaces.

3.05 CUTTING:

A. Inspect existing conditions of Work, including components subject to damage or movement during cutting, patching, excavating or backfilling.

B. After uncovering Work, inspect conditions affecting installation of new materials.

C. Do not cut or notch structural members without specific written acceptance of Engineer.

D. Cutting shall be performed with a concrete saw and diamond saw blades of proper size.

E. Corners of square or rectangular openings shall be cored. Do not overcut corners of openings. Corners shall be chipped out square, if required, so as not to cause cracking at the corners.

F. Provide for control of slurry generated by sawing operation on both sides of element.

G. When cutting reinforced concrete, the cutting shall be done so as not damage bond between the concrete and reinforcing steel left in structure. Cut shall be made so that steel neither protrudes nor is recessed from face of the cut.

H. Adequate bracing and/or shoring of area to be cut shall be installed prior to start of cutting. Check area during sawing operations for cracking and provide additional bracing as required to prevent a partial release of cut area during sawing operations.

I. Provide equipment of adequate size to remove cut panel.

3.06 CORING:

A. Coring shall be performed with an accepted non-impact rotary tool with diamond core drills. Size of holes shall be suitable for pipe, conduit, sleeve, equipment or mechanical seals to be installed.

B. Provide protection for existing equipment, utilities and critical areas against water or other damage caused by drilling operation.

C. Slurry or tailings resulting from coring operations shall be removed from the area following drilling.

3.07 PATCHING:

A. Prepare surfaces to receive cementitious repair mortar in accordance with manufacturer’s instructions.

B. Mix the cementitious repair mortar material components in accordance with the manufacturer's instructions. Concrete surfaces should be surface saturated dry (SSD) with no standing water prior to mortar application.

C. Work a wet scrub coat of the mortar per the manufacturer's recommendations into the pores and voids in the substrate and over the substrate prior to mortar application by trowel.

D. Apply the cementitious repair mortar using a steel trowel to work the material into the surface. Fill voids from deepest to shallowest areas as the application work proceeds. Strictly follow the manufacturer's application requirements.

E. Once the repair areas are filled with repair mortar, strike off the mortar level with the surrounding concrete substrate. Do not leave a broom finish. Finish with a steel trowel until closed up at the surface and flat.

F. Cure the repair mortar in strict accordance with the manufacturer's instructions.

3.08 CLEANING:

A. Perform periodic and final cleaning as specified in Section 01 74 23, and:

1. Clean Owner-occupied areas daily.

2. Clean spillage, overspray, and heavy collection of dust in Owner-occupied areas immediately.

B. At completion of alterations work in each area, provide final cleaning and return space to condition suitable for use by Owner.

C. Remove debris from site each day. Removed material, except that listed or marked by Owner for retention, becomes property of Contractor.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 01 74 23

CLEANING UP

PART 1 - GENERAL

1.01 SUMMARY:

A. Execute cleaning during progress of Work and at completion of Work as indicated and in compliance with Contract Documents.

B. Refer to specification sections for specific cleaning for Products or Work.

1.02 DISPOSAL REQUIREMENTS:

A. Conduct cleaning and disposal operations to comply with local codes, ordinances, regulations, and anti-pollution laws. Do not burn or bury rubbish or waste materials on Project site. Do not dispose of volatile wastes, such as mineral spirits, oil, or paint thinner, in storm or sanitary drains. Do not dispose of wastes into streams or waterways.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Use only those cleaning materials which will not create hazards to property and persons or damage surfaces of material to be cleaned.

B. Use only cleaning materials recommended by manufacturer of surface to be cleaned.

PART 3 - EXECUTION

3.01 CLEANING DURING CONSTRUCTION:

A. At all times maintain areas covered by the contract and adjacent properties and public access roads free from accumulations of waste, debris, and rubbish caused by construction operations.

B. During execution of work, clean site, adjacent properties, and public access roads and dispose of waste materials, debris, and rubbish to assure that buildings, grounds, and public properties are maintained free from accumulations of waste materials and rubbish. Unneeded construction equipment shall be removed and all damage repaired so that the public and property owners will be inconvenienced as little as possible.

C. Wet down dry materials and rubbish to lay dust and prevent blowing dust.

D. Cover or wet excavated material leaving and arriving at the site to prevent blowing dust. Clean the public access roads to the site of any material falling from the haul trucks.

E. Where material or debris has washed or flowed into or been placed in existing watercourses, ditches, gutters, drains, pipes structures, work done under this contract, or elsewhere during the course of the Contractor's operations, such material or debris shall be entirely removed and satisfactorily disposed of during the progress of the work, and the ditches, channels, drains, pipes, structures, and work, etc., shall, upon completion of the work, be left in a clean and neat condition.

F. On or before the completion of the work, the Contractor shall, unless otherwise especially directed or permitted in writing, tear down and remove all temporary buildings and structures built by him; shall remove all temporary works, tools, and machinery or other construction equipment furnished by him; shall remove, acceptably disinfect, and cover all organic matter and material containing organic matter in, under, and around privies, houses, and other buildings used by him; shall remove all rubbish from any grounds which he has occupied; and shall leave the roads and all parts of the premises and adjacent property affected by his operations in a neat and satisfactory condition.

G. Provide on-site containers for collection and removal of waste materials, debris, and rubbish in accordance with applicable regulations.

3.02 FINAL CLEANING:

A. General: Perform final cleaning. Conduct cleaning and waste-removal operations to comply with local laws and ordinances and Federal and local environmental and antipollution regulations.

B. Cleaning: Employ experienced workers or professional cleaners for final cleaning. Clean each surface or unit to condition expected in an average commercial building cleaning and maintenance program. Comply with manufacturer's written instructions.

1. Complete the following cleaning operations before requesting inspection for certification of Substantial Completion for entire Project or for a designated portion of Project:

a. Clean Project site, yard, and grounds, in areas disturbed by construction activities, including landscape development areas, of rubbish, waste material, litter, and other foreign substances.

b. Sweep paved areas broom clean. Remove petrochemical spills, stains, and other foreign deposits.

c. Rake grounds that are neither planted nor paved to a smooth, even-textured surface.

d. Remove tools, construction equipment, machinery, and surplus material from Project site.

e. Remove snow and ice to provide safe access to building.

f. Clean exposed exterior and interior hard-surfaced finishes to a dirt-free condition, free of stains, films, and similar foreign substances. Avoid disturbing natural weathering of exterior surfaces. Restore reflective surfaces to their original condition.

g. Remove debris and surface dust from limited access spaces, including roofs, plenums, shafts, trenches, equipment vaults, manholes, attics, and similar spaces.

h. Sweep concrete floors broom clean in unoccupied spaces.

i. Vacuum clean concrete/tile floors in occupied spaces.

j. Clean transparent materials, including mirrors and glass in doors and windows. Remove glazing compounds and other noticeable, vision-obscuring materials. Polish mirrors and glass, taking care not to scratch surfaces.

k. Remove labels that are not permanent.

l. Wipe surfaces of mechanical and electrical equipment and similar equipment. Remove excess lubrication, paint and mortar droppings, and other foreign substances.

m. Vacuum inside and outside of all new and existing electrical panels, MCCs, variable speed drives, etc., which have been affected by dust or dirt due to construction activities.

n. Clean plumbing fixtures to a sanitary condition, free of stains, including stains resulting from water exposure.

o. Replace disposable air filters and clean permanent air filters. Vacuum clean exposed surfaces of diffusers, registers, and grills.

p. Clean light fixtures, lamps, globes, and reflectors to function with full efficiency.

q. Leave Project clean and ready for occupancy.

C. Construction Waste Disposal: Comply with waste disposal requirements in Section 01 81 13.01.

D. Electrical Contractor shall touch-up paint or repaint damaged finishes on electrical items delivered to Project with finish coat of paint. Engineer will make final determination of items to be repainted or touched-up.

E. Prior to substantial completion or Owner occupancy, Contractor with Engineer and Owner**,** shall conduct inspection of sight-exposed interior and exterior surfaces and work areas to verify Work and site is clean.

3.03 CLEANING OF WASTEWATER TANKS:

A. Wet wells, tanks, and basins shall be washed down and swept before wastewater is allowed to enter.

END OF SECTION

SECTION 01 77 00

CONTRACT CLOSEOUT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. Section includes administrative and procedural requirements for contract closeout, including, but not limited to, the following as indicated and in compliance with Contract Documents:

1. Substantial Completion procedures.

2. Final completion procedures.

3. Warranties.

4. Final cleaning.

5. Repair of the Work.

6. Specific closeout and special cleaning requirements for the Work in those Sections.

7. Approved Operation and Maintenance Manuals

8. Record Drawings

9. Spare Parts

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Contractor's List of Incomplete Items: Initial submittal at Substantial Completion.

C. Certified List of Incomplete Items: Final submittal at Final Completion.

D. Certificates of Release: From authorities having jurisdiction.

E. Certificate of Insurance: For continuing coverage.

F. Schedule of maintenance materials.

1.04 SUBSTANTIAL COMPLETION PROCEDURES:

A. Contractor's List of Incomplete Items: Prepare and submit a list of items to be completed and corrected (Contractor's punch list), indicating the value of each item on the list and reasons why the Work is incomplete.

B. Submittals Prior to Substantial Completion: Complete the following a minimum of 20 days prior to requesting inspection for determining date of Substantial Completion. List items below that are incomplete at time of request.

1. Certificates of Release: Obtain and submit releases from authorities having jurisdiction permitting Owner unrestricted use of the Work and access to services and utilities. Include occupancy permits, operating certificates, and similar releases.

2. Submit closeout submittals specified in other Division 01 Sections, including project record documents, operation and maintenance manuals, final completion construction photographic documentation, damage or settlement surveys, property surveys, and similar final record information.

3. Submit closeout submittals specified in individual Divisions 02 through 33 Sections, including specific warranties, workmanship bonds, maintenance service agreements, final certifications, and similar documents.

4. Submit maintenance material submittals specified in individual Divisions 02 through 48 Sections, including tools, spare parts, extra materials, and similar items, and deliver to location designated by Owner. Label with manufacturer's name and model number where applicable.

a. Schedule of Maintenance Material Items: Prepare and submit schedule of maintenance material submittal items, including name and quantity of each item and name and number of related Specification Section. Obtain Engineer’s signature for receipt of submittals.

5. Submit test/adjust/balance records.

6. Submit sustainable design submittals required in Specification 01 81 13.01.

7. Submit changeover information related to Owner's occupancy, use, operation, and maintenance.

C. Procedures Prior to Substantial Completion: Complete the following a minimum of 20 days prior to requesting inspection for determining date of Substantial Completion. List items below that are incomplete at time of request.

1. Advise Owner of pending insurance changeover requirements.

2. Make final changeover of permanent locks and deliver keys to Owner. Advise Owner’s personnel of changeover in security provisions.

3. Complete startup and testing of systems and equipment.

4. Perform preventive maintenance on equipment used prior to Substantial Completion.

5. Instruct Owner's personnel in operation, adjustment, and maintenance of products, equipment, and systems. Submit demonstration and training video recordings specified in Division 01 Section "Training."

6. Advise Owner of changeover in heat and other utilities.

7. Participate with Owner in conducting inspection and walkthrough with local emergency responders.

8. Terminate and remove temporary facilities from Project site, along with mockups, construction tools, and similar elements.

9. Remove labels that are not permanent labels.

10. Complete final cleaning requirements, including touchup painting.

11. Touch up and otherwise repair and restore marred exposed finishes to eliminate visual defects.

D. Inspection: Submit a written request for inspection to determine Substantial Completion a minimum of 20 days prior to date the work will be completed and ready for final inspection and tests. On receipt of request, Engineer will either proceed with inspection or notify Contractor of unfulfilled requirements. Engineer will prepare the Certificate of Substantial Completion after inspection or will notify Contractor of items, either on Contractor's list or additional items identified by Engineer, that must be completed or corrected before certificate will be issued.

1. Reinspection: Request reinspection when the Work identified in previous inspections as incomplete is completed or corrected.

2. Results of completed inspection will form the basis of requirements for final completion.

1.05 STARTING OF SYSTEMS:

A. Conform to the requirements of Section 01 78 23, Section 01 78 24 and Section 01 78 25.

B. Coordinate schedule for start-up of various equipment and systems.

C. Notify Engineer seven days prior to start-up of each item.

D. Verify each piece of equipment or system has been checked for proper lubrication, drive rotation, belt tension, control sequence, and for conditions which may cause damage.

E. Verify tests, meter readings, and specified electrical characteristics agree with those required by equipment or system manufacturer.

F. Verify wiring and support components for equipment are complete and tested.

G. Execute start-up under supervision of applicable manufacturer's representative in accordance with manufacturers' instructions.

H. When specified in individual specification Sections, require manufacturer to provide authorized representative to be present at site to inspect, check, approve equipment or system installation prior to start-up, to supervise placing equipment or system in operation, and to train the Owner's staff.

I. Submit a written report in accordance with Section 01 33 00 that equipment or system has been properly installed and is functioning correctly.

1.06 DEMONSTRATION AND INSTRUCTIONS:

A. Conform to the requirements of Sections 01 78 23, 01 78 24 and 01 78 25.

B. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Owner's personnel in detail to explain all aspects of operation and maintenance.

C. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at agreed time, at designated location.

D. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.

E. Required instruction time for each item of equipment and system is specified in individual sections.

1.07 PROJECT RECORDS DOCUMENTS:

A. The Contractor shall provide Record Documents in accordance with Section 01 78 39.

B. Certificates of Substantial Completion and Final Completion shall not be issued until record drawings are reviewed and verified to be complete, and the Contractor has satisfied all requirements for Substantial Completion and Final Completion of the package Work.

1.08 EQUIPMENT INVENTORY SPREADSHEET

A. As part of the Owner's asset management program, the Contractor shall complete all fields for the equipment inventory file for each piece of equipment and device provided under this Contract, as a requirement for Substantial Completion. An electronic format of the equipment inventory spreadsheet will be provided to the successful General Contractor.

1.09 PROTECTING INSTALLED CONSTRUCTION:

A. Protect installed Work and provide special protection where specified in individual specification sections.

B. Provide temporary and removable protection for installed products. Control activity in immediate work area to prevent damage.

C. Provide protective coverings at walls, projections, jambs, sills, and soffits of openings.

D. Protect finished floors, stairs, and other surfaces from traffic, dirt, wear, damage, or movement of heavy objects, by protecting with durable sheet materials.

E. Prohibit traffic or storage upon waterproofed or roofed surfaces. When traffic or activity is necessary, obtain recommendations for protection from waterproofing or roofing material manufacturer.

F. Prohibit traffic from landscaped areas.

1.10 SPARE PARTS AND MAINTENANCE PRODUCTS:

A. Furnish spare parts, maintenance, and extra products in quantities specified in individual specification sections.

B. Deliver to location as directed by Owner; obtain receipt prior to final payment.

C. Coat parts to protect from moisture.

D. Crate in containers designed for prolonged storage suitable for handling with hoisting equipment containers.

E. Stencil on containers:

1. Manufacturer/supplier name

2. Unit name

3. Spare part name

4. Manufacturer catalogue number

5. Other identifying information

6. Precautionary information

1.11 FINAL COMPLETION PROCEDURES:

A. Submittals Prior to Final Completion: Before requesting final inspection for determining final completion, complete the following:

1. Submit a final Application for Payment according to General Conditions.

2. Certified List of Incomplete Items: Submit certified copy of Engineer's Substantial Completion inspection list of items to be completed or corrected (punch list), endorsed and dated by Engineer. Certified copy of the list shall state that each item has been completed or otherwise resolved for acceptance.

3. Certificate of Insurance: Submit evidence of final, continuing insurance coverage complying with insurance requirements.

B. Inspection: Submit a written request for final inspection to determine acceptance a minimum of 10 days prior to date the work will be completed and ready for final inspection and tests. On receipt of request, Engineer will either proceed with inspection or notify Contractor of unfulfilled requirements. Engineer will prepare a final Certificate for Payment after inspection or will notify Contractor of construction that must be completed or corrected before certificate will be issued.

1. Reinspection: Request reinspection when the Work identified in previous inspections as incomplete is completed or corrected.

1.12 LIST OF INCOMPLETE ITEMS (PUNCH LIST):

A. Organization of List: Include name and identification of each space and area affected by construction operations for incomplete items and items needing correction including, if necessary, areas disturbed by Contractor that are outside the limits of construction.

1. Organize list of spaces in sequential order.

2. Organize items applying to each space by major element, including categories for ceiling, individual walls, floors, equipment, and building systems.

3. Include the following information at the top of each page:

a. Project name

b. Date

c. Name of Engineer

d. Name of Contractor

e. Page number

4. Submit list of incomplete items in the following format:

a. MS Excel electronic file. Engineerwill return annotated file.

b. PDF electronic file. Engineer will return annotated file.

1.13 SUBMITTAL OF PROJECT WARRANTIES:

A. Time of Submittal: Submit written warranties on request of Engineer for designated portions of the Work where commencement of warranties other than date of Substantial Completion is indicated, or when delay in submittal of warranties might limit Owner's rights under warranty.

B. Organize warranty documents in accordance with Specification 01 78 36.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 FINAL CLEANING:

A. General: Perform final cleaning in accordance with Section 01 74 23.

B. Construction Waste Disposal: Comply with waste disposal requirements in 01 81 13 .01

3.02 REPAIR OF THE WORK:

A. Complete repair and restoration operations before requesting inspection for determination of Substantial Completion.

B. Repair or remove and replace defective construction. Repairing includes replacing defective parts, refinishing damaged surfaces, touching up with matching materials, and properly adjusting operating equipment. Where damaged or worn items cannot be repaired or restored, provide replacements. Remove and replace operating components that cannot be repaired. Restore damaged construction and permanent facilities used during construction to specified condition.

1. Remove and replace chipped, scratched, and broken glass, reflective surfaces, and other damaged transparent materials.

2. Touch up and otherwise repair and restore marred or exposed finishes and surfaces. Replace finishes and surfaces that that already show evidence of repair or restoration.

   a. Do not paint over "UL" and other required labels and identification, including mechanical and electrical nameplates. Remove paint applied to required labels and identification.

3. Replace parts subject to operating conditions during construction that may impede operation or reduce longevity.

4. Replace burned-out bulbs, bulbs noticeably dimmed by hours of use, and defective and noisy starters in fluorescent and mercury vapor fixtures to comply with requirements for new fixtures.

3.03 ADJUSTING:

A. Adjust operating products and equipment to ensure smooth and unhindered operation.

END OF SECTION

SECTION 01 78 23

OPERATION AND MAINTENANCE DATA

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section includes procedural requirements for providing, compiling and submitting operation and maintenance data required for this project.

B. The SLCWRF utilizes a computerized maintenance management system (CMMS) for asset management. This software (Nexgen) allows for the import of asset data if setup properly. To aid in this process, the FORM (FORM 01 78 23 sample provided at the end of specification) has been updated as an electronic PDF such that the data may be exported after the form has been filled out. Electronic versions of this form will be provided to the Contractor for completion. The FORM is generic and the CMMS software is setup by equipment classes where asset data differs by equipment class. As a result, a version of the FORM is provided for each equipment class. Examples of equipment classes are pump, valve, motor, etc. The Contractor shall fill out a form for each asset. Not all equipment that will require an asset FORM may be listed on the P&ID, assets that need to be tracked in the CMMS system are determined by DPU and a FORM will be provided to the Contractor.

1.02 SUMMARY:

A. This section includes administrative and procedural requirements for preparing operation and maintenance manuals and the CMMS asset management forms, including the following:

1. General contents of data.

2. Specific data for each equipment and system.

3. Manual for materials and finishes.

4. Assembly.

1.03 DEFINITIONS:

A. System: An organized collection of parts, equipment, or subsystems united by regular interaction.

B. Subsystem: A portion of a system with characteristics similar to a system.

C. The term ‘Supplier’ shall be considered interchangeable with the term ‘Manufacturer’ when Manufacturer is directly supplying equipment to Contractor.

1.04 SUBMITTALS:

A. O&M Manual Content: Operations and maintenance manual submittal requirements are specified in individual Specification Sections for the Products for which they must be supplied. Submit reviewed manual content formatted and organized by this Section.

1. Engineer and Owner will comment on whether content of operations and maintenance submittals are acceptable.

2. Where applicable, clarify and update reviewed manual content to correspond to revisions and field conditions.

B. Initial O&M Manual: Submit draft copy of each manual electronically for review and approval prior to shipment of major process or electrical equipment. Engineer will comment on whether general scope and content of manual are acceptable. Engineer shall have the discretion on what equipment constitutes 'major process or electrical equipment'.

C. Pre-Final Manual Submittal: Submit each manual electronically in final form prior to training and requesting inspection for Substantial Completion.

1. Equipment supplier shall revise each manual to comply with Engineer's comments and address any revisions requested by Engineer.

D. Submit one (1) hardcopy and final electronic manual after training, startup, testing and commissioning which includes any revisions made to the equipment during this period to reflect the conditions in the field.

E. CMMS Asset management forms once completed by suppliers and verified to be accurate and complete by Contractor.

1.05 FORMAT (O&M MANUAL HARDCOPY):

A. Prepare data in the form of an O&M instructional manual.

B. Binders: Commercial quality, 8-1/2 x 11-inch three-hole post type binders with hardback, 3-inch maximum binder size. When multiple binders are used, correlate data into related consistent groupings. Three ring binders are not acceptable.

C. Arrange contents by Specification Section numbers and sequence of Table of Contents of this Project Manual.

D. Provide tabbed fly leaf for each separate product and system, with printed description of product and major component parts of equipment. Insert type tab labels must be secured or bonded to prevent the labels from falling out.

E. Text: Manufacturer's printed data, or typewritten data on 20 pound paper.

F. Drawings: Provide with reinforced punched binder tab. Bind in with text; fold larger drawings to size of text pages and insert into clear plastic envelopes that can be secured into the three-hole post binders. Data Sleeve: Provide each binder with a separate dedicated data sleeve for holding a copy of the final O&M manual on a flash drive. Flash drives placed directly into the binder cover sleeve shall not be acceptable.

1.06 FORMAT (O&M MANUAL ELECTRONIC DOCUMENTATION):

A. The Contractor must provide Operation and Maintenance Manual information specific to the configuration of the project in electronic form. Documents should be formatted like a web site complete with index page and Table of Contents. The electronic format must be such that the Owner is able to load the files onto a server to provide online access via any standard web browser. The Contractor shall make use of HTML (for text based documents) and PDF (for CAD type drawings) file formats.

B. The electronic O&M data must be organized in a logical manner to aid operation in troubleshooting and information retrieval. PDF type files shall be bookmarked to each major section for ease of navigation and all text within the document must be searchable. Photos or scans included within the O&M data which cannot be searched will not be acceptable.

1.07 QUALITY ASSURANCE:

A. Preparation of data shall be performed by personnel:

1. Trained and experienced in O&M of described equipment.

2. Familiar with requirements of this section.

3. Skilled as technical writers to the extent required to communicate the essential data to the Reader.

4. Skilled as drafters competent to prepare any required drawings.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 GENERAL CONTENTS OF O&M MANUAL DATA:

A. Each individual manual shall contain equipment data pertaining to not more than one Specification section number as indicated in the Contract Documents.

B. Title Sheet: First page in data listing following:

1. Title: "OPERATION AND MAINTENANCE INSTRUCTIONS".

2. Title of Project: As shown on Contract Documents.

3. Name(s) of applicable building(s) or structure(s) in which equipment is located.

4. Name of equipment as described in Contract Documents.

5. Supplier's name, address, and telephone number.

6. Supplier's purchase order number, manufacturer's shop order number or other such numbers required for parts and service ordering.

7. Manufacturer's name, address, and telephone number.

8. Name, address, and telephone number for local source of supply for parts and service.

C. Equipment List: Immediately following title sheet containing the following:

1. Table of Contents: Immediately following equipment list. Arrange in logical, systematic order and shall include as minimum bookmarked dividers. Each page shall be numbered.

2. Tabbed Dividers: Insert tabbed section dividers between each major section

a. Provide title of section on each tab.

b. Provide table of contents for each tabbed section, arranged in systematic order.

3. Equipment Data Sheets: Provide catalog sheets showing configuration, manufacturer's specifications, models, options, and styles of equipment and major components being provided. Product data sheets will show project specific information with inapplicable information deleted by crossing out or removal. Include in tabbed section(s).

4. Text:

a. Include only those sheets applicable to Project.

b. Each sheet shall:

(1) Identify specific equipment or part installed.

(2) Identify text applicable to equipment or part installed.

(3) Do not include inapplicable information or neatly strike it out.

c. All text must be searchable. Scans or photos will not be acceptable.

5. Drawings:

a. Supplement text with drawings to clearly illustrate following:

(1) Equipment and components.

(2) Relations of component parts of equipment and systems.

(3) Control and flow diagrams.

b. Actual drawings of equipment from manufacturer. "Typical" drawings are not acceptable, unless they accurately illustrate actual installation for this contract.

c. Drawings must be clear and generated by their native software. Documents must be searchable. Scans or photos will not be acceptable.

6. Specially written information, as required to supplement text for particular installation.

a. Provide explanation of interrelationships of equipment and components, and effects one component has on another or entire system.

b. Provide overall instructions and procedures for equipment tying in instructions and procedures for separate components into unified instructional package.

c. Provide glossary of any special terms used by the manufacturer if applicable.

d. Organize in consistent format under separate headings for different O&M procedures.

e. Provide logical sequence of instructions in order of O&M action required for each procedure.

3.02 CMMS REQUIREMENTS FOR EQUIPMENT:

A. Each asset form shall already contain the following information provided by the Engineer:

1. Project Name
2. Contract Number
3. Equipment Tag
4. Contractor
5. Equipment Tag
6. Equipment Name
7. Equipment Description
8. Equipment Class, which shall include but not be limited to:

a. Actuator
b. Air Dryer
c. Air System
d. Backflow
e. Blower
f. Boiler
g. Chemical Feed System
h. Chiller
i. Chlorinator
j. Chlorine Ring
k. Compressor
l. Condensate Trap
m. Control Panel
n. Conveyor
o. Cover
p. Crane
q. Cyclone
r. Diffuser
s. Digester
t. Drive Unit
u. Electrical Equipment
v. Elevator
w. Engine
x. Equipment
y. Expansion Tank
z. Fan
aa. Filter
bb. Flame Arrestor Unit
cc. Flare
dd. Gate

ee. Gearbox
ff. Generator
gg. Genset
hh. Grinder
ii. Grit Chain
jj. Grit Washer
kk. Hatch
ll. Heat Exchanger
mm. Heater
nn. Hopper
oo. HVAC Component
pp. HVAC
qq. Instrumentation Element
rr. Instrumentation
ss. Lab Equipment
tt. Mixer
uu. Mixing System
vv. Motor
ww. Odor Control UnitOpener
xx. Overhead Door
yy. Process Tank
zz. Pump
aaa. Radiator
bbb. Receiver Tank
ccc. Rotary Drum Thickener
ddd. Safety Valve
eee. Samplers
fff. Scrubber
ggg. Security
hhh. Street Lighting
iii. Structures
jjj. Super Structure
kkk. Tank
lll. Valve
mmm. Vaporizer
nnn. Vibrator

9. Parent ID
10. Equipment Main Location
11. Equipment Sub Location 1, which shall include:
    a. Primary Treatment
12. Equipment Sub Location 2, which shall include:
    a. 10 Influent Pump Station

13. Equipment Sub Location 3, which shall include but not be limited to:

    a. 0802 Stand-by Power

    b. 1001 Influent Pump Station

14. Equipment Sub Location 4 (Further location detail when necessary)

15. Equipment Sub Location 5 (Further location detail when necessary)

B. Each asset form shall have the following information completed by the Contractor:

1. MANUFACTURER: The company name that manufactured the asset

2. MODEL NUMBER: The model or part number of the asset

3. SERIAL NUMBER: The unique serial number of the asset as tracked by the manufacturer.

4. PROCESS: The process for which the asset is serving. For example, the BSS Feed Pump would be BSS (Biosolids, Secondary). If the asset does not serve a process, then leave it blank.

5. CLASSIFICATION: If the asset is rated for a Class I Division 1 or Class I Division 2 location then make the appropriate selection. Otherwise, leave as Unclassified.

6. SERVICE: If the asset is to be in or out of service (typically in service)

7. O&M LINK / URL: Provide a link or URL to the O&M Manual for the Asset.

8. CONDITION: Since the equipment is new this should be set to a 1 (SLCDPU uses a 1-5 numbering scheme with 1 being new and 5 being beyond repair).

9. PURCHASE DATE: Enter the date that the OWNER takes ownership of the asset.

10. INSTALL DATE: Enter the date of substantial completion associated with the asset.

11. WARRANTY EXPIRES: Enter the date for when the vendor warranty expires. Expiration date shall be formatted (month(XX)-day(XX)-year(XXXX))

12. PURCHASE COST: Enter the price to purchase the asset. Separately list costs such as shipping, O&M manual requirements, and startup, commissioning, and testing.

13. VENDOR: Enter the name of the company from which the asset was purchased (this is often a local distributor and not the manufacturer). Enter the additional vendor contact information (point of contact, email, phone number, mobile number, and address).

14. EQUIPMENT SUMMARY: The next section of information varies for each equipment class. For example, the pump class asks for flow, head, RPM, suction diameter, discharge diameter, etc. Leave items that are not applicable blank.

15. MAINTENANCE SUMMARY: The CONTRACTOR is to enter each maintenance operation associated with the asset. An example might be greasing a pump or changing oil or performing an inspection. List each Maintenance Operation required and provide the list of tasks required to perform the maintenance. Refer to specific information in Manufacturer's Manual, if applicable. Where applicable, refer by number to the "Lubricant List" on the last page of the FORM for Lubrication Operation. List the frequency of the operation and/or if it should be by a meter (number of hours in operation or number of miles traveled).

16. LUBRICANT LIST: List all lubricants required to perform maintenance on the asset throughout the life of the asset. List the lubricant type and enter its name, viscosity, and recommended manufacturer.

17. SPARE PARTS LIST: Enter all spare parts recommended for the asset. Enter the vendor from which to purchase the part, the part number, a description of the part, the number of units in a package when purchasing the part, the quantity of spares required and the unit cost. Identify which spare parts are being provided by the CONTRACTOR as part of the contract.

18. ADDITIONAL DATA AND REMARKS: Provide any additional data and remarks about the asset that would be beneficial to the WRF staff. Attach additional sheets if necessary.

C. Each asset form shall have the following information completed by the Owner:

1. CRITICALITY: The criticality of the asset relative to the WRF's operation. This is a scale of 1-5 where 1 is the most critical and 5 is not critical.

2. CREW: The WRF staff has several different crews for performing maintenance. Once each asset has its maintenance operations identified, the OWNER will assign the appropriate crew to each operation.

D. For each asset and system include:

1. Completed Equipment Data Form typewritten on Form 01 78 23-2. An electronic copy of Form 01 78 23-2 will be provided to the Contractor for each asset. Contractor shall be responsible for distribution to suppliers and completion of forms.

2. Description of equipment and component parts:

a. Function.

b. Normal operating characteristics.

c. Limiting conditions.

d. Performance curves.

e. Engineering data.

f. Test as applicable.

g. Complete nomenclature and model number of replaceable parts including keyed labeled exploded diagram.

h. Complete nameplate data.

i. Owner's tag (or asset) numbers for equipment as indicated on the Contract Drawings.

3. Operating Procedures:

a. Startup and break-in.

b. Normal operating instructions.

c. Regulation and control.

d. Stopping and shutdown.

e. Emergency instructions.

f. Summer and winter operating instructions, as applicable.

g. Special operating instructions.

4. Maintenance Procedures:

a. Routine maintenance operations.

b. Guide to troubleshooting.

c. Disassembly, repair, and reassembly instructions.

d. Alignment, adjusting, and checking instructions.

5. Servicing and Lubrication Schedule:

a. List of lubricants required and quantity to be applied.

b. Schedule of lubrication.

c. Schedule for other routine maintenance.

6. Manufacturer's printed instructions regarding safety precautions for both (a) protection of personnel operating equipment and systems and (b) prevention of damage to equipment and systems.

7. Description of sequence of operation of controls.

8. Assembly drawings and diagrams required for maintenance.

9. Manufacturer's parts list and illustrations:

    a. Predicted life of parts subject to wear.

    b. Items recommended to be stocked by the Owner as spare parts and quantities of same.

10. Accepted control diagrams such as ladder diagrams, instrumentation loop diagrams, and electrical schematics.

11. Bill of material.

12. Other data as required under applicable Specification sections.

E. Each electric and electronic system, as applicable to equipment such as switchgear, motor control centers, panel boards, switchboards, starters, breakers, and relays shall include:

1. Description of System and Component Parts:

    a. Function.

    b. Normal operating characteristics.

    c. Limiting conditions.

    d. Performance curves.

    e. Engineering data.

    f. Rating tables.

    g. Tests, as applicable.

    h. Complete nomenclature and model number of replaceable parts.

    i. Complete nameplate data.

    j. Owner's Tag (asset) numbers for equipment as indicated on the Contract Drawings.

2. Circuit Directories of Panel Boards:

    a. Electrical service.

    b. Controls.

    c. Communications.

3. Complete instrumentation

    a. Loop diagrams.

    b. Tabulated listing of components in each control circuit or loop.

4. Operating Procedures:

    a. Routine and normal operating instructions.

    b. Sequences required.

    c. Special operating instructions.

5. Maintenance Procedures:

    a. Routine maintenance operations.

    b. Guide to troubleshooting.

    c. Disassembly, repair, and reassembly instructions.

    d. Adjustment and checking instructions.

6. Manufacturer's printed instructions regarding safety precautions for both:

    a. Protection of personnel operating equipment and systems.

    b. Prevention of damage to equipment and systems.

7. List of original all of the manufacturer's components, spare parts with diagram, and recommended quantities to be maintained in storage by the Owner.

8. Other data as required under pertinent sections of Specifications.

F. Prepare and include additional data when need for such data becomes apparent during instruction of Owner's personnel. Differences between the equipment O&M manual and the manufacturers training session shall result in the training and/or O&M Manual being corrected.

3.03 MANUAL FOR MATERIALS AND FINISHES:

A. Building Products, Applied Materials, and Finishes: Include product data, with catalog number, size, composition, and color and texture designations. Provide information for re-ordering custom manufactured products.

B. Instructions for Care and Maintenance: Include manufacturer's recommendations for cleaning agents and methods, precautions against detrimental agents and methods, and recommended schedule for cleaning and maintenance.

C. Moisture Protection and Weather Exposed Products: Include product data listing applicable reference standards, chemical composition, and details of installation. Provide recommendations for inspections, maintenance, and repair.

D. Additional Requirements: As specified in individual product specification sections.

E. Provide a listing in Table of Contents for design data, with tabbed fly sheet and space for insertion of data.

3.04 ASSEMBLY OF O&M MANUALS:

A. Assemble one (1) set.

B. Remove bindings of individual manuals.

C. Insert index tabs labeled with the respective piece of equipment to separate individual manuals.

D. Provide a Table of Contents at the front of the document showing the equipment items in the order in which they appear. Each equipment items shall include the functional name, applicable specifications section, and the plan listing, if any.

E. The preventive maintenance schedule shall be bound in the front of each section immediately following the Table of Contents. The schedule shall be identified with respect to the piece of equipment it is referring to.

F. Sheet Size: 8-1/2 x 11 sheets.

G. Drawings may be on 11 x 17-inch sheets folded to 8-1/2 x 11-inches. .

H. Engrave on covers and end of binder, title OPERATIONS AND MAINTENANCE INSTRUCTIONS, name of Project, Owner's project number, date of Contract, and volume number with subject matter of contents.

I. Electronic files shall be named in the following format (name of equipment)_O&M Manual.

END OF SECTION

SECTION 01 78 24

TRAINING

PART 1 - GENERAL

1.01 SUMMARY:

A. Section includes administrative and procedural requirements for instructing the Owner's personnel, including the following:

1. Instructor manual
2. Trainee manual
3. Facilities for training
4. Schedule
5. Preparation
6. Instruction
7. Training contents
8. Demonstration and training video recordings
9. Field quality control
10. Training documentation

B. Payment for work covered by this section shall be included in the lump sum cost of the Supplier’s Proposal.

1.02 DEFINITIONS:

A. The term ‘Supplier’ shall be considered interchangeable with the term ‘Manufacturer’ when Manufacturer is directly supplying equipment to Contractor.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Submit an electronic copy of the outline of instructional program for demonstration and training, including a list of training modules and a schedule of proposed dates, times, length of instruction time, and instructors' names for each training module. Include learning objective and outline for each training module.

a. Indicate proposed training modules using manufacturer-produced demonstration and training video recordings for systems, equipment, and products in lieu of video recording of the live instructional module.

b. Submit a draft training outline for review by Engineer and Owner. Supplier shall incorporate all comments into training schedule.

c. Submit final training course outline for review.

d. After final course outline is accepted by Engineer, submit student notes and instructor guides for review.

2. Qualification Data for Instructor.

a. Submit resumes, including three outside references, for each instructor proposed for training program. The qualifications of the instructor shall include:

(1) Type of training instructor has received for the specific equipment the training module will cover, including dates and who provided the training.

(2) Training Work experience including the employers name and address, dates of employment and type of training provided and to whom.

b. Engineer will review resumes. Based upon review of resumes, Engineer will approve, request additional information, or reject proposed instructors for training program.

c. If proposed instructor is rejected, Contractor shall submit resume and references on alternate instructor for acceptance.

3. Within 7 days after each training module, submit list of participants and length of instruction time.

4. Submit electronic copy of each training module within seven calendar days following the delivery of each training module.

   a. Provide an applied label with the following information:

      (1) Name of Project

      (2) Training Session Name

      (3) Name of Construction Manager

      (4) Name of Contractor

      (5) Date of training

   b. At completion of training, submit complete training manual(s) for Owner's use in PDF electronic file format.

1.04 QUALITY ASSURANCE:

A. Instructor Qualifications:

1. A factory-authorized service representative, complying with requirements in Section 01 45 00, Article 1.2, experienced in operation and maintenance procedures and in providing training for the products and systems installed under this Contract.

1.05 COORDINATION:

A. Contractor to coordinate instruction schedule with Owner's operations. Adjust schedule as required to minimize disrupting Owner's operations and to ensure availability of the Owner's personnel.

B. Contractor to coordinate instructors, including providing notification of dates, times, length of instruction time, and course content.

C. Contractor to coordinate content of training modules with content of accepted emergency, operation, and maintenance manuals. Do not submit instruction program(s) for review until the operation and maintenance data required under Section 01 78 23 has been reviewed and accepted Engineer.

PART 2 - PRODUCTS

2.01 INSTRUCTOR MANUAL:

A. The Contractor shall prepare an Instructor Manual for each curriculum that includes all of the information specified below and written at the journeyman level for electrician

specialists, mechanical specialists and instrument technicians, and for wastewater treatment plant operators, or other disciplines, depending upon the target audience.

B. The Instructor Manual shall be consistent with the nomenclature and contents of the accepted Contractor's O&M Manuals required in Section 01 78 23. The O&M Manuals cannot be substituted for the Instructor Manual.

C. The purpose of the Instructor Manual is to define the concepts and information that will be taught to each target audience and to describe the methods and materials to be used during the training. The Instructor Manual is designed to provide specific guidance to the Instructor regarding all aspects of the training program. The Instructor Manual shall include:

1. Description of the equipment
2. Parts and equipment graphics
3. Safety procedures
4. Startup checks and procedures
5. Overview of routine operation, including startup and shutdown and operating parameters
6. Routine, preventive, and corrective maintenance procedures
7. Lubrication (schedule and type)
8. Assembly and disassembly procedures
9. Troubleshooting procedures
10. Parts list
11. Special maintenance practices
12. Emergency shutdown

D. All manuals shall be presented in electronic format per the requirements of Specification Section 01 33 00. All equipment shall be cross-referenced to the equipment tag identification numbers.

E. Each Instructor Manual shall contain:

1. Instructor Manual cover page
2. Instructor Manual table of contents

3. Lesson Plan which shall include:

    a. Lesson Plan cover page

    b. Lesson Plan summary

    c. Lesson Plan text, including:

        (1) Identity of the target audience (a separate Lesson Plan is required for each target audience, such as mechanical O&M personnel, electronic/electrical O&M personnel, etc.)

        (2) Length of the training program and each topic to be covered

        (3) Performance and/or training objectives

        (4) Outline of the material to be covered

        (5) Training strategies to be used and interaction with the trainees

        (6) Audio visual and/or support materials required, and when used or referred to during instruction

        (7) A list of resource and/or reference materials

4. A copy of all training aids, including electronic files.

5. A copy of trainee materials (handouts, reference materials, etc.) in electronic format.

F. The Supplier shall submit the equipment manufacturer's lesson plans for acceptance by the Engineer no less than ninety (90) days prior to the date that the training is to take place.

G. With the exception of cutaway models or other items expressly exempted by the Engineer, all training aids and trainee materials contained in the Instructor Manual or used in the delivery of training shall become the property of the Owner and may be duplicated by the Owner for its own use.

H. The Supplier shall provide required acceptance and/or copyright releases obtained from those who own proprietary and/or copyrighted materials provided by the Contractor so that the materials can be reproduced by the Owner.

2.02 TRAINEE MANUAL:

A. Program Structure:

1. Develop an instruction program that includes individual training modules for each system and for equipment not part of a system, as required in the individual Specification Sections.

B. Training Manuals:

1. The Supplier shall submit a Trainee Manual for each curriculum that includes all of the information specified below and written at the journeyman level for electrician specialists, mechanic specialists and instrument technicians, and for wastewater treatment plant operators, or other disciplines, depending upon the target audience.

2. The Trainee Manual shall be consistent with the nomenclature and content of the accepted Contractor O&M Manuals required in Specification Section 01 78 23. The O&M Manual cannot be substituted for the Instructor Manual or Trainee Manual.

3. The purpose of the Trainee Manual is to provide an organized package of information for use by trainees during the training sessions and as reference material for operation and maintenance in the future. The Trainee Manual shall include:

a. Description of the equipment

b. Parts and equipment graphics including “exploded” views

c. Safety procedures

d. Pre-startup checks

e. Startup procedures

f. Operation and monitoring procedures including normal operating parameters, and the operating limits of the equipment

g. Shutdown procedures

h. Troubleshooting procedures

i. Non-routine emergency procedures

j. Safety/Protective equipment required by Trainees

4. All manuals shall be presented in electronic format per the requirements of Specification Section 01 33 00. All equipment shall be cross-referenced to the equipment tag identification numbers.

5. Training Manual Format:

   a. Size: 8-1/2 inch by 11 inch

   b. Text: Manufacturer's printed data, or neatly typewritten, including:

      (1) Table of Contents

      (2) Pretest

      (3) Learning Objectives

      (4) General Operations

      (5) Theory

      (6) Specific Equipment Information

   c. Drawings:

      (1) Provide suitable for printing on 11 x 17 inch paper

   d. Cover: Identify with typed or printed title "Training Manual"

      (1) Title of Project

      (2) Identify separate structure or system as applicable

      (3) Identify general subject matter covered in Manual

   e. All documents shall be searchable and generated with a computer in the native software format. Scanned or photographed images will not be acceptable.

C. Training Modules:

1. Develop a learning objective and teaching outline for each module. Include a description of the specific skills and knowledge that each participant is expected to master.

2. For each module, include instruction for the following as applicable to the system, equipment, or component:

    a. Basis of System Design, Operational Requirements, and Criteria: Include the following:

        (1) System, subsystem, and equipment descriptions

        (2) Performance and design criteria if the training provider is delegated design responsibility

        (3) Operating standards

        (4) Regulatory requirements

        (5) Equipment function

        (6) Operating characteristics

        (7) Limiting conditions

        (8) Performance curves

    b. Documentation: Review the following items in detail:

        (1) Emergency manuals

        (2) Operations manuals

        (3) Maintenance manuals

        (4) Project record documents

        (5) Identification systems

        (6) Warranties and bonds

        (7) Maintenance service agreements and similar continuing commitments

    c. Emergencies: Include the following, as applicable:

        (1) Instructions on meaning of warnings, trouble indications, and error messages.

        (2) Instructions on shutdown.

        (3) Shutdown instructions for each type of emergency.

(4) Operating instructions for conditions outside of normal operating limits.

(5) Sequences for electric or electronic systems.

(6) Special operating instructions and procedures.

d. Operations: Include the following, as applicable:

(1) Start-up procedures.

(2) Equipment or system break-in procedures.

(3) Routine and normal operating instructions.

(4) Regulation and control procedures.

(5) Control sequences.

(6) Safety procedures.

(7) Instructions on stopping.

(8) Normal shutdown instructions.

(9) Operating procedures for emergencies.

(10) Operating procedures for system, subsystem, or equipment failure.

(11) Seasonal and unattended operating instructions.

(12) Required sequences for electric or electronic systems.

(13) Special operating instructions and procedures.

e. Adjustments: Include the following:

(1) Alignments.

(2) Checking adjustments.

(3) Noise and vibration adjustments.

(4) Economy and efficiency adjustments.

f. Troubleshooting: Include the following:

(1) Diagnostic instructions.

(2) Test and inspection procedures.

g. Maintenance: Include the following:

(1) Inspection procedures.

(2) Types of cleaning agents to be used and methods of cleaning.

(3) List of cleaning agents and methods of cleaning detrimental to product.

(4) List of lubrication products, procedures, and intervals.

(5) Procedures for routine cleaning

(6) Procedures for preventive maintenance.

(7) Procedures for routine maintenance.

(8) Instruction on use of special tools.

h. Repairs: Include the following:

(1) Diagnosis instructions.

(2) Repair instructions.

(3) Disassembly; component removal, repair, and replacement; and reassembly instructions.

(4) Instructions for identifying parts and components.

(5) Review of spare parts needed for operation and maintenance.

PART 3 - EXECUTION

3.01 FACILITIES FOR TRAINING:

A. Use Owner's designated training facilities for specified field training programs.

B. Facilities include installation sites, which shall be used for hands-on training programs.

C. Coordinate use of Owner's facilities with Owner and Engineer.

3.02 SCHEDULE:

A. Coordinate training periods Engineer and Supplier's representatives.

1. Training shall be limited to no more than three days per week. No training shall be conducted on Mondays or Fridays.

2. The Supplier shall coordinate the manufacturer's training services with the Owner and the Engineer, providing a minimum of fourteen (14) days prior notice of training, subject to the acceptance of the Engineer and the Owner.

3. In order to provide training for an adequate number of the Owner operation and maintenance personnel, a minimum of two 8-hour training days shall be provided for each item of equipment at the site, unless otherwise specified in the specifications.

4. The Supplier shall deliver all training material to the Engineer and the Owner a minimum of fourteen (14) days prior to the scheduled training.

5. The Contractor shall maintain a calendar of training events which defines each submission for each vendor training curriculum. Calendar shall be updated as required.

6. Reschedule canceled training sessions 7 calendar days in advance.

7. Failure of supplier's or manufacturer's representative to appear for scheduled training, failure to notify Engineer 48 hours in advance of need to cancel scheduled training, or failure to arrive within 30 minutes of start of scheduled training shall result in reimbursement of Owner and Engineer for time lost by Owner's operating personnel and Engineer in waiting for arrival of manufacturer's representative. Except in case of failure to arrive on time, time will not exceed one hour for each Owners employee scheduled to receive training and the Engineer. Failure to arrive on time will be reimbursed by actual time late, up to one hour, after one hour training will be rescheduled.

B. Training Procedures:

1. The instructor shall arrive at the training site at least one hour before training is scheduled to be delivered in order to review the Instructor Manual with the Engineer, Owner and complete final preparations for presentation of the training session. The instruction shall comply with all safety requirements, including wearing a hard hat, safety shoes, and other safety and/or personal protective equipment.

a. Information presented in the training program shall be based on the Instructor and Trainee Manuals.

b. The Engineer will monitor and evaluate the performance of the instructor and the quality of the training session. Unacceptable sessions are those where the accepted lesson plan was not presented, where inadequate time was taken to present lesson plan or the training was not understood by the trainees. The adequacy of the training shall be determined solely by the Engineer. Contractor shall repeat any training sessions deemed unacceptable, at no additional cost to the Owner.

c. A safety briefing shall be conducted by the instructor prior to use of any equipment.

C. Training shall be completed minimum of 14 days before commissioning on each piece of equipment or unit process begins.

D. Owner's personnel will require training, both for operating and maintenance functions. These individuals shall be trained in small groups at times and dates agreed upon by the Owner.

3.03 PREPARATION:

A. Assemble educational materials necessary for instruction, including documentation and training modules. Assemble training modules into a training manual organized in coordination with requirements of this Section and in Section 01 78 23.

B. Set up instructional equipment at instruction location.

3.04 INSTRUCTION:

A. Prepare instruction program and training modules, to coordinate instructors, and to coordinate between Contractor and Owner for number of participants, instruction times, and location.

B. Engage qualified instructors to instruct Owner's personnel to adjust, operate, and maintain systems, subsystems, and equipment not part of a system.

1. Owner will furnish the Contractor with names and positions of participants after the final course outline is accepted.

C. Manufacturer's Training Location and Reference Material:

1. Conduct training on-site in the completed and fully operational facility using the actual equipment in-place.

2. Conduct training using final operation and maintenance data submittals as training aides.

D. Cleanup:

1. Collect used and leftover educational materials and remove from the Project site if unwanted by the Owner.

2. Remove instructional equipment.

3. Restore systems and equipment to condition existing before initial training use.

3.05 TRAINING CONTENT:

A. Maintenance of Instrumentation:

1. Training Requirements:

a. Describe overall function of each instrument and control loop installed under this Contract.

b. Locating probable source of malfunction in instrumentation equipment determining symptoms of trouble, establishing probable cause and effecting solution.

c. Taking appropriate preventive and corrective maintenance procedures necessary to keep instrumentation system in proper operating condition, including calibration and testing.

2. Course Materials:

a. Pertinent portions of submittals specified in specifications such as calibration data and maintenance instructions.

b. Detailed course outlines and troubleshooting guides for field use. Troubleshooting guides shall include symptoms, probable causes and solutions for all cases of trouble described during training program.

3. Training program shall not include any time specified for system start-up instruction or acceptance testing.

B. Maintenance of Process Equipment:

1. Training Requirements:

a. Describe functions of process equipment.

b. Component preventive and corrective maintenance activities required to keep unit equipment in good operating conditions.

c. Instruct trainees in locating probable source of equipment malfunctions, determining symptoms of trouble, establishing probable cause, and effecting solution.

2. Course Materials:

a. Pertinent portions of operation and maintenance manuals as well as alignment tolerances, lubrication schedules, vibration analysis instructions and parameters, and special calibration test and procedures.

b. Detailed course outlines and troubleshooting guides for each piece of equipment. Trouble-shooting guides shall include symptoms, probable causes, and solutions for trouble described during training program.

3. Method of training maintenance personnel shall include Contractor using Owner's equipment to demonstrate trouble-shooting, preventive and corrective maintenance procedures.

C. Operation of Process Equipment:

1. Training Requirements:

a. Being able to implement start-up and shutdown procedures for each piece of equipment individually, as well as start-up and shutdown of systems comprising equipment. This instruction shall include normal operation, alternative operations, and emergency operations.

b. Understand functions of instrumentation, describing individual components and how each component is used in monitoring and controlling equipment and processes for the instrumentation supplied by the manufacturer.

c. Understand operating modes possible as result of modifications and installations.

d. Locating probable source of system inefficiency, determining symptoms, establishing probable cause, and re-stabilizing system efficiency for systems.

e. Precautions for safe operation of equipment, instrumentation, and control system.

f. Emergency procedures for equipment and systems during pump malfunction, chemical spills, and other extreme conditions.

2. Course Materials:

a. Pertinent portions of Operations and Maintenance Manuals, including start-up and shutdown procedures; descriptions of equipment and

instrumentation functions and modes of operations, control, and monitoring; troubleshooting instructions and process control instructions.

b. Detailed course outlines and operations guides for equipment and processes for field use. Operations guides shall include general operating procedures, start-up and shutdown procedures, optimization procedures, and emergency operating procedures.

3. Methods of training Owner's operations personnel shall include field training program at Owner's site consisting of classrooms and hands-on training using Owner's equipment and systems.

3.06 DEMONSTRATION AND TRAINING VIDEO RECORDINGS:

A. General:

1. The Owner has engaged a qualified commercial videographer to record demonstration and training sessions in video recordings.

2. Coordinate all training with Owner's videographer.

3. Include classroom instructions and demonstrations, board diagrams, and other visual aids, but not student practice.

4. At beginning of each training module, record each chart containing learning objective and lesson outline.

3.07 FIELD QUALITY CONTROL:

A. Manufacturer's Training Effectiveness:

1. Instructor shall be clear and audible on the electronic media or the sessions will need to be redone at no additional cost to the owner.

2. Effectiveness of training shall be determined by Engineer as "Satisfactory" or "Unsatisfactory".

3. Unsatisfactory evaluations shall include recommendations for corrective action and the training session must be given again at no cost to the owner.

3.08 TRAINING DOCUMENTATION:

A. On completion of his training, the manufacturer's or supplier's representative shall submit to Engineer a complete signed Form 01 78 24-1 Demonstration his training is complete.

B. If the Owner approves the training, the acceptance will be documented in a completed Form 01 78 24-2.

C. Differences between the equipment O&M manual and the manufacturers training session shall result in the training and/or O&M Manual being corrected.

SECTION 01 78 25

PLANT TESTING, STARTUP AND COMMISSIONING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide planning, functional completion testing, startup and commissioning as indicated and specified. Section includes:

1. Pump Station Checkout Plan

2. Functional Completion Testing

3. Startup

4. Commissioning

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. B31.1: Power Piping Code

B. American Water Works Association (AWWA):

1. C600: Installation of Ductile-Iron Water Mains and Their Appurtenances

1.03 DEFINITIONS:

A. The Pump Station Checkout Plan (the Plan) incorporates all aspects of functional completion testing, startup, and training to ensure the facility operates properly and meets design intent and performance.

B. Functional Completion Testing is testing of the equipment and unit process systems to confirm that construction and installation has been completed in anticipation of initial startup of the equipment and unit process systems. Functional Completion Testing includes:

1. Physical Checkout shall be defined as the process of physically inspecting products after they have been installed in the Work to determine if the Products have been properly and completely installed, and are ready for Field and/or Functional Testing. The requirements for Physical Checkout are contained in the pertinent technical specification(s) (if applicable) and in Paragraph 1.08 of this Section.

2. Field Testing shall be defined as testing that is performed by the Contractor, with Supplier assistance, on Products after they have been installed in the Work, and after conducting physical checkout, for the purpose of proving that the tested Products meet the requirements of the pertinent technical specifications. Administrative and minimum technical requirements for field testing are specified in Paragraph 1.08 of this Section, while additional technical requirements are contained in PART 3 of the pertinent technical specification(s). The test criteria are specified in Paragraph 1.08 of this Section.

C. Startup shall be defined as the operation of equipment or unit process systems using clean water, air, or other fluids and gases as necessary to demonstrate the operation of the equipment or unit process systems with other equipment that is a part of, or a treatment process for the Facility. Administrative and minimum technical requirements for startup are specified in Paragraph 1.09 of this Section, while additional technical requirements are contained in PART 3 of the pertinent technical specification(s).

D. Commissioning shall be defined as the operation of equipment or unit process systems using process liquids or process solids, plant support equipment, and plant utilities to demonstrate equipment or unit process systems are capable of processing water or wastewater at specified flows and conditions for a sustained period of operation as required by this section or equipment or unit process systems specifications. Administrative and minimum technical requirements for Commissioning are specified in Paragraph 1.10 of this Section, while additional technical requirements are contained in PART 3 of the pertinent technical specification(s).

E. Reliability Testing is defined as a test performed as an extended operation of the constructed facilities to confirm that the equipment and unit process systems work together as a complete Facility under continuous operation for the specified period. The Reliability Test shall be conducted after all the major equipment and unit process systems have successfully completed Startup. Supplier's Representative, sometimes referred to in the technical specifications as a Factory-Trained Service Representative, shall be defined as a person, or persons provided by the Supplier, who is qualified by having the training and experience, to provide technical and/or process related advice, and/or assistance, relating to the installation or utilization of the Products provided by that same Supplier, for installation and utilization in the Work.

1.04 ROLES AND RESPONSIBILITIES:

A. The Contractor shall provide all outside services, materials, labor, supplies, test equipment and other items necessary to perform the Functional Completion Testing and Startup. Commissioning shall be conducted by others once the new WRF is operational. In addition, the Contractor shall arrange for and provide the participation or assistance of survey crews, quality control technicians, Supplier's representative(s), and required governmental agency representatives.

B. The Contractor shall provide the services of the Supplier's representative(s) as follows:

1. Assistance during installation as specified in PART 3 of the specifications in Division 2 through 44 and as specified herein.

2. Field Testing as specified in PART 3 of the specifications in Divisions 2 through 44, and as specified herein.

3. Startup as specified in PART 3 of the specifications in Divisions 2 through 44, and as specified herein.

C. The Supplier's representative's activities required by this Section are in addition to the requirements for vendor training and other services specified elsewhere in the Contract Documents. Timing for the performance of these services is to be defined in the Contractors Checkout Plan, specified herein.

D. The Engineer will review and comment on the Contractor's deliverables, participate in the physical inspection activities, witness the shop and field testing, witness functional testing, maintain the permanent record of all testing results, and provide verification of conformance to the specifications. The Engineer's right to perform inspections, witness tests or monitor or assess the Work and activities does not relieve the Contractor of its obligation to comply with the requirements of the Contract Documents nor does it imply completion of the Work.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Submit a Plant Checkout Plan for the facility in accordance with the requirements of Section 01 33 00. Submit a Functional Test Plan in accordance with the requirements of Section 01 33 00.

1.06 QUALITY ASSURANCE:

A. Preparation of the plant checkout plan, functional completion testing and startup shall be performed by personnel:

1. Trained and experienced in O&M of the described equipment.

2. Familiar with the requirements of this section.

1.07 PUMP STATION CHECKOUT PLAN:

A. The Contractor shall be responsible for preparing, coordinating, and executing the Plan.

1. The Contractor shall use the resources of the equipment and unit process systems suppliers in this work, particularly for specific equipment and unit process systems.

2. An initial draft of the Plan shall be submitted as indicated here:

    a. The initial draft Plan for the Facility shall be completed and submitted by the Contractor to the Engineer for review as defined in Section 01 33 00. The Engineer will require 45 days to review the submittal and return with any exceptions noted.

    b. The Contractor shall incorporate the Engineer's comments into the revised Plan within 30 days of receiving comments, and reissue the Plan to the Engineer and Owner.

    c. The Contractor shall regularly schedule meetings with the Engineer and Owner to review and coordinate activities required by the Plan.

B. The Contractor shall provide a dedicated field staff to support the Plan activities. A single point of contact for the Contractor shall be responsible for day to day activities and shall be the primary contact with the CM or Resident Engineer regarding Plan activities. Support staff shall include but not be limited to designated mechanical, electrical and instrumentation and control engineers and technicians, and operating staff.

C. The Plan shall define:

1. The logical and systematic performance of functional completion testing, startup, and reliability testing including:

    a. A chronological schedule of all testing and inspection activities.

    b. A checklist of all inspection and testing activities broken down by location, discipline, system, and device or item.

    c. All blank forms proposed by the Contractor for verification or recording of the functional completion testing, startup, and reliability testing**.**

    d. An index which cross references the forms to their intended application(s).

    e. A list of all supplier certifications, including those required by the applicable technical specifications. Provisions shall also be included for retesting, in the event it is required.

2. A list of participants in functional completion testing, startup, and reliability testing**.**

3. A list of special test equipment required for functional completion testing, startup, and reliability testing.

4. Sources of the test media (water, power, air.) for functional completion testing.

5. The proposed method of delivery of the media to the equipment to be tested during functional completion testing, startup, and reliability testing.

6. Temporary or interim connections for the sequencing of multiple units during functional completion testing, startup, and reliability testing.

7. Ultimate disposal of the test media after functional completion testing, startup, and reliability testing.

D. The plan shall be reviewed by the Engineer, modified or revised as necessary by the Contractor, then re-reviewed by the Engineer. The Contractor shall continue to update the Plan, working in conjunction with the Engineer, prior to the start of the scheduled equipment checkout and functional testing activities as specified in Paragraph 1.08 herein. Each specific element of the plan must receive review or comment by the Engineer, two weeks prior to the actual commencement of testing as defined herein.

E. The Contractor shall designate, in the Plan, an individual of the Contractor, to coordinate and manage the activities defined in the Plan.

1.08 FUNCTIONAL COMPLETION TESTING:

A. Functional Completion Testing shall be completed as construction and installation of equipment is completed to demonstrate that the equipment is ready for equipment and unit process systems startup.

1. Functional Completion Testing shall be done in a coordinated manner based on the Plan prepared by the Contractor.

a. The Owner's operating and maintenance staff shall be allowed to observe for the purposes of familiarization and training.

b. Additional witnesses, such as the Engineer, may be present to represent the Owner.

2. Functional Completion Testing procedures and documentation forms shall be developed by the Contractor. The procedures shall include a listing of items inspected for Functional Completion Testing.

3. If any equipment or unit process systems do not meet Functional Completion Testing requirements, it shall be the responsibility of the Contractor and/or equipment suppliers to make the necessary corrections or replacements and repeat the test.

4. The equipment and unit process systems shall not be started up or put into service until the Functional Completion Testing is completed as evidenced by a completed Functional Completion Testing certificate for the equipment or subsystem.

5. Modifications to the equipment and unit process systems required to meet Functional Completion Testing requirements shall be provided, and all retesting shall be performed at no additional cost to the Owner.

6. A Functional Completion Testing Certificate shall be prepared by the Contractor for each piece of equipment or unit process and submitted to the Engineer and Owner for review.

1.09 STARTUP:

A. Startup activities for the Facility shall not be initiated until the requirements of Functional Completion Testing are completed for the equipment or unit process systems.

B. The requirements of this section shall be satisfactorily completed for all systems/equipment prior to beginning Reliability Testing.

C. The Contractor shall be responsible for startup.

1. The Owner's operating and maintenance staff shall be allowed to observe for the purposes of familiarization and training.

2. Additional witnesses, such as the Engineer, may be present to represent the Owner.

D. For equipment or unit process systems that do not meet the specified Startup requirements, it shall be the responsibility of the Contractor and/or equipment or unit process systems suppliers to make the necessary corrections or replacements and repeat Startup at no additional cost to the Owner.

E. Startup Reports for each piece of equipment or unit process shall be completed and submitted by the Contractor to the Engineer and Owner for review as defined in Section 01 33 00.

1.10 COMMISSIONING:

A. Commissioning activities for the Facility shall be conducted by others once the new WRF Facility is operational.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 PUMP STATION CHECKOUT PLAN:

A. The Plan shall include the following items as a minimum:

1. Cover Sheet with Plant identification, title, date and other information as needed to properly identify the specific information for the Facility.

2. Status and revisions sheet with appropriate dates and signatures spaces to document the development and status of the document.

3. Table of Contents including Appendix.

4. Equipment and systems descriptions with anticipated break down for individual startup activities. This section shall define the individual "packages" for startup activities for the equipment or unit process systems.

5. Schedule of events for startup and other activities covered by the Plan.

   a. The schedule shall define dates for completing activities for equipment and unit process systems.

   b. The schedule shall be the Contractor's best estimate of time sequence at the time of issuance.

   c. The Contractor shall submit monthly schedule updates to the Plan.

   d. The schedule shall follow the required sequencing as specified herein.

6. Sign-off sheets consisting of certification forms or completion reports required by the specifications shall be included in the Plan. Standard forms shall be developed by the Contactor for this purpose.

7. Reports, test results and other supporting data shall be collected by the Contractor for documentation of the specific details leading to the certification or completion.

3.02 FUNCTIONAL COMPLETION TESTING:

A. Provide 30 days written notice to the Engineer for each functional completion test so that the Engineer, may witness the functional completion tests. The Engineer may witness the performance of any or all functional completion testing, at their option.

B. Testing shall be conducted in accordance with the accepted Plan using applicable standard techniques reviewed by the Engineer and Owner.

1. Local and remote instrumentation may be used to record test data where it is determined the devices have been calibrated and sufficient to obtain necessary data.

C. The Contractor shall develop standard data sheets to document Functional Completion Testing requirements have been met for all equipment and unit process systems included in the Plan.

1. As equipment testing is completed the appropriate data sheet shall be completed and signed by the responsible party and submitted to the Engineer for review and acceptance.

2. Data values shall be stated in the engineering units noted in the equipment specifications.

D. A detailed Functional Completion Test plan shall be prepared and submitted to the Engineer for review and comment as noted paragraph 1.08 above.

1. The plan shall be prepared by the Contractor in conjunction with the equipment or subsystem supplier and shall become a part of the overall Plan.

E. In the event no reference to procedures is made, or no procedures for startup are contained in a technical specification for the following test parameters, the following shall be the checkout requirements. Should these requirements conflict with the Supplier's recommendations or in any way be less stringent than the Supplier's requirements, they shall be superseded by the Supplier's requirements for checkout testing.

1. Measurement of wearing ring clearances for all pumps requiring assembly, so equipped:

a. Take two readings taken opposed to each other by 90 degrees.

b. All measured clearances shall be within Supplier's specifications for new installations. Replace and recheck rings found to be out of round or out of specified tolerance.

2. Measurement of Impeller Bore for all pumps requiring assembly:

a. Take two readings opposed to each other by 90 degrees.

b. All measured clearances shall be within Supplier's specifications for new installations. Replace and recheck impellers found to be out of round or out of specified tolerance.

3. Measurement of shaft runout for all rotating equipment requiring assembly:

   a. Remove bearings from the shaft. Support shaft on pedestal rollers or in a lathe.

   b. Check each shoulder on the shaft.

   c. Take two readings for each shoulder, opposed to each other by 90 degrees.

   d. All measured clearances shall be within Supplier's specifications for new installations. Replace and recheck shafts found to be out of round or out of specified tolerance.

4. Vibration Measurements:

   a. Provide vibrational signature testing and documentation for each piece of direct drive or close coupled rotating equipment with a motor HP of 100 or above and a rated operating speed in excess of 1999 RPM.

   b. Unless specified otherwise, the current edition of the Hydraulic Institute Standard, "Acceptable Field Vibration Limits" shall be the standard for vibrational testing.

   c. Take all specified vibrational readings in three directions: vertical, horizontal, and axial.

   d. Provide vibrational measurements in the following engineering units:

      (1) Displacement in thousandths of an inch (mils), peak to peak.

      (2) Velocity in inches per second (ips), peak to peak.

      (3) Acceleration in feet per second per second (lg=32.3 ft/sec./sec.) zero to peak.

      (4) Spike energy in g-SE.

      (5) The vibrational readings shall be less than the device rotating frequency, and within the operating band specified by the Supplier.

      (6) Amplitude Allowable Maximums:

RPM	Amplitude inches peak to peak:
3,000 and above	0.001
1,500 - 2,999	0.002
1,000 - 1,499	0.0025
999 and below	0.003

5. Belt Drives:

    a. All belts shall ride within the sheave and not slip to the bottom of the groove(s).

    b. Belt tension shall be in accordance with Supplier's recommendations.

    c. Pulley alignment shall be within Supplier's recommendations.

6. Gear Drives and Reducers:

    a. Check gears for lash at no less than three points around the gear.

    b. Rotate gears a full 360 degrees while checking alignment.

7. Coupling/Shaft Alignment:

    a. Perform all final alignments and checks with a dial indicator or a laser device. Feeler gauges and straight edges are not acceptable.

    b. Eliminate soft foot conditions prior to aligning.

    c. When checking for final soft foot, any displacement in excess of 0.002" must be corrected.

    d. When checking for pipe strain, any displacement in excess of 0.002" requires piping realignment.

    e. Alignments will not be regarded as final until the grout is set and all piping has been attached. Demonstrate that alignment is not changed by attachment of piping.

    f. Shim the driving element, never the driven element.

    g. Take bracket sag corrections into account when using a dial indicator. Bracket sag shall be determined on a rigid pipe.

    h. Mount a dial indicator to the driven element so that it can be rotated. Rotate both elements while aligning.

    i. When aligning three coupled elements, align gear reduction elements with the driven element first, then align the driver to the gear reduction element.

    j. Check all four alignments, i.e., angular alignment in the vertical and horizontal planes, and parallel alignment in the vertical and horizontal planes.

k. The acceptable alignment accuracy for flexible couplings is +0.005 inches, or the Supplier's specifications, whichever is more stringent.

l. The dial indicator must be perpendicular to the alignment surface.

m. Number hold down nuts prior to tightening. Loosen in reverse order. Tighten in ascending order.

n. Use only clean, deburred shims. Clean the machine base and feet from rust or burrs prior to alignment.

8. Measurement of Noise (dB):

a. Eliminate noise sources generated by adjacent construction activity prior to testing.

b. Establish a background noise level prior to testing.

c. Perform noise level testing on each installed device as required by the technical specifications.

d. The maximum noise level exposure is 85 dBA over eight hours continuous for office, shop, and other areas where the Owner's personnel will be performing their assigned duties.

9. Hydrostatic Testing:

a. AWWA C600 standards latest edition are the standards for all hydrostatic testing.

b. Visually inspect all welds prior to testing, for cracks, undercut on surface greater than 1/32-inches deep, lack of fusion on surface, reinforcement greater than Table 127.4.2 located in ANSI B31.1 Power Piping, and incomplete penetration (when accessible). Repair or rework as directed by the Engineer.

c. At no time during hydrostatic testing shall any part of the piping system be subjected to a stress greater than 90 percent of its yield strength at test temperature.

d. After 10 minutes of full hydrostatic test pressures, make an examination for leakage of all joints, connections, and all regions of high stress, such as around openings and thickness transition sections.

e. Unless otherwise specified, the minimum required hydrostatic test pressure shall be 1.5 times the design pressure as specified and as indicated.

f. Pressure holding time shall be 10 minutes plus the time required to inspect for leakage.

g. Maximum pressure shall not exceed the maximum rated pressure for any component in the system being tested.

10. Electrical Equipment:

a. The testing standards for electrical components are those contained in Section 26 05 10 and the pertinent technical specification(s).

F. Where required by the equipment specifications, the Contactor shall furnish an authorized, competent representative of the equipment or unit process supplier to supervise and coordinate the Functional Completion Testing program.

1. Instrument readings and other test data shall be tabulated by the Contractor.

G. Documentation Requirements:

1. Certificates are required for all Functional Completion Testing for equipment and unit process systems. Contents of the certificate shall be at a minimum:

a. Contractor Review Comments, and Approval Page. This page shall include Certification by the preparer that he/she is the person responsible for the test data and the data is authentic and accurate. This page shall include a listing and signature of all witnesses to the test

b. Equipment Suppliers Review Comments, and Approval Page. This page shall include Certification by the equipment or unit process systems suppliers that the equipment or unit process systems are properly installed and suitable for startup.

c. Engineer and Owner Review Comments, and Approval Page.

d. Process, Equipment, and P&IDs Involved in this Functional Completion Test

e. FCT Schedule

f. Test Descriptions/Procedures

(1) Equipment or unit process systems tested.

(2) Test dates.

(3) Electrical Inspection and Tests

(4) Test results.

(5) Any repairs or corrections required to obtain acceptable test results.

(6) Calibration sheet for instrumentation or devices used for testing but not part of plant installation.

(7) Copies of calibration records for plant installed instrumentation

g. Certify Mechanics and Installation. Inspection and certification to be conducted by equipment representative. Inspect and certify that each piece of equipment meets the following requirements:

(1) Not damaged in transportation or installation.

(2) Properly installed with no undue force imposed from piping or supports.

(3) Is properly lubricated.

(4) Motor rotation is correct.

(5) Free of overheating.

(6) Free of vibration.

(7) Free of noise.

(8) Functions without overloading.

(9) Piping and other connections are completed.

(10) No leaks at equipment connections (static pressure testing).

h. Certify Electric Valve Mechanics and Installation

i. Inspect and certify that each valve meets the following requirements:

(1) Not damaged in transportation or installation.

(2) Properly installed with no undue force imposed from piping or supports.

(3) Is properly lubricated.

(4) Motor rotation is correct.

(5) Free of overheating.

(6) Free of vibration.

(7) Free of noise.

(8) Functions without overloading.

(9) Piping and other connections are completed.

(10) No leaks at equipment connections (static pressure testing).

j. Inspection and certification to be conducted by Contractor.

k. Instrumentation and Control Inspection and Tests

l. Inspect and certify instrumentation and control circuits for the following:

(1) Loop checks have been completed for all signal and control circuits.

(2) All instruments have been calibrated.

(3) All instrumentation tubing has been pressure tested and any leaks repaired.

(4) Manual modes function as intended.

(5) Protective interlocks function as intended.

(6) Remote modes function as intended.

(7) Automatic modes function as intended.

m. Instrumentation tests include the following:

(1) Complete loop checks for all signals and controls. Control panel operates process properly in automatic mode.

2. Tests certificates shall be submitted no later than 30 calendar days, after testing ends. The Engineer and Owner shall have no more than 30 calendar days to complete a review and return with any exceptions noted.

3.03 STARTUP:

A. Provide 30 days written notice to the Engineer for each startup procedure so that the Engineer, may witness the each startup procedure. The Engineer may witness the performance of any or all startup procedure, at their option.

B. Startup shall begin at the conclusion of Functional Completion Testing, when the equipment or unit process systems are subjected to full operation using a process flow substitute.

1. Startup activities shall be carried out with clean water or air, or other flows as required to show the equipment and unit process systems are functional.

2. Process flows or process solids shall not be used for Startup.

3. The various vendors, equipment suppliers and manufacturers shall provide on-site supervision and assistance for Startup services for the new facility.

C. The Contractor shall coordinate all startup activities for equipment and unit process systems in accordance with the accepted Plan. The Contractor shall develop a detailed Startup plan as part of that Plan that includes the following as a minimum:

1. Description of the overall, general startup process.

2. List of equipment and unit process systems included for Startup activities.

3. Detailed startup sequence of activities.

4. Equipment and system boundaries as shown using marked-up P&IDs.

5. Listing of staff and responsibilities for activities.

D. Startup Requirements: The following are minimum requirements for completion of Startup activities:

1. Startup shall show that the equipment or unit process systems are suitable for continuous operation using clean water and other fluids or gases (no process fluids or solids) and that the flows and operating parameters are in compliance with specified design conditions.

a. Startup shall also demonstrate that local and remote instrumentation and controls are functioning properly and communicating with each other properly.

b. Equipment or unit processes shall be operated for a minimum of 2 days without interruptions in service.

c. If the startup fails, the contractor will be responsible for redoing the startup testing at no additional costs to the owner.

E. Documentation Requirements:

1. A Startup certificate shall be prepared and submitted to the Engineer for review and returned with any exceptions noted. The reports shall include, but not be limited to, the following:

2. Contents of the certificate shall be at a minimum:

   a. Contractor Review Comments and Approval Page. This page shall include Certification by the preparer that he/she is the person responsible for the test data and the data is authentic and accurate. This page shall include a listing and signature of all wittiness's to the test. Certification by the Contractor that the equipment or the unit process systems were operated continuously for the specified period and that the equipment or unit process systems operated in compliance with the specified operating conditions, parameters and performance.

   b. Equipment Suppliers Review Comments and Approval Page. This page shall include Certification by the equipment or unit process systems suppliers that the equipment or unit process systems have been started up properly and operated within the design parameters. Certification by the equipment or unit process systems supplier that the equipment or the unit process systems were operated continuously for the specified period and that the equipment or unit process systems operated in compliance with the specified operating conditions, parameters and performance.

   c. Engineer Review Comments, and Approval Page.

   d. Process, Equipment, and P&IDs Involved in this startup test.

   e. Startup Schedule

   f. Test Descriptions/Procedures

      (1) Equipment or unit process systems tested.

      (2) Test dates.

      (3) Electrical Inspection and Tests

      (4) Test results.

      (5) Any repairs or corrections required to obtain acceptable test results.

      (6) Calibration sheet for instrumentation or devices used for testing but not part of plant installation.

g. Appendix:

(1) A summary of all data used in the calculations, including source, formulas with all terms defined.

(2) Calculations for all data submitted, fully defined.

(3) Copies of all raw field data sheets, including those indicating sampling point locations, and notes.

(4) Production and/or operational data.

(5) Calibration procedures and work sheets for sampling equipment.

(6) Copies of calibration records for instrumentation.

SECTION 01 78 27

RELIABILITY TEST

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section specifies the Reliability Test work required as a basis for completion of the project.

1. The Reliability Test is an extended operation test as part of the overall Completion Testing requirement.

2. The Reliability Test shall be scheduled as specified herein and in accordance with Section 01 78 25.

B. An extended operation Reliability Test shall be completed for the constructed facilities to confirm that the equipment and unit process systems provided by this contract work together as a complete Facility under continuous operation for the specified time period.

1. The Reliability Test shall be conducted after all the major equipment and unit process systems have successfully completed in accordance with Plant Testing Startup and Commissioning in accordance with Section 01 78 25.

C. The Contractor will provide guidance for managing, supervising, and directing the Owner's designated operating and maintenance staff during the Reliability Test.

1. The Contractor shall provide the services of equipment and systems suppliers to assist.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 RELIABILITY TEST PLAN:

A. A detailed test plan shall be prepared and submitted to the Engineer for review and returned with comments prior to commencing the Reliability Test in accordance with Section 01 33 00. The plan shall be prepared by the Contractor in conjunction with the equipment or unit process suppliers with review by the Engineer. Minimum requirements of the Reliability Test Plan shall be:

1. A description of the schedule of events.

2. A description of the instrument readings required and frequency of readings.

3. A detailed layout showing the valves, pumps, instruments, generators, etc. that will be operated/opened closed and cycled through.

3.02 RELIABILITY TESTING:

A. For the Reliability Test, the Influent Pump Station systems shall be operated to obtain stable operating conditions, typical of normal operation of the facility. Each side of the influent pump station shall be operated independently to demonstrate operability.

B. Reliability Test operating data, shall be collected and submitted to the Engineer and Owner on a daily basis for review.

1. Test data collected at a minimum shall include operating conditions for influent pumps and generators.

C. Contractor shall be responsible for including any temporary or permanent connections necessary to recirculate water between the forcemains to demonstrate operability of the pump station.

D. Local and remote on-site instrumentation equipment shall be used to obtain necessary data to document operating parameters. Where local instrumentation is available, manual logging of the data shall be done in conjunction with the instrumentation readings to verify remote instrumentation readings. The operating data will be used by the Engineer to determine the successful completion of the test.

1. The Facility shall be operated continuously for the period of 5 days to demonstrate sustainable, reliable operation while recirculating W1 or W3 water.

a. For the Reliability Test, plant data shall be collected and recorded to show that the Facility was operated in accordance with normal ranges and performance parameters for the facility.

b. Components of the systems shall be those items associated with the system being operated and not a part of other idle systems. The systems to be run to demonstrate a successful Reliability Test are:

(1) Influent Pumps

(2) Control Valves/Flow Metering Instruments

(3) Backup Generators

c. Up to 4-12 hour shutdown periods for maintenance will be allowed during the test period. Shutdowns that occur because of utility power outages, acts of God, or failure of support systems not part of this contract, are exempt from the allowed shutdown periods. Operation of standby equipment or processes shall not be allowed unless part of the constructed system. If more than the allowed shut downs occur, corrective measures shall be taken by the Contractor and the test shall be re-run in its entirety at no additional cost to the Owner.

3.03 TEST COORDINATION:

A. The Contractor will provide guidance for managing, supervising, and directing the Owner's designated operating and maintenance staff during the Reliability Test.

1. The Contractor shall work closely with the equipment or unit process systems suppliers to aid in coordination of required plant functions involving systems not furnished by the supplier of the equipment or unit process systems suppliers. This shall include but is not limited to support equipment, utilities, and support processes.

B. The Contactor shall furnish authorized competent representatives of the equipment or unit process systems suppliers to attend and assist with the Reliability Test.

1. The equipment and unit process systems shall not be solely operated by these representatives.

2. All modifications to operations must be through the Contractor and any changes in operation recommended by these representatives shall be thoroughly explained and documented to the operating staff.

3.04 TEST FAILURE:

A. Pump Station operating data shall be used to determine that the Facility has successfully completed the Reliability Test. If at any time the daily data does not indicate acceptable operation, the Engineer will notify the Contractor to change or modify operation to bring the operation back into acceptable ranges.

B. In the event that the Reliability Test was not successfully completed, the Contractor shall repeat the test at no additional cost to the Owner.

3.05 LETTER OF COMPLETION:

A. After review and return with any exceptions noted of Reliability Testing data reports, the Engineer shall provide a Letter of Completion (with exceptions noted) to the Contractor for the Facility.

END OF SECTION

SECTION 01 78 36

WARRANTIES AND BONDS

PART 1 - GENERAL

1.01 SCOPE OF WORK:

A. This Section specifies general administrative and procedural requirements for warranties and bonds required by the Contract Documents, including manufacturer's standard warranties on products and special warranties.

1.02 DEFINITIONS:

A. Standard Product Warranties are pre-printed written warranties published by individual manufacturers for particular products and are specifically endorsed by the manufacturer to the Owner.

B. Special Warranties are written warranties required by or incorporated in the Contract Documents, either to extend time limits provided by standard warranties or to provide greater rights for the Owner.

C. Standard Product Warranties and Special Warranties shall start on the date established as the date of Substantial Completion.

1.03 RELATED WORK:

A. Refer to Conditions of Contract for the general requirements relating to warranties and bonds.

B. General closeout requirements are included in Section 01 77 00.

C. Specific requirements for warranties for the Work and products and installations that are specified to be warranted, are included in the individual Sections of Division 2 through 46.

D. Certifications and other commitments and agreements for continuing services to Owner are specified elsewhere in the Contract Documents.

1.04 SUBMITTALS:

A. Submit written warranties to the Owner prior to the date fixed by the Engineer for Substantial Completion. If the Certificate of Substantial Completion designates a commencement date for warranties other than the date of Substantial Completion for the Work, or a designated portion of the Work, submit written warranties upon request of the Owner.

B. When a designated portion of the Work is completed and occupied or used by the Owner, by separate agreement with the Contractor during the construction period, submit properly executed warranties to the Owner within fifteen days of completion of that designated portion of the Work.

C. When a special warranty is required to be executed by the Contractor, or the Contractor and a subcontractor, supplier or manufacturer, prepare a written document that contains appropriate terms and identification, ready for execution by the required parties. Submit a draft to the Engineer for acceptance prior to final execution.

D. Refer to individual Sections of Divisions 2 through 46 for specific content requirements, and particular requirements for submittal of special warranties.

E. At Final Completion, compile a pdf file of each required warranty and bond properly executed by the Contractor, or by the Contractor, subcontractor, supplier, or manufacturer. Organize the warranty documents into an orderly sequence based on the table of contents of the Contract Documents and submit under a separate cover. Provide bookmarks embedded into the pdf for easy access.

F. Table of Contents: Neatly typed, in the sequence of the Table of Contents of the Contract Documents, with each item identified with the number and title of the specification Section in which specified, and the name of the product or work item.

G. When operating and maintenance manuals are required for warranted construction, provide additional copies of each required warranty, as necessary, for inclusion in each required manual.

1.05 WARRANTY REQUIREMENT:

A. Related Damages and Losses: When correcting warranted Work that has failed, remove and replace other Work that has been damaged as a result of such failure or that must be removed and replaced to provide access for correction of warranted Work.

B. Reinstatement of Warranty: When Work covered by a warranty has failed and been corrected by replacement or rebuilding, reinstate the warranty by written endorsement. The reinstated warranty shall be equal to the original warranty with an equitable adjustment for depreciation.

C. Replacement Cost: Upon determination that Work covered by a warranty has failed, replace or rebuild the Work to an acceptable condition complying with requirements of Contract Documents. The Contractor is responsible for the cost of replacing or rebuilding defective Work regardless of whether the Owner has benefited from use of the Work through a portion of its anticipated useful service life.

D. Owner's Recourse: Written warranties made to the Owner are in addition to implied warranties, and shall not limit the duties, obligations, rights and remedies otherwise

available under the law, nor shall warranty periods be interpreted as limitations on time in which the Owner can enforce such other duties, obligations, rights or remedies.

E. Rejection of Warranties: The Owner reserves the right to reject warranties and to limit selections to products with warranties not in conflict with requirements of the Contract Documents.

F. The Owner reserves the right to refuse to accept Work for the Project where a special warranty, certification, or similar commitment is required on such Work or part of the Work, until evidence is presented that entities required to countersign such commitments are willing to do so.

G. Disclaimers and Limitations: Manufacturer's disclaimers and limitations on product warranties do not relieve the Contractor of the warranty on the Work that incorporates the products, nor does it relieve suppliers, manufacturers, and subcontractors required to countersign special warranties with the Contractor.

SECTION 01 78 39

PROJECT RECORD DOCUMENTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide project record documents as indicated and in compliance with Contract Documents.

B. Maintain at site one record copy of:

1. Drawings.

2. Project Manual.

3. Addenda.

4. Change orders and other modifications to Contract.

5. Engineer's Field Orders, Work Change Directives, Written Amendments, or clarifications.

6. Returned Shop Drawings and other submittals.

7. Field test records.

8. Construction photographs.

9. Associated permits.

10. Certificates of inspection and approvals.

1.02 SUBMITTALS:

A. At Substantial Completion:

1. Deliver pdf marked up set of Drawings to Engineer for use in preparation of record drawings.

B. Submit with transmittal letter containing following:

1. Date

2. Project title and number

3. Contractor's name and address

4. Title of record document

5. Signature of Contractor or authorized representative

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 MAINTENANCE OF DOCUMENTS AND SAMPLES:

A. Store record documents in electronic format.

1. Provide secure storage space for storage of samples.

B. Maintain record documents in electronic format accessible via cloud storage system for Engineer and Owner to access at any time. Do not use record documents for construction purposes.

C. Make record documents and samples available for inspection by Engineer or Owner.

D. Failure to properly maintain record documents may be reason to delay portion of progress payments until records comply with Contract Documents.

3.02 RECORD DOCUMENTS:

A. General:

1. Maintain complete set of Drawings and Project Manual, including Addenda, annotated to show changes made during construction.

2. Label document “PROJECT RECORD”.

3. Record information concurrently with construction progress:

a. Do not conceal Work until information is recorded.

b. Record changes made by Field Order, Change Order or Work Change Directive and identify document number.

c. Record changes made by Change Order, Work Change Directive or order for minor change in Work and identify document number.

4. Give particular attention to concealed equipment and materials that would be difficult to measure and record at later date.

B. Drawings:

1. Graphically depict changes by modifying or adding to plans, details, sections, elevations, or schedules. Contractor may be required to generate sketches to accurately depict what was build and acceptance shall be at the discretion of the Engineer if sufficient information is provided.

2. Make changes on each sheet affected by changes.

3. Dimensions:

a. Depths of various elements of foundation in relation to finish first floor datum.

b. Horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements.

4. Location of internal utilities and appurtenances concealed in construction, referenced to visible and accessible features of structure.

5. Details not on original Drawings.

6. Location and identification of exposed interior piping, including those shown schematically on Drawings.

7. Size of equipment and location including connections.

8. Standard details shall be modified to depict actual construction activities if consistently modified for the project. Isolated locations with a change from a standard detail shall be individually annotated separately.

9. Electrical and Instrumentation:

   a. Horizontal and vertical locations and size of underground cable, conduit, and duct runs dimensioned from established building lines.

   b. Plan locations, alignments, and size of interior concealed and exposed feeders and conduits. This shall include conduits and feeders cast into concrete.

   c. Size and location of access panels.

   d. Variations from original Drawings.

C. Specifications:

1. Mark Specification sections to show substantial variations in actual Work performed in comparison with text of Specifications and modifications.

2. Include variations in products delivered to site and from manufacturer's installation instructions and recommendations.

3. Give particular attention to substitutions and selection of options and similar information.

4. Note related record drawing information and Product Data.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 01 81 13.01

SUSTAINABLE DESIGN REQUIREMENTS – ENVISION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Envision is a sustainability certification framework that includes 64 sustainability and resilience credits organized around five categories: Quality of Life (QL), Leadership (LD), Resource Allocation (RA), Natural World (NW), and Climate and Resilience (CR). There are five levels of achievement under each credit. The levels of achievement in order of increasing point value are Improved, Enhanced, Superior, Conserving, and Restorative. Envision is designed for infrastructure projects and will be applied campus-wide for the NEW WRF. The project is pursuing Platinum certification under the Envision v3 framework. Documentation of sustainability practices from design through operations is the basis of framework requirements.

B. Section includes general requirements and procedures for compliance with certain Envision credits needed for the Project to obtain Envision Platinum certification based on the Institute for Sustainable Infrastructure (ISI) Envision Certification program, meaning at least 50 percent of total applicable points must be met under Envision Version 3, 2018.

C. The following Envision credits require compliance during construction:

1. QL1.3 Improve Construction Safety

2. QL1.6 Minimize Construction Impacts

3. QL3.3 Enhance Local Views and Character

4. LD1.4 Pursue Byproduct Synergies

5. RA1.1 Support Sustainable Procurement Practices

6. RA1.2 Use Recycled Materials

7. RA1.4 Reduce Construction Waste

8. RA1.5 Balance Earthwork on Site

9. RA2.2 Reduce Construction Energy Consumption

10. RA3.3 Reduce Construction Water Consumption

11. NW2.1 Reclaim Brownfields

12. NW2.3 Reduce Pesticide and Fertilizer Impacts

13. NW2.4 Protect Surface and Groundwater Quality

14. NW3.1 Enhance Functional Habitats

15. NW3.2 Enhance Wetland & Surface Water Functions

16. NW3.4 Control Invasive Species

1.02 REFERENCES:

A. Institute for Sustainable Infrastructure (ISI) (https://sustainableinfrastructure.org/): Envision – Version 3

1.03 ADMINISTRATIVE REQUIREMENTS:

A. The Contractor shall respond to questions and requests from the Engineer, the Owner, and ISI regarding Envision credits or other sustainability requirements that are the responsibility of the Contractor, that depend on product selection or product qualities, or that depend on the Contractor's procedures until ISI have made their determinations on the Project's Envision certification application. Document responses as informational Submittals.

B. Contractor should assign a person as the Envision Coordinator. This person can have other project responsibilities but shall be the point person for all project Envision-related questions/reporting. The Envision Coordinator shall:

1. Ensure compliance with the sustainability requirements document in this and subsequent sections.

2. Provide monthly reporting of inventories related to sustainable procurement (RA1.1), recycled materials (RA1.2), construction waste diverted (RA1.4), earthwork (RA1.5), and energy (RA2.2) and potable water consumption during construction (RA3.3).

3. Compile sustainability submittal documentation from applicable Manufacturers.

4. Provide a monthly log of sustainable requirements evaluated and implemented during the course of the entire project.

C. Provide Envision Action Plan within 30 days of Notice to Proceed and include the following:

1. Envision Coordinator Contact Information

2. Construction Management Plan for complying with identified Envision credits

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Envision Coordinator: Notify the Engineer of changes in personnel performing the Envision Coordinator function.

D. The Owner reserves the right to reject products and assemblies based on incomplete or inaccurate submittals.

1.05 ENVISION CRITERIA:

A. QL 1.3 Improve Construction Safety:

1. Targeted Level of Achievement: Conserving

a. Contractor makes strong commitments to monitor and improve health and safety for onsite construction operations.

b. Documentation is created to track health and safety performance, promote best practices during construction, and to correct any deficiencies.

c. Safety and security competency training for all field personnel are conducted as specified in project safety plan. Contractor provides minimum training requirements.

d. Contractor has a specific site and project security plan. Contractor provides minimum training requirements.

e. Contractor provides programs that promote health and wellbeing.

B. QL1.6 Minimize Construction Impacts:

1. Targeted Level of Achievement: Conserving

a. A Construction Management Plan is implemented to address the temporary inconveniences associated with construction. Plan is informed by stakeholder engagement.

b. The Construction Management Plan addresses four types of construction impacts: noise, safety/wayfinding, access/mobility, or lighting.

c. The Construction Management Plan includes robust feedback mechanisms and performance monitoring and reporting for construction impacts.

C. QL3.3 Enhance Local Views and Character:

1. Targeted Level of Achievement: Restorative:

a. The Construction Management Plan identifies how the Northwest Oil Drain will be protected during construction.

D. LD1.4 Pursue Byproduct Synergies:

1. Targeted Level of Achievement: Conserving

a. The project includes short-term byproduct reuse during construction, e.g., beneficially reusing or repurposing traditional waste streams (Long-term reuse of effluent, heat, and gas will occur during operation.)

E. RA1.1 Support Sustainable Procurement Practices:

1. Targeted Level of Achievement: Enhanced

a. A minimum of 15 percent (by weight, cost, or volume) of the purchased materials shall follow sustainable practices as identified by Salt Lake City Policy 6.01.07 Sustainable Procurement, and SLCDPU New Water Reclamation Facility (WRF) Project EXHIBIT S – Support Sustainable Procurement Practices.

F. RA1.2 Use Recycled Materials:

1. Targeted Level of Achievement: Superior

a. A minimum of 25 percent (by weight, cost, or volume) of the purchased materials shall be considered recycled materials with recycled content and/or reused existing structures or materials.

G. RA1.4 Reduce Construction Waste:

1. Targeted Level of Achievement: Enhanced

a. A Construction Waste Management Plan is implemented that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be sorted on site or commingled.

b. A minimum of 50 percent (by weight or volume) of the waste materials shall be recycled, reused and/or salvaged.

H. RA1.5 Balance Earthwork on Site:

1. Targeted Level of Achievement: Enhanced

2. Contractor meets one of the following:

(1) 100 percent of fill and excavated materials are sourced or reused within 10 miles of the site; or

(2) Excavated material moved off site and/or fill brought onto the site does not exceed 50 percent of total site soil handling.

I. RA2.2 Reduce Construction Energy Consumption:

1. Targeted Level of Achievement: Improved

a. Planning reviews are used to identify and analyze options for reducing energy consumption during construction.

J. RA3.3 Reduce Construction Water Consumption:

1. Targeted Level of Achievement: Superior

a. Planning reviews are used to identify and analyze options for reducing water consumption during construction.

b. At least five (5) potable water conservation strategies are implemented.

K. NW2.1 Reclaim Brownfields:

1. Targeted Level of Achievement: Conserving

a. The project is located on a site classified as a brownfield or is known to contain contamination.

b. Active remediation, or a combination of active and passive remediation, is performed to reduce human exposure and to remove or break down contamination on the site.

L. NW2.3 Reduce Pesticide and Fertilizer Impacts:

1. Targeted Level of Achievement: Superior

a. Fewer, little, or no fertilizers or pesticides will be used on the project site during construction and operation.

(1) Exceptions are allowed for the controlled use of fertilizer for initial landscaping establishment.

(2) Exceptions are allowed for the controlled use of pesticides for removal of existing invasive species.

M. NW2.4 Protect Surface and Groundwater Quality:

1. Targeted Level of Achievement: Restorative:

a. Contractor determines potential impacts to surface water or groundwater quality, including temperature, during construction.

b. Contractor reduces the risk of quality degradation to surface water and/or groundwater during construction.

N. NW3.1 Enhance Functional Habitats:

1. Targeted Level of Achievement: Superior

a. Efforts are made to avoid and minimize impacts to existing terrestrial habitats.

b. Mitigation measures ensure that existing habitat functions including quantity, quality, and connectivity are maintained and two or more of these ecosystem functions are enhanced compared to existing conditions.

O. NW3.2 Enhance Wetland & Surface Water Functions:

1. Targeted Level of Achievement: Superior

a. Actively protect three ecosystem functions including hydrologic connection, water quality, aquatic/riparian habitat, and sediment transport/sedimentation.

P. NW3.4 Control Invasive Species:

1. Targeted Level of Achievement: Restorative

a. Best practices are used to prevent unintentional introduction of known invasive species to the site.

b. The Construction Management Plan includes provisions for preventing the introduction of invasive species (plant or animal).

c. The Construction Management Plan establishes a program that controls minor infestations of invasive species on site before and throughout construction.

d. Contractor establishes and implements a program that controls minor infestations of invasive species on site before and throughout construction.

e. Contractor guards against future infestations by supporting the establishment of native and/or noninvasive species.

1.06 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

B. QL1.3 Improve Construction Safety:

1. Contractor shall submit documentation of strong commitments to monitor and improve health and safety for onsite construction operations.

2. Contractor shall submit documentation of tracking health and safety performance, promoting best practices during construction, and correcting any deficiencies.

3. Contractor shall submit documentation of safety and security competency training programs.

4. Contractor shall submit documentation of a specific site and project security plan.

5. Contractor shall submit documentation of programs that promote health and wellbeing.

C. QL1.6 Minimize Construction Impacts:

1. Contractor shall submit a Construction Management Plan that addresses concerns from stakeholders associated with the temporary inconveniences of construction and mitigation measures for at least four of the following: noise, safety/wayfinding, access/mobility, or lighting. The Construction Management Plan shall include robust feedback mechanisms and performance monitoring and reporting for construction impacts.

2. Programs to monitor and inform impacted stakeholders on project performance in addressing construction impacts shall be documented.

D. QL3.3 Enhance Views and Local Character:

1. Contractor shall submit a Construction Management Plan that addresses how the Northwest Oil Drain will be protected during construction.

E. LD1.4 Pursue Byproduct Synergies:

1. Contractor shall submit a Construction Waste Management Plan that, at a minimum, identifies the materials to be diverted from disposal and how the materials will be beneficially reused/repurposed, including the final destination of the materials.

2. Contractor shall submit an inventory of waste materials that have been recycled, reused, or salvaged including a general description of each type/category of

construction and demolition materials generated, location and percentage of materials reused/repurposed by weight or volume.

3. Contractor shall submit an inventory and description of other actions taken to beneficially reuse conventional waste streams during construction, if not already captured in other submittals.

F. RA1.1 Support Sustainable Procurement Practices:

1. Contractor shall submit an inventory of purchases with supporting calculations of the percentage of total project materials by cost, weight or volume that align with the sustainable procurement practices including a description of the materials, the Manufacturer or Supplier of the material, and evidence of the disclosure requirements.

G. RA1.2 Use Recycled Materials:

1. Contractor shall submit an inventory of total materials used on the project by weight, volume, or cost (this must be consistent for all inventories).

2. Contractor shall submit an inventory of materials containing recycled content including the name of the product, name of the manufacturer, the weight, volume, or cost of the material (consistent for all materials), and the percentage of recycled content (either post-industrial or post-consumer recycled content).

3. Contractor shall submit an inventory of existing materials or structures that have been reused or salvaged including the location and weight, volume, or cost. In determining weight, volume, or cost, the project team may refer to standard equivalents.

H. RA1.4 Reduce Construction Waste:

1. Contractor shall submit a Construction Waste Management Plan that, at a minimum, identifies the materials to be diverted from disposal and whether the materials will be sorted on site or commingled.

2. Contractor shall submit an inventory of waste materials that have been recycled, reused, or salvaged including a general description of each type/category of construction and demolition materials generated, location and percentage of materials diverted by weight or volume.

I. RA1.5 Balance Earthwork on Site:

1. Contractor meets one of the following requirements:

a. Contractor shall submit documentation showing how the project balanced cut and fill on site and calculations of the percentage of excavated materials remaining on site; or

b. Contractor shall submit documentation showing the destination of any materials moved off site and their proximity to the project site (must be within 10 miles).

J. RA2.2 Reduce Construction Energy Consumption:

1. Contractor shall submit documentation that one or more planning reviews were conducted to identify and analyze options for reducing energy consumption during construction.

K. RA3.3 Reduce Construction Water Consumption:

1. Contractor shall submit documentation that one or more planning reviews were conducted to identify and analyze options for reducing potable water consumption during construction.

2. Contractor shall submit documentation that the project has implemented water conservation strategies during construction as specified in the Envision V3 manual.

3. Contractor shall submit calculation of potable water saved (gallons) for each strategy as compared to not implementing the strategy over the construction duration.

L. NW2.1 Reclaim Brownfield:

1. Contractor shall submit evidence of contamination on site. Documentation shall include information delineating the lateral and vertical extents of impact and the concentrations of the identified contamination of concern.

2. Contractor shall submit a mitigation and remediation plan that has been approved by the appropriate regulatory agencies.

3. Contractor shall submit construction phase monitoring and remediation plans to ensure contaminant mobilization is minimized and in compliance with applicable federal, state, and local exposure requirements and planned development.

M. NW2.3 Reduce Pesticide and Fertilizer Impacts:

1. Contractor shall submit documentation indicating the necessity, benefits, and term of use for any fertilizers or pesticides used on the project site.

N. NW2.4 Protect Surface and Groundwater Quality:

1. Contractor shall submit documentation explaining potential impacts to surface water and/or groundwater quality, their risk, and consequences.

2. Contractor shall submit documentation demonstrating that spill and leak prevention and response plans are in place.

3. Contractor shall submit documentation of project construction decisions intended to reduce the risk of surface water and/or groundwater quality degradation.

O. NW3.4 Control Invasive Species:

1. Contractor shall submit a Construction Management Plan to prevent the introduction of invasive species. The plan includes best practices to ensure that construction materials and equipment used on site are free of invasive species and seeds.

2. Contractor shall submit documentation of control, containment or suppression activities during construction for any major infestations of invasive species found on site.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 ENVISION CREDITS:

A. QL 1.3 Improve Construction Safety:

1. Contractor shall comply with project safety plan.

2. Contractor shall track health and safety performance and correct any deficiencies that are identified during construction as specified by the project safety plan.

3. Contractor shall implement safety training for all field personnel as specified by the project safety plan.

B. QL1.6 Minimize Construction Impacts:

1. Contractor shall implement procedures and policies to minimize construction impacts as specified by the Construction Management Plan.

C. LD1.4 Pursue Byproduct Synergies:

1. Contractor shall comply with the Construction Waste Management Plan.

2. Contractor shall reuse or repurpose existing structures or materials when possible.

D. RA1.1 Support Sustainable Procurement Practices:

1. Contractor shall select materials that align with Salt Lake City Policy 6.01.07 Sustainable Procurement guidelines, and SLCDPU New Water Reclamation Facility (WRF) Project Exhibit S – Support Sustainable Procurement Practices.

E. RA1.2 Use Recycled Materials:

1. Contractor shall select recycled materials, materials with recycled content, and/or reused existing structures or materials in accordance with recycled materials requirement.

F. RA1.4 Reduce Construction Waste:

1. Contractor shall recycle, reuse and/or salvage waste materials in accordance with the waste reduction requirement.

G. RA1.5 Balance Earthwork On Site:

1. Contractor shall source fill and/or reuse cut from sites that meet credit requirements.

H. RA2.2 Reduce Construction Energy Consumption:

1. Contractor shall attend planning reviews to identify and analyze options for reducing energy consumption during construction.

I. RA3.3 Reduce Construction Water Consumption:

1. Contractor shall attend planning reviews to identify and analyze options for reducing water consumption during construction.

2. Contractor shall implement five (5) water conservation strategies identified during planning reviews.

J. NW3.1 Enhance Functional Habitats:

1. Contractor shall manage wetlands restoration efforts during construction.

K. NW3.2 Enhance Wetland & Surface Water Functions:

1. Contractor shall manage wetlands restoration efforts during construction.

L. NW3.4 Control Invasive Species:

1. Contractor shall implement the programs and policies for controlling invasive species throughout construction as specified by the Construction Management Plan.

END OF SECTION

DIVISION 02

EXISTING CONDITIONS

Page Intentionally Left Blank

SECTION 02 01 20

PROTECTING EXISTING UNDERGROUND UTILITIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. The Contractor must protect all existing underground utilities within the work limits and along adjacent property that may be impacted through construction activities, regardless of if these utilities are shown on the contract documents, including but not limited to:

1. The existing forcemains between the existing IPS and the WRF.

2. The existing overhead power lines along Reclamation Rd.

3. Compaction.

4. Alternative support methods.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Record drawings to include record survey coordinates and elevations.

2. Proposed locations for any potholes per Section 02 32 19.

1.03 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.04 PROJECT/SITE CONDITIONS:

A. Pipelines will be indicated on the drawings, but the right is reserved to the Owner, acting through the Engineer, to make such modifications in location as may be found desirable to avoid interference with existing utilities.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Except as indicated, or as specifically authorized by the Engineer, where existing utilities to remain must be removed, reconstruct utilities with new material of the same size, type, capacity, and quality as that removed.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Comply with the requirements in Section 01 14 14.

B. Notify Bluestakes of Utah at least 72 hours before digging operations are scheduled to begin.

C. Review pothole data provided by Owner.

D. Potholes: Excavate potholes per Section 02 32 19 to field verify the locations, depth of bury, diameter, and pipe material of existing underground utilities at crossings and at tie-in points before ordering materials or commencing excavation. Immediately notify the Engineer if conflicts are encountered.

1. When excavating within 3 feet of existing forcemains, these test pits must be hand-dug.

3.02 PREPARATION:

A. Where utilities are parallel to or cross work, but do not conflict with work, notify the Utility Owner at least 48 hours in advance of construction at the crossing. Coordinate the construction schedule with the Utility Owner.

3.03 PROCEDURES:

A. Protect in Place: Protect utilities in place, unless abandoned, and maintain the utility in service, unless otherwise indicated or specified.

B. Damage to Utilities to Remain: If existing utilities to remain are damaged, immediately notify Utility Owner, and repair to Owner's satisfaction.

3.04 PROTECTION OF THRUST BLOCKS:

A. Protect thrust blocks on existing waterlines or sewer force mains in place or shore to resist the thrust by a means accepted by the Engineer and reconstruct. If the thrust blocks are exposed or rendered to be ineffective in the opinion of the Engineer, reconstruct them to bear against firm unexcavated or backfill material.

END OF SECTION

SECTION 02 01 30

CONNECTIONS TO EXISTING BURIED PIPELINES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Connecting to Existing Buried Pipelines

1. Tapping existing buried ductile iron, and PVC pipelines.

2. Line stopping.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B16.1: AN Standard for Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800

2. C153: Ductile-Iron Compact Fittings for Water Service

3. C223: Fabricated Steel and Stainless Steel Tapping Sleeves

4. C509: Resilient Seated Gate Valves for Water Service

5. C515: Reduced-Wall, Resilient-Seated Gate Valves for Water Supply Service

6. C550: Protective Interior Coatings for Valves and Hydrants

7. C800: Underground Service Line Valves and Fittings

D. Manufacturer's Standardization Society (MSS):

1. SP-60: Connecting Flange Joint Between Tapping Sleeves and Tapping Valves

2. SP-113: Connection Joint Between Tapping Machine and Tapping Valve

E. NSF International (NSF):

1. 61: Drinking Water System Components Health Effects

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Manufacturer’s catalog data for products to be used.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Tapping Sleeves (for tapping outlets 4-inch to 12-inch diameter) for Ductile Iron and PVC Pipe:

1. Manufacturers:

a. Smith-Blair

b. Mueller

c. Romac

2. Products:

a. Complies with AWWA C223.

b. 18-8 Type 304 stainless steel.

c. Bolts, Nuts, and Washers: Type 304 Stainless Steel, coated to protect from galvanic corrosion.

d. Outlet: Recessed for tapping valve per MSS-SP 60.

e. Pressure Rating: To match or exceed rating of existing piping.

f. Certified to meet NSF 61 standard for potable water pipes only.

B. Tapping Valves (4-inch to 12-inch diameter):

1. Manufacturers:

a. Mueller (US Pipe)

b. EJ Prescott

c. American Flow Control

2. Products:

a. Conforms to AWWA C509 or AWWA C515.

b. Ends: Conform to ANSI B16.1, Class 125, and MSS SP-60 and MSS SP-113.

c. Wedge: Iron, fully encapsulated in rubber.

d. Stem: Non-rising.

e. Bonnet and Stuffing Box: 304 stainless steel.

f. Nuts and Bolts: 304 stainless steel.

3. Coating:

a. Fusion bonded epoxy, conforming to AWWA C550.

b. Certified to meet NSF 61 standard for potable water pipes only.

C. Tapping or Service Saddles (4-inch diameter and smaller) for Ductile Iron and PVC Pipe:

1. Manufacturers:

a. Ford Meter Box 202BSD

b. Smith-Blair

c. Romac 202NS

d. Mueller

2. Products:

a. Conforms to AWWA C800 and NSF 61.

b. Body: Bronze or , 85-5-5-5 Cast Red Brass per ASTM B584 or B62 or ductile iron meeting ASTM A536 with 10-12 mil fusion bonded black nylon

c. Outlet: Threaded NPT.

d. Gasket: Buna-N, conforming to NSF 61.

e. Straps: 18-8, Type 304 Stainless Steel.

(1) Single at least 3-inches wide or multiple each 1.5-inches wide.

(2) Double at least 2-inches wide each.

f. Studs, Nuts, and Washers: Type 304 Stainless Steel, coated to protect from galvanic corrosion.

g. Pressure Rating: To match or exceed rating of existing piping.

D. Line Stop Fittings:

1. Manufacturers:

a. ADS, Hydra-Stop

b. Furmanite, IPSCO Flo-Stop

2. Products:

a. Type 304 Stainless Steel split sleeve.

b. Seals: Rubber gasket constructed of Buna-N.

c. Bolts and Nuts: Steel, ASTM A325.

3. Rubber Stopper:

a. Fully expandable rubber, minimum 100 psi pressure rating, or

b. Carbon steel pivoting head with Buna-N sealing element, minimum 100 psi pressure rating.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Line Stopping: Expose the existing pipeline and determine the pipe wall thickness prior to ordering the line stop materials. If wall thickness cannot be visually ascertained, utilize pipe thickness testing using ultrasonic technology.

B. Tapping: Expose the existing pipeline to be tapped. Verify material of construction and outside diameter prior to ordering tapping materials.

3.02 PREPARATION:

A. Coordinate work to be performed with pipeline Owner.

3.03 INSTALLATION:

A. Line Stopping:

1. Install concrete and support thrust blocking before installing the temporary pressure tapping machinery and valve.

2. After tapping and line stopping operations have been completed, seal the tee fitting with an ASTM A36 steel pin-locked completion plug with Buna-N O-ring seal.

3. Close the fitting with a blind flange meeting the requirements of AWWA C110.

4. Repair any damage that occurs to line stop fitting, accessories, or existing pipeline.

5. Dispose of water and/or sewer and existing pipeline at no additional cost to Owner.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 02 32 13

SOIL BORINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide labor, materials, tools and equipment for making borings, including drilling boreholes, taking and preserving soil samples, keeping records, submitting logs and shipping soil samples, as indicated and in compliance with Contract Documents.

B. Wells (permanent or temporary) drilled to a depth greater than 30 feet shall be completed by a licensed Utah Licensed Well Driller, registered with the State, and appropriately abandoned. Complete the work in accordance with applicable state laws, rules, as required.

C. Drill borings at locations, to depths and sizes indicated.

1. Obtain samples of soil samples of type, sizes and recovery indicated.

2. Advance borings through obstructions unless terminated by the Engineer.

a. Relocate borings for convenience and with permission of Engineer.

b. Seal abandoned borehole if required by Engineer.

3. Determine depth to groundwater at boring locations.

4. Perform in situ testing at 5 foot intervals as coordinated with the Engineer.

5. Decontaminate equipment as indicated or as deemed necessary by the Engineer.

D. Complete boreholes as required by Engineer.

1. Install monitoring wells, see Section 02 32 25

2. Seal borehole, or backfill boring as indicated and when authorized by Engineer.

3. Complete boreholes as required by Engineer.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. D1586: Penetration Test and Split Barrel Sampling of Soil.

2. D1587: Thin Wall Tube Sampling of Soils.

3. D2488: Description and Identification of Soils (Visual-Manual Procedure)

4. D3550: Ring-Lined Barnel Sampling of Soils

5. D4220: Preserving and Transporting Soil Samples.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Mail no later than one day after completion of each boring and other subsurface exploration, one copy of signed field log to Engineer at indicated address.

C. After receiving and addressing boring log comments from Engineer, submit three copies of completed typed final boring logs referenced to ground surface with soil strata, together with notes, remarks and pertinent information at the completion of the work. All completed logs neatly type written on 8-1/2-inch by 11-inch paper.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Split Spoon and Drive Tube Samples: Recovery of less than 6 inches of the driven length of undisturbed soil is not an acceptable sample and a second sample is required immediately below unsuccessful recovery, after first advancing the borehole to undisturbed material.

C. Undisturbed Tube Samples:

1. Produce samples suitable for laboratory examination and testing.

2. Samples having less than 50 percent recovery of undisturbed soil is not an acceptable sample and a second sample is required immediately below the unsuccessful recovery, after first advancing the borehole to undisturbed material.

D. Classify soil samples in accordance with ASTM D2488.

1.05 DELIVERY, STORAGE AND EQUIPMENT:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Unless otherwise coordinated with the Engineer deliver or ship samples prepaid to:

1. Address:

AECOM
Attention: Rob Snow, PE
756 East Winchester Street, Suite 400
Salt Lake City, UT 84107

C. Package and transport split spoon and driven tube samples in accordance with ASTM D4220, Group A or B.

D. Package and transport undisturbed tube samplers in accordance with ASTM D4220, Group C or D.

E. Package and transport in accordance with ASTM D5079.

F. Protect jar samples from freezing, overheating, disturbances and breakage.

G. Protect tube samples from vibration, freezing, overheating and disturbance, shield from direct sunlight and store vertically in wooden or Styrofoam containers acceptable to the Engineer.

1.06 SITE CONDITIONS:

A. The site conditions are granular fills overlying generally soft clays with minor sand layers. Much of the fill is undocumented. Use rotary wash or hollow stem auger drilling methods.

B. Potholing may be required to remove obstructions.

C. Potable water for drilling is available to the Contractor on site from the Owner.

1. Coordinate with the Owner and Engineer.

2. Provide means of conveyance from the source to the drill site.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Undisturbed Tubes:

1. Piston and Push Sample Tubes (ASTM D1587):

a. Provide 3-inch O.D., 30-inch long piston sample tubes or 2-inch O.D., 20-inch long push sample tubes as indicated.

b. Provide a sharp cutting edge and positive inside clearance and 16 gage wall thickness.

c. Provide inside diameter of cutting edge 1/64-inch less than O.D. of sampler tube or as deemed necessary by Engineer.

d. Welds may not project from the seam.

e. Provide smooth hard lacquer or teflon coating.

f. Dented or damaged tubes are not acceptable and shall be removed from the site by the Contractor.

B. Sealing Wax: Provide microcrystalline wax such as Gulf Petrowax.

C. Plastic Cap: Provide tight fitting plastic caps for the ends of tubes.

D. Tape: Provide friction tape to attach plastic caps to ends of tubes.

E. Fill Material: Provide non-compressible fill material, such as sand, to backfill the tube between top of the sample and the top cap.

F. Portland Cement (Type I or II) for grout backfill.

G. Sand: Standard washed concrete fine aggregate in accordance with ASTM C33.

H. Bentonite: Chips of compressed bentonite clay, maximum 3/8-inch diameter.

2.02 EQUIPMENT:

A. Drilling Equipment: Provide following as indicated:

1. Truck mounted rig consisting of drilling equipment for advancing rotary wash or hollow stem auger pipe as required for taking required samples

B. Casing: Provide minimum 3-inch I.D. steel, flush jointed pipe or hollow stem augers.

C. Split Spoon Sampler (ASTM D1586):

1. Provide standard 24 inch long, 1-3/8-inch I.D. and 2-inch O.D. split barrel sampler, equipped with check valve, basket shoe sample retainer, as indicated.

D. Piston Tube Sampler: Provide the following as indicated or equal:

1. Stationary piston consisting of thin wall tube sampler containing a close fitting piston operated by a separate piston rod and sampler head with spring and piston rod check.

2. Advance tube to a depth of 24-inches hydraulically. Advancing thin wall tubes by means other than a piston operated sampler is not allowed unless accepted by Engineer.

E. Hammer:

1. 140 pound weight to drive standard split spoon sampler.

2. 300 pound weight to drive steel casing, and 3-inch non-standard split spoon sampler.

PART 3- EXECUTION

3.01 BOREHOLE:

A. Advance borehole to sampling depth by:

1. Spinning casing

2. Hollow stem auger

B. When obstructions are encountered above specified depth, advance casing or borehole past such obstructions.

C. Cased Holes:

1. Spin casing vertically through earth or other materials to such depth below ground surface as required to obtain samples or as deemed necessary.

2. Remove all materials from inside casing to depth sampled using water and acceptable chopping bits or augers.

a. Allow reuse of wash water:

(1) By use of settling basin, or

(2) With permission of Engineer.

b. Size pump used for recirculation of wash water so as to remove all material from inside casing.

D. When using hollow stem augers:

1. Advance augers with plug in place to sampling depth, or

2. Advance augers without plug to sampling depth and cleanout inside casing as described.

E. After drilling and sampling to required depth, install monitoring well (see Section 02 32 25), or backfill boring, as deemed necessary by Engineer.

F. Conduct in-situ testing every five feet as coordinate with the Engineer.

G. Remove casing or auger upon completion of the hole.

1. Do not remove until:

a. Groundwater levels have been measured, or perforated pipe installed.

b. Engineer has authorized such removal.

3.02 SAMPLING:

A. General:

1. Take samples at ground surface and 5-foot intervals or change of strata unless deemed necessary by Engineer.

2. Obtain samples by driving or pushing sampler into undisturbed material below bottom of borehole as deemed necessary by the Engineer or indicated.

B. Split Spoon Samples:

1. Drive standard split spoon sampler to full depth with a 140-pound hammer having a free-fall of 30 inches in conformance with ASTM D1586. Drive 3-inch split spoon sampler to full depth with 300 pound hammer having a free fall of 24-inches in conformance with ASTM D3550.

2. Record number of blows for each 6 inches of penetration.

3. Describe sample in accordance with ASTM D2488.

4. Preserve representative sample(s) in 8-ounce glass jars (ASTM D4220).

5. If earth is very compact and cannot be sampled using split spoon sampling method coring methods may be required to obtain sample.

6. Refusal is defined as a rate of advance of less than 12 inches per 120 blows or 1-inch per 50 blows when driven with a 140-pound hammer free-falling 30 inches.

a. Refusal not accepted as termination of borehole above bottom elevation given or as deemed necessary.

C. Drive Tube Samples:

1. Drive 2-inch I.D. thin wall minimum of 18 inches with 140-pound hammer free-falling 30 inches in conformance with ASTM D3550.

2. Record number of blows for each 6 inches of penetration.

3. Allow sampler to remain at rest for at least 5 minutes to develop friction between sample and tube.

4. Shear the sample with two complete rotations of the tube.

D. Undisturbed Tube Samples:

1. Press 3-inch O.D. thin wall tube to depth of 24 inches below bottom of borehole without rotation in one continuous operation under steady pressure at rate of not less than 1 foot per second in conformance with ASTM D1587.

2. Allow sampler to remain at rest for at least 5 minutes to develop friction between sample and tube.

3. When thin wall sampler is withdrawn from borehole, establish atmospheric pressure at top of sample just below piston.

4. Detach piston head mechanism in manner to cause minimum disturbance to sample.

5. Preserving Tube Samples (ASTM D4220):

a. After retrieving sample, remove 1 inch of sample from bottom of tube to make up jar sample.

b. Remove all disturbed material from top of the tube.

c. Seal ends of tube with wax placed in increments to prevent voids to a total thickness of at least 1 inch.

d. Fill void between wax and end of tube with noncompressible material, such as sand.

e. Seal ends with plastic cap, friction tape and microcrystalline wax. Do not heat wax to more than few degrees above its melting point.

f. Mark tube samples to indicate upper end of sample, sample interval, date collected, and sample recovery.

g. Store samples in accepted containers, in a vertical position and a protected location.

3.03 BACKFILLING BOREHOLE:

A. At the completion of the boring and with permission of the Engineer backfill the boring with a Bentonite/Portland Cement Grout.

1. Mix grout using not more than 6 gallons of water per 94 pound bag of Portland Type I/II Cement. Use 3 to 5 pounds of bentonite powder per bag of cement. Mix water with bentonite prior to adding cement. Mix grout well until free of lumps.

2. Pump cement through a tremie pipe discharging at the bottom of the hole while the casing or augers are still in the ground.

3. When the grout has displaced all fluid inside of the casing and appears at the surface, discontinue pumping and remove tremie pipe.

4. Remove casing or augers in increments. If level of grout falls below the bottom of the casing or augers discontinue removing auger, and continue grouting operations, until grout is again at ground surface.

B. Revisit borehole 24 hours after grouting operation, and backfill the settled top portion with grout.

C. For borings above the water table, backfill the boring using alternating lifts of clean sand and bentonite chips, with permission of the Engineer.

1. Add water to hydrate the bentonite chips.

D. If borings are made through asphalt surfaces, backfill the top 3-inches of the borehole with a black-top patch, tamped into place. Patch should be flush with the existing paved surface.

3.04 RECORDS:

A. As work progresses, drill crew foreman keeps complete, neat, accurate and legible record of each boring that contains the following.

1. Date and time

2. Engineer, Contractor, Inspector, and Drill Foreman

3. Boring number

4. Ground elevation at hole (established by the Engineer)

5. Type of borehole, auger or casing size, sample type(s), blows per foot for driven casing.

6. Height of drop and weight of drop hammer for taking drive samples, and size of drill rod.

7. Results of all boring details arranged on boring log showing stratification, thickness, and classification of materials penetrated, sample locations, type, number, length, recovery, and number of blows required for each 6-inch penetration of the sampler.

8. Depth of groundwater table at each hole prior to removing casing and 24 hours after removing casing.

9. Any unusual groundwater condition such as artesian flow or zones of loss of circulation.

10. Total depth of borehole

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 02 32 14

VIBRATION MONITORING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide vibration monitoring as indicated and in compliance with Contract Documents.

1. Furnish, install, maintain, monitor, and remove vibration monitoring equipment as specified and as indicated.

2. Monitor vibrations, air blast overpressures and noise levels originating from construction operations as indicated or specified.

3. Modify construction operation procedures if existing operation creates vibration, air blast overpressure, or noise exceeding specified amounts.

4. Vibration monitoring for blasting shall conform to the requirements of this specification section and the requirements of all applicable Local and State Authorities.

1.02 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00.

B. Retain the services of an independent vibration consulting firm with the following in-house personnel to conduct the following vibration monitoring requirements:

1. Preparation, signing and stamping of monitoring plans and daily reports, and overseeing monitoring and interpretation of monitoring equipment shall be performed by personnel with the following qualifications:

a. Be a State of Utah Registered Professional Engineer.

b. Have a minimum of 5 years' experience in the vibration consulting field.

c. Have successfully completed at least 5 projects with vibration-inducing operations, air blast overpressures, and noise levels equal to or more severe than those to be encountered.

2. Installation, monitoring and interpretation of monitoring equipment shall be performed by personnel with the following qualifications:

   a. Have at least 3 years' experience in the operation of monitoring equipment proposed for use and interpretation of records produced by such equipment.

   b. Have installed, operated, monitored and interpreted equipment and records on at least 3 projects with vibration-inducing operations, air blast overpressures, and noise levels from similar construction activities.

3. Performed and maintained calibration records on all instruments used to monitor the blasting program.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Qualifications of the independent vibration consulting firm's Professional Engineer as specified in subparagraph 1.02.B.1 including the names of the 5 successful projects with names, current addresses, and telephone numbers of persons in charge of representing the owners or the owners at the time of monitored vibration-inducing operation, air blast overpressures, and noise levels.

2. Qualifications of the vibration consulting firm's personnel to install, operate and interpret the monitoring equipment as specified in subparagraph 1.02.B.2 including the name of the personnel and the names of the 3 projects per person which they installed, operated, monitored, and interpreted monitoring equipment with names, current addresses and telephone numbers of persons in charge of representing the owners or the owners at the time of monitored vibration-inducing operations, air blast overpressures, and noise levels.

3. Two weeks prior to commencement of blasting or other vibration inducing operations, submit in writing the plan for monitoring operations and equipment to be used to assure compliance with the vibration, air blast overpressure, and noise limitation. As a minimum, this plan shall provide for the following:

   a. Recommended vibration limiting methods to meet the specified peak particle velocity limitations and locations for taking measurements.

   b. Manufacturer's brochures and written operation instructions for seismograph recording equipment intended to be used for each vibration occurrence.

4. Daily reports, while blasting or performing other vibration-inducing operations, detailing each source of vibration, location of monitoring, and the vibration records highlighting peak particle velocities. For blasting, include the air blast overpressure records as well as a plot of particle velocity versus scaled distance.

All daily reports shall be stamped and signed by the Vibration Consulting Firm's Professional Engineer.

PART 2 - PRODUCTS

2.01 EQUIPMENT:

A. Provide a low frequency sensitive three-component seismic recording instrument with wave paper trace, variable trigger level setting, peak particle velocity memory operation (in inches/second) and air blast overpressure and sound level readout capability that meets the following criteria:

1. Seismic Frequency Range: 2 to 200 Hertz (plus or minus 3 dB)

2. Acoustic Frequency Range: 2 to 200 Hertz (plus or minus 1 dB)

3. Velocity Range: 0.02 to 4.0 inches per second

4. Sound Range: 90 to 140 dB linear

5. Transducer: Three mutually perpendicular axes: radial, transverse, and vertical

6. Recording: Time-history of waveform capability

B. Manufacturers:

1. Instantel, Inc., Kanata (Ottawa) Ontario, Canada

2. Slope Indicator Co., Seattle, WA

3. Thomas Instruments, Inc., Spoffard, NH

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Furnish specified instrumentation to be installed, operated and interpreted by the vibration consulting firm's personnel, as specified below and indicated.

B. Monitor vibrations and record the entire particle velocity wave train, not just peak velocities. Obtain accurate, legible seismometer records of monitored vibrations.

C. Perform all blasting and other vibration-inducing operations so that vibrations reaching adjacent structures and facilities are within specified limits.

D. Monitor vibrations by measuring the peak particle velocity in the vicinity of work. Peak particle velocity is defined as a maximum vector sum of three velocity components,

measured concurrently in mutually perpendicular directions at any point by an instrument. The peak particle velocity as measured by the vibration consulting firm's personnel on or at the location as specified in the submitted vibration monitoring plan, shall not exceed the limits specified below:

Type of Concrete	Age of Concrete (Hrs)	Peak Particle Velocity In./Sec
Mass Concrete (footings, mats, slab-on-grade, fill concrete, etc.)	0 – 10 11 and over	1.0 2.0
Concrete Structures (walls, columns, elevated slabs, etc.)	0 – 11 11 – 24 24 and over	0.5 1.0 2.0
Existing Structures, Residences or Utilities		0.5

E. Air blast over pressures resulting from the blasting shall be recorded. Operate the instruments to make a permanent record for each blast.

F. In the event any recordings indicate that vibration or air over pressure limits are being exceeded, immediately suspend all blasting and other vibration-inducing operations and submit a report to the Engineer. Revise operations to reduce vibrations and submit a copy of the revised procedure to the Engineer at no additional cost to the Owner.

G. If evidence of displacement or damage to utilities, equipment, or structures is observed or reported, immediately notify the Engineer and discontinue operations creating the vibrations. Revise operation to reduce vibrations and submit a copy of the revised procedure to the Engineer.

H. Restore or replace utilities, equipment, or structures damaged by vibrations or air blast overpressures at no additional cost to the Owner.

3.02 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 02 32 19

SUBSURFACE UTILITY LOCATING (POTHOLING)

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section includes materials and procedures for performing pothole operations to locate existing underground utilities.

B. The work described in this section shall be considered on a case by case basis as proposed by Contractor. Engineer has procured potholing services and included the findings as part of the design provided to Contractor.

1.02 REFERENCES:

A. American Society of Civil Engineers (ASCE):

1. 38-02: Standard Guidelines for the Collection and Depiction of Existing Subsurface Utility Data.

B. Canadian Standards Association (CSA):

1. S250: Mapping of Underground Utility Infrastructure

C. American Public Work Association (APWA) Utah Chapter

1. APWA 2017 Manual of Standard Plans and Specifications

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

B. Submit request for pre-marking of pothole locations at least three calendar days prior to the commencement of field activities.

C. For Work to be completed outside the WRF property and on public rights-of-way, submit a traffic control/protection plan at least 3 calendar days prior to the commencement of field activities.

D. Submit proposed method of potholing, including description of equipment to be used, and schedule for potholing for acceptance at least 14 calendar days prior to the commencement of field activities. Obtain Owner's approval of pothole locations prior to commencement of field activities.

E. Submit field logs to the Owner within two working days after the completion of pothole excavations in each area. Include dates of potholing operations and any additional discovered information or pertinent data. Include for each pothole excavation field log:

1. Pothole number.

2. Date of pothole.

3. Depths to top and bottom of utility (measured from existing grade over utility at pothole).

4. Miscellaneous Contractor's notes.

5. Reference distance to above ground structure or permanent reference point from located utility.

6. Photograph(s) record of each pothole.

F. Submit temporary steel cap and/or steel plate bridging shop drawings at least seven calendar days prior to the commencement of field activities.

G. Submit tamped sand and gravel design for pothole backfill at least 7 calendar days prior to the commencement of field activities.

H. Submit asphalt concrete mix design at least 7 calendar days prior to the commencement of field activities.

1.04 PROCEDURES:

A. Subsurface utility-locating (potholing) services shall conform to CI/ASCE 38-02. For the purpose of this scope, "locate" means to obtain the horizontal and vertical position of the utility line by excavating a circular test hole or narrow trench (where approved of and/or requested by the Owner). Construct test holes using vacuum excavation or comparable nondestructive equipment in a manner that will cause no damage to the utility.

B. Subsurface utility locating shall consist of test hole excavations at locations indicated on the pothole plans as approved by the Owner. Narrow trench excavations (slot potholes) may be required at locations approved by the Owner or to locate multiple parallel utilities.

1.05 TIME OF COMPLETION/SCHEDULE:

A. The Contractor shall diligently prosecute the work to completion after Notice to Proceed to allow Engineer sufficient time to make adjustments to the design, if needed, before the Contractor begins the Work.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Tamped Sand and Gravel Backfill at Test Holes and at Exploratory Trenches

1. Tamped sand and gravel backfill shall consist of Granular Borrow. Refer to APWA 2017 Standard Specifications Section 31 05 13 Common Fill.

B. Asphalt Concrete Pavement Repair at Exploratory Trenches and at Test Holes

1. Asphalt concrete paving shall conform to APWA Section 32 12 05.

2. Asphalt shall be PG58-28 DM 1/2. Asphalt content in the pavement shall be 5.5 percent to 6.0 percent.

3. Areas to be paved shall receive prime coat. Prime coat shall be per APWA Section 32 12 13.19.

4. Aggregate shall be minimum 8-inches per APWA Section 32 11 23.

5. Paving thickness shall match existing plus 1 inch and shall match existing grade.

PART 3 - EXECUTION

3.01 POTHOLING OPERATIONS:

A. Underground Service Alert Requirements: Comply with Blue Stakes of Utah requirements for notification prior to excavation. Contact Blue Stakes of Utah at 1-800-662-4111 (or dial 811) no less than two and no more than 7 days prior to the start of exploratory excavation. Verify whether or not a representative of each utility or agency will be present during excavation, and coordinate with said individual(s). Take any precautions required by the utility owner.

B. Furnish, install, maintain, and remove necessary traffic signs, barricades, lights, signals, cones, pavement markings, and other traffic control devices. Perform traffic control in accordance with Salt Lake City and OSHA Regulations for Construction Projects.

C. Conduct potholing operations in a manner that minimizes the damage potential to existing underground utilities in order to ensure that the existing facilities will remain in operation without interruption. Contractor shall be responsible for, and repair to pre-existing condition (at Contractor's expense) any existing underground utilities damaged by potholing operations.

D. Backfill and repair test hole excavations immediately after obtaining the measurement data. Backfill and repair trench excavations requiring use of temporary steel plate bridging within four working days. Promptly provide notice to the Engineer for

scheduling field survey activities. Advise Owner of number of pothole excavations completed and number remaining.

E. Coordinate and cooperate with and facilitate field data collection by Engineer's surveyor. Pothole excavations shall sufficiently expose subsurface utilities to allow surveyor to easily determine and measure the following data:

1. Elevation at top and bottom of utility.

2. Elevation of existing grade over utility at pothole.

3. Coordinates at surface.

4. Utility type.

5. Outside diameter of utility or width of duct banks.

6. Utility material and condition.

F. Location and Depiction of Existing Utilities: Existing utility plans shall be present and utilized during potholing activities. The plans shall be compared to utility/agency paint markings following Underground Service Alert notification as well as locations premarked by the Owner's surveyor. If discrepancies are found between the plans and paint markings, promptly notify the Owner prior to commencement of any excavation.

3.02 EXCAVATION:

A. Protect utilities or underground structures from damage during potholing. Immediately report any damaged utilities to the affected utility's owner and the Owner. Repair immediately any damaged utilities in accordance with the respective utility owner's requirements. Neatly cut and remove existing pavement. Excavate test holes in such a manner as to prevent any damage to wrappings, coatings, or other protective coverings, utilizing vacuum excavation or hand digging.

B. Methods: Backhoe excavation is not permitted except for trench excavations**.** Use the following methods for pothole excavations:

1. Hand Digging: Hand digging is the method of excavating a pothole by manual means with hand-held, nonmechanical equipment such as a shovel.

2. Vacuum Excavation: Vacuum excavation shall consist of air or water pressure to break up the soil and a vacuum device to collect the spoil. Determine if air or water vacuum excavation shall be used depending upon specific site and environmental characteristics. Soil type such as heavy clay may require water vacuum excavation. Utilize air vacuum excavators if mud from water vacuum excavators cannot be disposed properly. Use air vacuum excavators if damage to utilities, such as cutting through cables, will occur with the use of water vacuum excavators.

   a. Air: Air vacuum excavators shall utilize a high velocity air stream to penetrate, expand, and break up the soil. Remove the loosened particles of soil and rock from the excavation through the use of a vacuum.

   b. Water: Water vacuum excavation systems shall excavate the pothole using high-pressure water to reduce and loosen the soil. Remove the wet soil and mud slurry to a spoil tank using a vacuum.

C. Size of Test Hole Excavation: Maximum test hole size shall be 8 inches in diameter at surface, unless indicated otherwise, or approved by Engineer due to subsurface conditions.

D. Size of Exploratory Trench Excavation: Trench width and length shall be as approved by the Engineer. Width and length may be affected by existing subsurface conditions. Trench depth shall be as required to accurately locate subsurface utilities.

3.03 TEMPORARY STEEL PLATE BRIDGING, WITH A NONSKID SURFACE (WHERE REQUIRED FOR APPROVED TRENCHES)

A. Provide steel plate bridging with a nonskid surface and shoring to preserve unobstructed traffic flow. In such cases, the following conditions shall apply:

   1. Steel plates used for bridging shall extend a minimum of 12 inches beyond the edges of the trench.

   2. Install steel plate bridging to operate with minimum noise.

   3. Shore the trench to support the bridging and traffic loads.

   4. Use temporary paving with cold asphalt concrete to feather the edges of the plates.

   5. Secure bridging against displacement by using adjustable cleats, shims, or other devices.

B. Install steel plate bridging and shoring using the following method:

   1. Attach approach plate(s) and ending plate (if longitudinal placement) to the roadway by a minimum of two dowels predrilled into the corners of the plate and drilled 2 inches into the pavement. Butt subsequent plates to each other. Compact

fine graded asphalt concrete to form ramps, maximum slope 8.5 percent with a minimum 12-inch taper to cover all edges of the steel plates. When steel plates are removed, backfill the dowel holes in the pavement with either graded fines of asphalt concrete mix or concrete slurry.

C. Maintain the steel plates, shoring, and asphalt concrete ramps.

D. Unless specified, use of steel plate bridging at any given location shall not exceed four consecutive working days in any given week. Cover backfilling of excavation with a minimum of 3 inches of temporary layer of cold mix asphalt concrete.

E. The following table shows the required minimal thickness of steel plate bridging required for a given trench width. In addition, plate thickness shall be sufficient for all anticipated loads.

Trench Width (feet)	**Minimum Plate Thickness (inches)**
1	1/2
1-1/2	3/4

F. The Contractor may use standard steel plate with known coefficient of friction equal or exceeding 0.35.

G. Use a "Rough Road" sign with black lettering on an orange background in advanced of steel plate bridging. This is to be used along with any other required construction signing.

3.04 POTHOLE REPAIR:

A. After excavating a test hole or trench, provide and install a temporary steel cap (over test hole) or temporary steel plate bridging (over trench) to facilitate data gathering by Owner's surveyor.

B. Following data gathering by surveyor, remove temporary steel caps and/or steel plate bridging, and backfill excavation with accepted material as follows:

1. Test Hole Excavations: Sand-gravel backfill per Part 2 of this section. Bring to grade with asphalt cement pavement per Part 2 of this section. Match existing pavement thickness plus 1 inch.

2. Exploratory Trenches: Backfill per Part 2 of this section. Match existing pavement thickness plus 1 inch.

C. The finished surface of the repair shall be of like material and constructed to the same finished grade as the adjacent pavement. The finished surface shall be such that it does

not allow water to pond. There shall be no discernable difference in surface level at the joint between the existing pavement and the completed repair.

3.05 DISPOSAL OF CUTTINGS:

A. Dispose of cuttings on-site.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 02 32 25

GROUNDWATER MONITORING WELLS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide groundwater monitoring wells as indicated and in compliance with Contract Documents.

1. Scope includes all labor, materials, tools and equipment to install groundwater monitoring wells at locations indicated on drawings and as directed by the Engineer.

B. Environmental Protection Agency (EPA):

1. RCRA Groundwater Monitoring, Draft Technical Guidance, November, 1992.

2. Guide To Management of Investigation Derived Waste, 9345.3-03fs, January 1992.

C. USDA Natural Resources Conservation Service (NRCS):

1. Soil Texture classification

D. National Sanitation Foundation (NSF)/American National Standards Institute (ANSI):

1. Standard 14: Plastics Piping System Components, and Related Materials, January 14, 2002, Document No. NSF/ANSI 14-2002.

2. Standard 60: Drinking Water Treatment Chemicals – Health Effects (well drilling products)

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Monitoring Well Record Drawings. Document dimensions, depths, intervals:

a. Well Screen

b. Casing

c. Sand Pack

d. Bentonite Seal(s)

B. Provide digital boring log documenting soil types showing soil types, depth to rock, presence or absence of fill materials, Photoionization Detector Readings (PID), split spoon blow counts, and additional pertinent information.

C. Comply with Utah State Regulations.

1. Wells regulated by the State Engineer that are drilled to a depth of greater than 30 feet must be constructed by a currently licensed Utah Licensed Well Driller.

2. A Utah Licensed Well Driller or a Utah Licensed Pump Installer must perform installation and repair of pumps on wells regulated by the State Engineer

3. Utah regulated wells include:

a. Test Wells, Monitoring Wells, and Piezometers

b. Inclinometers and Dewatering Wells if they affect an established aquifer

D. Submit monitoring well record and construction data in accordance with applicable federal, State, and local laws and regulations.

E. Comply with the requirements specified in Section 01 81 13.01.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Follow standard practices ASTM D5092.

C. Install in accordance with specification. Provide personnel licensed or qualified in accordance with local, state, and federal regulations.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Send typed logs to AECOM within 5 days of completion of work.

1. Mailing address:

AECOM
Attention: Rob Snow, P.E.
756 East Winchester Street, Suite 400
Salt Lake City, Utah 84107

1.06 PROJECT/SITE CONDITIONS:

A. Complete well installation and associated work in accordance with Health and Safety Plan (HASP). Read, understand, and sign HASP. Contractor is responsible for the safety of their employees.

B. Adverse weather conditions must be considered. Work will not be conducted during severe weather such as lightning and other hazardous conditions.

C. Consider subsurface utilities and overhead utility hazards. Prior to starting any subsurface work:

1. Ensure that Blue Stakes Utah (phone 811, https://www.bluestakes.org/requests/) has been properly notified and that all subsurface utilities have been identified and cleared.

2. Blue Stakes may not provide clearances for all utilities such as cable television or internet, local municipal water and sewer, or on industrial sites. It is the responsibility of the Contractor to ensure all underground services have been cleared.

3. Coordination with owner and appropriate utility companies MUST be accomplished;

4. Contractor and/or Owner MUST be referenced for responsibility for clearance of utilities in the contract. This applies to ALL subsurface work.

5. Note: Utility "One Call" clearance MUST be verified by owner, site plans, and other means of subsurface obstruction identification. "One Call" subsurface utility clearance often incorporates subcontractors that may or may NOT be accurate.

D. It is the responsibility of the contractor to provide water, power, and required support materials to drill and sample soil borings, to install groundwater monitoring wells, and to properly handle and contain all Investigation Derived Waste (IDW) according to EPA Guide To Management Of Investigation Derived Waste.

1.07 WARRANTY:

A. Contractor must warranty the quality of the well installation and associated work.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Install groundwater monitoring well for the purpose of measuring groundwater levels and water quality.

B. Decontaminate all drilling equipment as necessary prior to starting work and in between boreholes commensurate with the level of contamination. Properly contain all decontamination materials. Install only well materials certified by the manufacturer to be free of contaminants.

2.02 MATERIALS:

A. Sand: Clean, subangular to rounded quartz sand at least 99.0 percent SiO_2 by weight. To ensure freedom from organic impurities, loss on ignition (L.O.I.) should not exceed 0.1 percent. Well sand pack must be appropriately sized corresponding to the well screen size.

B. Well Screen: 10-foot length of flush-jointed, threaded, 2-inch inside diameter, Schedule 40, NSF-pw polyvinylchloride (PVC) pipe with 0.010-inch machined slots. Screen is to be capped at lower end.

1. Three slots are to be spaced at 120-degree intervals along the pipe circumference, with each slot 90 degrees in width. Vertical slot spacing will be 0.125 inches or less.

B. Casing: Flush jointed, threaded, 2-inch diameter, PVC, NSF-pw pipe with non-threaded cap.

C. Bentonite Chips: Pellets of compressed bentonite, maximum 3/8-inch diameter.

D. Protective "stick-up" Casing: 5-foot length, nominal 4-inch diameter steel pipe with vented locking steel cap. Cap shall slip over protective pipe a minimum of 3 inches and

shall be secured with a keyed-alike brass padlock that has a 5/16-inch diameter hardened steel shackle.

E. Flushmount Casing: Minimum 8-inch diameter, traffic resistant, watertight, steel maintenance hole with minimum 12-inch long galvanized skirt. Well shall be secured with a 2-inch diameter gasket security plug with a keyed-alike brass padlock that has a 5/16-inch diameter hardened steel shackle.

F. Concrete: A fine aggregate and cement premix blended with clean, potable water to form thick concrete slurry.

G. Portland cement for grout backfill.

PART 3 - EXECUTION

3.01 WELL INSTALLATION:

A. Daylight the area of the soils investigation using vac-truck or other methods approved by the Engineer to a depth of 4 feet below the existing ground surface.

B. Install in accordance with ASTM D5092.

C. After hole has been bored or backfilled to the proper depth as directed by the Engineer, place a 6-inch layer of clean sand in the bottom of the borehole.

D. Place clean well screen and riser in borehole.

E. Remove casing simultaneously whenever material is placed down hole.

1. Do not withdraw casing faster than material is placed to prevent collapse of hole.

2. Do not withdraw casing too slowly so that sand will bridge inside and lift well screen.

F. Place sand pack to 2 feet above top of well screen and tamp.

G. Place a 2-foot layer of bentonite chips above sand pack. Hydrate bentonite chips with clean potable water, for 2-hour (minimum).

H. Backfill and compact remaining annular space with grout by means of tremie method, or drill cuttings to a depth at which the base of protective casing or flushmount casing will be set.

I. Install centralizers as necessary to ensure the well is straight.

J. If protective “stick-up” casing is required:

1. Install 5-foot length of nominal 4-inch (minimum) inside diameter steel casing with overlapping locking cap extending to 2 feet above ground.

2. Place concrete around steel casing so that it extends to a depth of at least 3 feet and slopes away from the well at the surface.

3. Secure PVC well casing with vented PVC cap.

4. If flushmount casing is required:

a. Secure well with 2-inch diameter expandable security plug with brass lock.

b. Install minimum 8-inch diameter maintenance hole so that it is flush with the above ground surface.

c. Place concrete around maintenance hole extending from bottom of maintenance hole and tapering to a 2-foot diameter concrete pad that slopes away from the well at the surface.

K. Label well appropriately with a permanent non-corrosive tag or permanent markings (e.g., MW-1).

L. Place keyed alike corrosion resistant locks on expandable flush mounted locks or steel stick-up protective casing to deter vandalism. Consider the security requirements of the site and the well.

M. If wells are required in roads or on road shoulders install flush mounted cover. Install bollards with high visibility paint if appropriate to protect well stick ups.

3.02 WELL DEVELOPMENT:

A. After well installation, develop wells by pumping, as directed by the Engineer until water produced is free of particulates. Contain development water for disposal on site as directed by the Engineer.

B. Develop with suction pump if water level is within suction limit.

C. Develop with submersible pump, piston pump, or bailer if water level is too deep for suction pump.

D. Contain all development water and dispose of all development in an on-site facility as directed by the Engineer.

3.03 PROTECTION:

A. Protect wells as necessary in temporary condition (highway cones or other highly visibility markers) or permanently with steel bollards set in concrete if necessary in high traffic areas.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 02 32 29

DECONTAMINATION AND SAFETY PROCEDURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Furnish labor, materials, tools and equipment for decontamination of all equipment and supplies used for drilling borings, taking samples and installing groundwater monitoring wells.

1.02 REFERENCES:

A. Environmental Protection Agency (EPA):

1. Guide to Management of Investigation Derived Waste (IDW), 9345.3-03fs, January 1992.

1.03 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Conduct decontamination of equipment and materials and comply with health and safety requirements in accordance with specification and to satisfaction of Engineer.

C. The Contractor shall evaluate the known and potential hazards.

1. The Contractor’s Health and Safety Plan shall at a minimum conform to the requirements set forth in the AECOM Site-Specific Health and Safety Plan.

2. The Contractor’s Health and Safety Plan shall include any site specific safety requirements required by the site Owner and Governing Authority.

PART 2 - PRODUCTS

2.01 EQUIPMENT:

A. Decontamination Equipment:

1. Portable steam cleaning equipment.

2. Pump sprayer for reagent grade solvent application, satisfactory to Engineer.

3. Water.

4. Lab grade detergent.

5. New brushes for scrubbing equipment.

6. Polyethylene plastic sheeting.

B. Safety Equipment:

1. Level D Protection.

a. Work clothing, including reflective vest and gloves.

b. Safety glasses.

c. Steel toed boots.

d. Hard hat.

2. Level C Protection:

a. Air-purifying respirators with organic vapor cartridges (full face piece).

b. Chemical protective gloves.

c. Chemical protective boots.

d. Chemical protective coveralls.

e. Hard hat and steel toed boots.

3. Level B Protection:

a. Self-contained breathing apparatus (full face piece).

b. Inner and outer chemical protective gloves.

c. Chemical protective boots.

d. Chemical protective coveralls.

e. Hard hat and steel toed boots.

PART 3 - EXECUTION

3.01 EQUIPMENT DECONTAMINATION PROCEDURES:

A. Drilling Equipment:

1. Decontaminate all equipment that contacts soils directly or indirectly, such as drive casings, drill rods, sampling equipment and storage areas on drill rig for such equipment, as follows:

a. Before first borehole has been started.

b. After completion of each borehole and prior to commencement of next borehole.

c. After last borehole of drilling program has been completed.

2. Decontamination procedures will be conducted as follows:

a. Steam clean equipment.

b. Spray equipment with reagent grade solvent, if deemed necessary by and to satisfaction of the Engineer.

c. Steam clean as final rinse.

3. Conduct decontamination of drilling equipment at decontamination areas designated by and to satisfaction of Engineer.

a. If required, construct decontamination pad as deemed necessary and to satisfaction of Engineer.

B. Sampling Equipment:

1. Wash sampling equipment before and after each use in water, then scrub sampling equipment in a water and lab grade detergent solution, and finally rinse equipment in clean water.

a. Add both a reagent grade solvent and deionized water rinse to the decontamination procedure if deemed necessary by Engineer.

C. Well Development Equipment:

1. Decontaminate all equipment that comes or will come into contact with well during development process, such as hoses or bailers, using hand or steam cleaning methods and reagent grade solvent, as deemed necessary by Engineer.

D. Investigation Derived Waste:

1. Containerize any Investigation Derived Waste (IDW) generated during drilling, sampling and well development activities that is deemed by the Engineer or Governing Authority to be contaminated, potentially contaminated, or surplus.

a. IDW materials may include but are not limited to soil cuttings, drilling fluids, decontamination fluids, purge water, and disposable personal protective equipment.

b. IDW materials shall be containerized in DOT approved, water tight 55-gallon drums that are suitable for temporary storage and eventual transport to a licensed disposal facility.

c. See IDW reference above.

3.02 MATERIALS DECONTAMINATION PROCEDURE:

A. Casing and Screens:

1. Clean with lab grade detergent, as deemed necessary by Engineer, immediately before installation in borehole.

3.03 HEALTH AND SAFETY PROCEDURES:

A. Health and Safety Meeting. All drilling crew personnel must attend a daily mandatory health and safety meeting led by the subcontractor's designated site safety officer prior to commencement of drilling activities. Subjects discussed during the meeting shall include:

1. Site safety.

2. Use of protective equipment (including fit test if necessary).

3. Decontamination procedures.

B. Equipment Availability:

1. Provide complete set of safety equipment for specified level of protection for each drilling crew member.

C. Air Quality Monitoring:

1. AECOM health and safety personnel will monitor air quality at top of borehole and at face level during drilling and well construction.

2. If monitoring indicates a potential health hazard as defined in the health and safety plan, all site personnel shall use protective equipment and clothing as appropriate to the level of protection until a hazard no longer exists.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 02 41 00

DEMOLITION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide demolition and alterations of existing conditions as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. United States Environmental Protection Agency (USEPA):

1. 832: Storm Water Management for Construction Activities: Developing Pollution Prevention Plans and Best Management Practices.

B. Salt Lake County:

1. Best Management Practices for Construction Activities.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Demolition Plan including locations for disposal and/or recycling of demolished material.

2. Sustainable Design Submittals.

3. Construction Waste Management Plan including goal for amount of waste to be recycled, i.e., 25 percent, 50 percent, etc.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Demolition Plan: Provide description of sequence, methods, and equipment used for demolition (including disposal) for review prior to beginning work.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 PREPARATION:

A. Survey Markers and Monuments:

1. Provide three reference points, established by a licensed land surveyor, for each survey marker or monument temporarily removed. Record locations and designations of survey markers and monuments prior to removal.

2. Store removed markers and monuments during demolition work, and replace upon completion of work. Reestablish survey markers and monuments in conformance with recorded reference points. Forward letter to Engineer, signed by a licensed land surveyor, verifying reestablishment of survey markers and monuments.

B. Burning of demolition debris is prohibited.

C. Protect existing structures, equipment, and appurtenances to remain.

D. Obtain permission from Engineer before abandoning or removing existing structures, materials, equipment and appurtenances.

E. Provide fire extinguishers in areas where demolition work is performed by use of an open flame. Exercise necessary precautions for fire prevention.

F. Maintain circulation of traffic within area at all times during demolition operations.

G. Confine apparatus, storage of materials, demolition work, new construction, and operations of workmen to areas that will not interfere with continued use and operation of entire facility. Provide and maintain lights, barriers, and temporary passageways for free and safe access.

H. Provide shoring or bracing where necessary to prevent settlement or displacement of existing or new structures. Do not overload floors.

I. Coordinate with the Engineer and Plant Electrician prior to demolition of electrical duct banks, light poles, and/or equipment and conduct “Make Safe” activities to ensure power is properly disconnected.

3.02 DEMOLITION:

A. Demolish and remove existing construction, utilities, equipment, and appurtenances.

B. Provide maximum practicable protection from inclement weather for materials, equipment, and personnel located in partially dismantled structures.

C. Protect persons and property throughout progress of work. Provide safe working conditions for personnel.

D. Wet down work during demolition operations to prevent dust from arising. Minimize spread of dust and airborne particles.

E. Complete demolition work on upper levels before disturbing supporting members on lower levels.

F. Cap or plug with concrete, pipes and other conduits which are abandoned in place.

G. All concrete and asphalt concrete designated to be demolished shall be disposed of at an approved recycled facility or reused on-site as reviewed and approved by the Engineer.

H. Removed materials, equipment, and appurtenances, not designated for relocation, become property of Contractor and shall be disposed of off-site at a location(s) approved by the Engineer.

3.03 SALVAGE:

A. Store equipment to be salvaged or relocated as approved by Engineer. Protect salvaged items from damage during work.

B. Salvage fire hydrants for future use by Owner. Store in vicinity of original location and place so as not to interfere with construction.

3.04 REPAIR/RESTORATION:

A. Repair or remove items that are damaged. Repair and install damaged items to condition at least equal to that which existed prior to start of work.

END OF SECTION

Page Intentionally Left Blank

DIVISION 03

CONCRETE

Page Intentionally Left Blank

SECTION 03 01 30

CONCRETE REPAIR

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide concrete repair as indicated and in compliance with Contract Documents.

B. Complete repair mortar system installation in accordance with these specifications and the mortar system manufacturer's instructions regarding surface preparation, application, inspection and requirements for safety.

C. Complete crack repair work in accordance with these specifications and crack repair material manufacturer's instructions.

D. Complete joint repair work in accordance with these specifications and the joint repair material manufacturer's instructions.

E. The areas of concrete repair shall be determined by the Engineer and shall include any location where acidic attack of the concrete surfaces has reached a depth of 1/2-inch or deeper and at any air voids, bugholes or poorly consolidated concrete areas where the specified filler/surfacer materials cannot be used for filling or surfacing of the concrete.

F. If repair work is required for an area indicated to receive protective lining or coating, provide such repair in accordance with the requirements of this specification and the related lining specifications.

G. The repair work specified herein is intended to cover the requirements for repair of concrete only, to a maximum depth of approximately 2-inch. If after blasting and cleaning, an area is discovered that requires a repair greater than 2-inch deep, or an area is discovered that requires repair or replacement of reinforcing steel notify the Engineer so that details may be provided to the Contractor to complete the repair.

2. 6F-163: "Surface Preparation of Steel or Concrete Tank Interiors"

3. TPC2: "Coatings and Linings for Immersion Service"

1.03 MEASUREMENT:

A. Crack Repair: The quantities in linear feet to be measured for payment shall be the actual length of cracks repaired by the methods and materials specified under.

1. Epoxy crack repair.

2. Flexible polyurethane crack repair.

3. Rigid polyurethane crack repair.

B. Spall Repair Depth 2-inch or Less: The quantities in square feet to be measured for payment shall be the actual square footage of spalled concrete repaired by the method and materials specified under spall repair.

C. Spall Repair Depth Greater than 2-inch: The quantities in cubic feet to be measured for payment shall be the actual cubic footage of spalled concrete repaired by the method and materials specified under spall repair.

D. Joint Repair: The quantities in linear feet to be measured for payment shall be the actual length of joints repaired by the methods and materials specified under joint repair.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Procedures proposed for the accomplishment of repair work. Include a detailed description of the methods and equipment to be used for each operation, and the sequence of operations to be coordinated with other works in progress.

2. Manufacturer's recommendations and product data sheets for all repair materials including performance criteria, surface preparation, ambient condition requirements and applications, curing requirements, volatile organic compound (VOC) data, and safety requirements.

3. Material Safety Data Sheets (MSDS) for any materials brought on-site including all repair system materials, solvents and abrasive blast media.

4. Qualifications of foreman and epoxy gun operators and demonstration of meeting the minimum requirements specified.

5. Design Mixes: Provide concrete and cement mortar in conformance with Section 03 30 00 and as specified herein.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Furnish the names of all subcontractors proposed for use for this work including necessary evidence and/or experience records to ascertain their qualifications in the application of epoxy, polyurethane polymer-modified and cement-based compounds.

C. Include in accepted applicator qualifications:

1. A minimum of five (5) years' experience in applying epoxy, polyurethane and polymer-modified and cement-based compounds similar to those specified in this Section.

2. A letter from the manufacturer of the specified materials, on the manufacturer's letterhead, signed by an officer of the company, stating that the subcontractor/ applicator has been trained in the proper techniques for the preparation of the surface, and proper methods for mixing, placing, curing, and caring of the manufacturer's products. This letter shall further state that the subcontractor/applicator is on the manufacturer's approved list of contractors.

D. Adhere strictly to the manufacturer's recommendations regarding temperature at time of application for all work. Do not use epoxy materials when either the temperature of the concrete to be repaired or the ambient temperature is below 50 degrees F. 24 hours before, during, or for a period of 48 hours after the completion of the repair. Temporary heat may be used to meet the specified requirements.

E. Use new epoxy, repair materials and use within the shelf life limitations set forth by the manufacturer. Clearly mark the shelf life limitations of each container.

F. The Contractor is ultimately responsible for the concrete repair work. Inspections by the Engineer or others do not limit the Contractor's responsibility.

G. Make all parts of the work accessible for inspections by the Engineer. Correct any conditions not in conformance with the specifications at no additional cost to the Owner.

H. Provide a Representative on site at all times when work is ongoing to represent the Contractor and to have authority to receive and execute all instructions given by the Engineer.

I. Allow changes in the specified repair work methods only with the permission of the Engineer.

J. Provide technical field support or training services required by the accepted material manufacturers at no additional cost to the Owner.

K. Provide materials from a single manufacturer for all components of a single repair.

1.07 SERVICES OF MANUFACTURERS REPRESENTATIVES:

A. Provide the services of a qualified manufacturer's technical representative to instruct the Contractor's personnel in the mixing, proper use and application of the epoxy, polyurethane, polymer-modified and cement-based compounds.

B. Provide written certification from the manufacturers' representative that materials have been mixed and applied properly and surfaces to receive these products have been prepared properly, all in conformance with manufacturer's requirements.

C. Provide on-site time required for the manufacturer's representative to achieve a successful installation at no additional cost to the Owner.

1.08 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements in APWA Section 01 66 00.

B. Provide shelter to store materials in area or areas designated by the Owner solely for this purpose. Confine mixing, thinning, clean-up and associated operations and storage of repair mortar materials debris before authorized disposal, to these areas.

C. Mix all specified materials in the sheltered mixing operation and materials from direct sunlight and inclement weather. Protect facilities from staining and damage.

D. Do not dispose of waste materials on-site.

E. Store waste temporarily in closed, nonflammable containers until final disposal. Keep no rubbish in Contractor's area longer than 24 hours.

F. Deliver all materials to the job site in new, unopened containers. Each container shall bear the manufacturer's name and label. Labels on all material containers shall contain the following information:

1. Name of product.

2. Federal Specification Number if applicable.

3. Manufacturer's batch number.

4. Manufacturer's name.

5. Generic type of material.

6. Hazardous material identification label.

7. Shelf life date.

G. Clearly mark all containers indicating any safety hazards associated with the use of or exposure to the materials.

H. Handle and store materials to prevent damage or loss of label. Protection of materials is the Contractor's responsibility.

1.09 PROJECT/SITE CONDITIONS:

A. Environmental Requirements:

1. Comply with the repair material manufacturer's recommendations as to environmental conditions under which materials can be applied and cured.

2. Do not apply materials when dust is being generated.

B. Protection:

1. Cover or otherwise protect finish work or other surfaces not being repaired.

C. Ventilation:

1. Provide ventilation to meet product requirements prior to, during, and after application.

PART 2 - PRODUCTS

2.01 WATER:

A. The water used for mixing concrete repair products shall be clear, potable and free of deleterious substances.

2.02 AGGREGATE:

A. All aggregates shall conform to ASTM C33 and Section 03 30 00.

2.03 EPOXY BONDING AGENT:

A. Epoxy bonding agent shall conform to ASTM C881 Type I, II, IV or V; Grade 2 for epoxy resin adhesives, depending on the application. The class of epoxy bonding agent shall be suitable for all ambient and substrate temperatures.

B. Products:

1. Sika Corporation; Sikadur 32

2. The Euclid Chemical Company; Duralcrete

2.04 ANTI-CORROSION COATING:

A. Anti-corrosion coating shall be a three-component, epoxy-modified cementitious material.

B. Products:

1. Sika Corporation; Sika Armatec 110

2. Sto Concrete Restoration Division; CR 246

3. The Euclid Chemical Company; Duralprep

2.05 EPOXY CRACK REPAIR BINDER:

A. Epoxy crack repair binder shall be a two-component, 100 percent solids, high-modulus, low viscosity epoxy adhesive suitable for crack grouting by injection.

B. Products:

1. Sika Corporation; Sikadur 52

2. The Euclid Chemical Company; Duralcrete LV

3. BASF; SBC Concresive 1380

2.06 FLEXIBLE POLYURETHANE CRACK REPAIR MATERIAL:

A. Flexible polyurethane crack repair material shall be a one-component, water-activated polyurethane hydrophilic injection grout capable of 700 percent expansion. Polyurethane grout shall form a tough flexible foam seal that is impenetrable to water.

B. Products:

1. Prime Resins; Prime Flex 900 XLV

2. Avanti International; Scotch Seal 5600 Chemical Grout

2.07 RIGID POLYURETHANE CRACK REPAIR MATERIAL:

A. Rigid polyurethane crack repair material shall be a one-component, water-activated polyurethane hydrophobic injection grout capable of 700 percent expansion. Polyurethane grout shall form a tough rigid foam seal that is impenetrable to water.

B. Products:

1. De Neef Construction Chemicals; Hydro-Active Cut

2. Prime Resins; Prime Flex 920

3. Sika Corporation; Sikafix HH LV

2.08 EPOXY REPAIR MORTAR:

A. Epoxy Repair Mortar shall be two-component, 100 percent solids, 100 percent reactive epoxy resin system.

B. Spall repair mortar for use in horizontal applications.

1. Products:

a. BASF; Concresive Paste LPL

b. Sika Corporation; Sikadur 22 Lo-Mod

C. Spall repair mortar for use in vertical and overhead applications.

1. Products:

a. Sika Corporation; Sikadur 23 Lo-Mod Gel

2.09 SPALL REPAIRS USING NON-SHRINK CEMENTITOUS MORTAR:

A. Products:

1. BASF; EMACO S88 CI

2. BASF; Thorite

3. Sauereisen, Inc.; Underlayment F-120

2.10 SPALL REPAIRS USING POLYMER MODIFIED CEMENTITOUS MORTAR:

A. Repair spalls repair not requiring formwork using a two-component, polymer-modified cementitious mortar having a minimum 28-day compressive strength of 7,000 psi.

B. Spall repair mortar for use in horizontal applications.

1. Products:

a. Sika Corporation.; Sikatop 122 Plus

b. The Euclid Chemical Company; Duraltop Fast Set

C. Spall repair mortar for use in vertical applications.

1. Products:

a. Sika Corporation; Sikatop 123 Plus

b. The Euclid Chemical Company; Duraltop Gel

2.11 SPALL REPAIRS REQUIRING FORMWORK:

A. Repair spalls repair requiring formwork using a two-component, polymer-modified cementitious mortar/pea gravel mixture and shall have a minimum 28-day compressive strength of 6,000 psi. Mix each unit of mortar with Saturated Surface Dry (SSD) pea gravel to form the repair material following the manufacturer's recommendations.

B. Products:

1. Sika Corp.; Sikatop 111 Plus

2. The Euclid Chemical Company; Duraltop Flowable Mortar

2.12 WATERPROOF MEMBRANE PATCH:

A. Waterproof membrane patch shall be a hypalon sealing strip secured to the concrete substrate with an epoxy adhesive.

B. Install sealing system per manufacturer's recommendations.

C. Products:

1. Sika Corporation; Sikadur Combiflex

2.13 CEMENT BASED TEXTURED COATING:

A. Products:

1. Sika Corporation; Sikatop 144

2. The Euclid Chemical Company; Duraltop Coating

3. BASF; Thoroseal/Acryl 60

2.14 SEALANT:

A. Sealant shall be a two-component polyurethane sealant as specified in Section 03 15 00. Primers and bond breakers shall conform to the sealant manufacturer's recommendations.

2.15 EXPANSION JOINT FILLER:

A. Expansion joint filler shall be as specified in Section 03 15 00.

PART 3 - EXECUTION

3.01 GENERAL REQUIREMENTS:

A. Perform exterior work during dry weather and appropriate temperature conditions in accordance with the manufacturer's recommendations. Protect unfinished work during inclement weather with tarpulins or heavy gage polyethylene sheeting.

B. Perform work in spaces within structures at temperature and conditions suitable for proper curing in accordance with the manufacturer's recommendations.

C. Coordinate concrete rehabilitation work with other work being performed.

D. Remove scaling, broken, loose and disintegrating materials by use of hand tools or power driven saws, down to solid unyielding material.

E. Clean surfaces thoroughly of efflorescence, oils, grease and other objectionable material in area to be repaired in accordance with the manufacturer's recommendations.

3.02 EPOXY BONDING AGENT:

A. Use epoxy bonding agent to adhere fresh mortar to existing concrete. Roughen existing concrete surfaces prior to application of bonding agent. Concrete surface shall be clean and

sound, free of all foreign particles and laitance. Place repair material while bonding agent is still tacky or per the written instructions of the manufacturer. Reapply bonding agent if bonding agent cures prior to placement of repair material.

B. Conform to all the requirements of ACI 503.4, and as specified herein.

3.03 ANTI-CORROSION COATING:

A. Sandblast, clean and coat reinforcing steel that is cut or exposed during alteration and/or repair operations with an anti-corrosive coating.

B. Cover all exposed parts of the steel with the coating and apply according to manufacturer's recommendations.

3.04 EPOXY CRACK REPAIR:

A. Cracks on horizontal surfaces: When permitted by the Engineer, repair existing structural cracks by gravity feeding an epoxy crack repair binder into the prepared crack.

1. Grout concrete surface at the crack to form a minimum 1/4-inch wide by 1/4-inch deep V-notch and clean to remove all loose and foreign particles. Fill crack with clean, dry sand and pour epoxy crack repair binder into V-notch, completely filling crack.

2. As binder penetrates into crack, apply additional binder to the V-notch.

B. Cracks on vertical or horizontal surfaces: Repair existing structural cracks by pressure injecting an epoxy crack repair binder into the prepared crack per Section 03 64 23. Seal cracked surfaces and install injection ports per manufacturer's recommendations.

1. Do not cut reinforcement steel when drilling holes for injection ports. If rebar is encountered during drilling, abandon the hole and relocate. Patch the abandoned hole immediately with epoxy mortar flush with the surface of the existing concrete.

2. Once the surface sealing material has cured, inject crack with epoxy crack repair binder as directed by the manufacturer.

3. Remove injection ports upon satisfactory completion of crack injection and patch with epoxy mortar.

3.05 RIGID AND FLEXIBLE POLYURETHANE CRACK REPAIR:

A. Repair leaking cracks by pressure injecting with a waterproof hydrophilic or hydrophobic injection grout seal crack surfaces and install injection ports per manufacturer's recommendations.

B. Do not cut rebar when drilling holes for injection ports. If rebar is encountered during drilling, abandon the hole and patch immediately with epoxy mortar flush with the surface of the existing concrete.

C. Once the surface sealing material has cured, inject crack with waterproof hydrophilic or hydrophobic injection grout as directed by the manufacturer.

3.06 SPALL REPAIR:

A. Saw cut the perimeter of the repair area to a minimum depth of 1/4-inch below the surface of the concrete.

B. Chip all loose concrete in the repair area to remove loose and degraded concrete to a minimum of 1/4-inch or until a sound substrate is reached.

C. Clean the area and repair to the original dimensions with spall repair patching material according to the manufacturer's recommendations.

D. Make final finished surface of patches flat, level and even with the existing concrete surface. Do not feather repair mortar to meet existing concrete surface.

E. Finish final patches on horizontal surfaces consistent with the finish on the existing structure.

3.07 JOINT REPAIR:

A. Remove sealant, bond breaker and joint filler.

B. Remove unsound concrete on the joint faces.

C. Remove laitance and provide a clean dry surface.

D. Prepare an epoxy mortar by combining epoxy crack repair binder with aggregate following the manufacturer's instructions.

E. Restore surface to original dimensions by trowelling epoxy mortar onto the existing substrate in a manner to ensure bonding following the manufacturer's instructions.

F. Cure repair in accordance with the manufacturer's instructions.

G. Install new joint filler, bond breaker and sealant.

3.08 CEMENT BASED TEXTURED COATING:

A. Clean existing concrete areas requiring a textured coating and apply the cement based textured coating according to manufacturer's recommendations.

B. Complete other concrete rehabilitation prior to applying coating.

3.09 CURING:

A. Cure repair materials in accordance with manufacturer recommendations.

3.10 CLEANING:

A. Mechanically remove excess material from walls, floors, etc. after material has cured.

B. Clean excess materials caused by work under this section from existing surfaces by the use of power sanders. Vacuum surfaces to receive final cleaning and finishing specified under other sections of the specifications. Sand cracks flush to adjacent surfaces.

C. Remove misplaced sealants using methods and materials recommended by the manufacturers. Leave finished work and work area in a neat and clean condition.

3.11 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 03 05 10

LEAKAGE TESTING OF CONTAINMENT STRUCTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section describes the method of testing concrete containment structures for leakage. All containment structures shall be leak tested unless specifically exempted by the Engineer as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Concrete Institute (ACI):

1. 350.1: Tightness Testing of Environmental Engineering Concrete Structures and Commentary.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Provide piping and equipment to test concrete structures for leakage as described herein.

PART 3 - EXECUTION

3.01 GENERAL:

A. Hydrostatically test reinforced concrete structures which will contain fluids to determine that they conform to leakage criteria specified herein and are free of detectable leaks. Do not hydrostatically test walls that are to be restrained or laterally supported by slabs until slab concrete has obtained the specified compressive strength.

B. Prior to testing, clean exposed surfaces by thoroughly hosing and removing surface laitance and loose matter from walls and slabs. Remove wash water and debris from the structures by means other than washing through plant piping. All potential leakage points shall be identified and repaired prior to filling the tank with water for the tightness test. Methods for repairing concrete shall be as described in Section 03 01 30.

C. No backfilling, floor finish, concrete or mortar fill, wall insulation, gasproofing or protective coatings, or permanent pipe connections shall be applied to or installed in any new containment structures until they have been subjected to loading for settlement and tested for leakage. Testing shall not be done until the concrete has reached its specified design strength.

3.02 PRELOADING TEST:

A. For the Preloading Test the Contractor shall maintain the liquid level in the structures at the design maximum water level for 72-hours.

3.03 LEAK TEST PROCEDURE:

A. Leakage testing shall meet the provisions of ACI 350.1 – Tightness Testing of Environmental Engineering Concrete Structures. The test criterion shall be HST-NML (no measurable loss) for fully lined prior to tightness test, secondary containment structures; HST-050 (0.050 percent per day) for other tanks as defined by ACI 350.1; HST-100 (0.100 percent per day) for concrete paved reservoirs and channels.

B. Leakage testing shall meet the provisions of ACI 350.1 – Tightness Testing of Environmental Engineering Concrete Structures. The test criterion shall be HST-050 (0.050 percent per day) for other tanks as defined by ACI 350.1.

C. During the test period, the excavation around the structure shall be kept dewatered by the Contractor. Dewatering shall maintain the groundwater level to below the top of the base slab. The Contractor shall temporarily seal all bottom openings and wall openings below maximum water level in the structures, furnish and fill the structures to the design maximum water level with clean water. The Contractor shall make his own arrangements for handling the water for testing and its transfer from one structure to another and its final disposal.

D. Filling rate shall not exceed 4-feet/24 hours of water depth with continuous monitoring. Filling shall be at a uniform rate.

E. Filling rate shall not exceed a rate as permitted by the Engineer of water depth with continuous monitoring. Filling shall be at a uniform rate.

F. During the leakage test period, the Engineer will inspect the structure for leakage or change in volume. If moist spots become visible, indicating the existence of minor leaks, or if the water level indicates hidden leakage, the Contractor shall furnish all materials and do all work necessary to locate the leaks and make the structure watertight to the complete satisfaction of the Engineer. No additional compensation will be allowed for such work.

G. If, in the opinion of the Engineer, during the course of the test weather conditions are such that it becomes difficult to accurately monitor the water level in the tank, the test shall be stopped, and started over again when weather permits, at no additional cost to the Owner.

H. On conclusion of the test, the Contractor shall pump or drain the water from the structure and dispose of it without damage to structures or surrounding facilities.

I. The water tightness test will be considered a pass when no wet spots are observed on the exterior surfaces of the containment structure during the water tightness test period and when the measured loss is less than the maximum specified.

3.04 REPAIR METHODS:

A. Methods for repairing concrete not passing the leakage test shall be as described in Section 03 01 30.

3.05 CLOSEOUT ACTIVITIES

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 10 00

CONCRETE FORMWORK

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide design and furnish materials for fabricating, erecting and removing formwork, falsework and shoring for cast-in-place concrete as indicated and in compliance with Contract Documents.

B. Use formwork to cast all cast-in-place concrete structures with the exception of neat-line dirt excavations and fillets with a dimensional extension to meet 3-inch rebar clearances.

C. Provide and remove all formwork for electrical work as shown on the drawings or specified under electrical work.

1.02 REFERENCES:

A. American Concrete Institute (ACI):

2. 309.2R: Identification and Control of Visible Effects of Consolidation on Formed Concrete Surfaces.

3. 318/318R: Building Code Requirements for Structural Concrete and Commentary.

4. 347: Guide to Formwork for Concrete.

5. 347.3R: Guide to Formed Concrete Surfaces

B. Engineered Wood Association (APA)

C. National Institute of Product Standards and Technology

1. Voluntary Product Standard PS 1 Structural Plywood

D. National Sanitation Foundation (NSF):

1. 61: Drinking Water System Components – Health Effects

1.03 DESIGN REQUIREMENTS:

A. Design formwork in conformance with methodology of ACI 347R for anticipated loads, lateral pressures, depth of concrete placement and rate of concrete placement. Design

shall consider any special requirements due to the use of self-consolidating, plasticized and/or retarded set concrete. All forms and shoring shall be designed at the contractor's expense.

B. See Section 03 35 01 for additional formwork requirements identified in Table 03 35 01-1 which may exceed the requirements of this section.

1.04 QUALIFICATIONS:

A. Formwork Designer: Formwork, falsework, and shoring design shall be stamped by an engineer licensed in the State of Utah.

1.05 SUBMITTALS:

A. Submit product data for form ties, spreaders, chamfer strips, void forms, form coatings, and bond breakers.

B. Submit following shop drawings in accordance with Section 01 33 00.

1. Layout of panel joints and tie hole pattern. Form Ties-Tapered Through-Bolts: Proposed method of sealing form tie holes.

2. Product data for form ties, spreaders, chamfer strips, and bond breakers.

3. Layout and locations of void forms.

1.06 QUALITY ASSURANCE:

A. Comply with requirements in Section 01 45 00 and as specified.

B. Design of Formwork:

1. The Contractor shall assume responsibility for the design, engineering and construction of formwork. Forms shall be designed to produce concrete members identical in shape, lines and dimensions to members shown on the Contract Documents.

2. When high range water reducer (superplasticizer) is used in concrete mix or when self-consolidated concrete is specified, forms shall be designed for full hydrostatic pressure per ACI 347.

3. The formwork shall be designed for the loads and lateral pressures in accordance with ACI 347, ACI 318, and wind loads as specified by the local building code.

4. Construction and contraction joints, openings, offsets, keyways, recesses, moldings, chamfers, blocking, screeds, bulkheads, waterstops, anchorages, inserts, and other features shall be provided.

5. Formwork shall be designed to be readily removable without impact, shock, or damage to 'green' concrete surfaces and adjacent materials.

6. The maximum panel deflection shall be 1/360 of the span between structural members.

C. Unless otherwise specified herein, formwork shall be constructed so that the concrete surfaces will conform to the tolerance limits as given in ACI 117.

D. Materials, fabrications and workmanship found defective shall be promptly removed and replaced and new acceptable work shall be provided in accordance with Contract requirements at no additional cost to the Owner.

1.07 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements in APWA Section 01 66 00.

B. Materials shall be delivered to the site in an undamaged condition and at such intervals as will avoid delay in the work.

C. Material shall be stored and protected in a clean, properly drained location. Material shall be kept off the ground under a weather-tight covering permitting good air circulation. Formwork materials shall be stored on dry wood sleepers, pallets, platforms or other appropriate supports which have slope for positive drainage. Materials shall be protected from distortion, excessive stresses, corrosion and other damage. Materials shall not be stored on the structure in a manner that might cause distortion or damage to the supporting structure.

PART 2 - PRODUCTS

2.01 LUMBER:

A. Lumber used in form construction shall be Douglas fir, No. 2 grade, S4S, Standard Grading and Dressing Rules No. 16, West Coast Lumber Inspection Bureau; or Southern Yellow Pine, No. 2, S4S, Standard Grade Rules Southern Pine Inspection Bureau. Boards shall be 4 inches or more in width.

2.02 PLYWOOD:

A. Only grade-marked plywood conforming to APA shall be provided.

B. Plywood used in form construction shall be Grade B-B, Class 1 plyform, mill-oiled, and sanded on both sides in conformance with U.S. Product Standard PS 1 Structural Plywood.

C. Thickness shall be sized to maintain alignment and surface smoothness, but not less than 5/8-inch thick.

2.03 STEEL FORMS:

A. Commercial grade sheets not less than 16 gage shall be provided.

B. Stock material that is free from warps, bends, kinks, cracks, and rust or other matter that could stain the concrete shall be provided.

C. Galvanized metal stay in place concrete form system may be used at non-exposed concrete joint surfaces only.

1. Manufacturer:

a. AMICO Alabama Metal Industries Corporation, Birmingham, AL Stay-Form

2.04 FORM MATERIAL LOCATIONS:

A. Wall Forms and Underside of Slabs and Beams:

1. Materials: Plywood, hard plastic finished plywood, overlaid waterproof particleboard, or steel in new and undamaged condition, of sufficient strength and surface smoothness to produce specified finish.

B. Column Forms:

1. Rectangular Columns: As specified for walls.

2. Circular Columns: Fabricated steel or fiber reinforced plastic with bolted together sections or spirally wound laminated fiber form internally treated with release agent for height of column.

C. Slab-on-grade: Lumber, steel forms or plywood.

D. All Other Forms: Materials as specified for wall forms.

E. Rustication Grooves and Chamfer Strips: Nonabsorbent material, compatible with form surface, fully sealed on all sides prohibiting loss of paste or water between the two surfaces.

F. Chamfer Strips: Wood, fully sealed on all sides prohibiting loss of paste or water between the two surfaces.

2.05 FORM TIES:

A. Locate form ties on exposed surfaces in a uniform pattern. Place form ties so they remain embedded in the concrete except for a removable portion at each end. Form ties shall have conical or spherical type inserts with a maximum diameter of 1 inch. Construct form ties so that no metal is within 1-1/2 inch of the concrete surface when the

forms, inserts, and tie ends are removed. Do not use wire ties. Ties shall withstand all pressures and maintain forms within acceptable deflection limits.

B. Flat bar ties for panel forms (not permitted for hydraulic structures) shall have plastic or rubber inserts having a minimum depth of 1-1/2 inch and sufficient dimensions to permit patching of the tie hole.

C. Tapered form ties shall be tapered through-bolts or through-bolts that utilize a removable tapered sleeve.

D. Wire ties are not permitted.

E. Water Stop Ties: For water-holding structures, basements, pipe galleries, and accessible spaces below finish grade, furnish one of the following:

1. Integral steel water stop 0.103 inch thick and 0.625 inch in diameter tightly and continuously welded to tie.

2. Neoprene water stop 3/16-inch thick and 15/16 inch diameter whose center hole is one-half diameter of tie, or molded plastic water stop of comparable size.

F. Elastic Vinyl Plug:

1. Design and size of plug shall allow insertion with tool to enable plug to elongate and return to original length and diameter upon removal forming watertight seal.

2. Manufacturer:

a. Dayton Superior, Miamisburg, OH; A58 Sure Plug.

2.06 BOND BREAKER:

A. Bond breaker shall be a V.O.C.-compliant non-staining type that will provide a positive bond prevention.

B. Manufacturers:

1. Dayton Superior, Sure Lift J6LVOC

2. Nox-Crete, Inc.; Silcoseal Select.

2.07 FORM CAULKING:

A. Form caulking shall be a one-component, gun-grade silicone sealant that is capable of producing flush, watertight and non-absorbent surfaces and joints. Sealant shall be compatible with the type of forming material and concrete ingredients used.

B. Products:

1. Series 1200 Construction Caulking; GE Silicones, Waterford, NY.

2. Dow Corning 999-A; Dow Corning Co., Midland, MI.

2.08 CHAMFER STRIPS:

A. Provide 3/4 inch by 3/4-inch chamfer strips milled from clear, straight-grain pine, surfaced each side, or having extruded vinyl type with or without nailing flange unless otherwise shown on the Contract Documents.

2.09 INSERTS:

A. Provide galvanized cast steel or galvanized welded steel inserts, complete with anchors to concrete and fittings such as bolts, wedges and straps.

2.10 DOVETAIL ANCHOR SLOTS:

A. Provide dovetail anchor slots manufactured from 22 gage, galvanized steel with removable felt or polyurethane filler shall be provided where specified or shown on the Contract Documents.

2.11 VOID FORMS:

A. Continuous void forms.

B. Specifically design and manufactured for the purpose of creating a void area directly under concrete members which will allow a space for soil vertical upward movement.

C. Able to support the weight of concrete and construction loads to be placed thereon with no decrease in required void form depth.

D. Constructed from double faced corrugated carboard or fiberboard which is wax impregnated and laminated with moisture-resistant adhesive.

E. Capable of resisting moisture with no loss of load carrying strength or change in depth or configuration.

F. Manufacturer:

1. VoidForm Products, Inc Fort Worth, TX

2. Sonoco, Hartsville, SC

3. Sonovoid, Deslauriers, Inc, LaGrange Park, IL

2.12 FORM RELEASE AGENT:

A. Form release agent shall not bond with, stain, or adversely affect concrete surfaces and shall not impair subsequent treatments of concrete surfaces when applied to forms. A ready-to-use water-based material formulated to reduce or eliminate surface imperfections and containing no mineral oil or organic solvents.

B. Manufacturers and Products:

1. BASF, Shakopee, MN; MasterFinish RL 211.

2. Cresset Chemical Company; Crete-Lease 20-VOC.

3. Dayton Superior; Farm Fresh XL.

PART 3 - EXECUTION

3.01 FORM TOLERANCES:

A. Comply with the requirements of ACI 117 for tolerances for formed surfaces except as specified in Table 03 10 00-1 or 03 35 00.

Table 03 10 00-1	
Vertical alignment (plumbness)	1/4-inch in any 10 feet and 1-inch maximum for entire length
Variation in the lines and surfaces of foundation mats, base slabs and walls	1/4-inch in any 10 feet and 1-inch max. for entire length
Variation from the level or from the grades indicated on the drawings	1/4-inch in any 10 feet
Variation of the linear building lines from established position in plan	1/2-inch in any 20 feet and 1-inch maximum for entire length
Variation of distance between walls	1/4-inch in any 10 feet and 1-inch maximum for entire length and height
Variation in the sizes and locations of sleeves, floor openings and wall openings	+1/4-inch -1/2-inch
Variation in cross-sectional dimensions of columns and beams and in the thickness of slabs and walls	-1/4-inch. +1/2-inch.
Offset between adjacent panels of formwork facing material	1/2-inch (ACI 117 Class C finish).
Offset between adjacent panels of formwork facing material for exposed surfaces where appearance is of importance	1/8-inch (ACI 117 Class A finish).

B. Tolerances are not cumulative.

C. Where equipment is to be installed, comply with manufacturer's tolerances if more restrictive than above.

D. Failure of the forms to produce the specified concrete surface and surface tolerance shall be grounds for rejection of the concrete work. Rejected work shall be repaired or replaced at no additional cost to the Owner.

3.02 PREPARATION:

A. Clean form surfaces to be in contact with concrete or foreign material prior to installation. Tape, gasket, plug, and/or caulk joints, gaps, and apertures in forms so that the joint will remain watertight and withstand placing pressures without bulging outward or creating surface irregularities.

B. Coat form surfaces in contact with concrete with a form release agent prior to form installation.

C. Keep form coatings off steel reinforcement, items to be embedded, and previously placed concrete.

D. Steel Forms: Apply form release agent to steel forms as soon as they are cleaned to prevent discoloration of concrete from rust.

E. Form liners to be installed for architectural concrete finish shall be in accordance to the manufacturer recommendations. (Not Used in Contract)

F. Void Forms: protect void forms from exposure to moisture and damage prior to installation. See manufacturer recommendations.

3.03 ERECTION AND INSTALLATION:

A. Forms shall be constructed in accordance with ACI 347 to required dimensions, plumb, straight and mortar tight, and all joints and seams shall be made mortar-tight. Forms shall be substantial, properly braced, and tied together to maintain position and shape and to resist all pressures to which they may be subject. Unless otherwise indicated on the Contract Documents, formwork shall be constructed so that the concrete surfaces will conform to the tolerance limits in ACI 117 and herein specified.

B. Provide means for holding adjacent edges and ends of form panels tight and in accurate alignment to prevent the formation of ridges, fins, offsets, or similar surface defects in the finished concrete. Forms shall be tight and shall prevent the loss of mortar and fines during placing and vibration of concrete.

C. Provide exterior corners in concrete members with chamfers as specified.

D. Provide means for removing forms without damage to the surface of finished concrete.

E. Do not embed any form-tying device or part thereof other than metal in the concrete.

F. Locate large end of taper tie on the "wet" side of the wall.

G. Use only form or form-tying methods that do not cause spalling of the concrete upon form stripping or tie removal.

H. Form surfaces of concrete members except where placement of the concrete against the ground is shown in the drawings or as indicated below. The dimensions of concrete members shown in the drawings apply to formed surfaces, except where otherwise indicated. Placement of concrete against the ground shall be limited to footings.

I. Openings shall be of sufficient size to permit final alignment of pipes or other items without deflection or offsets of any kind. Allow space for packing where items pass through the wall to ensure watertightness. Provide openings with continuous keyways and water stops. Provide a slight flare to facilitate grouting and the escape of entrained air during grouting. Provide formed openings with additional reinforcement as shown in the typical structural details. Reinforcing shall be at least 2 inches clear from the opening surfaces and encased items.

J. Set anchor bolts and other embedded items accurately before placing concrete and hold securely in position until the concrete is placed and set. Check special castings, channels, or other metal parts that are to be embedded in the concrete prior to and again after placing concrete. Check nailing blocks, plugs, and strips necessary for the attachment of trim, finish, and similar work prior to placing concrete.

3.04 PROTECTION:

A. During installation, the forms shall not be used as a storage platform nor as a working platform until the forms have been permanently fastened in position.

B. Protect void forms from moisture until concrete placement.

3.05 PIPES AND WALL CASTINGS CAST IN CONCRETE:

A. Install wall spools, wall flanges, and wall anchors before placing concrete. Do not weld, tie, or otherwise connect the wall castings or anchors to the reinforcing steel.

B. Support pipe and fabricated fittings to be encased in concrete on concrete piers or pedestals. Concrete supports shall transfer loads to firm foundations so that no settlement will occur during construction.

C. Pipes or wall castings located below operating water level shall have water stop ring collars and shall be cast in place. Pipes fitted with thrust rings shall be cast in place.

D. All pipe penetrations through the slab shall have cast-in-place HDPE sleeves (minimum SDR 21) one pipe diameter larger than the carrier pipe.

3.06 REMOVAL OF FORMS:

A. Forms shall be removed in accordance with ACI 347 recommendations without damage to concrete and in a manner to ensure complete safety to the structure. Forms, form ties and bracing shall not be removed without specific permission of the Contractor's Registered Professional Engineer.

B. The following table indicates the minimum allowable time after the last cast concrete is placed before forms, shoring, or wall bracing may be removed; during which the air surrounding the concrete is above 50 degrees F.

Table 03 10 00-2	
Sides of footings and encasements	18 hours
Walls, vertical sides of beams, girders, columns, and similar members not supporting loads	48 hours
Slabs, beams, and girders	48 hours (forms only)
Shoring for slabs, beams, and girders	Until concrete strength reaches specified 28-day strength
Wall bracing	Until top or roof slab concrete reaches specified 28-day strength

C. Form removal and reshoring may be allowed with approval of the Engineer of Record. Removal times will be increased if the concrete temperature following placement is permitted to drop below 50 degrees F.

D. Do not remove supports and reshore.

3.07 PATCHING OF TAPERED TIE HOLES:

A. Clear tie hole of all loose debris with a taper tie void brush and flush debris from tie hole with air or water.

B. Install elastic vinyl plug from larger tie hole end in accordance with manufacturer’s instructions using an insertion tool as recommended by the manufacturer.

C. Coat entire annular surface of the hole with epoxy bonding compound prior to filling with non-shrink, non-metallic patching mortar. Apply epoxy in accordance with manufacturer’s instructions.

D. Fill each side of hole with mortar. Apply mortar to the "wet" side of the wall first. Consolidate mortar solidly into the hole.

3.08 ALUMINUM SURFACES IN CONTACT WITH CONCRETE:

A. Coat aluminum surfaces that will be in contact with concrete per Section 09 90 00.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION
